PENTEK CONCRETE SCABBLING SYSTEM HUMAN FACTORS ASSESSMENT - BASELINE

SECTION 1 - SUMMARY

Technology Description

The Pentek concrete scabbling system consists of the MOOSE® scabbler, the SQUIRREL®-I and SQUIRREL®-III scabblers, and VAC-PAC®. The scabblers are designed to scarify concrete floors and slabs using cross section, tungsten carbide tipped bits. The bits are designed to remove concrete in 3/8 inch increments. The bits are either 9-tooth or demolition type. The scabblers are used with a vacuum system designed to collect and filter the concrete dust and contamination that is removed from the surface.

Key Results

The human factors assessments focused on two main areas of exposure: dust and noise. The dust exposure was found to be minimal, but noise exposure was significant. Further testing for each of these exposures is recommended because the outdoor environment where the testing demonstration took place may skew the results. It is feasible that the dust and noise levels will be higher in an enclosed operating environment. In addition, other areas of concern were arm-hand vibration, whole-body vibration, ergonomics, heat stress, tripping hazards, electrical hazards, machine guarding, and lockout/tagout.

SECTION 2 - HEALTH AND SAFETY EVALUATION

General Safety and Health Concerns

Safety and health issues of concern with the Pentek concrete scabbling technology

included tripping hazards, electrical hazards, rotating machinery, lockout/tagout, heat stress, ergonomics, arm-hand vibration, whole-body vibration, noise, dust, and communication.

Industrial Hygiene Monitoring

During the testing demonstration, sampling was conducted for dust and noise. In addition, the wet-bulb globe temperature was monitored and observational evaluation was conducted for ergonomics and arm-hand vibration and whole-body vibration.

Ergonomically there is potential for muscle/back and knee stress and/or injury. Arm-hand vibration was not quantitatively measured, but it was readily apparent that there was exposure to arm-hand vibration that could potentially cause problems such as Raynaud's syndrome. There was also exposure to whole-body vibration.

Heat stress was monitored using wet-bulb globe measurements and worker physiological measurements such as blood pressure, pulse, and temperature. Work/rest regimen recommendations were made in accordance with ACGIH recommendations.

Personal sampling for total dust was conducted on the equipment operators. Personal sampling results were below allowable levels. Noise monitoring recorded a dose of 164% or an 8-hour TWA of 93.5 dBA for operator number 1 and 174.75% or an 8-hour TWA of 94 dBA. This exceeds the OSHA action level of 85 dBA and the permissible exposure of 90 dBA. A hearing conservation program will be essential for

anyone working with or around this equipment.

SECTION 4 - REGULATORY/POLICY ISSUES

Human Factors Interface

The technology was evaluated for operator interface with Anti-C PPE including a full face air-purifying respirator. While wearing the PPE, operators experienced some visibility problems due to the full face respirator, and some loss of tactile sensation and dexterity during maintenance activities. In addition, there was an increase in heat stress associated with the protective ensemble.

SECTION 3 - TECHNOLOGY APPLICABILITY

On observation, the technology did deposit some visible dust into the atmosphere. Air monitoring did not evidence an excessive dust level; however, the windy outdoor testing environment was not representative of an indoor work environment. There was some larger debris left on the surface at the sides of the scabbling head.

The MOOSE®, SQUIRREL®-I, and SQUIRREL®-III will need to be torn down to decontaminate. This will not necessarily guarantee that decontamination for alpha will be complete. It will be difficult to survey for alpha contamination due to all of the small spaces in the equipment that are hard to reach with a probe. According to the technology representative, many parts, such as the hoses and brushes, may be considered consumables.

The site safety and health personnel where the Pentek scabbling technology is being used need to be concerned with safety and health regulations applicable to the issues discussed above. Regulations that will apply may include but not be limited to the following areas: housekeeping, electrical, hand and power tools, machine guarding, lockout/tagout, ionizing radiation, toxic and hazardous substances, noise, respiratory protection, PPE, HAZCOM, HAZWOPER, and arm-hand and whole-body vibration.

SECTION 5 - OPERATIONAL CONSIDERATIONS & RECOMMENDATIONS

Recommendations for improved worker safety and health include good housekeeping, ergonomic training and awareness, a clamping system for vacuum hoses, assessing the SQUIRREL® for possible operation from a standing position, guarding all moving parts, assuring proper vacuum adjustment for adequate air flow, and engineering, administrative, and/or hearing protection be used for compliance with the OSHA noise standard.

Due to the windy outdoor testing conditions, it is recommended that the noise and dust monitoring be conducted while the technology is in use in an enclosed environment. Since Level A or Level B PPE may be required for contaminants other than alpha radiation, it is recommended that the human factors interface for these levels of protection be conducted.

Research supported by the U.S. Department of Energy's Federal Energy Technology Center, under cooperative agreement DE-FC21-95MC32260 with the Operating Engineers National HAZMAT Program, 250 Airport Circle, Beaver, WV 25813, phone 304-253-8674, fax 304-253-7758.
