--	----

BURLINGTON

The State Highway Department Building in Burlington has been evaluated in this geothermal energy appraisal. While there is no known geothermal resource at Burlington, a shallow water aquifer - Ogallala Aquifer - does exist beneath Burlington at depths of 200 to 300 feet. One particular water well is reported to be producing water at 59°F to 63°F at 800 to 1000 gpm. Therefore, the Ogallala is being considered as a source of warm water for the use of water-to-air heat pumps for space heating of the Highway Department Building.

The geothermal energy economics are evaluated for two options: (1) a new water well drilled on the site of the Highway Department Building and (2) the purchase of warm water from an existing City of Burlington water well. The latter option is evaluated only for the 12 percent/9 percent (through 1984/through 2000) natural gas price escalation case, whereas the former option is evaluated for both the 15 percent and the 12 percent/9 percent schedules.

The results of the economic evaluations generally indicate that heat pumps would not be economically competitive, particularly if the State purchased City water at the current water rates. Fuel price escalation rates greater than 15 percent per year can shift the heat pump/shallow well option to a marginal position.

The principal institutional/environmental issue to be addressed for the Burlington facility is an existing ordinance which only allows the City to drill water wells within the City. The City would either have to grant an exception for a State well or the City would own the well and sell the water to the State.

Resource Assessment for Burlington

There are absolutely no indicators of anomalous geothermal heat in the subsurface beneath Burlington, Colorado. There are no hot springs, alteration zones, sinter deposits, mappable fracture zones or volcanics within 78 miles of the town.

A water well in the Burlington area is reported to be 327 feet deep, with water being pumped from the 200-foot level in the Ogallala Aquifer. The well is producing at 800 to 1000 gpm with surface temperature of 59°F to 63°F.

If temperature gradient data from the nearest control point, an oil well 15 miles away, are applied to a 63°F well at 200 feet, then depths in excess of 5,600 feet would be required to encounter 150°F temperatures in the Burlington area.

Because there are no indicators of geothermal heat at Burlington, this site is used to study the heat pump potential only.

On-site drilling of a warm water well to 200 feet deep and a well drilling cost of \$5,000 are assumed for the Highway Department Building.

Building Retrofit Engineering for State Highway Department Building

The following engineering design specifications are prescribed for the Highway Department Building in Burlington. The proposed heat pump engineering schematic is provided in Figure 19.

Present Conventional Fuel Heating System

<u>Building</u>	<u>Square Footage</u>	<u>Fuel</u>	<u>Heating Equipment</u>	<u>Peak Heat Load (Btu/hr)</u>
Office	800	Natural gas	Forced air furnace	100,000
Garage	4,000	Natural gas	Overhead furnace	104,000
				<hr/> 204,000

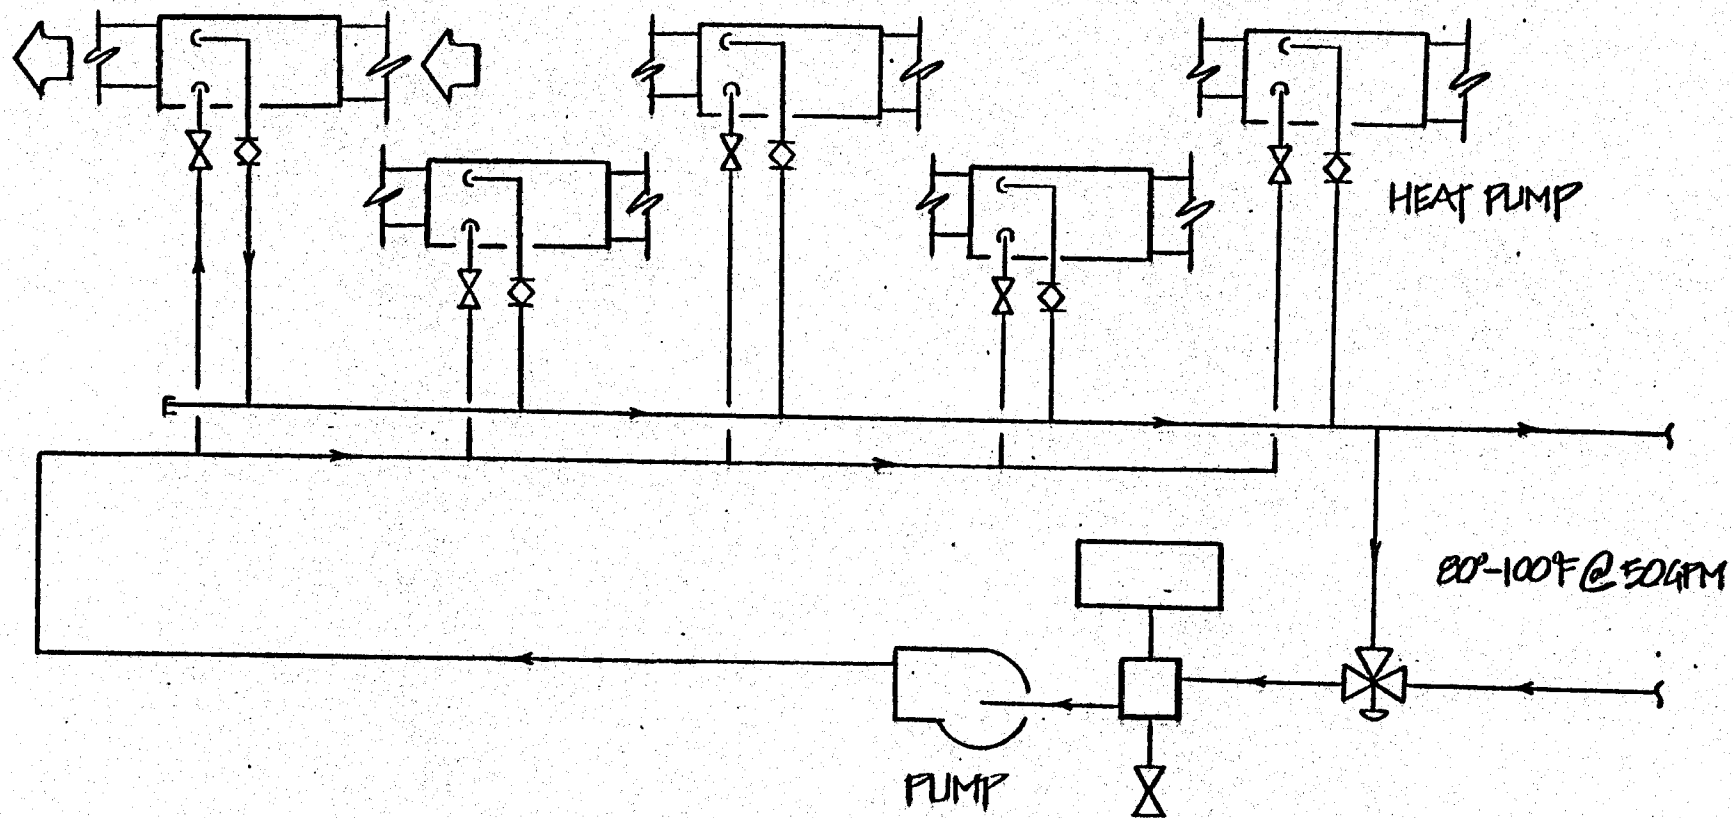

Geothermal System Design Specifications

Proposed System and Modifications:

1. Retrofit to utilize shallow aquifer as source for water-to-air heat pumps.
2. Replace gas furnace in office and gas unit heaters in garage with water-to-air heat pumps.
3. Existing air distribution will remain; however, additional sheet metal is required.
4. Circulating pump is required.
5. Air separator and expansion tank are required.
6. Distribution piping to heat pumps is required.
7. 3-way diverting valve is required.
8. More sophisticated temperature control is required.

Engineering Design:

Design heating can be accomplished with water-to-air heat pumps, utilizing a 60°F to 80°F direct warm water source at 30 gpm and $\Delta T = 15^\circ\text{F}$. Four 52,000 Btu/hr heat pumps (COP = 4.0) are used.

WATER TO AIR HEAT PUMP

BURLINGTON HIGHWAY DEPT.

Equipment Components and Cost Estimates:

<u>Component</u>	<u>Specifications</u>	<u>Quantity</u>	<u>Unit Cost</u>	<u>Total Cost</u>
Heat Pump	52,000 Btu/hr	4	\$1,250	\$ 5,000
Sheet Metal				1,000
Circulation Pump				1,000
Air Separator and Expansion Tank				1,200
Distribution Piping		200'	16	3,200
Insulation		200'	6	1,200
Temperature Controller				630
Subtotal				\$13,230
Contingency (10%)				1,323
Total				\$14,553

Economic Evaluations

On the following pages are presented the itemized geothermal capital improvement costs, the annual operating and maintenance costs for both the geothermal system and the conventional fuel system, and the results of the calculations of the four economic measures for the heat pump/shallow well option for the State Highway Department at Burlington; not included are the details for the heat pump option using purchased city water.

The heat pump capital improvement cost is estimated as \$23,597 for the heat pump/shallow well case and as \$32,948 for the heat pump/purchased water case. The cost difference is attributable to the costs of installing a moderate length (estimated at 500 feet) supply and return pipeline to a new city water well and/or main lines. The first year operating and maintenance costs are approximately equal at \$1,600 for both the heat pump/shallow well system and the existing natural gas heating system. The purchase of city water at current rates increases the first year operating and maintenance costs to \$5,900 for that heat pump option.

The calculated economic measures (assuming fuel price escalation of 15% per annum) are summarized as follows:

Heat Pump/Shallow Well System

Simple Payback Period:	16 years
Total Annualized Cost:	
Geothermal:	\$ 5,757
Conventional:	\$ 4,779
Total Undiscounted Savings:	\$62,852
Total Present Value Savings:	\$14,425

The heat pump/shallow well option is not economically competitive with the natural gas heating system for the given set of assumptions; it might become marginally competitive if natural gas prices increased more than 15 percent per year.

CAPITAL COSTS

Location: Burlington

Facility: Highway Department Building

Geothermal Option: Heat Pump with Shallow Well

A. Production Well System

Costs

Exploration	\$	N.R.
Reservoir Engineering		N.R.
Wells 1 @ \$ 5,000		5,000
Well Pumps (1) 30gpm, 240 ft-hd, 3.2 HP		1,000

Payback Period	16-17 years	>20 years

Institutional Requirements

In Burlington, since a ground water heat pump system is proposed, two approaches are technically possible: an on-site shallow (200 feet) well or purchase of City water. The City charge for water is \$9.50/month for the first 5,000 gallons and \$0.60 per thousand gallons thereafter. Wells other than wells drilled by the City are prohibited within the City. Presumably, there are provisions for exceptions such that a waiver for drilling a well for nonconsumptive use could be obtained. If this is the case, the water can be returned to the City, after removing the heat. If City water is to be purchased, an application is submitted to the City Clerk. No other City permits are indicated. (Phyllis Collins and Les McClain, pers. comm., 1980).

Environmental Considerations

At Burlington, the water that would be used in the heat pump system is the same water as that used in the City's domestic water system. As such, no environmental problems would be posed beyond those common to any domestic water system.
