BIBLIOGRAPHIES PUBLISHED BY THE TECHNICAL INFORMATION CENTER

The bibliographies listed below are available from the National Technical Information Service, U. S. Department of Commerce, Springfield, Virginia 22161.

Appropriate Technology: A Bibliography. March 1981. 191 refs. DOE/TIC-3385. Price Code A04.

Carbon Dioxide and Climate: A Bibliography. Oct. 1980. 394 refs. covering July 1, 1976 through Sept. 14, 1980. DOE/TIC-3382. Price Code A06.

Coal Processing: Gasification, Liquefaction, Desulfurization. A Bibliography, 1930–1974. Oct. 1974. 7441 refs. TID-3349. Price Code A99.

Coal Processing, Production, and Properties: A Bibliography. Sept. 1976. 6757 refs. TID-3349-S1P1, Citations. Price Code A20. TID-3349-S1P2, Indexes. Price Code A24.

Controlled Fusion and Plasma Research. A Literature Search. June 1977. 4723 refs. covering July 1976 through June 1977. TID-3557-S12. Price Code A99.

Cooling Towers: A Bibliography. Feb. 1981. 300 refs. DOE/TIC-3360(Suppl. 5). Price Code A05.

Electric Batteries: A Bibliography. April 1978. 5422 refs. TID-3361. Price Code A99.

Energy: Social and Economic Aspects. A Bibliography. July 1980. DOE/TIC-3383. Price Code A99.

Environmental Studies at the Savannah River Plant and Immediate Environs: A Bibliography. July 1975. 702 refs. TID-3353. Price Code A05.

Fuel Cells: A Bibliography. July 1980. 1067 refs. covering 1977 through June 1980. DOE/TIC-3359(Suppl. 1). Price Code A11.

Gas Cooled Reactor Technology: A Bibliography. May 1978. 1768 refs. covering July 1976 through Dec. 1977. TID-3339-S2. Price Code A17.

Geothermal Resources: Exploration and Exploitation. July 1976. 5476 refs. TID-3354-R1. Price Code A99.

Hydrogen Fuels: A Bibliography. Feb. 1981. 3298 refs. DOE/TIC-3358(Suppl. 1). Price Code A99.

Liquid Metal Fast Breeder Reactors: A Bibliography. Nov. 1980. 5465 refs. covering Jan. 1978 through Aug. 1980. DOE/TIC-3333(Suppl. 6), Vols. 1 and 2. Price Code A99.

Low-Level Radiation: Biological Interactions, Risks, and Benefits: A Bibliography. Sept. 1978. 3294 refs. covering July 1976 through Sept. 1978. TID-3373. Price Code A99.

Magnetohydrodynamics: Power Generation and Theory. A Bibliography. Nov. 1975. 8539 refs. covering 1957 through Oct. 1975. TID-3356. Price Code A99.

Nuclear Medicine, Bibliography on. Dec. 1976. 4362 refs. covering Jan. 1975 through June 1976. TID-3319-S7. Price Code A22.

Nuclear Quality Assurance: A Bibliography. Sept. 1978. 375 refs. covering Jan. 1976 through June 1978. TID-3337. Price Code A06.

Nuclear Raw Materials: A Selected Bibliography. Jan. 1976. 273 refs. TID-3357. Price Code A03.

Occupational Health Aspects of Uranium: A Selected Bibliography. 716 refs. covering 1948 through 1976. TID-3352. Price Code A07.

Oil Shales: Selected Bibliography of DOE Sponsored Research. Jan. 1980. 436 refs. DOE/TIC-3378. Price Code A07.

Oil Shales and Tar Sands: A Bibliography. April 1981. 5142 refs. DOE/TIC-3367(Suppl. 1). Price Code A99.

Radioactive Waste Processing and Disposal. April 1981. 3700 refs. covering Nov. 1979 through Dec. 1980. NUREG-0645 (TID-3311-10). Price Code A99.

Reactor Safety: A Bibliography. Nov. 1980. 3082 refs. covering June 1977 through June 1980. DOE/TIC-3525(Rev. 5)(Suppl. 12). Price Code A99.

Sodium Technology. August 1977. 1129 refs. covering Jan. 1975 through June 1976. TID-3334-S3. Price Code A10.

Solar Energy: A Bibliography. Mar. 1976. 9732 refs. TID-3351-R1P1, Citations. Price Code A-25. TID-3351-R1P2, Indexes. Price Code A17.

Transplutonium Elements: A Bibliography. Jan. 1977. 727 refs. covering Nov. 1975 through June 1976. TID-3317-S7. Price Code A07.

Radioactive Waste Processing and Disposal

A Bibliography

ABOUT THE TECHNICAL INFORMATION CENTER

The Technical Information Center, as the national information center for the Department of Energy, manages, publishes, and disseminates scientific, technical, and practical energy information acquired from worldwide sources. It builds and maintains energy information data bases used to prepare abstracting journals, bibliographies, and literature searches. The data bases are also searchable via the Department's on-line retrieval system, DOE/RECON. This information is provided to DOE program offices and contractors; scientists; engineers; educational, commercial, and industrial communities; and the general public. The Technical Information Center conducts an active announcement and marketing program. It establishes policy and administers control of an inventory and registry for DOE publications. The Center also develops and evaluates new and effective information systems and services as required by scientific and technical management within the Department of Energy.

ABOUT THIS BIBLIOGRAPHY

The Technical Information Center, beginning in 1958, has periodically issued bibliographies on radioactive wastes. This compilation contains 3700 citations of foreign and domestic research reports, journal articles, patents, conference proceedings, and books entered in the DOE Energy Data Base since Nov. 1979. These references, as well as references from the period January 1967 through November 1979, are available for on-line searching and retrieval using the DOE/RECON system.

The citations are arranged by subject category as shown in the table of contents. Within a given category the arrangement is alphanumeric by report number. Citations of unnumbered documents are arranged in reverse chronological order after the reports. Each complete bibliographic record is followed by an abstract or a listing of the subject descriptors used to describe the contents of the reference for machine storage and retrieval. In many cases phrases or clauses that augment the title are also included.

Five indexes, each preceded by a brief description, are provided: Corporate, Author, Subject, Contract Number, and Report Number.

The scientific and technical journals in which much of the literature appears are available in many libraries. The USDOE and non-US report literature is on file in microfiche form at the libraries listed on the inside back cover. Most reports can be purchased from the National Technical Information Service, 5285 Port Royal Road, Springfield, Virginia 22161.

If problems are encountered in obtaining journals or reports, assistance will be provided by the Technical Information Center, P.O. Box 62, Oak Ridge, TN 37830.

Previously issued radioactive waste bibliographies are:

TID-3311 containing 698 citations, issued 1958
TID-3555 containing 696 citations, issued 1960
TID-3555-S1 containing 874 citations, issued 1962
TID-3311-S1 containing 989 citations, issued 1964
TID-3311-S2 containing 1012 citations, issued 1966
TID-3311-S3 containing 2249 citations, issued 1972
TID-3311-S4 containing 464 citations, issued 1973
TID-3311-S5 containing 345 citations, issued 1974
TID-3311-S6 containing 2140 citations, issued 1975
TID-3311-S7 containing 1841 citations, issued 1976
TID-3311-S8 containing 4144 citations, issued 1978, (NUREG-0643)
TID-3311-S9 containing 3598 citations, issued 1980, (NUREG-0644)

TID-3311, TID-3555, TID-3555-S1, and TID-3311-S1 are available from TIC. The remaining bibliographies are available from NTIS.

NUCLEAR FUELS

1 (AAEC/PR--44U) NUCLEAR SCIENCE AND TECHNOLOGY BRANCH REPORT 1977. URANIUM FUEL CYCLE PROGRAM. Hardy, C.J. (Australian Atomic Energy Commission Research Establishment, Lucas Heights). Dec 1977. 15p. Dep. NTIS (US Sales Only), PC A02/MF A01.

A report of research programs continuing in the following areas is presented: mining and treatment of uranium ores, manufacture of uranium hexafluoride, uranium enrichment, waste treatment, reprocessing and the uranium fuel cycle. Staff responsible for each project are indicated.

2 (CONF-790949--2) NUCLEAR FUEL CYCLE. Leuze, R.E. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 64p. Dep. NTIS, PC A04/MF A01.

From Energy resources workshop; Oak Ridge, TN, USA (24 Sep 1979).

The visual aids used in a talk on the nuclear fuel cycle are presented.

3 (K-BD--904) SEISMIC DESIGN OF NONREACTOR NUCLEAR FACILITIES. Beavers, J.E. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). 1980. Contract W-7405-ENG-26. 8p. (CONF-800919--5). NTIS, PC A02/MF A01.

From 7. world conference on earthquake engineering; Istanbul, Turkey (8 Sep 1980).

The state-of-the-art for seismic design of nonreactor nuclear facilities is discussed. Both safety and economic aspects and trends of uranium enrichment plants are emphasized.

4 (KFK--2833) FUEL HANDLING, REPROCESSING, AND WASTE AND RELATED NUCLEAR DATA ASPECTS. Kuesters, H.; Lalovic, M.; Wiese, H.W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Jun 1979. 31p. (CONF-780921--14; PWA--81/78). Dep. NTIS (US Sales Only), PC A03/MF A01.

From Conference on neutron physics and other applied purposes; Harwell, UK (25 Sep 1978).

The essential processes in the out-of-pile nuclear fuel cycle are described, i.e. mining and milling of uranium ores, enrichment, fuel fabrication, storage, transportation, reprocessing of irradiated fuel, waste treatment and waste disposal. The aspects of radiation (mainly gammas and neutrons) and of heat production, as well as special safety considerations are outlined with respect to their potential operational impacts and long-term hazards. In this context the importance of nuclear data for the out-of-pile fuel cycle is discussed. Special weight is given to the LWR fuel cycle including recycling; the differences of LMFBR high burn-up fuel with large PuO_2 content are described. The HTR fuel cycle is discussed briefly as well as some alternative fuel cycle concepts.

5 NUCLEAR FUEL CYCLE. Bulletin de l'Association Suisse des Electricians ; 70: No. 22, 1194-2000(17 Nov 1979). (In French).

From 18. Congress of the international union of producers and distributers of electrical energy (UNIPEDE); Warsaw, Poland (11 - 15 Jun 1979).

All the operations covering extraction, preparation, use and disposal of nuclear fuel are economically interdependent, and in the case of enriched uranium were covered in detail in the UNIPEDE report presented in Vienna in 1976. The present article briefly summarises the operations in diagram form, discusses the major developments which have occurred since 1976 and examines present prospects in the three most sensitive areas: supply of natural uranium, uranium enrichment and the reprocessing of irradiated fuels.

6 CHEMICAL PROCESSES AND PROBLEMS ASSOCIATED WITH THE NUCLEAR FUEL CYCLE. Wethington, J.A. Jr. (Univ. of Florida, Gainesville). Transactions of the American Nuclear Society ; 33: 123-124(1979). (CONF-791103--).

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

FUEL CYCLE;SOLVENT EXTRACTION;ION EXCHANGE; URANIUM;RECOVERY;URANIUM ORES;ORE PROCESSING; PHOSPHATE ROCKS;MILL TAILINGS;RADIATION HAZARDS; CHEMISTRY;EDUCATIONAL TOOLS

7 INORGANIC CHEMISTRY OF NUCLEAR FUEL CYCLES. Findlay, J.R.; Jenkins, I.L. (UKAEA, Harwell. Atomic Energy Research Establishment. Chemical Technology Division); Glover, K.M.; Large, N.R.; Marples, J.A.C.; Potter, P.E.; Sutcliffe, P.W. (UKAEA, Harwell. Atomic Energy Research Establishment. Chemistry Division). pp 419-466 of Modern inorganic chemicals industry. Thompson, R. (ed.). London, England; The Chemical Society (1977).

From Modern inorganic chemicals industry symposium; London, UK (31 Mar 1977).

The aim of this article is to introduce the reader to the many aspects of the inorganic chemistry of the nuclear energy industry. The resources of thorium and uranium are discussed together with the various thermal and fast breeder nuclear reactor systems in which these materials are being exploited. Among the

topics reviewed are the extraction of thorium and uranium from their ores, the enrichment of uranium, the chemistry relating to the heat transfer media for gas-, water- and liquid metal-cooled nuclear reactor systems, and the preparation and fabrication of the various nuclear fuels. The complex chemical changes which occur during irradiation of nuclear fuels within a reactor due to the formation of over 30 elements from the fission of the actinide nuclei, the subsequent reprocessing of the fuel for the separation of uranium and plutonium from the fission product elements, and the inorganic chemical aspects of waste management are considered. Finally some aspects of the actinide elements other than thorium, uranium and plutonium, with particular emphasis on their industrial application, are discussed.

Reserves

8 RELEVANCE OF THE STUDIES OF THE OKLO NATURAL NUCLEAR REACTORS TO THE STORAGE OF RADIOACTIVE WASTES. Hagemann, R.; Roth, E. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Recherche et Analyse). Radiochimica Acta ; 25: No. 3-4, 241-247(1978).

The geological environment of the OKLO natural nuclear reactors is described along with the operating caracteristics of the reactors. Data relevant to the stability of most of the fission products and to the transuranium elements in the reaction zones are reviewed.

9 MIGRATION PATHS FOR OKLO REACTOR PRODUCTS AND APPLICATIONS TO THE PROBLEM OF GEOLOGICAL STORAGE OF NUCLEAR WASTES. Cowan, G.A. (Los Alamos Scientific Lab., NM (USA)). pp 693-699 of Les reacteurs de fission naturels. Vienna: IAEA (1978).

From IAEA symposium on natural fission reactors; Paris, France (19 Dec 1977).

Escape of the products from the Oklo reactor proceeds, first, by escape from the uraninite (UO_2) grains and, second, by transport out of the gangue. Escape from the grain by fission recoil accounts for prompt deposition in the gangue of 5-10% of the products. Escape by volume diffusion is very slow. The rate of loss by diffusion was highest during the operating period of the reactor and may have been of the order of 10^{-6} fraction/a for the most volatile elements. The least volatile elements have been retained in the grains. Their diffusion rates are less than $5x10^{-10}$/a. If similar loss rates can be achieved in synthetic uraninite (or thorianite), the overall rate of transport of most reactor products would be sufficiently limited by diffusion to ensure that essentially all the radioactive species would decay in situ. The principal geochemical requirements for a suitable storage site are those that ensure the survival of the UO_2 matrix, particularly that the pH and Eh are similar to the values at Oklo.

Exploration

10 (AECB--1116) RADIOACTIVE WASTE MANAGEMENT: YESTERDAY, TODAY AND TOMORROW. Prince, A.T. (Atomic Energy Control Board, Ottawa, Ontario (Canada)). Oct 1977. 26p. NTIS (US Sales Only), PC A03/MF A01.

The public believes that there is a radioactive waste problem, but knowledge in the field is so well advanced that the only problem left is how to choose the most economically effective method among many available. Tailings from uranium ore processing could be made harmless by removing the majority of the radium and storing the remaining waste in well-designed retention areas. Non-fuel reactor wastes may be handled by incineraton, reverse osmosis, and evaporation in a central waste management centre. The dry storage of spent fuel in concrete cannisters is being investigated. Ultimate disposal of high-level wastes will be in deep, stable geologic formations.

11 EQUIPMENT FOR COLLECTING SLUDGE SAMPLES FROM SAVANNAH RIVER PLANT WASTE TANKS. Allen, B.M. Jr. (E.I. du Pont de Nemours and Co., Inc., Aiken, SC). pp 386-390 of Proceedings of the 27th conference on remote systems technology. Wallin, D.R. (ed.). La Grange Park, IL: American Nuclear Society, Inc. (1980).

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

A sampler was developed to take 25-l samples of sludge from Savannah River Plant waste tanks. The cylindrical sample vessel has a retractable nose section. Sludge enters an annular space at the nose section as the sampler is forced through the sludge layer with rigid drive pipes. Two samples have been taken and transported in a special cask to a waste processing research facility at the Savannah River Laboratory.

12 RADIOACTIVE LIQUID WASTE MANAGEMENT OF TYPICAL PWR'S. Kang, C.S. (Daewoo Engineering Co. Ltd., Seoul (Republic of Korea)). Journal of the Korean Nuclear Society ; 11: No. 3, 213-217(Sep 1979).

The generation of radioactive waste is systematically reviewed and the characteristics of each waste stream is evaluated for logical processing. Three process schemes such as evaporators, reverse osmosis units, and dimineralizers are proposed to treat the radioactive liquid wastes, and reverse osmosis units are proposed for miscellaneous and detergent wastes. And the small amount of hot lab wastes are proposed to be directly solidified. A redundancy process was also proposed.

13 PROPOSAL OF THRESHOLD LEVELS FOR THE DEFINITION OF NON-RADIOACTIVE WASTES. Yoshida, Y. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Kogai To Taisaku (Journal of Environmental Pollution Control) ; 15: No. 5, 677-681(May 1979). (In Japanese).

With increasing amounts of radioactive wastes along with the advances of nuclear power generation and radioactive material utilizations, the needs for management cost reduction and resource saving have arisen. Under the situation, the threshold levels for the definition of non-radioactive solid wastes are required. The problem has been studied by an ad hoc committee in Nuclear Safety Research Association, by the request of the Science and Technology Agency. The matters described are the procedures of deriving the threshold levels, the feasibility studies of the management of waste threshold-level with several enterprises, and future subjects of study. The threshold levels are grouped in two, i.e. the unconditional level and the conditional level. According to the unconditional threshold level, solid wastes are separated definitely into radioactive and non-radioactive ones. According to the conditional threshold level, under certain conditions, some

radioactive solid wastes according to the unconditional level are regarded as non-radioactive ones.

Mining

14 (AAEC/PR--45U) RESEARCH ESTABLISHMENT PROGRESS REPORT 1978 - URANIUM FUEL CYCLE. (Australian Atomic Energy Commission Research Establishment, Lucas Heights). Dec 1978. 14p. NTIS (US Sales Only), PC A02/MF A01.

A report of research programs continuing in the following areas is presented: mining and treatment of uranium ores, uranium enrichment, waste treatment, reprocessing and the uranium fuel cycle. Staff responsible for each project are indicated.

15 SLUDGE DEWATERING BY BELT PRESS. Soderberg, R.L.; Dorman, K.R. (US Bur of Mines, Spokane, Wash). Mining Congress Journal ; 65: No. 8, 29-32(Aug 1979).

The Tait-Andritz mobile double belt filter sludge dewatering machine 20 S3 applies gradually-increasing pressure to dewater material. Four types of tailings were tested to examine possible applications of this system to waste disposal: general mill tailings from a lead, zinc, silver mine in the Coeur d' Alene mining district, cyclone overflow from the same mine, uranium mill tailings consisting of fine sand of sedimentary origin and unthickened coal wash plant waste.

16 LOW-LEVEL RADIOACTIVE WASTE DISPOSAL TECHNIQUES. (Camp Dresser and McKee, Inc, Austin, Tex). pp 69-73 of South Texas uranium seminar, 1978. Sethness, E.D. Jr.; Holmes, C.W. New York, NY; American Inst. of Mechanical Engineers (1979).

This brief review outlines several methods by which the U.S. uranium mining industry has sought to increase the sophistication of disposal and restoration techniques, while keeping pace with the continually changing Federal and state regulations. Considerable progress has been made in the short span of 15 years and the industry has not only maintained environmental quality, but managed to increase production rates as well. Two key methods of waste disposal are highlighted: tailings ponds and deep well injection. 13 refs.

17 FELDER URANIUM PROJECT--RENEWED OPERATIONS. (Exxon Miner Co). pp 101-105 of South Texas uranium seminar, 1978. Barrett, K.E. New York, NY; American Inst. of Mechanical Engineers (1979).

From South Texas uranium seminar; Corpus Christi, TX, USA (10 Sep 1978).

Exxon owns a uranium mill and holds two mining leases in Live Oak County, Texas, about halfway between San Antonio and Corpus Christi. The properties made up the Felder Uranium Operations which was reopened earlier this year. The feasibility study for reopening the Felder Project began in late 1975 and was not completed until late 1976. This paper discusses several areas of the feasibility study that required additional work prior to making the decision to renew operations. Mine planning evaluation and the actual mine planning are described briefly.

Feed Processing

18 (ORNL/TM--6488) GRAPHICAL DETERMINATION OF THE RADIONUCLIDE INVENTORY IN THE CONCENTRATE AND TAILINGS FROM PROCESSING FACILITIES. Crawford, D.J. (Oak Ridge National Lab., TN (USA)). Oct 1979. Contract W-7405-ENG-26. 42p. Dep. NTIS, PC A03/MF A01.

During radiological surveys of radionuclide processing facilities, one must make a determination of the expected inventory of all members of the three naturally occurring radionuclide decay chains. A set of graphs has been developed that display the decay and ingrowth of all members of the ^{232}Th, ^{238}U, and ^{235}U decay series. These graphs may be used in the field to predict present inventories from a knowledge of previous inventories. Equations used to generate several of the graphs are given in tables. 20 figures, 4 tables.

19 DRY CLEANING METHOD FOR COLD TRAP. Kawamura, F.; Komori, I. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1954-53,799/A/ . 27 Apr 1979. 3p. (In Japanese).

A method is described to remove solid contaminants deposited in a cold trap by only dry process, without use of chemicals. Solid products (such as UO_2F_2 and UF_4) deposited at the bottom or the like part of a cold trap are subjected to a jet of inert gases, such as nitrogen and argon. Pulverized and scrapped contaminants are then converted into aerosol form before removed by suction.

20 REMOVAL OF RADIONUCLIDES FROM PROCESS STREAMS--A REVIEW. Itzkovitch, I.J.; Ritcey, G.M. (Ont Res Found). CANMET (Canada Centre for Mineral and Energy Technology) Report ; No. 79-21, 1-85(Apr 1979).

This report details the origin and control of radium 226, thorium 230 and lead 210 contamination of mill effluent streams from conventional and non-conventional milling of uranium ores, reviews the basic chemistry of the radionuclides as it relates to potential alternatives for control and presents these alternatives along with a summary of published cost data. The conclusions from the study indicate that the current technology, using sulfuric acid processing, solubilizes only a comparatively small quantity of the radionuclides, with the solid tailings containing approximately the same concentration as the original ore. Present technology does not provide for complete removal and isolation of the radionuclides. 122 refs.

21 WET HIGH-INTENSITY MAGNETIC SEPARATION FOR THE CONCENTRATION OF WITWATERSRAND GOLD-URANIUM ORES AND RESIDUES. Corrans, I.J.; Levin, J. (Natl Inst for Metall, Randburg, Transvaal, S Afr). Journal of the South African Institute of Mining and Metallurgy ; 79: No. 8, 210-228(Mar 1979).

Wet high-intensity magnetic separation (WHIMS) for the concentration of gold and uranium was tested on many cyanidation residues, and on some ores and flotation tailings. The results varied, but many indicated recoveries of over 60 per cent of the gold and uranium. The main source of loss is the inefficiency of WHIMS for material of smaller particle size than 20;mu;m. The recoveries in the continuous tests were lower than those in the batch tests. The continuous tests indicated an operational difficulty that could be experienced in practice, namely the tendency for wood chips and ferromagnetic particles to block the matrix of the separator. It was decided that a solution to the problem lies in the modification of the separator to allow continuous removal of the matrix for

cleaning. A system has been developed for this purpose and is being demonstrated on a pilot-plant scale. A simple model describing the operation of the WHIMS machine in terms of the operating parameters is described. This should reduce the amount of empirical testwork required for the optimization of operating conditions and should provide a basis for scale-up calculations.

22 ENGINEERING EVALUATION OF THE DECOMMISSIONING OF FORMER URANIUM ORE PROCESSING FACILITIES. Rogers, V.C.; Overmyer, R.F.; Varley, C.R. (Ford, Bacon and Davis Utah, Inc., Salt Lake City (USA)). pp 411-430 of Decommissioning of nuclear facilities. Vienna, Austria; IAEA (1979).

From International symposium on the decommissioning of nuclear facilities; Vienna, Austria (13 Nov 1978).

The United States Department of Energy has sponsored engineering services relating to the decommissioning and reclamation of former uranium ore milling and processing facilities. The engineering services are divided into two stages: Title I and Title II. The Title I services include: an engineering assessment of existing conditions, estimations of types, areas and volumes of radioactive materials, assessment of building decontamination or demolition efforts, the estimation of potential environmental impacts and the determination of various decommissioning and reclamation alternatives, including cost. The Title II services include the preparation of detailed plans and specifications for implementing the selected reclamation alternatives. Reports have been issued for the Title I effort on 22 inactive uranium milling sites in eight western states. The amount of tailings and contaminated material estimated at the sites ranges from 40,000 to 2,470,000 tons. In some cases, the environmental and health impacts dictate that the tailings and contaminated materials be removed from their current location to alternative long-term storage sites. Alternate sites were located based upon remoteness from populated areas, satisfactory hydrological conditions, availability of cover material, and present and future use of the land. Where on-site storage is considered practical and at alternate storagelocations, the tailings and contaminated materials will be covered with physical stabilization materials such as clay, soil, and gravel or riprap to reduce gamma radiation to background rates, to reduce radon exhalation, and to eliminate the further spread of contaminated materials.

23 PROCESS FOR ENRICHING NUCLEAR FUEL FROM BREEDER AND FISSION WASTE MATERIAL. Puchala, H. (to Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,700,334/A/. 13 Jul 1978. 7p. (In German).

It is proposed to obtain material suitable for nuclear fuel from ores and from burnt up fuel in nuclear power stations, by having smelting furnaces arranged in stages which make separation of material containing calcium-carbide and material containing ferrosilicon possible. The former is processed, and nuclear fuel is contained in the latter, which is enriched by continuous smelting and solidification processes and is later released by a well known process.

24 CHEMISTRY OF PROTACTINIUM, NEPTUNIUM, AMERICIUM, AND CURIUM IN THE NUCLEAR FUEL CYCLE. Keller, O.L. Jr. (Oak Ridge National Lab., TN (USA)). Radiochimica Acta ; 25: No. 3-4, 211-223(1978).

A review of the chemistry of the actinide elements protactinium, neptunium, americium, and curium is given with a focus on their most important roles in the nuclear fuel cycle. The chemistry of Pa in molten salts and molten bismuth as it relates to a conceptual Molten Salt Breeder Reactor is given, followed by a discussion of its behavior in aqueous systems. The principal reactions of neptunium, particularly as they relate to control of oxidation states, are presented for the Purex process. And finally a discussion is given of the new reagents and processes being developed for partitioning of Am(III) and CU(III) from fission products in high level wastes.

25 NUCLEAR FUEL SUPPLY FOR COUNTRIES EMBARKING ON A NUCLEAR POWER PROGRAMME, AND ASPECTS OF DEVELOPING A DOMESTIC NUCLEAR FUEL INDUSTRY. Schmiedel, P.; Pekarek, H. (Kraftwerk Union A.G., Erlangen (Germany, F.R.)). pp 333-342 of Problems associated with the export of nuclear power plants. Proceedings of a symposium held by the IAEA in Vienna, 6-10 March 1978. Vienna; IAEA (1978).

In connection with the implementation of a nuclear power programme, the long-term availability of nuclear fuel-cycle services and the eventual development of a domestic nuclear fuel industry need to be carefully evaluated in any country. The various aspects and possibilities for secure supplies and services for the individual nuclear fuel-cycle steps for light-water reactors - uranium concentrate; uranium enrichment; the manufacture of fuel assemblies; and the disposal of spent fuel - are discussed in detail. The present situation and future tendencies are reviewed on a worldwide basis in order to draw conclusions concerning the supply situation of countries which do not have local fuel supplies. It is shown that foreign supplies of natural uranium, enrichment and fuel manufacturing services need not lead to non-acceptable dependence, because of the increasing international diversification of supply sources as a result of the worldwide implementation of nuclear power programmes. Concerning the disposal of spent fuel assemblies several possibilities of avoiding undue difficulties are discussed. Reference is made to the status of fuel-cycle activities in the Federal Republic of Germany, and the available technology and experience are described for each step of the fuel cycle.

26 METHOD OF WASTE WATER RECYCLING IN URANIUM ORE CHEMICAL TREATMENT PLANTS. Klicka, V.; Mitas, J.; Vacek, J. Czech Patent 167,412/B/. 15 Feb 1977. 5p. (In Czech).

Waste water is thickened by evaporation to a saturated solution from which sodium sulfate as the least soluble component is obtained by further evaporation or cooling. After further purification the obtained sodium sulfate may be used in another industry. The supernatant is returned to the sorption-elution process where the remaining uranium is extracted using common methods. The remaining solution replaces part of the acids for eluant preparation. The waste water evaporation condensate is used in a chemical water treatment plant in place of water from external sources.

27 ATMOSPHERIC Kr^{85} POLLUTION BY NUCLEAR ENERGY. Eggermont, G.; Jacobs, R.; Janssens, A. (Ghent Rijksuniversiteit (Belgium). Instituut voor Kernwetenschappen). Annales de l'Association Belge de Radioprotection ; 1: No. 3, 275-294(1976). (In Dutch).

The nuclear energy development will cause in

2000 a global atmospheric ^{85}Kr pollution of 1 to 1.8 10^{-9} Ci/m^3. Higher maxima can occur in the northern troposphere and in the neighborhood of reprocessing centers. The resulting doses are lower than M P D for population at risk and for genetic risk for the total population. The somatic risk for the total population considering essentially the skin as the most exposed organ results in 4000 to 8000 victums especially in the densely populated world regions. Control techniques such as cryogenic distillation are cost-effective. The application in reprocessing centers influences the cost of the kWh by about 1%. The combined climatological effects of nuclear and chemical pollution demand further research. An optimal time schedule for application of retention is calculated and can be postponed if further reprocessing delays occur; 90% in 1980 and 99% in 1985 can stabilize the pollution. Risks of gaseous waste management are quantified for Belgain nuclear programmes.

Fuels Production and Properties

28 DIRECT DETERMINATION OF THE TOTAL FISSILE CONTENT IN IRRADIATED FUEL ELEMENTS, WASTE CONTAINERS AND OTHER SAMPLES OF THE NUCLEAR FUEL CYCLE. Filss, H.P. (Kernforschungsanlage Juelich, Ger). Nuclear Materials Management ; 8: No. 2, 74-79(1979).

A non-destructive assay system for the direct determination of fissile material is presented which is not influenced by the presence of high level fission product radioactivity (;similar;100 Ci). In order to explain the basic principles of this system, some neutron transport properties in hydrogeneous materials are discussed which lead to the specific attenuation of the source neutrons. Some typical aspects from the measurement of medium-size waste boxes are reported. The system was originally developed for the assay of irradiated HTR pebble bed fuel materials. 10 refs.

29 NONDESTRUCTIVE ASSAY SYSTEM FOR USE IN DECOMMISSIONING A PLUTONIUM-HANDLING FACILITY. Roche, C.T.; Vronich, J.J.; Bellinger, F.O.; Perry, R.B. (Argonne Natl Lab, Ill). Nuclear Materials Management ; 8: 162-173(1979).

Argonne National Laboratory is decommissioning a facility used to fabricate reactor fuel elements. The equipment is contaminated with alpha emitters at levels up to 10^{12} dpm/100 cm^2. The objective of decontamination is to reduce the TRU concentrations below 10 nCi/g of waste. A portable NDA procedure using NaI(Tl) gamma-spectrometric techniques was selected to measure the residual Pu and ^{241}Am in the glove boxes. 13 refs.

30 ALTERATION OF PROCESSING OF NUCLEAR FUEL MATERIALS IN KUMATORI WORKS OF NUCLEAR FUEL INDUSTRIES, LTD. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 6, 46-50(Aug 1978). (In Japanese).

A report of the Committee on Examination of Nuclear Fuel Safety to the Atomic Energy Commission of Japan Concerning alteration of processing nuclear fuel materials is presented. Its safety was confirmed. The alteration of processing nuclear fuel materials in Kumatori Works of Nuclear Fuel Industries, Ltd. is as follows. Concerning buildings: the main building is expanded to construct a transport vessel storage; the storage No. 3 for UO_2 powder and others is installed; and a storage for fuel assembly parts is installed. Concerning equipments: for forming, a press, a sintering furnace and three pellet transport equipments are installed along with other improvements; for cladding, improvements are made to raise the capacity; for assemblying, improvement is made to raise the capacity of fuel assembly production for storing UO_2 powder, etc.

Spent Fuels Reprocessing

31 (AED-Conf--78-274-000, pp vp) BEHAVIOUR OF NP AND PU IN THE REPROCESSING OF THORIUM-CONTAINING NUCLEAR FUELS. Wenzel, U.; da Silveira Branquinho, C.L. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Chemische Technologie). 1978. (In German).

From Lecture meeting on principles and applications of nuclear-, radio-, and radiation chemistry; Lindau, F.R. Germany (16 Oct 1978).

32 (ANL--78-76) CHEMICAL ENGINEERING DIVISION FUEL CYCLE PROGRAMS. QUARTERLY PROGRESS REPORT, APRIL-JUNE 1978. Steindler, M.J.; Ader, M.; Barletta, R.E. (Argonne National Lab., IL (USA)). Dec 1979. Contract W-31-109-ENG-38. 301p. Dep. NTIS, PC A14/MF A01.

Fuel cycle studies reported include development of centrifugal contactors for Purex processes. Tricaprylmethyl-ammonium nitrate and di-n-amyl-n-amylphosphonate are being evaluated as Thorex extractants. Dispersion of uranium and plutonium by fires, and mechanisms for subdividing and dispersing liquids and solids were reviewed. In the pyrochemical and dry processing program, a facility for testing containment materials is under construction; a flowsheet for carbide fuel processing has been designed and studies of carbide reactions in bismuth are underway; salt transport processes are being studied; process-size refractory metal vessels are being fabricated; the feasibility of AIROX reprocessing is being determined; the solubility of UO_2, UO_2 + fission products, and PuO_2 in molten alkali metal nitrates, has been investigated; a flowsheet was developed for reprocessing actinide oxides in molten salts; preparation of Th-U carbide from the oxide is being studied; new flowsheets based on the Dow Aluminum Pyrometallurgical process for reprocessing of spent uranium metal fuel have been prepared; the chloride volitility processing of thorium-based fuels is being studied; the reprocessing of $(Th,U)O_2$ solid solution in KCl-LiCl-$ThCl_4$-Th is being studied; and a flowsheet for processing spent nuclear fuel in molten tin has been constructed. Leach rates of simulated encapsulated waste forms in a metal matrix were studied. Nine criteria for handling waste cladding hulls were established. Strontium and tin migration in glauconite columns was measured. Radioactive Sr in a stream of water moved through oolitic limestone as rapidly as water, but in a stream of water equilibrated with the limestone, Sr moved through the limestone one-tenth as fast. Migration of trace quantities of Cs and I through kaolinite was studied. 88 figures, 53 tables.

33 (ANL--79-6) CHEMICAL ENGINEERING DIVISION FUEL CYCLE PROGRAMS. QUARTERLY PROGRESS REPORT, JULY-SEPTEMBER 1978.

Steindler, M.J.; Ader, M.; Barletta, R.E. (Argonne National Lab., IL (USA)). Jan 1980. Contract W-31-109-ENG-38. 280p. Dep. NTIS, PC A13/MF A01.

Fuel cycle work included hydraulic performance and extraction efficiency of eight-stage centrifugal contactors, flowsheet for the Aralex process, Ru and Zr extraction in a miniature centrifugal contactor, study of Zr aging in the organic phase and its effect on Zr extraction and hydraulic testing of the 9-cm-ID contactor. Work for predicting accident consequences in LWR fuel processing covered the relation between energy input (to subdivide a solid) and the modes of particle size frequency distribution. In the pyrochemical and dry processing program corrosion-testing materials for containment vessels and equipment for studying carbide reactions in bismuth is under way. Analytical studies have been made of salt-transport processes; efforts to spin tungsten crucibles 13 cm dia continue, and other information on tungsten fabrication is being assembled; the process steps of the chloride volatility process have been demonstrated and the thoria powder product used to produce oxide pellets; solubility of UO_2, PuO_2, and fission products in molten alkali nitrates is being investigated; work was continued on reprocessing actinide oxides by extracting the actinides into ammonium chloroaluminate from bismuth; the preparation of thorium-uranium carbide from the oxide is being studied as a means of improving the oxide reactivity; studies are in progress on producing uranium metal and decontaminated ThO_2 by the reaction of $(Th,U)O_2$ solid solution in molten salts containing $ThCl_4$ and thorium metal chips. In the molten tin process, no basic thermodynamic or kinetic factors have been found that may limit process development.

34 (CEA-CONF--4241) TREATMENT OF LIQUID EFFLUENTS OF REPROCESSING PLANTS BY A CHEMICAL PROCESS: FRENCH EXPERIENCE. Fernandez, N.; Taillard, D.; Pottier, P. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. de Chimie Appliquee). 1977. 26p. (In French). (CONF-771139--34). Dep. NTIS (US Sales Only), PC A03/MF A01.

From Radioactive effluents from nuclear fuel reprocessing plants seminar; Karlsruhe, F.R. Germany (22 Nov 1977).

The goal of radioactive effluent processing is to obtain a liquid with a residual activity level allowing disposal and a minimum amount of slurries. Insolubilization methods used in France are described to eliminate fission products in reprocessing plants effluents i.e. strontium, cesium, ruthenium and antimony; others radioelements are generally carried away with others precipitates. Evolution of the process is expressed in terms of reprocessing needs and improvements. Decontamination factors better than 100 are now possible with concentration factors between 30 and 50.

35 (CONF-791184--1) SEPARATION OF URANIUM FROM PROCESS WASTEWATERS USING MICROBIAL CELLS AS SORBENTS. Shumate, S.E. II; Strandberg, G.W.; Parrott, J.R. Jr.; Locke, B.R. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 17p. (CONF-791072--4). NTIS, PC A02/MF A01.

From 9. annual hydrometallurgical meeting; Toronto, Canada (11 Nov 1979).

A mixed culture of denitrifying bacteria was evaluated for separating U from process wastewaters. The mixed culture was obtained as films on coal particles in an operating fluidized-bed bioreactor system. Biosorption of U by the mixed culture was rapid, reaching a saturation of approx. 0.14 g U per gram of dry cells. Two contacting devices were also evaluated. 4 figures. (DLC)

36 (CONF-800334--7) DEVELOPMENTS IN EFFLUENT CONTROL FOR BREEDER REPROCESSING FACILITIES. Yarbro, O.O.; Sears, M.B. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 8p. Dep. NTIS, PC A02/MF A01.

From 2. DOE environmental control symposium; Reston, VA, USA (17 Mar 1980).

10 CFR 20 and 40 CFR 190 impose tight restrictions on the releases of radioactive materials from the fuel cycle. Retention factors needed in the LMFBR and LWR fuel cycles to meet the 40 CFR 190 release limits of ^{85}Kr, ^{129}I, and ^{239}Pu are listed. Technologies for the control of I, ^{85}Kr, and tritium are discussed. Advanced effluent control systems will be demonstrated in the Hot Experimental Facility. (DLC)

37 (CONF-800610--2) REMOVAL OF ACTINIDES FROM NUCLEAR FUEL REPROCESSING WASTES USING AN ORGANOPHOSPHOROUS EXTRACTANT. Chamberlain, D.B.; Maxey, H.R.; McIsaac, L.D.; McManus, G.J. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Jan 1980. Contract EY-76-C-07-1570. 29p. Dep. NTIS, PC A03/MF A01.

From American Institute of Chemical Engineering conference; Philadelphia, PA, USA (6 Jun 1980).

By removing actinides from nuclear fuel reprocessing wastes, long term waste storage hazards are reduced. A solvent extraction process to remove actinides has been demonstrated in miniature mixer-settlers and in simulated columns using actinide feeds. Nonradioactive pilot plant results have established the feasibility of using pulse columns for the process.

38 (CONF-800743--1) RECOVERY OF PLUTONIUM FROM HEPA FILTERS BY CE(IV)-PROMOTED DISSOLUTION OF PuO_2 AND RECYCLE OF THE CERIUM PROMOTER. Leuze, R.E.; Bond, W.D.; Scheitlin, F.M. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 33p. NTIS, PC A03/MF A01.

From International conference on Nuclear waste transmutation; Austin, TX, USA (22 Jul 1980).

The experimental studies carried out included (1) the electrolytic production of Ce(IV) from Ce(III), (2) the leaching of refractory PuO_2 from HEPA filter materials with maintenance of Ce(IV) concentrations by anodic oxidation during leaching, and (3) evaluation of methods for contecting the HEPA solids with the leaching solution and for separating the solid residue from the leaching liquor. Anodic oxidation of Ce(III) was accomplished with an electric current efficiency of about 85% at current densities of 0.04 to 0.4 A/dm^2 at a platinum anode. Refractory PuO_2 was dissolved by a 4.0 M HNO_3 - 0.1 M Ce(IV) solution in 1.5 h at 100°C using stirred-contact leaching of the solids or by recirculating the leachant through a packed column of the solids. Cerium (IV) concentrations were maintained continuously by anodic oxidation throughout leaching. Dissolution times up to 10 h were required unless the HEPA media were oxidized initially in air at 300°C to destroy carbonaceous species which consumed Ce(IV) more rapidly than it could be regenerated by anodic oxidation. Leaching solids in packed columns avoided the relatively difficult liquid-solids separation by centrifugation which was required

after stirred-contact leaching; however, the solids handling difficulties associated with charging and discharging of the packed columns in a remote environment remain a significant design obstacle. A chemical flowsheet is proposed for the recovery of actinides from HEPA filters. A 4 M HNO_3 - 0.1 M Ce(IV) nitrate solution is used as the leachant and the Ce(III) is recycled to the leaching operation using bidentate solvent extraction.

39 (CONF-800802--18(Draft)) IODINE EVOLUTION FROM NUCLEAR FUEL DISSOLVER SOLUTIONS BY AIR SPARGING. Morgan, J.G.; Holland, W.D. (Oak Ridge National Lab., TN (USA); Tennessee Technological Univ., Cookeville (USA)). 1980. Contract W-7405-ENG-26. 32p. NTIS, PC A03/MF A01.

From 89. annual meeting of the American Institute of Chemical Engineers; Portland, OR, USA (17 Aug 1980).

Iodine removal rates were measured from air-sparged nitric acid solutions in experiments designed to simulate part of the iodine recovery system in an advanced fuel reprocessing flowsheet. Variables studied were temperature, sparge rate, and iodine and acid concentrations. Experimental mass transfer coefficients were determined and compared to results based on correlations available in the literature.

40 (CONF-800943--(Summ.)) FUEL CYCLES FOR THE 80'S. (American Nuclear Society, Oak Ridge, TN). 1980. 170p. NTIS, PC A08/MF A01.

From National topical meeting of fuel cycles for the 80's; Gatlinburg, TN, USA (29 Sep 1980).

Papers presented at the American Nuclear Society's topical meeting on the fuel cycle are summarized. Present progress and goals in the areas of fuel fabrication, fuel reprocessing, spent fuel storage, accountability, and safeguards are reported. Present governmental policies which affect the fuel cycle are also discussed. Individual presentations are processed for inclusion in the Energy Data Base.(DMC)

41 (CONF-800943--(Summ.), pp 86-87) PROSPECTS FOR THE BACK-END OF THE FUEL CYCLE IN BELGIUM. Detilleux, E.J. 1980.

From National topical meeting of fuel cycles for the 80's; Gatlinburg, TN, USA (29 Sep 1980).

42 (DOE/ET/34036--T1) STUDY OF THE POTENTIAL USES OF THE BARNWELL NUCLEAR FUEL PLANT (BNFP). FINAL REPORT. (International Energy Associates Ltd., Washington, DC (USA)). 25 Mar 1980. Contract AC05-80ET34036. 302p. NTIS, PC A14/MF A01.

The purpose of this study is to provide an evaluation of possible international and domestic uses for the Barnwell Nuclear Fuel Plant, located in South Carolina, at the conclusion of the International Nuclear Fuel Cycle Evaluation. Four generic categories of use options for the Barnwell plant have been considered: storage of spent LWR fuel; reprocessing of LWR spent fuel; safeguards development and training; and non-use. Chapters are devoted to institutional options and integrated institutional-use options.

43 (DP--1527) TRACE ELEMENTS RETAINED IN WASHED NUCLEAR FUEL REPROCESSING SOLVENTS. Gray, L.W.; MacMurdo, K.W. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Sep 1979. Contract EY-76-C-09-0001. 21p. Dep. NTIS, PC A02/MF A01.

Analysis of purified TBP extractant from solvent extraction processes at Savannah River Plant showed several stable elements and several long-lived radioisotopes. Stable elements Al, Na, Br, Ce, Hg, and Sm are found in trace quantities in the solvent. The only stable metallic element consistently found in the solvent was Al, with a concentration which varies from about 30 ppM to about 10 ppM. The halogens Br and Cl appear to be found in the solvent systems as organo halides. Radionuclides found were principally ^{106}Ru, ^{129}I, ^{3}H, ^{235}U, and ^{239}Pu. The ^{129}I concentration was about 1 ppM in the first solvent extraction cycle of each facility. In the other cycles, ^{129}I concentration varied from about 0.1 to 0.5 ppM. Both ^{129}I and ^{3}H appear to be in the organic solvent as a result of exchange with hydrogen.

44 (DPSTD-AFCT--77-7) SPENT FUEL HANDLING AND STORAGE FACILITY FOR AN LWR FUEL REPROCESSING PLANT. Baker, W.H.; King, F.D. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Jan 1979. Contract EY-76-C-09-0001. 196p. Dep. NTIS, PC A09/MF A01.

The facility will have the capability to handle spent fuel assemblies containing 10 MTHM/day, with 30% if the fuel received in legal weight truck (LWT) casks and the remaining fuel received in rail casks. The storage capacity will be about 30% of the annual throughput of the reprocessing plant. This size will provide space for a working inventory of about 50 days plant throughput and empty storage space to receive any fuel that might be in transit of the reprocessing plant should have an outage. Spent LWR fuel assemblies outside the confines of the shipping cask will be handled and stored underwater. To permit drainage, each water pool will be designed so that it can be isolated from the remaining pools. Pool water quality will be controlled by a filter-deionizer system. Radioactivity in the water will be maintained at less than or equal to 2×10^{-4} Ci/m^3; conductivity will be maintained at 1 to 2 μmho/cm. The temperature of the pool water will be maintained at less than or equal to 40°C to retard algae growth and reduce evaporation. Decay heat will be transferred to the environment via a heat exchanger-cooling tower system.

45 (ENICO--1003) EVALUATION OF SUBMICRON PARTICLE SIZE CLASSIFICATION AND COLLECTION TECHNIQUES FOR NUCLEAR FACILITY OFF-GAS STREAMS. Fernandez, S.J.; Pierce, G.D.; Murphy, L.P.; Motes, B.G. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Aug 1979. Contract AC07-79ID01675. 33p. Dep. NTIS, PC A03/MF A01.

The present state-of-the-art in submicron aerosol size classification and collection is evaluated. Electrostatic precipitation, cryogenic collection, cascade impaction, and granular bed filtration are examined as collection methods. Methods of aerosol size classification reviewed are: electrical aerosol size analysis and the diffusion battery. An integrated sampler that includes the methods of collection and classification selected, the electrofluidized bed and the diffusion battery, is proposed and development plan presented.

46 (ENICO--1034) TECHNICAL QUARTERLY PROGRESS REPORT, OCTOBER 1-DECEMBER 31, 1979. Plung, D.L. (ed.). (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Jul 1980. Contract AC07-79ID01675. 116p. NTIS, PC A06/MF A01.

Special Materials Production: results of work on the long-term management of ICPP high-level wastes, ICPP plant process improvement, advanced graphite fuels reprocessing, ICPP waste management development, technical support to the New Waste Calcining Facility, effluent monitoring methods evaluation and development, and technical program improvement are reported. Results of work on pelleted waste form development, a Rover mass balance model, pneumatic transport studies, calciner autoignition studies, and development of a continuous alpha monitor are presented. Fuel Cycle Research and Development: results of krypton-85 storage development work are presented. This quarter's work focused on: (1) krypton zeolite encapsulation - including krypton loading and leakage tests and zeolite materials development, and (2) krypton storage development - including conceptual design alternatives, materials and pilot-plant testing, and long-term tests. Other Energy Projects: results of work are presented on nuclear materials security, reactor source term program, burnup methods for fast breeder reactor fuels, specialized fuel research - analytical support, negative thermal ionization mass spectrometry, iodine adsorber evaluation program, and Oklo studies. In addition, results of work on radiological consequences of containment purge, iodine pathway studies, and offsite emergency instrumentation for accidents involving light-water nuclear power plants are reported.

47 (ENICO--1055) PRELIMINARY SAFETY EVALUATION OF A COMMERCIAL-SCALE KRYPTON-85 ENCAPSULATION FACILITY. Christensen, A.B.; Tanner, J.E.; Knecht, D.A. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Sep 1980. Contract AC07-79ID01675. 54p. NTIS, PC A04/MF A01.

This report demonstrates that a commercial-scale facility for encapsulating krypton-85 in zeolite-5A or glass at a 2000 MTHM per year nuclear fuel reprocessing plant can be designed to contain fragments and the 340 to 850 kCi krypton-85 inventory from an assumed catastrophic failure of the high pressure vessel. The vessel failure was assumed as a worst case and was not based on a detailed design evaluation or operating experience. The process design is based on existing commercial hot isostatic pressing technology operated at up to 40 times the scale required for krypton encapsulation. From the calculated process gas inventory in the pressure vessel and vessel design, the explosive energy of 8.4 kg TNT and vessel plug and fragment velocities were calculated. The facility Containment Cell housing the high pressure vessel was designed to contain the gases, fragments, and the shock wave energy calculated for vessel failure. The Access Cell located directly above the Containment Cell was designed to be a tertiary confinement of krypton-85, should the access hatch be breached.

48 (ETR--299) ACTIVITY REPORT 1978. Delande, E.; Drent, W. (eds.). (European Company for the Chemical Processing of Irradiated Fuels, Mol (Belgium)). Jul 1979. 73p. Dep. NTIS (US Sales Only), PC A05/MF A01.

The principal activities of Eurochemic plant in the fields of reprocessing and the solidification and conditioning of liquid and solid wastes are presented in this report that covers the period 1 January to 31 December 1978. Works in the plant are closely related to the decontamination in cooperation with specialized firms. Active operation of bituminization facility was started in June, and a total of 66 m^3 of medium level waste was incorporated into bitumen by the end of 1978. The associated storage facility was in active operation since June and preliminary studies for its extension were completed. A facility was completed for the conditioning of solid wastes arising from the decontamination operation of solid wastes whch were stored under water during plant operation.

49 (IAEA-R--1841-F) REMOVAL OF RADIOIODINE SPECIES FROM GASEOUS STREAM ON INORGANIC ABSORBENTS. FINAL REPORT FOR THE PERIOD 1 NOVEMBER 1976 - 31 OCTOBER 1977. Vujisic, L. (International Atomic Energy Agency, Vienna (Austria)). Nov 1978. 15p. Dep. NTIS (US Sales Only), PC A02/MF A01.

As a contribution to the development of an impregnated absorbent for the removal of airborne iodine species in the off-gas streams of nuclear facilities the adsorption of ^{131}I-labelled methyl iodide on impregnated alumina was investigated. Alcoa alumina H-151 was impregnated with metal nitrates (Ag, Ag+Cd, Ag+Pb) and with triethylenediamine (TEDA). The removal efficiency of CH_3I was experimentally evaluated, as functions of relative humidity of air-stream, its temperature and flow rate and of the amount of impregnated materials. Under constant temperature, relative humidity and face velocity, the retention of CH_3I increases as the total amount of Ag impregnation increases. In a wet air-stream the only efficient impregnation was found to be with silver nitrate. At constant temperature the CH_3I retention decreases with increasing relative humidity or face velocity of the stream. An increase of temperature favours the CH_3I retention. Very low retention of CH_3I was found on TEDA impregnated alumina.

50 (INIS-mf--4782, pp 171-185) REPROCESSING AND WASTE MANAGEMENT. Merz, E. 1977. (In German).

From Energy policies forum of the Landesregierung; Stuttgart, F.R. Germany (9 May 1977).

After a historical survey of problems and failures in existing reprocessing plants, the Purex process and the treatment and storage of different types of waste are described. The risk in reprocessing (radiation exposure) and possible accidents are treated in some more detail.

51 (INIS-mf--5372, pp 52-54) SAFETY CONSIDERATIONS IN A FUEL REPROCESSING PLANT. Siddiqui, H.R.; Kumar, S.V. (Bhabha Atomic Research Centre, Bombay (India). Fuel Reprocessing Div.); Krishnamony, S. (Bhabha Atomic Research Centre, Bombay (India). Health Physics Div.). 1979.

52 (INIS-mf--5564, pp 46-58) STUDY OF SOME SALTLESS REDUCERS OF PLUTONIUM AND NEPTUNIUM.

Koltunov, V.S.; Tikhonov, M.F.; Zhuravleva, G.I.; Vashman, A.A. 1977. (In Russian).
From 4. symposium on study into irradiated fuel reprocessing; Karlovy Vary, Czechoslovakia (28 Mar 1977).
The problem of applying some saltless Pu and Np reducers in the radioactive liquid wastes is discussed. The problem is of interest for nuclear fuel reprocessing technology. Namely, peculiarities of Pu(6), Pu(4), Np(6) and Np(5) reduction by hydroxylamine, hydrazine and ascorbic acid are considered. The chemical reaction kinetics in nitric acid and oxychloride media are studied. Depending on different conditions of concentration and the type of reducer, temperature, solution acidity and presence of catalyst, rates and duration of individual reactions can differ significantly, which allows to solve different technical tasks. Orders of constant rate and thermodynamical activation parameters for all the above reactions of Pu and Np are determined. Mechanisms of the reactions are discussed. On the basis of the obtained data, a number of methods is suggested for stabilization of different ion pairs Np and Pu(Np(5)-Pu(3), Np(5)-Pu(4), Np(4)-Pu(3) and others) aimed at their separation, or joint recovering at extraction, reextraction and sorption.

53 (INIS-mf--5564, pp 72-82) VANADIUM(5) AS OXIDANT OF NEPTUNIUM AND PLUTONIUM. Koltunov, V.S.; Marchenko, V.I.; Solovkin, A.S.; Tverdovskii, A.N.; Frolov, K.M.; Pushkov, A.A. 1977. (In Russian).
From 4. symposium on study into irradiated fuel reprocessing; Karlovy Vary, Czechoslovakia (28 Mar 1977).
Kinetics and equilibrium of reactions of Np(4), Np(5), Np(6), Pu(3), and Pu(4) ions with vanadium(5) in aqueous solutions and in two-phase systems of TBP-nitric acid are investigated. The investigation was carried out by spectrophotometric method in the $HClO_4$ solutions. Vanadium(5) is a selective oxidant for neptunium and plutonium ions; it oxidizes lower valent Np and Pu forms up to Np(6) and Pu(4). In vanadium(4) presence Pu(6) and Pu(5) reduce to Pu(4). Thus, vanadium is a reagent for neptunium and plutonium stabilization in the most extractible valent forms- Np(6) and Pu(4), which results in the high level of their extraction by TBP from the NH_3 solutions. The full neptunium and plutonium separation may be practically obtained by selective reduction of Np(6) with hydrazine up to Np(5) in the two-phase system. Shown is the possibility of obtaining some reactions mentioned above not only in mixers-settlers but in apparatus with short time of phase contact as well, for instance, in centrifugal extractors.

54 (INIS-mf--5564, pp 304-311) STUDYING THERMOPHYSICAL PROPERTIES OF HIGH-ACTIVE SECONDARY PRODUCTS OF REPROCESSING OF THE BOR-60 REACTOR SPENT FUEL ELEMENTS BY FLUORIDE GASEOUS METHOD. Vorobei, M.P.; Kirillovich, A.P.; Lavrinovich, Yu.G. 1977. (In Russian).
From 4. symposium on study into irradiated fuel reprocessing; Karlovy Vary, Czechoslovakia (28 Mar 1977).
The investigation results are presented of temperature dependence of thermal conduction, specific heat and thermal stability of high-active powdered secondary products of irradiated fuel reprocessing of the BOR-60 reactor by fluoride-gaseous method. The study of thermal and physical properties of sorbents (NaF), calcareous chemical absorbent (95%Ca $(OH)_2$+5%NaOH), and fluoration residues as well was based on differential thermography characterized by satisfactory accuracy (+-15%) and fit for remote maintenance. Thermal conduction of processed high-active sorbents is 20-25% higher than thermal conductivity of initial nonactive material. The general regularity for all sorbents studied is thermal conduction decrease, which passes through the minimum in the range of 500-550 deg C, at temperature increase. Specific heat of all samples grows monotonously with temperature increase. Fluorating residue thermal conduction is 3-5 times as high as sorbent and chemical absorbent thermal conduction. It decreases with temperature increase. It is noted that for dry powdered and granulated materials the character of thermal conduction temperature dependence is mainly defined by relation of such properties as porosity, granula size, bulk density, solid and gaseous phase volume.

55 (INIS-mf--5565, pp 270-275) INVESTIGATION INTO PLUTONIUM SEPARATION FROM SORBENTS AND HIGH-ACTIVE WASTES OF GAS-FLUORIDE TECHNOLOGY. Gorbunov, V.F.; Novoselov, G.P.; Ulanov, S.A. 1977. (In Russian).
From 4. symposium on study into irradiated fuel reprocessing; Karlovy Vary, Czechoslovakia (28 Mar 1977).
The results of investigation into the interaction of plutonium fluorides and some fission products with metal oxides in the molten alkali metal fluorides are presented. Plutonium tetrafluoride reacts with calcium and aluminium oxides forming plutonium dioxide. The plutonium dioxide is slightly soluble in molten salts and it may be quantitatively separated from them. The effect of an oxide precipitant nature on the complete plutonium separation from the molten salts and on its purification from fission products is studied. It is shown that an aluminium oxide precipitates plutonium from the melt, but it does not react with the rare earth fluorides, thus permitting the plutonium separation from the rare earth compounds which form the bulk of fuel fluorating residues.

56 (INIS-mf--5565, pp 210-221) STOP AND REGULATING VALVES FOR RADIOCHEMICAL PLANTS. Cheika, I.; Goudek, A.; Moizhish, K.; Shraer, V. 1977. (In Russian).
From 4. symposium on study into irradiated fuel reprocessing; Karlovy Vary, Czechoslovakia (28 Mar 1977).
The papers on developing stop and regulating valves and selecting material for these valves are reviewed. The main technical requirements of the radiochemical production to the valves are: the fluid stream velocity of 0.2-10000 l/s, remote exchange, one year lifetime or 15000 cycles, the pressure and temperature of the fluid up to 0.6 MPa and up to 120 deg C. It is presupposed to use 03Cr18Ni12 and 03Cr18Ni12Mo2-3 type steels for these valves. The CrWCO type lining materials for the working medium of nitrogen acid are acknowledged unfit. Significantly better anticorrosion properties are found for the electrodes with the 1Cr18Ni Mo2-5 Mn2-4 type lining. The bellow valve design meets the suggested technical requirements most fully. Two perspective projects of the valve of this type are presented.

57 (INIS-mf--5567, pp 260-267) SYNTHESIS AND USE OF STABILIZED INORGANIC IONITES FOR CAPTURING FISSION PRODUCTS. Dolezhal, J.; Kourzhim, V.; Santarova, M.; Steiskal, J. 1975. (In Russian).
From 3. CNEA symposium on investigations in

the field of spent fuel reprocessing; Marianske Lazne, Czechoslovakia (24 Apr 1974).

The advantage of inorganic ionites is high heat and radiation resistance as well as high selectivity towards a certain ion. However, difficulties arise when attempts are made to prepare these materials as particles which, when used for packing ion-exchange columns, reveal suitable hydrodynamic properties: their dimensions should remain constant during ion exchange to avoid plugging of the column. The paper describes a sol-gel technique for preparing stable ball-like particles. Possible application of ion exchange for extracting nuclides from fluorination wastes is also discussed.

58 (INIS-mf--5567, pp 144-151) EXTRACTION OF AMERICIUM, CURIUM, STRONTIUM AND RARE EARTHS FROM AQUA-TAIL SOLUTIONS OF WWER SPENT FUEL ELEMENT REPROCESSING. Shevchenko, V.B.; Smelov, V.S.; Kozlov, A.G.; Chubukov, V.V.; Lanin, V.P.; Smetanin, E.Ya. 1975. (In Russian).

From 3. CMEA symposium on investigations in the field of spent fuel reprocessing; Marianske Lazne, Czechoslovakia (24 Apr 1974).

Theoretical grounds are discussed of conditions ensuring quantitative extraction of strontium, americium, curium, rare earths from the aqueous solution and regimes of element fraction separation during reextraction operations. Technological scheme is described of element extraction from water-tail solutions of WWER spent fuel element reprocessing. This scheme includes: operations of joint extraction of americium, curium, strontium, 0.6M rare earths by di-2-ethylhexylphosphoric acid solution (HDEHP) in the hydrocarbon diluent; strontium reextraction by dilute nitric acid; reextraction of solution containing 0.8M lactic acid and 0.05M sodium dtpa; rare earth reextraction by 3M nitric acid. The technological scheme proposed ensures high degree of element extraction, allows strontium, americium, curium and rare earth successive and selective reextraction with 92-95% output from initial quantity.

59 (INIS-mf--5568, pp 230-239) ECONOMIC STUDY OF SPENT FUEL REPROCESSING USING THE SYWA COMPUTER PROGRAM. Til'e, D.; Fisher, V. 1975. (In Russian).

From 3. CMEA symposium on investigations in the field of spent fuel reprocessing; Marianske Lazne, Czechoslovakia (24 Apr 1974).

Studies were made aimed at verification of the computer model validity and obtaining reprocessing-related economic solutions for any scheme of nuclear power development. The base variant assumes PWR and FBR type electricity generating capacities and aqueous reprocessing of spent oxide fuels. Several other variants considered include fluoride reprocessing, different unit capacities of spent fuel reprocessing plants and timing of their introduction different durations of spent fuel storage. The total costs as well as specific capital, operation and maintenance costs have been calculated. The validity of the SYWA program has been demonstrated, the final results being very sensitive to the input parameters.

60 (INIS-mf--5569, pp 174-189) INTERCONNECTION BETWEEN FUEL REPROCESSING AND RADIOACTIVE WASTE TREATMENT. Dlougi, Z. 1975. (In Russian).

From 3. CMEA symposium on investigations in the field of spent fuel reprocessing; Marianske Lazne, Czechoslovakia (24 Apr 1974).

Problems of LWR and LMFBR type reactors spent fuel reprocessing and associated radioactive waste processing and disposal are discussed in terms of radiation safety and environmental impact. The discussion is based on the experience accumulated in the USA and Western Europe. Data are provided on typical isotopic compositions of the spent fuels and radioactivity of major fission products, actinides and corrosion products formed as a result of fuel cans activation. The experience in radioactive liquid waste storage and processing is summarized. The current practice in radioactive gaseous waste stock disposal in the atmosphere is discussed at greater length. Geological, hydrological and meteorological implications of site selection for spent nuclear fuel reprocessing plants are also considered. The current practice in the field of spent fuel processing is shown to ensure the radiation safety and minimal environmental impact.

61 (INIS-mf--5571, pp 141-144) TYPES AND PROPERTIES OF SOLID AND GASEOUS WASTES PRODUCED DURING EXPERIMENTAL FLUORIDE-GASEOUS REGENERATION OF THE BOR-60 REACTOR FUEL. Kirillovich, A.P.; Lavrinovich, T.G.; Dem'yanovich, M.A.; Skiba, O.V.; Ivanov, P.M.; Serov, A.V.; Vasil'ev, G.I. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Experimental data are given concerning types and characteristics of radioactive wastes obtained during melting of fuel cans and reprocessing of the uranium oxide fuel from the BOR-60 reactor by means of the gaseous fluoride method. Characteristics of irradiated fuel elements and fuel regeneration processes are given. Fuel reprocessing includes fuel elements declading and uranium dioxide purufication by removal of fission products by gaseous-fluoride method. As a result of processing of fuel cans, solid wastes in form of fuel can material ingots and ceramics have been obtained. Characteristics of the wastes obtained as a result of processing, including gaseous ones are given. Characteristics of solid wastes, produsd on fluorination of spent fuels and isotope composition of aerosols from fuel reprocessing are stated.

62 (LA--8272-PR) FISSION PRODUCT RELEASE. PROGRESS REPORT, OCTOBER 1-DECEMBER 31, 1979. Norris, A.E. (comp.). (Los Alamos Scientific Lab., NM (USA)). Mar 1980. Contract W-7405-ENG-36. 9p. Dep. NTIS, PC A02/MF A01.

The set of experiments, undertaken to compare the effects of leaching spent fuel wafers in deionized water at pH 4 under oxidizing and under reducing conditions, was concluded this quarter. Analyses of the leachant solutions still are in progress. A new set of leaching experiments under oxidizing and reducing conditions was begun at pH 8, a pH value likely to be encountered in the ground waters near a nuclear waste repository. Additional experiments were performed to determine whether reducing conditions could be obtained that resulted in less dissolution of UO_2 than has been observed in previous measurements. Addition of a palladium-black catalyst to an ongoing UO_2 dissolution experiment in which hydrogen gas is the reducing agent dramatically lowered the uranium concentration in solution. Work is continuing to determine whether the uranium decrease is caused by a change in the solution or by provision of additional uranium sorption sites.

Use of Fe^{2+} (o-phenanthroline)$_3$ as a reductant in an experiment with sintered UO_2 yielded uranium concentrations in deionized water that were about one-tenth the values obtained in the similar spent-fuel leaching experiments.

63 (ORNL--5566) ACTINIDE PARTITIONING-TRANSMUTATION PROGRAM FINAL REPORT. I. OVERALL ASSESSMENT. Croff, A.G.; Blomeke, J.O.; Finney, B.C. (Oak Ridge National Lab., TN (USA)). Jun 1980. Contract W-7405-ENG-26. 151p. NTIS, PC A08/MF A01.

This report is concerned with an overall assessment of the feasibility of and incentives for partitioning (recovering) long-lived nuclides from fuel reprocessing and fuel refabrication plant radioactive wastes and transmuting them to shorter-lived or stable nuclides by neutron irradiation. The principal class of nuclides considered is the actinides, although a brief analysis is given of the partitioning and transmutation (P-T) of ^{99}Tc and ^{129}I. The results obtained in this program permit us to make a comparison of the impacts of waste management with and without actinide recovery and transmutation. Three major conclusions concerning technical feasibility can be drawn from the assessment: (1) actinide P-T is feasible, subject to the acceptability of fuels containing recycle actinides; (2) technetium P-T is feasible if satisfactory partitioning processes can be developed and satisfactory fuels identified (no studies have been made in this area); and (3) iodine P-T is marginally feasible at best because of the low transmutation rates, the high volatility, and the corrosiveness of iodine and iodine compounds. It was concluded on the basis of a very conservative repository risk analysis that there are no safety or cost incentives for actinide P-T. In fact, if nonradiological risks are included, the short-term risks of P-T exceed the long-term benefits integrated over a period of 1 million years. Incentives for technetium and iodine P-T exist only if extremely conservative long-term risk analyses are used. Further RD and D in support of P-T is not warranted.

64 (ORNL/Sub--79/31056/1/A3) ACTINIDE PARTITIONING-TRANSMUTATION PROGRAM FINAL REPORT. V. PRECONCEPTUAL DESIGNS AND COSTS OF PARTITIONING FACILITIES AND SHIPPING CASKS (APPENDIX 3). (Parsons (Ralph M.) Co., Pasadena, CA (USA)). Jun 1980. Contract W-7405-ENG-26. 405p. NTIS, PC A18/MF A01.

This Appendix contains cost estimate documents for the Fuels Reprocessing Plant Waste Treatment Facility. Plant costs are summarized by Code of Accounts and by Process Function. Costs contribution to each account are detailed. Process equipment costs are detailed for each Waste Treatment Process. Service utility costs are also summarized and detailed.

65 (ORNL/Sub--79/31056/1/A4) ACTINIDE PARTITIONING-TRANSMUTATION PROGRAM. V. PRECONCEPTUAL DESIGNS AND COSTS OF PARTITIONING FACILITIES AND SHIPPING CASKS, APPENDIX 4. FINAL REPORT. (Parsons (Ralph M.) Co., Pasadena, CA (USA)). Jun 1980. Contract W-7405-ENG-26. 254p. NTIS, PC A12/MF A01.

This Appendix contains cost estimate documents for the Fuels Fabrication Plant Waste Treatment Facility. Plant costs are summarized by Code of Accounts and by Process Function. Costs contributing to each account are detailed. Process equipment costs are detailed for each Waste Treatment Process. Service utility costs are also summarized and detailed. Shipping cask costs are provided.

66 (ORNL/TM--6984) ACTINIDE PARTITIONING-TRANSMUTATION PROGRAM FINAL REPORT. IV. MISCELLANEOUS ASPECTS. Alexander, C.W.; Croff, A.G. (Oak Ridge National Lab., TN (USA)). Sep 1980. Contract W-7405-ENG-26. 81p. NTIS, PC A05/MF A01.

This report discusses seven aspects of actinide partitioning-transmutation (P-T) which are important in any complete evaluation of this waste treatment option but which do not fall within other major topical areas concerning P-T. The so-called miscellaneous aspects considered are (1) the conceptual design of a shipping cask for highly neutron-active fresh and spent P-T fuels, (2) the possible impacts of P-T on mixed-oxide fuel fabrication, (3) alternatives for handling the existing and to-be-produced spent fuel and/or wastes until implementation of P-T, (4) the decay and dose characteristics of P-T and standard reactor fuels, (5) the implications of P-T on currently existing nuclear policy in the United States, (6) the summary costs of P-T, and (7) methods for comparing the risks, costs, and benefits of P-T.

67 (PNCT--841-78-60) OPERATION TESTING LABORATORY IN PNC REPROCESSING PLANT, (1). TRANSFER EQUIPMENTS FOR CHOPPED FUEL, DISSOLVER SOLUTION, DEGRADED SOLVENT AND HIGH ACTIVE WASTE. Gonda, K.; Nemoto, T.; Yasu, S.; Miyachi, S. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Nov 1978. 29p. (In Japanese). NTIS (US Sales Only), PC A03/MF A01.

The transfer equipment for chopped fuel, dissolver solution, degraded solvent and high active waste were installed in the Operation Testing Laboratory of PNC Reprocessing Plant. This paper describes the transfer mechanism and the transfer method of each equipment.

68 (PNL--2985) CLADDING HULL DECONTAMINATION PROCESS: PRELIMINARY DEVELOPMENT STUDIES. Griggs, B.; Bryan, G.H. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Dec 1979. Contract EY-76-C-06-1830. 63p. Dep. NTIS, PC A04/MF A01.

An investigation of the chemical and radioactive properties of fuel hulls was conducted to assist in a decontamination process development effort. The removal of zirconium oxide layers from zirconium was accomplished by a treatment in 600°C HF followed by a dilute aqueous reagent. Similar treatment in fused alkali-zirconium fluoride salt baths was examined. A remotely operated small batch facility was developed and process parameters determined. 16 figures, 9 tables.

69 (PNL--3153) COMPARATIVE TECHNIQUES FOR NUCLEAR FUEL CYCLE WASTE MANAGEMENT SYSTEMS. Pelto, P.J.; Voss, J.W. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Sep 1979. Contract EY-76-C-06-1830. 177p. Dep. NTIS, PC A09/MF A01.

A safety assessment approach for the evaluation of predisposal waste management systems is described and applied to selected facilities in the light water reactor (LWR) once-through fuel cycle and a potential coprocessed UO_2-PuO_2 fuel cycle. This approach includes a scoping analysis on pretreatment waste streams and a more detailed analysis on proposed waste management processes. The primary evaluation parameters used in this study include radiation exposures to the public from radionuclide releases from normal

operations and potential accidents, occupational radiation exposure from normal operations, and capital and operating costs. On an overall basis, the waste management aspects of the two fuel cycles examined are quite similar. On an individual facility basis, the fuel coprocessing plant has the largest waste management impact.

70 (PNL--3166(Pt.1)) CLADDING HULL DECONTAMINATION AND DENSIFICATION PROCESS. PART 1. THE PROTOTYPE CLADDING HULL DECONTAMINATION SYSTEM. Lambright, T.M.; Montgomery, D.R. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Apr 1980. Contract EY-76-C-06-1830. 56p. NTIS, PC A04/MF A01.

A prototype system for decontaminating Zircaloy-4 cladding hulls has been assembled and tested at Pacific Northwest Laboratory. The decontamination process consists of treatment with a gaseous mixture of hydrogen fluoride (HF) and argon (Ar) followed by a dilute aqueous etch of ammonium oxalate, ammonium citrate, ammonium fluoride, and hydrogen peroxide. The continuous cleaning process described in this report successfully descaled small portions of most charges, but was unable to handle the original design capacity of 4 kg/hr because of problems in the following areas: control of HF reactor temperatures, regulation of HF and argon mixtures and flows, isolation of the HF reactor atmosphere from the aqueous washer/rinser atmosphere, regulation of undesirable side reactions, and control over hull transport through the system. Due to the limited time available to solve these problems, the system did not attain fully operational status. The work was performed with unirradiated hulls that simulated irradiated hulls. The system was not built to be remotely operable. The process chemistry and system equipment are described in this report with particular emphasis on critical operating areas. Recommendations for improved system operation are included.

71 (PNL-SA--7752) KRYPTON-85 STORAGE IN SOLID MATRICES. Tingey, G.L.; McClanahan, E.D.; Bayne, M.A.; Gray, W.J.; Hinman, C.A. (Battelle Pacific Northwest Labs., Richland, WA (USA); Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract AC06-76RL01830. 9p. (CONF-791112--67). NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Storage of Kr-85 will be required in support of nuclear power reactors beginning in 1983. Both approaches described here appear to meet the requirements for such a storage medium. Entrapment of the Kr during sputtering has several rather obvious safety advantages. The operation of the process at low rho and at or below room temperature should reduce markedly the potential for significant Kr-85 release to the environment during processing of the waste stream. It also appears that adaptation of this process for handling radioactive materials would also be simpler than the large high pressure, high temperature apparatus required for loading the glass sample. Furthermore, a significantly higher Kr loading is possible in the sputtered metals thus reducing the volume required for storage by as much as a factor of 50 to 100. On the other hand, the low density loaded glass process takes advantage of a very inexpensive starting material and existing commercial technology for high temperature, high pressure processes. The volume of the Kr-loaded glass matrix could be reduced by going to still higher pressures.

72 (PNL-SA--7844) KILOGRAM-SCALE PURIFICATION OF AMERICIUM BY ION EXCHANGE. Wheelwright, E.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1979. Contract EY-76-C-06-1830. 20p. (CONF-7910108--4). NTIS, PC A02/MF A01.

From Symposium on separation science and technology for energy applications; Gatlinburg, TN, USA (30 Oct 1979).

Sequential anion and cation exchange processes have been used for the final purification of ^{241}Am recovered during the reprocessing of aged plutonium metallurgical scrap. Plutonium was removed by absorption of Dowex 1, X-3.5 (30 to 50 mesh) anion exchange resin from 6.5 to 7.5 M HNO_3 feed solution. Following a water dilution to 0.75 to 1.0 M HNO_3, americium was absorbed on Dowex 50W, X-8 (50 to 100 mesh) cation exchange resion. Final purification was accomplished by elution of the absorbed band down 3 to 4 successive beds of the same resin, preloaded with Zn^{2+}, with an NH_4OH buffered chelating agent. The recovery of mixed ^{241}Am-^{243}Am from power reactor reprocessing waste has been demonstrated. Solvent extraction was used to recover a HNO_3 solution of mixed lanthanides and actinides from waste generated by the reprocessng of 13.5 tons of Shippingport Power Reactor blanket fuel. Sequential cation exchange band-displacement processes were then used to separate americium and curium from the lanthanides and then to separate approx. 60 g of ^{244}Cm from 1000 g of mixed ^{241}Am-^{243}Am.

73 (RHO-LD--79-3A) PROCESS TECHNOLOGY AND PROCESS DEVELOPMENT. ROCKWELL HANFORD OPERATIONS SEMIANNUAL REPORT, OCTOBER 1978-MARCH 1979. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Aug 1979. Contract EY-77-C-06-1030. 144p. Dep. NTIS, PC A07/MF A01.

This semiannual report provides information on the technical progress of process technology and process development activities being performed by Research and Engineering, Rockwell Hanford Operations to improve the processing of irradiated reactor fuels, the production of plutonium, and the management of resultant chemical wastes. The work reported herein was performed during the period October 1978 through March 1979.

74 (RHO-LD--79-3B) ROCKWELL HANFORD OPERATIONS PROCESS TECHNOLOGY AND PROCESS DEVELOPMENT. SEMIANNUAL REPORT, APRIL-SEPTEMBER 1979. (Atomics International Div., Richland, WA (USA). Rockwell Hanford Operations). Jun 1980. Contract AC06-77RL01030. 145p. NTIS, PC A07/MF A01.

This semiannual report provides information on the technical progress of process technology and process development activities being performed by Research and Engineering, Rockwell Hanford Operations, to improve the processing of irradiated reactor fuels, the production of plutonium, and the management of resultant radioactive wastes. The work reported herein was performed during the period April 1979 through September 1979.

75 (RHO-SA--122) CONTINUOUS-FLOW APPARATUS FOR DETERMINATION OF ^{90}SR IN MIXTURES OF FISSION PRODUCTS. Jewett, J.R. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Jul 1979. Contract EY-77-C-06-1030. 19p. (CONF-7909110--1). Dep. NTIS, PC A02/MF A01.

From Federation of Analytical Chemistry and

Spectroscopy Societies conference; Philadelphia, PA, USA (17 Sep 1979).

Strontium-90 is determined at Rockwell Hanford Operations in nuclear waste processing plant solutions, and liquid and gaseous effluents. The ^{90}Sr is separated from these samples by liquid/liquid extraction, evaporated to dryness on a stainless steel counting dish, then determined by gross beta counting with a gas proportional counter. This solvent extraction method is based on the selective extraction of various radionuclides by TBP and TTA in 4-methyl-2-pentanone. 15 figures.

76 (SAI--00979-1) IDENTIFICATION OF IODINE-129 SOURCES, CONCENTRATIONS, CONTAMINANT LEVELS AND RADIOIODINE MONITORING TECHNIQUES IN LWR REPROCESSING OPERATIONS. Hower, R.B.; Pence, D.T. (Science Applications, Inc., San Diego, CA (USA)). Oct 1978. Contract EY-77-C-09-0979. 41p. Dep. NTIS, PC A03/MF A01.

Six proposed reprocessing facility designs are described. The potential sources and concentrations of I-129 in each facility are determined and the effects of voloxidation are discussed. The sources and concentrations of NO, NO_2, water vapor, and organic contaminants are also disccussed. Iodine-129 monitoring requirements for process and stack gas streams are determined based on averages of expected I-129 concentrations at the six proposed facilities. Various monitoring techniques are summarized, including LEPS (Low Energy Photon Spectrometry), mass spectrometry, and laser-based methods. The mass spectrometric methods which are potentially sensitive enough are medium pressure photoionization, molecular beam photoionization, surface ionization, and API (Atmospheric Pressure Ionization). The laser-based methods which have the appropriate sensitivities are the laser-induced fluorescence monitor and the intracavity dye laser.

77 (UJV--4620-D,CH,E) PROCESSING OF SPENT NUCLEAR FUEL FROM LIGHT WATER REACTORS. Sraier, V. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Nov 1978. 53p. (In Czech). Dep. NTIS (US Sales Only), PC A04/MF A01.

A comprehensive review is given of the reprocessing of spent nuclear fuel from LWR's (covering references up to No. 18 (1977) of INIS inclusively). Particular attention is devoted to waste processing, safety, and reprocessing plants. In the addendum, the present status is shown on the example of KEWA, the projected large German fuel reprocessing plant.

78 (WINDSCALE-TRANS--813) STATE OF DEVELOPMENT AND PROBLEMS OF CHEMISTRY AND PROCESS TECHNOLOGY IN NUCLEAR FUEL PROCESSING. Baumgaertner, F. (UKAEA Windscale Nuclear Power Development Labs.). 1979. 24p. Available from British Library Lending Division, Boston Spa.

Fuel processing is based on the well-known technology of multi-stage back extraction. Adaptation of conventional apparatus to nuclear technology limitations is not generally necessary. There are no unknown steps, from a technical aspect, for which new ways must be first sought. There is sufficient knowledge and practical experience in the Federal Republic after 10 years preliminary work to be able to plan and to build a technical processing plant. Present development work is concerned with minimisation of gaseous emission and reduction of liquid radioactive waste volumes, process optimisation and increasing the scale of the operation. Long term research aims to develop a still better understanding of the molecular reactions in the Purex Process. These projects are carried out externally to the Nuclear Research Centres, in the nuclear chemistry technical school groups, which are in contact with Industrial and the centre laboratories. A fuel element lasts for about 3 years full power operation in a nuclear power station. If the residual nuclear fuel is to be separated from the nuclear waste, the fuel element must be chemically processed. The chemical and technological problems that have to be solved are dealt with here under 3 headings. 1. Which chemical and technological problems are to be solved. 2. How have they been dealt with previously. 3. What can be achieved by further technical developments and research work.

79 (PNL-TR--409) INVESTIGATIONS OF THE SOLIDIFICATION OF FEED CLARIFICATION SLUDGE IN AN INORGANIC MATRIX RESISTANT TO RADIATION AND HEAT (VITRIFICATION), SUBPROJECT B. Stammler, M.; Eggersdorfer, R.; Gaar, H.; Harr, K.; Schwaemmlein, W.; Sherriff, R. (Battelle-Institut e.V., Frankfurt am Main (Germany, F.R.)). 13 Oct 1980. Translation of BMFT-FB (KWA 1688 A), April 1980 105p. NTIS, PC A06/MF A01.

After concentration, dissolver sludge can be embedded into a glass matrix. The resulting product shows high radiation and recrystallization stability. The process to make the product is simple and causes practically no secondary waste. Mixtures of simulated FKS and frit can be processed into spherical pellets on a pelletizing disc. Another possibility is to pour the mixture into hemispherical cavities in a suitable substrate material. Sintering at about 700°C results in pellets with a vitrified surface. Some of the equipment necessary for the process has been tested.

80 POSITIVE TECHNICAL BALANCE OF BACK-END FUEL CYCLE ACTIVITIES. COMMENTS ON THE 1979 STATUS REPORT OF THE REPROCESSING AND WASTE TREATMENT PROJECT AT KARLSRUHE. Schmieder, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Heisse Chemie); Specht, S. (Gesellschaft zur Wiederaufarbeitung von Kernbrennstoffen m.b.H., Eggenstein-Leopoldshafen (Germany, F.R.)). Atomwirtschaft, Atomtechnik ; 25: No. 3, 155-156(Mar 1980). (In German).

The reprocessing and waste treatment project (PWA) with about 240 people employed is one of the largest projects within the Karlsruhe Nuclear Research Centre. According to an agreement concluded with the Deutsche Gesellschaft fuer Wiederaufarbeitung von Kernbrennstoffen (DWR) in mid-1979, the activities of the PWA are strictly coordinated with the work carried out by other research facilities and by industry so as to serve the main purpose of establishing a national German reprocessing centre. The Status Report of the PWA presents among others recent results of work on criticality safety, suitability of high-level radioactive vitrified waste for safe ultimate storage, and further development of vitrification techniques for reducing high-level radioactive to solid waste. In addition to results of research and development activities, the report also informs about first findings of a comparative study recently taken up on behalf of the Federal Ministry for Science and Technology for the evaluation of various alternatives to current back-end fuel cycle activities.

81 SCHEMATIC FLOW SHEET COMPARISON OF REPROCESSING PLANTS. Baumgaertner, F. (Technische Univ. Muenchen, Garching (Germany, F.R.). Inst. fuer Radiochemie). Atomkernenergie/Kerntechnik ; 35: No. 2, 81-94(1980). (In German).

Schematic flow sheets of representative Purex-type reprocessing plants namely Purex plant Hanford, Magnoxplant Windscale, NFS, Eurochemic, WAK, BNFP and NFRRC are presented. The process schemes allow direct comparison of different plants by superposition. The following characteristics of the plants are compared: 1. The arrangement of extraction cycles with position of extractors; 2 the combination of solvent washing cycles as sources of the alkaline medium active waste; 3. the rafinate- and condensate-streams as well as the product purification in front of evaporators as the sources of acid and organic medium active waste.

82 ACTINIDE SEPARATIONS. Navratil, J.D.; Schulz, W.W. (eds.). Washington, DC; American Chemical Society (1980). 609p. (CONF-790415--P5).

From 177. national meeting of the American Chemical Society; Honolulu, HI, USA (1 Apr 1979).

Actinide recovery, partition, and purification are explored. The 39 chapters are grouped into six sections: ion exchange and precipitation, solvent extraction, pyrochemical and photochemical methods, power reactor fuel reprocessing, recovery from waste solution, and general methods/review papers. Separate abstracts were prepared for 29 of these chapters; the remaining ten chapters have been previously abstracted. (DLC)

83 STUDIES ON ACTINIDES SEPARATION IN JAERI. Ishimori, T. (Japan Atomic Energy Research Inst., Tokyo). pp 333-350 of Actinide separations. Navratil, J.D.; Schulz, W.W. (eds.). Washington, DC; American Chemical Society (1980).

From 177. national meeting of the American Chemical Society; Honolulu, HI, USA (1 Apr 1979).

The separation of actinides has been studied for various purposes in Japan Atomic Energy Research Institute (JAERI). Studies carried out so far, are classified into four categories: preparation of actinide nuclides, separation chemistry for chemical analysis, separation of actinides from radioactive waste, and reprocessing of spent nuclear fuels. The present work is to review studies of actinide separation performed in JAERI, emphasizing the need of the separation for the main purpose of individual. Concern is focussed on the separation of transuranium elements and studies on thorium and uranium are put aside. 9 figures.

84 HEAD-END PROCESS FOR WASTE DISPOSAL WITHIN THE FUEL CYCLE. Tischer, H.; Merz, E. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Chemische Technologie). pp 433-436 of Jahrestagung Kerntechnik '80 - Reaktortagung 1980. Tagungsbericht. Sektion 4: Brennstoffkreislauf und Spaltstoff-Flusskontrolle. Eggenstein-Leopoldshafen, Germany, F.R.; Fachinformationszentrum Energie, Physik, Mathematik (1980). (In German)

85 PLUTONIUM PROCESSING FOR THE FAST REACTOR FUEL CYCLE. Allardice, R.H. (UKAEA Culham Lab., Abington); Taylor, H.A. Nuclear Engineering International ; 24: No. 292, 52-55(Nov 1979).

Current Dounreay and Windscale experience in reprocessing, fabrication and plutonium waste operations together with the continuing UK development programme to establish process and plant design for larger scale operations is described. The necessity for considering these fuel cycle operations an an entity and avoiding the independent optimization of individual areas, in order to obtain the preferred balance for safe and reliable Pu processing operations is emphasized.

86 PLUTONIUM RECOVERY GOES ON-STEAM. Barrett, T.R.; Mills, A.L. Processing ; 25: No. 11, 42-43(Nov 1979).

The Dounreay fast reactors DFR and PFR are very briefly described, with particular reference to their fuel elements. The spent fuel reprocessing plant is described in more detail under the headings: fuel subassemblies (dimensions, composition, preparation for reprocessing); dissolution and recovery (U-Pu separation from fission products, etc., and from each other); waste products.

87 CLOSING THE FAST FUEL CYCLE AT DOUNREAY. Moss, J. Electrical Review (London) ; 205: No. 11, 16-17(21 Sep 1979).

The opening of the new fast reactor fuel reprocessing plant at Dounreay enables plutonium based fuel used in the PFR to be reprocessed and the plutonium to be sent to Windscale for fabricating into new fuel rods. An outline is given of the fuel cycle including plans for waste disposal.

88 PROCESS FOR THE DECONTAMINATION OF WASTE GASES OF A REPROCESSING PLANT FOR SPENT FUEL AND/OR FERTILE MATERIAL AND INSTALLATION FOR ITS REALISATION. Henrich, E.; Leuchtmann, D.; Weinlaender, W. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,759,185/A/. 5 Jul 1979. 14p. (In German).

The recombination bottom column consists of a lower parallel-flow column and an upper counterflow column in which tritiated water vapour, aerosols, nitric oxides, iodine, ruthenium tetroxide, and $^{14}CO_2$ are removed from the waste gas. By means of a nitric oxide washing, a waste gas practically free of iodine and ruthenium tetroxide is produced, and the iodine is led to the counterflow column for futher treatment. 93 HEAD-END OF A REPROCESSING PLANT FOR HTR FUEL ELEMENTS. Tischer, H.; Hartmann, K. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Chemische Technologie). Atomwritschaft, Atomtechnik ; 24: No. 6, 331-333(Jun 1979). (In German).
One of the main goals pursued by the HTR fuel cycle project carried out by KFA Juelich and by industry is to solve the problem of closing the uranium/thorium fuel cycle for HTRs by suitable reprocessing and final storage of waste material. Methods and techniques for reprocessing spent fuel elements and recycling fissionable fuel as well as treating radioactive waste are being developed. The effects towards developing a head-end of a HTR reprocessing plant have now yielded results allowing a comprehensive technical concept to the presented also for the dual-particle fuel system which involves particularly difficult problems in the head-end process.

95 EXXON NUCLEAR FUEL RECOVERY AND RECYCLING CENTER: PROCESS DESCRIPTION. Ritter, G.L. (Exxon Nuclear Co., Inc., Richland, WA). Nuclear Technology ; 43: No. 2, 194-202(Apr 1979).
The Purex solvent extraction process will be used in the nuclear fuel recovery and recycling center to reprocess up to 2100 MT/yr of spent light water reactor fuels. Modifications to the process will be made to improve fission product decontamination and to treat gaseous and liquid radioactive waste streams. These modifications will allow overall decontamination factors for most fission products from recovered uranium and plutonium of > 10^{10}. No liquid process wastes will be released, and releases of radioactive materials in gaseous effluents will be as low as reasonably achievable. 7 figures, 2 tables.

96 EXXON NUCLEAR FUEL RECOVERY AND RECYCLING CENTER FACILITY DESCRIPTION. Birchler, J.E.; Caudill, H.L. (Exxon Nuclear Co., Inc., San Francisco, CA). Nuclear Technology ; 43: No. 2, 203-212(Apr 1979).
Exxon Nuclear Company, Inc. has submitted an application to the US Nuclear Regulatory Commission for a construction permit to build a 1500 MT/yr (expandable to 2100 MT/yr) reprocessing plant on the Oak Ridge Reservation in Tennessee. The proposed plant utilizes the basic Purex solvent extraction process for recovering uranium and plutonium from spent nuclear fuel. A basic design objective of the nuclear fuel recovery and recycling center (NFRRC) is to ensure that the plant personnel and the general public are not exposed to excessive radiation. This is accomplished through the application of engineered confinement systems and the incorpation of confinement features in the various facilities and support systems. The design featues include those employed (a) to withstand environmental and accident forces and (b) to ensure radiological protection. The NFRRC is comprised of two interconnected principal facilities with their related support facilities. These are the fuel receiving and storage facility and the fuel reprocessing facility. 2 figures.

97 REPROCESSING OF IRRADIATED FUELS. Piatier, H. (Compagnie Generale des Matieres Nucleaires (COGEMA), La Boursidiere, 92 - Le Plessis-Robinson ;France)). Revue Generale Nucleaire ; No. 2, 159-167(Mar-Apr 1979). (In French).
Having first itroduced the dry and wet (Purex) reprocessing procedures, the reprocessing situation in France and the coordination and cooperation policies applied in this at the European level are described. The problem of wastes issued from the reprocessing operations, both as concerns reliability and the economics of the fuel cycle is considered.

98 METHOD OF LOCATING RADIATION DETECTORS. Shirai, Takamori; Inami, Ichiro; Suzuki, Takeo. (to Nippon Atomic Industry Group Co. Ltd., Tokyo). Japanese Patent 54-1799/A/. 8 Jan 1979. 3p. (In Japanese).
Purpose: To avoid direct contact between a detector and radioactive liquid wastes upon on-line measurement of radio activity for radioactive liquid wastes. Method: A by-pass is provided to a pipe through which liquid wastes flow thus making laminar flow of the liquid wastes. A detection portion is provided to the laminar flow portion. In the detection portion, are formed an upper chamber and a lower chamber in contaction to the laminar flow. The upper chamber is filled with a fluid having a specific gravity lower than that of the liquid wastes and insoluble to the liquid wastes, for example, benzene or cyclohexane, which is contacted to the laminar flow. A radiation detector is provided in the above fluid of a low specific gravity. This can prevent the direct contaction between the detector and the liquid wastes and avoid the deposition of oils and scales contained in the liquid wastes to the detector. The above liquid of the lower specific gravity is circulated and cleaned by a pump. In the lower chamber of the pipe, a fluid

having a specific gravity higher than that of the liquid wastes and insoluble to the liquid wastes is filled for removing the precipitating substances.

99 PROCESS FOR TAKING SAMPLES, IN PARTICULAR FROM HOT CONCENTRATES FLOWING IN PIPES, WHICH CONTAIN RADIOACTIVE OR CORROSIVE SUBSTANCES. Stiefel, M. (to Babcock - Brown Boveri Reaktor G.m.b.H., Mannheim (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,729,326/A/. 4 Jan 1979. 8p. (In German).

The sample is taken from a bypass line. A block of valves with four outlets is used for this purpose, where there is always part of the concentrate in one valve chamber. The valve chamber can be shut off from the bypass line using two valves in the outlets. The contents of the chamber are then flushed with a solvent (e.g. water) into a mixing container, via two of the other valves in the other two outlets, and is diluted in the ratio 1:99. The actual sample extraction is via a sample vessel, which can be connected to the mixing vessel. The process requires no direct cooling, and the dilution reduces the danger from the substance.

100 SAFETY IN ALTERATION OF THE FUEL REPROCESSING PLANT IN POWER REACTOR AND NUCLEAR FUEL DEVELOPMENT CORPORATION. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 9, 126-130(Jan 1979). (In Japanese).

A report of the Committee on Examination of Nuclear Fuel Safety to the Atomic Energy Commission of Japan, concerning the safety in the alteration of the fuel reprocessing plant in Power Reactor and Nuclear Fuel Development Corporation, was presented, and its safety was confirmed. The alteration is as follows. On the site of the fuel reprocessing plant, in order to carry out the technology development of the asphalt solidification for radioactive liquid wastes, a facility for developing asphalt solidification technology is installed. The technology development facility consists of an asphalt solidification treatment facility, an asphalt solid storage, and an exhaust stack. The radioactive liquid wastes subjected to asphalt solidification are the liquid concentrated from the evaporation treatment of low-level radioactive waste water in the waste disposal area, the sludge from chemical sedimentation treatment in the same area, and the liquid concentrated from the evaporation treatment in the development facility for the evaporation treatment of ultra-low level radioactive waste water.

101 INVESTIGATION OF THE REPROCESSING AND WASTE MANAGEMENT REQUIREMENTS OF PRESENT AND ALTERNATIVE NUCLEAR FUEL CYCLES. Rochlin, G.I. Sacramento, CA; California Energy Commission (1979). 158p. (NP--24158(Vol.1)). California Energy Commission, 1111 Howe Ave., Sacramento, CA, 95825.

This study examines various nuclear fuel cycles with regard to economics, health and safety, and proliferation implications. Emphasis is placed on the question of whether reprocessing of nuclear fuel is required in particular fuel cycles. This emphasis is prompted by California state law, which prohibits (under certain conditions) the licensing of nuclear fission thermal power plants requiring the reprocessing of fuel rods. The report concludes that there are several fuel cycles, including the light water reactor cycle, which do not require reprocessing on technical or resource/economic grounds. The final decision to reprocess in many cases depends upon the resolution of environmental, health, and safety issues.

102 INVESTIGATION OF THE REPROCESSING AND WASTE MANAGEMENT REQUIREMENTS OF PRESENT AND ALTERNATIVE NUCLEAR FUEL CYCLES. VOLUME II. APPENDICES. Rochlin, G.I. Sacramento, CA; California Energy Commission (1979). 197p. (NP--24158(Vol.2)). California Energy Commission, 1111 Howe Ave., Sacramento, CA, 95825.

The following appendices are included: spread of nuclear power, data from Nuclear Proliferation Factbook, LWR fuel cycle descriptions and flowsheets, thorium fuel cycles in LWRs, LWR-thorium and advanced LWR cycles, thorium fuel cycle in HWRs, CANDU and advanced HWR cycles, thorium fuel cycles in HTGRs, HTGR cycles, fast breeder fuel cycles, and technical safeguard features of advanced fuel cycles. (DLC)

103 MONTE CARLO CALCULATIONAL DESIGN OF AN NDA INSTRUMENT FOR THE ASSAY OF WASTE PRODUCTS FROM HIGHLY ENRICHED SPENT FUELS. Eccleston, G.W.; Schrandt, R.G.; MacDonald, J.L. (Los Alamos Scientific Lab., NM). Transactions of the American Nuclear Society, Supplement ; 33: No. 1, 36-37(1979).

104 SURVEY OF NUCLEAR FUEL REPROCESSING TECHNOLOGIES. Selvaduray, G.; Goldstein, M.K.; Anderson, R.N. (Sci Serv, Inc, Redwood City, Calif). Conservation and Recycling ; 3: No. 2, 93-134(1979).

A comprehensive review of 32 separation technologies applicable to nuclear fuel reprocessing has been conducted. These techniques have been classified and subdivided according to their principles of separation. The input fuels, principles of separation, history, stage of development, ability to extract plutonium and other pertinent information are summarized and tabulated for reference and comparison. For the most part the flow sheets and technologies involved in each separation process are described and the primary advantages and disadvantages are discussed. Engineering parameters such as decontamination factors, operating temperature, number of stages, chemistry and construction materials needed are examined. 99 refs.

108 NUCLEAR DEBATE. REPROCESSING: LA HAGUE. THE WEAKER LINK. Sciences et Avenir ; No. 27, 25, 27, 29, 31(1979). (In French).
Working conditions of the reprocessing plant are examined. The actual capacity of the plant is estimated. Tables and graphs give radiation doses of workers and comparisons are made with other reprocessing plants. Ageing of the plant, waste disposal into the sea and limits of the Purex process are also discussed.

109 NUCLEAR DEBATE. REPROCESSING: LA HAGUE. A TECHNIQUE UNDER CONTROL. Aycoberry, Claude (Compagnie Generale des Matieres Nucleaires (COGEMA), La Boursidiere, 92 - Le Plessis-Robinson (France)). Sciences et Avenir ; No. 27, 24, 26, 28, 30(1979). (In French).
After giving advantages of reprocessing, safety is examined for population, workers and operations. Storage of spent fuels, cooling, high activity fission products, containment during reprocessing, criticality are briefly described. Irradiation of personnel is very low at La Hague plant. It is possible to treat the different fuels on an industrial scale.

110 CHAPTER 4. WASTE DISPOSAL. PAPER 6. REPROCESSING AND WASTE MANAGEMENT. Abrahamson, D. (Minnesota Univ., Minneapolis (USA)). pp 105-111 of Nuclear energy and nuclear weapon proliferation. London, England; Taylor and Francis (1979).
From Stockholm International Peace Research Institute symposium; Stockholm, Sweden (12 Oct 1978).
The existence of the special nuclear materials, particularly plutonium-239, produced in reactors which were either ostensibly or actually operated for electricity production is one factor contributing to the increased risk of nuclear weapon proliferation. Were there no reprocessing of spent fuel from these reactors, plutonium-239 would be unavailable for at least the several hundred years during which the radioactivity of the fission products effectively prevents access to the spent fuel. There seem to be no compelling reasons why reprocessing is necessary for responsible management of the radioactive wastes. In several respects reprocessing complicates waste management or makes it less safe. However, neither waste management nor safeguards considerations have weighed heavily in the decisions whether or not to reprocess spent fuel. Of energy sources known to be viable options to replace the fossil fuels, only breeder reactors could, even theoretically, supply sufficient commercial energy to satisfy projections based on historical trends. The logic of the industrialized economies demands reprocessing and the breeder reactor, and rejects non-nuclear alternatives because these alternatives would not permit energy consumption rates tens of times greater than the present rate. Impediments such as possibly hazardous conditions associated with waste or plutonium management have been brushed aside by the 'experts' as hobgoblins of small minds.

111 DECOMMISSIONING ASPECTS OF A NUCLEAR CHEMICAL PLANT. Rao, M.K. (Bhabha Atomic Research Centre, Bombay (India)). pp 597-600 of Decommissioning of nuclear facilities. Vienna, Austria; IAEA (1979).
From International symposium on the decommissioning of nuclear facilities; Vienna, Austria (13 Nov 1978).
The need for decommissioning of nuclear installations at the end of their useful lives is beginning to be felt. A brief discussion on the various considerations relevant for the decommissioning effort is included in the paper. Decommissioning work could be minimized if suitable provisions were incorporated at the design stage. Experience with the partial decommissioning of the Trombay Fuel Reprocessing Plant prior to reconstruction to extend its life is touched upon.

112 PROCESS FOR SEPARATING FISSION GASES FROM IRRADIATED NUCLEAR FUEL. Bray, L.A.; Boldt, A.L. (to Exxon Nuclear Co., Inc., Bellevue, WA (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,801,744/A/. 10 Aug 1978. 18p. (In German).
Transient fission products (xenon, iodine, krypton, tritium) can be removed from irradiated nuclear fuel particles by treating them with NO_2, or a mixture of NO_2 with O_2 and NO at temperatures between 325 and 650°C. 4 examples explain the process.

113 SAFETY CONCERNING THE PARTIAL ALTERATION OF THE FUEL REPROCESSING FACILITY IN POWER REACTOR AND NUCLEAR FUEL DEVELOPMENT CORPORATION. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 3, 13-15(Jul 1978). (In Japanese).
A report of the Committee on Examination of Nuclear Fuel Safety was presented to the Atomic Energy Commission of Japan, which is concerned with the safety in the partial alteration of the fuel reprocessing facility in the Power Reactor and Nuclear Fuel Development Corporation. Its safety was confirmed. The alteration is as follows. In order to raise the storage capacity of low-level radioactive solid wastes, the second storage is installed. The building for low-level solid waste storage is a ferro-concrete structure, total floor space is 1,260 m^2, two-storied with one basement floor. The basement floor is for storage, the first floor for receiving, storage, etc., and the second floor for storage and machinery room. The capacity of the second storage is for about 9,500 200 l drums (equivalent to about four years waste discharge). The contents of the safety examination are safety of facilities such as aseismatic property and radiation protection, and effects on the surrounding environment. (Mori, K.

114 SAFETY CONCERNING THE PARTIAL ALTERATION OF THE FUEL REPROCESSING FACILITY IN POWER REACTOR AND NUCLEAR FUEL DEVELOPMENT CORPORATION. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 3, 15-16(Jul 1978). (In Japanese).
A report of the Committee on Examination of Nuclear Fuel Safety was presented to the Atomic Energy Commission of Japan, which is concerned with the safety in the partial alteration of the fuel reprocessing facility in the Power Reactor and Nuclear Fuel Development

Corporation. Its safety was confirmed. The alteration is as follows. Ultra-low level liquid waste from the high-level radioactive material research facility in Tokai Works is received in liquid-waste storage tanks of the facility removing oil from liquid wastes. Receiving standards are: up to 600 m^3 yearly; and total α + total β is not more than 1×10^{-7} Ci/m^3, and tritium is not more than 1×10^{-3} Ci/m^3. The contents of the examination are safety of the facilities and effects on the surrounding environment. (Mori, K.

115 FRENCH COMMERCIAL PLANT FOR REPROCESSING AND VITRIFICATION OF SPENT REACTOR FUEL. Koksvik, R.M. Ingenioer-nytt ; 14: No. 44, 16-17(2 Jun 1978). (In Norwegian).

The basic principles of the system for the reprocessing of spent reactor fuel on a commercial basis at the plant at Marcoule in France are described. After four months cooling the canning is stripped mechanically and the fuel dissolved in boiling nitric acid. Using TBP the uranium and plutonium are separated from the fission products. The plutonium is then separated by valency change and aqueous extraction. The uranium is transferred to a refinery and stored as hexahydrate. The plutonium is concentrated and precipitated as oxalate, dried and converted via oxide to fluoride, thence to metal. The fission products are concentrated and converted to glass form in a process dependent on the reactor type, the burnup and their chemical processing. The two processes developed, the 'pot' process and the continuous process, are described in some detail. The final disposal of the radioactive wastes is not yet decided, and temporary storage facilities have therefore been built, with a capacity for 30 years of reprocessing.

116 DEVELOPMENT OF ENRICHMENT AND REPROCESSING TECHNOLOGIES IN JAPAN. Amanuma, T. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Gensan Nenji Taikai Gijiroku (Proceedings of Japan Atomic Industrial Forum, Incorporated) ; No. 11, 191-197, 225-231(1978).

The present status of the development of fuel cycle technologies for LWR systems in Japan is reviewed. As for the uranium enrichment technology, recent development of the centrifuge method is briefly explained. The construction schedule of the pilot plant at Ningyo-Toge is also shown. The completion of the plant is expected in 1980, and 7000 machines will be in full operation. Other methods such as gaseous diffusion, chemical separation, and laser method are briefly described. Comparisons among these different methods are also made in various economical aspects. As for the reprocessing technologies, those concerned with environmental problems, nuclear non-proliferation, and safeguard measures are explained. Recovery of krypton and xenon, method of co-processing, and co-operative research and development with IAEA are the main topics here. Finally, the technological development in the field of high-level radioactive waste disposal is explained. The construction schedule of an experimental facility (CPF), development of solidification techniques, and the methods of final disposal are the main topics treated here.

117 STATUS OF NUCLEAR FUEL REPROCESSING, SPENT FUEL STORAGE, AND HIGH-LEVEL WASTE DISPOSAL. NUCLEAR FUEL CYCLE COMMITTEE, CALIFORNIA ENERGY RESOURCES CONSERVATION AND DEVELOPMENT COMMISSION. DRAFT REPORT. Sacramento, CA: California Energy Commission (1978). 290p. (NP--24060). California Energy Commission, Sacramento, CA.

An analysis of the current status of technologies and issues in the major portions of the back-end of the nuclear fuel cycle is presented. The discussion on nuclear fuel reprocessing covers the reprocessing requirement, reprocessing technology assessment, technology for operation of reprocessing plants, and approval of reprocessing plants. The chapter devoted to spent fuel storage covers the spent fuel storge problem, the legislative response, options for maintaining full core discharge capacity, prospective availability of alterntive storage options, and the outlook for California. The existence of a demonstrated, developed high-level waste disposal technology is reviewed. Recommendations for Federal programs on high-level waste disposal are made.

118 QUALITY ASSURANCE PROGRAM REQUIREMENTS FOR POST REACTOR NUCLEAR FUEL CYCLE FACILITIES. Hinsdale, IL: American Nuclear Society (1978). vp.

This standard sets forth requirements for the establishment and execution of quality assurance programs for the design, procurement, construction, operation, and decommissioning of post reactor nuclear fuel cycle facilities. This standard shall apply specifically to spent fuel and waste storage installations, fuel reprocessing plants, plutonium processing and plutonium fuel fabrication plants, and other post reactor related facilities.

119 EXTRACTION PROCESS OF FISSION PRODUCTS FROM SPENT NUCLEAR FUEL ELEMENTS. Anav, M.; Chesne, A.; Leseur, A.; Miquel, P.; Pascard, R. (to CEA, 75 - Paris (France)). French Patent 2,405,541/E/. 10 Oct 1977. 8p. (In French).

Process for extracting fission products contained in irradiated nuclear fuel elements consisting in bringing these elements into contact with water after having treated them mechanically to remove their cladding and/or cut them up, then separate these treated elements from the aqueous solution and recuperating at least one of the fission products concerned from this by concentrating it by distillation so as to obtain a concentrate containing these fission products and then processing this concentrate in order to ensure a long term storage of these fission products.

120 METHOD FOR MEASURING TRITIUM ACTIVITY FROM RADIOACTIVE SOLUTION. Ali, S.A.H.; Leifeld, W. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,612,893/A/. 6 Oct 1977. 12p. (In German).

It is proposed to dilute the solution to be measured with a strongly alkaline solution and then to let it come into an equilibrium state with a substance absorbing moisture (e.g. to keep it in a small flash that has got on the inner side of the screw cap a pre-ground molded body from a molecular sieve). Afterwards the substance absorbing moisture is removed and, in another room, finely dispersed in clear water, so that the liquid being formed and containing titrated water can be measured in conventional manner.

121 IODINE 129 TRAPPING IN IRRADIATED FUEL REPROCESSING PLANTS. Jacquemin, M. ;CEA

Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 ;France). Dept. de Protection);
Schuettelkopf, H. ;Kernforschungszentrum Karlsruhe G.m.b.H. ;Germany, F.R.)). pp 84-87 of Iode-129. Compte rendu d'une reunion de specialistes de l'AEN. Paris, 13-16 juin 1977. Paris, France; OECD (1977). (In French)
From NEA specialist meeting on Iodine-129; Paris, France (13 Jun 1977).
Production of iodine 129 is briefly described. Decontamination factors (D.F.) required in the USA, Federal Republic of Germany and France are given. Trapping of iodine 129 is examined. In a first method it is realized by scrubbing with a solution of soda or potash, or diluted nitric acid plus mercuric nitrate or hyperazeotropic nitric acid (DF 10 to 100), in a second method iodine is adsorbed on solids: silver exchanged zeolites or silicates impregnated with silver nitrate (DF 1000 to 10 000). For a high D.F. and to save silver the best is to use the first method and then the second one. Storage and disposal are also examined and costs are given for the different trapping processes.

122 IODINE RETENTION IN LA HAGUE REPROCESSING PLANT. Jacquemin, M. ;CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 ;France). Dept. de Protection). pp 88-89 of Iode-129. Compte rendu d'une reunion de specialistes de l'AEN. Paris, 13-16 juin 1977. Paris, France; OECD (1977). (In French)
From NEA specialist meeting on Iodine-129; Paris, France (13 Jun 1977).
Iodine is trapped by scrubbing with a soda solution, decontamination factor (D.F.) is 15, modifications are in progress to get a DF of 50. Each year 800t of spent fuel are reprocessed and 800 m^3 of soda solution are needed, iodine is extracted as copper iodide and stored in concrete. To avoid treatment of great volumes another process is studied in a pilot plant: iodine is concentrated by distillation and precipitated as metallic iodide.

Transport and Storage

123 (AECL--6331) TRANSPORTATION OF NUCLEAR FUEL. Prowse, D.R. (Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). Jan 1979. 10p. Dep. NTIS (US Sales Only), PC A02/MF A01.
Shipment of used fuel from nuclear reactors to a central fuel management facility is discussed with particular emphasis on the assessment of the risk to the public due to these shipments. The methods of transporting used fuel in large shipping containers is reviewed. In terms of an accident scenario, it is demonstrated that the primary risk of transport of used fuel is due to injury and death in common road accidents. The radiological nature of the used fuel cargo is, for all practical purposes, an insignificant factor in the total risk to the public.

124 (AECL--6356) PROPOSAL TO STUDY THE STABILITY OF ZIRCALOY-CLAD UO_2 FUEL ELEMENTS DURING LONG-TERM STORAGE. Bain, A.S.; Hardy, D.G.; Tayal, M. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Sep 1978. 13p. Dep. NTIS (US Sales Only), PC A02/MF A01.
Irradiated CANDU fuel bundles have been successfully stored under water for up to 16 years. Laboratory corrosion data give confidence that such storage for much longer times will pose no problem. This report outlines a proposed experimental program to study the stability of irradiated Zircaloy-clad UO_2 fuel elements during long-term storage in water. We intend to perform, at five-year intervals during the next twenty to thirty years, non-destructuve (e.g. neutron radiography) and destructive (e.g. metallographic examination) tests on irradiated fuel elements currently stored in the bays of the NRX and NRU reactors, in dry storage in Building 375 at Chalk River Nuclear Laboratories and in the storage bays at Pickering Nuclear Generating Station in order to monitor the continued ability of the clad to contain radioactive fission products. These tests are designed to study the effects of the severity of a fuel element's internal environment (controlled primarily by element power and burnup) and the rate of the element's external corrosion (both aqueous and galvanic) on clad stability. The results obtained from such periodic checks on the Zircaloy sheaths are expected to confirm that discharged CANDU fuel can be safely stored in an interim storage facility for at least 50 years before it is transferred to an underground repository, or to a reprocessing plant.

125 (AECL--6577) LONG-TERM STORAGE OF FUEL IN WATER. Hunt, C.E.L.; Wood, J.C.; Bain, A.S. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Jun 1979. 18p. (CONF-7906142--2). NTIS (US Sales Only), PC A02/MF A01.
From 19. Canadian Nuclear Association annual international conference; Toronto, Canada (10 Jun 1979).
Two intact and two defective elements stored for 11 years and two intact elements stored for 16 years were metallographically examined in 1978. The experimental bundle stored for 11 years showed no differences between the original examination and the present one. The NPD bundle, which had been stored for 16 years, showed no differences from other NPD bundles which had been examined shortly after discharge from the reactor. In parallel, fission product induced stress corrosion cracking of Zircaloy-4 below 373 K is being studied. Although cracks can grow by iodine stress corrosion, the depth of starter crack and amount of applied stress required are so large that stress corrosion cracking of stored fuel is very unlikely.

126 (AGNS--35900-1-1-49) STUDIES AND RESEARCH CONCERNING BNFP: ADVANCED CASK HANDLING STUDIES. McCreery, P.N. (Allied-General Nuclear Services, Barnwell, SC (USA)). Oct 1979. Contract ET-78-C-09-1040. 75p. Dep. NTIS, PC A04/MF A01.
Cask turnaround times at loading and unloading sites can be improved by providing better working conditions, improved safety, reduced decontamination time, training, and where practical to do so, improved facility design. This report consists of treatments of several of these topics with the common goal of improving operational efficiency.

127 (AGNS--35900-1.2-45) STUDIES AND RESEARCH CONCERNING BNFP: SPENT FUEL DISASSEMBLY AND CANNING PROGRAMS AT THE BARNWELL NUCLEAR FUEL PLANT (BNFP). Townes, G.A.; Rogell, M.L.; Anderson, R.T. (Allied-General Nuclear Services, Barnwell, SC (USA)). Oct 1979. Contract ET-78-C-09-1040. 82p. Dep. NTIS, PC A05/MF A01.
Methods of disassembling and canning spent fuel to allow more efficient storage are being investigated at the BNFP. Studies and development programs are aimed at dry

disassembly of fuel to allow storage and shipment of fuel pins rather than complete fuel assemblies. Results indicate that doubling existing storage capacity or tripling the carrying capacity of existing transportation equipment is achievable. Disassembly could be performed in the BNFP hot cells at rates of about 12 to 15 assemblies per day.

128 (AGNS--35900-1.3-47) STUDIES AND RESEARCH CONCERNING BNFP. SPENT FUEL DISASSEMBLY: INCREASING HOT-CELL STORAGE CAPACITY AT THE BARNWELL NUCLEAR FUEL PLANT. Anderson, R.T. (Allied-General Nuclear Services, Barnwell, SC (USA)). Oct 1979. Contract ET-78-C-09-1040. 82p. Dep. NTIS, PC A05/MF A01.

This report presents the results of work performed at AGNS in 1979 related to production-rate fuel disassembly in the existing hot cell spaces of the BNFP. The primary advantage of the developed technique is realized at a reprocessing plant facility where suitable hot cells and connecting storage pools are available. The existing spent fuel pools are also candidates for away-from-reactor (AFR) storage space. Storage estimates based on utilization of the BNFP indicate that a major expansion from 1600 MTU up to 3000 MTU is possible. The report presents data on the results of initial process development and prototype equipment testing. Assessments were made of operational safety, licensing, and economic factors. These studies indicate that the techniques are performable and have economic merit when there is a requirement for a large increment of new storage capacity. A development program plan is presented. This plan delineates the future work required to bring the process to a point where implementation is possible.

129 (AGNS--35900-1.4-59) STUDIES AND RESEARCH CONCERNING BNFP. NUCLEAR SPENT FUEL TRANSPORTATION STUDIES. Anderson, R.T.; Maier, J.B. (Allied-General Nuclear Services, Barnwell, SC (USA)). Nov 1979. Contract ET-78-C-09-1040. 63p. Dep. NTIS, PC A04/MF A01.

Currently, there are a number of institutional problems associated with the shipment of spent fuel assemblies from commercial nuclear power plants: new and conflicting regulations, embargoing of certain routes, imposition of transport safeguards, physical security in-transit, and a lack of definition of when and where the fuel will be moved. This report presents a summary of these types and kinds of problems. It represents the results of evaluations performed relative to fuel receipt at the Barnwell Nuclear Fuel Plant. Case studies were made which address existing reactor sites with near-term spent fuel transportation needs. Shipment by either highway, rail, water, or intermodal water-rail was considered. The report identifies the impact of new regulations and uncertainty caused by indeterminate regulatory policy and lack of action on spent fuel acceptance and storage. This stagnant situation has made it impossible for industry to determine realistic transportation scenarios for business planning and financial risk analysis. A current lack of private investment in nuclear transportation equipment is expected to further prolong the problems associated with nuclear spent fuel and waste disposition. These problems are expected to intensify in the 1980's and in certain cases will make continuing reactor plant operation difficult or impossible.

130 (AGNS--35900-1.5-37) STUDIES AND RESEARCH CONCERNING BNFP: ASSISTANCE TO DEPARTMENT OF ENERGY. FINAL REPORT. Darr, D.G.; Highberger, P.F. (Allied-General Nuclear Services, Barnwell, SC (USA)). Sep 1979. Contract EY-76-C-09-0001. 21p. Dep. NTIS, PC A02/MF A01.

During FY 1979, the Savannah River Operations Office of the Department of Energy requested Allied-General Nuclear Services undertake the following special studies: (1) early receipt and storage of foreign spent fuel; (2) safety and environmental impact of interim AFR storage in the BNFP-FRSS; and (3) status of BNFP licensing. Each of the above studies was completed and a report issued during FY 1979.

131 (AGNS--35900-CONF-7) COOLDOWN TESTING OF NUCLEAR FUEL CASKS. Anderson, R.T. (Allied-General Nuclear Services, Barnwell, SC (USA)). Aug 1979. Contract ET-78-C-09-1040. 27p. (CONF-790822--12). Dep. NTIS, PC A03/MF A01.

From 87. AICHE national meeting; Boston, MA, USA (19 Aug 1979).

The results of development related to the thermal interaction between dry spent fuel casks and nuclear fuel under operating situations are presented. The tests were performed at the Barnwell Nuclear Fuel Plant using full-sized truck and rail casks and electrically heated dummy fuel assemblies.

132 (AGNS--35900-CONF-41) SPENT FUEL DISASSEMBLY AND CANNING PROGRAMS AT THE BARNWELL NUCLEAR FUEL PLANT (BNFP). Townes, G.A. (Allied-General Nuclear Services, Barnwell, SC (USA)). Oct 1979. Contract ET-78-C-09-1040. 16p. (CONF-791103--40). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

Methods of disassembling and canning spent fuel to allow more efficient storage are being investigated at the BNFP. Studies and development programs are aimed at dry disassembly of fuel to allow storage and shipment of fuel pins rather than full fuel assemblies. Results indicate that doubling existing storage capacity or tripling the carrying capacity of existing transportation equipment is achievable. Disassembly could be performed in the BNFP hot cells at rates of about 12 to 15 assemblies per day.

133 (AGNS--35900-CONF-63) SPENT-FUEL DISASSEMBLY AND CANNING PROGRAMS AT THE BARNWELL NUCLEAR FUEL PLANT (BNFP). Townes, G.A. (Allied-General Nuclear Services, Barnwell, SC (USA)). Feb 1980. Contract AC09-78ET35900. 6p. (CONF-800901--2). NTIS, PC A02/MF A01.

From Symposium on intermediate range atmospheric transport processes and technology assessment; Gatlinburg, TN, USA (29 Sep 1980).

Doubling pool storage and tripling truck cask shipping capability appear feasible based on preliminary development work performed at the BNFP. This would be accomplished by disassembly of the fuel assembly and canning of the fuel pins. The dry, remote disassembly and canning in the headend cells offer adequate rates, easily controlled operator exposure, and visual inspection of the fuel pins and operations through shielded windows.

134 (AGNS--47921-3026-TPR-1) DEMONSTRATE FUEL DISASSEMBLY/ENCAPSULATION. TECHNICAL PROGRESS REPORT, APRIL 1980-JUNE 1980.

(Allied-General Nuclear Services, Barnwell, SC (USA)). 25 Jul 1980. Contract AC09-79ET47921. 9p. NTIS, PC A02/MF A01.

Work on this project is focused on demonstrating disassembly and encapsulation of nuclear fuels as a means to increase spent fuel storage. The effort commenced on April 17, 1980, and is progressing satisfactorily. The Equipment/Procedure Preparation and Process Assessment Studies sub-tasks are currently underway with the Equipment Demonstration sub-task scheduled to commence February 1, 1981. The equipment design effort associated with the former sub-task and the technical studies and investigations associated with the latter sub-task continue to verify the feasibility of this concept to enhance the use of fuel storage resources.

135 (AGNS--47921-TPR-5) AFR SPENT FUEL STORAGE PROGRAM. TECHNICAL PROGRESS REPORT, JULY 1980-SEPTEMBER 1980. (Allied-General Nuclear Services, Barnwell, SC (USA)). 24 Oct 1980. Contract AC09-79ET47921. 17p. NTIS, PC A02/MF A01.

Work on this project is focused on developing design and licensing information for the model facility. The subcontracts for soils and structural design and the security system design have been completed. The rack design subcontract is progressng satisfactorily. Design of facility modifications have been completed and draft reports are underway. Licensing documentation is approximately 65% complete and progressing at a satisfactory pace to meet scheduled projections.

136 (BAW--1484-1) CRITICAL EXPERIMENTS SUPPORTING CLOSE PROXIMITY WATER STORAGE OF POWER REACTOR FUEL. TECHNICAL PROGRESS REPORT, OCTOBER 1, 1977-DECEMBER 31, 1977. Baldwin, M.N.; Hoovler, G.S. (Babcock and Wilcox Co., Lynchburg, VA (USA)). Mar 1978. Contract EY-77-C-09-1001. 17p. Dep. NTIS, PC A02/MF A01.

Experiments are being conducted on critical configurations of clusters of fuel rods, mocking up LWR-type fuel elements in close proximity water storage. Spacings between fuel clusters and the intervening material are being varied to provide a variety of benchmark loadings. (DLC)

137 (BAW--1484-1) CRITICAL EXPERIMENTS SUPPORTING CLOSE PROXIMITY WATER STORAGE OF POWER REACTOR FUEL. TECHNICAL PROGRESS REPORT, OCTOBER 1-DECEMBER 31, 1978. Baldwin, M.N.; Hoovler, G.S. (Babcock and Wilcox Co., Lynchburg, VA (USA)). Mar 1978. Contract EY-77-C-09-1001. 20p. Dep. NTIS, PC A02/MF A01.

Experimental measurements are being conducted on critical configurations of clusters of fuel rods mocking up LWR-type fuel elements in close proximity water storage. The square clusters with 14 rods on each side are arranged in 3 x 3 arrays. Both the spacing between the fuel clusters and the intervening material are being varied to provide a variety of benchmark loadings. The KENO IV code and the PDQ07 code (in selected cases) will be used to analyze each benchmark loading to determine the calculated k/sub eff/ of each configuration. Experimental results obtained during the fourth calendar quarter of 1977 are presented.

138 (BAW--1484-3) CRITICAL EXPERIMENTS SUPPORTING CLOSE PROXIMITY WATER STORAGE OF POWER REACTOR FUEL. TECHNICAL PROGRESS REPORT, APRIL 1, 1978-JUNE 30, 1978. Baldwin, M.N.; Hoovler, G.S.; Eng, R.L.; Welfare, F.G. (Babcock and Wilcox Co., Lynchburg, VA (USA)). Sep 1978. Contract EY-77-C-09-1001. 15p. Dep. NTIS, PC A02/MF A01.

Experimental measurements are being taken on critical configurations of clusters of fuel rods mocking up LWR-type fuel elements in close proximity water storage. The results will serve to benchmark the computer codes used in designing nuclear power reactor fuel storage racks.

139 (BAW--1484-3) CRITICAL EXPERIMENTS SUPPORTING CLOSE PROXIMITY WATER STORAGE OF POWER REACTOR FUEL. Baldwin, M.N.; Hoovler, G.S.; Eng, R.L.; Welfare, F.G. (Babcock and Wilcox Co., Lynchburg, VA (USA)). Sep 1978. Contract EY-77-C-09-1001. 14p. Dep. NTIS, PC A02/MF A01.

Experimental measurements are being taken on critical configurations of clusters of fuel rods mocking up LWR-type fuel elements in close proximity water storage. The results will serve to benchmark the computer codes used in designing nuclear power reactor fuel storage racks.

140 (BAW--1484-4) CRITICAL EXPERIMENTS SUPPORTING CLOSE PROXIMITY WATER STORAGE OF POWER REACTOR FUEL. TECHNICAL PROGRESS REPORT, JULY 1, 1978-SEPTEMBER 30, 1978. Baldwin, M.N.; Hoovler, G.S.; Eng, R.L.; Welfare, F.G. (Babcock and Wilcox Co., Lynchburg, VA (USA)). Nov 1978. Contract EY-77-C-09-1001. 89p. Dep. NTIS, PC A05/MF A01.

Experimental measurements are being taken on critical configurations of clusters of fuel rods mocking up LWR-type fuel elements in close proximity water storage. The results will serve to benchmark the computer codes used in designing nuclear power reactor fuel storage racks. KENO calculations of Cores I to VI are within two standard deviations of the measured k/sub eff/ values.

141 (BAW--1484-5) CRITICAL EXPERIMENTS SUPPORTING CLOSE PROXIMITY WATER STORAGE OF POWER REACTOR FUEL. TECHNICAL PROGRESS REPORT, OCTOBER 1, 1978-DECEMBER 31, 1978. Baldwin, M.N.; Hoovler, G.S.; Eng, R.L.; Welfare, F.G. (Babcock and Wilcox Co., Lynchburg, VA (USA)). Mar 1979. Contract EY-77-C-09-1001. 39p. Dep. NTIS, PC A03/MF A01.

Experimental measurements are being taken on critical configurations of clusters of fuel rods mocking up LWR-type fuel elements in close proximity water storage. The results will serve to benchmark the computer codes used in designing nuclear power reactor fuel storage racks. KENO calculations of k/sub eff/ are in close agreement with experimental values for nine cores, with differences being 0.0059 or about one standard deviation.

142 (BAW--1484-5) CRITICAL EXPERIMENTS SUPPORTING CLOSE PROXIMITY WATER STORAGE OF POWER REACTOR FUEL. TECHNICAL PROGRESS REPORT, OCTOBER 1-DECEMBER 31, 1978. Baldwin, M.N.; Hoovler, G.S.; Eng, R.L.; Welfare, F.G. (Babcock and Wilcox Co., Lynchburg, VA (USA)). Mar 1979. Contract EY-77-C-09-1001. 40p. Dep. NTIS, PC A03/MF A01.

Experimental measurements are being taken on critical configurations of clusters of fuel rods mocking up LWR-type fuel elements in close proximity water storage. The results will serve to benchmark the computer codes used in designing nuclear power reactor fuel storage

racks.

143 (BAW--1484-6) CRITICAL EXPERIMENTS SUPPORTING CLOSE PROXIMITY WATER STORAGE OF POWER REACTOR FUEL. TECHNICAL PROGRESS REPORT, JANUARY 1-MARCH 31, 1979. Baldwin, M.N.; Hoovler, G.S. (Babcock and Wilcox Co., Lynchburg, VA (USA)). May 1979. Contract EY-77-C-09-1001. 14p. Dep. NTIS, PC A02/MF A01.

Experimental measurements are being taken on critical configurations of fuel rod clusters mocking up LWR-type fuel elements in close proximity water storage. The results will serve to benchmark the computer codes used in designing nuclear power reactor fuel storage racks. Measurements on Cores XIII through XXI are reported in this document.

144 (BAW--1484-7) CRITICAL EXPERIMENTS SUPPORTING CLOSE PROXIMITY WATER STORAGE OF POWER REACTOR FUEL. TECHNICAL PROGRESS REPORT. Baldwin, M.N.; Hoovler, G.S.; Eng, R.L.; Welfare, F.G. (Babcock and Wilcox Co., Lynchburg, VA (USA)). Jul 1979. Contract EY-77-C-09-1001. 103p. Dep. NTIS, PC A05/MF A01.

Close-packed storage of LWR fuel assemblies is needed in order to expand the capacity of existing underwater storage pools. This increased capacity is required to accommodate the large volume of spent fuel produced by prolonged onsite storage. To provide benchmark criticality data in support of this effort, 20 critical assemblies were constructed that simulated a variety of close-packed LWR fuel storage configurations. Criticality calculations using the Monte Carlo KENO-IV code were performed to provide an analytical basis for comparison with the experimental data. Each critical configuration is documented in sufficient detail to permit the use of these data in validating calculational methods according to ANSI Standard N16.9-1975.

145 (CAEC--012) ASSESSMENT OF THE LONG-TERM STORAGE OF ZIRCALOY FUEL RODS IN WATER. Munir, Z.A. (California Univ., Davis (USA). Dept. of Mechanical Engineering). 15 Oct 1977. 28p. NTIS, PC A02/MF A01.

This report is a preliminary assessment of corrosion mechanisms which might affect the integrity of zircaloy-clad fuel rods during long periods of underwater storage. Potential corrosion mechanisms are discussed, and those which merit further investigation are identified. These are the principal recommendations. Current methods of degradation assessment of spent fuel are inadequate; other methods must also be used. The general corrosion of zircaloy under water storage is believed to be too low to justify concern over periods of 10 to 20 years. Additional experimental work is needed to establish the roles of the following variables on zircaloy corrosion: degree of residual stress; fission product uptake and the degree of prior embrittlement; galvanic coupling with other metals of the fuel rod storage assembly; and the nature and concentrations of surface layer contaminants accumulated during reactor residence.

146 (CONF-780506--(Vol.1), pp 36-42) HZ-75T SPENT FUEL SHIPPING CASK. Onodera, A.; Yamashita, M.; Yamada, T. (Hitachi Shipbuilding and Engineering Co., Ltd., Osaka, Japan). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

The HZ-75T is the first large scale spent fuel shipping cask licensed and fabricated in Japan to transport the spent fuel of 2nd generation nuclear power reactors. It was originally designed by NL Industries, Inc. and Battelle Columbus Laboratories in 1973 to the IAEA Regulations for the Safe Transport of Radioactive Materials 1967 and 10 CFR Part 71 Packaging of Radioactive Material for Transport and Transportation of Radfoactive Material. The design was partially modified in the course of design and licensing to meet the revised 1973 Edition of the IAEA Regulations and the Japanese Safety Criteria for the Transport of Radioactive Materials, 1975. The design capacity of the HZ-75T is 7 PWR or 17 PWR fuel assemblies, of which average burn up is 33,000 MWD/MTU or 27,500 MWD/MTU. Special consideration was made for the sea transport, as all nuclear power plants in Japan are located on the coast and spent fuels are most economically transported by sea going vessel. For this purpose the HZ-75T was designed to be cooled by air for land transport and water or air for sea transport. Total weight of the loaded cask, 80 tons, was primarily restricted by the crane capacity in the spent fuel storage building. Other features associated with the HZ-75T designs are (1) stainless steel clad copper fin for the dissipaton of decay heat of 84 kW, (2) impact limiters of multilayer circular metal tubes, and (3) use of stainless steel for overall surface of the cask for easy decontamination and maintenance.

147 (CONF-780506--(Vol.1), pp 59-64) SPENT FUEL TRANSPORTATION: A REQUISITE FOR ANY ALTERNATIVE IN THE BACK-END OF THE NUCLEAR FUEL CYCLE. Nordahl, J.H.; O'Malley, L.C. (Exxon Nuclear Company, Inc., Bellevue, WA). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

All of the technologies which are currently being examined for the back-end of the nuclear fuel cycles have at least one thing in common - spent fuel transportation. The characteristics of the spent fuel and the transportation requirements can vary significantly between fuel cycle alternatives. The choice of packaging designs for spent fuel transportation may also be highly dependent on the fuel management alternative which is generally adopted. Where reprocessing is deferred and the spent fuel is placed in interim storage, the incentive is to allow the spent fuel to cool in basin storage for several years. Two of the spent fuel parameters which most directly impact packaging designs, the gamma and thermal source strengths, are significantly different depending on the fuel management scenario adopted. In the design of an efficient spent fuel packaging system, these parameters will affect design tradeoffs in the areas of payload, weight, shielding material and heat dissipation systems. Exxon Nuclear has pursued the design of spent fuel transporters to be optimized for serving a maturing LWR industry, with a major objective being to transport short-cooled spent fuel from reactors to a reprocessing plant. Design work conducted with the Boeing Engineering and Construction Company has produced truck and rail transporter design concepts which meet Exxon Nuclear's design objectives. However, in the evaluation of reprocessing alternatives and delays, these transporter design concepts developed to serve a large reprocessing plant may not prove to be optimum for near-term use for transport of longer aged fuel. The discharge of spent fuel requiring transportation has exceeded the capacity of existing transportation equipment.

148 (CONF-780506--(Vol.1), pp 127-134)
LICENSING EXPERIENCES, RISK ASSESSMENT, DEMONSTRATION TEST ON NUCLEAR FUEL PACKAGES AND DESIGN CRITERIA FOR SEA GOING VESSEL CARRYING SPENT FUEL IN JAPAN. Aoki, S. (Tokyo Inst. of Tech., Japan); Ikeda, K. 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

In Japan spent fuels from nuclear power plants shall be shipped to reprocessing plants by sea-going vessels. Atomic Energy Committee has initiated a board of experts to implement the assessment of environmental safety for sea transport. As a part of the assessment a study has been conducted by Central Research Institute of Electric Power Industry under sponsorship of Nuclear Safety Bureau, which is intended to guarantee the safety of sea transport. Nuclear Safety Bureau also has a program to carry out a long term demonstration test on spent fuel package using full scale package models. The test consists of drop, heat transfer, fire, collapse under high external pressure, immersion, shielding and subcritical test. The purpose of this test is to obtain the public acceptance and also to verify the adequacy of the safety analysis for nuclear fuel packages. In order to secure the safety of sea transport, the Ministry of Transportation has provided for the design criteria for sea-going vessel in the case of full load shipping, which aims to make minimum the probability of sinking at collision, grounding and other unforeseen accidents on the sea and also to retain the radiation exposure to crews as low as possible. The design criteria consists of the following items: (1) structural strength of vessel, (2) collision protective structure, (3) arrangement of holds, (4) stability after damage, (5) grounding protective structure, (6) cooling system, (7) tie-down equipment, (8) radiation inspection apparatus, (9) decontamination facilities, (10) emergency water flooding equipment for ship fire, (11) emergency electric sources, etc. Based on the design criteria a sea-going vessel names HINOURA-MARU has been reconstructed to transport spent fuel packages from nuclear power stations to the reprocessing plant.

149 (CONF-780506--(Vol.1), pp 143-149)
SAFETY EVALUATION ON TRANSPORT OF FUEL AT SEA AND TEST PROGRAM ON FULL SCALE CASK IN JAPAN. Nagukara, T.; Maki, Y.; Tanaka, N. (Central Research Inst. of Electric Power Industry, Chiba, Japan). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

With the operation of the reprocessing factory in Japan, the spent fuel will be transported by a ship on the domestic sea area of Japan. This paper discusses the probability of the sinking of the ship with the cask, the release of radionuclides from the sunken cask and the resultant radiological impact on individuals and populations at risk as follows: 1. Based on recent statistics about the number of ships in service and shipping casualties around Japan, the probability of the sinking of a ship navigated along the scheduled routes is estimated; 2. The radioactive material released into the sea water is determined by survey of types of radionuclides and quantities of radioactive material transported, and by analyses of the effects of hydrostatic pressure induced deformative and corrosive behavior of sunken casks as well as fuel rods; 3. Ocean models of diffusion of radioactive material are considered for the selected area on scheduled shipping routes and the concentration of radioactivity in sea is determined. Then, the population and individual doses are estimated from consumption of sea foods and effect of the exterior radiation from contaminated sea shore is also considered.

150 (CONF-780506--(Vol.1), pp 163-169) US PERSPECTIVE OF TRANSPORTING RADIOACTIVE MATERIALS BY SEA. Chitwood, R.B. (Dept. of Energy, Washington, DC). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

The reason for the US interest in transportation of radioactive materials by sea is discussed. The national and international institutional considerations related to this subject are covered. Some economic aspects in transporting these materials, particularly spent fuels, by sea are also presented. (DC)

RAILROAD PERSPECTIVE ON TRANSPORTATION OF SPENT FUEL AND HIGH LEVEL WASTE AND RECENT ICC DECISIONS. Paschall, J.R. (Chessie System Railroads, Cleveland, OH). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

This paper attempts to summarize some railroad viewpoints on issues concerning transportation of spent fuel and high-level waste and to outline Interstate Commerce Commission decisions arising over differing opinions about the manner of such transportation. Although the railroad position includes a number of legal arguments, it also involves operating expertise and a number of well-based questions concerning the safety of casks under actual operating conditions in regular trains. The commonly-used estimates of accident frequency and severity in regular trains are severe underestimates based on a mistake in the annual number of railroad car-miles, inadequacies in and misunderstanding of accident reporting, and invalid assumptions, especially concerning fires, which some actual data suggest are far more frequent than assumed. Thus, railroads estimate casks could be involved in at least 12 accidents involving severe fires by 1990. A number of unanswered questions about casks and perceived inadequacies in testing lead to a conservative railroad position. These include the possibility of escape routes of materials other than by breach such as weld and pressure relief valve failures and direct radiation hazards through loss of shielding. These doubts are fostered through experience with accidents more severe than those used in testing or certification as well as these questions. Also, there is doubt concerning the integrity of fuel rod cladding (used as a second level of containment) in credible accident situations. Moreover, the damage estimates of $1,000 per man rem have been shown to have no relationship to damages in a transportation accident.Added safety is expected in special trains for at least 17 reasons involving speed, transit time, routing, train consist, crew alertness, reduced slack and other reduced hazards and accident opportunities.

GOVERNMENT'S DUTY, AS SHIPPER AND REGULATOR, TO KEEP SPENT FUEL AND WASTE ON TRACK: THE ICC CASES. DiStefano, J. (Dept. of Energy, Washington, DC). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las

Vegas, NV, USA (7 May 1978).

The transportation of radioactive materials, particularly spent nuclear fuel and radioactive waste, is at once the most studied and the most misunderstood category of hazardous materials transportation. During recent years, agencies of the United States Government have expended substantial effort and money not only studying many aspects of nuclear materials transportation but also litigating the safety and economics of such transportation. The movement of such materials has been attacked, not only by some state and local organizations, but also, by senior members of the transportation industry - the nation's railroads. This paper will discuss the government's role in the litigation which has developed between the railroad industry on one side and the government and the nuclear industry on the other. For more than two years, the Department of Energy has joined with representatives of other government agencies and the nuclear industry in an effort to preserve the viability of rail transportation of radioactive materials under reasonable common carrier tariffs. The southern and western railroads had restricted such transportation by requiring spent fuel and radioactive waste to move only in special trains. The eastern railroads and some midwestern roads had refused any common carriage for these commodities. Because tariff rates or the absence of such rates sparked this controversy, the United States Interstate Commerce Commission became the tribunal to hear these cases in the first instance.The issues heard included the adequacy of current safety requirements including packaging, testing and insurance. By the end of 1977, the ICC had issued initial decisions striking down the restrictive tariffs and ordering publication of tariffs where none existed. The litigation, however, will not be finally concluded for some time.

153 (CONF-780506--(Vol.1), pp 186-192)
PRIVATE SHIPPERS' EFFORTS TO TRANSPORT SPENT NUCLEAR FUEL AND WASTE BY RAIL: THE INTERSTATE COMMERCE COMMISSION CASES. Brown, O.F. II. (LeBoeuf, Lamb, Leiby and MacRae, Washington, DC). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

While the nuclear industry is beset on many sides by opposition and uncertainty, notable success has been achieved to date by fighting railroads that would impose onerous restrictions on the transportation of nuclear materials on their own battleground. Regardless of how commercial spent nuclear fuel is ultimately handled, it must eventually be shipped from reactor sites. The most efficient method for doing this is generally by railroad. The railroads of the Nation have contended either that they are not common carriers for the transportation of radioactive materials, or if common carriers, that the carriage must be by the use of special trains and special operating procedures at great additional expense. The rationale for this railroad position has been principally one of concern with regard to the hazards presented and the adequacy of safety regulations and insurance-indemnity coverage. The nuclear industry, realizing that, if the railroads prevailed, the added cost per year by the mid-1980s could be about $600 million and that extensive safety precautions had been provided, challenged the railroads' positions before the Interstate Commerce Commission. This paper will describe the position of the nuclear industry in opposing unnecessary restrictions sought to be imposed by the railroads, including the uncertainties presented by the lack of published tariffs, the risks of carriage with and without added requirements, the insurance-indemnity coverage available, and the need for railroad transportation. As of this time, the Interstate Commerce Commission has concurred with the position of the nuclear shippers and has found the railroads' positions unreasonable and in violation of applicable laws. This legal battle, however, will continue until finally concluded by the ICC or by the courts if appeals are taken.

154 (CONF-780506--(Vol.1), pp 193-198)
PLACING THE SPECIAL TRAINS ISSUE IN PERSPECTIVE. Rhoads, R.E. (Battelle Pacific Northwest Labs., Richland, WA); DeSteese, J.G.; Loscutoff, W.V.; Chais, M. 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

The Association of American Railroads has proposed changes in the way railroads handle shipments of radioactive materials. These changes are embodied in a set of recommended operating practices that would require shipments of spent fuel and radioactive waste to be moved only in special train service. The proposed operating practices include a 35 mph maximum speed restriction, a passing restriction and a no-other freight restriction. Shippers of radioactive materials oppose the imposition of these operating practices. The special train issue is currently being argued in hearings before the Interstate Commerce Commission. The history and current status of these hearings are reviewed. Pacific Northwest Laboratories has undertaken a study to provide perspective on the safety and economic factors related to the use of special trains for shipping spent fuel. The results of this study for the amount of spent fuel anticipated to be shipped in 1986 are reviewed. The safety analysis determines the frequencies and severities of accidents for conventional freight trains and compares these to extrapolated frequencies and severities of accidents for conventional freight trains subject to the special train operating restrictions. Results of the study show that the adoption of special trains and attendant operating restrictions has limited potential for improving safety during shipment. The economic analysis compares the cost of spent fuel shipments made by special train and by conventional freight train service.Results of the economics phase of the study show that the use of special trains will most likely increase the cost of shipments by about 50%, although under certain circumstances shipping costs for spent fuel by special trains may be up to 20% lower than by conventional train service. Possible methods to resolve the special train issue are explored.

155 (CONF-780506--(Vol.1), pp 206-213)
COMPATIBILITY OF RADIOACTIVE MATERIALS TRANSPORTATION WITH RAILROAD OPERATIONS: TWO VIEWS. Eldridge, C.C.; Van Gorp, P.H. (Bechtel Power Corp., San Francisco, CA). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

The nuclear industry has a growing need for safe, economical and efficient transport of nuclear spent fuel and similar radioactive materials. In most cases railroads are the clearly economic mode of transport. Many US rail carriers have shown an increasing reluctance - in some instances an outright

refusal - to handle these commodities. This is in spite of very stringent packaging and safety regulations, and a virtually perfect accident record to date. Following several years of fruitless discussions with the railroads on this issue, the nuclear industry filed several complaints with the Interstate Commerce Commission seeking to force the railroads to handle this traffic in normal operations. The history and results of the investigations stemming from these complaints are covered in other papers. The testimony, exhibits and briefs submitted in these cases illustrate the reasons for the railroads' safety concerns and why they believe certain train operating restrictions will produce a safer transport environment. Despite the acknowledged sturdiness of spent fuel casks, the rail industry has not been convinced that the tests and model simulations used by the nuclear industry to design and certify casks adequately portrayed the forces actually generated in a railroad accident. The most significant of the operating changes proposed by the carriers in response to this concern was the requirement that spent fuel be moved only in special trains.According to the railroads, this would permit closer monitoring; reduce both the probability and consequences of accidents; permit better control of speeds; and minimize switching and terminal handling. A review of the material submitted by both the protestants and respondents in these proceedings provides a clearer understanding of the litigants' respective positions, as well as some insights into practical railroading as it pertains to the transportation of nuclear materials.

156 (CONF-780506--(Vol.1), pp 297-303)
EUROPEAN EXPERIENCE WITH ASPHALT PACKAGING OF RADIOACTIVE WASTES. Stewart, J.E. (Werner and Pfleiderer Corp., Waldwick, NJ). 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).
In Europe, the use of asphalt is synonymous with volume reduction of low and medium level radioactive waste. It started at Marcoule, France in the early 1960's and soon was adopted by Karlsruhe in West Germany, Eurochemic in Belgium, and in other countries. The use of an asphalt (or bitumen) binder, or immobilizing agent, in the VRS (Volume Reduction and Solidification) process proved to be beneficial in many ways. At Karlsruhe, for example, the VRS asphalt system replaced a cement system (non-volume reducing) and resulted in two drums of solidified waste versus ten with cement. This process reduced the transportation problem considerably. Asphalt is an inert, waterproof material and provides significantly improved package integrity under all conditions of on-site storage, transportation, and burial. The asphalt VRS system provides considerable cost savings, particularly for the recurring items such as binder, containers, transportation, and burial. These annual savings may approach $500,000 annually for a 1000 MWe nuclear plant. End product advantages include higher resistance to leaching and other environmental impacts, as well as less internal corrosion of the drums.

157 (CONF-780506--(Vol.1), pp 331-338)
SPENT FUEL SHIPPING AND STORAGE SYSTEM FOR ATUCHA NUCLEAR POWER STATION. Marticorena, J.O. (Consorzio NUCLITAL, Genoa, Italy); Quilici, O. 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).
Argentina's Atucha Nuclear Power Station is on the HWR type with pressure vessel. Its natural UO_2-zircaloy fuel assemblies are bundles of 36 fuel rods, 620 cm in length and 11 cm in diameter. The fuel elements are irradiated up to 7000 MWD/MTU and stored in a conventional decaying pool adjacent to the reactor building. A project was developed to design and build a shipping cask and a dry storage place for interim storage of spent Atucha's fuel. This paper describes the cask and storage design, as well as the special container (basket) for the fuel elements. The operation of the whole system is described, with emphasis on safety aspects, and a brief reference is made to heat transfer, corrosion and costs. Safety analysis shows that even in accident conditions the radiation dose on workers in the area will be under the maximum allowed levels. Cask and storage design allows for refrigeration by air convection without surpassing a temperature of 250°C in the hottest fuel rod. Estimate unit costs for the storage system are under 0.1 mills/kWh.

158 (CONF-780506--(Vol.1), pp 341-350)
EMPIRICAL EQUATIONS FOR PUNCTURE ANALYSIS OF LEAD-SHIELDED SPENT FUEL SHIPPING CASKS. Shieh, R.C. (Nuclear Regulatory Commission, Washington, DC). 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).
In-depth review and analysis of the existing experimental puncture data of unlaminated steel plates and lead-shielded prismatic and cylindrical steel casks are made. Based on these test data, empirical equations applicable to puncture analysis and designs of steel plate and shell components of spent fuel casks are developed in terms of nondimensional incipient puncture energy, shell thickness and curvature parameters. In addition, the present study also examines the static puncture force behavior and puncture failure mechanism of unlaminated mild steel plates. This results in shedding some additional light on the puncture failure mechanism and better understanding of the puncture force behavior. Certain possible distortions in model-predicted prototype cask puncture responses (through use of the exact replica scale model testing techniques) are also discussed and a correctional measure presented.

159 (CONF-780506--(Vol.1), pp 351-358)
PUNCTURE PHENOMENA IN LOW VELOCITY IMPACT OF RADIOACTIVE WASTE SHIPPING CONTAINERS. Little, R.W. (Michigan State Univ., East Lansing); Larder, R.A. 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).
Punch penetration phenomena of a radioactive waste shipping container when subjected to low velocity impact are studied both analytically and experimentally. Model cask materials in the form of circular test samples of stainless steel, backed with high density material (lead or uranium) are dropped on a steel punch with impact velocities of 220 in/sec or less. The experimental program involves 25 static tests and 67 dynamic tests in which plate thicknesses, backing material and punch diameters are varied. A detailed finite element analysis including the effects of plastic-work hardening in the materials and plate laminate separation was made on two geometries; ballasted with an impact velocity of 66.7 in/sec and unballasted with an impact velocity of 200 in/sec. An alternate analytical program was developed based upon a system frequency spectra analysis. A Rayleigh-Ritz approach was

selected, including the laminated plates, deformable punch and elastic ballast in the potential energy, and distributed mass in the kinetic energy. A model analysis using the first five frequencies was performed and stress calculations included the effects of plastic deformation. Excellent agreement was obtained between the Rayleigh-Ritz and the finite element analyses. In most cases, it was observed that initial impact was not sufficient to cause onset of punch yield or plate puncture but the plate vibration effects would initiate failure at a later time. The Rayleigh-Ritz program was used to analyze the different experimental configurations and then compared to experimental data. This research indicates that low velocity impact studies of radioactive waste shipping containers must consider the phenomena of structural vibrations. The analytical approach developed offers an accurate, quick and inexpensive method of examining low velocity impact.

160 (CONF-780506--(Vol.1), pp 375-383)
CORRELATION OF EXPERIMENTAL SHIPPING CASK MODEL STRUCTURAL BEHAVIOR BY COMPUTER ANALYSIS. Balmert, M.; Groom, J. (Battelle Columbus Labs., OH). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

As an aid in the planning and investigation of an experimental research program on the effects of environmental accidents upon spent fuel shipping containers, a study is being made to correlate the results of tests of scale model shipping casks with those of complex structural computer models. After surveying the available codes, a general purpose, dynamic, nonlinear computer program (ADINA) was chosen to model several experiments. Among these are: stainless steel cylindrical containers dropped on end from a height of 12 inches; lead and uranium filled cask models dropped 12 inches and 30 feet, in both end and side orientations. The results will be used for selection of the test parameters by the prediction and planning of failure test conditions, as well as confirmation of previous test results. Together, the experimental and theoretical analyses will provide a realistic assessment of the effects of accident loadings on spent fuel shipping containers.

161 (CONF-780506--(Vol.1), pp 447-453)
DETERMINATION OF ALLOWABLE MAXIMUM ACCELERATION LOADS FOR THE TRANSPORT OF IRRADIATED FUEL. Hill, R.G.; Waymire, G.R. (Exxon Nuclear Co., Inc., Bellevue, WA). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

In developing design criteria for the transport of irradiated fuel assemblies, the maximum mechanical loads which may be applied without cladding breach must be specified. A breach in the fuel rod cladding will result in releasing gaseous and perhaps particulate radioactivity to the transporter cavity. While this failure will not result in a safety hazard during the transport of the fuel assemblies, it could result in delays in unloading and preparing the transporter for additional shipments. Two finite element models of a PWR fuel assembly were developed to provide a relationship between transport input accelerations and fuel rod stress and strain. The models were set up for loading in the axial or transverse direction to the fuel assembly. Non-linear effects such as the fuel rods impacting the tie plates for axial loads and impact with adjacent fuel rods for transverse loads were included in the analyses. Test and Finite Element Model (FEM) analysis has demonstrated that both the impact and sliding phenomenon are linear with respect to strain and stress. Based on the irradiated cladding material properties and derived strain limits, these models can then be used to determine the acceleration limits for the design of the transporter suspension system. This paper describes the analytical models used, typical results obtained from the analyses, and considerations involved in formulating the resultant criteria. It is proposed that criteria developed from these analyses may be used in monitoring the operation of spent fuel transport equipment.

162 (CONF-780506--(Vol.1), pp 150-153)
MOTOR VESSEL HONOURA MARU: A SPECIALIZED CARRIER FOR SPENT FUEL. Mori, Y. (Nuclear Transport Service Co., Ltd., Tokyo, Japan). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

In Japan, the volume of nuclear spent fuel is increasing and reprocessing has been become an urgent matter. Means of transporting spent fuels were studied and the criteria for a vessel resulted. The construction of the ship HINOURA MARU was completed on July 1, 1977. Several trial voyages were performed last year and the first vogage was undertaken in January of this year. Spent fuel will be transported from electric power companies to the reprocessing plant for ten years. The HINOURA MARU is a vessel of 1290 tons gross and includes the following special structures and special equipment: 1. double hull structure against collision; 2. double bottom structure against grounding; 3. structure of radiation shield; and 4. cargo cooling equipment, etc.

163 (CONF-780506--(Vol.1), pp 154-162)
STRENGTH AND WATER-TIGHTNESS OF THE CLOSURE HEAD AND VALVES OF A MODEL CASK UNDER HIGH EXTERNAL PRESSURE. Terada, O.; Kumada, M.; Hayakawa, T.; Mochizuki, S.; Ohrui, K. (Mitsui Engineering and Shipbuilding Co., Ldd., Tokyo, Japan). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

This paper describes experimental research on the strength and water-tightness of the closure head and attached valves of a model cask under high external pressure, in simulation of its having been accidentally lost in the deep sea. Both the external pressure tests and the corrosion tests were carried out using scale models of the closure head of an 80-ton spent-fuel shipping cask, and the full size pressure relief valves and drain valves which were to be attached to the actual cask. Based on the results of the above tests, evaluations were made, and new information was obtained on the pressure-proof strength and water-tightness of the closure head of the cask and the valves. Lastly, research which is being carried on in Japan on the pressure equalizer is also introduced.

164 (CONF-780506--(Vol.1), pp 17-27)
STANDARDIZE OR NOT TO STANDARDIZE: THE PROS AND CONS OF STANDARDIZED DESIGNS FOR CASKS AND CASK TRANSPORT SYSTEMS. Brobst, W.A.; Chais, M. (Dept. of Energy, Washington, DC). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

There are many different cask designs that

have been approved, built, and used over the years. Some special-use vehicles have been built. In the US, there are now over a dozen current use casks. With a sharp increase in the number of spent fuel shipments coming up in the next decade, and the beginning of high-level waste shipments in the late 1980's, there could be a proliferation of cask and transport vehicle designs. But is this a good idea. Should there be more casks of fewer designs, or are custom-designed casks and vehicles a better way to go. This paper examines the advantages and disadvantages of standardized designs for casks and cask transport systems. Factors of safety, economics, efficiency, and public acceptance are considered. Examples of other transport hardware standardization are given and evaluated. The effects of cask standardization on reactor and processing plant design and operations are examined, as well as the effects of plant standardization on the transport system. This is a chicken and egg situation, and will require close cooperation between designers of transport system hardware and plant hardware.

165 (CONF-780506--(Vol.1), pp 52-58)
CONCEPTUAL DESIGN OF A SHIPPING CASK FOR RAIL TRANSPORT OF SOLIDIFIED HIGH LEVEL WASTE. Rhoads, R.E.; Peterson, P.L. (Battelle Pacific Northwest Labs., Richland, WA). 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).
No commercial facilities to reprocess spent fuel from light water reactors are currently in operation in the US. Whether or not such facilities will be operated during the remainder of this century is currently a topic of national debate. If it is decided to proceed with the reprocessing option, much work remains to be done to develop commercial facilities to solidify the liquid high level waste generated from the process, transport it to a federal repository and isolate it from the environment. The Department of Energy is currently conducting a variety of research activities in these areas so that reprocessing facilities could be developed and operated in a timely fashion if the decision to use this technology is made. This paper reports the results of a study to develop a conceptual design for a shipping cask to transport solidified high level waste from a reprocessing plant to a federal repository by rail. Scale models of the cask design and accompanying graphics displays have also been developed. The design of a shipping container for radioactive materials is dependent on a variety of design constraints. The design constraints important to development of a cask for shipping solidified high level waste are reviewed. Since commercial facilities to solidify high level waste have not been operated, assumptions based on current technology were made concerning the properties of the solidified high level waste that would be shipped.The conceptual cask would transport nine canisters of waste. The canisters are assumed to be 0.3 m in diameter and 3 m long. Possible cask configurations for other canister sizes are described.

166 (CONF-780506--(Vol.1), pp 69-74)
URANIUM-LEAD SHIELDING FOR NUCLEAR MATERIAL TRANSPORTATION SYSTEMS. Lusk, E.C.; Miller, N.E.; Basham, S.J. Jr. (Battelle Columbus Labs., OH). 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).
The basis for the selection of shielding materials for spent fuel shipping containers is described with comments concerning the favorable and unfavorable aspects of steel, lead, and depleted uranium. A concept for a new type of material made of depleted uranium and lead is described which capitalizes on the best cask shielding characteristics of both materials. This cask shielding is made by filling the shielding cavity with pieces of depleted uranium and then backfilling the interstitial voids with lead. The lead would be bonded to the uranium and also to the cask shells if desired. Shielding density approaching 80 percent of that of solid uranium could be achieved, while a density of 65 percent is readily obtainable. This material should overcome the problems of the effect of lead melting in the fire accident, high thermal gradients at uranium-stainless steel interfaces and at a major reduction in cost over that of a solid uranium shielded cask. A development program is described to obtain information on the properties of the composite material to aid in design analysis and licensing and to define the fabrication techniques.

167 (CONF-780506--(Vol.1), pp 102-109)
DESIGN, LICENSING AND FABRICATION OF A 64,000 POUND, TOP AND BOTTOM LOADING, TYPE B SHIELDED OVERPACK. Hansen, L.J. (Nuclear Packaging, Inc., Tacoma, WA). 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).
The NUPAC OH-142 shielded overpack has been designed to provide a flexible package capable of transporting 142 cubic feet (4m^3) of medium-to-high level wastes. It was primarily designed for the transport of spent ion exchange resins from Canadian reactors to the Quadricell retrievable storage facility. During the design phase it was determined that with minor modifications its function could be expanded from a pure top loading transportation shield to one of a top and bottom loading transfer cask. As it is used to transport liners of ion exchange resins to the Quadricell where, through the use of its bottom unloading feature, the shield can be placed atop the Quadricell, thus allowing a liner to be lowered directly into the storage cell. The resultant transfer provides minimum operator exposure.

168 (CONF-780506--(Vol.1), pp 424-436)
MODEL TESTING OF HEAVY SPENT FUEL CASKS AND WASTE PACKAGINGS. Schulz-Forberg, B.; Huebner, H.W.; Wieser, K.E. (Bundesanstalt fuer Materialpruefung, Berlin, Germany). 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).
Testing of models of appropriate scale is allowed by the 1973 IAEA regulations, Section VII, No. 701c. So and due to cost-benefit-analysis and limited capacity of test facilities, model testing of spent fuel casks and waste packagings has become more and more effective in the procedure of approving a packaging design. To verify model laws and scaling, two test series were performed by BAM. The first one with lead cylinders to verify the right scaling of deformation, the second one with rigid steel cylinders to verify the right scaling of forces. Besides this, investigations were made concerning the vibration behavior of lid constructions and the modeling of tightness. In the latter case, considerations were especially made for the tightness due to the geometry and the flow of the respective medium, including the use of different types of gaskets, looking also to the activity leakage rate. Based on these considerations, three test

series were carried out by BAM with models of the 100t Biblis packaging (scales: 1/12 and 1/3), the 1/5 scale model of the 32t TN28 waste packaging and the 1/2 scale model of the 32t TN8/9 spent fuel cask (200 m drop test). Besides model considerations, the latter super drop test is intended to lead to a better public acceptance while simulating the most severe impact conditions coming from a truck/train-traffic.

169 (CONF-780506--(Vol.1), pp 479-486)
ASSESSMENT OF THE HEAT TRANSFER PROPERTIES OF SPENT FUEL SHIPPING CASKS. Aoki, S.; Shimada, H.; Tamura, K. (Tokyo Inst. of Tech., Japan). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

The purpose of this study is to assess the fire safety of spent fuel shipping casks through the analysis of fire test results. On the basis of results of open fire tests conducted in 1973-1974, of 1/2, 1/2.5 and 1/4 scale models of 80 ton cylindrical casks, heat transfer properties of the cask models in open fire were evaluated by computer analysis and the method for evaluation was confirmed to be feasible. A comparison was made between the temperature-time curves from the tests and those from the computer analyses. Observations are summarized as follows. 1) The temperatures in the upper part of the cask models were generally higher than the computer temperatures, while in the lower part, they both agreed with each other. 2) The average flame temperature can be used as the outer boundary temperature for the analysis, unless the flame temperature fluctuates very much. 3) When the heat transfer by convection to casks in an open fire is computed, equations of forced convection by wind, not those of natural convection, should be used. 4) It is believed that when the flame temperature distribution is not even, the heat flux by radiation should be computed with different flame temperatures taken into consideration.

170 (CONF-780506--(Vol.2), pp 683-692)
WORLDWIDE SPENT FUEL TRANSPORTATION LOGISTICS. Best, R.E. (Nuclear Assurance Corp., Atlanta, GA); Garrison, R.F. 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

This paper presents an overview of the worldwide transportation requirements for spent fuel. Included are estimates of numbers and types of shipments by mode and cask type for 1985 and the year 2000. In addition, projected capital and transportation costs are presented. For the year 1977 and prior years inclusive, there is a cumulative worldwide requirement for approximately 300 MTU of spent fuel storage at away-from-reactor (AFR) facilities. The cumulative requirements for years through 1985 are projected to be nearly 10,000 MTU, and for the years through 2000 the requirements are conservatively expected to exceed 60,000 MTU. These AFR requirements may be related directly to spent fuel transportation requirements. In total nearly 77,000 total cask shipments of spent fuel will be required between 1977 and 2000. These shipments will include truck, rail, and intermodal moves with many ocean and coastal water shipments. A limited number of shipments by air may also occur. The US fraction of these is expected to include 39,000 truck shipments and 14,000 rail shipments. European shipments to regional facilities are expected to be primarily by rail or water mode and are projected to account for 16,000 moves. Pacific basin shipments will account for 4500 moves. The remaining are from other regions. Over 400 casks will be needed to meet the transportation demands. Capital investment is expected to reach $800,000,000 in 1977 dollars. Cumulative transport costs will be a staggering $4.4 billion dollars.

171 (CONF-780506--(Vol.2), pp 693-699)
TRANSPORT OF IRRADIATED FUEL IN THE EUROPEAN COMMUNITY, 1975-1985. Rocco, P. (Commission of the European Communities, Ispra, Italy). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

This report is a study on the development of the transport of irradiated fuel in the Community for a ten year period (1975 to 1985). Forecasts made in the 1975 to 1976 period evaluated the installed nuclear power in the Community for 1981 to 1982 as 86 GW with a doubling of this power for 1985. On this basis, the yearly transports of spent oxide fuel were raising to more than 1000 in 1985, whereas the corresponding values for spent magnox fuel were 750. More recent forecasts show strong reduction of the former values. In fact, a reflective tendency and the economic situation have reduced the orders of new power plants and delayed the building times. In the same way, reprocessing difficulties have led to long waiting periods in the pools. This report considers the new situation. The installed nuclear power for the next years is given following the latest information and the yearly output of irradiated fuel is computed. The reprocessing possibility of the Community and the construction in some countries of high capacity storage ponds are briefly reviewed. The foreseen shipments of out of Community fuel (especially Japanese) are taken in account. Typical LWR fuel elements, which will constitute the bulk of the Community transports for the next years are described, so as the actual and future shipping flasks. The tendency to the dimensional increase of the flasks will lead to a progressive reduction of the road transports in favor of rail transports. In the United Kingdom the rail transports are already predominant. A prospect is given of the technical and administrative procedures of these transports and of the discrepancies existing among the different Community countries. Finally, starting from the national fuel outputs, the number of annual transports is evaluated for the next years in each country and in the Community as a whole, making some alternative hypotheses for flasks of different capacity.

172 (CONF-780506--(Vol.2), pp 700-709)
TRANSPORT OF IRRADIATED FUELS WITHIN THE ITALIAN ELECTRONUCLEAR POWER PROGRAM. Faloci, C. (Comitato Nazionale per l'Energia Nucleare, Rome, Italy); Piermattei, S.; Cane, G.; Zaffiro, B.; Forasassi, G.; Tomassetti, G. 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

The problem of spent fuel transport in Italy has been under consideration since 1966. In this paper the authors analyze the experience gained during a ten year period in the transport field from the view point of the designers' sustomers and control authorities. Since the recent approval by the Italian government of the electronuclear power program the transport of irradiated fuels will assume in the future a role so prominent that it will strongly influence the national activities in

the nineties. Therefore, a forecast is made of the future nuclear movements according to the development of the nuclear program. The conditions are examined for the optimum organization to coordinate the future movements to coordinate. The main concern is to achieve the maximum safety and the minimum risk for the population. The technical problems connected with the above mentioned transport organization are pointed out on the basis of past experiences and future projections due to the new features and performances of the fuels to be used in the new plants. According to experience, a series of questions concerning the casks must be still answered. They concern the design criteria to be adopted for heat exchange, shielding, criticality and the practical solutions for the handling of the casks. Analysis indicates that advice and ideas from international organizations would be helpful, mainly concerning the criteria to interpretate the tests, their meaning on scale model and the holding down arrangements for different transport modes. Some suggestions are then presented to find the answer to some of the problems and they could also be used as a starting point in the selection of some important topics to be studied in depth by the experts.

173 (CONF-780506--(Vol.2), pp 719-726)
TRUCK VS RAIL SHIPMENT OF SPENT NUCLEAR FUEL. Dufrane, K.H. (Chem-Nuclear Systems, Inc., Orchard Park, NY). 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).
In the evaluation of truck and rail transportation for spent nuclear fuel, three basic factors generally play a key role. These may be summarized as (1) economic, (2) operational, and (3) political. Any one of these three items may mandate the selection of truck or rail due to the singular importance of a particularly critical or sensitive item. However, in most instances, the final selection is the result of all three factors taken in combination. Both the operational and political factors are mainly site and/or location dependent, while economic additionally depends on off-site factors such as transportation distances, available services, cask use charges, and destination requirements. Operational limitations would be established by site factors such as the availability of qualified personnel to handle the cask turnaround, available time slots, suitable cask handling facilities, and access to the desired transportation mode. Political considerations would include any local restrictions, special agreements, and the relative visibility of the contemplated truck or rail shipments. Economic factors for the evaluation of truck and rail shipments include the man power and equipment turnaround costs at both the source and destination, travel distances and associated transport time, cask cost of daily use charges, direct transportation cost plus associated support activities, and specialized restrictions, tariffs, embargos, etc. that may be applied (i.e. special train charges, overweight permits, weekend or night travel restrictions, schedule restrictions, etc.). The economic, operational and political factors mentioned are expanded and discussed in greater detail.

174 (CONF-780506--(Vol.2), pp 727-729)
PUBLIC ACCEPTANCE OF RADIOACTIVE WASTE TRANSPORTATION SYSTEMS. Gablin, K.A. (Protective Packaging, Inc., Louisville, KY). 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).
As the thoughts of the country concentrate on the problems of transportation of waste through high traffic urban areas, the problem of how to deal directly and honestly with the public takes on greater significance in the nuclear industry. Non-technical aspects of the methods of transportation, especially by railroad and highway, enter into the total scheme of moving radioactive waste from both weapon and nuclear power plant sources to final processing and disposal. Factors such as shape, color, size, familiarity, and industrial designing are necessary ingredients that take on equal or more significance that the designing of containers to survive the hypothetical accident conditions of the present, or even of the future. Protective Packaging, Inc. has been a leader in the presentation of containers to the private and public sector of the nuclear industry. The products have undergone very open testing, in public, with both invited and uninvited witnesses. In those experiences, dating back to 1969, the problems of public acceptance will be related between the technical problems and the associated social and political problems that relate to container acceptance by the public in today's world. Proven experience data, relative to the safety of the present day systems will be discussed, as well as methods of improving the image in the future. Review will also be given to the effort by industry to discuss the proven record with parties outside the nuclear industry, i.e., individuals and pressure groups that are diametrically opposed to review the facts relative to safety as opposed to other, but more traditional industries.

175 (CONF-780506--(Vol.2), pp 741-747)
OPERATIONS EXPERIENCE WITH THE NAC-1 LEGAL WEIGHT TRUCK CASK. Viebrock, J.M.; Hoffman, C.C. (Nuclear Assurance Corp., Atlanta, GA). 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).
The first three years of operation of Nuclear Assurance Corporation's (NAC) four (4) NAC-1 Casks have demonstrated that shipments of spent fuel, fuel rods and other highly irradiated reactor components can be moved routinely by legal weight truck transport. Shipments of these materials have involved some 800,000 miles of highway travel and cask handling at some fifteen different nuclear facilities. This paper presents details on NAC's operations experience with these casks including cask description, cask handling (loading and unloading), pre-shipment testing, facility turnaround and transit times, operator exposure, transport vehicles and shipper/carrier/cask owner responsibilities, actual experience with regard to facility interfacing requirements and operational procedures. Cask and equipment utilization is discussed together with the methods used to control operation costs and to improve the economics of truck transport.

176 (CONF-780506--(Vol.2), pp 748-753)
INTERSTATION TRANSFER OF SPENT NUCLEAR FUEL. Kunita, R.K.; Wallace, A.R. (Carolina Power and Light Co., Raleigh, NC). 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).
During the period from October 1977 through January 1978 Carolina Power and Light Company (CP and L) transferred a substantial number of

spent nuclear fuel assemblies from storage at one nuclear station to another station for interim storage there. The spent fuel assemblies were removed from the fuel storage pool at the H. B. Robinson Plant, Unit No. 2, located near Hartsville, South Carolina, and transferred to a newly modified fuel storage pool at Brunswick Plant, Unit No. 1, located near Southport, North Carolina. After a careful engineering study, CP and L chose the General Electric IF-300 Irradiated Fuel Shipping Cask System as the most practicable cask for use in our particular situation. This system consists of a spent fuel cask licensed under 10CFR71 as a Type B package, the skid on which it is mounted along with a diesel engine cooling system and personnel enclosure, and the railcar on which it is transported. When the cask arrived at our Brunswick Plant in May 1977, CP and L became the first utility to purchase and take delivery of its own spent fuel shipping cask. Actual transfer of fuel marked the culmination of an intensive effort on the part of several departments within CP and L. The difficulties encountered in registering as a user of the cask and in taking possession of the cask and railcar were many and varied. Due to the limited shipping window, the decision was made to use special train service for the shipments. Dry run operations at both sites utilizing an empty cask revealed problems which required prompt attention. Modifications to equipment and procedures were made as required. When actual shipments were begun, equipment problems were quick to arise and cause minor delays. Once the campaign was in full swing, however, the personnel involved became more experienced in handling the cask and operations went more smoothly.

177 (CONF-780506--(Vol.2), pp 804-806)
SPENT FUEL TRANSPORTATION ACCIDENT: A STATE'S INVOLVEMENT. Neuweg, M. (Illinois Dept. of Public Health, Springfield). 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

On February 9, 1978 at 8:20 p.m., the duty officer for the Illinois Radiological Assistance Team was notified that a shipment containing uranium and plutonium was involved in an accident near Gibson City, Illinois on Route 54. It was reported that a pig containing an unknown amount of uranium and plutonium was involved. The Illinois District 6A State Police were called to the scene and secured the area. The duty officer in the meantime learned after numerous telephone calls, approximately 1 hour after the first notice was received, that the pig actually was a 48,000 pound cask containing 6 spent fuel rods and the tractor-trailer had split apart and was blocking one lane of the highway. The shipment had departed from Dresden Nuclear Power Station, Morris, Illinois, enroute to Babcox and Wilcox in Lynchburg, Virginia. Initial reports indicated the vehicle had split apart. Actually, the semi-trailer bed had buckled beneath the cask due to apparent excess stress. The cask remained entirely intact and was not damaged, but the state highway was closed to traffic. The State Radiological Assistance Team was dispatched and arrived on the scene at 12:45 a.m. Immediate radiation monitoring revealed a reading of 4 milliroentgen per hour at 10 feet from the cask. No contamination existed nor was anyone exposed to radiation unnecessarily. The cask was transferred to a Tri-State semi-trailer vehicle the following morning at approximately 6:30 a.m. At 9:30 a.m., February 10, the new vehicle was again enroute to its destination. This incident demonstrated typical occurrences involving transportation radiation accident: misinformation and/or lack of information on the initial response notification, inaccuracies of radiation monitorings at the scene of the accident, inconsistencies concerning the occurrences of the accident and unfamiliar terminology utilized by personnel first on the scene, i.e., pig, cask, vehicle split apart, etc.

178 (CONF-780506--(Vol.2), pp 887-889)
EXPERIENCE IN COMPLYING WITH QUALITY ASSURANCE REQUIREMENTS FOR CASK LIFTING DEVICES. Hoffman, C.C.; Best, R.E. (Nuclear Assurance Corp., Atlanta, GA). 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

The Nuclear Assurance Corporation (NAC) owns and operates four NAC-1 truck casks. These casks are used to ship spent reactor fuel assemblies and radioactive reactor-core components. The casks have been loaded or unloaded at a total of fifteen nuclear facilities in the United States. In addition, NAC has used another large, overweight-truck cask to ship radioactive reactor core components from a reactor to a waste burial site. There are many individual differences in the cask handling facilities at each of the reactor stations, nuclear research facilities and the storage and burial sites serviced. Various types of auxiliary lifting and handling devices for on-site cask operations have been required. The quality assurance requirements for the equipment used in interfacing casks with nuclear power plant facilities have become more stringent. This paper presents details on the type of special equipment being employed, the quality assurance requirements that are imposed, and the quality assurance audits that are being performed. The paper presents NAC's experiences in the development and procurement of a variety of cask-facility equipment and the implementation of quality assurance procedures for the design, manufacture, acceptance and in-service inspection and test of the equipment. Also, experiences in working with customers' engineering and quality assurance organizations are discussed with specific attention given to the establishment of interface equipment requirements and the documentation that must be developed. The paper discusses a number of factors that must be considered in the development of design criteria for cask lifting devices. In addition to the criteria that are important to the functional safety of the equipment, other considerations important to the equipment utilization and effectiveness are presented.

179 (CONF-780506--(Vol.2), pp 933-936)
RADIOLOGICAL RISK ANALYSIS OF TRUCK AND RAIL TRANSPORTATION OF NUCLEAR WASTES. Fullwood, R.R.; Mendoza, Z.; Ritzman, R.L.; Aron, W.; Straker, E.A. (Science Applications, Inc., Palo Alto, CA). 1978.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

A radiological accident risk analysis of the transportation of nuclear waste has been performed for the following waste transportation modes: spent fuel (NLI 10/24, rail; NFS-4, truck), plutonium dioxide (6M, truck), vitrified high level waste (conceptual cask, rail), cladding hulls (conceptual cask, truck, and rail) and non-high level waste (Super-Tiger, truck). In order to simplify the problem, accident categories were defined corresponding to failure and degree of failure of various barriers. Fault trees, for each category, were prepared and quantified using

various sources of failure probabilities, the transportation accident probabilities were taken from SLA 74-0001. All accidents of public concern involve penetration of the protection barriers. Based on recent full scale testing and analysis, the only mechanisms for this penetration is impalement on accident debris such as a rail or axile. This probability is taken to be the probability of a missile (conservatively assuming all missiles are impalement stubs) times the probability of penetration obtained from two missile penetration formulae. The source terms for the accidents were obtained from several physiochemical models. Cesium release source terms were calculated using the WASH-1238 supplement 2 model. The population dose was calculated using the WASH-1400 draft computer program which uses mean demographics and meteorologies appropriate to a nuclear power plant. No cancer effects are estimated. The relative mix of transportation modes was adapted from recent projections for the US in 1990. The findings are that transportation of plutonium either as a powder or as a TRU containment of non-high-level waste represents the two highest risk modes. Eliminating PuO_2 transport, this work finds total non-occupational risks to be less than presented in GESMO except for lung risks which are slightly higher.

180 (CONF-780506--(Vol.2), pp 939-945) TRANSPORTATION OF POSTFISSION RADIOACTIVE WASTES FROM THE COMMERCIAL LWR FUEL CYCLE. Murphy, E.S.; Clark, L.L.; Napier, B.A. (Battelle Pacific Northwest Labs., Richland, WA). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

Requirements for transportation of postfission radioactive wastes from the commercial LWR fuel cycle were studied. Only radioactive wastes that would require transport to federal facilities for interim storage or final disposal were considered. These wastes included spent fuel, solidified high-level waste, fuel residues and non-high-level TRU waste. Transportation requirements were determined and transport facilities described; packaging and shipping costs were estimated; and the potential environmental impacts of transportation and of postulated accidents were evaluated. Projections are given for the number one cost of waste shipments for the once-through fuel cycle and for a uranium plus plutonium recycle option. The projections are based on an assumed nuclear generating capacity of 400 GWe in the year 2000. On a cost per kg of heavy metal basis, truck cask shipments appear to cost about the same as rail cask shipments. However, shipping cost estimates do not take into account the large increase in cask handling capacity required if all shipments were by truck. It is therefore assumed that cask shipments will be by rail. Under normal transport conditions, no radioactive materials will be released from shipping containers to the atmosphere, ground or water. Direct radiation doses calculated for members of the general population from passing rail or truck shipments of radioactive wastes are insignificant when compared to doses from natural background radiation. In the absence of accident data involving material releases, a series of minor, moderate and severe accident scenarios for radioactive shipments were postulated. Expected frequencies for these accidents were calculated on the basis of accident statistics and assumed total shipment miles; material releases were postulated for each accident scenario; and radiation doses from these postulated releases were calculated.

187 (CONF-801115--5(Draft)) PREDICTING ROUTES OF RADIOACTIVE WASTES MOVED ON THE U.S. RAILROAD SYSTEM. Hillsman, E.L.; Johnson, P.E.; Peterson, B.E. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-

26. 7p. NTIS, PC A02/MF A01.
From 6. international symposium on packaging and transporting radioactive material; Berlin, F.R. Germany (10 Nov 1980).
Relative to the use of public roads, railroads offer several advantages for the movement of radioactive wastes. These include the ability to accommodate large, heavy containers, the ability to transfer large volumes in a single movement, and the safety of a dedicated, centrally controlled right-of-way. The principal disadvantage of railroads is that the shipper has considerably less freedom to specify the route a shipment will take. The lower density of the railroad network, the need to coordinate waste shipments with other traffic in the system, and the private ownership of the US network all reduce the shippers routing power. Although the shipper can dictate an exact route, this could require the use of a special train at an increased cost. Before considering the general use of special trains to move radioactive wastes, it is first desirable to determine how these materials would move as general rail traffic. This paper describes the development of a system to predict routes of general rail traffic at Oak Ridge National Laboratory (ORNL).

188 (DOE/ET/47906--2) FUEL-CLAD FAILURE DETECTION. FINAL REPORT, TASK 1. Reier, M.; Keneshea, F.; Younger, J. (Nuclear Services Corp., Campbell, CA (USA)). 16 Nov 1979. Contract AC09-79ET47906. 63p. Dep. NTIS, PC A04/MF A01.
A study has been made of the means of identifying spent nuclear fuel assemblies which have suffered clad rupture. Various probe techniques, such as the use of an ultrasonic probe or boroscope for visual inspection of individual rods, are not feasible because of the inaccessibility of interior rods and the inordinate time consumed in checking a single assembly. The PIXE (Proton Induced X-Ray Emission) method has also been investigated. Although it should produce satisfactory results, it would be far more expensive, without any obvious advantages, than a sipping system for fission products. In-situ sipping of an assembly in a large rack would be extremely desirable; however, unambiguous results cannot be predicted without trying it and comparing with a technique which isolates the assembly from the neighboring ones. Finally, the conceptual design of a sipping system is proposed which is about 2-1/2 times faster than current ones in operation without any loss in accuracy or increased complexity. 5 figures, 7 tables.

189 (DOE/NE--0002) SPENT FUEL STORAGE REQUIREMENTS: THE NEED FOR AWAY-FROM-REACTOR STORAGE. (Department of Energy, Washington, DC (USA). Div. of Spent Fuel Storage and Transfer). Jan 1980. 12p. Dep. NTIS, PC A02/MF A01.
The analyses of on-site storage capabilities of domestic utilities and estimates of timing and magnitude of away-from-reactor (AFR) storage requirements were presented in the report DOE/ET-0075 entitled Spent Fuel Storage Requirements: The Need For Away-From-Reactor Storage published in February 1979 by the US Department of Energy. Since utility plans and requirements continue to change with time, a need exists to update the AFR requirements estimates as appropriate. This short report updates the results presented in DOE/ET-0075 to reflect recent data on reactor operations and spent fuel storage. In addition to the updates of cases representing the range of AFR requirements in DOE/ET-0075, new cases of interest reflecting utility and regulatory trends are presented.

190 (DOE/NE--0010) SPENT NUCLEAR FUEL: A COMPARISON OF AT-REACTOR BASIN STORAGE AND AWAY-FROM-REACTOR STORAGE. (Department of Energy, Washington, DC (USA). Assistant Secretary for Nuclear Energy). Jul 1980. 25p. NTIS, PC A02/MF A01.
A nuclear power reactor operator, confronted with rising spent fuel inventories that would soon exceed storage capacity, has several options to remedy this situation: transshipment, reracking of existing at-reactor storage basins (ARB), new ARB's, and away-from-reactor (AFR) basins. This report examines the latter two cases where a macro-economic comparison of each storage system is developed. The AFR storage system proved to be significantly more economical. This analysis indicates that 46 ARB's would be needed to meet storage requirements compared to only three AFR's. The total discounted costs associated with building new ARB's and AFR's are $4.7 billion and $1.2 billion respectively.

191 (DOE/NV/10061--1) SPENT FUEL HANDLING AND PACKAGING PROGRAM. QUARTERLY REPORT, OCTOBER-DECEMBER 1979. Durrill, D.C. (Westinghouse Electric Corp., Mercury, NV (USA). Advanced Energy Systems Div.). Jan 1980. Contract AC08-80NV10061. 13p. NTIS, PC A02/MF A01.
Balance of 13 fuel assemblies for the Climax programs were received; 9 were completely encapsulated, 4 were canistered without welding; all were placed in Hot Bay lag storage. Six Climax electrically heated mockup assemblies (EHMA) were pre-assembled at E-MAD, delivered to the Climax site and assembly was completed. The BWR fuel handling tool was fabricated and proof tested. The new constant air monitor (CAM) equipment was received. Fuel Temperature Test controller modifications were completed and testing was resumed. Calorimeter equipment installation was resumed; modification of lower vertical supports was completed; and the first review draft of the operating procedure was issued. The Lag Storage Pit ventilation test was completed.

192 (DOE/NV/10061--2) SPENT FUEL HANDLING AND PACKAGING PROGRAM. QUARTERLY REPORT, JANUARY-MARCH 1980. Durrill, D.C. (Westinghouse Electric Corp., Mercury, NV (USA). Advanced Energy Systems Div.). Apr 1980. Contract AC08-80NV10061. 17p. NTIS, PC A02/MF A01.
The following was completed: calorimeter equipment modification, installation, calibration and checkout, climax canister thermocouple channel/Climax shield plug alignment checks, Climax canister/shield plug/dummy fuel lifting force measurement, 1 KW PWR Fuel Temperature Test, and lag Storage Pit radiation background measurement study.

193 (DOE/NV/10061--3) SPENT FUEL HANDLING AND PACKAGING PROGRAM. QUARTERLY REPORT, APRIL-JUNE 1980. Durrill, D.C. (Westinghouse Electric Corp., Mercury, NV (USA). Advanced Energy Systems Div.). Jul 1980. Contract AC08-80NV10061. 19p. NTIS, PC A02/MF A01.
This document is a report of activities performed by Westinghouse Advanced Energy Systems Division-Nevada Operations at the E-MAD Facility, Area 25, Nevada Test Site, in meeting subtask objectives during the third quarter of

FY 1980. Activities during this period included completion of encapsulation and preparation for shipment of 11 spent fuel assemblies to be tested at the Climax test site by Lawrence Livermore Laboratories; calorimetry of two fuel assemblies; repeat of three 1 kW Fuel Temperature Test runs; acquisition of gas samples from fueled canisters; removal of ten R-MAD shielding windows; and assembly and checkout of the canister cutter, which was received from AESD-Large.

194 (DOE/NV/10061--4) COMMERCIAL WASTE AND SPENT FUEL PACKAGING PROGRAM. QUARTERLY REPORT, JULY THROUGH SEPTEMBER 1980. Hakl, A.R. (Westinghouse Electric Corp., Mercury, NV (USA). Advanced Energy Systems Div.). Oct 1980. Contract AC08-80NV10061. 20p. NTIS, PC A02/MF A01.

This document is a report of activities performed by Westinghouse Advanced Energy Systems Division-Nevada Operations at the E-MAD Facility, Area 25, Nevada Test Site, in meeting subtask objectives during the fourth quarter of Fiscal Year 1980. These activities include removal of the one kilowatt (kw) spent fuel assembly and installation of a two kw assembly into the Fuel Temperature Test in the West Process Cell; transfer of fueled canisters to Drywells 1, 2 and 3, and initiation of the Drywell Interaction Test; initiation of the two kw Drywell Test in Drywell 5; calorimetry; gas sampling; neutron spectra measurement; installation and qualification of the Canister Cutter; and continuation of the three kw Soil Temperature Test.

195 (DOE/SR--0004(Vol.1)) DEPARTMENT OF ENERGY STUDY ON SPENT NUCLEAR FUEL STORAGE. (Department of Energy, Washington, DC (USA)). Mar 1980. 47p. NTIS, PC A03/MF A01.

This report defines the needs for storage facilities and identifies possible sites in three regions of the US where such facilities could be located. The three sites are: Barnwell, South Carolina; Morris, Illinois; and West Valley, New York. This report includes consideration of the technical, economic, and regulatory factors associated with providing spent fuel storage in existing or potential at-reactor storage pools, and in AFR storage pools. This determination was based on specific data regarding the storage capacity needed to accommodate spent fuel from reactor pools by January 1, 1985, that the utilities would be unable to provide for themselves.

196 (DOE/SR--0004(Vol.2)) APPENDICES FOR DEPARTMENT OF ENERGY STUDY ON SPENT NUCLEAR FUEL STORAGE. (Department of Energy, Washington, DC (USA)). Mar 1980. 92p. NTIS, PC A05/MF A01.

Eight appendices comprise this report: predicted away-from-reactor storage requirements; detailed cost information for at-reactor and away-from-reactor storage pools; spent fuel storage studies by federal agencies or interagencies; detailed site information; reactors with near term considerations; state legislation affecting siting of away-from-reactor storage; Department of Energy Act of 1978; and legislation affecting transportation to AFR facilities.

197 (DOE/SR-SF--2002(Rev.1)) SPENT LWR FUEL STORAGE COSTS: RERACKING, AR BASINS, AND AFR BASINS. (Department of Energy, Aiken, SC (USA). Savannah River Operations Office). Jan 1980. 11p. Dep. NTIS, PC A02/MF A01.

Whenever possible, fuel storage requirements will be met by reracking existing reactor basins and/or transfer of fuel to available space in other reactor basins. These alternatives represent not only the lowest cost storage options but also the most timely. They are recognized to face environmental and regulatory obstacles. However, such obstacles should be less severe than those that would be encountered with AR or AFR basin storage. When storage requirements cannot be met by the first two options, the least costly alternative for most utilities will be use of a Federal AFR. Storage costs of $100,000 to $150,000 MTU at a AFR are less costly than charges of up to $320,000/MTU that could be incurred by the use of AR basins. AFR storage costs do not include transportation from the reactor to the AFR. This cost would be paid by the utility separately. Only when a utility requires annual storage capacity for 100 MTU of spent fuel can self-storage begin to compete with AFR costs. The large reactor complexes discharging these fuel quantities are not currently those that require relief from fuel storage problems.

198 (DOE/SR-SF--2003) SPENT FUEL STORAGE CAPACITY IN NEW REACTORS. (Department of Energy, Aiken, SC (USA). Savannah River Operations Office). Dec 1979. 13p. Dep. NTIS, PC A02/MF A01.

The standard spent fuel storage pools of the US power reactors currently under construction are sized at about 1000 ft^2 and 1225 ft^2 for BWR and PWR respectively. These basins, when equipped with SS racks, will contain 11 and 13 years fuel discharge respectively, each with full core reserve. With densification by fuel pin disassembly and reassembly into light SS cans, their capacity can be increased to 19 and 27 years respctively. With moderately expanded basin size, estimated to cost $3.0 and $1.6 million, and with boron SS basin racks, estimated to cost $2.5 and $1.0 million for BWR and PWR respectively, the basin capacities could be expanded to handle 20 years of reactor discharge. With fuel rod reassembly, the capacity of these basins would increase to 40 years or full reactor lifetime discharge. Utilities will move toward these moderately expanded size basins.

199 (DOE/SR-SF--2005-9) MONTHLY AWAY-FROM-REACTOR SPENT FUEL STORAGE REPORT: AFR PROGRAM. (Department of Energy, Aiken, SC (USA). Savannah River Operations Office). Sep 1980. 124p. NTIS, PC A06/MF A01.

This monthly away-from-reactor (AFR) report on spent fuel storage covers the following areas: planning and management; facility acquisition; legislative requirements; technical support; transportation, and international activity. The planning and management section provides a general statement of monthly activities which are itemized under that applicable program area. Specific program objectives, associated project activity and cost and milestone charts are provided. Some of the highlights of this report are: under facility acquisition, a reinforced concrete buttress outside of the basin wall has been selected as the best method for supporting the south wall in the event of add-on pool construction at the Morris operation; under legislative requirements, a formal draft of the fee report for Congress, Department of Energy Fee and Cost Studies of Spent Nuclear Fuel Storage and Disposal has been issued and is being reviewed internally; under technical support, the Technical Data Summary for AFR safeguards and non-proliferation concerns has been issued, and John Hopkins University is continuing work on streamlining computer

programs and developing and testing methods to address timing and capacity considerations in the AFR site selection; under transportation, Sandia Laboratories conducted high-velocity impact tests on spent fuel to determine released product dispersion, and has developed a computer model to evaluate the thermal transient inside a spent fuel cask during and after an accident; and under international activity, a US proposal for a work plan and allocation of tasks for the Pacific Basin feasibility study has been transmitted to the Japanese team to prepare for the initial joint working level meeting in October.

200 (DOE/SR-SF--20005-5) MONTHLY AWAY-FROM REACTOR SPENT FUEL STORAGE REORT AFR PROGRAM. (Department of Energy, Aiken, SC (USA). Savannah River Operations Office). May 1980. 66p. NTIS, PC A04/MF A01.

The program covered planning and management, facility acquisition, legislative requirements, technical support, transportation, and international activities. (DLC)

201 (DP-MS--79-71) FEDERAL FEES AND CONTRACTS FOR STORAGE AND DISPOSAL OF SPENT LWR FUEL. Clark, H.J. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1979. Contract EY-76-C-09-0001. 18p. (CONF-791108--3). Dep. NTIS, PC A02/MF A01.

From 72. AICHE meeting; San Francisco, CA, USA (25 Nov 1979).

The methodology for establishing a fee for federal spent fuel storage and disposal services is explained along with a presentation of the cost centers and cost data used to calculate the fee. Results of the initial fee calculation and the attendant sensitivity studies are also reviewed. The current status of the fee update is presented. The content of the proposed contract for federal services is briefly reviewed.

202 (DP-MS--80-31) LICENSING OF AWAY-FROM-REACTOR (AFR) INSTALLATIONS. Gray, P.L. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 18p. (CONF-800943--9). NTIS, PC A02/MF A01.

From National topical meeting of fuel cycles for the 80's; Gatlinburg, TN, USA (29 Sep 1980).

Storage of spent fuel at Away-From-Reactor (AFR) installations will allow reactors to continue to operate until reprocessing or other fuel disposal means are available. AFR installations must be licensed by the Nuclear Regulatory Commission (NRC). Although wide experience in licensing reactors exists, the licensing of an AFR installation is a relatively new activity. Only one has been licensed to date. This paper delineates the requirements for licensing an AFR installation and projects a licensing schedule. Because the NRC is developing specific AFR requirements, this schedule is based primarily on draft NRC documents. The major documents needed for an AFR license application are similar to those for a reactor. They include: a Safety Analysis Report (SAR), and Environmental Report (ER), safeguards and security plans, decommissioning plans, proposed technical specifications, and others. However, the licensing effort has one major difference in that for AFR installations it will be a one-step effort, with follow-up, rather than the two-step process used for reactors. The projected licensing schedule shows that the elapsed time between filing an application and issuance of a license will be about 32 months, assuming intervention. The legal procedural steps will determine the time schedule and will override considerations of technical complexity. A license could be issued in about 14 months in the absence of intervention.

203 (DPSP-AFR--79-6-3) STATUS OF AWAY FROM REACTOR SPENT FUEL STORAGE PROGRAM. King, F.D. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). Jul 1979. Contract EY-76-C-09-0001. 6p. (CONF-791108--9). Dep. NTIS, PC A02/MF A01.

From 72. AICHE meeting; San Francisco, CA, USA (25 Nov 1979).

The Away From Reactor (AFR) Spent Fuel Program that the US Department of Energy established in 1977 is intended to preclude the shutting down of commercial nuclear power reactors because of lack of storage space for spent fuel. Legislation now being considered by Congress includes plans to provide storage space for commercial spent fuel beginning in 1983. Utilities are being encouraged to provide as much storage space as possible in their existing storage facilities, but projections indicate that a significant amount of AFR storage will be required. The government is evaluating the use of both existing and new storage facilities to solve this forecasted storage problem for commercial spent fuel.

204 (DPST--77-458) COMPUTER MODEL FOR LWR FUEL STORAGE. Brotherton, J. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 30 Sep 1977. Contract EY-76-C-09-0001. 75p. Dep. NTIS, PC A04/MF A01.

Portions of document are illegible.

WATER COOLED REACTORS;FUEL POOLS;SPENT FUEL STORAGE;FUEL CYCLE;FORECASTING;INVENTORIES; TRANSPORT

205 (GA-A--15828) EVALUATION OF FSV-1 CASK FOR THE TRANSPORT OF LWR IRRADIATED FUEL ASSEMBLIES. (General Atomic Co., San Diego, CA (USA)). May 1980. Contract AT03-80SF10791. 180p. (TTC--0119). NTIS, PC A09/MF A01.

The Model FSV-1 spent fuel shipping cask was designed by General Atomic Company (GA) to service the Fort St. Vrain (FSV) nuclear generating station, a High Temperature Gas Reactor (HTGR) owned and operated by Public Service Company of Colorado (PSC). This report presents an evaluation of the suitability of the FSV-1 cask for the transport of irradiated Light Water Reactor (LWR) fuel assemblies from both Pressurized Water Reactors (PWR) and Boiling Water Reactors (BWR). The FSV-1 cask evaluation parameters covered a wide spectrum of LWR fuel assemblies, based on burnup in Megawatt Days/Metric Ton of Heavy Metal (MWD/MTHM) and years of decay since irradiation. The criteria for suitability included allowable radiation dose rates, cask surface and interior temperatures and the Gross Vehicle Weight (GVW) of the complete shipping system.

206 (HEDL-SA--1890-FP) ROLE OF SPENT FUEL CHARACTERIZATION IN THE DEVELOPMENT OF SAFE REPOSITORIES. Fish, R.L.; Davis, R.B.; Cantley, D.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1979. Contract EY-76-C-14-2170. 25p. (CONF-791033--8). Dep. NTIS, PC A02/MF A01.

From 1. annual ONWI information meeting; Columbus, OH, USA (30 Oct 1979).

Portions of document are illegible.

Objective is to understand the spent fuel

performance. In order to do this, we must quantify the spent fuel characteristics at various time intervals during specific field and laboratory tests. This spent fuel characterization is used to identify and describe mathematically the degradation modes experienced during the tests. Incorporation of these descriptions into the more comprehensive spent fuel performance prediction model will aid in the overall licensing of repositories for permanent disposal of the spent fuel waste form.

207 (HEDL-SA--1891-FP) SPENT FUEL: PREDICTION MODEL DEVELOPMENT. Almassy, M.Y.; Bosi, D.M.; Cantley, D.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1979. Contract EY-76-C-14-2170. 29p. (CONF-791033--6). Dep. NTIS, PC A03/MF A01.

From 1. annual ONWI information meeting; Columbus, OH, USA (30 Oct 1979).

Portions of document are illegible.

The need for spent fuel disposal performance modeling stems from a requirement to assess the risks involved with deep geologic disposal of spent fuel, and to support licensing and public acceptance of spent fuel repositories. Through the balanced program of analysis, diagnostic testing, and disposal demonstration tests, highlighted in this presentation, the goal of defining risks and of quantifying fuel performance during long-term disposal can be attained.

208 (HEDL-SA--2054-FP) ELEVATED TEMPERATURE TESTING OF SPENT NUCLEAR FUEL RODS. Stellrecht, D.E.; Pasupathi, V.; Krogness, J.C. (Battelle Columbus Labs., OH (USA); Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1980. Contract AC14-76FF02170. 20p. (CONF-800607--64). NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

The results of the first three tests have indicated that the experimental equipment designed for this program has functioned well and that the equipment and techniques constitute a viable test method for determining the stability of spent nuclear fuel rods at elevated temperatures. Test capsules are reusable and additional testing is feasible.

209 (HEDL-SA--2138) SPENT FUEL RESISTANCE TO INTERNALLY PRODUCED CLADDING DEGRADATION. Einziger, R.E.; Cantley, D.A.; Krogness, J.C.; Stellrecht, D.E.; Pasupathi, V. (Westinghouse Hanford Co., Richland, WA (USA); Battelle Columbus Labs., OH (USA)). May 1980. Contract AC14-76FF02170. 15p. (CONF-8005107--1). NTIS, PC A02/MF A01.

From Alternate waste form information workshop; Gatlinburg, TN, USA (13 May 1980).

These tests were conducted over a narrow temperature range considerably above anticipated disposal conditions and utilized only one set of rods from a single reactor. The following conclusions are made: The measured cladding strain was sufficiently large so that failure mechanism verification by inducing breaches in unmodified rods heated to elevated temperatures for short periods of time does not appear to be practical based on a stress rupture mechanism. At the elevated test temperatures, though, Blackburn's formulization based on stress rupture gives very conservative estimates of breach times. In addition to the high cladding strain, the fuel exhibited no additional gas release or axial fission product migration at 482°C. The nondestructive examination gave no additional indication of internal deterioration of the fuel rod.

210 (HEDL-TC--1331) MATERIALS INTERACTION TEST SUMMARY DESCRIPTION. Krogness, J.C. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1980. Contract EY-76-C-14-2170. 14p. Dep. NTIS, PC A02/MF A01.

The Materials Interaction Test is designed to provide early scoping data on host rock performance and interaction between nuclear waste canister materials and host repository media under conditions representative of expected disposal environments. Capsules containing these materials were put in a spent fuel assembly and subsequently placed in a disposal test to study behavior in a low-level radiation environment at temperatures expected to range between 300 and 400°F. Thermal control capsules are being exposed in laboratory furnaces to allow a determination and separation of thermal and radiation effects. Post-test specimen examinations are planned to determine material property changes and interaction effects and provide data for understanding the effectiveness of host rock, canister, and cladding materials in long-term waste isolation.

211 (HEDL-TC--1334(Rev.1)) SPENT FUEL CHARACTERIZATION PLAN FOR DRY SURFACE STORAGE DEMONSTRATION TESTS. Krogness, J.C. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1980. Contract EY-76-C-14-2170. 13p. Dep. NTIS, PC A02/MF A01.

Pre- and post-test examinations are planned for spent fuel assemblies to be placed in Dry Surface Storage Demonstration (DSSD) tests at the Nevada Test Site (NTS). Selected spent fuel assemblies are being characterized to determine the condition of the assemblies and fuel rods prior to packaging for disposal. At the end of the two to five year DSSD program, the spent fuel assemblies will undergo a post-test characterization for analysis and comparison with pre-test examination data. Data obtained from these as well as from other demonstration tests and laboratory spent fuel tests will be used to develop a performance prediction model for spent fuel disposal.

212 (HEDL-TME--78-58) SPENT FUEL INTEGRITY DURING TRANSPORTATION. Funk, C.W.; Jacobson, L.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1980. Contract EY-76-C-14-2170. 54p. Dep. NTIS, PC A04/MF A01.

The conditions of recent shipments of light water reactor spent fuel were surveyed. The radioactivity level of cask coolant was examined in an attempt to find the effects of transportation on LWR fuel assemblies. Discussion included potential cladding integrity loss mechanisms, canning requirements, changes of radioactivity levels, and comparison of transportation in wet or dry media. Although integrity loss or degradation has not been identified, radioactivity levels usually increase during transportation, especially for leaking assemblies.

213 (HEDL-TME--79-20) SPENT FUEL DATA FOR WASTE STORAGE PROGRAMS. Greene, E.M. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1980. Contract AC14-76FF02170. 102p. NTIS, PC A06/MF A01.

Data on LWR spent fuel were compiled for dissemination to participants in DOE-sponsored

waste storage programs. Included are mechanical descriptions of the existing major types of LWR fuel assemblies, spent LWR fuel fission product inventories and decay heat data, and inventories of LWR spent fuel currently in storage, with projections of future quantities.

214 (INFCE/DEP/WG--7/5) PACKAGING OF LWR SPENT FUEL FOR GEOLOGIC REPOSITORIES. (INFCE (USA)). Sep 1979. 17p. NTIS (US Sales Only), PC A02/MF A01.

One of the waste forms considered for geologic disposal by the INFCE Working Group 7 is spent, unreprocessed fuel from the Light Water Reactor (LWR) fuel cycle. This report describes a concept for a facility designed to package spent fuels from both Boiling-Water Reactors (BWR) and Pressurized-Water Reactors (PWR) in sealed, steel canisters, filled with helium, as assumed by the INFCE Working Group 7. Many features of the conceptual facility would be applicable for more complex, alternative packaging methods that are also briefly discussed. These methods include alternatives varying from simple, single-wall canisters to complex, multi-wall containers. Filler or stabilizer materials in the containers may involve solid metals (e.g., lead); solid nonmetallic materials or particulate materials. The use and selection of these filler or stabilizer materials, as well as the materials used for the canister, need to be evaluated from a systems viewpoint. The choices are dependent upon the role these materials might play in the multiple barrier system designed to isolate the radionuclides in the spent fuel and the degree of redundant safety desired by a particular country for a particular geologic situation.

215 (INIS-mf--4765) HANDLING FINAL STORAGE OF UNREPROCESSED SPENT NUCLEAR FUEL. I. GENERAL. (Kaernbraenslesaekerhet, Stockholm (Sweden)). 1978. 111p. Dep. NTIS (US Sales Only), PC A06/MF A01.

The present second report from KBS describes how the safe final storage of spent unreprocessed nuclear fuel can be implemented. According to the Swedish Stipulation Law, the owner must specify in which form the waste is to be stored, how final storage is to be effected, how the waste is to be transported and all other aspects of fuel handling and storage which must be taken into consideration in judging whether the proposed final storage method can be considered to be absolutely safe and feasible. Thus, the description must go beyond general plans and sketches. The description is therefore relatively detailed, even concerning those parts which are less essential for evaluating the safety of the waste storage method. For those parts of the handling chain which are the same for both alternatives of the Stipulation Law, the reader is referred in some cases to the first report. Both of the alternatives of the Stipulation Law may be used in the future. Handling equipment and facilities for the two storage methods are so designed that a combination in the desired proportions is practically feasible. In this first part of the report are presented: premises and data, a description of the various steps of the handling procedure, a summary of dispersal processes and a safety analysis.

216 (INIS-mf--5010) HANDLING OF FINAL STORAGE OF UNREPROCESSED SPENT NUCLEAR FUEL. 2. TECHNICAL. (Kaernbraenslesaekerhet, Stockholm (Sweden)). 1978. 325p. Dep. NTIS (US Sales Only), PC A15/MF A01.

In this report the various facilities incorporated in the proposed handling chain for spent fuel from the power stations to the final repository are cescribed. Thus the geological conditions which are essential for a final repository are discussed as well as the buffer and canister materials and how they contribute towards a long-term isolation of the spent fuel. Furthermore one chapter deals with leaching of the deposited fuel in the event that the canister is penetrated as well as the transport mechanisms which determine the migration of the radioactive substances through the buffer material. The dispersal processes in the geosphere and the biosphere are also described together with the transfer mechanisms to the ecological systems as well as radiation doses. Finally a summary is given of the safety analysis of the proposed method for the handling and final storage of the spent fuel.

217 (INIS-mf--5013, pp 29-58) HANDLING AND FINAL STORAGE OF UNREPROCESSED SPENT NUCLEAR FUEL. [nd].

Safe handling and storage of high level radioactive waste. A condensed version of the proposals of the Swedish KBS-Project regarding reprocessing waste, spent fuel.

The following stages in the handling of the fuel on its way to final storage are proposed in this report. 1) The spent fuel is stored at the nuclear power plant for at least six months. 2) The fuel is then transported to a central storage facility for spent nuclear fuel, where it is stored for 40 years. 3) The fuel is transported to an encapsulation station located above ground in connection with the final repository. Here the fuel rods are separated from the other parts of the fuel assemblies. The fuel rods are enclosed in copper canisters and the cavities are filled up with lead. Other radioactive material is embedded in concrete cubes. 4) The copper canisters are taken to a final repository which is built at a depth of approximately 500 metres in the bedrock. The copper canisters are surrounded by blocks of highly compacted bentonite - a clay which possesses very low permeability and which swells considerably upon absorbing water. 5) The facility can be kept open as long as surveillance is deemed desirable. It is then sealed by filling all tunnels and shafts with a mixture of quartz sand and bentonite. 6) The concrete cubes containing the metal components of the fuel assemblies are deposited in a separate repository at a depth of 300 metres in the bedrock. This repository is sealed with concrete, sand and bentonite.

218 (INIS-mf--5565, pp 54-61) PROBLEMS OF SPENT NUCLEAR FUEL TRANSPORT. Kondrat'ev, A.N.; Kalinin, B.V.; Mikhajlov, G.V.; Popov, V.A.; Yulikov, E.I. 1977. (In Russian).

From 4. symposium on study into irradiated fuel reprocessing; Karlovy Vary, Czechoslovakia (28 Mar 1977).

The experience in the field of spent nuclear fuel transportation in the CMEA member-states and also in France, West Germany and the USA is reviewed. Represented are some characteristics of transportation casks, railway wagons and spent assemblies with the storage time ranging from 0.5 to 3 years.

219 (INIS-mf--5569, pp 164-173) SPENT NUCLEAR FUEL SHIPMENT. Arkhipovskii, Yu.I.; Burlakov, V.A.; Kondrat'ev, A.N.; Lyubimov, E.D.; Markovin, A.P. 1975. (In Russian).

From 3. CMEA symposium on investigations in the field of spent fuel reprocessing; Marianske Lazne, Czechoslovakia (24 Apr 1974).

The world experience in spent nuclear fuel shipments is summarized. Major attention is paid to the development of safe, reliable and economical casks, to the choice of the most efficient spent fuel transport (motorway, railway and maritime) and to some international legal and organizational aspects of the problem. Among those considered are both ''dry'' and ''wet'' designs of casks with different biological shields from gamma radiation (steel, lead, depleted uranium) and neutrons (boron, cadmium, water) and different cooling systems. Limits on cask weight and optimum time of spent fuel storage before shipment influence heavily the choice of a particular material, design and dimensions of casks.

220 (K/OP--268) UTILIZATION OF PROBABILISTIC NETWORK ANALYSES IN PLANNING LONG-RANGE ENGINEERING PROJECTS. Swindle, D.W. Jr.; Gift, E.M.; Bustamante, F.M. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). 6 Sep 1979. Contract W-7405-ENG-26. 10p. (CONF-791207--1). Dep. NTIS, PC A02/MF A01.

From Winter simulation conference; San Diego, CA, USA (3 Dec 1979).

The application of the GERT (Graphical Evaluation and Review Technique) probabilistic network analysis technique and the results obtained from a program analysis using GERT is discussed. A historical summary of decision analysis techniques leading to the development and application of GERT is included. Discussion is provided on the GERT methodology, study rationale, and results of an analysis examining the Receiving and Storage Task at the Oak Ridge National Laboratory. Long-range program planning advantages using GERT are identified and discussed as relates to the methodology's decision analysis capability.

221 (KBS-TR--108) CRITICALITY IN A SPENT FUEL REPOSITORY IN WET CRYSTALLINE ROCK. Behrenz, P.; Hannerz, K. (Kaernbraenslesaekerhet, Stockholm (Sweden)). May 1978. 65p. Dep. NTIS (US Sales Only), PC A05/MF A01.

The KBS project proposes a method for final disposal of spent fuel as waste in a repository in deep mined cavities in wet crystalline rock. Such a repository would contain large amounts of fissile nuclides. This report considers the risks associated with assembly of these nuclides into critical configurations. Any criticality incident must be preceded by penetration of the long lived copper canisters surrounding the spent fuel waste, the life of which has been estimated to hundreds of thousands of years. Hence canister failure at a time where sufficient amounts of plutonium 239 still remain is already an unlikely event. It turns out that in order to create a situation where criticality with this nuclide could take place subsequent to canister failure several other unlikely conditions have to be simultaneously assumed. Thus the overall probability of the occurence of criticality is vanishingly small. Criticality with uranium 235 involves time perspectives far longer than are otherwise considered in connection with nuclear waste disposal. For geometric and other reasons it has to take place within the mined cavities of the repository, i.e. the deposition holes for the canisters or the tunnels above them. In fact, the senarios leading to criticality incidents in the repository are based on so unlikely assumptions that they border on physical impossibilities and would hardly merit consideration in an ordinary safety analysis. The sole reason for discussing them at length in this report is the fact that statements are frequently appearing in the literature and public debate claiming that criticality represents a major hazard in geologic disposal of spent fuel. The conclusion of this report is that, at least as far as the KBS proposal is concerned, such claims can be dismissed and that the total risk potential associated with criticality incidents in the repository can be considered negligible.

222 (LA--7969-PR) FISSION PRODUCT RELEASE. PROGRESS REPORT, APRIL 1-JUNE 30, 1979. Norris, A.E. (comp.). (Los Alamos Scientific Lab., NM (USA)). Aug 1979. Contract W-7405-ENG-36. 15p. (ONWI/Sub--79/E511-01200-12). Dep. NTIS, PC A02/MF A01.

Experiments continued this quarter to measure the rates of leaching reactor products from spent UO_2 fuel under oxidizing and reducing conditions. One pair of spent fuel wafers was leached in deionized water for 65 days at 25°C. Then the temperature was raised to 70°C. Lanthanide and actinide elements were observed to be leached at one-tenth the rate under reducing conditions at 25°C than under oxidizing conditions. At 70°C, the rates of leaching these elements decreased. After 30 days at the higher temperature, the differences between oxidizing and reducing conditions no longer were apparent in the leach rate data. A second pair of spent fuel wafers was leached at 25°C under the same conditions as the first pair. Duplicate results were obtained. In experiments to measure the rate of dissolution of finely divided UO_2 in deionized water, values of 9×10^{-7} and 6×10^{-7} g $cm^{-2}day^{-1}$ were obtained at a pH of 4.1 and an Eh of +0.5 V. Similar measurements were made at an Eh of -0.15 V, but the data could not be interpreted in terms of a UO_2 dissolution rate.

223 (LA--8237-PR) SPENT-FUEL STORAGE FACILITY PROJECT. PROGRESS REPORT, JUNE 1-SEPTEMBER 30, 1979. Cobb, D.D. (comp.). (Los Alamos Scientific Lab., NM (USA)). Jun 1980. Contract W-7405-ENG-36. 37p. NTIS, PC A03/MF A01.

The Los Alamos Scientific Laboratory (LASL) safeguards groups (Q-1, Q-2, Q-3, Q-4, and Q-5) and the nuclear data group (T-2) are participating in the US Department of Energy Away-From-Reactor Spent-Fuel Storage Program. This report presents the status of the LASL Spent-Fuel Storage Facility Project being performed under the direction of Savannah River Laboratory. Four task areas are: concept development, spent-fuel assay, spent-fuel verification, and automated data-base management.

224 (LA--8463-MS) IRRADIATED FUEL INSPECTION IN A STORAGE POND WITH NO FUEL MOVEMENT AND AN UNCOLLIMATED DETECTOR. Rinard, P.M. (Los Alamos Scientific Lab., NM (USA)). Jul 1980. Contract W-7405-ENG-36. 25p. NTIS, PC A02/MF A01.

It is assumed that the assemblies are not to be moved during the inspection in order to reduce the time required. The task is simplified further when the detector is well collimated. If the collimation is insufficient to respond to only one assembly from among an array of fuel assemblies, then an unfolding process is needed. A formulation of the detector's behavior is given followed by an unfolding process to yield the detector's response to each assembly as if it were isolated. Some simulated arrays are used to illustrate the sensitivity of the procedure to normal fluctuations in the measured quantities. Measurements with an ionization chamber on

actual arrays of up to fourteen PWR assemblies are treated to provide a realistic application of the unfolding process. An unfolding technique is essential with a poorly collimated detector, but the examples warn that weak source strengths surrounded by much stronger sources will not be accurately recovered and even the detection of voids is thus uncertain. Some simulated arrays of up to 100 assemblies indicate that unacceptably inaccurate results may be caused by even the small normal fluctuations in measured values. Any use of an unfolding process is thus quite limited.

225 (NEDG--21889) SPENT FUEL RECEIPT AND STORAGE AT THE MORRIS OPERATION. Astrom, K.A.; Eger, K.J. (General Electric Co., San Jose, CA (USA). Nuclear Energy Div.). Jun 1978. Contract EY-76-C-04-0789. 95p. Dep. NTIS, PC A05/MF A01.

Operating and maintenance activities in an independent spent fuel storage facility are described, and current regulations governing such activities are summarized. This report is based on activities at General Electric's licensed storage facility located near Morris, Illinois, and includes photographs of cask and fuel handling equipment used during routine operations.

226 (NTIS/PS--79/0704) HAZARDOUS MATERIALS TRANSPORTATION. PART 2. RADIOACTIVE MATERIALS AND WASTES (CITATIONS FROM THE NTIS DATA BASE). REPORT FOR 1964-APR 1979. Carrigan, B. (National Technical Information Service, Springfield, VA (USA)). Jul 1979. 174p. NTIS PCN01/MF N01.

The bibliography cites studies on the hazards, risks, and uncertainty of transporting radioactive wastes and materials. The design of shipping containers and special labels for identification purposes for transporting fuels and wastes are also cited. Studies are included on legislation dealing with the safety and health of the population and the environmental problems associated with transporting radioactive materials. (This updated bibliography contains 167 abstracts, 27 of which are new entries to the previous edition.)

227 (NUREG/CR--0956) COMMENTARY ON SPENT FUEL STORAGE AT MORRIS OPERATION. Eger, K.J.; Zima, G.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Oct 1979. Contract EY-76-C-06-1830. 122p. (PNL--3065). Dep. NTIS, PC A06/MF A01.

The General Electric Company is providing technical support to Battelle Pacific Northwest Laboratories in the analysis of the design, operation, and maintenance experience in the handling of nuclear fuel at the Independent Spent Fuel Storage Facility. The purpose of this report is to provide a description of spent fuel handling activities and systems, and an analysis of the storage performance as developed over the seven year operational history of the Morris Operation. Design considerations and performance are analyzed for both the basin and key supporting systems. The bases for this analysis are the provisions for containing radioactive by-product materials, for shielding from the radiation they emit, and for preventing the formation of a critical array. These provisions have been met effectively over the history of storage at Morris. The release of radioactive materials is minimized by the protection of the cladding integrity, the containment of the basin water, the removal of radioactive and other contaminants from the water, and by filtering and then dispersing the basin air. Four auxiliary systems are provided to accomplish this, the basin leak detection system, the filter, the coolers, and the building ventilation system. This successful history notwithstanding, action to reduce personnel exposure, to improve fuel handling reliability and to lessen the potential for accidents continues to be taken.

228 (NUREG/CR--1312) METHODS FOR EVALUATING THE LEAK TIGHTNESS OF SPENT FUEL CONTAINER CLOSURES. Benda, B.J.; Langland, R.T. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Feb 1980. Contract W-7405-ENG-48. 137p. (UCRL--52738). Dep. NTIS, PC A07/MF A01.

Quarter- and half-scale configurations of five different seal-flange hardware configurations were built, including: polymer O-rings, silver-coated hollow-metal O-rings, Conoseals, Grayloc seals, and Batzer seals. Using helium as a tracer gas, leak-rate tests were conducted under conditions simulating normal use of spent fuel containers. Leak rates were then correlated with such measured and calculated parameters as temperature, bolt load, seal-flange interface stress, and the differential pressure across the seal. Computer codes were developed, and analyses of the seal-flange configuration related bolt closure force to both seal-flange interface contact stress and surface area.

229 (NVO--210) SAFETY ASSESSMENT DOCUMENT FOR THE SPENT REACTOR FUEL GEOLOGIC STORAGE TEST IN THE CLIMAX GRANITE STOCK AT THE NEVADA TEST SITE. (Department of Energy, Las Vegas, NV (USA). Nevada Operations Office). Jan 1980. 250p. Dep. NTIS, PC A11/MF A01.

The objective of the Spent Fuel Geologic Storage Test in the Climax Granite Stock is to evaluate the response of a granitic rock mass to the underground storage of encapsulated spent reactor fuel in a geometry that simulates a module of a large-scale geologic repository. This document reports an assessment of the safety of conducting this test. Descriptions are provided of the geography, meteorology, hydrology, geology, and seismology of the Climax Site; the effects of postulated natural phenomena and other activities at the nevada Test Site on the safety of the test; and the design and operation of the test facility and associated equipment. Evaluations are made of both the radiological and nonradiological impacts of normal operations, abnormal operations, and postulated accidents. It is concluded that conduct of the spent fuel test at the Climax Site will not result in any undue risk to the public, property, environment, or site employees.

230 (ONWI--39(Vol.1)) ASSESSMENT OF LWR SPENT FUEL DISPOSAL OPTIONS. VOLUME 1. SUMMARY AND CONCLUSIONS. (Bechtel National, Inc., San Francisco, CA (USA)). Jul 1979. Contract EY-76-C-06-1830. 36p. Dep. NTIS, PC A03/MF A01.

The study identifies several spent fuel waste forms as well as the high level waste (HLW) and other waste forms from fuel reprocessing, defines facility and system design features to handle, transport, process, encapsulate, and dispose of these spent fuel and waste forms, and provides a comparative assessment of each of the spent fuel/waste alternatives with respect to technical feasibility, safeguards, criticality, radiological impact, retrievability, and economics. This volume provides the reader with a general overview of the study, coupled with

the specific conclusions developed from the comparative assessments of the study cases and study variations.

231 (ORNL/SUB--79/13866/1) FLEET SERVICING FACILITIES FOR SERVICING, MAINTAINING, AND TESTING RAIL AND TRUCK RADIOACTIVE WASTE TRANSPORT SYSTEMS: FUNCTIONAL REQUIREMENTS, TECHNICAL DESIGN CONCEPTS AND OPTIONS COST ESTIMATES AND COMPARISONS. Watson, C.D.; Hudson, B.J.; Keith, D.A.; Preston, M.K. Jr.; McCreery, P.N.; Knox, W.; Easterling, E.M.; Lamprey, A.S.; Wiedemann, G. (Allied-General Nuclear Services, Barnwell, SC (USA)). May 1980. Contract AC04-76DP00789; W-7405-ENG-26. 150p. NTIS, PC A07/MF A01.

This is a resource document which examines feasibility design concepts and feasibility studies of a Fleet Servicing Facility (FSF). Such a facility is intended to be used for routine servicing, preventive maintenance, and for performing requalification license compliance tests and inspections, minor repairs, and decontamination of both the transportation casks and their associated rail cars or tractor-trailers. None of the United States' waste handling plants presently receiving radioactive wastes have an on-site FSF, nor is there an existing third party facility providing these services. This situation has caused the General Accounting Office to express concern regarding the quality of waste transport system maintenance once the system is placed into service. Thus, a need is indicated for FSF's, or their equivalent, at various radioactive materials receiving sites. In this report, three forms of FSF's solely for spent fuel transport systems were examined: independent, integrated, and colocated. The independent concept was already the subject of a detailed report and is extensively referenced in this document so that capital cost comparisons of the three concepts could be made. These facilities probably could service high-level, intermediate-level, low-level, or other waste transportation systems with minor modification, but this study did not include any system other than spent fuel. Both the Integrated and Colocated concepts were assumed to be associated with some radioactive materials handling facility such as an AFR repository.

232 (ORNL/TM--7024) POSSIBILITY OF MULTIPLE TEMPERATURE MAXIMA IN GEOLOGIC REPOSITORIES FOR SPENT FUEL FROM NUCLEAR REACTORS. Beyerlein, S.W.; Claiborne, H.C. (Oak Ridge National Lab., TN (USA)). Jan 1980. Contract W-7405-ENG-26. 42p. Dep. NTIS, PC A03/MF A01.

Heat transfer studies show that two temperature maxima at the disposal horizon could be experienced in CANDU spent fuel repositories - one at about 60 years and another slightly higher one at 13,000 years. Because CANDU spent fuels display a monotonically decreasing heat generation rate, it is not immediately obvious why this behavior should occur. This report investigates this behavior, confirms the Canadian results, demonstrates that the double peak phenomenon is due to the presence of the right mixture of short- and long-lived nuclides in the fuel, and concludes that the 13,000-year maximum is largely an artifact of the infinite or very large plane source model. When more realistic repository geometries are used, the second peak disappears for repository sizes less than about 1 km^2. Over the long term, radial and surface heat transfer causes the thermal history of the disposal region to deviate from that predicted by infinite plane (or large finite) source models by reducing the magnitude of the second peak. Beyond a 1000-year time horizon, care should be exercised in modeling spent fuel repositories to include the proper boundary conditions. For the first few centuries after emplacement, however, the infinite source model is consistent with the finite disk source model as well as with arrays of spherical and point sources. The second temperature peak can be avoided by restricting the size of the repository and/or partitioning out the long-lived components of the fuel. When spent fuel from PWRs was examined for multiple temperature maxima, only one peak was found, even for the infinite plane source model.

233 (ORNL/TM--7170) TRANSPORTATION ANALYSIS FOR THE CONCEPT OF REGIONAL REPOSITORIES. Joy, D.S.; Hudson, B.J. (Oak Ridge National Lab., TN (USA)). Jun 1980. Contract W-7405-ENG-26. 84p. NTIS, PC A05/MF A01.

Over the past several years, planning associated with the National Waste Terminal Storage (NWTS) program assumed the use of one or two large, centrally located repository facilities. Recently, an alternative approach has been proposed which consists of the use of multiple, smaller regional repositories. In this report, several regional concepts were studied and the transportation requirements for the shipment of spent fuel to the regional repositories were estimated. In general, the transportation requirements decrease as the number of repositories increase. However, as far as transportation is concerned, the point of diminishing returns is reached at approximately one repository in each of three to four regions. Additional savings beyond this point are small. A series of sensitivity studies is also included to demonstrate the impact on the total transportation requirements of varying cask capacity, rail speed, or truck speed. Since most of the projected fuel shipments are to be made by rail, varying the capacity of the rail cask or varying average rail transport speed will have a major effect on overall transportation requirements.

234 (ORNL/TM--7179) OAK RIDGE NATIONAL LABORATORY SHIPPING CONTAINERS FOR RADIOACTIVE MATERIALS. Schaich, R.W. (Oak Ridge National Lab., TN (USA)). May 1980. Contract W-7405-ENG-26. 202p. NTIS, PC A10/MF A01.

Portions of document are illegible.

The types of containers used at ORNL for the transport of radioactive materials are described. Both returnable and non-returnable types are included. Containers for solids, liquids and gases are discussed. Casks for the shipment of uranium, irradiated fuel elements, and non-irradiated fuel elements are also described. Specifications are provided. (DC)

235 (PB--292599) A GENERIC ASSESSMENT OF BARGE TRANSPORTATION OF SPENT NUCLEAR FUEL. Unione, A.J.; Garcia, A.A.; Stuart, R. (Science Applications, Inc., Palo Alto, CA (USA)). Sep 1978. 280p. NTIS, PC A13/MF A01.

This generic study provides data and methodologies to evaluate the transportation of spent reactor fuel to reprocessing plants by barge or barge-rail intermodal/water methods. The probabilities of barge accidents are examined under different conditions and severities to evaluate the radiological consequences including radio-nuclide source term data. The study addresses operational methods, equipment requirements and availability, manpower regulations, radiological impacts, and the economics

associated with several different barge routes and barge-rail intermodal mixes. Also included are the estimated radiation doses to public personnel under normal operating conditions. Although the study specifically treats the shipment of fuel from reactors to reprocessing plants, the results are linked to intermodal/water transportation of spent fuel to interim or permanent storage facilities as well.

236 (PNL--2982) SPENT LWR FUEL LEACH TESTS: WASTE ISOLATION SAFETY ASSESSMENT PROGRAM. Katayama, Y.B. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Apr 1979. Contract EY-76-C-06-1830. 50p. Dep. NTIS, PC A03/MF A01.

Spent light-water-reactor (LWR) fuels with burnups of 54.5, 28 and 9 MWd/kgU were leach-tested in deionized water at 25°C. Fuel burnup has no apparent effect on the calculated leach rates based upon the behavior of ^{137}Cs and $^{239+240}Pu$. A leach test of 54.5 MWd/kgU spent fuel in synthetic sea brine showed that the cesium-based leach rate is lower in sea brine than in deionized water. A rise in the leach rate was observed after approximately 600 d of cumulative leaching. During the rise, the leach rate for all the measured radionuclides become nearly equal. Evidence suggests that exposure of new surfaces to the leachant may cause the increase. As a result, experimental work to study leaching mechanisms of spent fuel has been initiated. 22 figures.

237 (PNL--3017) OPPORTUNITIES TO INCREASE THE PRODUCTIVITY OF SPENT FUEL SHIPPING CASKS IN THE UNITED STATES. Winsor, G.H.; Faletti, D.W.; DeSteese, J.G. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Mar 1980. Contract AC06-76RL01830. 89p. (TTC--0078). NTIS, PC A05/MF A01.

Trends indicate that future transportation requirements for spent fuel will be different from those anticipated when the current generation of casks and vehicles was designed. Increased storage capacity at most reactors will increase the average post irradiation age of the spent fuel to be transported. A scenario is presented which shows the 18 casks currently available should be sufficient until approximately 1983. Beyond this time, it appears that an adequate transportation system can be maintained by acquiring, as needed, casks of current designs and new casks currently under development. Spent fuel transportation requirements in the post-1990 period can be met by a new generation of casks specifically designed to transport long-cooled fuel. In terms of the number of casks needed, productivity may be increased by 19% if rail cask turnaround time is reduced to 4 days from the current range of 6.5 to 8.5 days. Productivity defined as payloads per cask year could be increased 62% if the turnaround time for legal weight truck casks were reduced from 12 hours to 4 hours. On a similar basis, overweight truck casks show a 28% increase in productivity.

238 (PNL--3105) PACIFIC NORTHWEST LABORATORY (PNL) SPENT FUEL TRANSPORTATION AND HANDLING FACILITY MODELS. Andrews, W.B.; Bower, J.C.; Burnett, R.A.; Engel, R.L.; Rolland, C.W. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Sep 1979. Contract EY-76-C-06-1830. 80p. Dep. NTIS, PC A05/MF A01.

A spent fuel logistics study was conducted in support of the US DOE program to develop facilities for preparing spent unreprocessed fuel from commercial LWRs for geological storage. Two computerized logistics models were developed. The first one was the site evaluation model. Two studies of spent fuel handling facility and spent fuel disposal facility siting were completed; the first postulates a single spent fuel handling facility located at any of six DOE laboratory sites, while the second study examined siting strategies with the spent fuel repository relative to the spent fuel handling facility. A second model to conduct storage/handling facility simulations was developed. (DLC)

239 (PNL--3171) SPENT FUEL AND FUEL POOL COMPONENT INTEGRITY. ANNUAL REPORT, FY 1979. Johnson, A.B. Jr.; Bailey, W.J.; Schreiber, R.E.; Kustas, F.M. (Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1980. Contract EY-76-C-06-1830. 86p. Dep. NTIS, PC A05/MF A01.

International meetings under the BEFAST program and under INFCE Working Group No. 6 during 1978 and 1979 continue to indicate that no cases of fuel cladding degradation have developed on pool-stored fuel from water reactors. A section from a spent fuel rack stand, exposed for 1.5 y in the Yankee Rowe (PWR) pool had 0.001- to 0.003-in.-deep (25- to 75-μm) intergranular corrosion in weld heat-affected zones but no evidence of stress corrosion cracking. A section of a 304 stainless steel spent fuel storage rack exposed 6.67 y in the Point Beach reactor (PWR) spent fuel pool showed no significant corrosion. A section of 304 stainless steel 8-in.-dia pipe from the Three Mile Island No. 1 (PWR) spent fuel pool heat exchanger plumbing developed a through-wall crack. The crack was intergranular, initiating from the inside surface in a weld heat-affected zone. The zone where the crack occurred was severely sensitized during field welding. The Kraftwerk Union (Erlangen, GFR) disassembled a stainless-steel fuel-handling machine that operated for 12 y in a PWR (boric acid) spent fuel pool. There was no evidence of deterioration, and the fuel-handling machine was reassembled for further use. A spent fuel pool at a Swedish PWR was decontaminated. The procedure is outlined in this report.

240 (PNL--3261) APPLICATION OF ALARA PRINCIPLES TO SHIPMENT OF SPENT NUCLEAR FUEL. Greenborg, J.; Brackenbush, L.W.; Murphy, D.W. Burnett, R.A.; Lewis, J.R. (Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1980. Contract AC06-76RL01830. 99p. (TTC--0073). NTIS, PC A05/MF A01.

The public exposure from spent fuel shipment is very low. In view of this low exposure and the perfect safety record for spent fuel shipment, existing systems can be considered satisfactory. On the other hand, occupational exposure reduction merits consideration and technology improvement to decrease dose should concentrate on this exposure. Practices that affect the age of spent fuel in shipment and the number of times the fuel must be shipped prior to disposal have the largest impact. A policy to encourage a 5-year spent fuel cooling period prior to shipment coupled with appropriate cask redesign to accommodate larger loads would be consistent with ALARA and economic principles. And finally, bypassing high population density areas will not in general reduce shipment dose.

241 (PNL--3268) CRITICALITY SAFETY CONSIDERATIONS IN THE GEOLOGIC DISPOSAL OF SPENT NUCLEAR FUEL ASSEMBLIES. Gore, B.F.; McNair, G.W.; Heaberlin, S.W. (Battelle

Pacific Northwest Labs., Richland, WA (USA)). May 1980. Contract AC06-76RL01830. 53p. NTIS, PC A04/MF A01.

Features of geologic disposal which hamper the demonstration that criticality cannot occur therein include possible changes of shape and form, intrusion of water as a neutron moderator, and selective leaching of spent fuel constituents. If the criticality safety of spent fuel disposal depends on burnup, independent measurements verifying the burnup should be performed prior to disposal. The status of nondestructive analysis method which might provide such verification is discussed. Calculations were performed to assess the potential for increasing the allowed size of a spent fuel disposal canister if potential water intrusion were limited by close-packing the enclosed rods. Several factors were identified which severely limited the potential of this application. The theoretical limit of hexagonal close-packing cannot be achieved due to fuel rod bowing. It is concluded that disposal canisters should be sized on the basis of assumed optimum moderation. Several topics for additional research were identified during this limited study.

242 (PNL-SA--6519) PLACING THE SPECIAL TRAINS ISSUE IN PERSPECTIVE. Rhoads, R.E.; Chais, M.; DeSteese, J.G.; Loscutoff, W.V. (Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1978. Contract EY-76-C-06-1830. 7p. Dep. NTIS, PC A02/MF A01.

The contention of the Association of American Railroads (AAR) that special trains are necessary for handling spent fuel is discussed. These special trains would not move faster than 35 mph nor carry any nonradioactive freight. When a special train meets, passes, or is passed by another train, one train would stand still while the other moves past at a speed of less than 35 mph. The shippers feel these special trains are not necessary and that they would increase the cost of transporting spent fuel possible alternatives to the current standoff between railroads and shippers of radioactive material are mentioned.

243 (PNL-SA--6520) RISK OF TRANSPORTING SPENT NUCLEAR FUEL BY TRUCK. Elder, H.K.; Andrews, W.B.; Rhoads, R.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1978. Contract EY-76-C-06-1830. 10p. (CONF-780506--44). Dep. NTIS, PC A02/MF A01.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

Portions of document are illegible.

The risk methodology used to evaluate the risk in shipping spent fuel includes: 1) a description of the spent fuel transport system, 2) identification of potential release sequences, 3) evaluation of the probabilities and consequences of the releases, and 4) calculation and assessment of the risk. The system description includes projected industry characteristics, amounts to be shipped, shipping package descriptions, material characteristics, transport mode, transport routes used and weather and population distribution information. Release sequences are identified by fault tree analysis tehniques. Releases are evaluated using package failure data, normal transport and transport accident environment data and mathematical models for material dispersion and resultant health effects. This information is combined to calculate the shipping system risk which is compared to other known risks. The data may be further analyzed to determine the primary contributors to the risk and identify possible methods for reducing the risk, if the current risk level is judged by society to be unacceptable.

244 (PNL-SA--6521) ANALYSIS OF FREIGHT TRAIN ACCIDENT STATISTICS FOR 1972-1974. Murphy, E.S. (Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1978. Contract EY-76-C-06-1830. 8p. (CONF-780506--42). Dep. NTIS, PC A02/MF A01.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

Both train speed and dollar damage have been used in transportation studies as measures of accident severity. Analysis of freight train accident data for the three year period, 1972-74 showed that, in general, as speed increases dollar damage to railroad property also increases. A greater percentage of high speed than low speed accidents result in high dollar damage. Factors, in addition to speed, that can have an important effect on accident severity include the type of accident, the kinds of railcars and other equipment involved, and the geographical environmental of the accident. Threshold levels of accident stresses (e.g., impact and puncture forces and fire temperature and duration) are required to compromise the integrity of shipping containers used for the transport of radioactive materials. Analyses of accident severity using either speed or dollar damage as a basis can provide some insights into the possible risks involved in transport of radioactive materials. however, care must be taken in the strict use of results since there is no direct correlation between either speed or dollar damage and cask failure threshold levels.

245 (PNL-SA--6526) CONCEPTUAL DESIGN OF A SHIPPING CASK FOR RAIL TRANSPORT OF SOLIDIFIED HIGH LEVEL WASTE. Rhoads, R.E.; Peterson, P.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1978. Contract EY-76-C-06-1830. 7p. Dep. NTIS, PC A02/MF A01.

A shipping cask uniquely designed to transport solidified high level waste (SHLW) from reprocessing spent LWR fuel has not yet been developed. Battelle, Pacific Northwest Laboratory (PNL) has conducted a program for the Department of Energy to develop a conceptual design for a rail cask for transporting SHLW, and to produce models and graphical displays based on the conceptual design for use at technical meetings and in public information displays. The results of this work are summarized in this paper.

246 (PNL-SA--7344) NEAR SURFACE SPENT FUEL STORAGE: ENVIRONMENTAL ISSUES. Nelson, I.C.; Shipler, D.B.; McKee, R.W.; Glenn, R.D. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1979. Contract EY-76-C-06-1830. 20p. (CONF-791004--2). Dep. NTIS, PC A02/MF A01.

From ASCE national meeting; Atlanta, GA, USA (Oct 1979).

Interim storage of spent fuel appears inevitable because of the lack of reprocessing plants and spent fuel repositories. This paper examines the environmental issues potentially associated with management of spent fuel before disposal or reprocessing in a reference scenario. The radiological impacts of spent fuel storage are limited to low-level releases of noble gases and iodine. Water needed for water basin storage of spent fuel and transportation accidents are considered; the need to minimize the distance travelled is pointed out. Resource commitments for

construction of the storage facilities are analyzed.

247 (PNL-SA--7734) LONG-TERM LEACHING OF IRRADIATED SPENT FUEL. Katayama, Y.B.; Bradley, D.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1979. Contract AC06-76RL01830. 29p. (CONF-791112--68). NTIS, PC A03/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Spent Light Water Reactor (LWR) fuel with burnups of 9, 28 and 54 MWd/kg U were leach tested at 25°C in deionized water in a Paige apparatus. No discernible differences in leach rates were observed due to burnup. Additionally, the 28 MWd/kg U fuel was IAEA leach tested in five different leachants using the IAEA method. Deionized water gave the highest leach rates and a calcium chloride solution gave the lowest leach rates. An accelerated leaching period was observed during the Paige leach test of the 54 MWd/kg U spent fuel. Comparison between spent fuel and borosilicate waste glass leach rates was made. In sodium bicarbonate solution the leach rates are near equal and the glass becomes increasingly more durable with $CaCl_2$ solution, followed by sodium chloride solution, WIPP B brine and deionized water where the glass is two to three orders of magnitude more leach resistant than spent fuel. 16 figures.

248 (RFP--2862) NATIONAL WASTE TERMINAL STORAGE PROGRAM: CONTAINMENT SYSTEM CONCEPTS FOR TRANSPORTING TYPE B QUANTITIES OF TRANSURANIC WASTE. Rushton, R.J.; Merlini, R.J. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 14 Sep 1979. Contract EY-76-C-04-3533. 94p. Dep. NTIS, PC A05/MF A01.

A series of shipping containment system preliminary concepts for Type B quantities of transuranic waste have been formulated. The concepts were based on hypothetical accident protection requirements, potential waste forms, and selected hardware design/considerations. The concepts consist of suggested waste system containment configurations and construction material suggestions. Analysis of the concepts, based on such features as fabrication ease and cost, utility, and payload efficiency, revealed that concepts utilizing processed waste forms and/or disposable waste packages to provide a major portion of the required accident protection are most favorable.

249 (RFP--2982) CHEMISTRY RESEARCH AND DEVELOPMENT. PROGRESS REPORT, DECEMBER 1978-MAY 1979. Miner, F.J. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 30 Jun 1980. Contract AC04-76DP03533. 60p. NTIS, PC A04/MF A01.

Progress and activities are reported on component development, pilot plant development, and instrumentation and statistical systems. Specific items studied include processing of pond sludge, transport of radioactive materials and wastes, corrosion, decontamination and cleaning, fluidized-bed incineration, Pu contamination of soils, chemical analysis, radiometric analysis, security. (DLC)

250 (RHO-C--25(Vol.2)(Draft)) DRY WELL STORAGE FACILITY CONCEPTUAL DESIGN STUDY: ENVIRONMENTAL ASSESSMENT. REPORT NO. 79-8-R. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations; Kaiser Engineers, Oakland, CA (USA)). Feb 1979. Contract EY-77-C-06-1030; EY-76-C-06-2195. 37p. Dep. NTIS, PC A03/MF A01.

The Dry Well Storage Facility will receive canisters (packages) containing spent fuel assemblies from a Spent Fuel Receiving and Packaging Facility or a Packaged Fuel Transfer Facility and store them in dry wells. The reference site for this study will be adjacent to the 200-W Area at the Hanford Reservation on a plateau approximately six miles from the Columbia River. This report discusses the potential nonradiological and radiological impacts on the environment due to construction, operation, and decommissioning of the facility.

251 (RHO-LD--79-83-3Q) COMMERCIAL WASTE AND SPENT FUEL PACKAGING PROGRAM. QUARTERLY TECHNICAL PROGRESS REPORT, APRIL-JUNE 1979. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 1979. Contract EY-77C-06-1030. 33p. Dep. NTIS, PC A03/MF A01.

Objectives are to develop waste package criteria for all commerical waste types, develop a standardized demonstration package for spent fuel for dry well storage, study the performance of spent fuel assemblies under geologic storage conditions, and continue dry surface storage demonstration activities. This document reports activities during this time period. (DLC)

252 (RHO-LD--95) CLOSURE WELD DEVELOPMENT FOR SPENT FUEL CANISTERS. INTERIM REPORT. Tignac, L.L. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Jun 1979. Contract EY-77-C-06-1030. 27p. Dep. NTIS, PC A03/MF A01.

In the spent fuel receiving and packaging facility, spent fuel assemblies would be enclosed within heavy-walled carbon steel canisters, and caps would be welded onto the canisters such that the sealed canisters would meet the intent of requirements for coded pressure vessels. The entire canister sealing operation, including welding and weld inspection, would normally be conducted remotely in a shielded hot-cell. A weld development activity was initiated to investigate canister sealing operations and to provide design criteria and bases for the spent fuel receiving and packaging facility and the canister. The activity plan included laboratory evaluation of welding processes and weld inspection techniques. Full-scale demonstrations were planned to evaluate, develop, and demonstrate the remote handling aspects of the operation. In February 1979, direction was received to suspend the weld development activity and to store its associated records and materials.

253 (RHO-SA--136) SPENT FUEL RECEIVING AND PACKAGING FACILITY CONCEPTUAL DESIGN. Henry, K.H.; Kurzeka, W.J. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Oct 1979. Contract EY-77-C-06-1030. 8p. (CONF-791033--5). Dep. NTIS, PC A02/MF A01.

From 1. annual ONWI information meeting; Columbus, OH, USA (30 Oct 1979).

The Spent Unreprocessed Fuel (SURF) Program was initiated to provide facilities to receive and package the spent fuel, and to provide interim storage in surface structures with a passive cooling mode. This paper describes the conceptual design of the Receiving and Packaging Facility (RPF) module for that program. The design is also applicable to packaging spent fuel for geologic disposal.

254 (RHO-SA--141) STANDARDIZED EXPERIMENTAL PACKAGE FOR SPENT FUEL. Davis, J.M.; Smith, R.E. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Oct 1979. Contract EY-77-C-06-1030. 7p. (CONF-791033--4). Dep. NTIS, PC A02/MF A01.
From 1. annual ONWI information meeting; Columbus, OH, USA (30 Oct 1979).
Design requirements are set forth for a package for geologic disposal of spent fuel. Conceptual design has been completed and preliminary drop tests conducted. (DLC)

255 (SAND--79-1402) PROGRAM STRATEGY DOCUMENT FOR THE NUCLEAR MATERIALS TRANSPORTATION TECHNOLOGY CENTER. Jefferson, R.M. (ed.). (Sandia Labs., Albuquerque, NM (USA)). Jul 1979. Contract EY-76-C-04-0789. 122p. Dep. NTIS, PC A06/MF A01.
A multiyear program plan is presented which describes the program of the Nuclear Materials Transportation Technology Center (TTC) at Sandia Laboratories. The work element plans, along with their corresponding work breakdown structures, are presented for TTC activities in the areas of Technology and Information Center, Systems Development, Technology, and Institutional Issues for the years from 1979 to 1985.

256 (SAND--79-1424) POSTMORTEM METALLURGICAL EXAMINATION OF A FIRE-EXPOSED SPENT FUEL SHIPPING CASK. Rack, H.J.; Yoshimura, H.R. (Sandia Labs., Albuquerque, NM (USA)). Apr 1980. Contract EY-76-C-04-0789. 35p. NTIS, PC A03/MF A01.
A potmortem examination of a large fire-exposed rail-transported spent fuel shipping container has revealed the presence of two macrofissures in the outer cask shell. The first, a part-thru crack located within the seam weld fusion zone of the outer cask shell, was typical of hot cracks that may be found in stainless steel weldments. The second, located within the stainless steel base metal, apparently originated at microcracks formed during the welding of a copper-stainless steel dissimilar metal joint. The latter microcrack then propagated during the fire-test, ultimately penetrating the outer shall of the cask. 18 figures, 2 tables.

257 (SAND--79-1841) ALARA STUDIES ON SPENT FUEL AND WASTE CASKS. Sutherland, S.H. (Sandia Labs., Albuquerque, NM (USA)). Apr 1980. Contract EY-76-C-04-0789. 35p. (TTC--0050). Dep. NTIS, PC A03/MF A01.
In this report, some implications of applying the ALARA concept to cask designs for transporting spent fuel, high-level commercial and defense waste, and remote-handled transuranic waste are investigated. The XSDRNPM, one-dimensional radiation transport code, was used to obtain potential shield designs that would yield total dose rates at 1.8 m from the cask surface of 10, 5, and 2 mrem/h. Gamma shields of depleted uranium, lead, and steel were studied. The capacity of the casks was assumed to be 1, 4, or 7 elements or canisters, and the wastes were 1, 3, 5, and 10 years old. Depending on the dose rate, the cask empty weights and lifetime transportation costs were estimated.

258 (SAND--79-1929C) ENVIRONMENTAL EFFECTS ASSOCIATED WITH THE TRANSPORTATION OF RADIOACTIVE MATERIAL. McClure, J.D.; Pope, R.B.; Yoshimura, H.R. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 8p. (CONF-791112--20). Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
The primary aim of this paper has been to describe some of the background information concerning nuclear materials transportation systems, accident statistics, accident severities, and test information - all of which when combined yield an environmental statement of the risks associated with the transportation of radioactive materials. The results of the ultimate risk analysis are expressed in terms of numbers of fatalities and, in that sense at least, tend to be an absolute measure of risk. When these risks are compared with other accepted societal risks, the relative risks associated with radioactive material transportation can be established. This information can be used to make decisions at the governmental level and to inform an interested public about these risks. It can be concluded that the risks associated with the transportation of radioactive material are low relative to the other risks that society has already accepted.

259 (SAND--79-2262) PROCEEDINGS OF THE NUCLEAR MATERIALS TRANSPORTATION PROGRAM DEVELOPMENT SEMINAR. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 224p. (CONF-7904121--). Dep. NTIS, PC A10/MF A01.
From Nuclear materials transportation program development seminar; Albuquerque, NM, USA (18 Apr 1979).
This document includes viewographs (overview, systems developments, technology, information and institutional issues), discussions, workshop reports, points of agreement and action items, and independent summary.

260 (SAND--80-0061C) THERMAL ANALYSIS OF HNPF SPENT FUEL SHIPPING CONTAINER IN TORCH ENVIRONMENTS. Eggers, P.E.; Crawford, H.L.; Trujillo, A.A.; Pope, R.B.; Yoshimura, H.R. (Ridihalgh, Eggers and Associates, Columbus, OH (USA); Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 7p. (CONF-800723--23). NTIS, PC A02/MF A01.
From 19. national heat transfer conference; Orlando, FL, USA (27 Jul 1980).
A thermal analysis of a modified HNPF cask has been performed to predict cask temperatures in simulated torch fire environments. A portion of this analysis also provided a basis for the modifications leading to the design of external cooling fins, a pressure relief valve system, a spent fuel torch fire analyses will provide comparison with experimentally measured temperatures of the HNPF cask, in torch fire environments, which will be obtained in the future. Scope of this study was analytical in nature and involved the use of a computer-based heat transfer analysis methods. Product of this study is the prediction of cask temperatures and internal pressures under normal and torch-fire accident conditions. This study also involved an analysis of the torch fire literature in order to develop an empirically based thermal model for the torch environment. 8 figures, 3 tables.

261 (SAND--80-0062C) THERMAL RESPONSE MODELING OF A CONTACT-HANDLED TRANSURANIC WASTE SHIPPING CONTAINER SYSTEM TO A FIRE. Suchsland, K.E.; Kwong, K.C.; Fretter, E.F.; Boyd, R.D.; Auerbach, I.; Yoshimura, H.R. (Acurex Corp., Mountain View, CA (USA). Aerotherm Div.; Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract EY-

76-C-04-0789. 21p. (CONF-800723--5). NTIS, PC A02/MF A01.
From 19. national heat transfer conference; Orlando, FL, USA (27 Jul 1980).
Portions of document are illegible.
A one-dimensional thermal model has been developed to predict the response of a transuranic (TRU) waste shipping container accidentally exposed to a fire environment. The basic wall structure of the container consists of polyurethane foam (64 kg/m^3) sandwiched between two steel plates. The foam thermal model, based on high temperature experimental data, is developed for the case in which the virgin foam is in a nonoxidizing environment. The experimental results indicate that foam decomposition is highly heat rate dependent. At low quasi-steady heating rates, the foam changes to a bubbling black viscous liquid. At very high heating rates, pyrolysis gases are formed as the foam decomposes and a 20% (by weight) residual char remains. This porous char acts as a radiation shield which can significantly reduce thermal transport. In the case of a TRU shipping container wall, this char will slow the thermal penetration rate and drastically reduce the heat load to the container contents. When the front surface of the wall was subjected to 1333°K, numerical computations predict that after approximately 1800 s the foam temperature rise at a depth of 10.2 cm was less than 200 K (uncharred). After approximately 3600 s the foam temperature rise at a depth of 20.4 cm was 23°K. Typical waste contents temperature rise was predicted to be less than 56°K after 3600 s of heating.

262 (SAND--80-0085C) ASSESSMENT OF LMFBR SPENT FUEL SHIPPING CASK CONCEPTS FOR THE CRBRP AND THE US CONCEPTUAL DESIGN STUDY. Pope, R.B.; Ortman, J.M.; Eakes, R.G.; Leisher, W.B.; Dupree, S.A. (Sandia National Labs., Albuquerque, NM (USA); Los Alamos Technical Associates, Inc., NM (USA)). 1980. Contract AC04-76DP00789. 8p. (CONF-801115--3). NTIS, PC A02/MF A01.
From 6. international symposium on packaging and transporting radioactive material; Berlin, F.R. Germany (10 Nov 1980).
Study of conceptual shipping systems for CRBRP and CDS spent fuel has shown that systems significantly different from those used for LWR spent fuel will be required. In the conceptual design, liquid sodium was assumed to be the coolant in canisters containing the spent fuel assemblies, and multiple levels of containment were provided by canisters, an inner cask lid and an outer cask lid. Cask cooling at the reactor site during loading, and cooldown at the receiving site prior to unloading are significant but tractable problems.

263 (SAND--80-0761C) POST TEST EVALUATION OF A FIRE TESTED RAIL SPENT FUEL CASK. Rack, H.J.; Yoshimura, H.R. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 6p. (CONF-801115--2). NTIS, PC A02/MF A01.
From 6. international symposium on packaging and transporting radioactive material; Berlin, F.R. Germany (10 Nov 1980).
Postmortem examination of a large rail-transported spent fuel shipping cask which had been exposed to a JP-4 fuel fire revealed the presence of two macrofissures in the outer cask shell. One, a part-through crack located within the seam weld fusion zone of the outer cask shell, is typical of hot cracks found in stainless steel weldments. The other, a through-crack, was apparently initiated during the formation of a copper-stainless steel dissimilar metal joint, with crack propagation through the cask outer shell having occurred during the fire-test. 8 figures.

264 (SAND--80-0784) PROGRAM STRATEGY DOCUMENT FOR THE NUCLEAR MATERIALS. TRANSPORTATION TECHNOLOGY CENTER (FY 80). Jefferson, R.M. (ed.). (Sandia Labs., Albuquerque, NM (USA)). Apr 1980. Contract FY-76-C-04-0789. 260p. (TTC--0080). Dep. NTIS, PC A12/MF A01.
The TTC's program is divided into four principal areas, Technology and Information Center, Systems Development, Technology, and Institutional Issues. These areas are broken into activities, elements, and subelements which are delineated in this document.

265 (SAND--80-1633C) ANALYSIS AND MODEL TESTING OF A SUPER TIGER TYPE B WASTE TRANSPORT SYSTEM IN ACCIDENT ENVIRONMENTS. May, R.A.; Yoshimura, H.R.; Romesberg, L.E.; Joseph, B.J. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 4p. (CONF-801107--10). NTIS, PC A02/MF A01.
From ANS international conference; Washington, DC, USA (17 Nov 1980).
Sandia National Laboratories is investigating the response of a Type B packaging containing drums of contact-handled transuranic waste (CH-TRU) as a part of a program to evaluate the adequacy of experimental and analytical methods for assessing the safety of waste transport systems in accident environments. A US NRC certified Type B package known as the Super Tiger was selected for the study. This overpack consists of inner and outer steel shells separated by rigid polyurethane foam and can be used for either highway or rail transportation. Tests using scale models of the vehicular system are being conducted in conjunction with computer analyses.

266 (SAND--80-8021) SAFETY ANALYSIS REPORT FOR PACKAGING A DOT 7A SPECIFICATION CONTAINER FOR TRITIATED LIQUID WASTES. Alford, E. (Sandia National Labs., Livermore, CA (USA)). Aug 1980. Contract AC04-76DP00789. 24p. NTIS, PC A02/MF A01.
This Safety Analysis Report for Packaging (SARP) was prepared in accordance with ERDA (DOE) Appendix 5201 for DOE/ALO review and approval of packaging of tritiated liquid wastes to be shipped from Sandia National Laboratories, Livermore, (SNLL) California. This report presents information pertinent to the construction of tritiated liquid waste shipping containers. It contains design and development considerations, explains tests and evaluations required to prove the container can withstand normal transportation conditions, and demonstrates that the Sandia container-and-radioactive-material shipment package is in compliance with DOE and Department of Transportation (DOT) safety requirements. An internal review of this SARP has been performed in compliance with the ERDA (DOE) Manual, 5201 Appendix V.

267 (SRO--1051-1) ALTERNATIVES FOR WATER BASIN SPENT FUEL STORAGE: EXECUTIVE SUMMARY AND COMPARATIVE EVALUATION. Viebrock, J.M. (Nuclear Assurance Corp., Atlanta, GA (USA)). Sep 1979. Contract EW-78-C-09-1051. 140p. (NAC-C--7915). Dep. NTIS, PC A07/MF A01.
A five part report identifies and evaluates alternatives to conventional methods for water basin storage of irradiated light water reactor fuel assemblies (spent fuel). A recommendation is made for development or further evaluation

of one attractive alternative: Proceed to develop fuel disassembly with subsequent high density storage of fuel pins (pin storage). The storage alternatives were evaluated for emplacement at reactor, in existing away-from-reactor storage facilities and in new away-from-reactor facilities. In the course of the study, the work effort necessarily extended beyond the pool wall in scope to properly assess the affects of storage alternatives on AFT systems.

268 (SRO--1051-3) ALTERNATIVES FOR WATER BASIN SPENT FUEL STORAGE USING PIN STORAGE. Viebrock, J.M.; Carlson, R.W. (Nuclear Assurance Corp., Atlanta, GA (USA)). Sep 1979. Contract EW-78-C-09-1051. 109p. (NAC-C--7917). Dep. NTIS, PC A06/MF A01.

The densest tolerable form for storing spent nuclear fuel is storage of only the fuel rods. This eliminates the space between the fuel rods and frees the hardware to be treated as non-fuel waste. The storage density can be as much as 1.07 MTU/ft^2 when racks are used that just satisfy the criticality and thermal limitations. One of the major advantages of pin storage is that it is compatible with existing racks; however, this reduces the storage density to 0.69 MTU/ft^2. Even this is a substantial increase over the 0.39 MTU/ft^2 that is achievable with current high capacity stainless steel racks which have been selected as the bases for comparison. Disassembly requires extensive operation on the fuel assembly to remove the upper end fitting and to extract the fuel rods from the assembly skeleton. These operations will be performed with the aid of an elevator to raise the assembly where each fuel rod is grappled. Lowering the elevator will free the fuel rod for transfer to the storage canister. A storage savings of $1510 per MTU can be realized if the pin storage concept is incorporated at a new away-from-reactor facility. The storage cost ranges from $3340 to $7820 per MTU of fuel stored with the lower cost applying to storage at an existing away-from-reactor storage facility and the higher cost applying to at-reactor storage.

269 (SRO--1051-4) ALTERNATIVES FOR WATER BASIN SPENT FUEL STORAGE USING RACKED AND UNRACKED CONCEPTS. Viebrock, J.M.; Eggers, P.E. (Nuclear Assurance Corp., Atlanta, GA (USA)). Sep 1979. Contract EW-78-C-09-1051. 178p. (NAC-C--7918). Dep. NTIS, PC A09/MF A01.

Spent fuel storage alternatives to conventional racking were: core plate storage, horizontal racks, stacked racks, and unracked storage. (1) The parameter that controls storage density in water basin spent fuel storage is the spacing between fuel assemblies. One method which will permit closer spacing and greater storage density is to position poison materials within and/or between fuel assemblies by inserting control rods in all positions in PWR assemblies or placing poison plates between BWR assemblies similar to the control scheme used in reactors. This core-plate concept offers little or no improvement over the conventional poisoned storage racks currently in use. (2) Another method is to stack the racks into two tiers, hence, a double rack. This concept is not feasible for a new away-from-reactor facility because of the design limitation of 30 feet for the storage pool depth. Evaluation of the nuclear, thermal, and structural aspects of nonpoison type stacked rack storage indicates a maximum storage density of 0.78 MTU/ft^2 for PWR fuel assemblies and 0.80 MTU/ft^2 for BWR fuel assemblies. These stacked rack storage densities are based on filling every hole in both levels of storage racks; storage densities comparable to poison-type vertical storage racks can be achieved by filling every other hole (checkerboard pattern) and by minimizing the distance between adjacent assemblies. (3) The storage density of horizontal storage racks is controlled by the height of the stacked horizontal storage cells. (4) The storage density of unracked horizontal storage is controlled by the distance between fuel assemblies and the number of rows or levels of storage.

270 (SRO--1051-5) ALTERNATIVES FOR WATER BASIN SPENT FUEL STORAGE: GENERIC ISSUES. Viebrock, J.M.; Blackwood, M.J.; Genser, J.R.; Panter, H.R.; Ridihalgh, J.L.; Ward, J.R. (Nuclear Assurance Corp., Atlanta, GA (USA)). Sep 1979. Contract EW-78-C-09-1051. 138p. (NAC-C--7919). Dep. NTIS, PC A07/MF A01.

The need for fuel storage was examined and categorized storage concepts that provide increased density were categorized. During the categorization process it became apparent that several issues were common to all concepts, and they were separated from the rest for generic study: criticality, licensing considerations, materials and water chemistry. Section A documents the criticality analyses that were performed for both PWR and BWR fuel assemblies including the following parameters: enrichment, burnup, stainless steel thickness, Boral plate thickness, spacing between stainless steel canister and fuel assembly, and boron concentration in water. Results were used in the concept studies to identify acceptable storage rack design ranges and to provide a framework for the design optimization of spent fuel storage racks/canisters, in general. Section B deals with the licensing environment for spent fuel storage and goes into the past, present and future regulatory postures on both the state and federal levels. One of the limiting factors for storage density is the current set of criticality license criteria. It is recommended to have a unified set of criteria for away-from-reactor spent fuel storage which takes advantage of the inherent characteristics of both the fuel and the facility. Materials issues for long-term storage in a water basin system are evaluated in Section C for state-of-the-art and advanced concept storage methods. Section D deals with the water compatibility issues associated with spent nuclear fuel.

271 (UCID--18629) STRESSMETER PLACEMENT AT SPENT FUEL TEST IN CLIMAX GRANITE. Abey, A.E.; Washington, H.R. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 20 May 1980. Contract W-7405-ENG-48. 20p. NTIS, PC A02/MF A01.

Vibrating wire stressmeters were installed in the Spent Fuel Facility at the Nevada Test Site. These stressmeters will measure the changes in in situ stress during the five-year spent fuel test. Before installation, laboratory tests were conducted to study reproducibility of placement and to develop a program hopefully to reduce corrosion of the stressmeters while in place at the Spent Fuel Facility. These laboratory tests are discussed along with the installation of the stressmeters at the Spent Fuel Facility.

272 (UCID--18660) ADVANCED THREE-DIMENSIONAL THERMAL MODELING OF A BASELINE SPENT FUEL REPOSITORY. Altenbach, T.J.; Lowry, W.E. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 29 Apr 1980. Contract W-7405-ENG-48. 55p. Dep. NTIS, PC

A04/MF A01.

A three-dimensional thermal analysis using finite difference techniques was performed to determine the near-field response of a baseline spent fuel repository in a deep geologic salt medium. A baseline design incorporates previous thermal modeling experience and OWI recommendations for areal thermal loading in specifying the waste form properties, package details, and emplacement configuration. The base case in this thermal analysis considers one 10-year old PWR spent fuel assembly emplaced to yield a 36 kW/acre (8.9 W/m²) loading. A unit cell model in an infinite array is used to simplify the problem and provide upper-bound temperatures. Boundary conditions are imposed which allow simulations to 1000 years. Variations studied include a comparison of ventilated and unventilated storage room conditions, emplacement packages with and without air gaps surrounding the canister, and room cool-down scenarios with ventilation following an unventilated state for retrieval purposes. It was found that at this low-power level, ventilating the emplacement room has an immediate cooling influence on the canister and effectively maintains the emplacement room floor near the temperature of the ventilating air.

273 (UCRL--52918) METHOD FOR CALCULATING INTERNAL RADIATION AND VENTILATION WITH THE ADINAT HEAT-FLOW CODE. Butkovich, T.R.; Montan, D.N. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 1 Apr 1980. Contract W-7405-ENG-48. 17p. NTIS, PC A02/MF A01.

One objective of the spent fuel test in Climax Stock granite (SFTC) is to correctly model the thermal transport, and the changes in the stress field and accompanying displacements from the application of the thermal loads. We have chosen the ADINA and ADINAT finite element codes to do these calculations. ADINAT is a heat transfer code compatible to the ADINA displacement and stress analysis code. The heat flow problem encountered at SFTC requires a code with conduction, radiation, and ventilation capabilities, which the present version of ADINAT does not have. We have devised a method for calculating internal radiation and ventilation with the ADINAT code. This method effectively reproduces the results from the TRUMP multi-dimensional finite difference code, which correctly models radiative heat transport between drift surfaces, conductive and convective thermal transport to and through air in the drifts, and mass flow of air in the drifts. The temperature histories for each node in the finite element mesh calculated with ADINAT using this method can be used directly in the ADINA thermal-mechanical calculation.

274 (UCRL--83976) TEST STORAGE OF SPENT REACTOR FUEL IN THE CLIMAX GRANITE AT THE NEVADA TEST SITE. Ramspott, L.D.; Ballou, L.B. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 13 Feb 1980. Contract W-7405-ENG-48. 17p. (CONF-800313--5). Dep. NTIS, PC A02/MF A01.

From Waste management conference; Tucson, AZ, USA (10 Mar 1980).

A test of retrievable dry geologic storage of spent fuel assemblies from an operating commercial nuclear reactor is underway at the Nevada Test Site. This generic test is located 420 m below the surface in the Climax granitic stock. Eleven canisters of spent fuel approximately 2.3 years out of reactor core (about 2 kW/canister thermal output) will be emplaced in a storage drift along with 6 electrical simulator canisters and their effects will be compared. Two adjacent drifts will contain electrical heaters, which will be operated to simulate within the test array the thermal field of a large repository. The test objectives, technical concepts and rationale, and details of the test are stated and discussed.

275 (UNI-SA--74) RESTORATION OF AN IRRADIATED FUEL STORAGE FACILITY. Wahlen, R.K. (United Nuclear Industries, Inc., Richland, WA (USA)). 1980. Contract EY-76-C-06-1857. 13p. (CONF-800542--1). NTIS, PC A02/MF A01.

From Concrete decontamination workshop; Seattle, WA, USA (28 May 1980).

The irradiated fuel storage basin in the KW nuclear production reactor at the Hanford Site in Richland, Washington, was decontaminated and painted in preparation for converting the facility to storage of irradiated fuel from N reactor. Corrosion product, activation product, and some fission product built up in the basin over the years and was present in a layer of sludge about 3 inches deep on the basin floor. The solid waste was packaged in approved containers and buried in the 200 Area burial site on the Hanford Project. The concrete walls and pillars in the basin were decontaminated with a high-pressure aqua-blaster. Using a water jet, the sludge was flushed to a sump where it was picked up with a sludge pump and deposited in a crib which was formed in the basin area using a bulkhead to isolate the crib from the basin. After decanting the excess water from the sludge, it was pumped to a large tank designed to meet the burial and transport regulations. The tank containing the sludge was then transferred to the 200 Area burial site and placed in the burial trench. The cement walls, floor, and columns were painted with an epoxy paint. This paper reviews the procedures and techniques used in cleaning the storage basin.

276 (Y/OWI/SUB--77-22303/4) THERMOELASTIC ANALYSES OF SPENT FUEL REPOSITORIES IN BEDDED AND DOME SALT. TECHNICAL MEMORANDUM REPORT RSI-0054. Callahan, G.D.; Ratigan, J.L. (RE/SPEC, Inc., Rapid City, SD (USA)). 13 Oct 1978. Contract W-7405-ENG-26. 192p. Dep. NTIS, PC A09/MF A01.

Global thermoelastic analyses of bedded and dome salt models showed a slight preference for the bedded salt model through the range of thermal loading conditions. Spent fuel thermal loadings should be less than 75 kW/acre of the repository pending more accurate material modeling. One should first limit the study to one or two spent fuel thermal loading (i.e. 75 kW/acre and/or 50 kW/acre) analyses up to a maximum time of approximately 2000 years. Parametric thermoelastic type analyses could then be readily obtained to determine the influence of the thermomechanical properties. Recommendations for further study include parametric analyses, plasticity analyses, consideration of the material interfaces as joints, and possibly consideration of a global joint pattern (i.e. jointed at the same orientation everywhere) for the non-salt materials. Subsequently, the viscoelastic analyses could be performed.

277 STORAGE AND SHIPMENT OF SPENT FUEL ELEMENTS. INFCE WORKING GROUP 6. Kapteinat, H.P. (Nuklear-Ingenieur Service G.m.b.H., Bonn (Germany, F.R.). Abt. Reaktoranlagen). Atomwritschaft, Atomtechnik ; 25: No. 5, 265-268(May 1980). (In German).

The storage and shipment of spent fuel elements constitute an intermediate step in the fuel cycle to be followed by reprocessing or direct final storage of the fuel. Although INFCE did not offer an answer to the question of the maximum possible duration of temporary storage by indicating a concrete span, its description and evaluation of various technologies and experiences associated with the storage and shipment of spent fuel elements contains information which may serve as a guideline in planning and executing temporary storage as part of a back end fuel cycle concept. In addition, Working Group 6 studied institutional aspects of temporary storage in relation to the non-proliferation of nuclear weapons and the safeguarding of national nuclear programs and back end fuel cycle concepts.

278 EUROPEAN SPENT FUEL EXPERTISE. Messenger, W. de L.M. Hazard. Cargo Bull.; 10-11(May 1980).
A brief description of spent nuclear fuel transport in Europe, with particular reference to Nuclear Transport Ltd., is given.

279 DETERMINATION OF THE STATIONARY TEMPERATURE LEVEL IN AN INTERMEDIARY STORAGE OF SPENT NUCLEAR FUEL ELEMENTS. Jeschar, R.; Tenhumberg, M. (Technische Univ. Clausthal, Clausthal-Zellerfeld (Germany, F.R.). Inst. fuer Waermetechnik und Industrieofenbau); Gardeik, H.O. (Forschungsinstitut der Zementindustrie, Duesseldorf (Germany, F.R.)); Schoenfeld, R. (Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.). Abt. Thermofluiddynamik); Klein, K. (Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.). Abt. Verfahrenstechnik). Brennstoff-Waerme-Kraft ; 32: No. 5, 197-203(May 1980). (In German).
The article presents a calculation method for the determination of the stationary temperature level in an intermediary storage for heat-producing nuclear fuel elements. The heat produced in the storage of nuclear fuel elements is removed to the surrounding air by an indirect cooling through air relying on free flow. The cooling concept and the derivation of the calculation method are extensively discussed and the results shown.

280 PUBLICATION OF THE MINISTER FOR ECONOMIC AFFAIRS, TRADE, AND TRANSPORTATION CONCERNING THE 2ND SUPPLEMENT ON THE TRANSPORT OF SPENT FUEL ELEMENT CASKS TO THE SITE OF GEMEINSCHAFTSKERNKRAFTWERK NECKAR (GKN) AND ITS HANDLING THERE. Roth. Bundesanzeiger ; 32: No. 77, 2(Apr 1980). (In German).

282 CRITICALITY EXPERIMENTS WITH SUBCRITICAL CLUSTERS OF LOW ENRICHED UO_2 RODS IN WATER WITH URANIUM OR LEAD REFLECTING WALLS. Bierman, S.R.; Durst, B.M.; Clayton, E.D. (Battelle-Pacific Northwest Labs., Richland, WA). Contract EY-76-C-06-1830. Nuclear Technology ; 47: No. 1, 51-58(Jan 1980).
A series of criticality experiments with 2.35 and 4.31 wt.% ^{235}U enriched UO_2 rods in water has provided well-defined benchmark-type data showing that both depleted uranium and lead reflecting walls, submerged in the water reflector, are better neutron reflectors than water alone. For each fuel enrichment, the critical separation between three subcritical, near optimally moderated fuel clusters was observed to increase as either 77-mm-thick depleted uranium or 102-mm-thick lead reflecting walls were moved toward the fuel. The maximum reactivity effect was observed for the depleted uranium with approx. 20 mm of water between the reflecting walls and the fuel region, whereas for the lead, a maximum effect was obtained with essentially no water between the reflecting walls and the fuel region.

283 UNLOADING AND TRANSFER-TECHNIQUES OF SPENT FUEL. Kunze, P. (Gesellschaft zur Wiederaufarbeitung von Kernbrennstoffen m.b.H., Eggenstein-Leopoldshafen (Germany, F.R.)). Atomkernenergie/Kerntechnik ; 35: No. 2, 105-110(1980). (In German).
This paper shows the handling of spent LWR-fuel in the head-end part of the fuel reprocessing facility. Installations, handling, and transfer techniques are described in the cask unloading area, as well as in the storage pond, in the mechanical cell and also in the dissolve. Furthermore the different technical installations in the most important plants in Europe, USA and Japan are described, together with the concept of the future plants of USA and Great Britain. (orig.) 891 HPH/orig. 892 MKO.

287 NEUTRON PHYSICAL ASPECTS OF THE STORAGE OF BWR FUEL ELEMENTS. Woloch, F.; Sdouz, G.; Suda, M. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Vienna. Inst. fuer Reaktorsicherheit). Atomkernenergie/ Kerntechnik ; 35: No. 3, 166-169(1980). (In German).
For the storage of BWR fuel elements in a high density fuel rack using boronated steel absorbers and in a fuel rack with a larger pitch without absorber, criticality calculations are performed. The cooling water density is varied for the storage without absorbers. For the selected pitches of 16.5 cm for the high density fuel rack and 25 cm for the fuel rack without absorber respectively the ksub(infinitely) values of 0.933 and 0.748 are obtained. The dependence of the results on different calculational methods and on the influence of the variation of three important design parameters, i.e. of the concentration of boron, of the thickness of the boronated steel and of the watergap is investigated for the high density fuel rack. The average isothermal temperature coefficient is obtained for the high density fuel rack as -4.5 x 10^{-4} sup(0)C^{-1} and as approx. 2.0 x 10^{-4} sup(0)C^{-1} for the fuel rack without absorbers. For both ways of storage the aspects of safety of the results are discussed thoroughly. (orig.) 891 RW/orig. 892 CKA.

288 NUCLEAR SPENT FUEL STORAGE IN THE PACIFIC. HEARING BEFORE THE COMMITTEE ON INTERIOR AND INSULAR AFFAIRS, HOUSE OF REPRESENTATIVES, NINETY-SIXTY CONGRESS, FIRST SESSION ON S. 1119. HEARING HELD IN HONOLULU, HAWAII, DECEMBER 27, 1979. Washington, DC: Committee on Interior and Insular Affairs (1980). 237p. GPO.
This hearing concerned nuclear spent fuel storage in the Pacific. The United States has made preliminary studies on the possibility of establishing in the Pacific basin an international facility for the temporary storage of spent fuel from nuclear power reactors. This work is being undertaken in accordance with US non-proliferation policy. Interim storage constitutes less of a proliferation risk than the alternative of premature reprocessing which would separate out of the spent fuel weapons-usable plutonium. The US has placed attention on the Pacific basin area because of projected future storage needs of Western Pacific countries and the importance that dealing with those needs has for global energy and non-proliferation concerns. No decision will be reached in the near future on whether to build such a facility and where it might be located. A preliminary consideration in determining whether to move forward with the project will be the results of thorough evaluation of the possible impact on health, safety, and environment of the region. The US is asking Japan to join in a full feasibility study of the proposal. The US has informed governments in the region of the concept; futher consultations with interested nations and other parties will be undertaken as this evaluation proceeds. The relevant congressional committees are informed, and congressional approval will be sought at various stages. Permanent disposal of nuclear waste in the Pacific is not being considered. (DP)

289 METHOD TO ENCAPSULE SPENT NUCLEAR FUEL IN A SAFETY CLADDING ENABLING LONG-TERM STORAGE. Fleischer, L.R.; Gunasekaran, M. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). German(FRG) Patent 2,922,382/A/. 13 Dec 1979. 38p. (In German).
The fuel rods or fuel elements with e.g. UO_2 filling are encapsuled entirely with a specially prepared concrete (one or several layers) which on the one hand retain the radioactive materials and on the other hand remove the decay heat and form a gamma and neutron shield. For this purpose, metal fibres (e.g. Cu) are mixed in the concrete which is impregnated with polymers e.g. a resin mixture. Many examples and tables are given.

290 TRANSPORT AND STORAGE DEVICE FOR RADIOACTIVE MATERIALS. Lovincic, M.; Sobottka, H.C. German(FRG) Patent 2,821,780/A/ . 22 Nov 1979. 18p. (In German).
The spent fuel elements of the LWR are contained in gastight radiation protection containers, where the remaining space is filled with water, graphite, pyrites or glass pebbles. One or more such radiation protection containers are accommodated in a flask shaped case, which has slot shaped openings on both sides. The radiation protection containers are cooled inside the case by natural convection.

291 DYNAMIC ANALYSIS OF STORAGE RACKS FOR SPENT FUEL ASSEMBLIES. Habedank, G.; Habip, L.M.; Swelim, H. (Kraftwerk Union A.G., Offenbach am Main (Germany, F.R.). Hauptbereich Reaktortechnik). Nuclear Engineering and Design ; 54: No. 3, 379-383(Nov 1979).
The dynamic response of storage racks for spent fuel assemblies subjected to base excitation is calculated. While classical methods of linear structural dynamics may be adequate at low levels of excitation, nonlinear effects due to uplift, for example, can no longer be neglected at high excitation levels. Several nonlinear dynamic analyses have been performed for different types of storage racks with uplift capability. With the help of the numerical results, the rocking behavior of storage racks and their structural integrity has been examined.

292 NOTIFICATION OF THE MINISTER FOR SOCIAL AFFAIRS CONCERNING THE DATE OF A DISCUSSION TO BE HELD PURSUANT TO NUCLEAR LAW ON THE INSTALLATION AND OPERATION OF COMPACT-TYPE FUEL STORES IN THE UNTERWESER NUCLEAR POWER PLANT, OF OCTOBER 16, 1979. Knollmann (Niedersaechsisches Sozialministerium, Hannover (Germany, F.R.)). Bundesanzeiger ; 31: No. 206, 5(Oct 1979). (In German).

293 RADIOACTIVE MATERIAL STORAGE. Sakakibara, M.; Yamada, K.; Fujita, Y. (Hitachi Engineering Co. Ltd., Ibaraki (Japan)). (to Hitachi Ltd., Tokyo (Japan); Hitachi Engineering Co. Ltd., Ibaraki (Japan)). Japanese Patent 54-96,698/A/. 31 Jul 1979. 4p. (In Japanese).
A space (box) accommodating radioactive materials is made movable, and the radiation is effectively shielded by the attenuation of the radioactive materials in storage due to the lapse of the storage time and the shielding of the radiation due to the liquefied shielding material up to the shielding wall of the storage installation, whereby the shielding

wall of the storage installation is made thin and the capacity in the installation is enlarged, thus the accommodation capacity, that is, the storage capacity being increased.

294 SUPPORT FOR A FUEL ELEMENT STORAGE RACK. Schabert, H.P.; Weber, R.; Schwabe, I. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,637,879/8/. 19 Jul 1979. 10p. (In German).
The floor of the storage pond for fuel elements of a PWR is provided with a metal lining, on the surface of which there are projections of spherical shape. They point towards the storage rack and are lined up with the support bolts in the storage rack, so that the hood-shaped design of the ends of the support bolts can surround the spherical surface of the projection. Thus not only axial forces, but bending moments and lateral forces can be absorbed by the supports.

295 NOTIFICATION CONCERNING THE PLANNED INSTALLATION AND OPERATION OF COMPACT-TYPE FUEL ELEMENT STORAGE DEVICES AT UNTERWESER NUCLEAR POWER PLANT, JULY 2, 1979. Knollmann (Niedersaechsisches Sozialministerium, Hannover (Germany, F.R.)). Bundesanzeiger ; 31: No. 131, 5(Jul 1979). (In German).

311 DRY STORAGE OF IRRADIATED MAGNOX FUEL IN AIR. Maxwell, E.O. (Central Electricity Generating Board, London (UK)); Deacon, D. Nuclear Engineering International ; 24: No. 285, 71-75(May 1979).
A description is given of the large dry store for irradiated Magnox fuel at Wylfa. The storage is basically a concrete box 60 x 1 x 4.5m and 2m thick with a capacity of 350t uranium or 28992 fuel elements, and depending upon natural convection of air for cooling. Freshly irradiated fuel is first stored for 150 days in the original CO_2 cooled dry stores to reduce irradiation to an acceptable level before being removed to a store skip. Details are given of the layout of the plant, method of transfer and the transfer machine, and the skips. Development work and automatic control of the transfer equipment are also discussed.

312 AIR COOLED STORAGE OF CANDU FUEL. Mayman, S.A.; Ohta, M.M. (Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). Nuclear Engineering International ; 24: No. 285, 69-70(May 1979).
As an alternative to water pools for interim storage of spent fuel the concept of the concrete canister was developed by Whiteshell Nuclear Research Establishment Canada. Fuel bundles loaded into baskets and then sealed in cans are placed in the central cavity of a concrete cylinder. Cooling is by radiation and convection to the wall, by conduction through the concrete, and then by natural air convection over the outer surfaces of the canister. A conceptual design study of a large irradiated fuel storage facility was completed. Studies carried out during the development and demonstration programme are described. The main areas were in fuel handling, heat transfer and thermal stress, and behaviour of defected fuel. The programme has demonstrated that dry storage of irradiated fuel is both economical and practical.

313 ENERGY STORED IN IRRADIATED NACL. Lidiard, A.B. (UKAEA, Harwell. Atomic Energy Research Establishment). Philosophical Magazine, [Part] A: Defects and Mechanical Properties ; 39: No. 5, 647-659(May 1979).
Also available as AERE-TP--760.
Recently reported measurements of the energy stored in heavily irradiated NaCl are reviewed in the light of recent understanding of radiation-damage processes in this material. It is shown that, in the ranges of temperatures and dose rates of these experiments, the F-centres produced by the irradiation are retained principally in the form of colloids: the stored energy is thus a direct measure of the number of F-centres retained in this form. Comparison of these results with the prediction of the recently proposed theory of colloid growth shows that the predictions of the dependence of colloid growth rates upon temperature and dose rate are qualitatively correct. The dependence of stored energy dose, however, appears to require the inclusion of a thermally activated back-reaction and possible modifications to the theory are briefly discussed. However, further experiments in this range of temperatures and dose rates are necessary for more quantitative tests of the theory. This reconsideration of the data does not alter the broad conclusion as to the relative insignificance of stored energy in a natural salt formation used as a radioactive waste repository, although more extensive measurements permitting a more exact test of theory would allow better predictions to be made for such applications.

314 SHROUD FOR STORING RADIOACTIVE SPENT NUCLEAR FUEL ELEMENTS. (to Brooks and Perkins, Inc., Southfield, MI (USA)). British Patent 1,544,233/A/. 19 Apr 1979. 9p.
Tubular shrouds, having neutron absorbing panels between inner and outer spaces, are used for storing spent fuel elements in pools.

315 FRAMEWORK FOR STORING LONG FUEL ELEMENTS. Langhammer, K.H.; Weber, R. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,742,724/A/. 5 Apr 1979. 12p. (In German).
The fuel elements of square cross section for the PWR are surrounded by boron steel sheaths. An austenitic steel sheet is welded to the upper and lower end of each sheath. With

these ends, the sheaths can contribute to the strength of the framework by forming part of it, as the sheets can be provided with holes or projections - which are mechanically connected to the framework. The forces taken up in this way are transmitted via the welds to large surfaces in the mechanically sensitive boron sheets, which therefore are lightly stressed. The sheaths can consist of several longitudinal parts welded together. In this case the weld is interrupted in the area of impact by boron steel and boron-free steel.

316 DESIGN AND OPERATIONAL CHARACTERISTICS OF HIGH-DENSITY FUEL STORAGE FACILITIES. Grimm, E.A. (General Electric Co., San Jose, CA). Nuclear Technology ; 43: No. 2, 146-154(Apr 1979).

General Electric (GE) experience in operation of the Morris spent fuel storage facility, which now contains over 300 Mg of both boiling water reactor (BWR) and pressurized water reactor spent fuel, confirms that receipt, handling, and storage of spent fuel can be accomplished safely with negligible impact on the environment or the operation itself. Basin water treatment is accomplished with disposable powdered resins applied to a precoated filter-demineralizer unit, and special applications of Zeolites aid in maintaining radiocobalt and radiocesium concentrations to $< 4 \times 10^{-4}$ μCi/ml in the basin water. No gaseous radioisotopes from damaged or leaking fuel have been observed, and no significant increases in radioactivity or loss of cladding integrity have been observed during fuel handling and storage. GE has utilized this experience to design an expansion of the Morris basin and to design Boral-poisoned, high-density, stainless-steel storage modules for BWR reactor pools. These free-standing modules store BWR fuel on 165.1-mm (6.5-in.) center spacing, and a sliding low-friction support system limits the seismic loads applied to the fuel. Application of this fuel storage experience has permitted expansion of storage capacity for spent fuel at Morris ad at BWR reactors, permitting continued operation until federal programs for long-term storage have been clarified and implemented. 8 figures.

317 SUBSURFACE STORAGE OF COMMERCIAL SPENT NUCLEAR FUEL. Richards, L.M.; Szulinski, M.J. (ARCO-Polymers, Inc., Philadelphia). Nuclear Technology ; 43: No. 2, 155-164(Apr 1979).

The Atlantic Richfield Company has developed the concept of storing spent fuel in dry caissons. Cooling is passive; safety and safeguard features appear promising. The capacity of a caisson to dissipate heat depends on site-specific soil characteristics and on the diameter of the caisson. It is estimated that approx. 2 kW can be dissipated in the length of one fuel element. Fuel elements can be stacked with little effect on temperature. A spacing of approx. 7.5 m (25 ft) between caissons appears rasonable. Business planning indicates a cost of approx. 0.2 mill/kWh for a 15-yr storage period. 12 figures, 4 tables.

318 SPENT FUEL STORAGE EXPERIENCE. Johnson, A.B. Jr. (Battelle-Pacific Northwest Labs., Richland, WA). Nuclear Technology ; 43: No. 2, 165-173(Apr 1979).

Irradiated nuclear fuel has been stored in water pools at essentially all nuclear reactors, beginning with the earliest plants in 1943. Fuel from water-cooled power reactors is clad either with Zircaloy or with stainless steel. Zircaloy-clad fuel has been stored US pools since 1959. Some experimental stainless-steel-clad fuel was stored for 12 yr in the US before reprocessing. Canadian Zircaloy-clad fuel has been stored since 1962. There has been no evidence that the fuel has degraded during pool storage, based principally on visual observations and radiation monitoring of pool air and water. However, several fuel rods have been subjected to metallographic examination after pool exposures up to 11 yr, also with no evidence that the fuel cladding has degraded in the pool. Canadian fuel stored up to 10 yr was returned to a reactor and performed well. Favorable storage experience also has been indicated for other countries with fuel residence times of 5 to 10 yr. The pool storage environment is high-purity water at 5.3 to 7.5 pH, except for pools for pressurized water reactors, which utilize boric acid pool chemistry at 4.5 to 6.0 pH. Pool water temperatures generally range between 20 and 50°C. The favorable storage experience, demonstrated technology, successful handling of fuel with reactor-induced defects, benign storage environments, and corrosion-resistant materials offer sufficient bases to proceed with expanded storage capacities and extended fuel storage until questions regarding fuel reprocessing and final storage of nuclear wastes have been resolved. Some surveillance is justified to detect degradation if it becomes significat. Surveillance programs are already under way in several countries. 1 figure, 6 tables.

319 SOME ASPECTS OF THE THERMAL ANALYSIS OF METAL-ENCAPSULATED SPENT FUEL. Jardine, L.J.; Steindler, M.J. (Argonne National Lab., IL). Nuclear Technology ; 43: No. 2, 273-284(Apr 1979).

A thermal analysis was made of a storage concept for a reference intact spent fuel assembly encapsulated in a metal matrix in a cylindrical canister. Maximum temperatures within the canister, as well as the canister surface temperatures, were estimated for interim storage of canisters in environments of a water basin, an air basin, and a vertical sealed storage cask. Comparisons of the thermal analyses of the metal-encapsulated concepts were made with a canister with an air filler (i.e., no metal encapsulation). A similar analysis was also made for a concept employing sheared spent fuel segments rather than an intact fuel assembly. 5 figures, 5 tables.

320 FUEL STORAGE TANK. Peehs, M.; Stehle, H.; Weidinger, H. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,743,453/A/. 29 Mar 1979. 11p. (In German).

The stationary fuel storage tank is immersed below the water level in the spent fuel storage pool. In it there is placed a fuel assembly within a cage. Moreover, the storage tank has got a water filling and a gas buffer. The water in the storage tank is connected with the pool water by means of a filter, a surge tank and a water purification facility, temperature and pressure monitoring being performed. In the buffer compartment there are arranged catalysts a glow plugs for recombination of radiolysis products into water. The supply of water into the storage tank is performed through the gas buffer compartment. (DG).

321 FUEL TRANSPORTING DEVICE. Imoto, K.; Igarashi, R.; Terai, K. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 1954-36,482/A/. 17 Mar 1979. 5p. (In Japanese).

Purpose: To improve the reliability in the transportation of fuels by always providing duplicate or more sealing function during transportation of fuels by a fuel transporting device which connects the upper and the lower fuel pools in a reactor building with a transport pipe. Constitution: A transport pipe for communicating the upper fuel pool with the lower fuel pool is provided with an upper sealing device, an inner sealing device just below the upper sealing device and a lower sealing device always capable of sealing during fuel handling at the lower portion of the vertical transport pipe. This can always ensure duplicate or more sealing function in the fuel transportation and if any one of the sealing means is failed individually, sealing function can be kept maintained. Flow out of the upper pool water can eliminate the danger that the spent fuels are exposed to air and produce undesired irradiation exposure source.

322 RACK FOR HOLDING FUEL ASSEMBLIES OF NUCLEAR REACTORS. Friedrichs, H.; Letic, V.; Ristow, U. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,739,232/A/. 15 Mar 1979. 6p. (In German).

The compact rack made of boron steel is used for storing fuel assemblers from LWR's especially PWR's. It is designed in the shape of a chequeboard pattern. Only one out of two pool elements has got a closed cover of square cross section; in this way positions that are without covers of their own are created. The shielding, which is essential for the reactivity, then results from the neighboring pool elements having closed covers.

323 SPENT FUEL STORAGE FACILITY HAVING FORCED RECYCLE DEVICE. Ochiai, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 54-31,898/A/. 8 Mar 1979. 5p. (In Japanese).

The cooling effect for fuel rods can be improved by disposing a jet pump or the like near the bottom of a fuel support rack and pressurizing cooling water to forcibly circulate it from the bottom to the upper portion of the support rack. A grid-like support rack and a fuel support plate for containing and supporting spent fuel rods are mounted by way of a partition wall to an installation frame and disposed in a storage tank. The partition wall is provided with a throat and a nozzle, and pressurized driving water supplied from the outside of the storage tank is jetted by way of an exhaust pipe from the nozzle. Inside cooling water and driving water are mixed and agitated in the throat extending while surrounding the nozzle, recovered with pressure by a diffuser and then supplied through apertures in the support plate to the spent fuels. If no driving water is supplied to the nozzle, spontaneous circulation is effected through the throat to attain moderate cooling effect.

324 COOLING AND DECONTAMINATION INSTALLATION FOR FUEL ELEMENT TRANSPORT CONTAINERS. Dietsch, A. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,732,810/A/. 8 Feb 1979. 7p. (In German).

The system serves as a spray protection device and guide tube for water used to treat the shipping container in a fuel cycle center. It consists of two semi-shells connected by means of bolts along generating lines and jointly variable in height relative to the shipping container.

325 DEVICE FOR THE COOLING AND/OR DECONTAMINATION OF FUEL ELEMENT TRANSPORT CONTAINERS. Schaaf, W. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,732,796/A/. 8 Feb 1979. 7p. (In German).

The chamber consists of a cubic space whose walls are made of prefabricated components (concrete) which can be assembled on the spot. It can be closed by a door consisting of two wings which, in turn, can be swiveled and folded. The fuel transport cask can be secured either to the walls or to the ceiling of the chamber by means of straps. The lid is equipped with a flap which can be firmly and tightly connected with the door. It closes a gap through which the cask can be handled by lifting gear (waste management facility).

326 DEVICE FOR THE COOLING AND/OR DECONTAMINATION OF FUEL ELEMENT TRANSPORT CONTAINERS. Schaaf, W. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,732,815/A/. 8 Feb 1979. 6p. (In German).

The cubic chamber is made of prefabricated concrete components. The fuel element shipping container is suspended in it either by means of claws from the ceiling or on the sidewalls. A penetration opening for a hoisting tool in the ceiling can be firmly and tightly sealed by a lid (fuel cycle center).

327 FUEL ELEMENT POND. Schneider, W. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,731,307/A/. 1 Feb 1979. 7p. (In German).

The fuel element pond is part of a fuel reprocessing centre, to which spent fuel elements from LWR's are supplied, for example. The fuel element transport containers are driven to and fro in the dry state. During loading and unloading of transport containers, the pond is filled with water. After emptying the pond again, its walls may be contaminated. Cleaning of the pond walls takes place with a spray device, which is remotely operated. It consits of a pipe, which is connected to the cleaning liquid (water with citric acid) and which has spray nozzles. It may be connected to a float so that it follows the different water levels, or the nozzles can be closed according to the water level.

328 FUEL ELEMENT TRANSPORT CONTAINER. Benna, P.; Neuenfeldt, W. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,730,331/A/. 25 Jan 1979. 8p. (In German).

The reprocessing system includes a large number of waterfilled ponds next to each other for the intermediate storage of fuel elements from LWR's. The fuel element transport device is allocated to a middle pond. The individual ponds are separated from each other by walls, and are only accessible from the middle pond via narrow passages. The transport device includes a telescopic running rail for a trolley with a grab device for the fuel element. The running rail is supported in turn by a second trolley, which can be moved by wheels on rails. Part of the drive of the first trolley is arranged on the second one. Using

this transport device, adjacent ponds can be served through the passage openings.

329 NUCLEAR REACTOR FACILITY. Weber, R.; Kaetscher, E. (to Siemens A.G., Berlin (Germany, F.R.); Siemens A.G., Muenchen (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,253,232/C/. 25 Jan 1979. 8p. (In German).

The facility consists of a PWR with a fuel pit filled with water and a crane for handling a fuel transport cask. Beside the fuel pit and connected with it there is arranged a depositing shaft for the transport casks. The transport cask and the depositing shaft work together like piston and cylinder. From it there results such hydraulic braking that the inpact of the transport cask hitting the bottom of the shaft is not dangerous. The depositing shaft may also be formed by a steel tube inserted into the fuel pit.

330 LOADING POND FOR A FUEL ELEMENT TRANSPORT CONTAINER. Schneider, W.; Hoeger, E. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,731,274/A/. 25 Jan 1979. 8p. (In German).

The fuel elements from LWR's are supplied for reprocessing in transport containers. These are lowered into the loading pond before unloading. The loading pond can be divided into an upper and a lower part by a conical lid and a ring around the loading pond walls. The transport container is inserted in the dry condition, together with the lid. Its surface is therefore contaminated if the upper part is flooded with contaminated water. The lower part of the loading pond can be filled with clean water, which is compressed by excess pressure below the lid. When the loading pond is emptied and before lifting out the empty transport container, the water from the topside of the lid is lowered in level via a gutter in the surrounding ring, and does not contaminate the transport container.

331 STORAGE RACK FOR SPENT FUEL ELEMENTS. Bauer, N.; Hnilica, K.D.; Rehn, H.; Schmidt, G. (to Nuklear-Ingenieur Service G.m.b.H., Hanau (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,730,850/A/. 25 Jan 1979. 29p. (In German).

The storage rack for the intermediate storage of fuel elements from BWR or PWR type reactors consists of the following: Tubes of square crossection, which are set next to one another in rows or like a chessborad. The walls are double-walled and sealed. In the intermediate spaces there are plates of B_4C compressed with graphite, which are surrounded by load-bearing spacing material. A grid of reinforcing rods and spacers and a support plate ensure sufficient stiffness, so that the wall thickness of the stainless steel can be kept thin. The storage rack is made earthquake proof. The support plate rests on highly adjustable feet.

332 TRANSPORT OF STORAGE CONTAINER FOR RADIOACTIVE MATERIALS, PARTICULARLY FOR IRRADIATED NUCLEAR REACTOR FUEL ELEMENTS. Baatz, H.; Rittscher, D.; Fischer, J. (to Rheinisch-Westfaelisches Elektrizitaetswerk A.G., Essen (Germany, F.R.); STEAG Kernenergie G.m.b.H., Essen (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,740,933/B/. 18 Jan 1979. 4p. (In German).

The container consists of a tank with closing lid. The tank has a metal outer skin, a cast metal intermediate layer and an inner protective skin made of stainless steel. The outer and intermdiate layers are cast from and iron-carbon or Cu alloy, where the intermediate layer may be made as a cast matrix with embedded depleted uranium pellets. The outer and intermediate layers are made as a standard casting made of cast iron with graphite pellets. The outer layer has channels filled with absorber and/or moderator material. The inside of the container can be filled with water or emptied via pipelines.

333 SAFETY IN MARINE TRANSPORT OF SPENT FUEL IN JAPAN. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 9, 111-120(Jan 1979). (In Japanese).

Concerning the safety of the marine transport of spent fuel in Japan, a report of the Committee on Examination of Nuclear Fuel Safety to the Atomic Energy Commission of Japan was presented. In Japan, with the operation of a fuel reprocessing plant in the Power Reactor and Nuclear Fuel Development Corporation, the transport of spent fuel by sea is unavoidable due to the geographical features of Japan, and its safety is essential. The following matters are described: the safety evaluation of the marine transport involving shipwreck and sunken spent-fuel casks; research and development of the pressure equilibrium valves for casks; the safety measures in the marine transport including transport ship equipments and navigation; the laws and regulations concerning the standards for the transport, etc.; and safety assessment. In conclusion, the safety in the marine transport of spent fuel in Japan was confirmed because of high degree of cask integrity, the rare possibility of sinking of the ship, the adequate safety design of the ship, etc.

334 DISCUSSION DATE FOR THE PLANNED FUEL ELEMENT INTERMEDIATE STORAGE SITE AT AHAUS ON FEBRUARY 4 AND 7, 1979. GRS (Gesellschaft fuer Reaktorsicherheit) Kurz-Information, Reihe E ; No. 6, 1-3(1979). (In German).

FEDERAL REPUBLIC OF GERMANY;HEARINGS; LICENSING;PLANNING;RADIOACTIVE WASTE FACILITIES; RADIOACTIVE WASTE STORAGE;SAFETY;SPENT FUEL STORAGE;AWAY-FROM-REACTOR STORAGE

335 1ST AMENDMENT TO THE LICENCE FOR STORAGE OF TRANSPORT CONTAINERS FOR SPENT FUEL ELEMENTS IN THE STORAGE FACILITY OF THE GEMEINSCHAFTSKERNKRAFTWERK NECKAR (GKN) AND THEIR HANDLING THERE. GRS (Gesellschaft fuer Reaktorsicherheit) Kurz-Information, Reihe E ; No. 16, 1-4(1979). (In German).

Of the fuel elements spent during operation so far, those spent in 1978 will be transported to the French reprocessing plant at La Hague. The licence refers to the use of suitable transport containers and their handling there.

336 (RISLEY-Trans--4086) ARRANGEMENT FOR THE PREVENTION OF THE CONTAMINATION OF A FUEL ELEMENT STORAGE POOL. (SUPPLEMENT TO: P 27 18 305.7 - VPA 77 P 9317). 1979. Translation of German(FRG) Patent 2,722,870. 5p. Dep. NTIS (US Sales Only), PC A02/MF A01.

The arrangement consists of a metal casing adapted to suit the configuration of the fuel element which is completely sealed by a removable lid, serving at the same time as a grip, and is provided with an overpressure

valve and a water filling system. The overpressure valve consists of a U-tube arranged vertically inside, and a bell head for the collection of gases is provided which is joined to the casing by means of disconnectable catches. (DLC)

337 SPENT FUEL DISPOSITION--THE SITUATION IN THE UNITED STATES. Hanson, A.S. (Yankee At Electr Co, Westboro, Mass). Energy Technology (Washington, D.C.) ; 6: 857-861(1979).
Because neither reprocessing nor spent fuel disposal can be expected in significant quantities during the 1980's, the only alternative near-term disposition of spent fuel in the US will be interim storage. New at-reactor storage techniques and away-from-reactor storage facilities will be needed to provide the required storage capacity. In the long term spent fuel reprocessing and waste disposal must be done if nuclear power is to remain an important energy source for the US.

343 STORAGE RACK FOR HOLDING SPENT FUEL ELEMENTS FROM NUCLEAR POWER PLANTS. Krieger, F. (to Noell (G.) und Co., Wuerzburg (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,723,849/A/. 7 Dec 1978. 9p. (In German).
In the fuel rack containing a great number of compartments with square cross-sections, the structural elements required by the system are statically designed in such a way, that optimal utilization of space as well as shielding of the compartments with respect to each other is guaranteed. In order to achieve this the compartments may be formed by profiled sheets having got trapezoidal edges taken off. Two sheets, each running parallel with respect to each other, form a double shell. The compartments are formed by another double shell, also consisting of two sheets and lying mirror-inverted with respect to the first shell touching this one.

344 AMERICAN PROPOSALS FOR LONG RANGE STORAGE OF IRRADIATED FUEL. Sugier, A. (CEA, 75 - Paris (France). Dept. des Programmes). Revue de l'Energie ; No. 310, 641-649(Dec 1978). (In French).
The American politics of irradiated fuel management is reviewed, the short-range storage of huge amounts of wastes being the fundamental problem. Two steps are considered: the "At the Reactor" storage, ensured by the electricity companies, and the "Away From Reactor" storage on the DOE's responsibility. A technical and economical study has been carried out in order to estimate the cost of the AFR provisory storage and a project of taxation has been established on this basis.

345 DRUM FOR STORING FUEL ELEMENT CLUSTERS. Artemiev, L.N.; Batjukov, V.I.; Fadeev, A.I. (to Dautsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,723,681/A/. 30 Nov 1978. 11p. (In German).
The drum has tube-shaped holes being arranged in several rows that are concentrical with respect to the circumference of the cartridge and serve to a accommodate fuel assemblies. These fuel assemblies can be inserted into the holes through the tubes of a transfer line by means of a transfer machine. In order to speed up the transfer process the holes of the individual rows are arranged in such manner that in each position of the drum at least one hole of each row is placed on the trajectory (arc of a circle or straight line) of the gripping equipment of the transfer machine. By this means the heavy drum must be moved less often.

346 STORAGE OF SPENT FUELS IN THE USA. SOME THOUGHTS ON THE LEGAL POSITION. Cagnetta, J.P. Archiv fuer Energiewirtschaft ; 32: No. 11, 899-904(Nov 1978). (In German).
A report is given on the present legal situation concerning the storage of spent nuclear fuel in the USA. Due to the restrictive energy policy of the government which prevents further commercial reprocessing, there are long-term bottle-necks in the intermediate storage of spent nuclear fuel. The alternatives of the electricity supply undertakings in order to prevent the partial shutdown of their plants are discussed. As a result of the lacking legal

foundations, the DOE (Department of Energy) is at the moment not in the position to build disposal plants for spent fuels, nor to operate them, nor to make contracts for the storage with a third party.

347 SPENT FUEL CARRIER ''HINOURA MARU''. Atoms in Japan ; 22: No. 11, 32-38(Nov 1978).
With the development of nuclear power in Japan, the amount of spent fuel has increased gradually, and its reprocessing has become a serious problem. This led to the construction of the first reprocessing plant in Tokai Village, Ibaraki Prefecture. The method to transport spent fuel safely and economically was studied, and it was decided to transport it by sea from various power stations mostly located in coastal areas to the exclusive port for the Tokai Plant, then by land transport from the port to the reprocessing plant about 4 km distant. Ship Inspection Regulation No. 610 was established by the Ministry of Transport in 1974, and the spent fuel carrier ''HINOURA MARU'' was designed and rebuilt on the basis of this regulation. The collision-enduring hull structure, the water depth and size of the ports concerned, the number of casks, the operation cost and others were investigated thoroughly. The main particulars of the ship are as follows: gross tonnage 1290 t, length overall 77.55 m, full load draft 4.20 m, service speed 11 knots, propulsive power 2500 PS, the number of casks loaded 4, and complement 20. The features of this ship are the collision and stranding-enduring structures, stability characteristic, radiation shield structure, hold-cooling equipment, cask-fixing equipment, hold bilge tanks, and water pouring equipment for holds. The management of spent fuel transport is explained.

348 EXTERNAL FUEL ELEMENT POOL AS TEMPORARY STORAGE FACILITY AND PERMANENT REPOSITORY. Stueger, R. (Kernkraftwerk-Planungsgesellschaft m.b.H., Vienna (Austria)); Thurnher, K. (Brown, Boveri und Cie A.G., Mannheim (Germany, F.R.)). Atomwritschaft, Atomtechnik ; 23: No. 10, 465-466(Oct 1978). (In German).
BUILDINGS;BWR TYPE REACTORS;FUEL POOLS;AWAY-FROM-REACTOR STORAGE;SPENT FUEL STORAGE

349 TRANSPORT OF RADIOACTIVE MATERIALS. Swindell, G.E. (International Atomic Energy Agency, Vienna (Austria). Div. of Nuclear Safety and Environmental Protection). International Atomic Energy Agency Bulletin ; 20: No. 5, 17-24(Oct 1978).
This document presents, very briefly, some data which has been collected, in particular for the USA concerning the transport of radioactive materials and other related topics. It also shows up some features on the more specific problems connected with the transport of plutonium or spent fuel.

350 CONTAINER FOR IRRADIATED FUEL. Guy, R. (to Foster Wheeler Power Products Ltd., London (UK); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,709,602/A/. 7 Sep 1978. 6p. (In German).
The transport container for irradiated or used nuclear fuel is provided with an identical heat shield against fires on the top and bottom sides. Each heat shield consists of two inner nickel plates, whose contact surfaces are polished to a mirror finish and an outer plate of stainless steel. The nickel plate on the box is spot welded to it while the second nickel plate is spot welded to the steel plate. Both together are in turn welded so as to be leaktight to the edges of the box. For extreme heat effects and based on the different (bimetal) coefficients of expansion, the steel plate with the nickel plate attached to it bulges away from the box. The second nickel plate remains at the box, so that a subpressure space is formed with the mirror nickel surfaces. The heat radiation and heat conduction to the box are greatly reduced by this.

351 (PNL-TR--399) PERMANENT STORAGE FACILITY FOR SPENT FUEL ASSEMBLIES. Klein, D.; Stuger, R. Translated from Atomwritschaft, Atomtechnik ; 401-403(Sep 1978). 11p. NTIS, PC A02/MF A01.
The capital costs for a permanent storage facility for spent LWR fuel assemblies with a storage capacity of 540 tons of uranium and with its own infrastructure lie on the order of ca. 260 DM/kg U. In the operating costs, a distinction must be made between costs in the charging stage and costs during the subsequent storage period. The specific operating costs amount to ca. 9 DM/kg U during the charging stage and decrease to 3 to 4 DM/kg U during exclusive storage operation. In conclusion, this prototype shows: fuel assemblies can be admitted to an air-cooled storage facility as early as a few years after their removal from the reactor, without being subjected to initial temperature stresses in excess of those during the preceding reactor operation. The system in which the fuel assemblies are cooled by natural convection of outside air offers inherent safety and low operating expenses. Radiological pollution of the environment can be reduced to extremely low levels by suitable precautions.

352 SPENT FUEL CASK. Asano, M. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 53-90,597/A/. 9 Aug 1978. 4p. (In Japanese).
Purpose: In order to ensure safety of a spent fuel cask, a method for strengthening a basket and keeping a interior in the cask at a subcritical state has been described. Constitution: The interior of the hollow cylinder of the cask is partitioned by a lattice-shaped basket accommodating therein a neutron absorption substance. In the thus partitioned chamber there is provided a hollow prismatic bolt, in which spent fuel assemblies are accomodated. The other part of the basket is filled with water, thereby shielding radiation emitted from spent fuel assemblies on one hand and cooling spent fuel assemblies on the other. The filled neutron absorbers are in a powdery or granular state, and diffused rapidly in water when any accident takes place thereby keeping the cask at a subcritical state.

353 SPENT FUEL TRANSPORTATION IN THE FUEL CYCLE. Labrousse, M. (Compagnie Generale des Matieres Nucleaires (COGEMA), 92 - Chatillon (France)). Techniques de l'Energie ; No. 17, 17-20(Jun 1978). (In French).
In the fuel cycle, it is the spent fuel transportation which offers the most original character against conventional transportation as requiring very special packaging which has to fulfill special safety conditions on public thoroughfares or working centers. Facing safety and economy criteria three parameters intervene in designing such packagings: the mass of the package, its internal and external lay out.

354 Shiyozumi kakunenryo no anzen yuso ni kansuru chosa kenkyu hokokusho. (SURVEY AND

RESEARCH REPORT ON THE SAFE TRANSPORT OF SPENT NUCLEAR FUELS). Sekiguchi, A. (Tokyo Univ. (Japan)); Asano, J.; Ueki, K.; Okubo, M.; Orui, K. Tokyo, Japan; Ship Building Research Association of Japan (Mar 1978). 149p. (In Japanese).

This report was prepared by a committee organized by the Shipbuilding Association of Japan to investigate various technical and administrative problems associated with the safety of sea transportation of spent nuclear fuels. The study has been undertaken by three sub-committees, namely transportation sub-committee, radiation protection sub-committee, and sub-committee for evaluation of spatial distribution of radiation. Investigations were made on the following fields. (1) Survey of existing regulations; IMCO recommendation and domestic regulatory guides are included here. (2) Survey on the safety aspects of transportation methods; effects of ship structure in case of accidents (collision, stranding and fire) are included here. (3) Survey on the protection against radiation in the ship with spent fuel; investigations of various regulatory guides are included. The method of radiation measurement and calculational methods are also investigated. Measurement of neutrons from spent fuel and multiplication and shielding of neutrons in the spent fuel casks for PWR fuels are briefly discussed in the appendix.

355 COMPARISON OF CONCEPTS FOR INDEPENDENT SPENT FUEL STORAGE FACILITIES. Held, C.; Hintermayer, H.P. (Kernkraftwerk-Planungsgesellschaft m.b.H., Vienna (Austria)). pp 179-195 of Compte rendu du seminaire de l'AEN sur le stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

The design and the construction costs of independent spent fuel storage facilities show significant differences, reflecting the fuel receiving rate (during the lifetime of the power plant or within a very short period), the individual national policies and the design requirements in those countries. Major incremental construction expenditures for storage facilities originate from the capacity and the type of the facilities (casks or buildings), the method of fuel cooling (water or air), from the different design of buildings, the redundancy of equipment, an elaborate quality assurance program, and a single or multipurpose design (i.e. interim or long-term storage of spent fuel, interim storage of high level waste after fuel storage). The specific costs of different designs vary by a factor of 30 to 60 which might in the high case increase the nuclear generating costs remarkably. The paper also discusses the effect of spent fuel storage on fuel cycle alternatives with reprocessing or disposal of spent fuel.

356 SPENT FUEL STORAGE -- THE MAGNITUDE OF THE PROBLEME. Hogroian, P. (Nuclear Energy Agency, 75 - Paris (France)). pp 31-40 of Compte rendu du seminaire de l'AEN sur le stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

The events that have led to the present state of spent nuclear fuel storage are reviewed, including initiatives in fuel reprocessing and plans for extended storage. An estimate is made of the amounts of spent fuel that may result from nuclear power programmes of the OECD and the world, derived from projections of total energy requirements and nuclear power growth. These are presented on a regional basis up to the year 2000 and in the longerterm, to lend some feeling for the future magnitude of spent fuel storage requirements.

357 U.S. SPENT FUEL POLICY: A STATUS REPORT. Robinson, B. (Department of Energy, Washington, DC (USA)). pp 41-54 of Compte rendu du seminaire de l'AEN sur le stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

On October 18, 1977, the U.S. Department of Energy announced the broad principles of a new U.S. spent fuel storage policy. Since that announcement, there has been a high level of activity focused on fleshing out the detailed policy required to ensure the effective implementation of those principles. The desire to develop a policy which: meets all requirements from the point of view of environment, health, and safety, is integrated into an overall waste management policy, and reflects input and comment from all interested parties, has resulted in a deliberate approach to the development of a comprehensive policy. These efforts will begin to yield significant results over the next several months. The purpose of this paper is to review some of the recent, current and planned events and activities which are relevant to that policy development; to indicate the likely timing of those events and activities; and to discuss the framework for policy development which is currently shaping staff-level analysis.

358 PROSPECTS OF SPENT MANAGEMENT IN SPAIN. Cabanilles Batalla, P.A.; Lopez Perez, B.; Uriarte Hueda, A. (Junta de Energia Nuclear, Madrid (Spain)); Melches Serrano, C.; Ramirez Ontalba, E.; Selgas Suarez, F. pp 55-61 of Stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

The purpose of this paper is to outline the forecast on spent fuel management in Spain, taking into account international developments during the last few years, especially in LWR fuels. This forecast is based on the following plans: increase of storage capacity in reactors; construction of an independent spent fuel storage installation (ISFSI) and a fuel reprocessing pilot plant.

359 COST AND IMPLICATIONS OF A MIDDLE-TERM PROGRAM FOR STORAGE OF SPENT FUEL IN A NUCLEAR POWER STATION (BWR). Mochon, J.L.; Quintana, R. (Hidroelectrica Espanola, Madrid). pp 167-177 of Stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

The paper is based on the experience gained with the Cofrentes Nuclear Power Station Project. Originally, the station had two spent fuel storage pools, in the fuel building, plus a little pool inside the containment, and all were to be fitted with extensive aluminum storage racks with a total capacity for 1+1/3 cores. Due to the present world situation with regard to the 'back-end' of the fuel cycle, it was decided to enlarge the pools' size and to change the design of the racks, to obtain a final storage capacity of 5+1/4 cores, so covering over 18 years of operation. The changes introduced in the project, as well as its costs, and the possibilities of election still open are examined in the paper.

360 EVALUATION OF THE PROBLEMS ASSOCIATED WITH ENEL'S IRRADIATED FUEL MANAGEMENT. Sani, L.; Zelelli, U. (Ente Nazionale per l'Energia Elettrica, Rome (Italy)). pp 153-165 of Stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

The present difficulties in the reprocessing field, which will continue for a period of time not easily definable, impose on the nuclear utilities the research of adequate solutions to solve the problem associated with storage of the fuels discharged by the nuclear power stations in operation. In this context, the paper examines the technical aspects of the various possible alternatives and on the basis of the Italian nuclear program, possible storage strategies are discussed on the assumption of the development of an adequate oxide-fuel reprocessing capacity. The problems related to storage in pools at the station or away from reactor are described in the light of the recent experience made in Italy with the adaptation of an old pool reactor out of service, that is, the Avogadro reactor in Saluggia, to store the fuels of the stations now in operation. Finally some economic aspects are considered in order to ascertain their impact on the cost of energy produced.

361 U.S. DEPARTMENT OF ENERGY PROGRAM TO SUPPORT THE DESIGN AND LICENSING OF A SPENT FUEL STORAGE BASIN. Whitfield, R.P. (Energy Research and Development Administration, Aiken, SC (USA). Savannah River Operations Office). pp 75-82 of Stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

The U.S. Government has announced a policy to accept title to and provide storage capacity for spent nuclear fuel from power reactors in the U.S. and other countries when it is in the non-proliferation interest of the U.S. In support of this policy, the U.S. Department of Energy has underway a program of research, development and design studies to provide the technology base for design and licensing of a spent fuel storage basin. The program is currently on a schedule that would support a storage basin being brought on line in early 1983 and, in addition, develop technology for future generation facilities.

362 CENTRAL SPENT FUEL STORAGE IN SWEDEN. Gustafsson, B.; Hagberth, R. (Swedish Nuclear Fuel Supply Co, SKBF AB Kaernkraft, AKK Stockholm, Sweden). pp 119-133 of Stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

This paper describes a planned central spent fuel storage facility in Sweden. The nuclear power program and quantities of spent fuel generated in Sweden is discussed. A general description of the facility is given with emphasis on the lay-out of the buildings, transport casks and fuel handling. Finally a possible design of a Swedish transportation system is discussed.

363 STUDY ON SEPARATE SPENT FUEL STORAGE FACILITY. Hanelius, A.; Rastas, A. (TVO Power Company, Finland); Ivung, B.; Tiren, I. (ASEA-ATOM AB, Vaesteraas (Sweden)). pp 107-118 of Stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

The TVO Power Company (TVO) has two 660 MWe BWR units under construction on the southwest coast of Finland. In order to support the licensing of the power plant units a study on a separate Spent Fuel Storage Facility (SFSF) located on the power plant site was made by TVO together with AB ASEA-ATOM. The study report contains a principal technical design and preliminary safety assessment of the SFSF. The study proves that the interim storage of spent fuel, if needed, can be safely arranged on the power plant site by technically feasible means.

364 INTERNATIONAL VIEW OF SPENT FUEL STORAGE AS ONE ASPECT OF FUEL CYCLE SAFETY. Ilari, O. (Nuclear Energy Agency, 75 - Paris (France)); Jouannaud, C. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire). pp 85-96 of Stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

The authors outline the current international co-operation connected with the safety of fuel cycle facilities, with particular reference to the safety of facilities for the storage of spent fuel. The view of the NEA/CSNI Working Group on the Safety of the Fuel Cycle are reported and the principal problems of the safety of fuel storage are reviewed in the perspective of the safety of the entire fuel cycle. It is concluded that the problems associated with short-term storage are well understood and managed, and that the additional problem of maintaining the integrity of fuel assemblies during long-term storage requires further research.

365 SOME SHIELDING AND ENGINEERING ASPECTS OF IRRADIATED THERMAL OXIDE FUEL TRANSPORT FLASKS. Twite, M. (British Nuclear Fuels Ltd., Risley); Miller, P.C. (UKAEA Atomic Energy Establishment, Winfrith). pp 139-145 of Radiation protection in nuclear power plants and the fuel cycle. Vol. 2. London, England; British Nuclear Energy Society (1978).

From Conference on radiation protection in nuclear power plants and the fuel cycle; Bristol, UK (27 Nov 1978).

The paper presents some of the basic requirements of transport of irradiated fuel that have been laid down by the International Atomic Energy Agency and describes the latest of a series of transport flasks that has been successfully used by British Nuclear Fuels Limited to meet these and other requirements. It continues with a description of the main shielding components and outlines their methods of manufacture. The models and codes used for evaluating external radiation levels in both the axial and radial directions are described. The flask must have the flexibility to transport either PWR or BWR fuel elements and actual cases are presented for both fuel configuratiens. The paper then goes on to highlight some of the conflicting shielding and engineering requirements e.g. water circulation port diameter optimisation, ullage volume optimisation, lead slump implications and how these problems were resolved. It finally briefly touches on some possible alternative shielding materials and the difficulties encountered in assessing their future technical and economic benefit.

366 CONTAINER FOR TRANSPORT OF RADIOACTIVE MATERIALS. (to UKAEA London Office). French

Patent 2,366,674/A/. 21 Sep 1977. Priority date 30 Sep 1976, United Kingdom of Great Britain and Northern Ireland (UK), 6p. (In French).

A cylindrical receptacle for transporting a radioactive substance comprising a cover that may be hermetically shut and a lining covering the cylindrical wall of the receptacle placed in a movable manner in the latter to form a shield against the gamma radiation. The characteristic of this receptacle is that a movement of the lining in contact with the cover is prevented by means of a ring divided into several segments that is removably secured to the lining and adjusts in a complementary slot machined in the wall of the receptacle between the cover and the lining.

367 FACILITY FOR STORING ELONGATED NUCLEAR FUEL ASSEMBLIES. Wade, E.E. (to Westinghouse Electric Corp., Pittsburgh, PA (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,655,403/A/. 4 Aug 1977. 19p. (In German).

The patent deals with a reduction of the space and financial effort caused by simultaneous storage of several core charges of spent fuel, which possibly may be required in the future. This facility tries to find an optimal solution by means of a compact but sufficiently safe configuration. Thereby it is avoided to place the active zones of neighboring fuel assemblies, extending only over part of their length, e.g. 1/4, directly beside one another, i.e. at the same level. Thus the hazard of a reciprocal reaction as well as the local concentration of the heat going to be produced is excluded. A framework contains 'cells', arranged close together in a honeycomb structure, each of which may contain a vertically placed fuel assembly. By means of a bottom plate which is individually adjusted within each cell each fuel assembly is positioned in a level which is different from that of the 6 neighboring assemblies surrounding it. It is shown that this requirement is met by only 4 level steps. Thus in the rows 1, 3, 5 etc. the levels 'a' and 'b' are alternatingly fixed and in the rows 2, 4, 6 etc the levels 'c' and 'd'. Always two of the 6 neighboring assemblies of a fuel assembly with the level 'a' are positioned at the levels 'b', 'c', and 'd'. The difference of level from one step to the next is equal to the length resp. height of the active zone. If the active zone of each assembly does not exceed 1/4 of its length, also two (or even more) assemblies may be stored one above the other, the level grading of a lower layer being kept up in the layer placed above. Therefore the requirement with respect to the active zone is met in the upper layer of assemblies, too. It is an obvious prerequisite that only fuel assemblies with active zones having got equal axial length and lying at the same level will be stored together. (RW) 891 RW.

368 NUCLEAR FUEL STORAGE ARRANGEMENT. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). British Patent 1,557,889/A/. 19 Jan 1977. 7p.

A compact nuclear fuel storage arrangement is described and diagrams with explanatory notes and dimensions given. The object of the invention is to provide an arrangement wherein the storage space for spent fuel assemblies is efficiently utilized without accumulation of a critical mass. Elongated nuclear reactor fuel assemblies each with an active and an inactive section along its longitudinal axis are stored. The arrangement comprises a frame structure forming a plurality of elongated cells, one for each fuel assembly, these being positioned radially adjacent to each other without spaces between. The fuel assemblies are axially positioned in staggered relation along the longitudinal axis of the cells so that the active section of each fuel assembly is adjacent to the inactive section of each radially adjacent fuel assembly. This allows a reduction in the storage space required but the radial distance between the closest active sections is at least one cell diameter.

369 SEISMIC ANALYSIS OF A DRY SPENT FUEL CASK HANDLING SYSTEM. Morris, N.F. (Manhattan Coll., New York (USA)); Harstead, G.A.; Soeoet, O. (Soeoet and Harstead Associates, New York, NY, USA). pp K6/6 1-8 of Structural mechanics in reactor technology. Vol. K(b). Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

An unusual system has been developed for handling the spent fuel cask during loading of spent fuel from the storage pool to decontamination and loading of the cask onto a railroad car or truck. The unique feature of this system is that the outer surface of the cask is kept dry. However, since the system is so unusual a seismic analysis of the system was deemed necessary. The dry cask system was analyzed as a three-dimensional framework carrying a tank. It is an unusual system in that the tank is much more rigid than the supporting system. The actual analyses were carried out with the aid of SAP IV. Even though this meant that computer softwear support would not be available, it was felt the system could be modeled so that it would be satisfactorily analyzed with this program. This proved to be the case although, of course, some difficulties arose in the analysis. In summary, a detailed seismic analysis was carried out for a rather complex mechanical/structural system in an efficient manner utilizing state-of-the-art, public domain programs.

370 IMPROVEMENTS OF CONTAINERS FOR HEAT PRODUCING MATERIALS. (to Robatel-S.L.P.I., 69 - Lyon (France)). French Patent 2,368,123/A/. 14 Oct 1976. 10p. (In French).

Container for the transport and/or confinement of irradiated fuel elements, in which the internal containment is filled with a liquid to ensure that the heat given off by the elements is transferred by convection to the external wall. It includes a separate buffer capacity, partially filled with air or gas, which communicates with the containment through a pipe oriented so that this capacity automatically offsets the changes of pressure resulting from temperature variations without ever allowing the occluded air or gas from reaching the containment.

371 METHOD FOR STORING NUCLEAR FUEL IN RESPOSITORIES. Schweitzer, D.G.; Sastre, C. US Patent Application 070,548. [nd]. 5p.

A method for storing radioactive spent fuel in repositories containing polyphenyl or silicon oil as the storage medium is disclosed. Polyphenyls and silicon oils are non-corrosive and are not subject to radiation damage. Thus, storage periods of up to 100 years are possible.

372 METHOD FOR STORING SPENT NUCLEAR FUEL IN REPOSITORIES. Schweitzer, D.G.; Sastre, C.; Winsche, W. US Patent Application 068,359.

[nd]. 8p.
A method for storing radioactive spent fuel in repositories containing sulfur as the storage medium is disclosed. Sulfur is non-corrosive and not subject to radiation damage. Thus, storage periods of up to 100 years are possible.

Marketing and Economics

373 (PNL--3317-2) COMMERCIAL US NUCLEAR REACTORS AND WASTE: THE CURRENT STATUS. Platt, A.M.; Robinson, J.V. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Sep 1980. Contract AC06-76RL01830. 53p. NTIS, PC A04/MF A01.
Between March 1 and June 15, 1980, the declared size of the commercial light waste reactor (LWR) nuclear power industry in the US has decreased another 9 GWe. For the presently declared size: the 165 declared reactors will peak at a capacity of 153 GWe in 2001 and will consume about 870,000 MTU as enrichment feed; the theoretical rate of enrichment requirements will peak at about 19,000,000 SWUs/y in the year 2014; as few as two repositories each with capacity equivalent to 100,000 MTU would hold the waste; and predisposal storage reactor basins and AFRs (away-from-reactor basins) would peak at <85,000 MTU in the year 2020 if the two respositories were commissioned in the years 1997 and 2020. It should be noted that the number of declared LWRs has dropped from 226 on December 31, 1974 to 165 as of this writing. The oil equivalent of the energy loss, assuming a 50% efficiency in use as in cars, is 17,000 million barrels. This is about 10 years of the current rate of US consumption of OPEC oil.

374 CHANGES AHEAD FOR NUCLEAR INDUSTRY. To the Point ; 8: No. 19, 17(11 May 1979).

375 FUEL CYCLE INDUSTRIALIZATION PROGRAM PREPARED BY N-FUEL RESEARCH COMMITTEE, ANRE. Atoms in Japan ; 22: No. 9, 27-34(Sep 1978).
To meet the new situation resulting from the scaling down of nuclear power development plan in Japan, and the changes due to the new U.S. nuclear non-proliferation policy, the Nuclear Fuel Research Committee of the Agency of Natural Resources and Energy of MITI has prepared the ''Interim Report on the Nuclear Fuel Cycle''. It sets out in precise terms the methods that should be followed for establishing the nuclear fuel cycle in Japan. Major items treated in this report are; uranium ore development, promotion of uranium stockpiling, construction of domestic uranium enrichment plant, promotion of the construction of a nuclear fuel park, Pu utilization and cooperation in international movement for nuclear non-proliferation, and the establishment of measures for radioactive waste management. Discussions are made from technological, economical, and political view points. Also attached are a table of the comprehensive industrialization plan up to the year 2000 and a table of estimated nuclear fuel demand and supply in Japan.

Waste Management

376 (ANL--80-66, pp 128-143) NUCLEAR FUEL CYCLE STUDIES. Jun 1980.
Chemical Engineering Division research highlights, 1979.
For the metal-matrix encapsulation of radioactive waste, brittle-fracture, leach-rate, and migration studies are being conducted. For fuel reprocessing, annular and centrifugal contactors are being tested and modeled. For the LWBR proof-of-breeding project, the full-scale shear and the prototype dissolver were procured and tested. 5 figures. (DLC)

377 (ANL/ES--80) ENGINEERING EVALUATION OF A FORMERLY UTILIZED MED/AEC SITE. SITE A AND PLOT M, PALOS FOREST PRESERVE, PALOS PARK, ILLINOIS. (Argonne National Lab., IL (USA)). Sep 1979. Contract W-31-109-ENG-38. 76p. Dep. NTIS, PC A05/MF A01.
This engineering evaluation report (EER) addresses one of these MED/AEC sites known as Site A/Plot M, located in Palos Park, Illinois. The EER describes in technical detail a number of options for remedial action that could be taken with respect to the contamination at Site A/Plot M and presents estimates of the costs associated with these options. A companion document, Environmental Analysis Report on a Formerly Utilized MED/AEC Site, Site A and Plot M, Palos Forest Preserve, Palos Park, Illinois (ANL/ES-79), has also been prepared. It describes in detail the existing site environment and evaluates the environmental impacts of the various remedial options discussed in this report. This EER contributes to a better understanding of the mitigation or resolution of environmental problems posed by the subject MED/AEC site and serves as a basis for determining whether or not remedial actions are warranted. The knowledge derived from the evaluation of a number of remedial options should be helpful in the final disposition of other MED/AEC sites located elsewhere.

378 (ARH--2619) CAPSULE CALORIMETER DEVELOPMENT REPORT. Hall, J.C. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 2 Oct 1972. Contract EY-77-C-06-1030. 58p. Dep. NTIS, PC A04/MF A01.
A capsule calorimeter has been designed, fabricated, and tested that is capable of measuring the rate of thermal energy generation of a capsule source with an accuracy of plus or minus five percent over a range of 300 watts to 1,000 watts of power. Three operating modes were investigated. The rate of temperature rise mode of operation was found to be the superior operating mode based on accuracy, time cycle, and simplicity of operation. This mode of operation is recommended for use in the encapsulation plant for performing calorimetric determinations on the strontium and cesium capsules that will be produced in the plant. The heat generation data collected by calorimetry will be used for isotopic assay of the capsule sources. The capsule calorimeter is specifically designed for installation into a remotely operated hot cell.

379 (B-HARC--411-021) PUBLIC PARTICIPATION IN NUCLEAR WASTE MANAGEMENT. Schilling, A.H.; Nealey, S.M. (Battelle Human Affairs Research Center, Seattle, WA (USA)). Apr 1979. Contract EW-78-C-06-1076. 25p. Dep. NTIS, PC A02/MF A01.
The recent report of the Interagency Review Group (IRG) on Nuclear Waste Management formalized what has become increasingly clear in recent years: public participation in nuclear waste management decisions is a fact of life and will be more emphasized in the future

than in the past. The purpose of this paper is to discuss, and stimulate discussion, of major issues which must be considered before attempting to design and implement a program to encourage public participation in this complex and sensitive area. Public participation is a term with many possible meanings. The term is used here to stand for a very wide range of activities including: providing information about programs and intended actions, seeking advice or permission from state or local officials, conducting public meetings to announce plans and receive reactions, conducting hearings, establishing consultative panels of outside experts or special interest group members, and even conducting surveys of public opinion and concern. This paper is not a proposal or a set of specific recommendations, but a stimulus to thought and discussion. It was prepared with DOE's role in waste management in mind, and benefits from the authors' opportunity to observe the public participation process in this topic area to data. The paper is organized into four sections that take account of (1) past participation efforts, (2) why public participation is necessary and what might be gained by it, (3) considerations in designing a participation program, and (4) major principles involved in conducting a public participation program, including a brief review of participation procedures.

380 (BMI-X--702) ACCEPTANCE CRITERIA FOR TRANSURANIC WASTE PACKAGES FOR DISPOSAL IN A LICENSED GEOLOGIC REPOSITORY. Christensen, R.N.; Miller, N.E. (Battelle Columbus Labs., OH (USA)). Sep 1980. Contract W-7405-ENG-92. 79p. NTIS, PC A05/MF A01.

Purpose of the predicted future criteria is to anticipate what changes will be necessary for the TRU wastes which are in storage awaiting disposal. The probable future criteria were predicted on the basis of an evaluation of waste package criteria recently developed by several sources. The BCL/RHO Waste Package Criteria served as a starting point for the present study. Criteria from the other sources were categorized according to the characteristic of the waste package described in the BCL/RHO document. Two additional areas not covered in the BCL/RHO document were added to form a potential list of nineteen criteria. Discussions were held with representatives of NRC, EPA, and ONWI.

381 (CAEC--007(Vol.2)) LOW-LEVEL RADIOACTIVE WASTE MANAGEMENT. VOLUME II. FORECAST REQUIREMENTS. Feizollahi, F. (NUS Corp., Palo Alto, CA (USA)). Nov 1978. 76p. (NUS--3158). California Energy Commission, 1111 Howe Ave., Sacramento, CA 95825.

This report is concerned with the forecast of future requirements for power-reactor low-level-waste management consisting of estimates of the quantities of low-level radioactive wastes that will be generated in commercial light-water-reactor plants. Non-LWR sources are also discussed. This study does not make projections of nuclear power growth beyond 1995 for California, nor beyond 1990 for the United States. However, projections of radwaste quantities are extended beyond 1995 for California, and beyond 1990 for the United States, only for the waste quantities generated by the LWR plants operating, under construction, or formally announced.

382 (CONF-790420--) CERAMICS IN NUCLEAR WASTE MANAGEMENT. Chikalla, T.D.; Mendel, J.E. (eds.). (Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1979. Contract EY-76-C-06-1830. 385p. Dep. NTIS, PC A17/MF A01.

From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).

Seventy-three papers are included, arranged under the following section headings: national programs for the disposal of radioactive wastes, waste from stability and characterization, glass processing, ceramic processing, ceramic and glass processing, leaching of waste materials, properties of nuclear waste forms, and immobilization of special radioactive wastes. Separate abstracts were prepared for all the papers. (DLC)

383 (CONF-790420--, pp 210-212) VISCOSITY AND ELECTRICAL CONDUCTIVITY OF GLASS MELTS AS A FUNCTION OF WASTE COMPOSITION. Plodinec, M.J.; Wiley, J.R. (E.I. du Pont de Nemours and Co., Aiken, SC). May 1979.

From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).

Radioactive waste at the Savannah River Plant contains high concentrations of nonradioactive compounds of iron and aluminum. Simulated waste compositions containing varying ratios of iron to aluminum were added to glass melts to determine the effect on the melt properties. Waste containing high aluminum increased the melt viscosity, but waste containing high iron reduced the melt viscosity. Aluminum and iron both reduced the melt conductivity.

384 (CONF-790420--, pp 198-202) COMPATIBILITY OF ACTINIDES WITH HLW BOROSILICATE GLASS: SOLUBILITY AND PHASE FORMATION. Walker, C.T. (European Inst. for Transuranium Elements, Karlsruhe, Germany); Riege, U. May 1979.

From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).

Actinide oxides in the amounts expected in HLW glass are completely soluble in the glass. At 1400°K, the solubility of PuO_2 in borosilicate glass is about 4.5 wt % and is unaffected by the addition of 20 wt % HLW oxides. The presence of 10 wt % Gd_2O_3 gives rise to a segregate phase of the type $Pu_{0.7}Ce_{0.2}Gd_{0.1}O_2$ and hence decreases the solubility of PuO_2 to 1.3 wt %.

385 (CONF-790420--, pp 36-40) DEVELOPMENT OF COMPREHENSIVE WASTE ACCEPTANCE CRITERIA FOR COMMERCIAL NUCLEAR WASTE. O'Hara, F.A.; Miller, N.E.; Ausmus, B.S.; Yates, K.R.; Means, J.L.; Christensen, R.N.; Kulacki, F.A. (Battelle Columbus Labs., OH). May 1979.

From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).

A detailed methodology is presented for the identification of the characteristics of commercial nuclear waste which may require criteria. This methodology is analyzed as a six-step process which begins with identification of waste operations and proceeds until the waste characteristics affecting the potential release of radionuclides are determined. All waste types and operations were analyzed using the methodology presented. Several illustrative example are included. It is found that thirty-three characteristics can be identified as possibly requiring criteria.

386 (CONF-790420--, pp 41-46) APPROACH

TOWARDS LONG TERM PREDICTION OF STABILITY OF NUCLEAR WASTE FORMS. Yen-Bower, E.L.; Clark, D.E.; Hench, L.L. (Univ. of Florida, Gainesville). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
An experimental method for predicting long-term stability of nuclear waste encapsulants uses various ratios of surface area to the solution volume exposed to the encapsulant. A graphical technique, involving leaching indices and exposure times, illustrates how predictions can be made based on laboratory experiments, field trials, and museum artifacts.

387 (CONF-790420--, pp 52-56) COMPARISON OF GLASS AND CRYSTALLINE WASTE MATERIALS. Ross, W.A.; Turcotte, R.P.; Mendel, J.E.; Rusin, J.M. (Battelle Pacific Northwest Labs., Richland, WA). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Either glass or crystalline materials can be shown to have some advantage when a single property is considered. However, the differences are small and each material has both assests and liabilities. With proper design, either type of waste form can almost certainly be utilized to solidify and contain radioactive waste.

388 (CONF-790420--, pp 57-61) GLASSES AS MATERIALS USED IN FRANCE FOR MANAGEMENT OF HIGH-LEVEL WASTES. Bonniaud, R.A.; Jacquet Francillon, N.R.; Laude, F.L.; Sombret, C.G. (Commissariat a l'Energie Atomique, Marcoule, France). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Sodium borosilicate and sodium aluminoborosilicate glasses have been selected as final materials in the field of the solidification of high-level radioactive wastes. The properties related to long-term storage are reviewed. The effects of alpha emission upon the structure and of aqueous leaching upon radioactive release are emphasized.

389 (CONF-790420--, pp 62-65) CHARACTERIZATION OF BOROSILICATE GLASSES CONTAINING SIMULATED HIGH-LEVEL RADIOACTIVE WASTES FROM PNC. Terai, R.; Eguchi, K.; Yamanaka, H. (Government Industrial Research Inst., Osaka, Japan). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The characterization of borosilicate glasses containing simulated HLW from PNC has been carried out. Phase separation of molybdates, volatilization, viscosity, electrical resistivity, thermal conductivity, elastic modulus, chemical durability, and devitrification of these glasses have been measured, and the suitability of the glasses for the vitrified solidification processes is discussed from the viewpoint of safety.

390 (CONF-790420--, pp 203-209) INVESTIGATION OF CRYSTALLIZATION IN GLASSES CONTAINING FISSION PRODUCTS. Malow, G. (Hahn-Meitner-Institut fuer Kernforschung, Berlin, Germany). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Five potential solidification products for high-level waste (four borosilicate glasses and one celsian glass ceramic) have been investigated in terms of crystallization. In all glasses and in the glass ceramic, crystallization, and recrystallization, respectively, were observed by heating above 773°K, however, at very different periods of time (0.1d greater than or equal to 100d). The noble metals precipitated into various phases. Crystal growth proceeded at the phase boundary glass-noble metal. In all products rare earth phases crystallized. Silicate phases rarely formed. The leach resistance (by the grain titration and Soxhlet tests) decreased after heat treatment in all cases. The changes were found to be within one order of magnitude for all products. 2 figures, 4 tables.

391 (CONF-790420--, pp 213-217) EFFECTS OF COMPOSITION ON WASTE GLASS PROPERTIES. Mellinger, G.B.; Chick, L.A. (Battelle Pacific Northwest Labs., Richland, WA). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The electrical conductivity, viscosity, chemical durability, devitrification, and crystallinity of a defense waste glass were measured. Each oxide component in the glass was varied to determine its effect on these properties. A generic study is being developed which will determine the effects of 26 oxides on the above and additional properties of a wide field of possible waste glasses. 5 figures, 2 tables.

392 (CONF-790420--, pp 224-228) PELLETED WASTE FORM FOR HIGH-LEVEL ICPP WASTES. Lamb, K.M.; Priebe, S.J.; Cole, H.S.; Taki, B.d. (Allied Chemical Corp., Idaho Falls, ID). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Simulated zirconia-type calcined waste is pelletized on a 41-cm diameter disc pelletizer using 5% bentonite, 2% metakaolin, and 2% boric acid as a solid binder and 7M phosphoric plus 4M nitric acid as a liquid binder. After heat treatment at 800°C for 2 hours the pellets are impact resistant and have a leach resistance of 10^{-4} g/cm$_2$. day, based on Soxhlet leaching for 100 hours at 95°C with distilled water. An integrated pilot plant is being fabricated to verify the process. 1 figure, 4 tables.

393 (CONF-790420--, pp 233-237) RELATIVE LEACH BEHAVIOR OF WASTE GLASSES AND NATURALLY OCCURRING GLASSES. Adams, P.B. (Corning Glass Works, NY). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Simulated nuclear waste glasses of the sodium-borosilicate type with a low waste loading and of the zinc-borosilicate type with a high waste loading have been compared with obsidians. The resuls indicate that the waste glasses would corrode in normal natural environments at a rate of about 0.1 μm per year at 30°C and about 5 μm per year at 90°C, compared with obsidians which seem to corrode at, or less than, about 0.01 μm per year at 30°C and less than 1 μm per year at 90°C. Activation energies for reactions of the two waste glasses with pure water are about 20 kcal/g-mol. 3 figures, 7 tables.

394 (CONF-790420--, pp 289-293) SIMULATIONS OF RADIATION DAMAGE IN GLASSES. Antonini, M.; Lanza, F.; Manara, A. May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Simulation of the damage produced in glasses by alpha emitters has been performed using fission fragments and accelerated Ni ions. As a unit of damage the number of displaced atoms has been assumed. Stored energy was considered as a basic quantity for verification. The results obtained compare very well with the existing data. 2 figures, 4 tables.

395 (CONF-790420--, pp 294-299) RADIATION EFFECTS IN VITREOUS AND DEVITRIFIED SIMULATED WASTE GLASS. Weber, W.J.; Turcotte, R.P.; Bunnell, L.R.; Roberts, F.P.; Westsik, J.H. Jr. (Battelle Pacific Northwest Labs., Richland, WA). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The long-term radiation stability of vitreous and partially devitrified forms of high-level waste glass was investigated in accelerated experiments by ^{250}Cm doping. The effects of radiation on microstructure, phase behavior, density, impact strength, stored energy, and leachability are reported to a cumulative radiation dose of 5×10^{18} α decays/cm^3. This dose produces saturation of radiation effects in most properties. 4 figures.

396 (CONF-790420--, pp 300-304) EFFECTS OF IRRADIATION ON STRUCTURAL PROPERTIES OF CRYSTALLINE CERAMICS. Clinard, F.W. Jr.; Hurley, G.F. (Los Alamos Scientific Lab., NM). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Stability of crystalline ceramic nuclear waste may be degraded by self-irradiation damage. Changes in density, strength, thermal conductivity, and lattice structure are of concern. In this paper, structural damage of ceramics under various radiation conditions is discussed and related to possible effects in nuclear waste.

397 (CONF-790420--, pp 315-320) CRYSTAL CHEMISTRY OF THE SYNTHETIC MINERALS IN CURRENT SUPERCALCINE-CERAMICS. McCarthy, G.J. (Pennsylvania State Univ., University Park); Pepin, J.G.; Pfoertsch, D.E.; Clarke, D.R. May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Crystal chemistry of the synthetic mineral phase assemblages in current supercalcine-ceramics has been investigated. X-ray diffraction and a variety of electron optical tools (SEM, STEM, electron microprobe) have been used to characterize the crystal structure types and solid solution substitutions.

398 (CONF-790420--, pp 327-332) EFFECT OF IMPACT ENERGY ON SOLID-WASTE COMPOSITES OF BRITTLE AND DUCTILE MATERIALS. Mecham, W.J.; Jardine, L.J.; Steindler, M.J. (Argonne National Lab., IL). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
A method of analysis of impacts that could occur prior to final geologic isolation is outlined for two generic solid waste forms: (1) a glass monolith and (2) a composite of ceramic pellets embedded in a continuous metal phase. This latter form is also referred to as a metal-matrix waste form. Relevant methods, models, and methodologies reported in the literature for impact analyses of solid radioactive waste forms are summarized. Preliminary descriptive and calculational models are outlined for estimating and for comparing the impact deformations. The models are based on energy balances and are proposed to serve as a basis for design and testing of solid waste forms.

399 (CONF-790420--, pp 305-309) METAMICT STATE RADIATION DAMAGE IN CRYSTALLINE MATERIALS. Haaker, R.F.; Ewing, R.C. (Univ. of New Mexico, Albuquerque). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Metamict minerals provide an excellent basis for the evaluation of long-term radiation damage effects, particularly such changes in physical and chemical properties as microfracturing, hydrothermal alteration, and solubility. This paper summarizes pertinent literature on metamictization and proposes experiments that are critical to the elucidation of structural controls on radiation damage in crystalline phases.

400 (CONF-790420--, pp 310-314) RADIATION DAMAGE STUDIES ON SYNTHETIC NACL CRYSTALS AND NATURAL ROCK SALT FOR WASTE DISPOSAL APPLICATIONS. Klaffky, R.W. (Brookhaven National Lab., Upton, NY); Swyler, K.J.; Levy, P.W. May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Radiation damage studies are being made on synthetic NaCl and natural rock salt crystals from various localities, including potential repository sites. Measurements are being made with equipment for recording the radiation-induced F-center and colloid particle absorption bands during irradiation with 1.5 MeV electrons at various temperatures. A technique has been developed to resolve the overlapping F-center and colloid bands. The resulting spectra and curves of absorption verus dose provide information on colloid particle size and concentration and activation energies for processes occurring during colloid formation; additional data suggest that both strain and radiation-induced dislocations contribute to the colloid formation process. 5 figures, 1 table.

401 (CONF-790420--, pp 13-16) CONCEPT FOR THE TREATMENT AND DISPOSAL OF RADIOACTIVE WASTES IN THE GERMAN ENTSORGUNGSZENTRUM. Salander, C.; Zuehlke, P. (Deutsche Gesellschaft fuer Wiederaufarbeitung von Kernbrennstoffen mbH, Hannover, Germany). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The concept for treatment and disposal of radioactive wastes in the planned German Entsorgungszentrum is presented. HLLW will be converted to borosilicate glass. Medium- and low-level-liquid waste concentrates will be fixed by cementation. The products will be finally disposed of in a salt dome just below the Entsorgungszentrum.

402 (CONF-790420--, pp 27-32) INFLUENCE OF SYSTEM CONSIDERATIONS ON WASTE FORM DESIGN.

Bauer, A.A.; Matthews, S.C.; Peterson, R.W. (Office of Nuclear Waste Isolation, Columbus, OH). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The design of waste forms is constrained by waste management system considerations imposed during generation, treatment, packaging, transportation, storage, and isolation. In the isolation phase, the waste form provides one of the barriers to release in a multibarrier system that includes the natural geologic and hydrologic barriers as well as other engineered barriers.

403 (CONF-790420--, pp 33-35) IAEA COORDINATED RESEARCH PROGRAM ON THE EVALUATION OF SOLIDIFIED HIGH-LEVEL RADIOACTIVE WASTE PRODUCTS. Grover, J.R..; Schneider, K.J. (International Atomic Energy Agency, Vienna, Austria). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
A coordinated research program on the evaluation of solidified high-level radioactive waste products has been active with the IAEA since 1976. The program's objectives are to integrate research and to provide a data bank on an international basis in this subject area. Results and considerations to date are presented.

404 (CONF-790420--, pp 218-223) PHASE BOUNDARY EFFECTS IN METAL MATRIX EMBEDDED GLASSES. Schiewer, E. (Hahn-Meitner-Institut fuer Kernforschung GmbH, Berlin, Germany). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
An investigation was performed to study reactions at the phase boundaries of glass-lead composites at temperatures up to the softening point of the glass. Some metal was oxidized at the boundary and penetrated into the glass. Solid-state diffusion was rate controlling. In the case of a phosphate glass, fission products were depleted in the boundary area. Molybdenum migrated into the lead, and cesium migrated into the glass core. 2 figures, 3 tables.

405 (CONF-790420--, pp 333-337) STRESS ANALYSIS OF GLASS-CANISTER INTERACTION: A STUDY OF RESIDUAL STRESSES AND FRACTURING. Simonen, F.A.; Friley, J.R. (Battelle Pacific Northwest Labs., Richland, WA). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Residual stresses and cracking in canisters filled with vitrified nuclear waste are simulated using finite element computer calculations. Cooling rates, internal heat generation, and thermal expansion coefficients significantly affect stress levels. Glass behavior within the softening temperature range is taken to follow the instant freezing concept of Bartenev.

406 (CONF-790420--, pp 365-369) CHARACTERISTICS OF STORED HIGH-LEVEL ICPP WASTE CALCINE. Staples, B.A.; Pomiak, G.S.; Wade, E.L. (Allied Chemical Corp., Idaho Falls, ID). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Calcined high-level radioactive defense waste stored at the Idaho Chemical Processing Plant for up to twelve years was sampled for retrievability. The calcine was determined to be retrievable as expected. A program to determine physical and chemical characterisitcs for future retrieval and alternative waste treatment processes has been completed.

407 (CONF-791112--50) CHARACTERIZATION OF IMPACT FRACTURE OF BRITTLE SOLID-WASTE FORMS. Mecham, W.J.; Jardine, L.J.; Pelto, R.H.; Steindler, M.J. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 13p. Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
This paper presents a methodology for analyzing particle size distributions obtained in impact testing of brittle waste-form materials. The methodology includes (a) a linear two-parameter lognormal correlation of the weight fraction less than any given size, (b) a mathematical function of the two lognormal parameters to determine the total surface area in terms of a dimensionless shape factor, and (c) a surface-energy constant to predict the anticipated increase of surface area from the known energy absorbed in the impact of the brittle material. Preliminary measurements were made on impacted simulated glass specimens. The analysis is used as an example of the methodology. These results are also compared with reanalyzed impact test data reported by others.

408 (CONF-791112--66) SYSTEMATIC APPROACH FOR ASSESSMENT OF ALTERNATIVE NUCLEAR WASTE MANAGEMENT STRATEGIES. Yeh, G.T. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 8p. Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
A systematic approach for alternative nuclear waste management assessment is prescribed for evaluating the fate and transport of radwaste in the environment and to man. The approach consists of a system of flow dynamic and waste transport models for the physical environment, transfer models to biota, and dose models to man. Flow dynamic and waste transport models are included for computing spatial-temporal variations of the flow field and radwaste concentration in subsurface aquifers, surface water regimes, estuaries/oceans, and the atmosphere. Transfer models are linked to flow dynamic and waste transport models to study the uptake from and to the physical environment of the waste by aquatic and terrestrial biota. Dose models are used to compute both the radwaste input to man and its effects on man. With these series of computations, the radiation dose from alternative nuclear waste management strategies can be computed. Coupled with the exposure and effect analysis, the approach should facilitate the selection of the best management methodologies among many alternatives.

409 (CONF-791185--2) DISPOSAL OF RADIOACTIVE WASTES. Blomeke, J.O. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 37p. Dep. NTIS, PC A03/MF A01.
From ANS student chapter seminar; College Station, TX, USA (5 Nov 1979).
Radioactive waste management and disposal requirements options available are discussed. The possibility of beneficial utilization of radioactive wastes is covered. Methods of interim storage of transuranium wastes are listed. Methods of shipment of low-level and

high-level radioactive wastes are presented. Various methods of radioactive waste disposal are discussed. (DC)

410 (CONF-800117--1) NUCLEAR WASTE MANAGEMENT: A PERSPECTIVE. Leuze, R.E. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 37p. Dep. NTIS, PC A03/MF A01.

From American Nuclear Society conference; Tulsa, OK, USA (15 Jan 1980).

The scope of our problems with nuclear waste management is outlined. Present and future inventories of nuclear wastes are assessed for risk. A discussion of what is presently being done to solve waste management problems and what might be done in the future are presented. (DC)

411 (CONF-800403--(Vol.2), pp 1360-1371) PRESENT STATUS OF NUCLEAR WASTE MANAGEMENT IN THE FEDERAL REPUBLIC OF GERMANY. Nickel, H. (Nuclear Research Centre Juelich, Germany). Jun 1980.

From ANS thermal reactor safety meeting; Knoxville, TN, USA (8 Apr 1980).

The German Government and federal authorities have stipulated in a special regulation that new nuclear power stations will only be licensed if safe waste management (entsorgung) is guaranteed. Hence the energy-producing utilities commenced the planning of a national fuel-cycle-centre (Entsorgungszentrum) which includes installations for reprocessing and ultimate storage. Detailed studies have shown that from a safety engineering viewpoint, there is no objection to this waste management concept. However, for political reasons, its realization is not acceptable at present. Hence the Federal Government considered alternative solutions, e.g., the construction of away-from-reactor, temporary storage facilities and a small scale reprocessing plant.

412 (CONF-800416--3) PROGRESS REPORT ON THE DESIGN OF A LOW-LEVEL WASTE PILOT FACILITY AT ORNL. Hensley, L.C.; Turner, V.L.; Pruitt, A.S. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 7p. Dep. NTIS, PC A02/MF A01.

From UCC-ND and GAT waste management seminar program; Portsmouth, OH, USA (22 Apr 1980).

All low-level radioactive solid wastes, excluding TRU wastes, are disposed of by shallow land burial at the Oak Ridge National Laboratory. Contaminated liquids and sludges are hydrofractures. The TRU wastes are stored in a retrievable fashion in concrete storage facilities. Currently, the capacity for low-level radioactive waste burial at the Oak Ridge National Laboratory is adequate for another six years of service at the current solids disposal rate which ranges between 80,000 and 100,000 cu ft per year. Decontamination and decommissioning of a number of ORNL facilities will be a significant activity in the next few years. Quantities of radioactive materials to be stored or disposed of as a result of these activities will be large; therefore, the technology to dispose of large quantities of low-level radioactive wastes must be demonstrated. The UCC-ND Engineering Division, in concert with divisions of the Oak Ridge National Laboratory, has been requested to prepare a conceptual design for a facility to both dispose of the currently produced low-level radioactive waste and also to provide a test bed for demonstration of other processes which may be used in future low-level radioactive wastes disposal facilities. This facility is designated as the Low-Level Waste Pilot Facility (LLWPF). This paper describes the status of the conceptual design of a facility for disposal of the subject radioactive waste.

413 (CONF-800444--1) OVERALL ASSESSMENT OF ACTINIDE PARTITIONING AND TRANSMUTATION FOR WASTE MANAGEMENT PURPOSES. Blomeke, J.O.; Croff, A.G.; Finney, B.C.; Tedder, D.W. (Oak Ridge National Lab., TN (USA); Georgia Inst. of Tech., Atlanta (USA)). 1980. Contract W-7405-ENG-26. 21p. Dep. NTIS, PC A02/MF A01.

From 2. technical meeting on the nuclear transmutation of actinides; Ispra, Italy (21 Apr 1980).

A program to establish the technical feasibility and incentives for partitioning (i.e., recovering) actinides from fuel cycle wastes and then transmuting them in power reactors to shorter-lived or stable nuclides has recently been concluded at the Oak Ridge National Laboratory. The feasibility was established by experimentally investigating the reduction that can be practicably achieved in the actinide content of the wastes sent to a geologic repository, and the incentives for implementing this concept were defined by determining the incremental costs, risks, and benefits. Eight US Department of Energy laboratories and three private companies participated in the program over its 3-year duration. A reference fuel cycle was chosen based on a self-generated plutonium recycle PWR, and chemical flowsheets based on solvent extraction and ion-exchange techniques were generated that have the potential to reduce actinides in fuel fabrication and reprocessing plant wastes to less than 0.25% of those in the spent fuel. Waste treatment facilities utilizing these flowsheets were designed conceptually, and their costs were estimated. Finally, the short-term (contemporary) risks from fuel cycle operations and long-term (future) risks from deep geologic disposal of the wastes were estimated for cases with and without partitioning and transmutation. It was concluded that, while both actinide partitioning from wastes and transmutation in power reactors appear to be feasible using currently identified and studied technology, implementation of this concept cannot be justified because of the small long-term benefits and substantially increased costs of the concept.

414 (CONF-800447--1) BIOLOGICAL DENITRIFICATION OF HIGH-NITRATES WASTES GENERATED IN THE NUCLEAR INDUSTRY. Francis, C.W. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 21p. Dep. NTIS, PC A02/MF A01.

From Water Research Centre and University of Manchester Institute of Science and Technology conference; Manchester, UK (15 Apr 1980).

Biological denitrification appears to be one of the most effective methods to remove nitrates from wastewater streams (Christenson and Harremoes, 1975). However, most of the research and development work has been centered on removal of nitrates from sewage or agricultural drainage waters, nitrate nitrogen concentration usually less than 50 g/m^3. Work was initiated at Oak Ridge National Laboratory (ORNL) in 1974 to test the use of biological nitrification in the removal of high concentrations of nitrate (in excess of 1.0 kg NO_3-N/m^3) from uranium purification waste streams. Since then, a full-scale treatment facility, a stirred reactor, has been installed at the Y-12 plant; and a pilot-plant, using a fluidized bed, has been proposed at Portsmouth Gaseous Diffusion Plant. The objective of this

manuscript is to present some applied microbiological research relating to possible constraints in biologically denitrifying certain waste streams in the nuclear industry and comparing the effectiveness of denitrification of these waste streams in three bench scale reactors, (1) a continuous flow-stirred reactor, (2) stirred bed rector, and (3) a fluidized bed reactor.

415 (CONF-800535--3) OVERVIEW OF RADIOACTIVE WASTE MANAGEMENT. Ritter, G.L. (EG and G Idaho, Inc., Idaho Falls (USA)). 29 May 1980. Contract AC07-76ID01570. 4p. NTIS, PC A02/MF A01.

From ASME Idaho section symposium; Idaho Falls, ID, USA (29 May 1980).

The question of what to do with radioactive wastes is discussed. The need to resolve this issue promptly is pointed out. Two significant events which have occurred during the Carter administration are discussed. An Interagency Review Group (IRG) on waste management was formed to formulate recommendations leading to the establishment of a National policy for managing radioactive wastes. The technical findings in the IRG report are listed. The author points out some issues not addressed by the report. President Carter issued a national policy statement on Radioactive Waste Management in February 1980. The most significant elements of this statement are summarized. The cancellation of the Waste Isolation Pilot Plant is currently meeting opposition in Congress. This and other items in the National Policy Statement are discussed.

416 (CONF-800607--27) DEPARTMENT OF ENERGY LOW-LEVEL WASTE MANAGEMENT STRATEGY. (EG and G Idaho, Inc., Idaho Falls (USA)). 1980. Contract EY-76-C-07-1570. 2p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

The DOE strategy recognizes that public perception of low-level waste management practices is not positive. Actions are included that are aimed at opening the system to the public. A better informed public will be able to better assess the performance of the low-level waste management system.

417 (CONF-800943--(Summ.), pp 6-8) WASTE MANAGEMENT R and D FOR THE NUCLEAR FUEL CYCLE. McElroy, J.L. 1980.

From National topical meeting of fuel cycles for the 80's; Gatlinburg, TN, USA (29 Sep 1980).

RADIOACTIVE WASTE MANAGEMENT;GOVERNMENT POLICIES;RADIOACTIVE WASTE DISPOSAL;UNDERGROUND DISPOSAL;TECHNOLOGY ASSESSMENT;TRANSURANIUM ELEMENTS;HIGH-LEVEL RADIOACTIVE WASTES

418 (CONF-800987--2) LEACH TESTING OF IDAHO CHEMICAL PROCESSING PLANT FINAL WASTE FORMS. Schuman, R.P. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). 1980. Contract AC07-79ID01675. 21p. NTIS, PC A02/MF A01.

From Workshop on comparative leaching behavior of radioactive waste forms; Argonne, IL, USA (3 Sep 1980).

A number of pellets and highly durable glasses prepared from nonradioactive-simulated high-level wasste calcines have been leach tested. The leach tests are patterned on the IAEA standard test and the proposed Materials Characterization Center tests. Most tests are made with static distilled water at 25, 70, 95, 250, and 350°C and in refluxing distilled water, Soxhlet, at 95°C. Leach rates are determined by analyzing the leachate by instrumental activation analysis or spectrochemical analysis and from weight loss. Leaches are run on glass using cast and core drilled cylinders, broken pieces and coarse ground material. Sample form has a considerable effect on leach rates; solid pieces gave higher leach rates than ground glass when expressed in $g/cm^2/day$. Cesium, molybdenum and weight loss leach rates of cast glass cylinders in distilled water varied from $<10^{-7}$ $g/cm^2/day$ at 25°C to approx. 10^{-3} $g/cm^2/day$ at 250°C. The leach rates in static distilled water at 95°C were considerably lower than those in refluxing distilled water, Soxhlet, at the same temperature. Even at 25°C, sodium, cesium, and molybdenum readily leached from the porous pellets, but the pellets showed no visible attack, even at 250°C.

419 (DOE/ET--0081(Revised)) ENVIRONMENTAL AND OTHER EVALUATIONS OF ALTERNATIVES FOR LONG-TERM MANAGEMENT OF STORED INEL TRANSURANIC WASTE. (Department of Energy, Washington, DC (USA). Office of Nuclear Waste Management). Dec 1979. Contract EY-76-C-07-1570. 640p. Dep. NTIS, PC A09/MF A01.

This study identifies, develops, and evaluates, in a preliminary manner, alternatives for long-term management of TRU waste stored at the Radioactive Waste Management Complex (RWMC) at the INEL. The evaluations concern waste currently at the RWMC and waste expected to be received by the beginning of the year 1985. The effects of waste that might be received after that data are addressed in an appendix. The technology required for managing the waste, the environmental effects, the risks to the public, the radiological and nonradiological hazards to workers, and the estimated costs are discussed.

420 (DOE/ET/41900--T2) DEVELOPMENT OF TAILORED CERAMICS FOR GEOLOGIC STORAGE OF NUCLEAR WASTES. QUARTERLY PROGRESS REPORT, JANUARY 1-MARCH 31, 1980. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 15 May 1980. Contract AC09-79ET41900. 38p. NTIS, PC A03/MF A01.

In the second quarter of activities on developing Tailored Ceramic waste forms for SRP waste compositions, emphasis was on the chemistry controlling the incorporation of the waste elements into the crystalline phases of the high-alumina content ceramic and the major factors affecting the consolidation process. Research on the design and synthesis of oxide and phosphate ceramic waste forms has continued with emphasis on fluorite-structure oxides and on rare earth phosphates with the monazite structure. Dissolution studies to date indicate that monazite is very stable.

421 (DOE/NE--0008) NUCLEAR WASTE MANAGEMENT PROGRAM SUMMARY DOCUMENT, FY 1981. (Department of Energy, Washington, DC (USA)). Mar 1980. 283p. Dep. NTIS, PC A13/MF A01.

The Nuclear Waste Management Program Summary Document outlines the operational and research and development (R and D) activities of the Office of Nuclear Waste Management (NEW) under the Assistant Secretary for Nuclear Energy, US Department of Energy (DOE). This document focuses on the current and planned activities in waste management for FY 1981. This Program Summary Document (PSD) was prepared in order to explain the Federal nuclear waste management and spent fuel storage programs to Congress and its committees and to interested members of the public, the private sector, and the research

community. The national energy policy as it applies to waste management and spent fuel storage is presented first. The program strategy, structure, budget, management approach, and public participation programs are then identified. The next section describes program activities and outlines their status. Finally, the applicability of departmental policies to NEW programs is summarized, including field and regional activities, commercialization plans, and environmental and socioeconomic implications of waste management activities, and international programs. This Nuclear Waste Management Program Summary Document is meant to serve as a guide to the progress of R and D and other energy technology programs in radioactive waste management. The R and D objective is to provide the Nation with acceptable solutions to short- and long-term management problems for all forms of radioactive waste and spent fuel.

422 (DOE/NV/00410--54) AREA 5 RADIOACTIVE WASTE MANAGEMENT SITE SAFETY ASSESSMENT DOCUMENT. Horton, K.K.; Kendall, E.W.; Brown, J.J. (Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (USA)). Feb 1980. Contract AC08-76NV00410. 75p. Dep. NTIS, PC A04/MF A01.

The Area 5 Radioactive Waste Management Safety Assessment Document evaluates site characteristics, facilities and operating practices which contribute to the safe handling and storage/disposal of radioactive wastes at the Nevada Test Site. Physical geography, cultural factors, climate and meteorology, geology, hydrology (with emphasis on radionuclide migration), ecology, natural phenomena, and natural resources are discussed and determined to be suitable for effective containment of radionuclides. Also considered, as a separate section, are facilities and operating practices such as monitoring; storage/disposal criteria; site maintenance, equipment, and support; transportation and waste handling; and others which are adequate for the safe handling and storage/disposal of radioactive wastes. In conclusion, the Area 5 Radioactive Waste Management Site is suitable for radioactive waste handling and storage/disposal for a maximum of twenty more years at the present rate of utilization.

423 (DOE/SR-WM--79-1(Suppl.)) DEFENSE TRANSURANIC WASTE AT THE SAVANNAH RIVER PLANT, AIKEN, SOUTH CAROLINA. SUPPLEMENTAL ALTERNATIVES FOR LONG-TERM MANAGEMENT. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Aug 1980. Contract AC09-76SR00001. 53p. NTIS, PC A04/MF A01.

Costs and risks are estimated for four supplementel alternatives for the long-term management of retrievably stored defense transuranic solid waste now stored in trenches and on pads at the Savannah River Plant. These alternatives supplement the twelve alternatives described in Reference 1, Alternatives for Long-Term Management of Defense Transuranic Waste at the Savannah River Plant, Aiken, South Carolina, by adding the use of the planned Alpha Waste Incinerator and Alpha Disassembly and Decontamination facilities to process retrievable stored TRU solid waste. The four supplemental alternatives are compared with three of the twelve alternatives described in Reference 1.

424 (DOE/SR-WM--79-3(Rev.4/80)) LONG-TERM HIGH-LEVEL WASTE TECHNOLOGY PROGRAM. (Department of Energy, Aiken, SC (USA). Savannah River Operations Office). Apr 1980. 43p. NTIS, PC A03/MF A01.

The Department of Energy (DOE) is conducting a comprehensive program to isolate all US nuclear wastes from the human environment. The DOE Office of Nuclear Energy - Waste (NEW) has full responsibility for managing the high-level wastes resulting from defense activities and additional responsiblity for providing the technology to manage existing commercial high-level wastes and any that may be generated in one of several alternative fuel cycles. Responsibilities of the Three Divisions of DOE-NEW are shown. This strategy document presents the research and development plan of the Division of Waste Products for long-term immobilization of the high-level radioactive wastes resulting from chemical processing of nuclear reactor fuels and targets. These high-level wastes contain more than 99% of the residual radionuclides produced in the fuels and targets during reactor operations. They include essentially all the fission products and most of the actinides that were not recovered for use.

425 (DOE/SR-WM--80-1) SAVANNAH RIVER WASTE MANAGEMENT PROGRAM PLAN. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Apr 1980. Contract EY-76-C-09-0001. 338p. Dep. NTIS, PC A15/MF A01.

This document provides the program plan as requested by the Savannah River Operations Office of the Department of Energy. The plan was developed to provide a working knowledge of the nature and extent of the waste management programs being undertaken by Savannah River contractors for the Fiscal Year 1980. In addition, the document projects activities for several years beyond 1980 to adequately plan for safe handling and storage of radioactive wastes generated at Savannah River, for developing technology to immobilize high-level radioactive wastes generated and stored at SR, and for developing technology for improved management of low-level solid wastes.

426 (DOE/TIC--10294) MANAGEMENT OF RADIOACTIVE WASTES. Blomeke, J.O. (Oak Ridge National Lab., TN (USA)). Nov 1979. Contract W-7405-ENG-26. 33p. Dep. NTIS, PC A03/MF A01.

This paper reviews the nature and characteristics of the radwastes, status of the work that has been done, options that are available in waste management, and plans and expectations for the near future. (DLC)

427 (DP--78-125-4) WASTE MANAGEMENT PROGRAM TECHNICAL PROGRESS REPORT, OCTOBER-DECEMBER 1978. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Jan 1980. Contract EY-76-C-09-0001. 156p. Dep. NTIS, PC A08/MF A01.

This quarterly report provides current information on operations and development programs for the management of radioactive wastes from the operation of the Savannah River Plant. The operational status and research progress are reported for the liquid waste treatment and storage facilities, the incinerator for solid waste, the solidification of waste in borosilicate glass, and siting of subsurface storage facilities.

428 (DP--79-125-1) WASTE MANAGEMENT PROGRAM TECHNICAL PROGRESS REPORT, JANUARY-MARCH 1979. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Jan 1980. Contract EY-76-C-09-0001. 79p. Dep. NTIS,

PC A05/MF A01.
This quarterly report provides current informaton on operations and development programs for the management of radioactive wastes from the operation of the Savannah River Plant. The operational status and research progress are reported for the liquid waste treatment and storage facilities, the incinerator for solid waste, the solidification of waste in borosilicate glass, and siting of subsurface storage facilities.

429 (DP--79-125-2) WASTE MANAGEMENT PROGRAM. TECHNICAL PROGRESS REPORT, APRIL-JUNE 1979. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). May 1980. Contract AC09-76SR00001. 37p. NTIS, PC A03/MF A01.
This quarterly report provides current information on operations and development programs for the management of radioactive wastes from the operation of the Savannah River Plant. The operational status and research progress are reported for the liquid waste treatment and storage facilities, the incinerator for solid waste, the solidification of waste in borosilicate glass, and siting of subsurface storage facilities.

430 (DP--79-125-3) WASTE MANAGEMENT PROGRAM TECHNICAL PROGRESS REPORT, JULY-SEPTEMBER 1979. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Jul 1980. Contract AC09-76SR00001. 50p. NTIS, PC A03/MF A01.
This quarterly report provides current information on operations and development programs for the management of radioactive wastes generated at the Savannah River Plant. The operational status and research progress are reported for the surveillance and maintenance and waste tank evaluation portions of the SR Interim Waste Program, for the process and equipment development studies of the Long-Term HLW Management R and D Program, and for the Office of Nuclear Waste Isolation studies of Other Waste Programs.

431 (DP--79-125-4) WASTE MANAGEMENT PROGRAM. TECHNICAL PROGRESS REPORT, OCTOBER-DECEMBER 1979. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Jul 1980. Contract AC09-76SR00001. 54p. NTIS, PC A04/MF A01.
This quarterly report provides current information on operations and development programs for the management of radioactive wastes from the operation of the Savannah River Plant. The research and development progress and operational status are reported for separation and concentration studies, process and equipment development, surveillance and maintenance of waste tanks, waste concentration, waste tank evaluation, tank replacement/waste transfer (formerly waste tank retirement), and development of criteria for the selection of sites for storage of waste forms produced in the Defense Waste Processing Facility.

432 (DP--80-125-1) WASTE MANAGEMENT PROGRAM TECHNICAL PROGRESS REPORT, JANUARY-MARCH 1980. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Sep 1980. Contract AC09-76SR00001. 77p. NTIS, PC A05/MF A01.
This quarterly report provides current information on operations and development programs for the management of radioactive wastes from operation of the Savannah River Plant. Process and equipment development studies are reported in the Long-Term Management Technology Program. The following studies are reported for Interim Waste Operations: surveillance and maintenance, waste concentration, low-level effluent waste, waste tank evaluation, and tank replacement/waste transfer (formerly waste tank retirement). The development of criteria for the selection of sites for storage of waste forms produced in the Defense Waste Processing Facility is described in the commercial waste program.

433 (DP--1488(Add.)) ELECTRICAL RESISTIVITIES OF GLASS MELTS CONTAINING SIMULATED SRP WASTE SLUDGES. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1978. Contract EY-76-C-09-0001. 6p. Dep. NTIS, PC A02/MF A01.
This addendum corrects the resistivities for Frit 21 glass melts for the resistance developed at high temperatures by the Pt wires in the resistivity probe. (DLC)

434 (DP-MS--79-55) CALCULATION OF RADIONUCLIDES IN THE DEFENSE WASTE PROCESSING FACILITY. Chandler, J.R.; Finch, D.R.; Becker, G.W. Jr. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1979. Contract EY-76-C-09-0001. 15p. (CONF-791103--51). Dep. NTIS, PC A02/MF A01.
From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).
SHIELD system calculations yield the isotopic inventory, activity, decay heat, and multigroup radiation source spectra for all of the DWPF process streams and for the solidified waste products. One application of these results is the analysis of the radiation emissions of the stored waste. Another application is the analysis of time dependent properties of the solidified waste. Initially, gamma radiation from /sup 137m/Ba decay contributes approximately one-third of the total energy. As the ^{137}Cs content decreases, the gamma contribution declines. The major producers of beta radiation are the ^{90}Sr, ^{137}Cs, and ^{144}Pr decay chains. As the glass age increases, however, the contribution from the actinides dominates increasingly. The inital activity level in the glass is 2000 curies per gallon. The activity and decay heat decrease by a factor of 2 in about fifteen years, and by a factor of 4 in fifty years. A similar analysis was made for the salt cake. Initially, the salt cake produces 0.01 watts per gallon from 2.4 curies per gallon of activity. In five years, the activity is reduced by a factor of 19, and the decay heat declines by a factor of 24. After ten years, both the activity and decay heat levels are less than 1% of their initial values. 7 figures, 4 tables.

435 (DP-MS--80-73) NATIONAL PERSPECTIVE ON WASTE MANAGEMENT. Crandall, J.L. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 47p. (CONF-800655--30). NTIS, PC A03/MF A01.
From 21. annual meeting of the Institute of Nuclear Materials Management; Palm Beach, FL, USA (30 Jun 1980).
Sources of nuclear wastes are listed and the quantities of these wastes per year are given. Methods of processing and disposing of mining and milling wastes, low-level wastes, decommissioning wastes, high-level wastes, reprocessing wastes, spent fuels, and transuranic wastes are discussed. The costs and safeguards involved in the management of this radioactive wastes are briefly covered in this

presentation. (DC)

436 (DPSPU--79-30-11) DEMONSTRATION OF RADIOACTIVE SLUDGE REMOVAL FROM SRP STORAGE TANK. Elder, H.H. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Sep 1979. Contract EY-76-C-09-0001. 18p. (CONF-791103--36). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

A remote process for removing radioactive sludge from underground waste tanks was demonstrated. Long-shafted centrifugal pumps circulated liquid waste within the tank to suspend the sludge, and the resulting slurry was pumped from the tank. Over 98% of the sludge was removed, while only 1.4 volumes water per volume sludge was added to waste inventory. Cleaning results were determined by remote wide-angle photographic and periscopic inspections. Demonstration data are being used to design facilities for waste removal from an additional 22 SRP waste tanks.

437 (DPST--76-303) RISK OF EARTHQUAKE DAMAGE TO WASTE MANAGEMENT FACILITIES. Poe, W.L. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 23 Jun 1976. Contract EY-76-C-09-0001. 53p. Dep. NTIS, PC A04/MF A01.

This report presents calculated results of the risk of earthquake damage to the solidification and RSSF steps of the long-term waste management. The consequences and risks presented in this report are probably overestimated because of the assumptions made. The earthquake risk for the solidification facility is 6.3×10^5/year. About two thirds of this risk is onplant risk that results from structural damage to the facilities. The other third of the risk is also onplant risk associated with cleanup of the plant site following the earthwuake. Only $1.10/year of the risk results from spread of contamination off plant and the ensuing population dose commitment. The dollar risk included the penalty resulting from 5.5×10^{-3} deaths per year due to earthquake damage. These deaths include instantaneous deaths to plant personnel and statistical deaths from radiation effects to the population exposed to released radionuclides. The risk for the RSSF facility is 4.2×10^5/year. Essentially all of the risk is onplant risk resulting from structural damage to the facility. Off-plant risk is negligible (4×10^{-16}/year) due to the high leach resistance of the waste form, its monolithic structure, and its containment. The risk of death from RSSF operations, caused by earthquake is essentially all onplant deaths and amounts to 1.3×10^{-3} deaths/year or about 25% of that given for the solidification facility.

438 (DPST--78-150-1) GAS PRODUCTION FROM ALPHA RADIOLYSIS OF CONCRETE CONTAINING TRU INCINERATOR ASH. PROGRESS REPORT 1, APRIL 1-JULY 31, 1978. Bibler, N.E. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1978. Contract AC09-76SR00001. 22p. NTIS, PC A02/MF A01.

This is the first progress report of an experimental study of gas evolution from alpha radiolysis of concrete containing ash from the incineration of transuranic (TRU) waste. During this experimental period, concretes containing simulated TRU incinerator ash were prepared from high alumina cement (HAC), from Portland Type I cement (I), and from Portland Type I pozzolanic cement (I-P). ^{238}Pu, an intense alpha emitter, was added to the concretes to produce radiolysis. Then, gas pressures were monitored, and gas compositions were determined. Only hydrogen was produced; its production was calculated as molecules per 100 eV of alpha energy absorbed. This quantity, $G(H_2)$, can be used to calculated H_2 production rates from acutal waste. Based on values of $G(H_2)$ determined in this period (0.30 to 0.65 molecules/100 eV), production rates would range from 660 to 1400 cm^3 of H_2 at STP per year for each curie of alpha activity. Other results were: (1) lowest values for $G(H_2)$ were obtained with concrete made from high alumina content; (2) the presence of ash in the concrete increased $G(H_2)$; (3) no effect of dose rate on $G(H_2)$ in the range 1.0×10^{16} to 1.2×10^{17} eV/min/g of concrete was detected; (4) there was also no effect on $G(H_2)$ of the pH of the water used to make the concrete; (5) presence of an organic complexing agent in the concrete decreased $G(H_2)$ and caused O_2 to be radiolytically consumed; and (6) lowering the water content, heating the concrete, lowered the $G(H_2)$.

439 (EGG-PHYS--5084) ASSESSMENT OF CRITICALITY MONITORING TECHNIQUES FOR A TRANSURANIC WASTE TREATMENT FACILITY. Vegors, S.H. Jr.; Nieschmidt, E.B.; Tsang, F.Y. (EG and G Idaho, Inc., Idaho Falls (USA)). Jul 1980. Contract AC07-76ID01570. 101p. NTIS, PC A06/MF A01.

Passive monitoring techniques were studied and compared for determining the amount of fissile material in transuranic (TRU) waste while in the Transuranic Waste Treatment Facility (TWTF). The passive counting techniques investigated were gamma ray, neutron, x-ray, and alpha particle. In addition, coincidence techniques using the correlation in time between the neutrons and/or gamma rays emitted by fissioning nuclei in a chain reaction were considered. Recommendations are given for the best method of monitoring the waste within the TWTF.

440 (EGG-PHYS--5085) PHOTON INTERROGATION ANNUAL REPORT FOR FY 1979. Nieschmidt, E.B.; Johnson, L.O.; Lawrence, R.S.; Vegors, S.H. Jr. (EG and G Idaho, Inc., Idaho Falls (USA)). Mar 1980. Contract EY-76-C-07-1570. 88p. Dep. NTIS, PC A05/MF A01.

Summaries of experimental information and information from vendors is presented to show the adequacy of the photon interrogation technique for transuranic waste assay. An instrument system is described which has high immunity to gamma flash and has good high count rate capabilities. Comparison of the progress of the program with a schedule presented at its inception is presented.

441 (EGG-RE-M--78-034) MIGRATION OF TRU-CONTAINING SLAG INTO CANDIDATE REFRACTORIES FOR WASTE MANAGEMENT. Seymour, W.C. (EG and G Idaho, Inc., Idaho Falls (USA)). Nov 1978. Contract EY-76-C-07-1570. 24p. Dep. NTIS, PC A02/MF A01.

Results of initial tests on transuranic migration into commercial refractories are reported. Five castable refractories and a plastic-bonded refractory were tested using the cup test method. Initial results indicate that castable materials will not survive conditions expected in the slagging pyrolysis unit; plastic refractories appear to have better performance. The major mechanism of migration into the tested refractories is pore penetration. Al_2O_3 and Al_2O_3-Cr_2O_3 phases appear resistant to chemical diffusion of

transuranics. 2 figures, 16 tables.

442 (EGG-WM--5233) DEVELOPMENT OF CRITERIA AND STANDARDS FOR MANAGEMENT OF LOW-LEVEL RADIOACTIVE WASTE. Grey, A.E.; Falconer, K.L. (EG and G Idaho, Inc., Idaho Falls (USA)). Aug 1980. Contract AC07-76ID01570. 37p. NTIS, PC A03/MF A01.

The basic need for criteria and standards for radioactive waste management is to ensure compliance with Federal and State regulations applicable to this activity. In addition, criteria and standards can establish the parameters by which a radioactive waste disposal site is selected, the form in which the waste is to be disposed, how a disposal site is to be operated, and how that site is to be closed when it reaches the end of its useful life. For developing criteria and standards, this report discusses the nature of low-level radioactive waste and the role government agencies play in regulating its management. It describes subject areas for which criteria and standards could be developed, current and evolving requirements, and future suggested analyses.

443 (ENICO--1012) TECHNICAL QUARTERLY PROGRESS REPORT, JANUARY 1-MARCH 31, 1979. Plung, D.L. (ed.). (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Sep 1979. Contract AC07-79ID01675. 165p. Dep. NTIS, PC A08/MF A01.

Special Materials Production: results are presented on the long-term management of ICPP high-level wastes, on ICPP plant process improvements, on advanced graphite fuels reprocessing, on ICPP waste management development, on technical support tc the Waste Calcining Facility and to the New Waste Calcining Facility, on effluent monitoring methods evaluation and development, and on technical program improvement. Presented are results on pelleted waste form development, actinide removal, calcine solids retrieval, and on a programmatic environmental impact statement. In addition, work on uranium accountability, zirconium fuel recovery, waste flowsheet development, and a mathematical model of ICPF solvent extraction columns is reported. Fuel Cycle Research and Development: results on krypton-85 storage development is reported. In particular, work on krypton-85 process and storage materials testing, zeolite encapsulation storage, and the long-term testing of krypton storage media are reported. Other Projects Supporting Energy Development: results reported include work on the nuclear materials security program, the in-plant source term program, on burnup methods for FBR fuels, and on specialized fuel research-analytical support. Other results include research on analytical methods, and on OKLO studies. In addition, results from the boiling water reactor off-gas systems evaluation are reported.

444 (ENICO--1013) TECHNICAL QUARTERLY PROGRESS REPORT, APRIL 1-JUNE 30, 1979. Plung, D.L. (ed.). (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Jan 1980. Contract AC07-79ID01675. 131p. Dep. NTIS, PC A07/MF A01.

Special Materials Production: results are reported on work done on long-term management of ICPP high-level wastes; this work includes post-calcination treatment, actinide removal, calcine solids retrieval and handling, and work on a Draft Programmatic Environmental Impact Statement. Results are also reported on plant process improvement, waste management development, and technical support to the New Waste Calcining Facility. Results of work done on the evaluation of HEPA filter test methods, and the development of a continuous alpha monitor are reported, as is work on technical program improvement. Fuel Cycle Research and Development: In the krypton-85 storage development program, results of work done are reported on: krypton zeolite encapsulation, krypton pressurized cylinders, and krypton storage development. Other Projects Supporting Energy Development: In the nuclear materials security program results of work done include that on the material control test and evaluation system, sensor and instrument development, and the portable mass spectrometer development. Other results reported include work done on the in-plant source term measurement program, burnup methods for fast breeder reactor fuels, and on specialized fuel research - analytical support. As part of the research on analytical methods, work on uranium separation for isotope dilution mass spectrometry and hexone volatility studies is reported. Results from Oklo studies are also reported.

445 (ENICO--1033) TECHNICAL QUARTERLY PROGRESS REPORT, JULY 1-SEPTEMBER 30, 1979. Plung, D.L. (ed.). (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Mar 1980. Contract AC07-79ID01675. 152p. Dep. NTIS, PC A08/MF A01.

Results are reported on the long-term waste management of ICPP high-level wastes, plant process improvement, waste management development, technical support to the NWCF, effluent monitoring methods evaluation and development, and technical program improvement. Presented are results on post-calcination of high-level wastes, uranium accountability development, fluorinel calcination flowsheet development, development of a continuous alpha monitor and results on process evaluation and monitoring. In addition, results of work on the Idaho Programmatic Environmental Impact Statement and on the evaluation of HEPA filter test methods are presented. In the krypton-85 storage development program, results are reported on krypton zeolite encapsulation and on krypton storage development. This work includes a conceptual design and cost estimate for a commercial-scale krypton encapsulation facility. Results of work on the nuclear materials security program are reported; this includes work on materials control test and evaluation system and on portable mass spectrometer development. Other results reported include work on the reactor source term program, burnup methods for fast breeder reactor fuels, absolute thermal fission yields and specialized fuel research - analytical support. Results from research on analytical methods include results on flame atomic absorption spectrophotometry and the analysis of phosphorous by a new colorimetric procedure. In addition, results from work on OKLO studies are reported.

446 (EPRI-NP--1494) ACTIVITY LEVELS OF TRANSURANIC NUCLIDES IN LOW-LEVEL SOLID WASTSE FROM US POWER REACTORS. FINAL REPORT. Cline, J.E.; Wright, K.L.; Hollcroft, J.W. (Science Applications, Inc., Rockville, MD (USA). Nuclear Environmental Services Div.). Aug 1980. 185p. NTIS, PC A09/MF A01.

This report, the final report on the project, describes the sampling, analytical techniques and results of the nuclide analyses of low-level waste samples from operating nuclear power plants. The complete nuclide data base is given in the report. Distributions of

measured ^{239}Pu concentratiens are presented for the principal sample categories. Median values of transuranic and other nuclide concentrations are calcuated for the same categories from the twenty-five plants included in the study. Samples were collected over a period of three and a half years. Median concentrations of ^{239}Pu are considerably below the ten nanocuries per gram in each waste category. A correlation has been found to exist between the measured concentrations of plutonium and cesium. This correlation can be used to estimate plutonium concentrations indirectly through gamma-ray spectrometry.

447 (EUR--6027) MONITORING OF PLUTONIUM CONTAMINATED SOLID WASTE STREAMS. CHAPTER IV: PASSIVE NEUTRON ASSAY. Birkhoff, G.; Bondar, L. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1978. 76p. Dep. NTIS (US Sales Only), PC A05/MF A01.

The fundamentals of the passive neutron technique for the non destructive assay of plutonium bearing materials are summarized. A reference monitor for the passive neutron assay of Pu contaminated solids is described in terms of instrumental design principles and performances. The theoretical model of this reference monitor with pertinent nuclear data and functions for the interpretation of experimental data is given.

448 (HEDL-TME--79-15) DIVISION OF WASTE MANAGEMENT PROGRAMS. PROGRESS REPORT, JULY-DECEMBER 1978. Lerch, R.E.; Allen, C.R.; Richardson, G.L. (comps.). (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1979. Contract EY-76-C-14-2170. 86p. Dep. NTIS, PC A05/MF A01.

This is the eleventh progress report on Division of Waste Management programs. The report describes progress in the second half of 1978 on the following programs: intermediate-level waste solidification, chemical processing of combustible solid waste, and application of acid digestion to commercial wastes. The latter two programs were combined in October 1978 into a single program, acid digestion of combustible wastes.

449 (IAEA-R--1898-F) WORK WITHIN THE COORDINATED PROGRAMME ON ENVIRONMENTAL EVALUATION AND HAZARD ASSESSMENT OF THE SEPARATION OF THE ACTINIDES FROM THE HIGH-LEVEL WASTE FROM FUEL REPROCESSING FOLLOWED BY EITHER TRANSMUTATION OR SEPARATE DISPOSAL. FINAL REPORT FOR THE PERIOD 1 NOVEMBER 1976 - 31 OCTOBER 1977. Haug, H.O. (International Atomic Energy Agency, Vienna (Austria)). Apr 1978. 8p. NTIS (US Sales Only), PC A02/MF A01.

Reduction of plutonium losses in non-high-level wastes streams from fuel reprocessing is important in the conventional post-fission operations and would be essential in any actinide partitioning alternatives. The balance of input process streams and output waste streams in present reprocessing technology is compared to the balance after process modifications based on recent experimental developments. The results are showing that by the introduction of new electrochemical redox processes and non-salt-forming process chemicals the routinely generated intermediate-level waste streams from PUREX reprocessing can be avoided. Plutonium-bearing waste streams can be extensively recycled within the chemical processing.

450 (INFCE/DEP/WG--7/15) RADIOLOGICAL HEALTH AND SAFETY IMPACT. (INFCE (Argentina)). Sep 1979. 90p. NTIS (US Sales Only), PC A05/MF A01.

The document provides estimates of the radiological impact of an adequate waste management system in terms of collective effective dose equivalent commitments. The assessments are carried out for radioactive wastes generated in every step of seven model fuel cycle strategies. The modelling covers mainly technical and geological isolation, fresh water pathways and ocean pathways, while air pathways are taken into account for mill tailings and for sediment resuspension. The resulting collective dose commitments are normalized per unit electric energy generated, and perspective is provided by evaluating the periods of time during with the same collective dose would be delivered by the natural radiation sources. Maximum doses in stylised critical groups and ''per caput'' doses in the population are also estimated.

451 (INFCE/DEP/WG--7/22) IMPACT FACTORS ON RADIOACTIVE WASTE MANAGEMENT. LEGAL AND INSTITUTIONAL MATTERS. Dejonghe, P. (INFCE (Belgium)). Mar 1979. 17p. NTIS (US Sales Only), PC A02/MF A01.

This paper deals with clear definitions of the responsibilities of all parties involved on short and long-term, adequate financial assurance and some international standards with regard to the specifications on conditioning, storage and disposal. Furthermore, a light is thrown on the specific institutional problems in radioactive waste management, that might arise from the application of the various fuel cycles considered in the INFCE Study.

452 (INIS-mf--4789, pp 11B-14B) ESCAPE PROBABILITY OF GAMMA FROM RADIOACTIVE CONTAMINATED SOLID WASTE. Bar-Ilan, A.; Knoll, A.; Notea, A.; Segal, Y. (Technion-Israel Inst. of Tech., Haifa. Dept. of Nuclear Science). 1978.

From Joint annual meeting of the Israel Nuclear Societies Ben Gurion University of the Negev; Beersheba, Israel (28 Dec 1978).

455 (INIS-mf--5570) RESEARCH ON DESACTIVATION OF LIQUID, SOLID AND GASEOUS RADIOACTIVE WASTES AND DECONTAMINATION OF SURFACES. PART 1. PROCESSING OF LIQUID RADIOACTIVE WASTES OF LOW AND MEDIUM ACTIVITY. (Sovet Ehkonomicheskoj Vzaimopomoshchi, Moscow (USSR). Postoyanniya Komissiya po Ispol'zovaniyu Atomnoj Ehnergii v Mirnykh Tselyakh). 1978. 143p. (In Russian). (CONF-761260--(Pt.1)). NTIS (US Sales Only), PC A07/MF A01.

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Separate abstracts were prepared for individual papers. (DLC)

456 (INIS-mf--5570, pp 9-14) ACTIVITIES OF THE IAEA IN THE FIELDS OF RADIOACTIVE WASTES HANDLING. Richter, D. (International Atomic Energy Agency, Vienna (Austria)). 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

One of the main problems in the development of nuclear power production is desactivation of radioactive wastes, especially those of high activity and alpha-emitting. The IAEA program on the radioactive wastes management is dealing with wastes from nuclear power plants and nuclear fuel cycle installations. This programm includes: wastes processing and disposal; nuclear power production and its influence in environment; shut down and desactivation of nuclear installations; technical and economic aspects of the radioactive wastes processing and disposal. IAEA is running research programs in the fields: of management of radioactive wastes from the processes of mining and processing of uranium ores, especially on migration of radium in environment; on management of wastes from the processes of uranium purification, enrichment and reactor fuel fabrication; on the alpha-emitting and high activity wastes from reactor fuel reprocessing; on radioactive wastes disposal in ground, geological formations and sea; on radioactivity leakage in environment; on the radionuclides behaviour in environment; on radioactive wastes management in regional fuel cycle centers; on desactivation of nuclear installations. In future international cooperation can be gained in the fields of safety of radioactive wastes burial sites; wastes solidification methods; evaluation of the environment contamination by liquid and gaseous radioactive wastes; trapping of krypton-85, iodine and aerosols from gaseous wastes.

457 (INIS-mf--5571, pp 41-47) INVESTIGATION OF HYDROGEN AND METHANE PRODUCTION WHEN IRRADIATION OF BITUMEN B45 AND BITUMEN B45 MIXED WITH SOLID SUBSTANCES. Pretschner, G.; Dagen, A. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Radiolysis of the bitumen components on influence of ionizing radiation causing gases generation, chiefly hydrogen and methane has been investigated. To avoid formation of explosive mixtures of some gases, for example, hydrogen with air, and to avoid heating of mixtures of bitumen and radioactive wastes because of the heat generation during decay, there is necessary to have cooling of bituminized wastes and removal of the radiolysis products in the stores for bituminized radioactive wastes with high specific activity. Investigations has shown that with specific activity higher than 10 Ci/kg heat removal and removal of radiolysis products were necessary. Bitumen B45 and bitumen compounds based on it has been exposed both to external irradiation by cobalt-60 and to internal irradiation by incorporated into bitumen and bitumen compounds strontium-90, cesium-137 and polonium-270. Internal irradiation is modeling real conditions of bituminized radioactive wastes burial. Parameters of the bitumen B45 are given. After irradiation, by means of the gas chromatography method it has been determined that the main components of the gases produced were hydrogen and methane. Volume of hydrogen and methane produced, depending on absorbed dose has been determined and coefficients of the hydrogen and methane production have been calculated. The results of investigations of methane and hydrogen production coefficients dependance from different conditions during external and internal irradiation are given.

458 (INIS-mf--5571, pp 83-85) TECHNICAL AND ECONOMIC ESTIMATIONS OF LIQUID WASTES LOCALIZATION CONFORMABLY TO THE LENINGRAD NUCLEAR POWER PLANT. Bukina, I.G. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

The problem of localization of liquid radioactive wastes conformably to the project of the Leningradian nuclear power plant is considered. Technical and economic estimation of the methods were considered conformably to the composition of the nuclear plant wastes with in a year of operation cited in the paper. Estimations has been made on two variants of technology. The first variant, - storage of liquid radioactive concentrates in tanks and the second variant, - solidification of liquid wastes by bituminization with subsequent burial of the salt-bitumen compound. Economic calculations have been done in confirmity with methodology accpted at the meeting of specialists from the CMEA member - countries in September 1968. Comparative technical and economic indices of localization of liquid radioactive wastes by the methods mentioned conformably to the project of the Leningradian nuclear power plant are given. It has been shown that in spite of the fact that bituminization were more complicated technological process in comparison to the storage of liquid radioactive concentrates in tanks, as to the safety of storage and technical and economic indices were cocerned the method of bituminization had considerable advantages.

459 (INIS-mf--5574, pp 28-32) EXPERIMENTAL DEVICES FOR STANDARD TESTING OF FILTERS DESIGN IN THE STATE BOARD FOR NUCLEAR SAFETY AND RADIATION PROTECTION OF THE GERMAN DEMOCRATIC REPUBLIC. Ullmann, W.; Przybrowski, S. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

The design of testing stand for the standard tests of aerosol filters is described. The aerosol, containing crystals of the sodium chloride is used as a test-aerosol. The aerosols measurements is based on the principle of the light emission of sodium vapors excited in the flame of a hydrogen burner. The methods are stated of the sodium chloride aerosols

production; determination of the dynamic resistance of the filter tested and determination of the air expenditure.

460 (INKA-Conf--78-396-000, pp 127-131) CHOICE OF OPTIMUM PACKING FOR THE TRANSPORT AND STORAGE OF RADIOACTIVE WASTES. Engelmann, H.J. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Abt. zur Behandlung Radioaktiver Abfaelle). 1978. (In German).
From International VGB conference on power plant auxiliaries with information exhibition; Essen, F.R. Germany (8 Mar 1978).
This report compares the possibilities of using various types of containers and shielding, in order to be able to determine the optimum packing for any given type of waste. The target here is to achieve the maximum possible amount of radio-activity per unit of packing, while complying with the regulations which apply for transport and storage. The producer of waste can save costs in processing, transport and final storage. The storage space in the final store is used to the optimum extent.

461 (K/OP--248) PLOTLIB: A COMPUTERIZED NUCLEAR WASTE SOURCE-TERM LIBRARY STORAGE AND RETRIEVAL SYSTEM. Marshall, J.R.; Nowicki, J.A. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). 31 Mar 1978. Contract W-7405-ENG-26. 83p. NTIS, PC A05/MF A01.
The PLOTLIB code was written to provide computer access to the Nuclear Waste Source-Term Library for those users with little previous computer programming experience. The principles of user orientation, quick accessibility, and versatility were extensively employed in the development of the PLOTLIB code to accomplish this goal. The Nuclear Waste Source-Term Library consists of 16 ORIGEN computer runs incorporating a wide variety of differing light water reactor (LWR) fuel cycles and waste streams. The typical isotopic source-term data consist of information on watts, curies, grams, etc., all of which are compiled as a function of time after reactor discharge and unitized on a per metric ton heavy metal basis. The information retrieval code, PLOTLIB, is used to process source-term information requests into computer plots and/or user-specified output tables. This report will serve both as documentation of the current data library and as an operations manual for the PLOTLIB computer code. The accompanying input description, program listing, and sample problems make this code package an easily understood tool for the various nuclear waste studies under way at the Office of Waste Isolation.

462 (KBS-TR--113, pp 1-19) CHEMICAL STABILITY OF CERAMICS. Carlsson, R.; Hermansson, L. (Svenska Silikatforskningsinstitutet, Goeteborg (Sweden)). Sep 1978. (In Swedish).
Studies of ceramic materials for encapsulation of high-active waste.
In this literature survey the chemical stability of ceramics in acid, neutral and basic hydrated environment has been studied. Furthermore different methods which are useful for the study of corrosion of ceramics are listed.

463 (KBS-TR--113, pp 1-16) INSPECTION OF 'LEACH TESTED' CERAMICS SPECIMENS. Lehtinen, B. (Institutet foer Metallforskning, Stockholm (Sweden)). Sep 1978. (In Swedish).
Studies of ceramic materials for incapsulation of high-active waste.
''Leach tested'' specimens of LD-porcelain, corderite, Corning pyro-ceramics and aluminium oxide have been examined in the SEM. Damage due to the leaching treatment is apparent on the surfaces of all samples, with the exception of the aluminium oxide specimen treated 30 days in water (pH 8,5, 90 deg C). After 100 days however, some indication of leaching is also observed on this material.

464 (KBS-TR--113, pp 1-27) LEACHING OF CERAMICS UNDER SIMULATED DISPOSAL CONDITIONS. Svensson, B.M.; Dahl, L. (Aktiebolaget Atomenergi, Studsvik (Sweden)). Sep 1978. (In Swedish).
Studies of ceramic materials for incapsulation of high-active waste.
Leaching tests have been performed with specimens of LD-porcelain, corderite and borning material, in simulated ground water as well as in day. The weights of all the specimens except the borning material increased after 10-30 days of leaching in water. After leaching in clay the weights decreased for all the elements. Furthermore the rate of corrosion of the borning material was determined to be 11+-6 μ per year between the 40th and the 150th day.

465 (KBS-TR--113) STUDIES OF CERAMIC MATERIALS FOR INCAPSULATION OF HIGH-ACTIVE WASTE. Hyden, L.; Bergstroem, L.; Carlsson, R.; Hermansson, L.;Svensson, B.M.; Dahl, L.; Lehtinen, B.; Leygraf, C.; Hultquist, G.; Olefjord, I. (Kaernbraenslesaekerhet, Stockholm (Sweden)). Sep 1978. 170p. (In Swedish). Dep. NTIS (US Sales Only), PC A08/MF A01.
Individual papers were abstracted separately.

466 (KFK--2519) ANNUAL REPORT 1976. Krause, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Entsorgungstechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Dec 1977. 139p. (In German). (PWA--43/77). Dep. NTIS (US Sales Only), PC A08/MF A01.
This report is a review over the results of the R + D work of the Waste Management Research Department (ABRA) in 1976. As in the two past years the main objectives were laboratory experiments, process development and remote handling experiments on the solidification of the high active waste liquids in a borosilicate glass. Further work was aimed at the treatment and solidification of medium active waste solutions, the aspects of nuclear technology regarding the final disposal of solidified radioactive materials in salt formations and the migration of actinides in soils.

467 (LA--7857) LOW-LEVEL TRANSURANIC WASTE ASSAY BY PHOTON INTERROGATION AND MODERATED NEUTRON COUNTING. Cates, M.R.; Franks, L.A.; Noel, B.W.; Pigg, J.L.; Close, D.A. (Los Alamos Scientific Lab., NM (USA)). Oct 1979. Contract W-7405-ENG-36. 17p. Dep. NTIS, PC A02/MF A01.
When fission is induced in trace amounts of transuranic contaminants in waste material, it provides signatures from fission products that can be used to assay the material before disposal. Given here are the results from counting photofission-induced delayed neutrons from ^{239}Pu in sample matrices. When delayed neutrons emitted after 5 min of photon irradiation with energies up to 18 MeV in 1-1

samples are counted, assay limits of 10 to 100 nCi/g for matrices with a density of up to 5 g/cm^3 are determined. Counting all delayed neutron emissions or some prompt neutrons improves sensitivities by a factor of 20 or more. The dynamics of photofission and delayed neutron production, use of an electron linear accelerator as a particle source, experimental and electronic details, and future experimental plans are discussed. 15 figures, 3 tables.

468 (LA--7921-PR) NUCLEAR WASTE MANAGEMENT TECHNOLOGY DEVELOPMENT ACTIVITIES. PROGRESS REPORT, JANUARY-DECEMBER 1978. Johnson, L.J.; Desilets, B.H. (comps.). (Los Alamos Scientific Lab., NM (USA)). Jun 1979. Contract W-7405-ENG-36. 73p. Dep. NTIS, PC A04/MF A01.

Summary reports describe progress in Los Alamos Scientific Laboratory (LASL) Health Research Division managed programs by the nuclear waste management task area for calendar year (CY) 1978. Development and application of assay instrumentation for measuring the radioactivity content of waste packages is reported. Work in developing test materials and laser-based instrumentation for in-place testing of high-efficiency particulate aerosol filters is discussed. Development and demonstration of a controlled air incinerator for treatment of radioactively contaminated combustible waste is described. Field data from the environmental geology and hydrology aspect of shallow earth disposal of radioactively contaminated waste are reviewed and related to improvement of land burial technology.

469 (LA--8294-MS) MEASUREMENT OF URANIUM AND PLUTONIUM IN SOLID WASTE BY PASSIVE PHOTON OR NEUTRON COUNTING AND ISOTOPIC NEUTRON SOURCE INTERROGATION. Crane, T.W. (Los Alamos Scientific Lab., NM (USA)). Mar 1980. Contract W-7405-ENG-36. 96p. NTIS, PC A05/MF A01.

A summary of the status and applicability of nondestructive assay (NDA) techniques for the measurement of uranium and plutonium in 55-gal barrels of solid waste is reported. The NDA techniques reviewed include passive gamma-ray and x-ray counting with scintillator, solid state, and proportional gas photon detectors, passive neutron counting, and active neutron interrogation with neutron and gamma-ray counting. The active neutron interrogation methods are limited to those employing isotopic neutron sources. Three generic neutron sources (alpha-n, photoneutron, and ^{252}Cf) are considered. The neutron detectors reviewed for both prompt and delayed fission neutron detection with the above sources include thermal (^{3}He, $^{10}BF_3$) and recoil (^{4}He, CH_4) proportional gas detectors and liquid and plastic scintillator detectors. The instrument found to be best suited for low-level measurements (< 10 nCi/g) is the ^{252}Cf Shuffler. The measurement technique consists of passive neutron counting followed by cyclic activation using a ^{252}Cf source and delayed neutron counting with the source withdrawn. It is recommended that a waste assay station composed of a ^{252}Cf Shuffler, a gamma-ray scanner, and a screening station be tested and evaluated at a nuclear waste site. 34 figures, 15 tables.

470 (LA-UR--80-1274) APPLICATION OF LINEAR ACCELERATOR TECHNOLOGY TO THE DETECTION OF TRACE AMOUNTS OF TRANSURANICS IN WASTE BARRELS. Cates, M.R.; Noel, B.W.; Caldwell, J.T.; Kunz, W.E.; Close, D.A.; Franks, L.A.; Pigg, J.L. (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 24p. (CONF-800611--3). NTIS, PC A02/MF A01.

From International symposium on the management of alpha-contaminated wastes; Vienna, Austria (2 Jun 1980).

Electron linear accelerators (linacs), as sources of photons and neutrons, can produce a significant number of fissions in transuranic isotopes contained in large barrels of waste material. Both photons and thermal neutrons have been used to detect about 1 mg of plutonium in 105-kg matrices. A sequential interrogation with neutrons and photons, easily possible with linacs, can show both fertile and fissile constituents among the heavy-mass isotopes. The advantages of linacs in solving existing assay problems include: (1) high available beam current; (2) variable beam current, beam energy, pulse width, and pulse repetition frequency; and (3) beam-scanning ability. They also are compatible with passive assay instruments. Their versatility makes it likely that they will remain useful as assay technology advances.

471 (LA-UR--80-1289) RECENT DEVELOPMENTS AT LOS ALAMOS FOR THE MEASUREMENT OF ALPHA CONTAMINATED WASTE. Caldwell, J.T.; Cates, M.R.; Close, D.A.; Crane, T.W.; Kunz, W.E.; Shunk, E.R.; Umbarger, C.J.; Franks, L.A. (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 18p. (CONF-800611--4; IAEA-SM--246/67). NTIS, PC A02/MF A01.

From International symposium on the management of alpha-contaminated wastes; Vienna, Austria (2 Jun 1980).

A comprehensive program is currently in progress for the development of sensitive, practical nondestructive assay techniques for the quantification of low level transuranics in bulk solid wastes. This program encompasses a broad range of nuclear and nonnuclear techniques including sophisticated passive gamma-ray and passive neutron detection systems, isotopic neutron source-based active interrogation systems, pulsed portable neutron generator active interrogation systems, electron accelerator based techniques and laser spectroscopy techniques. The mix of techniques ranges in development maturity from the well established (MEGAS, Shuffler, Passive 4π neutron counters) through the proof-of-principle stage (pulsed neutron generator techniques) to the under investigation stage (electron linac and laser spectroscopy techniques). Matrix compensation methods are being developed to improve the accuracy of waste screening and assay measurements. Specific detection systems have been designed to operate in the high level beta-gamma backgrounds associated with some commercial reactor wastes. The techniques being developed can be used with either low level or high level beta-gamma wastes in either low density or high density matrices.

472 (LA-UR--80-1794) A L-NCI/G SENSITIVITY TRANSURANIC WASTE ASSAY SYSTEM USING PULSED NEUTRON INTERROGATION. Kunz, W.E.; Atencio, J.D.; Caldwell, J.T. (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 8p. (CONF-800655--6). NTIS, PC A02/MF A01.

From 21. annual meeting of the Institute of Nuclear Materials Management; Palm Beach, FL, USA (30 Jun 1980).

We have developed a pulsed thermal neutron interrogation system and have demonstrated a sub-1-nCi/g assay sensitivity for high density TRU wastes contained in 200-liter barrels. We detect prompt fission neutrons, resulting in greatly enhanced sensitivity compared to

techniques in which delayed fission neutrons are detected. We observe a linear assay response over at least three orders of magnitude in ^{235}U (or ^{239}Pu) mass. We also have measured a flat (to +-10%) interrogation flux profile throughout the volume of a 200-liter barrel filled with 200 kg of sand and vermiculite, which indicates flatness of response to fissile material at different locations within the barrel.

473 (LA-UR--807145) LIQUID WASTE MANAGEMENT SYSTEMS IMPROVEMENT PROGRAMS AT LOS ALAMOS SCIENTIFIC LABORATORY. Emelity, L.A.; Stanley, P.M.; Buchholz, J.R. (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 28p. (CONF-800611--6). Dep. NTIS, PC A03/MF A01.

From International symposium on the management of alpha-contaminated wastes; Vienna, Austria (2 Jun 1980).

Programs at the Los Alamos Scientific Laboratory (LASL) are approximately 50% nuclear weapons related and 50% general energy research and development. Since its beginning in the 1940's liquid industrial wastes have been contaminated with isotopes of plutonium, americium, uranium and various beta-gamma emitters, but management and treatment efforts were, due to the proportions of the various isotopes, directed primarily at the alpha emitters. The evolution in management methods at LASL since the 40's has been reported in previous papers. This treatise discusses the most recent three-phase effort to modernize the systems to the probable standards of the next twenty years. The first phase, provision of double-encased, continuously monitored sewer system will soon be under construction. The second phase, modernization of the treatment facilities, has been funded and is in the final design stage. The third phase, not funded as of this date, will provide lined, monitored solar evaporation ponds for total management of the treated industrial wastes with no release of any liquid to the environment.

474 (LBL--10000, pp 527-543) OTHER PROJECTS. Mar 1980.

Materials and Molecular Research Division annual report 1979.

Progress is reported on: solution thermodynamics of sulfites and sulfite oxidation mechanisms, process chemical parameters in aqueous SO_2 removal by lime/limestone scrubbers, coal liquefaction research, thermodynamic properties of chemical species in nuclear waste, high strength austenitic alloys for generator retaining rings, oxygen reduction in concentrated phosphoric acid by carbon-supported Pt alloy electrocatalysts, and substructure and properties of sodium beta alumina solid electrolytes. (DLC)

475 (MLM--2669) TRITTIUM WASTE CONTROL: APRIL-SEPTEMBER 1979. (Mound Facility, Miamisburg, OH (USA)). 21 Dec 1979. Contract AC04-76DP00053. 28p. NTIS, PC A03/MF A01.

The Combined Electrolysis Catalytic Exchange (CECE) pilot unit has been modified. Start-up of these components has been completed. The 1 Ci/ml test of the solid polymer electrolyte (SPE) membrane was successfully terminated after 29 weeks and the 10 Ci/ml test was initiated immediately using the same cell and SPE membrane. The cryogenic distillation system was successfully integrated with the combined electrolysis catalytic exchange system; with a HT gas mixture containing 1000 Ci/m^3, 0.1 mole % tritium were completed with the integrated system. A high beam quality Nd:YAG pump laser based on an unstable resonator/far-field converter design was developed to pump the angle tuned optical parametric oscillator (OPO) for the ir excitation step in the H_2O/HTO separation. Absorption measurements were made. Gas generation rates caused by radiolysis of tritium waste materials were determined for polymer and non-polymer impregnated tritiated concrete and fixated and non-fixated tritiated waste vacuum pump oil. The pressure change of hydrogen cover gas over tritiated water on cement-plaster was also determined. Tests continue on samples of cement and cement-plaster mixtures which were injected with 386 Ci of tritiated water, cured and then impregnated with catalyzed styrene monomer which were polymerized. After 46 weeks the tritium released from the styrene-impregnated cement blocks equals only one half of the tritium released from the cement block without styrene impregnation. Two of the drums containing waste octane have now been packaged 7.5 y and show a release of 17 mCi. Another drum containing approximately 35,000 Ci of tritiated water solidified on cement, shows a release of nearly 21 mCi after 5 y.

476 (MLM--2714) TRITIUM WASTE CONTROL, OCTOBER 1979-MARCH 1980. (Mound Facility, Miamisburg, OH (USA)). 19 May 1980. Contract EY-76-C-04-0053. 23p. NTIS, PC A02/MF A01.

Modifications were made to the Combined Electrolysis Catalytic Exchange (CECE) pilot unit. After the SPE cell was dismantled to investigate a water circulation problem, an internal short circuit developed. Analyses were done for impurities in the CECE system; the problem appears to be a 1 to 2% oil (mostly insoluble organics) layer. A polystyrene-impregnated, tritiated-concrete waste package was prepared with 7921 Ci of tritium. The study of tritium release from representative burial packages was continued. Gas generation rates were determined for polymer and non-polymer impregnated tritiated concrete and fixated and non-fixated tritiated waste vacuum pump oil. The pressure change of hydrogen cover gas over tritiated water on cement-plaster was determined.

477 (NUREG--0527) REGULATION OF FEDERAL RADIOACTIVE WASTE ACTIVITIES. REPORT TO CONGRESS ON EXTENDING THE NUCLEAR REGULATORY COMMISSION'S LICENSING OR REGULATORY AUTHORITY TO FEDERAL RADIOACTIVE WASTE STORAGE AND DISPOSAL ACTIVITIES. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Material Safety and Safeguards). Sep 1979. 323p. NTIS.

The report contains two recommendations for extending the Commission's regulatory authority: (1) NRC licensing authority should be extended to cover all new DOE facilities for disposal of transuranic (TRU) waste and nondefense low-level waste. (2) A pilot program, focused on a few specific DOE waste management activities, should be established to test the feasibility of extending NRC regulatory authority on a consultative basis to DOE waste management activities not now covered by NRC's licensing authority or its extension as recommended in Recommendation 1.

478 (NUREG--0644) RADIOACTIVE WASTE PROCESSING AND DISPOSAL. (Department of Energy, Oak Ridge, TN (USA). Technical Information Center; Nuclear Regulatory Commission, Washington, DC (USA)). Jan 1980.

900p. (TID--3311-S9). Dep. NTIS, PC A99/MF A01.
This compilation contains 3597 citations/ abstracts of foreign and domestic research reports, journal articles, patents, conference proceedings, and books, which were entered in the DOE Energy Information Data Base since July 1978. (DLC)

479 (NUREG--0656) STUDY OF ALTERNATIVE METHODS FOR THE MANAGEMENT OF LIQUID SCINTILLATION COUNTING WASTES. Roche-Farmer, L. (Nuclear Regulatory Commission, Washington, DC (USA). Div. of Fuel Cycle and Material Safety). Feb 1980. 41p. NTIS.
The Nuclear Engineering Waste Disposal Site in Richland, Washington, is the only radioactive waste disposal facility that will accept liquid scintillation counting wastes (LSCW) for disposal. That site is scheduled to discontinue receiving LSCW by the end of 1982. This document explores alternatives presently available for management of LSCW: evaporation, distillation, solidification, conversion, and combustion. (DLC)

480 (NUREG/CR--0685) CHARACTERISTICS OF DEFENSE HIGH-LEVEL WASTE. Cheung, H.; Kniazewycz, B.G.; Kvam, D.J. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 31 May 1979. Contract W-7405-ENG-48. 68p. (UCRL--52704). Dep. NTIS, PC A04/MF A01.
This report presents a historical and technical review of the high-level radioactive waste management problems at Savannah River Plant, Hanford Reservation, and Idaho Chemical Processing Plant with major emphases on high-level waste inventory, characteristics, and management technologies. This information is presented for use as a portion of the defense high-level waste data base being developed to provide the US Nuclear Regulatory Commission with the necessary information to develop its regulatory framework and guidelines in this regard. 10 figures, 23 tables.

481 (NUREG/CR--1137) INSTITUTIONAL RADIOACTIVE WASTES, 1977. FINAL REPORT. Beck, T.J.; Cooley, L.R.; McCampbell, M.R. (Maryland Univ., Baltimore (USA). Radiation Safety Office). 1977. 132p. NTIS.
A followup survey to the 1975 institutional radioactive waste study (3) was conducted to obtain data for the calendar year 1977. The survey population of large medical and academic licensees shipped an estimated 7771 m^3 of low level radwaste for burial in 1977. Approximately 7% of the waste volume was ascribed to purely medical sources, 79% to sources conducting biological research and 14% to other academic sources. The estimated total activity shipped by the population in 1977 was 1,688 Ci, of which 81% was ^3H. Approximately 540 Ci of ^3H was shipped as depleted tritium targets for neutron generators. Much of the rest was in the form of labeled compounds or labeling reagents used in biological research. The fastest growing waste form produced by the population is waste liquid scintillation vials which have undergone a 60% increase in volume since 1975. The waste volume produced by the population appears to be increasingly linearly, at approximately the same rate as low-level radwastes in general.

482 (NUREG/CR--1326) PROPERTIES OF RADIOACTIVE WASTES AND WASTE CONTAINERS. QUARTERLY PROGRESS REPORT, OCTOBER-DECEMBER 1979. Manaktala, H.K.; Colombo, P.; Neilson, R.M. Jr. (Brookhaven National Lab., Upton, NY (USA)). Feb 1980. Contract EY-76-C-02-0016. 26p. (BNL-NUREG--51148). Dep. NTIS, PC A03/ MF A01.
Experiments were conducted to establish appropriate waste/binder ratios within which boric acid (simulated reactor waste) may be incorporated into portland type III cement to produce acceptable waste form. Both pH-adjusted and pH-unadjusted boric acid solutions were used. NaOH was used to adjust the boric acid pH. Data are reported for 3, 6, and 12 wt % boric acid wastes, with pH-adjusted values of 7, 10, and 12. Range of waste/binder ratios investigated are from 0.3 to 1.5. Results show: (a) pH-unadjusted 12 wt % boric acid waste (typical reactor waste concentration) does not solidify without neutralization with NaOH at waste/binder ratios investigated; (b) boric acid waste neutralized with NaOH, before solidification, requires shorter cure time compared with pH-unadjusted waste, and (c) the amount of pH adjustment, of boric acid with NaOH, needed to assure satisfactory solidification is a variable related to boric acid concentration in the waste. Impact tests were performed on urea-formaldehyde waste forms containing simulated BWR precoat filter cake in diatomaceous earth. Impact energies of 7.85, 15.7, and 31.4 joules were used. Data are provided, in graphical form, for formulations with waste/binder ratios of 1.6, 2.0, and 2.4. Results show: (a) higher impact loadings generate greater number of particulates in all size ranges, and (b) waste forms with higher waste/binder ratio produce greater number of particulate for a given impact loading. 8 figures, 7 tables.

483 (NUS--3383) POWER-REACTOR LOW-LEVEL RADIOACTIVE WASTE GENERATION AND WASTE MANAGEMENT PRACTICES EVALUATION. REPORT E. POLICY RECOMMENDATIONS, CONCLUSIONS, AND SUMMARY. Feizollahi, F.; Stouky, R.J.; Connelly, J.M.; Jentz, T.L. (NUS Corp., Palo Alto, CA (USA)). Aug 1979. 80p. California Energy Commission, 1111 Howe Ave., Sacramento, CA 95825.
A study was conducted to evaluate nuclear waste management technology and to identify the problems that will have to be solved within the next few years in order to allow the orderly development of large-scale management of low-level radioactive wastes generated at nuclear power facilities and by the nuclear power industry in California. This volume provides a technical, economic, and environmental overview of waste management alternatives that could be pursued by the State of California. (DLC)

484 (NVO--185(Rev.1)) OPERATIONAL RADIOACTIVE WASTE MANAGEMENT PLAN FOR THE NEVADA TEST SITE. (Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (USA); Department of Energy, Las Vegas, NV (USA). Nevada Operations Office). Jul 1979. Contract EY-76-C-08-0410. 44p. Dep. NTIS, PC A03/MF A01.
The Operational Radioactive Waste Management Plan for the Nevada Test Site establishes procedures and methods for the safe receiving, processing, disposal, or storage of radioactive waste. Included are NTS radioactive waste disposition program guidelines, procedures for radioactive waste management, description of storage areas and facilities, and a glossary of specifications and requirements.

485 (NVO--196-15) NEVADA NUCLEAR WASTE STORAGE INVESTIGATIONS. QUARTERLY REPORT, JANUARY-MARCH 1980. (Department of Energy,

Las Vegas, NV (USA). Nevada Operations Office). Jun 1980. 65p. NTIS, PC A04/MF A01.

The Nevada Nuclear Waste Storage Investigations (NNWSI) consist of a variety of studies and evaluations in support of the US Nuclear Waste Management Program. The NNWSI are primarily oriented towards developing or improving the technology of nuclear waste storage and disposal and determining whether selected underground rock media on or adjoining the Nevada Test Site (NTS) are technically acceptable for a licensed, permanent, high-level nuclear waste repository. The NNWSI Project for FY 1980 is comprised of eight tasks which are divided into subtasks: weapons test seismic investigations, geologic and hydrologic investigations, media investigations, engineering and technical support, quality assurance, technical review, Climax spent fuel test, and National Waste Terminal Storage Program support. (DLC)

486 (NVO--196-18) NEVADA NUCLEAR WASTE STORAGE INVESTIGATIONS. MANAGEMENT AND OVERVIEW QUALITY ASSURANCE PROGRAM PLAN. (Department of Energy, Las Vegas, NV (USA). Nevada Operations Office). Aug 1980. 33p. NTIS, PC A03/MF A01.

The Nevada Nuclear Waste Storage Investigations (NNWSI) Project Office is the US Department of Energy, Nevada Operations Office (DOE/NV) organization charged with the responsibility of administering and coordinating the activities of the various Participating Organizations and Support Contractors working on the NNWSI project. This Quality Assurance Program Plan (QAPP) describes how the NNWSI Project Office and their consultant and advisory organizations, Technical Overview and Quality Assurance Overview, perform the quality assurance (QA) aspects of administering and coordinating NNWSI activities. This QAPP was developed to comply with the elements of 10CFR50 Appendix B (Ref. A) criteria which apply to the activities of the Project Office and their advisory staff. These activities are intended to conform with the applicable portions of ANSI/ASME NQA-1-1979 (Ref. B).

487 (ONWI--87) CONSULTATION AND CONCURRENCE: WORKSHOP PROCEEDINGS, SEPTEMBER 23-26, 1979, THE ORCAS MEETING, EASTSOUND, WASHINGTON. (Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). Jan 1980. Contract EY-76-C-06-1830. 159p. Dep. NTIS, PC A08/MF A01.

Purpose of the workshop was to probe the concepts of consultation and concurrence and to address issues in establishing and maintaining an effective state-federal process in nuclear waste management. The workshop was a gathering of some 50 people from industry, the environmental movement, local government, executive and legislative branches of state government, US Congressional staffs, the US Department of Energy, Nuclear Regulatory Commission, ONWI, university social science departments, and other research institutions. The workshop consisted of general sessions at which ten papers covering various aspects of consultation and concurrence were presented and of working groups which further explored issues raised by the papers. This report presents a general summary of discussions, the text of a background paper prepared for the workshop, the presented papers, and individual comments by several participants.

488 (ORNL--5665, pp 111-127) NUCLEAR WASTE CHEMISTRY. Jul 1980.

Chemistry Division annual progress report, February 29, 1980.

The consolidation of salt in flowing brine was studied under uniaxial stress and the results correlated using a model. Adsorption of such ions as Cs(I), Sr(II), Eu(III), and I^- on such earth materials as clays or Al_2O_3 is being studied. Molten-salt processes are being investigated for separating components of high-level wastes; separation of Pd from Ru and complexes formed by $NbCl_5$ in chloro-aluminate melts were studied. Adsorption of actinides (Am,Np) on geological media is being studied. Lanthanide orthophosphates are being synthesized and studied (EPR, Raman,absorption, Moessbauer spctra) as possible alternatives to glass as actinide waste forms. 18 figures. (DLC)

489 (ORNL/OIAPA--13) PUBLIC INFORMATION ON RADIOACTIVE WASTE: A STUDY OF AN EMERGING ISSUE. Bronfman, L.M.; Bronfman, B.H.; Regens, J.L. (Oak Ridge National Lab., TN (USA)). Oct 1979. Contract W-7405-ENG-26. 59p. Dep. NTIS, PC A04/MF A01.

Through an analysis of information provided in the printed media on the topic of radioactive waste, the study analyzes the emergence of radioactive waste as a public issue in the press. Over eight hundred articles printed in both specialized and non-specialized sources from 1973 to 1978 have been content-analyzed in order to describe how the problem of radioactive waste is defined and what dimensions of the problems are receiving attention. Between 1973 and 1978, there was a substantial increase in the amount of information on the topic of radioactive waste available to the public through a variety of popular and specialized media sources. This increase coincides with documented public concern with the problem of radioactive waste. Discussions of radioactive waste have focused for all sources more frequently on themes not directly related to the technical problems of radioactive waste storage or isolation. A substantial amount of the information available to a variety of segments of the public is composed of discussions of real or perceived risk related to the existence of waste or to methods of disposing of it. In addition to risk, a substantial proportion of the discussions deal with institutional themes. Over time, the total amount of information on most dimensions of the radioactive waste problem has increased substantially. Institutional themes have gained relative to other issues over the three time periods. National and local press sources infrequently specify the form of waste being discussed thus providing evidence that the quality of technical information available to some members of the public is very low.

490 (ORNL/OIAPA--14) BIBLIOGRAPHY OF ARTICLES ON RADIOACTIVE WASTE FROM 1973-1978. Bronfman, L.M. (Oak Ridge National Lab., TN (USA)). Oct 1979. Contract W-7405-ENG-26. 47p. Dep. NTIS, PC A03/MF A01.

This bibliography of approximately 900 citations is a supplement to a study on the content of public information on radioactive waste. The bibliography distinguishes between diferent information sources: national press; general scientific press; nuclear scientific press; nuclear industry/utility; environmental press; and local press. In this bibliography articles which appeared in local newspapers in Michigan and Louisiana were included for the years 1976 and 1977, a time of considerable controversy within these states over the OWI's actions.

491 (ORNL/SUB--80/13837/3) PROGRAMMATIC ASSESSMENT OF RADIOACTIVE WASTE MANAGEMENT: NUCLEAR FUEL AND WASTE PROGRAMS. (Gilbert/Commonwealth, Reading, PA (USA)). Jun 1980. Contract W-7405-ENG-26. 135p. NTIS, PC A07/MF A01.

Gilbert/Commonwealth (G/C) has performed an assessment of the waste management operations at Oak Ridge National Laboratory (ORNL). The objective of this study was to review radioactive waste management as practiced at ORNL and to recommend improvements or alternatives for further study. The study involved: (1) an on-site survey of ORNL radioactive waste management operations; (2) a review of radioactive waste source data, records, and regulatory requirements; (3) an assessment of existing and planned treatment, storage, and control facilities; and (4) identification of alternatives for improving waste management operations. Information for this study was obtained from both personal interviews and written reports. The ORNL waste management operations have maintained radioactive releases to the environment well below regulatory requirements and have been successful, in recent years, in consistently reducing emissions. This has been accomplished primarily by upgrading equipment and procedures. However, this upgrading must be an on-going activity because of: (1) the changing nature of ORNL activities; (2) an increase in radioactive burden on-site; (3) the age of existing facilities and equipment; and (4) changes to regulatory requirements. As a result of reviewing ORNL operations, specific suggestions are offered for resolving isolated problems. However, these suggestions should be considered in the context of a comprehensive plan for the management of radioactive wastes at ORNL. Three areas were determined to warrant more detailed, consolidated studies: (1) waste management program planning; (2) development of a centralized computer based data acquisition system; and (3) a review for maintaining exposures to on-site personnel as low as reasonably achievable (ALARA).

492 (ORNL/TM--7253) HIGH-LEVEL WASTE PROGRAM. PROGRESS REPORT, OCTOBER 1, 1979-DECEMBER 31, 1979. (Oak Ridge National Lab., TN (USA)). Mar 1980. Contract W-7405-ENG-26. 51p. Dep. NTIS, PC A04/MF A01.

Waste Management Analysis for Nuclear Fuel Cycles: Example scenarios were evaluated for low-level waste management analysis. Depletion calculations for early- and advanced-oxide U-Pu cycle LMFBRs were completed. Fixation of Waste in Concrete: FUETAP concretes were made that had compressive strengths >60 MPa, thermal conductivities >1 W/m.K and densities of approx. 2 g/cm^3. These solids were able to withstand temperatures of 900°C for 24 h. Study of Ceramic and Cermet Waste Forms: Construction of the 23-cm ID spray calciner to be used for urea-waste solutions is nearing completion. Development of densification techniques at both low and elevated temperatures is continuing. Alternative High-Level Waste Forms Development: Sol-gel Synroc spheres (1 wt % waste) as dense as 95% with 1% open porosity have been prepared by sintering at 1200°C. Initial tests to incorporate as much as 25 wt % of simulated SRP waste sludge in Synroc spheres were successful. Construction has begun on a sphere forming system. High-Level Waste Container Development: A fabrication, assembly, and inspection sequence has been developed for a canister and overpack.

493 (ORNL/TM--7385/V1) RADIOACTIVE WASTE MANAGEMENT INTEGRATED DATA BASE: A BIBLIOGRAPHY. Johnson, C.A.; Garland, P.A. (Oak Ridge National Lab., TN (USA)). Sep 1980. Contract W-7405-ENG-26. 192p. NTIS, PC A09/MF A01.

The purpose of this indexed bibliography is to organize and collect the literature references on waste generation and treatment, characteristics, inventories, and costs. The references were captured into a searchable information file, and the information file was sorted, indexed, and printed for this bibliography. A completion of approximately 1100 references to nuclear waste management, the first of a series, is completed. Each reference is categorized by waste origin (commercial, defense, institutional, and foreign) and by subject area: (1) high-level wastes, (2) low-level wastes, (3) TRU wastes, (4) airborne wastes, (5) remedial action (formerly utilized sites, surplus facilities, and mill tailings), (6) isolation, (7) transportation, (8) spent fuel, (9) fuel cycle centers, and (10) a general category that covers nonspecific wastes. Five indexes are provided to assist the user in locating documents of interest: author, author affiliation (corporate authority), subject category, keyword, and permuted title. Machine (computer) searches of these indexes can be made specifying multiple constraints if so desired. This bibliography will be periodically updated as new information becomes available. In addition to being used in searches for specific data, the information file can also be used for resource document collection, names and addresses of contacts, and identification of potential sources of data.

494 (ORNL/TM--7385/V2) RADIOACTIVE WASTE MANAGEMENT INTEGRATED DATA BASE: A BIBLIOGRAPHY. Johnson, C.A.; Garland, P.A. (Oak Ridge National Lab., TN (USA)). Sep 1980. Contract W-7405-ENG-26. 409p. NTIS, PC A18/MF A01.

RADIOACTIVE WASTE MANAGEMENT;BIBLIOGRAPHIES; RADIOACTIVE WASTE DISPOSAL;RADIOACTIVE WASTES; RADIOACTIVE WASTE PROCESSING

495 (ORO--778) SPENT FUEL AND WASTE INVENTORIES AND PROJECTIONS. Carter, W.L.; Finney, B.C.; Alexander, C.W.; Blomeke, J.O.; McNair, J.M. (Oak Ridge National Lab., TN (USA)). Aug 1980. Contract W-7405-ENG-26. 88p. NTIS, PC A05/MF A01.

Current inventories of commercial spent fuels and both commercial and US Department of Energy radioactive wastes were compiled, based on judgments of the most reliable information available from Government sources and the open literature. Future waste generation rates and quantities to be accumulated over the remainder of this century are also presented, based on a present projection of US commercial nuclear power growth and expected defense-related activities. Spent fuel projections are based on the current DOE/EIA estimate of nuclear growth, which projects 180 GW(e) in the year 2000. It is recognized that the calculated spent fuel discharges are probably high in view of recent reactor cancellations; hence adjustments will be made in future updates of this report. Wastes considered, on a chapter-by-chapter basis, are: spent fuel, high-level wastes, transuranic wastes, low-level wastes, mill tailings (active sites), and remedial action wastes. The latter category includes mill tailings (inactive sites), surplus facilities, formerly utilized sites, and the Grand Junction Project. For each category, waste volume inventories and projections are given through

the year 2000. The land usage requirements are given for storage/disposal of low-level and transuranic wastes, and for present inventories of mill tailings.

496 (ORP/CSD--79-2) ASSESSMENT OF WASTE MANAGEMENT OF VOLATILE RADIONUCLIDES. Altomare, P.M.; Barbier, M.; Lord, N.; Nainan, D. (Mitre Corp., McLean, VA (USA). METREK Div.). May 1979. 124p. (MTR--7719). Environmental Protection Agency, Washington, DC.

This document presents a review of the Technologies for Waste Management of the Volatile Radionuclides of iodine-129, krypton-85, tritium, and carbon-14. The report presents an estimate of the quantities of these volatile radionuclides as are produced in the nuclear power industry. The various technologies as may be used, or which are under investigation, to immobilize these nuclides and to contain them during storage and in disposal are discussed. Also, the alternative disposal options as may be applied to isolate these radioactive wastes from the human environment are presented. The report contains information which was available through approximately January 1978.

497 (PB--80-105042) LOW-LEVEL RADIOACTIVE WASTE MANAGEMENT. VOLUME I: CURRENT POWER REACTOR LOW-LEVEL RADWASTE. FINAL REPORT. Frizollahi, F.; Connelly, J.M.; Jentz, T.L.; White, L.; Woo, D. (NUS Corp., Palo Alto, CA (USA)). Mar 1978. 269p. NTIS, PC A12/MF A01.

This study evaluates low-level waste management technology for light water reactors and identifies the problems that must be solved within the next few years to allow for the orderly development of large-scale management of low-level radioactive wastes generated at nuclear power facilities and by the nuclear power industry in California. This report is the first volume of a series and contains basic information and background data relative to the current industry practice in the area of power reactor low-level-waste management.

498 (PB--105083) LOW-LEVEL RADIOACTIVE WASTE MANAGEMENT. VOLUME V. POLICY RECOMMENDATIONS, CONCLUSIONS AND SUMMARY. FINAL REPORT. Feizollahi, F.; Stoouky, R.J.; Connelly, J.M.; Jentz, T.L. (NUS Corp., Palo Alto, CA (USA)). Aug 1979. 81p. NTIS, PC A A05/MF A01.

This study evaluates low-level waste management technology for light water reactors and identifies the problems that must be solved within the next few years to allow for the orderly development of large-scale management of low-level radioactive wastes generated at nuclear power facilities and by the nuclear power industry in California. Volume 5 provides a technical, economic, and environmental overview of waste-management alternatives that could be pursued by the State of California.

499 (PB--295360) CHARACTERIZATION OF SELECTED LOW-LEVEL RADIOACTIVE WASTE GENERATED BY FOUR COMMERCIAL LIGHT-WATER REACTORS. (New York State Energy Research and Development Authority, New York (USA); Dames and Moore, White Plains, NY (USA)). Dec 1977. Contract EPA-68-01-3294. 78p. NTIS PC A05/MF A01.

An investigation was made of the radionuclide makeup of light-water nuclear reactors' radioactive wastes presently being consigned to shallow land burial. The studies were contracted through the New York State Energy Research and Development Authority and consisted of radiochemical analyses of spent ion exchange resins, evaporator concentrates and filter sludges for specific radionuclides including activation products, fission products and transuranics. Ten waste samples were obtained from two BWRs and two PWRs.

500 (PB--295408) AN ANALYSIS OF LOW-LEVEL SOLID RADIOACTIVE WASTE FROM LWRS THROUGH 1975. Phillips, J.W.; Gaul, G.A. (Office of Radiation Programs, Washington, DC (USA). Technology Assessment Div.). Nov 1977. 106p. NTIS PC A06/MF A01.

In view of the wide disparity of data bases and conflicting conclusions, this study updates a previous EPA study. In addition, this study also provides a break down of projected annual volumes by type of waste, i.e., demineralizer resins and filter sludge, evaporator bottoms, and contaminated trash, and also identify the relative composition of the wastes by major nuclides. These latter results will be compared with similar results from other studies.

501 (PB--296947) LOW-LEVEL RADIOACTIVE WASTE MANAGEMENT. Watson, J.E. (ed.). (Environmental Protection Agency, Washington, DC (USA). Office of Radiation Programs). May 1979. 547p. (EPA--520/3-79-002; CONF-790209--). NTIS, PC A99/MF A01.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

Portions of document are illegible.

This publication contains the proceedings of the Twelfth Mid-year Topical Symposium of the Health Physics Society on Low-Level Radioactive Waste Management held in Williamsburg, Virginia, February 11-15, 1979. There are fifty-seven papers included covering such topics on radioactive waste management as (1) the origin, (2) handling and transportation, (3) disposal operations and alternatives (4) regulatory aspects, (5) environmental, and (6) public health aspects. Separate abstracts are prepared for individual papers.

502 (PB--296947, pp 121-124) VOLUME REDUCTION OF LOW-LEVEL RADIOACTIVE WASTE WITH A HAMMERMILL. Gregory, W.D. (Univ. of Rochester, NY). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

A Jacobson Model J-3 Hammermill was recently installed at the University of Rochester to process low-level radioactive wastes from hospital and research laboratories. The hammermill will handle both glass and plastic vials of all types. The waste is poured into a hopper located on the top of the seven foot high assembly. The material is gravity fed into the hammermill which is driven by a 15-horsepower motor at 3600 rpm. The waste is pounded by the rotating hammers into a metal screen perforated with one inch holes. The gound-up product is discharged from the bottom of the unit into a 55-gallon shipping drum. A volume reduction of 4:1 has been acheived on an equal mixture of glass and plastic vials.

503 (PB--296947, pp 151-158) PRELIMINARY IMPACT ASSESSMENT OF INSTITUTIONAL RADIOACTIVE WASTE DISPOSAL. Andersen, R. (Univ. of Maryland, Baltimore). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

A significant fraction of the low level radioactive wastes which are buried in the

commercial, shallow land burial sites in the US originate from non-fuel cycle sources. The primary radwaste producers in this category include large medical and academic institutions. This paper considers, in a preliminary manner, some of the impacts of disposing of institutional radwastes via the same methods and systems as are used to dispose of fuel cycle radwastes. Nuclide content and activity concentrations of institutional and reactor radwastes differ greatly. The varied physical and chemical forms of institutional radwastes may not be compatible for burial with reactor radwastes. Animal carcasses and other biological materials may adversely affect containment and transport parameters in the burial trenches. The time and expense involved in the commercial burial of institutional radwastes may not be commensurate with the actual radiological content of the materials. Finally, this method of disposal may not represent an optimum use of limited burial space.

504 (PB--296947, pp 174-181) WASTE MANAGEMENT OF URANIUM MINING AND MILLING OPERATIONS. Kirner, N.P. (State of Washington, Olympia); Moghissi, A.A.; Blackburn, P.A. May 1979.
From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).
Uranium mining and milling operations associated with waste practices are somewhat different from other nuclear operations in that no new radioactive material is generated. The methods and procedures of uranium mining and milling operations using the acid-leach solvent extraction method are described using the Sherwood Project of Western Nuclear, Inc., as an example.

505 (PB--296947, pp 182-195) MANAGEMENT OF LOW-LEVEL NATURAL RADIOACTIVITY WASTES OF PHOSPHATE MINING AND PROCESSING. Roessler, C.E.; Smith, Z.A.; Bolch, W.E.; Wethington, J.A. Jr. (Univ. of Florida, Gainesville). May 1979.
From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).
Redistribution of the uranium-series radionuclides associated with phosphate deposits produces what are, in effect, low-level radioactive wastes. Proposed management of these materials involved (1) restricting by-product uses to applications not causing significant exposures to man; and (2) returning other material to the land with simulation of the natural radioactivity depth profile by covering high activity overburden, tailings, clays, gypsum and other radioactivity-bearing wastes with a lower activity overburden layer. Radon flux models are being developed to aid design of materials placement.

506 (PB--296947, pp 231-233) REGULATORY ASPECTS OF LOW LEVEL WASTE DISPOSAL. Shealy, H.G. (South Carolina Dept. of Health and Environmental Control, Columbia). May 1979.
From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).
Regulating a low-level waste disposal site reveals many interesting facets of how this nation's low-level waste is being managed. Incidents and occurrences that happen to radioactive waste prior to arriving at a burial site and after it is received at the burial site will be described. Regulating the site involves numerous disciplines of engineering, chemistry, hydrology, geology, health physics, and others. Regulatory involvement of these elements will be reviewed. Classification of low-level waste as presently being implemented at the Chem-Nuclear, Barnwell, South Carolina, site will be discussed.

507 (PNL--3000-2) NUCLEAR WASTE MANAGEMENT. QUARTERLY PROGRESS REPORT, APRIL-JUNE 1979. Platt, A.M.; Powell, J.A. (comps.). (Battelle Pacific Northwest Labs., Richland, WA (USA)). Sep 1979. Contract EY-76-C-06-1830. 53p. Dep. NTIS, PC A04/MF A01.
Progress is reported on: decontamination and densification of chop-leach cladding residues; monitoring methods for particulate and gaseous effluents from waste solidification process; TRU waste immobilization; krypton solidification; ^{14}C and ^{129}I fixation; waste management system and safety studies; waste isolation safety assessment; well logging instrumentation development for shallow land burial; monitoring and physical characterization of unsaturated zone transport; detection and characterization of mobile organic complexes of fission products; and electropolishing for surface decontamination of metals. 9 figures, 14 tables. (DLC)

508 (PNL--3000-3) NUCLEAR WASTE MANAGEMENT. QUARTERLY PROGRESS REPORT, JULY-SEPTEMBER 1979. Platt, A.M.; Powell, J.A. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Nov 1979. Contract EY-76-C-06-1830. 92p. Dep. NTIS, PC A05/MF A01.
Research is reported on: decontamination and densification of chop-leach cladding residues, monitoring of effluents from waste solidification, TRU waste mobilization, Kr solidification, ^{14}C and ^{129}I fixation, waste management system and safety studies, waste isolation safety assessment, logging systems for shallow land burial, unsaturated zone transport, mobile organic complexes of fission products, electropolishing for surface decontamination of metals, and decontamination and decommissioning of Hanford facilities. (DLC)

509 (PNL--3000-4) NUCLEAR WASTE MANAGEMENT. QUARTERLY PROGRESS REPORT, OCTOBER-DECEMBER 1979. Platt, A.M.; Powell, J.A. (comps.). (Battelle Pacific Northwest Labs., Richland, WA (USA)). Apr 1980. Contract EY-76-C-06-1830. 101p. NTIS, PC A06/MF A01.
Progress and activities are reported on the following: high-level waste immobilization, alternative waste forms, nuclear waste materials characterization, TRU waste immobilization programs, TRU waste decontamination, krypton solidification, thermal outgassing, iodine-129 fixation, monitoring of unsaturated zone transport, well-logging instrumentation development, mobile organic complexes of fission products, waste management system and safety studies, assessment of effectiveness of geologic isolation systems, waste/rock interactions technology, spent fuel and fuel pool integrity program, and engineered barriers. (DLC)

510 (PNL--3000-5) NUCLEAR WASTE MANAGEMENT. QUARTERLY PROGRESS REPORT, JANUARY-MARCH 1980. Platt, A.M.; Powell, J.A. (comps.). (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jun 1980. Contract AC06-76RL01830. 107p. NTIS, PC A06/MF A01.
Reported are: high-level waste immobilization, alternative waste forms, nuclear waste materials characterization, TRU

waste immobilization, TRU waste decontamination, krypton solidification, thermal outgassing, iodine-129 fixation, unsaturated zone transport, well-logging instrumentation development, mobile organic complexes of fission products, waste management system and safety studies, assessment of effectiveness of geologic isolation systems, waste/rock interactions, engineered barriers, criteria for defining waste isolation, and spent fuel and pool component integrity. (DLC)

511 (PNL--3036) STRESS ANALYSIS OF HIGH-LEVEL WASTE CANISTERS: METHODS, APPLICATIONS, AND DESIGN DATA. Simonen, F.A.; Slate, S.C. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Oct 1979. Contract EY-76-C-06-1830. 156p. Dep. NTIS, PC A08/MF A01.

An overview of stress analysis methods, structural design procedures, and design data is presented for canisters used to package solidified wastes, particularly borosilicate glass. In addition, waste processing, canister materials, fabrication and inspection methods, and performance testing are summarized. Sources of stress in canisters are lifting and handling loads, internal pressure, high-temperature filling operations, transient heating and cooling, differential thermal expansions of canisters and glass, and impact loadings from low-probability accidents. Results of case studies that illustrate applicable methods of stress analyses are presented for these sources of stress. Existing sections of ASME Boiler and Pressure Vessel Code are applicable to canister fabrication, but the code does not cover many aspects of canister service loadings. Specialized criteria for minimum wall thicknesses to sustain filling stresses are proposed in this report. Results of a test program to measure the creep strength of candidate canister materials are described. Methods to predict residual stresses in the walls of waste canisters are described; predicted residual stress levels agree with measured stress levels. The consequences of these residual stresses are reviewed, and stress-corrosion cracking is identified as the mode of canister failure affected by residual stresses. Canister-closure design is covered in detail, particularly the welding and inspection of the final closure seal-weld. It is shown that the methods of fracture mechanics and fatigue-crack-growth analyses are valuable tools for evaluating the performance of closure welds in the presence of crack-like defects. Canister performance in process trials at PNL shows the ability of canisters to survive high temperatures and loadings during processing. Impact tests show that a suitably designed canister can sustain severe impacts without loss of intergrity.

512 (PNL--3078) NUCLEAR WASTE MANAGEMENT ISSUES: A MULTIDISCIPLINARY EVALUATION FRAMEWORK. TEKNEKRON B-52865-A-L. Hoffman, M. (Teknekron, Inc., Berkeley, CA (USA)). Feb 1980. Contract EY-76-C-06-1830. 90p. Dep. NTIS, PC A05/MF A01.

Initially, this paper characterizes the nuclear waste problem that requires analysis to establish the rationale for an interdisciplinary approach to resolve it. The problem characterization also explains why the specific concern with contaminated groundwater and intrusion through drilling has been selected for the focus of the panel meeting. The Nominal Group Technique (NGT), the group process format chosen for the experts' deliberations, is explained in some detail and its value in facilitating the desired dialogue is described. The dialogue is organized around the various issue areas that would be of concern to a program manager dealing with the potential problem of radioactivity escaping to the biosphere through human intrusion into contaminated groundwater. The participants are identified by professional discipline so that the dialogue can be presented in a realistic fashion. Both the content of the dialogue and its format are evaluated. Particular attention is given to their usefulness in generating a cross-section of subissues and factors that should be addressed when analyzing the waste disposal system's adequacy to prevent contaminated groundwater escaping to the biosphere.

513 (PNL--3152) LEACHING OF ACTINIDES AND TECHNETIUM FROM SIMULATED HIGH-LEVEL WASTE GLASS. Bradley, D.J.; Harvey, C.O.; Turcotte, R.P. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Aug 1979. Contract EY-76-C-06-1830. 104p. Dep. NTIS, PC A06/MF A01.

Leach tests were conducted using a modified version of the IAEA procedure to study the behavior of glass waste-solution interactions. Release rates were determined for Tc, U, Np, Pu, Am, Cm, and Si in the following solutions: WIPP B salt brine, NaCl (287 g/l), NaCl (1.76 g/l), $CaCl_2$ (1.66 g/l), $NaHCO_3$ (2.52 g/l), and deionized water. The leach rates for all elements decreased an order of magnitude from their initial values during the first 20 to 30 days leaching time. The sodium bicarbonate solution produced the highest elemental release rates, while the saturated salt brine and deionized water in general gave the lowest release. Technetium has the highest initial release of all elements studied. The technetium release rates, however, decreased by over four orders of magnitude in 150 days of leaching time. In the prepared glass, technetium was phase separated, concentrating on internal pore surfaces. Neptunium, in all cases except $CaCl_2$ solution, shows the highest actinide release rate. In general, curium and uranium have the lowest release rates. The range of actinide release rates is from 10^{-5} to 10^{-8} g/cm^2/day. 25 figures, 7 tables.

514 (PNL--3176) ^{85}KR MANAGEMENT TRADE-OFFS: A PERSPECTIVE TO TOTAL RADIATION DOSE COMMITMENT. Mellinger, P.J.; Hoenes, G.R.; Brackenbush, L.W.; Greenborg, J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jan 1980. Contract EY-76-C-06-1830. 126p. Dep. NTIS, PC A07/MF A01.

Radiological consequences arising from the trade-offs for ^{85}Kr waste management from possible nuclear fuel resource recovery activities have been investigated. The reference management technique is to release all the waste gas to the atmosphere where it is diluted and dispersed. A potential alternative is to collect, concentrate, package and submit the gas to long-term storage. This study compares the radiation dose commitment to the public and to the occupationally exposed work force from these alternatives. The results indicate that it makes little difference to the magnitude of the world population dose whether ^{85}Kr is captured and stored or chronically released to the environment. Further, comparisons of radiation exposures (for the purpose of estimating health effects) at very low dose rates to very large populations with exposures to a small number of occupationally exposed workers who each receive much higher dose rates may be misleading. Finally, cost studies (EPA 1976 and DOE 1979a) show that inordinate amounts of money will be required to lower this already extremely small 80-year

cumulative world population dose of 0.05 mrem/person (<0.001% of natural background radiation for the same time period).

515 (PNL--3254) MATERIALS CHARACTERIZATION CENTER PROGRAM PLAN. Nelson, R.D.; Ross, W.A.; Hill, O.F.; Mendel, J.E.; Merz, M.D.; Turcotte, R.P. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Mar 1980. Contract EY-76-C-06-1830. 82p. Dep. NTIS, PC A05/MF A01.

The Materials Characterization Center (MCC) has been established at Pacific Northwest Laboratory as part of the Materials Characterization Organization for providing an authoritative, referenceable basis for establishing nuclear waste material properties and test methods. The MCC will provide a data base that will include information on the components of the waste emplacement package - the spent fuel or processed waste form and the engineered barriers - and their interaction with each other and as affected by the environment. The MCC will plan materials testing, develop and document procedures, collect and analyze existing materials data, and conduct tests as necessary.

516 (PNL--3300(Pt.2), pp 161) DECOMMISSIONING AND DECONTAMINATION (BURIAL GROUND STABILIZATION) STUDIES. Cline, J.F. Feb 1980.

Pacific Northwest Laboratory annual report for 1979 to the DOE Assistant Secretary for Environment. Part 2. Ecological sciences.

The decommissioning and decontamination of retired Hanford facilities and the future use of surrounding landscapes require isolation of contaminated wastes from the biosphere. Burial ground stabilization studies were conducted to determine the effectiveness of physical barriers for isolating contaminated wastes in shallow-land burial sites from plants and animals. This study was undertaken to determine the effectiveness of using a layer of loose rock between the waste and the surface soil covering to prevent both plant root and animal penetrations.

517 (PNL--3317-1) COMMERCIAL NUCLEAR REACTORS AND WASTE: THE CURRENT STATUS. Platt, A.M.; Robinson, J.V. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Apr 1980. Contract EY-76-C-06-1830. 55p. Dep. NTIS, PC A04/MF A01.

During the last five years, the declared size of the commercial light water reactor (LWR) nuclear power industry in the US has steadily decreased. As of January 1980, the total number of power plants had dropped to 191 from the 226 in December 31, 1974. At least another nine were cancelled in the last few months. This report was developed as the first of a series to track implications to waste management due to such changes in the declared size of the industry. For the presently declared size, key conclusions are: the declared reactors will peak at a capacity of 162 GWe and consume about 10^6 MTU as enrichment feed. As few as two repositories of about 100,000 MTHM capacity each would hold the waste. Predisposal storage (reactor basins and AFRs) would peak at less than 100,000 MTHM (in the year 2020) with one repository opening in the year 1997 and the other in the year 2020. Most of the 100,000 MTHM would have to be in AFR storage unless current practice regarding reactor basin size was radically changed.

518 (PNL--3425) WASTES FROM SELECTED ACTIVITIES IN TWO LIGHT-WATER REACTOR FUEL CYCLES. Palmer, C.R.; Hill, O.F. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jul 1980. Contract AC06-76RL01830. 45p. NTIS, PC A03/MF A01.

This report presents projected volumes and radioactivities of wastes from the production of electrical energy using light-water reactors (LWR). The projections are based upon data developed for a recent environmental impact statement in which the transuranic wastes (i.e., those wastes containing certain long-lived alpha emitters at concentrations of at least 370 becquerels, or 10 nCi, per gram of waste) from fuel cycle activities were characterized. In addition, since the WG.7 assumed that all fuel cycle wastes except mill tailings are placed in a mined geologic repository, the nontransuranic wastes from several activities are included in the projections reported. The LWR fuel cycles considered are the LWR, once-through fuel cycle (Strategy 1), in which spent fuel is packaged in metal canisters and then isolated in geologic formations; and the LWR U/Pu recycle fuel cycle (Strategy 2), wherein spent fuel is reprocessed for recovery and recycle of uranium and plutonium in LWRs. The wastes projected for the two LWR fuel cycles are summarized. The reactor operations and decommissioning were found to dominate the rate of waste generation in each cycle. These activities account for at least 85% of the fuel cycle waste volume (not including head-end wastes) when normalized to per unit electrical energy generated. At 10 years out of reactor, however, spent fuel elements in Strategy 1 represent 98% of the fuel cycle activity but only 4% of the volume. Similarly, the packaged high-level waste, fuel hulls and hardware in Strategy 2 concentrate greater than 95% of the activity in 2% of the waste volume.

519 (PNL-SA--7072/T1) MANAGEMENT OF HIGH-LEVEL NUCLEAR WASTES. Platt, A.M.; McElroy, J.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Dec 1978. Contract AC06-76RL01830. 33p. NTIS, PC A03/MF A01.

Significant developments in the management of high-level nuclear wastes that have occurred in the last 2 years are reviewed. The principal thrust is on the policy and technical developments in the United States, but some attention is paid to major developments in other countries which have impacted technical direction in the US.

520 (PNL-SA--7540) CHARACTERIZATION OF NUCLEAR WASTE. Platt, A.M. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 14 Feb 1979. Contract EY-76-C-06-1830. 6p. (CONF-790304--9). Dep. NTIS, PC A02/MF A01.

From 19. annual ASME symposium, geological disposal of nuclear waste; Albuquerque, NM, USA (15 Mar 1979).

Nuclear wastes which are logical candidates for deep geologic disposal include commercial (spent fuel, reprocessing) and defense wastes. It is expected that the 5250 metric tons of spent fuel discharged through the end of 1978 would increase to about 100,000 tons by the end of 2000. The individual characteristics of each waste type (spent fuel, solidified waste, defense wastes) are described in turn. (DLC)

521 (PRAV--1-21) ALMA - TRANSPORT CONTAINER: MECHANICAL IMPACT BY ACCIDENTS; CONCEPTUAL DESIGN. Milchert, I. (Programraadet foer Radioaktivt Avfall, Stockholm (Sweden)). Aug 1979. 52p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01.

A recent pilot study of a sea transportation system for the radioactive waste storage project ALMA is continued. The mechanical stresses on special shipping containers (with an internal volume of 25 m^3) were investigated for normal handling and sea going conditions as well as for extreme conditions following free fall in water or air or caused by ship collisions. A non-shielding steel container was designed on the basis of the results obtained. The report contains collision calculations for the proposed vessel and calculations of velocities due to free fall of the container in water and air.

522 (RHO-CD--568) RADIOACTIVE WASTE PACKAGE ACCEPTANCE CRITERIA. Moore, E.L.; Calmus, D.B. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 1978. Contract EY-77-C-06-1030. 66p. Dep. NTIS, PC A04/MF A01.

Preliminary acceptance criteria have been developed for packages containing nuclear waste which must be stored or disposed of by the US Department of Energy. Acceptance criteria are necessary to ensure that the waste packages are compatible with all elements of the Waste Management System. The acceptance criteria are subject to revision since many of the constraints that will be imposed on the waste packages by the Waste Management System have either not been defined or are being revised. Delineation of the acceptance criteria will provide bases for handling, transporting and disposing of the commercial waste.

523 (RHO-CD--761) COST/RISK/BENEFIT ANALYSIS REPORT ON THE DECONTAMINATION AND DECOMMISSIONING OF Z-PLANT. Melvin, J.P.; Sexton, R.A.; Fort, M.L.; Nunn, S.E. (Atomics International Div., Richland, WA (USA). Rockwell Hanford Operations). 28 Sep 1979. Contract AC06-77RL01030. 104p. NTIS, PC A06/MF A01.

This study was performed to estimate the cost of decontaminating and decommissioning Z-Plant. All of the buildings in the Z-Plant exclusion area except Building 2736-Z, the plutonium storage vault, are included in the study. The study also excludes all underground facilities within the exclusion area which are not contained within a building and all Z-Plant related facilities outside the perimeter fence. The contamination in Z-Plant is primarily ^{239}Pu which has a half-life of 24,360 years. Because of the long half-life of ^{239}Pu, it is not practical to consider the isolation of the facility to await reduction of the contamination level by natural decay. Therefore, this study analyzes the costs, risk and benefit of decontaminating Z-Plant to four different levels of residual contamination. The three principle criteria used in the analysis are cost, the risk of offsite dose to the public, and the occupational exposure to onsite personnel.

524 (RHO-CD--883) NUCLEAR FUEL SERVICES WASTE CHARACTERIZATION AND WASTE REMOVAL SYSTEM. Smith, R.E. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Apr 1980. Contract AC06-77RL01030. 56p. NTIS, PC A04/MF A01.

The work covered by this DOE program is the key to providing necessary technical support to evaluate safety of continued in-tank storage and alternatives for final disposition of wastes at West Valley. The program has been scheduled to be performed as soon as feasible, consistent with budget requirements for accuracy and safety.

525 (RHO-LD--79-101-D) LONG-TERM HIGH-LEVEL DEFENSE WASTE TECHNOLOGY. PROGRESS REPORT, JULY-SEPTEMBER 1979. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Nov 1979. Contract EY-77-C-06-1030. 37p. Dep. NTIS, PC A03/MF A01.

Progress is reported in program management and support, waste preparation, and waste fixation. 3 figures, 5 tables. (DLC)

526 (RHO-SA--50) INSTRUMENT FOR DETERMINING VISCOSITIES AND ELECTRICAL RESISTIVITIES OF MOLTEN GLASS CANDIDATES FOR IMMOBILIZING HANFORD NUCLEAR DEFENSE WASTES. Riebling, E.F. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Sep 1978. Contract EY-77-C-06-1030. 40p. Dep. NTIS, PC A03/MF A01.

Viscosity and electrical resistivity information is required for a variety of glass melts as part of laboratory plant glass composition screening programs and/or part of pre-pilot plant parametric studies of glass composition/physical property relationships. This report describes the design specifications and calibration procedures of a recently assembled, dual-purpose, viscosity/electrical resistivity instrument. The instrument can detect molten glass viscosity between 10 and 16,000 poise and electrical resistivities larger than 2Ω.cm at temperatures between 1,000 and 1,550°C.

527 (RHO-SA--148) USE OF A DECOMMISSIONING COST/RISK/BENEFIT ANALYSIS TO IDENTIFY BENEFICIAL DESIGN FEATURES. Sexton, R.A. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 1980. Contract EY-77-C-06-1030. 6p. (CONF-800359--1). Dep. NTIS, PC A02/MF A01.

From NEA specialist meeting on decommissioning requirements in the design of nuclear facilities; Paris, France (17 Mar 1980).

A Cost/Risk/Benefit Analysis on the future decommissioning of the Hanford Z-Plant, a plutonium conversion and fabrication facility in the United States, was recently completed. The analysis has been used to identify decommissioning tasks high in cost of occupational radiation exposure. Recommendations for future design considerations have been made. They include ways of easing glove box removal, reducing piping removal requirements, and simplifying decontamination of structural surfaces.

528 (RISLEY-Trans--3999) RADIOACTIVE WASTES, CURRENT QUESTIONS. RADIOACTIVE WASTES AND THEIR MANAGEMENT. Sousselier, Y. (UKAEA Risley Nuclear Power Development Labs.). 1978. 12p. British Library Lending Division, Boston Spa.

The subject is treated under the following headings: usable wastes and by-products; origin of radioactive waste; classification of waste and basic characteristics; principles of waste management (practical rules for management, quantity of radioactive waste, development of waste management, present and future safety of waste management).

529 (SAND--79-0117) GAS GENERATION FROM TRANSURANIC WASTE DEGRADATION: AN INTERIM ASSESSMENT. Molecke, M.A. (Sandia Labs., Albuquerque, NM (USA)). Oct 1979. Contract EY-76-C-04-0789. 53p. Dep. NTIS, PC A04/MF A01.

A review of all available, applicable data pertaining to gas generation from the degradation of transuranic waste matrix material and packaging is presented. Waste forms are representative of existing defense-related TRU wastes and include cellulosics, plastics, rubbers, concrete, process sludges, and mild steel. Degradation mechanisms studied were radiolysis, thermal, bacterial, and chemical corrosion. Gas generation rates are presented in terms of moles of gas produced per year per drum, and in G(gas) values for radiolytic degradation. Comparison of generation rates is made, as is a discussion of potential short- and long-term concerns. Techniques for reducing gas generation rates are discussed. 6 figures, 10 tables.

530 (SAND--79-1245) GAS GENERATION FROM TRANSURANIC WASTE DEGRADATION: DATA SUMMARY AND INTERPRETATION. Molecke, M.A. (Sandia Labs., Albuquerque, NM (USA)). Dec 1979. Contract EY-76-C-04-0789. 71p. Dep. NTIS, PC A04/MF A01.

A comprehensive review of all applicable gas generation data resulting from the degradation of existing and potential forms of transuranic-contaminated wastes is presented. Extensive experimental studies have been performed under both realistic environmental conditions expected in the Waste Isolation Pilot Plant and overtest conditions. Degradation mechanisms investigated were radiolysis, thermal decomposition and dewatering, bacterial action, and chemical corrosion. Waste matrices studied include cellulosics, plastics, rubbers, organic composite, concrete-TRU ash, asphalt, process sludges, and mild steel. Measured gas generation rates are presented in terms of gas moles/year/drum of waste and in G(gas) values for radiolysis. The effects of multiple variables on gas generation are also described. 7 figures, 15 tables.

531 (SAND--79-1667C) MICROSTRUCTURAL CHARACTERIZATION OF GLASS AND CERAMIC SIMULATED WASTE FORMS. Headley, T.J.; Healey, J.T.; Hlava, P.F.; Kupfer, M.J.; Strachan, D.M. (Sandia Labs., Albuquerque, NM (USA); Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 1979. Contract EY-76-C-04-0789. 7p. (CONF-791112--5). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

The microstructures of three nonradioactive glass samples simulating three Hanford process waste forms were characterized. Two samples of iodine sodalite which simulate the fixation of radioactive iodine were also characterized. X-ray diffraction, electron microscopy + x-ray energy dispersive spectrometry, and electron microprobe analysis were used in the characterization. (DLC)

532 (SAND--79-1886C) TRANSPORTATION OF RADIOACTIVE WASTES FROM NUCLEAR FUEL CYCLES. (Sandia Labs., Albuquerque, NM (USA)). Sep 1979. Contract EY-76-C-04-0789. 35p. (CONF-790957--1). Dep. NTIS, PC A03/MF A01.

From International nuclear fuel cycle evaluation conference; Vienna, Austria (17 Sep 1979).

This paper discusses current and foreseen radioactive waste transportation systems as they apply to the INFCE Working Group 7 study. The types of wastes considered include spent fuel, which is treated as a waste in once-through fuel cycles; high-, medium-, and low-level waste; and gaseous waste. Regulatory classification of waste quantities and containers applicable to these classifications are discussed. Radioactive wastes are presently being transported in a safe and satisfactory manner. None of the INFCE candidate fuel cycles pose any extraordinary problems to future radioactive waste transportation and such transportation will not constitute a decisive factor in the choice of a preferred fuel cycle.

533 (SAND--80-0023C) TECHNOLOGY INFORMATION CENTER. Emerson, E.L.; Shepherd, E.W.; Minor, E.E. (Sandia Labs., Albuquerque, NM (USA)). 1980. Contract EY-76-C-04-0789. 7p. (CONF-800354--1). Dep. NTIS, PC A02/MF A01.

From 2. USDOE environmental control symposium; Washington, DC, USA (17 Mar 1980).

A Transportation Technology Center (TTC) has been established at Sandia to address the transportation of nuclear waste and spent fuel. The Technology Information Center (TIC) acts as TTC's clearing house for nuclear material transportation information. TIC's activities are divided into three activities: public information, policy information, and technical information. Some of the uses of TIC's activities are briefly outlined. (DLC)

534 (UCID--18121) DETERMINATION OF PERFORMANCE CRITERIA FOR HIGH-LEVEL SOLIDIFIED NUCLEAR WASTE. Heckman, R.A.; Holdsworth, T. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 7 May 1979. Contract W-7405-ENG-48. 281p. Dep. NTIS, PC A13/MF A01.

To minimize radiological risk from the operation of a waste management system, performance limits on volatilization, particulate dispersion, and dissolution characteristics of solidified high level waste must be specified. The results show clearly that the pre-emplacement environs are more limiting in establishing the waste form performance criteria than the post-emplacement environs. Absolute values of expected risk are very sensitive to modeling assumptions. The transportation and interim storage operations appear to be most limiting in determining the performance characteristics required. The expected values of risk do not rely upon the repositories remaining intact over the potentially hazardous lifetime of the waste.

535 (UCID--18150) REGULATABLE ELEMENTS IN THE HIGH-LEVEL WASTE MANAGEMENT PROGRAM. Oakley, D. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 26 Dec 1979. Contract W-7405-ENG-48. 32p. Dep. NTIS, PC A03/MF A01.

Regulatable elements of a deep geological nuclear waste isolation system are those characteristics of a candidate system which need to be specified to achieve control of its performance. This report identifies the regulatable elements with respect to waste form, repository design, site suitability, and the modeling and decision analysis processes. Regulatable elements in each section are listed and described briefly as they affect the short-term and long-term performance of a deep geological repository.

536 (UCRL--15143) RADIOLOGICAL PERFORMANCE OBJECTIVES FOR RADIOACTIVE WASTE DERIVED FROM PUBLIC VALUES. FINAL REPORT PR 78-20-80R. Watson, S.R.; Campbell, V.N.; Kuskey, K.P.; Feuerwerger, P.H. (Decisions and Designs, Inc., McLean, VA (USA)). May 1979. Contract W-7405-ENG-48. 174p. Dep. NTIS, PC A08/MF A01.

The study explored the feasibility of

incorporating public values into technical guidelines for nuclear-waste management: to this end (1) a set of value judgments to be elicited from the public was developed; (2) mathematical models for translating those judgments into guidelines were constructed; (3) fifty-eight people were selected and interviewed; and (4) the results of the interviews were used with the mathematical models to demonstrate the calculation of guidelines. Our study tentatively shows that a decision-analytic approach to risk evaluation is a feasible way to incorporate public judgments as to the relative significance of the various possible consequences of a waste repository. An important outcome of the study, however, was to encounter and identify in practice several problems to resolve in the use of public values to develop guidelines. The major problems fall under six headings: (1) definition of the set of values to assess; (2) methodology of assessment; (3) ability of public to quantitate their judgments; (4) social-choice theory behind mathematical models; (5) compatibility of models and data; and (6) technical objectives.

537 (UCRL--15168) PRE-SEALING RISK ANALYSIS. Ensminger, D.A.; Hough, M.E.; Oston, S.G. (Analytic Sciences Corp., Reading, MA (USA)). 7 Jan 1980. Contract W-7405-ENG-48. 85p. Dep. NTIS, PC A05/MF A01.
This report describes studies of accidents involving high-level radioactive waste before sealing the waste into a repository. The report summarizes work done in this area during Fiscal Year 1978 and supplements previous work. Models of accident probability, severity, and consequences are refined and extended.

538 (UCRL--15214) PROCEDURES FOR AGGREGATING CITIZEN PREFERENCES IN THE CONTEXT OF THE NUCLEAR WASTE MANAGEMENT PROBLEM. FINAL REPORT. Brock, H.W.; Sauer, G.L. (SRI International, Menlo Park, CA (USA)). Oct 1978. Contract W-7405-ENG-48. 73p. Dep. NTIS, PC A04/MF A01.
The purpose of the present paper is to provide an introduction to the theory of social choice and related disciplines, and to relate this theory to the concrete problem of nuclear waste management. In Section I of this report, an overview of the problem is provided. In Section II, two candidate preference aggregation procedures that can be used to identify a socially optimal waste management policy are identified. In Section III, a somewhat lengthy defense of the use of these two aggregation procedures is presented. Each is shown to be compatible with four intuitively appealing criteria of collective decision-making. In Section IV the application of one of the procedures to the evaluation of waste management alternatives is discussed. In Section V the problem of inferring evaluation parameters from expert and laypersons' judgments is addressed.

539 (USGS-OFR--80-817) BIBLIOGRAPHY OF REPORTS BY US GEOLOGICAL SURVEY PERSONNEL PERTAINING TO UNDERGROUND NUCLEAR TESTING AND RADIOACTIVE WASTE DISPOSAL AT THE NEVADA TEST SITE, AND RADIOACTIVE WASTE DISPOSAL AT THE WIPP SITE, NEW MEXICO, JANUARY 1, 1979-DECEMBER 31, 1979. Glanzman, V.M. (Geological Survey, Denver, CO (USA). Geologic Div.). 1980. Contract AC13-76GJ01664. 25p. NTIS, PC A02/MF A01.
This bibliography presents reports released to the public between January 1, 1979, and December 31, 1979, by personnel of the US Geological Survey. Reports include information on underground nuclear testing and waste management projects at the NTS (Nevada Test Site) and radioactive waste projects at the WIPP (Waste Isolation Pilot Plant) site, New Mexico. Reports on Project Dribble, Tatum Dome, Mississippi, previously prepared as administrative reports and released to the public as 474-series reports during 1979 are also included in this bibliography.

540 (ZfK--367, pp 101-104) SPECTRAL ANALYSIS OF RADIOACTIVE SOLUTIONS. Flach, N. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Dec 1978. (In German).
Annual report 1978. Nuclear chemistry department.

541 WHY EXTREMISTS PLAGUE THE NUCLEAR INSPECTOR. Moss, J. Electrical Review (London) ; 207: No. 3, 16-17(18 Jul 1980).
The problems of radioactive waste management were discussed by those of widely differing viewpoints at a joint symposium staged by the British Association for the Advancement of Science and the National Radiological Protection Board. The situation regarding high level waste was of particular concern. From opponents of nuclear power there were accusations of hasty decision making and lack of opportunity for public influence or debate. Deliberate distortion of facts by both the extreme supporters and extreme opponents of nuclear power was criticised by those involved in the regulation and safety of waste storage.

542 NUCLEAR POWER PLANTS AND NUCLEAR WASTE MANAGEMENT IN WEST GERMANY. Guck, R. (Badenwerk A.G., Karlsruhe (Germany, F.R.)). Elektrizitaetswirtschaft ; 79: No. 12, 423-425(Jun 1980). (In German).
On the occasion of the VDEW members' meeting on June 12, 1980, 'Elektrizitaetswirtschaft' has interviewed 10 leading personalities of the German electric power industry on issues of topical interest. The article presents the opinion of one of the interview partners on the title subject.

543 REALITY AND MYTHS. Williams, I.G.K. (Nuclear Energy Agency, 75 - Paris (France)). Atom (London) ; No. 283, 134-135(May 1980).
Extracts are presented from a paper delivered in March, 1980, at the annual conference of the Japan Atomic Industrial Forum. The extracts, and comments, deal with radioactive waste management and the protection of the public against radiation risks from radioactive wastes.

544 MODIFICATION OF THE WASTE MANAGEMENT PRINCIPLES FOR NUCLEAR POWER PLANTS. NEW LICENSING REQUIREMENTS. Haedrich, H. Atomwirtschaft, Atomtechnik ; 25: No. 5, 240-241(May 1980). (In German).
FEDERAL REPUBLIC OF GERMANY;FUEL CYCLE CENTERS;FUEL POOLS;NUCLEAR POWER PLANTS; RADIOACTIVE WASTE PROCESSING;RADIOACTIVE WASTE STORAGE;RADIOACTIVE WASTE MANAGEMENT;SPENT FUEL STORAGE;UNDERGROUND STORAGE

545 ALLOWING FOR UNCERTAINTIES IN THE EXPECTED WASTE MANAGEMENT COSTS. Lehtinen, R.; Silvennoinen, P.; Vira, J. (Technical

Research Centre of Finland, Helsinki). Radioactive Waste Management (New York) ; 1: No. 1, 43-55(May 1980).

By evaluating the estimates available, the uncertainties embedded in the waste management and disposal costs are expressed by means of subjective probability distributions. Cost data for each separate operational step are convoluted into a probability estimate of the total cost. As a case study the LWR spent fuel management is examined for both once-through and recycle alternatives. While the recycle cases entail lower expected costs the associated uncertainty variance is an order of magnitude larger than that for the once-through options.

546 LEACHING BEHAVIOUR OF RHYOLITE GLASS. Karkhanis, S.N.; Bancroft, G.M.; Fyfe, W.S.; Brown, J.D. (University of Western Ontario, London (Canada)). Nature (London) ; 284: No. 5755, 435-437(3 Apr 1980).

In an investigation into the potential use of rhyolite for diluting and stabilising nuclear waste the hydrothermal leaching and recrystallisation properties of the material have been investigated at temperatures up to 300°C using classical leach monitors of weight loss and solution analyses, scanning electron microscopy, electron spectroscopy for chemical analyses and secondary ion mass spectroscopy. It has been shown that rhyolite is more stable to leaching than borosilicates previously studied and that there is no evidence of a surface depleted layer.

547 TREATMENT AND STORAGE OF RADIOACTIVE GASES FROM NUCLEAR FACILITIES. Johannsen, K.H. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)); Schwarzbach, R. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Kernenergie ; 23: No. 3, 78-84(Mar 1980). (In German).

Treatment of exhaust air from nuclear facilities aimed at retaining or separating the radionuclides of iodine, xenon, and krypton as well as of tritium and carbon-14 and their storage are of special interest in connection with increasing utilization of nuclear power in order to reduce releases of radioactive materials to the atmosphere. The state of the art and applicability of potential processes of separating volatile fission and activation products from nuclear power stations and reprocessing plants are reviewed. Possibilities of ultimate storage are presented. An evaluation of the current stage of development shows that processes for effective separation of radioactive gases are available. Recent works are focused on economy and safety optimization. Long-term storage, in particular of extremely long-lived radionuclides, needs further investigation.

548 NUCLEAR WASTES, A QUESTIONNAIRE. Revue Generale Nucleaire ; 53(Feb 1980). (In French).

Questionnaire gives basic information for the public on nuclear wastes and radioactive waste management. Risk and regulations to reduce the risk to permissible limits are more particularly developed. A survey of radioactive wastes is made along the fuel cycle: production, processing, transport, disposal to end on effect of waste management on the cost of nuclear kWh.

549 RADIOACTIVE WASTE MANAGEMENT. SUMMARY OF THE REPORT OF AN EXPERT GROUP WHO STUDIED THE 1959 WHITE PAPER - THE CONTROL OF RADIOACTIVE WASTES. Morley, F. Atom (London) ; No. 279, 15-17(Jan 1980).

A summary is given of the report of an Expert Group appointed in 1976 to consider the 1959 White Paper 'The Control of Radioactive Wastes' in the light of the changes that have taken place since it was written and with the extended remit of examining 'waste management' rather than the original 'waste disposal'. The Group undertook to; review the categories and quantities present and future of radioactive wastes, recommend the principles for the proper management of these wastes, advise whether any changes in practice or statutory controls are necessary and make recommendations.

550 POLYMOLYBDATES AS PLUTONIUM (IV) HOSTS. Penneman, R.A. (Los Alamos Scientific Lab., NM); Haire, R.G.; Lloyd, M.H. pp 571-581 of Actinide separations. Navratil, J.D.; Schulz, W.W. (eds.). Washington, DC; American Chemical Society (1980).

From 177. national meeting of the American Chemical Society; Honolulu, HI, USA (1 Apr 1979).

Plutonium molybdate precipitated in the absence of Zr is a different structure (isostructural with $U(MoO_4)_2$ than the $ZrMo_2O_7(OH)_2(H_2O)_2$ whose structure was determined by Clearfield and Blessing. Because of the difference between Pu-O and Zr-O bond lengths (Δ=0.14A) at the same bond strength, it is expected that the $ZrMo_2O_7(OH)_2(H_2O)_2$ lattice will not accommodate extensive substitution of the larger Pu(IV) for Zr(IV). The plutonium-bearing precipitate obtained from nitric acid solutions (containing molybdenum, zirconium and plutonium) gives an x-ray powder diffraction pattern not distinguishable from that of $ZrMo_2O_7(OH)_2(H_2O)_2$ precipitated without plutonium. However, since the Pu content is low, the Pu could be present either in the Pu molybdate structure or replacing Zr in the Zr molybdate structure and not be detected in the x-ray patterns. Present data on the Zr and Pu molybdates have not provided evidence for the existence of heteropoly molybdate structures for those precipitates obtained from 1-5M HNO_3. Zachariasen's empirical rules relating bond strengths and bond lengths in 4f and 5f oxides is demonstrated to be useful when applied to the simple and complex molybdate structures.

551 EVALUATION OF LARGE CAVERNS FOR IN-SITU SOLIDIFICATION AND FINAL STORAGE OF MAW AND LAW WITH REGARD TO THE HEAT BUILD-UP IN THE WASTE PRODUCT. Hauser, W.; Smailos, E.; Koester, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Entsorgungstechnik). pp 473-476 of Jahrestagung Kerntechnik '80 - Reaktortagung 1980. Tagungsbericht. 553 GUIDE TO THE SAFE HANDLING OF RADIOACTIVE WASTES AT NUCLEAR POWER PLANTS. Vienna, Austria; IAEA (1980). 84p.
This guide discusses the responsibilities of the regulatory authorities, the design considerations of waste management systems and the source and characteristics of waste. Present techniques for treating, conditioning, storing and disposing of gaseous, liquid and solid wastes on and from the site are summarized, and a consensus of good practice in waste management based on current knowledge and experience is given. The guide also contains brief chapters on transport of wastes, monitoring systems, safety analyses and a review of future trends in waste management.

554 NUCLEAR POWER PLANT WASTE MANAGEMENT. Environmental Science and Technology ; 13: No. 12, 1456-1458(Dec 1979).
The future of nuclear power use depends largely on the success of efforts to develop an acceptable radioactive waste management strategy. Proposed radioactive waste treatment alternatives include: waste storage and disposal in geologic formations; reprocessing of spent fuel; and recycling of wastes for manufacturing purposes. Sweden's waste storage program is described. A strong federal nuclear waste policy is urged. (2 diagrams)

555 SUMMARY OF THE REPORT TO THE PRESIDENT BY THE INTERAGENCY REVIEW GROUP ON NUCLEAR WASTE MANAGEMENT. Nuclear Safety ; 20: No. 6, 706-721(Nov 1979).
On March 13, 1978, in response to the findings of an internal Department of Energy (DOE) task force which had reviewed the United States nuclear waste management program, President Carter established the Interagency Review Group (IRG) to formulate recommendations for the establishment of an administrative policy with respect to long-term management of nuclear wastes and supporting programs. Chaired by the Secretary of Energy, the IRG is composed of representatives of 14 government entities. The Nuclear Regulatory Commission (NRC) participated in the activities of the IRG as a nonvoting member. The IRG attempted to obtain a broad range of inputs and views from many sources, including Congress, state and local governments, Indian nations, industry, the scientific and technical community, public interest and environmental organizations, and the public. In October 1978 the IRG issued a draft report for public review and comment. Some 3300 comments were received and reviewed, and their final report, which was published in March 1979, reflects their consideration of these comments. This article summarizes the final report, using to the extent practical the same format, wording, and emphasis.

556 OTHER SORTS OF RADIOACTIVE WASTE. Goedkoop, J.A. (Stichting Energieonderzoek Centrum Nederland, Petten). Energiespectrum ; 3: No. 11, 274-278(Nov 1979). (In Dutch).
A nuclear centre with an electrical capacity of 1000 Megawatts has approximately 120 ton of natural uranium necessary. The quantity of one required to produce this depends of the quantity of uranium it contains and the yield with which it can be extracted. Reasonable values for these are 0.2% and 95% respectively. The necessary quantity of ore is therefore 63,000 ton and this is also approximately the quantity of waste remaining after the extraction process. The environmental problems that this ore waste causes and the solutions being tried are described. A comparison is made with nuclear fission waste.

557 NO WASTE MANAGEMENT WITHOUT REPROCESSING. Merz, E. (Instituts fur Chemische Technologie, W Germany). Atomwirtschaft, Atomtechnik ; 24: No. 10, 481-483(Oct 1979).
Arguments against the recent ban in W. Germany on further development of nuclear waste reprocessing techniques are presented. From the point of view of resource conservation, there are valid arguments in favor of reprocessing spent nuclear fuel and recycling fissile material. A recent temporary suspension in the erection of a reprocessing plant is discussed. Despite the W. German ban, a prototype reprocessing plant should be constructed. The plant would offer the possibility of maintaining, expanding, and optimizing existing technical knowledge of reprocessing and safety technologies. (5 references, 1 table)

558 NO WASTE MANAGEMENT WITHOUT REPROCESSING. Merz, E. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Chemische Technologie). Atomwirtschaft, Atomtechnik ; 24: No. 10, 481-483(Oct 1979). (In German).
The suspension of reprocessing has done more than merely cause a gap in the waste management concept of the Federal Government which, in its principles of waste management in nuclear power plants published 1977, laid down the rules for making use of spent fuel elements by reprocessing. From the point of view of resource conservation there are valid arguments in favor of reprocessing and fissile material recycling even now. The announcement of a temporary suspension in the erection of a reprocessing plant is alarming, especially in view of the long development lead required by industrial technologies to mature. Short term waste management needs are ruled mainly by speedy applications for permits, licenses and the construction of temporary fuel element storage facilities. For a repository to be erected at some later date it is necessary that the examination of the Gorleben salt dome be continued without delay. As far as the development of reprocessing technology is concerned, a prototype plant would offer a possibility in the meantime to maintain the technical know-how, expand it and optimize processing and safety technologies.

559 MATERIALS FOR SURFACE PROTECTION IN NUCLEAR FACILITIES. Kunze, S.; Loesch, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Entsorgungstechnik). Atomwirtschaft, Atomtechnik ; 24: No. 10, 484-487(Oct 1979). (In German).
Surfaces in nuclear facilities are protected by paint systems, coatings and metallic materials. Tests by the Karlsruhe technique of more than 900 commercial products indicated that only those protective coatings are capable of removing contamination by detergents which have low porosity, are homogeneous, will hardly swell, incorporate little water and are resistant to decontamination agents. In paint

systems with various degrees of gloss, care must be taken to ensure that these are not obtained by hydrophilic dyes or fillers but by matting additives. Floor covering should be installed in widths as large as possible which should be joined so as to be sealed against liquid penetration. In special linings which must use tiles, the joint fillers must be capable of decontamination just as the tiles themselves. Some of the materials tested were used in rooms and plant areas of the Karlsruhe Nuclear Research Center in which there was a hazard of contamination. The results found after these periods of practical use in most cases corresponded to the results of the tests conducted before such use.

560 POSSIBILITY OF UTILIZATION OF HIGH-ACTIVE WASTES FROM THE REGENERATION OF FAST POWER REACTOR FUEL. Vetrov, E.M.; Ikhlov, E.M. Atomnaya Energiya ; 47: No. 3, 187-188(Sep 1979). (In Russian).

564 ALBRECHT'S OFFICIAL STATEMENT CONCERNING GORLEBEN. Energiewirtschaftliche Tagesfragen ; 29: No. 6, 349-351(Jun 1979). (In German).
Although a nuclear waste management centre can principally not be realised with regard to safety aspects, the Lower-Saxonian State Government recommends to the Federal Government to abandon the project of recycling. Instead of this, a new concept of waste management should be decided upon the basic ideas of which might be listed as follows: 1. Immediate construction of inherently safe long-term temporary stores for the management of waste from nuclear power plants. 2. Pushing the research and development work for a safe ultimate storage facility of radioactive waste. 3. Deep drilling and, if positive results are obtained, mining development at the salt dome in Gorleben. If the drillings bring a negative result, to look for other ultimate storage facilities. 4. Decision concerning the most reasonable form of handling and ultimate storage of radioactive waste only when the energy-political future can be seen clearly.

566 SYSTEM TO MAKE USE OF ATOMIC WASTE. Mourad, S. (to Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,742,739/A/. 5 Apr 1979. 7p. (In German).
The spent nuclear fuel is formed into plate-shaped blocks. A Si photocell is placed on one or both sides inbetween an α and n absorbing foil of Ca tungstate. The γ and β radiation create a potential difference in one or both photocells. The whole system is surrounded by a radiation protecting jacket. (RW).

567 NUCLEAR WASTE MANAGEMENT TERMINOLOGY. Johnson, L.J. (Los Alamos Scientific Lab., NM (USA)). Health Physics ; 36: No. 4, 535(Apr 1979).
RADIOACTIVE WASTES;RECOMMENDATIONS; STANDARDIZED TERMINOLOGY;RADIOACTIVE WASTE MANAGEMENT

568 RADIOACTIVE WASTE DISPOSAL - POLICY AND PERSPECTIVES. Roberts, L.E.J. (UKAEA, Harwell. Atomic Energy Research Establishment). Nuclear Energy (Formerly Nuclear Energy Engineer) ; 18: No. 2, 85-100(Apr 1979).
Methods are discussed that have been developed and could be used for management and disposal of highly active wastes. The characteristics of such waste are, described and the concept of toxic potential is explained. General principles of waste disposal and the various options which have been considered are discussed. Studies on the incorporation of waste into glass, and on container materials are described. Consideration is also given to the requirements of stores and repositories from the aspect of heat dissipation, design, siting, etc. The advantages and disadvantages of the various types of geological formation ie salt, argillaceous deposits, hardrocks, suitable for containment of highly active wastes are examined. Studies carried out on the safety of repositories and an ocean disposal of the waste are summarised. The review ends with a brief account of the status of the vitrification process in the UK and abroad and of future programmes involving geological and related studies.

569 WASTE MANAGEMENT CENTRE CAN BE TECHNICALLY REALIZED. REPROCESSING OF SPENT FUEL ELEMENTS AS AN INTEGRAL PART OF SAFE WASTE MANAGEMENT. Huebenthal, K. (Bundesministerium fuer Forschung und Technologie, Bonn-Bad Godesberg (Germany, F.R.)). VDI (Verein Deutscher Ingenieure) Nachrichten ; 33: No. 15, 10(Apr 1979). (In German).
From 2. seminar on the chemistry of nuclear waste management; Kaprun, Austria (19 - 23

Mar 1979).
The West German waste management concept was presented by Oberregierungsrat Dr. Karlheinz Huebenthal of the Federal Ministry for Research and Technology at the 2nd seminar on the chemistry of nuclear waste management in Kaprun/ Austria. The article is an abridged version of his paper.

570 FINAL STORAGE IN EXISTING PLANTS TESTED. THE WASTE MANAGEMENT CENTRE WILL PROVIDE UP TO 4000 NEW PLACES OF WORK. Mitschke, J. (Deutsche Gesellschaft fuer Wiederaufarbeitung von Kernbrennstoffen m.b.H. (DWK), Hannover (Germany, F.R.)). VDI (Verein Deutscher Ingenieure) Nachrichten ; 33: No. 15, 8(Apr 1979). (In German).
From 2. seminar on the chemistry of nuclear waste management; Kaprun, Austria (19 - 23 Mar 1979).
On March 19 - 23, the 2nd seminar on the chemistry of nuclear waste management was held at Kaprun/Austria, by the Gesellschaft Deutscher Chemiker and the Verein Oesterreichischer Chemiker 'Arbeitsgruppe Radiochemie und Strahlenchemie'. Dipl.-Ing. Joachim Mitschke, board member of the Deutsche Geselischaft fuer Wiederaufarbeitung von Kernbrennstoffen mbH, gave a survey of the state of development of the Gorleben waste management centre. The article is an abridged version of his paper.

571 POSITION OF THE EUROPEAN COMMUNITIES AND BELGIUM CONCERNING THE PROBLEMS RAISED BY RADIOACTIVE WASTE. Hannequart, J.P.; Sancy, M. Amenagement du Territoire et Droit Foncier ; No. 5, 1-12(Apr 1979). (In French).
The first part of this article which concerns the position of the Communities regarding radioactive waste management, illustrates their progressive awareness of the special problems posed as compared to their previous consideration of the subject in the general context of radiation protection. Since the early 70's, the Communities' programme has been oriented towards strengthening research in waste management and in 1975, the European Parliament proposed the creation of a joint undertaking for such management. This is still in the form of a study prepared by the Commission of the European Communities. The author stresses the need for common action by Member countries to organise waste management in the framework of the Communities. The following part describes Belgian legislation applicable to all stages of radioactive waste management. The author stresses that, despite the detailed regularoty mechanism, there is a need for establishing a body responsible for controlling observance of regulatory measures in this field.

572 HIGH-LEVEL WASTE MANAGEMENT RESEARCH. Daglish, J. Atom (London) ; No. 269, 58-62(Mar 1979).
A review is made of world research into long term methods for the management of highly active radioactive wastes, including the options available. These wastes include those resulting from the reprocessing of reactor fuels and also those involving the actual disposal of spent fuel. The vitrification process receives much attention.

573 DECOMMISSIONING OF NUCLEAR FACILITIES. REPORT ON THE INTERNATIONAL SYMPOSIUM HELD IN VIENNA FROM 13 TO 17 NOVEMBER 1978. Schneider, K.J. (International Atomic Energy Agency, Vienna (Austria)). Atomic Energy Review ; 17: No. 1, 193-205(Mar 1979).
The Symposium was jointly sponsored by OECD/ NEA and IAEA and was attended by more than 225 participants from 26 countries. Forty one papers were presented in eight sessions which covered the following topics: national and international policies and planning; engineering considerations relevant to decommissioning; radiological release considerations and waste classifications; decommissioning experience; and decontamination and remote operations. In addition, a panel of decommissioning experts discussed questions from the participants.

574 ADVANCE PAYMENTS ON THE COST OF THE FEDERAL REPOSITORY FOR RADIOACTIVE WASTE. Strabburg, W. Atomwritschaft, Atomtechnik ; 24: No. 3, 130-132(Mar 1979).
Under W. Germany's Atomic Energy Act, the federal government is responsible for the final storage of radioactive wastes. Other steps of the back end fuel cycle must be implemented by private industry. Under the act, the government is entitled to charge for the costs of the erection and operation of any final repositories. To cover the initial investment involved in preparation and planning, the government is requesting advance payments from those wishing to use the repositories in the future. However, there is no legal basis for advance payments to be made, at least until an operating permit has been granted for the planned back-end fuel cycle center. Utilities operating nuclear power plants cannot be forced to make advance storage payments, and even an amendment to the Atomic Energy Act will not change the situation. (in German) (15 references)

575 CURRENT U.S. NUCLEAR REGULATORY COMMISSION LICENSING REVIEW PROCESS: URANIUM MILL TAILINGS MANAGEMENT. Scarano, R.A.; Linehan, J.J. pp 326-343 of Uranium resource/ technology seminar 2, 1979. Golden, CO; Colorado School of Mines (Mar 1979).
From Uranium resource technology seminar; Golden, CO, USA (12 Mar 1979).
The primary tailings management alternatives to be considered should be below-grade burial methods. A surface impoundment may be acceptable. Acceptability will depend on showing that location and design characteristics will assure long-term stability and that erosion will not take place at an accelerated rate compared with the surrounding environs. 1 ref.

576 Guide pratique de gestion des dechets radioactifs. (PRACTICAL GUIDELINES FOR RADIOACTIVE WASTE MANAGEMENT). Paris, France; CEA (Jan 1979). 237p. (In French).
This Guide has been compiled with a view to obtaining a concise and practical document rather than an exhaustive one. It is presented in sectional form, providing for each Centre or Establishment of the CEA the means available, with the identity of those responsible for implementing them. Each section includes the following information: organization chart of the radioactive decontamination department, classification of the wastes used, inventory of the constraints peculiar to the means employed, brief description of these means and cost of services. The information is restricted to the solid and liquid wastes contained in fission or activation products and in transuranic elements. Natural radioelements such as uranium, thorium or descendants have not been included.

577 HIDDEN DIMENSION OF THE NATIONAL ENERGY PLAN: EXECUTIVE POLICY DIRECTION IN NUCLEAR WASTE MANAGEMENT. Light, A.R. (Texas Tech Univ., Lubbock). Publius ; 9: No. 1, 169-187(Win 1979).

President Carter's energy plan excluded nuclear power issues, which he chose to deal with separately rather than risk delaying the passage of a National Energy Act. Proposals to streamline nuclear power plant licensing are shown to reflect an intergovernmental strategy which circumvents special-interest groups and designates state governments as the primary decision makers. A more cautious strategy was applied to nuclear waste management, however, because of the long history of intergovernmental blundering and because of President Carter's anti-reprocessing policy. A review of the Federal government's policies and the intergovernmental actions taken since 1976 focuses on efforts to establish waste sites in New Mexico and the question of state veto power. The discussion illustrates the problem of defining governmental limits and of establishing regulations which meet both national and local goals.

578 SCIENCE UNDERLYING RADIOACTIVE WASTE MANAGEMENT: STATUS AND NEEDS. Roy, R. (Pennsylvania State Univ., University Park, PA). pp 1-20 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

The technical system constitutes a major - but not necessarily determinative - component of the national plan (or system) for radioactive waste management (RWM). This technical RWM system can be conveniently divided into four subsystems: Storage; Radionuclide Immobilization; Isolation and Post Emplacement. It is essential to consider the interactions among these four subsystems in designing any system. Of these, the first and last have not been given much consideration and their role is delineated herein. Of the middle subsystems, up to 1978 the system designers have relied essentially exclusively on the Isolation subsystem (i.e., removal from the biosphere in a mine or seabed, preventing migration of ions, etc.). History has shown that technically this strategy has proved unacceptable. In the last two years the role of the solid waste form and thence the entire radionuclide immobilization subsystem has assumed a much more significant role. Indeed, it will be shown that recent research results give grounds for hope that this subsystem may carry most of the burden of proof of acceptable and verifiable removal of radionuclides from the biosphere. Recent research results which made some of this possible will be discussed, and indications provided where new science is needed in all four subsystems.

579 RADIOCHEMICAL PROBLEMS IN ATOMIC ENERGY AND THE ROLE OF NUCLEAR POWER PLANTS RESEARCH INSTITUTE IN THEIR SOLUTION. Metke, E. (Vyskumny Ustav Jadrovych Elektrarni, Jaslovske Bohunice (Czechoslovakia)). Journal of Radioanalytical Chemistry ; 51: No. 1, 9-13(1979).

The radiochemical problems connected directly with the operation of a nuclear power plant studied in the Nuclear Power Plants Research Institute, Jaslovske Bohunice (Czechoslovakia) are discussed.

580 NUCLEAR WASTE: BEYOND FAUST AND FATE. Maxey, M.N. (Univ. of Detroit, MI). Electric Perspectives ; No. 3, 27-32(1979).

Regarding development of the nuclear industry and the resulting turmoil over generation of nuclear wastes, Dr. Maxey presents as a fundamental bioethical principle for organizing evidence and dealing with conflicting opinions the following formulation: social justice requires an equitable mangement of potential hazards that might have harmful health effects and unjustifiable social consequences. By equitable management she means: (1) comprehensively informing policymakers about the broad spectrum of hazards; (2) make comparisons of actual costs to reduce the effects; and (3) only then make policies and set standards that will get the most public protection out of a finite amount of money. Translating this principle into public policy is no easy task, since opponents have developed several arguments that appeal to nonscientific moral and ethical premises. Briefly, these statements can be summarized as: (a) indefinite delay of high-level waste disposal facilities is regarded as morally preferable to a policy of implementing one of several currently available options, and (b) it is claimed that involuntary risks of radiation exposure imposed on present and unconsulted future generations violate ethical principles of social justice and equity. Dr. Maxey uses most of the article in countering these premises and finally suggests the following bioethical principle for guidance: any involuntary risks imposed by social policies for radiation protection must be congruent with, must not be in excess of, and may be reasonably less than, those involuntary risks imposed by the naturally occurring toxic elements and harmful effects from our natural environment.

581 PROGRAMMABLE CALCULATOR: ALTERNATIVE TO MINICOMPUTER-BASED ANALYZER. Hochel, R.C. (Savannah River Lab., Aiken, SC). pp 582-590 of Computers in activation analysis and gamma-ray spectroscopy. Carpenter, B.S.; D'Agostino, M.D.; Yule, H.P. (eds.). Washington, DC: Department of Energy (1979).

From Conference on computers in activation analysis and gamma-ray spectroscopy; Mayaguez, Puerto Rico (30 Apr 1978).

Described are a number of typical field and laboratory counting systems that use standard stand-alone multichannel analyzers (MCA) interfaced to a Hewlett-Packard Company (HP 9830) programmable calculator. Such systems can offer significant advantages in cost and flexibility over a minicomputyr-based system. Because most laboratories tend to accumulate MCA's over the years, the programmable calculator also offers an easy way to upgrade the laboratory while making optimum use of existing systems. Software programs are easily tailored to fit a variety of general or specific applications. The only disadvantage of the calculator vs a computer-based system is in speed of analyses; however, for most applications this handicap is minimal. Applications discussed give a brief overview of the power and flexibility of the MCA-calculator approach to automated counting and data reduction.

582 CHARACTERISTICS OF SOLIDIFIED HIGH-LEVEL WASTE PRODUCTS. Vienna: IAEA (1979). 112p.

The object of the report is to contribute to the establishment of a data bank for future preparation of codes of practice and standards for the management of high-level wastes. The work currently in progress on measuring the properties of solidified high-level wastes is being studied.

583 PROBLEM OF RADIOACTIVE WASTES FROM THE NUCLEAR INDUSTRY. Duyckaerts, G. (Liege Univ. (Belgium)). Electricite ; No. 168, 3-11(1979). (In French).

The economy of energetical sources leads normally to the fuel reprocessing in order to remove the fission products and the non fissile actinides and to recover the uranium not yet fissioned as well as the formed plutonium. Proliferation problems of nuclear weapons which may find solutions in regulations of international control apart, the irradiated fuels reprocessing presents problems of radiological protection for the very different lifetimes of the fission products and actinides and for their respective toxicity: if a storage of some months before reprocessing allows a considerable reduction in the quantity of radioactive matters by natural decay, some longliving elements contaminate the recovered fuel and complicate the risidues storage. This article is a summary of a study on the problems of radioactive wastes from the nuclear industry effected by research team of the University of Liege.

584 CHALLENGES OF NUCLEAR EFFLUENT MANAGEMENT IN THE NATIONAL PERSPECTIVE. Thomas, K.T. (Bhabha Atomic Research Centre, Bombay (India)). pp 205-230 of Operating experience of nuclear reactors and power plants. Bombay, India; Department of Atomic Energy (1979).

From Symposium on operating experience of nuclear reactors and power plants; Bombay, India (7 Feb 1977).

Most of the chemical and other process industries have to reckon with the inevitable question of disposal of waste materials; nuclear industry is no exception. But in the appreciation of societal responsibility for the preservation of the environment, nuclear industry has been an exception. The magnitude of the problem of nuclear effluents, the philosophy adopted in their management and the operational achievements have been reviewed. A projection into future, in respect of radioactive effluents in the National Nuclear Programme, is also included.

585 LEACHING BEHAVIOUR OF TRITIUM FROM A HARDENED CEMENT PASTE. Matsuzuru, H.; Moriyama, N.; Ito, A. ;arch Inst., Tokai, Ibaraki. Tokai Research Establishment). Annals of Nuclear Energy ; 6: No. 7-8, 417-423(1979).

Leaching of tritium from a hardened cement paste into an aqueous phase has been studied to assess the safety of solidification of the tritiated liquid waste with cement. Leaching tests were carried out in accordance with the method recommended by the International Atomic Energy Agency. The leaching fraction was measured as functions of the waste-cement wt ratio ,(Wa/C), temperature of leachant and curing time. The tritium leachability of cements follows the order: alumina cement > Portland cement > slag cement. The fraction of tritium leached increases with increasing Wa/C and temperature and decreasing curing period. A deionized water as a leachant gives a slightly higher leachability than the synthetic sea water. The coating of the specimen surface with bitumen reduces the leachability to about 5% of its value for the specimen without coating.

586 WASTE INVENTORY REPORT FOR REACTOR AND FUEL FABRICATION FACILITY WASTES. Phillips, J.W.; Feizollahi, F.; Martineit, R.A. (NUS Corp., Rockville, MD). Transactions of the American Nuclear Society ; 33: 433-435(1979). (CONF-791103--).

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

FUEL FABRICATION PLANTS;RADIOACTIVE WASTES; NUCLEAR POWER PLANTS;INVENTORIES;CHEMICAL PROPERTIES;PHYSICAL PROPERTIES;BWR TYPE REACTORS;PWR TYPE REACTORS;VOLUME;RADIOACTIVE WASTE PROCESSING

587 EFFLUENT CONTROLS AND ENVIRONMENTAL MONITORING PROGRAMS FOR URANIUM MILLING OPERATIONS. Maixner, R.D. (Cotter Corp, Canonn City, Colo). pp 266-276 of Uranium resource/technology seminar 2, 1979. Golden, CO; Colorado School of Mines (1979).

From Uranium resource technology seminar; Golden, CO, USA (12 Mar 1979).

Controls will reduce gaseous, particulate, and liquid discharges. Monitoring programs are used to determine effectiveness. The controls and programs discussed are used at Cotter Corporation's Canon City Mill in Colorado. 3 refs.

588 NONDESTRUCTIVE ANALYSIS AT B AND W'S URANIUM CONVERSION PLANT. Hardt, T.L.; Hughes, M.B.; Oedo, M.P. (Babcock and Wilcox Co, Lynchburg, Va). Nuclear Materials Management ; 8: 468-473(1979).

Containers and processing lines bearing high and low enriched uranium are routinely analyzed by nondestructive assay. Measurement systems used at Babcock and Wilcox's nuclear fuels plant in Apollo, Pennsylvania include the segmented gamma scanner (SGS) and the stabilized assay meter (SAM-II). These systems have been calibrated and used for a variety of tasks including uranium holdup measurements prior to decommissioning, in situ filter analysis and assay of calcined waste. 2 refs.

589 ACCEPTABLE RESIDUAL ACTIVITY LEVELS ALLOWING WASTE TO BE CONSIDERED INACTIVE. Chapuis, A.M.; Jacquemin, M. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire). pp 285-296 of Decommissioning of nuclear facilities. Vienna, Austria; IAEA (1979). (In French)

From International symposium on the decommissioning of nuclear facilities; Vienna, Austria (13 Nov 1978).

The dismantling of nuclear facilities will in the course of a few decades give rise to large amounts of activated or contaminated solid waste, a large part of which will in fact have only a very low level of activity. The authors propose residual activity limits below which this type of waste could be disposed of as ordinary waste, which means that the scrap metal could be sold for melting down or the broken concrete could be used as filling material. The proposed limits are defined with reference to permissible concentrations of contaminants in air and in water and in terms of external exposure. Their application would have perfectly acceptable consequences for individuals and the population as a whole.

590 MANAGEMENT OF RADIOACTIVE WASTES IN CANADA. PROCEEDINGS OF A SYMPOSIUM. Toronto, Canada; Canadian Nuclear Association (1979). 199p.

From Symposium on the Management of Radioactive Wastes in Canada; Toronto, Canada (10 - 11 Apr 1979).

Ten papers are presented, dealing with the management and environmental impact of

radioactive wastes, environmental considerations related to uranium mining and milling, the management of uranium refining wastes, reactor waste management, proposals for the disposal of low- and intermediate-level wastes, disposal of nuclear fuel wastes, federal government policy on radioactive waste management, licensing requirements, environmental assessment, and international cooperation in waste management.

591 RADIOACTIVE WASTE: A QUESTION OF PERSPECTIVE. Williams, I.K.G. (Nuclear Energy Agency, 75 - Paris (France)). Ingenioer-nytt ; 14: No. 92, 24-25,39(17 Nov 1978). (In Norwegian).
From International conference on the fuel cycle; London, UK (26 - 29 Sep 1978).
The nature of radioactive waste is briefly discussed and it is concluded that the high level waste is that which requires most attention. It is stated that the widespread opinion that satisfactory methods of treatment and disposal of high level waste cannot be developed is false. The problem of plutonium is then discussed and it is shown that the risk is much less than often assumed. The validity of final disposal in stable geological formations is also discussed, quoting the Oklo phenomenon to show that plutonium migration is unlikely. It is finally stated that by using geological formations which do not contain mineral resources the possibility of future boring disturbing the waste is remote.

592 DISPOSAL OF HAZARDOUS WASTES. Barnhart, B.J. (Los Alamos Scientific Lab., NM). Environmental Science and Technology ; 12: 1132-1136(Oct 1978).
The Fifth Life Sciences Symposium entitled Hazardous Solid Wastes and Their Disposal on October 12 through 14, 1977 was summarized. The topic was the passage of the National Resources Conservation and Recovery Act of 1976 will force some type of action on all hazardous solid wastes. Some major points covered were: the formulation of a definition of a hazardous solid waste, assessment of long-term risk, list of specific materials or general criteria to specify the wastes of concern, Bioethics, sources of hazardous waste, industrial and agricultural wastes, coal wastes, radioactive wastes, and disposal of wastes.

593 REGULATIONS OF COLLECTING RADIOACTIVE WASTES IN HUNGARY. Feher, L.; Kasza, J.; Pataky, J. (Fovarosi Kozegeszsegugyi es Jarvanyugyi Allomas, Budapest (Hungary)). Izotoptechnika ; 21: No. 10, 396-407(Oct 1978). (In Hungarian).
The transportation, processing and final disposal of radioactive wastes is managed in Hungary by the Public Health Station of Budapest. The new Processing and Burial Plant of Radioactive Wastes in Puspokszilagy is sufficient for all Hungarian demands. The new regulations of waste management based on the proper Hungarian Standard are reviewed. The order of storage and transportation of solid and liquid radioactive wastes and spent closed radioactive sources is treated in detail and the regulations for the handling of biological wastes and organic solvents are treated separately.

594 RADIOACTIVE WASTES AND THEIR MANAGEMENT. Sousselier, Y. (CEA, 75 - Paris (France)). Revue Generale Nucleaire ; No. 3, 160-165(Jun-Jul 1978). (In French).
The different categories of radioactive wastes are presented. The principles and practical rules of their management are given and the developements that could arise in this field are indicated.

595 VARIOUS ASPECTS OF TRANSPORTATION, STORAGE AND DISCHARGE OF RADIOACTIVE WASTES: FUTURE PROSPECTS. Olivier, J.-P. (Nuclear Energy Agency, 75 - Paris (France)). Revue Generale Nucleaire ; No. 3, 187-193(Jun-Jul 1978). (In French).
The radioactive waste transportation problems and the storage methods used for the different types of wastes are described. The problems arising from the final discharge of the wastes are analysed, and the possibilities to find appropriate solutions are studied.

596 DETERMINATION OF THE RADIOACTIVITY CATEGORIES IN LIQUID WASTES. Rodionova, L.F. (Leningrad Scientific Research Inst. of Radiation Hygiene, USSR). Gigiena i Sanitariya (U.S.S.R.) Issued in English Translation as Hygiene and Sanitation ; No. 2, 107-108(Feb 1978). (In Russian).
As a rule, radioactive wastes were not segregated by the levels of their radioactivity. A point has been made of the fact that various countries approached this problem completely randomly, designating different values for the low, medium, and high levels of radioactive wastes. It has been recommended to use the international standard No. 101 to 170 in setting up a new set of regulations for radioactive wastes. 2 references.

597 RADIOACTIVE WASTE MANAGEMENT IN WEST GERMANY. Krause, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Gensan Nenji Taikai Gijiroku (Proceedings of Japan Atomic Industrial Forum, Incorporated) ; No. 11, 198-204, 232-240(1978). (In Japanese).
The technologies developed in West Germany for radioactive waste management are widely reviewed. The first topic in this review paper is the disposal of low- and middle-level radioactive liquid wastes. Almost all these liquid wastes are evaporated, and the typical decontamination factor attained is 10^4 -- 10^6. The second topic is the solidification of residuals. Short explanation is given to bituminization and some new processes. The third topic is high-level liquid wastes. Degradation of glass quality due to various radiation is discussed. Embedding of small glass particles containing radioactive wastes into metal is also explained. Disposals of low-level solid wastes and the special wastes produced from reprocessing and mixed oxide fuel fabrication are explained. Final disposal of radioactive wastes in halite is discussed as the last topic. Many photographs are used to illustrate the industrial or experimental use of those management methods.

598 ISSUES ON MANAGEMENT, STABILIZATION AND ENVIRONMENTAL IMPACTS OF URANIUM MILL TAILINGS. Cunningham, R.E. (Nuclear Regulatory Commission, Washington, DC (USA)). pp 13-17 of Management, Stabilization, and environmental impact of uranium mill tailings. Paris, France; OECD Nuclear Energy Agency (1978).
From Management, stabilization, and environmental impact of uranium mill trailings; Albuquerque, NM, USA (24 Jul 1978).
Management and stabilization of uranium mill tailings has been controversial for over two decades. There are two basic issues: the nature of the risk to the public from tailings and

what must be done to mitigate that risk. This paper provides an overview of the issues and sets some goals to be accomplished at the 1978 NEA Seminar on Management, Stabilization and Environmental Impacts of Uranium Mill Tailings that could be helpful in resolving the issues.

599 DIE PROBLEMATIK DES RADIOAKTIVEN ABFALLS IN DER KERNTECHNIK. Essen, Germany, F.R.; Vulkan-Verl. (1978). vp. (In German). (CONF-7710151--; AED-Conf--77-470-005).
From Conference on the problems of radioactive wastes in nuclear technology; Essen, F.R. Germany (20 Oct 1977).
Individual papers are abstracted separately.

600 Kernbrennstoffkreislauf. Bd. 2. Entsorgung der Kernkraftwerke. Umweltaspekte und wirtschaftliche Betrachtungen. (NUCLEAR FUEL CYCLE. VOL. 2. WASTE MANAGEMENT IN NUCLEAR POWER PLANTS. ENVIRONMENTAL ASPECTS AND ECONOMIC CONSIDERATIONS). Keller, C.; Moellinger, H. (eds.). Heidelberg, Germany, F.R.; Huethig Verl. (1978). 219p. (In German).
The chemical reprocessing of irradiated fuels as well as the treatment and ultimate storage of radioactive waste are discussed. Environmental aspects of nuclear power plants, economic problems of the nuclear fuel cycle, and the behaviour of radioactive nuclear pollutants in the organism are presented. The problematic nature of plutonium technology and plutonium recycling is pointed out.

601 MANAGEMENT, STABILIZATION, AND ENVIRONMENTAL IMPACT OF URANIUM MILL TAILINGS. Paris, France; OECD Nuclear Energy Agency (1978). 498p. (CONF-780740--).
From Management, stabilization, and environmental impact of uranium mill trailings; Albuquerque, NM, USA (24 Jul 1978).
Individual papers were abstracted separately.

602 NUCLEAR WASTE MANAGEMENT ACT OF 1977. Mathias, C.McC. Jr.; O'Neill, J.H. Jr. Atomic Energy Law Journal ; 19: No. 1, 3-40(Spr 1977).
The Nuclear Waste Authority which would be created by S-63 and the proposed reforms to the regulatory process with respect to nuclear waste management would provide for institutions and a regulatory structure which could reasonably assure safe management of nuclear wastes in the United States. This proposal could serve as a model for the international management of nuclear wastes. Additionally, streamlining the regulatory structure with respect to nuclear wastes could serve as a paradigm for creating a more efficient framework for regulating other aspects of the energy supply industries. Nuclear waste is the responsibility of the Congress. Congress authorized and encouraged programs which produced nuclear waste. The Nuclear Waste Management Act of 1977 would provide the unified action, centralized responsibility and clearly defined policy essential to a resolution of the critical nuclear waste problem.

603 SUB-SEABED DISPOSAL OF HIGH-LEVEL RADIOACTIVE WASTE: PREVENTION OF MANAGEMENT. Deese, D.A. (Harvard Univ., Cambridge, MA). Atomic Energy Law Journal ; 19: No. 1, 41-71(Spr 1977).
The budgetary and institutional support Washington gives to the sub-seabed program will have a crucial influence on the progress of sub-seabed science and technology over the next three to five years. Despite the growing need of nations, such as Japan and Britain, for a high-level waste disposal option, a sub-seabed program will probably not be employed if it is not strongly funded and supported by the United States. Clearly, there are enough legal and political obstacles to destroy or delay a sub-seabed disposal program. The nontechnical hurdles to seabed disposal at least equal the scientific and technical ones. But, on the other hand, there are important potential social and political benefits to be gained from any serious attempt to mount a successful sub-seabed program. These lie principally in international cooperation on waste management, environmental protection, nonproliferation of nuclear weapons, and governing the deep seabed.

604 INSTRUMENT MAINTENANCE PROBLEMS IN RADIOACTIVE AREAS AND EQUIPMENT. Basu, S.K.; Kulkarni, M.D. (Tarapur Atomic Power Station (India)). pp 120-124 of Nuclear reactor instrumentation. Vol. 2, Sect. 3. Bombay; Department of Atomic Energy (1977).
From Symposium on nuclear reactor instrumentation; Bombay, India (20 Dec 1976).
Some of the problems experienced by instrument maintenance personnel while attending to the deficiencies of the equipment, namely, sump pumps and control valves used in resin regeneration facility are discussed. The deficiencies of these equipment in radioactive environ are required to be attended to during normal plant operation conditions to minimise radiation exposure of personnel. The procedures used to locate faults are given.

605 PROCESS AND PLANT IMPROVEMENTS IN THE MANAGEMENT OF RADIOACTIVE EFFLUENTS. Nabar, P.G.; Kharbanda, J.L.; Panicker, P.K. (Bhabha Atomic Research Centre, Bombay (India). Desalination and Effluent Engineering Div.). pp 331-336 of Operating experience of nuclear reactors and power plants. Bombay; Department of Atomic Energy (1977).
From Symposium on operating experience of nuclear reactors and power plants; Bombay, India (7 Feb 1977).
The effluent treatment plant at Trombay has been in successful operation for about a decade. However, based on operational experience gained so far, a programme was initiated to further improve performance and operational ease. An account of the process plant modifications done as well as the new processing techniques introduced is given. Treatment of effluents resulting from decontamination operations, removal of I^{131}, treatment of uranium mill effluents and other radioactive liquid effluents from processing of uranium concentrates, etc. are discussed in detail.

606 POLICY REPORT ON HIGH LEVEL RADIOACTIVE WASTES. Santa Fe, NM; Energy Resources Administration (1975). 81p. (NP--23948). Executive Office of the Governor, Energy Resources Administration, Santa Fe, New Mexico.
Report from the Governor's Task Force Committee.
For the near term, ERDA and the NRC believe bedded salt formations offer the best approach for implementing high-level radioactive waste disposal. Salt formations will likely be used as the repository site, with those in Southeastern New Mexico the most likely to be selected. If that happens, New Mexico must address the social issues that are bound to arise. Any ultimate waste disposal scheme that

consumes regional resources such as land must pay the opportunity cost of consumption in perpetuity. A federal waste repository, of itself, will provide very little benefit to a region. Little local employment will result and other economic impacts will be minimal. There is no compelling reason for the people of New Mexico to accept a high-level waste repository. The recommendations are made: that a committee of technical competent individuals should be appointed by the Governor and the Energy Resources Board to oversee this federal work in the southeastern salt beds, and that New Mexico should do its own risk-benefit analysis of the high-level radioactive waste repository.

Waste Processing

607 (AECL--6344) CANADIAN DEVELOPMENT PROGRAM FOR CONDITIONING CANDU REACTOR WASTES FOR DISPOSAL. Charlesworth, D.H.; Bourns, W.T.; Buckley, L.P. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Jul 1978. 37p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Currently, radioactive wastes arising from the operation of Canadian nuclear reactors are placed in interim storage in concrete containment structures except for gaseous and liquid wastes containing small amounts of radioactivity which are dispersed. With the objective of replacing storage by permanent disposal, a program is underway to develop and demonstrate an integrated process for converting all reactor wastes to a stable, leach-resistant form which will immobilize the radionuclides in the waste repository. The major tool for this development is a Waste Treatment Centre, now being constructed at Chalk River Nuclear Laboratories, which will combine reverse-osmosis, incineration, evaporation, and bituminizing processes.

608 (AED-Conf--76-760-000, pp 153-167) TREATMENT AND ULTIMATE STORAGE OF RADIOACTIVE WASTE. Levi, H.W. (Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.)). 1976. (In German).

From German-Dutch university weeks; Kleve, F.R. Germany (21 Jun 1976).

The author deals with the problem of treating and disposing of radioactive waste material and connects this with a concept and its technological realization.

609 (AED-Conf--78-274-018) INVESTIGATIONS ON THE EXTRACTION OF PU FROM MAW. Stoianik, B. (Technische Hochschule Darmstadt (Germany, F.R.). Fachbereich Anorganische Chemie und Kernchemie). (Technische Hochschule Darmstadt (Germany, F.R.). Fachbereich Anorganische Chemie und Kernchemie). 1978. 11p. (In German). (CONF-7810177--26). Dep. NTIS (US Sales Only), PC A02/MF A01.

From Lecture meeting on principles and applications of nuclear-, radio-, and radiation chemistry; Lindau, F.R. Germany (16 Oct 1978).

A suitable method to treat burnable middle active wastes (MAW) is wet ashing. The waste is carbonized in concentrated sulphuric acid at 250°C and oxidized by adding conc. HNO_3. The final product of the wet ashing is a suspension of organic and inorganic solids in conc. sulphuric acid. In order to determine the suitability of wet ashing regarding plutonium separation from MAW, the decomposition power of the acid solution with regard to the different highly annealed plutonium oxides or plutonium-uranium mixed oxides was investigated, as well as the distribution of plutonium between the concentrated sulphuric acid and the solids. Due to the slight solubility of plutonium sulphate, there is an expected enrichment of plutonium in the solid residue which is washed out with dilute sulphuric acid. In order to separate the plutonium from the washing solution, extraction methods (prim. amines), ion exchange and coprecipitation methods are examined. The target of the latter used method is the earliest possible confluence of the method with known plutonium separations in nuclear technology.

610 (AERE-M--3012) PROGRESS TOWARDS THE USE OF DISPOSABLE FILTERS. Macphail, I. (UKAEA Atomic Energy Research Establishment, Harwell. Materials Development Div.). Aug 1979. 13p. Dep. NTIS (US Sales Only), PC A02atMF A01.

Thermally degradable materials have been evaluated for service in HEPA filter units used to filter gases from active plants. The motivation was to reduce the bulk storage problems of contaminated filters by thermal decomposition to gaseous products and a solid residue substantially comprised of the filtered particulates. It is shown that while there are no commercially available alternatives to the glass fibre used in the filter medium, it would be feasible to manufacture the filter case and spacers from materials which could be incinerated. Operating temperatures, costs and the type of residues for disposal are discussed for filter case materials. (U.K.).

611 (AERE-R--9416) DESIGN STUDY FOR A FISSION PRODUCT FIXATION PLANT AND STORAGE AT WINDSCALE. Hill, K.M.; Ridley, G.; Adler, D.G. (UKAEA Authority Fuel Processing Directorate). 1961. 106p. Dep. NTIS (US Sales Only), PC A06/MF A01.

A flowsheet for a production plant has been worked out and the problems of designing a reliable production plant utilising it have been assessed. The properties of current glass compositions have been considered in relation to problems of permanent storage for periods of 800 to 1000 years and various storage proposals assessed. The performance of the preferred type of storage, i.e. dry storage in natural draught air-cooled vaults, has been estimated and consideration given to a number of variables affecting the optimum design. The design problems of a storage of the required life have been investigated in relation to suitable types of site and proposals made as to the types of construction to be used. Design work on tunnel loading facilities has been carried to the state of demonstrating feasibility. The capital costs and the economics of this type of waste storage have been investigated for unalloyed Magnox fuel and brief consideration given to alloyed and cermet fuels. Attention has been given to development problems of the whole system where they arise.

612 (AERE-R--9417) GLASSES AND CERAMICS FOR IMMOBILISATION OF RADIOACTIVE WASTES FOR DISPOSAL. Johnson, K.D.B.; Marples, J.A.C. (UKAEA Atomic Energy Research Establishment, Harwell). May 1979. 28p. Dep. NTIS (US Sales Only), PC A03/MF A01; Available from HMSO, price Pound 1.00.

The U.K. Research Programme on Radioactive Waste Management includes the development of processes for the conversion of high level liquid reprocessing wastes from thermal and fast reactors to borosilicate glasses. The properties of these glasses and their behaviour under storage and disposal conditions have been examined. Methods for immobilising activity

from other wastes by conversion to glass or ceramic forms is described. The U.K. philosophy of final solutions to waste management and disposal is presented.

613 (AERE-R--9432) HIGH-LEVEL WASTE SOLIDIFICATION - WHY WE CHOSE GLASS. Grover, J.R. (UKAEA Atomic Energy Research Establishment, Harwell. Chemical Technology Div.). May 1979. 13p. Dep. NTIS (US Sales Only), PC A02/MF A01.

This paper considers the desirable properties and factors to be assessed in the selection of a solidified waste product, surveys the possible product options and then analyses in detail their suitability in meeting the criteria.

614 (AGNS--47921-3026-TPR-2) DEMONSTRATE FUEL DISASSEMBLY/ENCAPSULATION. TECHNICAL PROGRESS REPORT, JULY 1980-SEPTEMBER 1980. (Allied-General Nuclear Services, Barnwell, SC (USA)). 25 Oct 1980. Contract AC09-79ET47921. 10p. NTIS, PC A02/MF A01.

Work on this project is focused on demonstrating disassembly and encapsulation of nuclear fuels as a means to increase spent fuel storage. The effort commenced on April 17, 1980, and is progressing satisfactorily. The Equipment/Procedure Preparation and Process Assessment Studies sub-tasks are currently underway with the Equipment Demonstration sub-task scheduled to commence February 1, 1981. The equipment design effort associated with the former sub-task and the technical studies and investigations associated with the latter sub-task continue to verify the feasibility of this concept to enhance the use of fuel storage resources.

615 (ANL--78-13) DECONTAMINAION OF METALS CONTAINING PLUTONIUM AND AMERICIUM. Seitz, M.G.; Gerding, T.J.; Steindler, M.J. (Argonne National Lab., IL (USA)). Jun 1979. Contract W-31-109-ENG-38. 57p. Dep. NTIS, PC A04/MF A01.

Melt-slagging (melt-refining) techniques were evaluated as a decontamination and consolidation step for metals contaminated with oxides of plutonium and americium. Experiments were performed in which mild steel, stainless steel, and nickel contaminated with oxides of plutonium and americium were melted in the presence of silicate slags of various compositions. The metal products were low in contamination, with the plutonium and americium strongly fractionated to the slags. Partition coefficients (plutonium in slag/plutonium in steel) of 7 x 10^6 were measured with boro-silicate slag and of 3 x 10^6 with calcium, magnesium silicate slag. Decontamination of metals containing as much as 14,000 ppM plutonium appears to be as efficient as for metals with plutonium levels of 400 ppM. Staged extraction, that is, a remelting of processed metal with clean slag, results in further decontamination of the metal. The second extraction is effective with either resistance-furnace melting or electric-arc melting. Slag adhering to the metal ingots and in defects within the ingots is in the important contributors to plutonium retained in processed metals. If these sources of plutonium are controlled, the melt-refining process can be used on a large scale to convert highly contaminated metals to homogeneous and compact forms with very low concentrations of plutonium and americium. A conceptual design of a melt-refining process to decontaminate plutonium- and americium-contaminated metals is described. The process includes single-stage refining of contaminated metals to produce a metal product which would have less than 10 nCi/g of TRU-element contamination. Two plant sizes were considered. The smaller conceptual plant processes 77 kg of metal per 8-h period and may be portable.The larger one processes 140 kg of metal per 8-h period, is stationary, and may be near te maximum size that is practical for a metal decontamination process.

616 (ANL--79-74) RECOVERY OF ACTINIDES FROM TBP-Na_2CO_3 SCRUB-WASTE SOLUTIONS: THE ARALEX PROCESS. Horwitz, E.P.; Bloomquist, C.A.A.; Mason, G.W.; Leonard, R.A.; Ziegler, A.A. (Argonne National Lab., IL (USA)). Aug 1979. Contract W-31-109-ENG-38. 43p. Dep. NTIS, PC A04/MF A01.

A flowsheet for the recovery of actinides from TBP-Na_2CO_3 scrub-waste solutions has been developed, based on batch extraction data, and tested, using laboratory-scale countercurrent extraction techniques. The process, called the ARALEX process, uses 2-ethyl-1-hexanol (2-EHOH) to extract the TBP degradation products (HDBP and H_2MBP) from acidified Na_2CO_3 scrub waste leaving the actinides in the aqueous phase. Dibutyl and monobutyl phosphoric acids are attached to the 2-EHOH molecules through hydrogen bonds, which also diminish the ability of the HDBP and H_2MBP to complex actinides. Thus all actinides remain in the aqueous raffinate. Dilute sodium hydroxide solutions can be used to back-extract the dibutyl and monobutyl phosphoric acid esters as their sodium salts. The 2-EHOH can then be recycled. After extraction of the acidified carbonate waste with 2-EHOH, the actinides may be readily extracted from the raffinate with DHDECMP or, in the case of tetra- and hexavalent actinides, with TBP. The ARALEX process can also be applied to other actinide waste streams which contain appreciable concentrations of polar organic compounds (e.g., detergents) that interfere with conventional actinide ion exchange and liquid-liquid extraction procedures. 20 figures, 6 tables.

617 (ANL/EIS--11) GENERIC WASTE MANAGEMENT CONCEPTS FOR SIX LWR FUEL CYCLES. DePue, J.D. (ed.). (Argonne National Lab., IL (USA)). Apr 1979. Contract W-31-109-ENG-38. 123p. Dep. NTIS, PC A06/MF A01.

This report supplements the treatment of waste management issues provided in the Generic Environmental Statement on the use of recycle plutonium in mixed oxide fuel in light water cooled reactors (GESMO, NUREG-0002). Three recycle and three no-recycle options are described in this document. Management of the radioactive wastes that would result from implementation of either type of fuel cycle alternative is discussed. For five of the six options, wastes would be placed in deep geologic salt repositories for which thermal criteria are considered. Radiation doses to the workers at the repositories and to the general population are discussed. The report also covers the waste management schedule, the land and salt commitments, and the economic costs for the management of wastes generated.

618 (ARH-SA--203) BIDENTATE ORGANOPHOSPHORUS EXTRACTION OF AMERICIUM AND PLUTONIUM FROM HANFORD PLUTONIUM RECLAMATION FACILITY WASTE. Schulz, W.W. (Atlantic Richfield Hanford Co., Richland, WA (USA)). Sep 1974. Contract AM06-76RL02130. 65p. (CONF-750607--57). NTIS, PC A04/MF A01.

From American Nuclear Society meeting; New Orleans, LA, USA (8 Jun 1975).

Applicability of bidentate organiphosphorus

reagents to recovery of americium and plutonium from Hanford's Plutonium Reclamation Facility acid (approx. 2M HNO_3) waste stream (CAW solution) was studied. A solvent extraction process which employs a 30% DHDECMP (dihexyl-N, N-diethylcarbamylmethylene phosphonate)-CCl_4 extractant was devised and successfully tested in mixer-settler runs with actual CAW solution. Substitution of DHDECMP for DBBP eliminates the need to perform careful neutralization of unbuffered CAW soluton and increases overall americium recovery from the present 60 to 80% level to greater than or equal to 90%. Disadvantages to such substitution include the high cost (approx. $50/liter) of DHDECMP and the need to purify it [by acid (6M HCl) hydrolysis and alkaline washing] from small amounts of an unidentified impurity which prevents stripping of americium with dilute HNO_3. Distribution data obtained in this study confirm Siddall's earlier contention that bidentate organophosphorus regents can be used to remove actinides from concentrated high-level Purex process acid waste; a conceptual flowsheet for such an extraction process is given.

619 (BARC--1028) DEVELOPMENT OF SUITABLE VITRIFIED RADIOACTIVE WASTE PRODUCTS WITH LOW FORMATION TEMPERATURES AND IMPROVED LEACH RESISTANCE - A PRACTICAL APPROACH. Vaswani, G.A.; Jahagirdar, P.B.; Rastogi, R.C.; Sunder Rajan, N.S. (Bhabha Atomic Research Centre, Bombay (India)). 1979. 31p. NTIS (US Sales Only), PC A03/MF A01.

In contrast to normal practice of employing theoretical considerations, a scheme based on practical approach has been evolved for the development of suitable glass compositions to produce vitrified radioactive wastes with low forming temperatures of around 1000degC and low leach rates of the order of 10^{-5} to 10^{-6} gm cm^{-2} d^{-1}. After fixing the percentage of the waste content at a moderate value, a number of formulations in the sodium borosilicate system are studied for their melting and leaching characteristics by simple and quick laboratory techniques. Based on the results, a composition with scope for further lowering of melting temperature and improvement in product durability is subjected to the introduction of different durability enhancing and/or melting temperature lowering oxides as well as the waste oxides so as to obtain an optimum composition. This composition is further subjected to variations in its Na_2O, Ba_2O_3 and SiO_2 content to get a region of compositions with optimum leaching and melting characteristics. A composition selected from the central portion of this region will retain its properties even if the proportion of waste oxides and glass forming additives vary during the commercial production of vitrified radioactive wastes.

620 (BM-RI--8463) ABSORPTION OF RADIUM AND THORIUM FROM NEW MEXICO URANIUM MILL TAILING SOLUTIONS. Beard, H.R.; Salisbury, H.B.; Shirts, M.B. (Bureau of Mines, Salt Lake City, UT (USA). Salt Lake City Research Center). 1980. 17p. Bureau of Mines, Washington, DC.

The absorption of radium and thorium from waste uranium leach liquor by clays and other materials was investigated. This work was conducted in support of the goal of minimizing the environmental conflicts, impacts, and occupational hazards associated with mining and milling operations. Tailing and soil samples from New Mexico were evaluated for their potential to absorb radium and thorium from tailing liquors. Absorption ranged from 0 to 97 pct for radium and 0 to 60 pct for thorium. Some samples that readily absorbed radium were contacted with various salt solutions that could be present in tailing solutions to determine whether desorption would be a potential problem. The desorption of radium ranged from 0 to 75 pct. An alpha spectrometric method was used to determine the radium and thorium concentrations in the solutions and solids.

621 (BNL--28193) KEYNOTE ADDRESS AT THE INTERNATIONAL CONFERENCE ON NUCLEAR WASTE TRANSMUTATION. Steinberg, M. (Brookhaven National Lab., Upton, NY (USA)). Jul 1980. Contract AC02-76CH00016. 13p. (CONF-800743--13). NTIS, PC A02/MF A01.

From International conference on nuclear waste transmutation; Austin, TX, USA (22 Jul 1980).

Most of the US research effort on radioactive waste management is concentrated on its solidification and storage in geologic formations. Transmutation is an alternative. It can be applied to weapons plutonium as well to spent fuel. (DLC)

622 (BNL--28282) APEX ACCELERATOR CYCLE FOR TRANSMUTATION OF LONG-LIVED FISSION WASTES. Powell, J.; Steinberg, M.; Takahashi, H.; Grand, P.; Botts, T.; Kouts, H.J.C. (Brookhaven National Lab., Upton, NY (USA)). 1980. Contract AC02-76CH00016. 30p. (CONF-800743--11). NTIS, PC A03/MF A01.

From International conference on nuclear waste transmutation; Austin, TX, USA (22 Jul 1980).

Based on preliminary studies, some conclusions can be drawn concerning the Accelerator Fuel Enricher and Fission Product Exterminator (APEX). APEX-1 and APEX-2 systems can destroy TU's, ^{137}Cs, and ^{90}Sr at acceptable cost and efficiency. The principal difference between APEX-1 and APEX-2 is the in-reactor and in-circuit inventory of ^{137}Cs and ^{90}Sr. Stable and low hazard wastes can be disposed of by burial. Accelerator breeders can effectively sustain a fission reactor economy indefinitely. Military waste can be blended into commercial fuel cycle for transmutation. Accelerator and target technologies appear practical and could be developed in a few years. More detailed studies are needed to better define the technical and economic features of the LAFER and APEX cycles, so that comparative assessments can be made between these cycles, as well as with other transmutation and waste disposal concepts.

623 (BNL-NCS--28103) ROLE OF THE NATIONAL NUCLEAR DATA CENTER IN THE FIELD OF NUCLEAR WASTE TRANSMUTATION. Rose, P.F. (Brookhaven National Lab., Upton, NY (USA)). 1980. Contract AC02-76CH00016. 21p. (CONF-800743--8). NTIS, PC A02/MF A01.

From International conference on nuclear waste transmutation; Austin, TX, USA (22 Jul 1980).

This report discusses the role of The National Nuclear Data Center (NNDC), formerly the National Neutron Cross Section Center. The NNDC collates and analyzes nuclear physics information for basic and applied research scientists. The NNDC performs functions that are characteristic of an information analysis center, namely bibliographic searches, data compilation, and critical appraisal of available information. Such compilations and searches are of unique importance for investigators in the field of nuclear waste transmutation. In addition, the NNDC issues

publications, provides technical support to its sponsors, and conducts seminars on important topics. A primary concern of the NNDC is the timely production and revision of reference nuclear data. The NNDC coordinates the Cross Section Evaluation Working Group (CSEWG), a cooperative effort of over 20 laboratories, and the Nuclear Data Network (NDN), a group of US Nuclear Data Centers involved in the study of nuclear structure. The NNDC also interfaces with similar groups outside the United States in activities contributing to documented computerized reference data files. The Department of Energy has established the NNDC as the Center to service requests from the research community for bibliographic and data retrievals for neutron, charged particle, nuclear structure, and radioactive decay data.

624 (CAEC--007(Vol.3)) LOW-LEVEL RADIOACTIVE WASTE MANAGEMENT. VOLUME III. FEASIBILITY OF VOLUME-REDUCTION PROCESSES. Feizollahi, F.; Phillips, J.W.; Bell, W.H. (NUS Corp., Palo Alto, CA (USA)). Nov 1978. 96p. (NUS--3183). California Energy Commission, 1111 Howe Ave., Sacramento, CA 95823.

This report contains a survey of the state of the art of volume-reduction technology and an evaluation of this technology for application to low-level radioactive waste from LWR plants. This survey indicated that the nuclear industry is rapidly gaining technological knowledge in the area of processes for volume reduction. Practical experience is rapidly being gained, but for most systems it has not been demonstrated that they can operate efficiently on waste from a US LWR plant with adequate containment of radioactivity and proper treatment of effluent gases and liquids while maintaining low exposure to the plant operators. It is concluded that there is no reason to believe that the use of volume-reduction systems in LWR plants will significantly reduce exposure to operators, either at the power plant or at the burial site. There may be some reduction in the exposure to the public during the waste transportation, but the exposure reduction ratio is smaller than the volume reduction ratio. The effect on the burial space requirements was evaluated and comparisons were made between non-volume-reduction, semi-volume-reduction, and full-volume-reduction systems. For a single-unit reactor plant in the 1000-MW(e) range, located within 300 to 400 miles of a burial site and using drums to package the waste, it is slightly more economical to use a non-volume-reduction system. However, under similar circumstances, for a double-unit reactor plant in the 2000-MW(e) range, both semi-volume-reduction and full-volume-reduction facilities were found to be economically feasible alternatives.

625 (CEA-CONF--4435) APPLICATION OF BORATE GLASSES AND VARIOUS BORON BEARING GLASSES TO THE MANAGEMENT OF FRENCH RADIOACTIVE WASTES. Bonniaud, R.; Redon, A.; Sombret, C. (CEA Centre de Marcoule, 30 - Bagnols-sur-Ceze (France)). 1978. 21p. (CONF-7806117--2). Copies available from Service de Documentation CEN Saclay, B.P. n°2, 91190 Gif-sur-Yvette (France).

From Conference on quality assurance in ceramic industries; Alfred, NY, USA (4 Jun 1978).

Silicates, as the most stable glasses, have been chosen to be basic products. The silicates become boroaluminosilicates for MTR and GG wastes. Boron is introduced as a fluxing agent and Al is used to make allowance of the quantity of Al in the solution. The case of LWR and FBR wastes are a little bit different. The corresponding glasses are borosilicates. Most of the fission product oxides have a tendancy to decrease the liquid temperature and boron is used mainly to loosen the network and to allow an entire vitrification. Some examples of glass composition are given. The main properties investigated are: the behaviour of the products submitted to thermal treatment, the behaviour under β irradiation, the loss of activity by aqueous leaching, the effect of α radionuclides. Two processes, a batch one and a continuous one have been developped. The batch process which is a pot vitrification method was the first in operation. This technique is satisfactory but unfortunately it does not meet the needs due to the growth of commercial nuclear energy. The continuous technique is composed of a rotary calciner coupled to a melting furnace. A first prototype equipment has been operated sucessfully for over 8000 hours with various simulated high level wastes (MTR, LWR, natural U). From this prototype, the Marcoule vitrification Plant was designed and built, scale to scale.

626 (CEA-CONF--4677) COLLECT AND TREATMENT OF RADIOACTIVE WASTES IN LOW ACTIVITY LABORATORIES. Cluchet, J.; Desroches, J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Protection contre les Rayonnements). 1979. 6p. (In French). (CONF-790181--5). NTIS (US Sales Only), PC A02/MF A01.

From SFRP session on safety in handling of low activity unsealed sources; Fontenay-aux-Roses, France (17 Jan 1979).

After recalling regulations concerning unsealed sources and low activity wastes produced by hospitals and biological laboratories, practical application of these rules is described. Sorting, storage and treatment of the different kind of wastes: solid, liquid, inactive, active of long or short life, containers to be used are examined.

627 (CEA-R--4946) PLUTONIUM SEPARATION BY REDUCTION STRIPPING. APPLICATION TO PROCESSING OF MIXED OXIDE $(U,PU)O_2$ FUEL FABRICATION WASTES. Arnal, T.; Cousinou, G.; Ganivet, M. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Developpement des Elements Combustibles). Nov 1978. 34p. (In French). NTIS (US Sales Only), PC A03/MF A01.

A procedure is described for separating plutonium from a uranium VI and plutonium IV mixture contained in an organic phase (tributyl phosphate diluted in dodecane). This separation is obtained by extracting the plutonium III using two organic reducers: hydrazine and paraminophenol. Paraminophenol has excellent reducing qualities, similar to those of ferrous sulphamate, but has the added advantage of not contaminating extracted plutonium. This procedure is currently used in processing production wastes from mixed oxide $(U,Pu)O_2$ fuels; the installation using this procedure is described in detail in this paper. Operating results show the remarkable efficiency of this procedure: the separated plutonium and uranium mass flows have been increased to 185 and 350 $g.h^{-1}$ respectively; the uranium contains less than 0.1 ppm of plutonium on completion of the purification cycle.

628 (CEGB-RD-B-N--4573) STRUCTURES AND STABILITY OF MEDIA INTENDED FOR THE IMMOBILIZATION OF HIGH LEVEL RADIOACTIVE WASTE. Tempest, P.A. (Central Electricity Generating

Board, Berkeley (UK). Berkeley Nuclear Labs.). May 1979. 28p. Dep. NTIS (US Sales Only), PC A03/MF A01.

High level radioactive waste contains about 40 different elements and, in time, many of these elements are transformed by radioactive decay into different-sized atoms with new chemical properties. The suitability of ordered crystal structures and unordered glass structures as media for immobilising the waste elements is compared. The structural properties of a mixture of synthetic minerals (SYNROC) are described and the various minerals' ability to accommodate ions of different radii and charge assessed. Similary the unordered structure of glass is examined and the probability of the glass remaining non-crystalline during manufacture and storage taken into account. Alternative glassification technologies in the form of the French AVM continuous process and the UK HARVEST batch processes are described and compared, and their likely effect on the structural properties of the final solid glass block considered.

629 (CONF-780506--(Vol.1), pp 304-314) LOW LEVEL RADWASTE PACKAGING: WHY NOT CEMENT. Wilson, R.B. (Hittman Nuclear and Development Corp., Columbia, MD). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

Over the past several years many words have been expended in a quest to define a variety of competing radioactive waste immobilization technologies. With the more recent recognition of the technical pitfalls of urea-formaldehyde (UF) a liquid chemical binder considered as optimum less than two years ago, utilities, architect-engineers and systems vendors find themselves in a technology void, awaiting the inevitable breakthrough which will identify the perfect immobilization agent. The culmination of these pressures has brought about the introduction of new immobilization technologies including: one which offers both volume reduction and immobilization in yet another new binder agent; the costly development of highly sophisticated volume reduction systems, the highly-concentrated products from which may pose as-yet unknown immobilization problems; and, the marketing of several new more expensive liquid chemical binders which are reputed to have eliminated the kinds of problems associated with urea-formaldehyde. This paper addresses these issues by coming full circle and arriving back at the initial approach employed for low level radwaste immobilization, the use of cement. Based on an evaluation of the three principal competing immobilization approaches, liquid chemical, bitumen and cement, the merits and drawbacks of each is examined. As will be described, an objective assessment of these competing technologies has resulted in a somewhat surprising conclusion that, while none of the approaches is without disadvantages, cement can be shown to offer the most reliable, versatile long-term solution to today's needs.

630 (CONF-780506--(Vol.2), pp 754-762) PACKAGING, TRANSPORTATION AND DISPOSAL OF REACTOR CORE COMPONENTS. Panter, H.R.; Mason, M.E.; Viebrock, J.M. (Nuclear Assurance Corp., Atlanta, GA). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

In recent years it became apparent in the nuclear industry that discharged fuel channels and other irradiated hardware from LWR's were utilizing significant storage space in plant spent fuel pools. Nuclear Assurance Corporation has fulfilled contracts with major US utilities for packaging and disposal of fuel channels, poison curtains, control rods and instrument sources from their BWR's. In order to conform to various shipping and burial regulations specifying allowable dose rates and isotopic content, activities of the non-fuel bearing components were calculated by the computer code ORIGEN, based on reactor operating parameters, cool times, and ASTM specifications. These data were used to evaluate various packaging configurations and/or shipping casks for conformity to the regulations and disposal site license constraints. Because of the high transportation and burial charges, the overall cost of disposing of this type waste is highly dependent on the number of shipments. NAC developed equipment to cut the bulky items and reduce the packing volume of the individual components tenfold. Equipment design and development also considered remote, underwater environment, physical characteristics of the irradiated material, i.e., zirconium embrittlement, the need to minimize required pool floor space and interference with other pool activities, operating convenience, and maintenance requirements.

631 (CONF-790420--, pp 1-3) DOE MATERIALS PROGRAM SUPPORTING IMMOBILIZATION OF RADIOACTIVE WASTES. Oertel, G.K.; Scheib, W.S. Jr. (Dept. of Energy, Washington, DC). May 1979.

From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).

A summary is presented of the DOE program for developing waste-form criteria, immobilization processes, and generation and evaluation of performance characterization data. Interrelationships are discussed among repository design, materials requirements, immobilization process definition, quality assurance, and risk analysis as part of the National Environmental Policy Act and regulatory processes.

632 (CONF-790420--, pp 17-24) UK PROGRAM: GLASSES AND CERAMICS FOR IMMOBILIZATION OF RADIOACTIVE WASTES FOR DISPOSAL. Johnson, K.D.B. (UKAEA, Harwell, England). May 1979.

From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).

The UK Research Program on Radioactive Waste Management includes the development of processes for the conversion of high-level-liquid-reprocessing wastes from thermal and fast reactors to borosilicate glasses. The properties of these glasses and their behavior under storage and disposal conditions have been examined. Methods for immobilizing activity from other wastes by conversion to glass or ceramic forms are described. The UK philosophy of final solutions to waste management and disposal is presented.

633 (CONF-790420--, pp 73-81) OPERATIONAL EXPERIENCE OF THE FIRST INDUSTRIAL HLW VITRIFICATION PLANT. Chotin, M.M. (Compagnie Generale des Matieres Nucleaires, Marcoule, France); Bonniaud, R.A.; Jouan, A.F.; Rabot, G.E. May 1979.

From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).

Marcoule Vitrification Plant which started up in active operation in June 1978 converts high-level radioactive liquid wastes into glass. The French vitrification process is a

continuous technique involving a calcination step. The glass is cast in stainless steel containers. After the lids are welded, a decontamination stage is operated prior to disposal.

634 (CONF-790420--, pp 82-85) COMPATIBILITY TESTS OF MATERIALS FOR A PROTOTYPE CERAMIC MELTER FOR DEFENSE GLASS-WASTE PRODUCTS. Wicks, G.G. (E.I. du Pont de Nemours and Co., Aiken, SC). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The corrosion--erosion resistance of potential electrode and refractory materials was evaluated by static and dynamic tests in simulated glass waste. Based on corrosion--erosion behavior, thermal and electrical properties, and cost and availability, Monofrax K3 (Carborundum Co.) and Inconel 690 (International Nickel Co.) were selected as the contact refractory and electrode materials, respectively, for a prototype ceramic melter.

635 (CONF-790420--, pp 86-92) VITRIFICATION OF HIGH-LEVEL RADIOACTIVE WASTE IN A CONTINUOUS LIQUID-FED CERAMIC MELTER. Weisenburger, S.; Gruenewald, W.; Koschorke, H. (Karlsruhe Nuclear Research Center, Germany). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The vitrification of simulated high-level liquid waste (HLLW) from the nuclear fuel cycle in a ceramic-lined waste melter is described. Particular reference is given to the present status of the melter technology. Some features are discussed arising from direct liquid feeding of the waste solution into the melter. Also presented are results concerning the entrainment of particulates as well as the loss of volatilized material into the melter off-gas. Ruthenium behavior in a liquid-fed ceramic melter is reported, and the extent of ruthenium volatility suppressed by predenitration of the waste solution is discussed. The 1500 h operation experience gained since 1976 with the pilot-scale vitrification unit is outlined, and the construction of an advanced melter having the potential for remote operation is given. The work described here is part of a German cooperative research and development program among seven institutions. One of the major objectives of this program is to provide a vitrification technology for the solidification of the LEWC waste stored at the Eurochemic site in Mol/Belgium. 3 figures, 4 tables.

636 (CONF-790420--, pp 93-96) VITRIFICATION OF HANFORD RADIOACTIVE DEFENSE WASTES. Kupfer, M.J. (Rockwell Hanford Operations, Richland, WA). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Hanford defense waste sludges and residual liquids are effectively immobilized by conversion to borosilicate glasses. The effects of composition on various properties such as chemical durability, viscosity, and devitrification are discussed. 5 tables.

637 (CONF-790420--, pp 97-101) SOLIDIFICATION OF HLW SOLUTIONS WITH THE PAMELA PROCESS. Heimerl, W. (Deutsche Gesellschaft fuer Wiederaufarbeitung von Kernbrennstoffen mbH, Mol, Belgium). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
A revised concept for the PAMELA process for the solidification of HLW solutions is described. The reasons for some changes, e.g., future use of borosilicate glass instead of phosphate glass, manufacture of glass blocks as well as blocks of glass beads in metal matrix, are discussed. Plans for a PAMELA demonstration plant to be built at Mol, Belgium, are presented.

638 (CONF-790420--, pp 102-106) DEVELOPMENT OF ENGINEERING SCALE HLLW VITRIFICATION TECHNIQUE AT PNC. Nagaki, H.; Oguino, N.; Tsunoda, N.; Segawa, T. (Power Reactor and Nuclear Fuel Development Corp., Ibaraki, Japan). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Some processes have been investigated to develop the technology of solidification of the high-level radioactive liquid waste generated from the nuclear fuel reprocessing plant operated by the Power Reactor and Nuclear Fuel Development Corporation (PNC) at Tokai-mura. This report covers the present state of development of a Joule-heated ceramic melter and a direct megahertz induction-heated melter. Engineering-scale tests have been performed with both melters. The Joule-heated melter could produce 45 kg or 16 liters of glass per hour. The direct-induction furnace was able to melt 5 kg or 1.8 liters of glass per hour. Both melters were composed of electrofused cast refractory brick. Thus it was possible to melt the glass at above 1200°C. Glass produced at higher melting temperatures is generally superior. 3 figures, 2 tables.

639 (CONF-790420--, pp 107-113) REVIEW OF CONTINUOUS CERAMIC-LINED MELTER AND ASSOCIATED EXPERIENCE AT PNL. Buelt, J.L.; Chapman, C.C.; Barnes, S.M.; Dierks, R.D. (Battelle Pacific Northwest Labs., Richland, WA). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Development of continuous, ceramic-lined melters applicable to immobilization of radioactive wastes began at PNL in 1973. A comprehensive program is curretly in progress. The melters constructed at PNL have incorporated remote and reliable design features necessary for radioactive use. The extensive experience with vitrification of simulated wastes has proven the continuous melter's applicability to radioactive waste immobilization.

640 (CONF-790420--, pp 114-117) PROGRESS IN FISSION PRODUCT SOLIDIFICATION AND CHARACTERIZATION UTILIZING THE JUELICH FIPS PROCESS. Halaszovich, S.; Merz, E.; Odoj, R. (Kernforschungsanlage, Juelich, Germany). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The FIPS process for solidification of fission product solutions is briefly presented. Its main characteristics concerning process and product control are discussed. A newly developed layout consisting of a thermobalance and a mass spectrometer is described. Possible effects of the results of the thermodynamic investigations on glass composition and processing are discussed.

641 (CONF-790420--, pp 118-121) LABORATORY-

SCALE GLASS MELTER FOR TESTING DEFENSE WASTE GLASS. Gombert, D. II. (Allied Chemical Corp., Idaho Falls, ID). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
A one-liter Joule-heated glass melter was built to test the applicability of continuous melting to simulated high-level calcined defense waste. Inconel 690 electrodes and K-3 refractory brick were chosen for their corrosion resistance to fluoride glass. The melter maintained a full melt at 1100°C using 3 kW. After approximately two months of operation the melter was dismantled for metallurgical examination. The Inconel 690 electrodes were heavily corroded. A second melter is now in operation to verify the findings of the first melter run.

642 (CONF-790420--, pp 122-126) INFLUENCE OF HEAT TRANSFER ON THE POT VITRIFICATION PROCESS. Morris, J.B. (Atomic Energy Research Establishment, Harwell, England). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The experimental data on the working zone in pot vitrification show that the mean wall heat flux (2 W/cm^2) is independent of vessel size. A simple model of the heat transfer processes is developed in which natural convection through the glass-forming region is the controlling mechanism. 3 figures.

643 (CONF-790420--, pp 127-131) RECENT DEVELOPMENTS IN LOW- AND INTERMEDIATE-LEVEL WASTE FIXATION BY CEMENT. Witte, H.O. (NUKEM GmbH, Hanau, Germany); Koester, R. May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Boron-containing radwaste sludge from PWR's can be incorporated into cement by addition of slaked lime, because in the presence of sufficient calcium the formation of tri-calcium aluminate is not inhibited. Incorporation of sodium nitrate into cement at least up to 20 wt % can be achieved with product qualities within acceptable levels. 5 figures, 2 tables.

644 (CONF-790420--, pp 132-135) FUETAP (FORMED UNDER ELEVATED TEMPERATURES AND PRESSURES) CONCRETES AS HOSTS FOR RADIOACTIVE WASTES. Moore, J.G.; Rogers, G.C.; Paehler, J.H.; Devaney, H.E. (Oak Ridge National Lab., TN). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Cementitious solids formed at less than or equal to 250°C and less than or equal to 70.3 kg/cm^2 (1000 psi) offer excellent possibilities as hosts for radioactive wastes. Preliminary results are presented on the effect of mix composition, temperature, and pressure on the physical properties of the resulting solids. Initial leach results are encouraging in the assessment of the ability of these FUETAP concretes to isolate radionuclides from the environment. 7 tables.

645 (CONF-790420--, pp 136-142) LOW TEMPERATUE CERAMIC RADIOACTIVE WASTE FORM. Roy, D.M.; Scheetz, B.E.; Grutzeck, M.W.; Sarkar, A.K.; Atkinson, S.D. (Pennsylvania State Univ., University Park). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Preliminary research on low temperature ceramic waste forms based upon modified calcium silicate and aluminate cements is described. Compositional and reaction variations, modified to achieve a strongly consolidated waste form which is reistant to significant change under the anticipated ambient, have been investigated. Extending previous studies in this laboratory, the recent work has utilized combinations of calcium aluminate cements and high early strength portland cements, different supercalcine waste formulations, and other additives. Both modified conventional cement composite consolidation methods and low-temperature hot-pressing methods were used to incorporate the supercalcine into a consolidated form. Products after initial consolidation and after drastic accelerated leaching treatment (hydrothermal leaching) were characterized. Uranium and simulated transuranics were found to be highly resistant to leaching; strontium was relatively resistant in many cases; and cesium leaching was found to be compositionally dependent. 8 tables.

646 (CONF-790420--, pp 143-149) SOLIDIFICATION OF HLLW BY GLASS-CERAMIC PROCESS. Oguino N. (Power Reactor and Nuclear Fuel Development Corp., Ibaraki, Japan); Masuda, S.; Tsunoda, N.; Yamanaka, T.; Ninomiya, M.; Sakane, T.; Nakamura, S.; Kawamura, S. May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The compositions of glass-ceramics for the solidification of HLLW were studied, and the glass-ceramics in the diopside system was concluded to be the most suitable. Compared with the properties of HLW borosilicate glasses, those of diopside glass-ceramic were thought to be almost equal in leach rate and superior in thermal stability and mechanical strength. It was also found that the glass in this system can be crystallized simply by pouring it into a thermally insulated canister and then allowing it to cool to room temperature. 2 figures, 5 tables.

647 (CONF-790420--, pp 150-154) COATING OF WASTE CONTAINING CERAMIC GRANULES. Neumann, W.; Kofler, D. (Researach Centre Seibersdorf, Vienna, Austria). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Simulated high-level waste granules produced by fluidized-bed calcination were overcoated by chemical vapor deposition (CVD) with pyrocarbon and nickel in laboratory-scale experiments. Successful development enables pyrocrbon deposition at temperatures of 600 to 800°K. The coated granules have excellent properties for long-term waste storage.

648 (CONF-790420--, pp 155-159) SOLIDIFICATION OF HLLW INTO SINTERED CERAMICS. O-Oka, K. (Toshiba Corp., Kawasaki, Japan); Ohta, T.; Masuda, S.; Tsunoda, N. May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Simulated HLLW from the PNC reprocessing plant at Tokai was solidified into sintered ceramics by normal sintering or hot-pressing with addition of some oxides. Among various ceramic products obtained so far, the most preferable was nepheline-type sintered solids formed with addition of SiO_2 and Al_2O_3 to the simulated waste calcine. The solid shows

advantageous properties in leach rate and mechanical strength, which suggest that the ceramic solids were prepared with additions of ZrO_2 or MnO_2, and some of them showed good characteristics.

649 (CONF-790420--, pp 160-163) EMBEDDING METHODS OF SOLIDIFIED WASTE IN METAL MATRICES. Neumann, W. (Research Center Seibersdorf, Vienna, Austria). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The embedding of simulated waste calcines by three different methods (vacuum-pressure casting, centrifugal casting, and metal stirred with the calcines) was investigated. The experimental performance is described and advantages and disadvantages noted. The feasibility of embedding fines by stirring in metal was shown. In addition, an estimation of the influence of porosity on the properties of composites was carried out.

650 (CONF-790420--, pp 164-168) DEVELOPMENT OF CERMETS FOR HIGH-LEVEL RADIOACTIVE WASTE FIXATION. Aaron, W.S.; Quinby, T.C.; Kobisk, E.H. (Battelle Pacific Northwest Labs., Richland, WA). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
A method is currently under development for the solidification and fixation of commercial and defense high-level radioactive wastes in the form of ceramic particles encapsulated by metal, i.e., a cermet. The chemical and physical processing techniques which have been developed and the properties of the resulting cermet bodies are described in this paper. These cermets have the advantages of high thermal conductivity and low leach rates.

651 (CONF-790420--, pp 169-173) DENSIFICATION OF CALCINES AND DIRECT CONTAINMENT OF SPENT NUCLEAR FUEL IN CERAMICS BY HOT ISOSTATIC PRESSING. Larker, H.T. (High-Pressure Lab., Robertsfors, Sweden). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Calcined HLLW and many other types of radioactive waste can be incorporated in synthetic mineral blocks by hot isostatic pressing. The processing can be made relatively simple, and lasting contamination of the hot press can be effectively avoided. The technique can also be applied to make canisters of synthetic corundum for spent fuel and a development up to full scale has been made. Results from corrosion tests on the densified materials are given, and the problem of obtaining relevant long-term leach rates for crystalline materials with mechanically disturbed surface layers is discussed.

652 (CONF-790420--, pp 174-178) IMMOBILIZATION OF HIGH-LEVEL WASTES IN SYNROC TITANATE CERAMIC. Ringwood, A.E.; Kesson, S.E. (Australian National Univ., Canberra). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The elements occurring in high-level nuclear reactor wastes can be safely immobilized by incorporating them within the crystal lattices of the constituent phases of a titanate ceramic, SYNROC. Close structural analogs of these phases (hollandite, perovskite, and zirconolite) occur in nature and have survived for periods of 20 to 2000 million years. Accelerated leaching tests in water and saline solutions show that SYNROC is unaffected after 24 hours at extreme conditions (up to 900°C and 5000 bars), whereas borosilicate glasses decompose within a few hours under much less severe hydrothermal conditions (e.g., 350°C and 1000 bars). A variant of the SYNROC process appears to be particularly well-suited for immobilization of US military wastes. The modified ceramic waste form consists of the three major SYNROC phases (hollandite, perovskite , and zirconolite) plus a variety of refractory Fe--Al--Mn bearing titanates and spinels, which are thermodynamically compatible with the SYNROC phases. The SYNROC phases serve to immobilize fission products and actinides, while the additional refractory phases serve to immobilize the Fe--Al--Mn oxides, which constitute a very large proportion of the calcined sludges. These additional phases include pseudobrookite (AL_2TiO_5--$FeTi_2O_5$ ss), hercynite ($FeAl_2O_4$), ulvospinel (Fe_2TiO_4), ilmenite ($FeTiO_3$, and BAIT (essentially $BaAl_2Fe_8Ti_{13}O_{38}$). Waste loadings about 4 times higher than those of glass could readily be achieved, offering considerable economic and safety benefits relative to glass technology.

653 (CONF-790420--, pp 179-182) USE OF NATURAL ALUMINOSILICATES AND POROUS CERAMIC MATERIALS FOR THE INCLUSION OF RADIOACTIVE WASTES. Lazarev, L.N.; Shashukov, E.A.; Kuznetsov, Yu.V.; Lyubtsev, R.I. (Radium Inst., Leningrad, USSR). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Data on using the porous inorganic materials, such as diatomite and shamote, for the incorporation of radioactive wastes are presented. In laboratory-scale experiments on simulated liquid wastes it has been shown that the operations of solution absorption by porous materials, drying and calcination of salts in pores, and the subsequent conversion into glassy phosphate-silicate products seem to be promising from a technological point of view. This product is characterized by a sodium leaching rate of the order of 10^{-5} g/cm^2 . d and good resistance to crystallization. The content of various oxides in the wastes can attain 15 to 20 wt %. The data on the dependence of plasticity and open porosity of the clay-like products on Na_2O, SrO, ZrO_2, and MnO_2 content are also given. 3 figures, 3 tables.

654 (CONF-790420--, pp 183-187) VITRIFICATION OF ICPP HIGH-LEVEL ZIRCONIA CALCINE. Berreth, J.R.; Gombert, D. II; Cole, H.S. (Allied Chemical Corp., Idaho Falls, ID). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
High-level radioactive calcined defense waste (approx. 50 wt % CaF_2) is vitrified using a frit containing 66% SiO_2, 24% Na_2O, 8% B_2O_3, and 2% CuO. Effects of Na, B, Li, Zn, Cu, and P on viscosity and acid leach resistance were measured. The glass contains up to 9% fluoride. Glass properties were measured. 6 tables.

655 (CONF-790420--, pp 188-192) DEVELOPMENT AND CHARACTERIZATION OF THE GLASS-CERAMIC VCP 15 FOR INMOBILIZATION OF HIGH-LEVEL-LIQUID RADIOACTIVE WASTE. Guber, W. (Kernforschungszentrum, Karlsruhe, Germany);

Hussain, M.; Kahl, L.; Mueller, W.; Saidl, J. May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Complementary to the glass developments for HAW solidification, a glass-ceramic matrix was synthesized (VC 15) and the derived HAW-containing product (VCP 15) was investigated on both inactive and highly radioactive scales. In comparing the glass-ceramic matrix with the glass products, an improvement in thermal properties was found, but the leaching resistance was only slightly better. The main advantage of the glass-ceramic system is its higher thermodynamic equilibrium, which increases the long-term stability and safety of solidified HAW in final storage.

656 (CONF-790420--, pp 321-326) POROUS GLASS MATRIX METHOD FOR ENCAPSULATING HIGH-LEVEL NUCLEAR WASTES. Macedo, P.B.; Tran, D.C.; Simmons, J.H.; Saleh, M.; Barkett, A.; Simmons, C.J.; Lagakos, N.; DeWitt, E. (Catholic Univ. of America, Washington, DC). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
A novel process which uses solidified porous high-silica glass powder to fixate radioactive high-level wastes is described. The process yields cylinders consisting of a core of high-silica glass containing the waste elements in its structure and a protective layer also of high-silica glass completely free of waste elements. The process can be applied to waste streams containing 0 to 100% solids. The core region exhibits a higher coefficient of thermal expansion and a lower glass transition temperature than the outer protective layer. This leads to mechanical strengthening of the glass and good resistance to stress corrosion by the development of a high residual compressive stress on the surface of the sample. Both the core and the protective layer exhibit extremely high chemical durability and offer an effective fixation of the radioactive waste elements, including ^{239}Pu and ^{99}Tc which have long half-lives, for calculated periods of more than 1 million years, when temperatures are not allowed to rise above 100°C.

657 (CONF-790420--, pp 338-341) UTILIZATION OF BOROSILICATE GLASS FOR TRANSURANIC WASTE IMMOBILIZATION. Ledford, J.A.; Williams, P.M. (Rockwell International, Golden, CO). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Incinerated transuranic waste and other low-level residues have been successfully vitrified by mixing with boric acid and sodium carbonate and heating to 1050°C in a bench-scale continuous melter. The resulting borosilicate glass demonstrates excellent mechanical durability and chemical stability.

658 (CONF-790420--, pp 342-348) CRYSTALLOCHEMICAL STABILIZATION OF RADWASTE ELEMENTS IN PORTLAND CEMENT CLINKER. Jantzen, C.M.; Glasser, F.P. (Univ. of Aberdeen, Old Aberdeen, Scotland). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Most of the elements present in a model PW-4b radwaste have been successfully incorporated during clinkering into the calcium silicate and ferrite phases comprising Portland cement. The bulk composition of a model waste has been systematically altered by the addition of other nonradioactive components to produce an inherently cementitious material. This has the advantage that (1) the radwaste ions are substituted directly into the crystal structure of the anhydrous cement phases, (2) the unhydrated cement continues to behave as a ceramic, (3) during hydration the radwaste ions can be more readily incorporated into the hydration products, and (4) the hydration products should represent a close approach to thermodynamic stability during storage in geological environments, e.g., low pressures and temperatures between 0°C and approx. 180°C. 4 figures, 4 tables.

659 (CONF-790420--, pp 354-358) PROCESSES FOR IMMOBILIZATION OF HIGH-LEVEL SOLID WASTES BY GLASS AND CERAMIC MATRICES. Lin, K.H.; Clark, W.E.; Howerton, W.B. (Oak Ridge National Lab., TN). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Processes for the immobilization of waste SiC hulls and fissile particles from reprocessing of HTGR fuels are presented. Compressed cylinders of waste-matrix material were formed under pressures of approx. 35, 71, or 142 MPa and sintered at temperatures ranging from approx. 500 to 1025°C for approx. 1 h. The cylinders containing 50% SiC-25% soft glass-25% red clay possess the most desirable properties (high mechanical strength, low surface area, and low leachability) of the several different compositions studied. Within the pressure and temperature ranges studied, the pressure of cylinder formation and the sintering temperature appear to have relatively minor effects on those properties except for the initial cesium leachability. Higher pressure and temperature would tend to reduce the initial leachability significantly. 5 tables.

660 (CONF-790420--, pp 359-364) INCORPORATION OF PRECIPITATE FROM TREATMENT OF MEDIUM-LEVEL LIQUID RADIOACTIVE WASTE INTO GLASS MATRIX OR CERAMICS TOGETHER WITH HIGH-LEVEL LIQUID WASTE. Hussain, M. (Kernforschungszentrum, Karlsruhe GmbH, Germany); Kahl, L. May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
MAW-splitting, i.e., precipitation and separation of the radioactive matter from the bulk liquid, has been developed at Kernforschungszentrum Karlsruhe (KfK) as an alternataive to direct solidification of MLLW-concentrates by bituminization or cementation. More than 90% of the total radioactivity is removed from MLLW stream by absorbing it on surface rich precipitate, which is ultimately vitrified with HLLW. An addition of MLLW-precipitate to a matrix (glass or glass-ceramic), to which HLLW has already been incorporated, showed no significant decrease in product quality or increase in product amount. 5 tables.

661 (CONF-790420--, pp 370-373) STABILIZATION OF HIGH-LEVEL WASTE FROM A CHLORIDE VOLATILITY NUCLEAR FUEL REPROCESSING SYSTEM. Smith, L.A.; Thornton, T.A. (Babcock and Wilcox Co., Lynchburg, VA). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Methods for stabilizing high-level waste

from a chloride volatility thorium-based fuel coprocessing system have been studied. The waste, which is present as chloride salts, is combined with SiO_2 or Al_2O_3 and pyrohydrolyzed to remove the chloride ions. The resulting solid is then combined with a flux and glassified. 3 figures, 4 tables.

662 (CONF-790420--, pp 374-377) GLASS-CRYSTALLINE MATERIALS FOR ACTIVE WASTE INCORPORATION. Kulichenko, V.V.; Krylova, N.V.; Vlasov, V.I.; Polyakov, A.S. (State Committee for the Utilization of Atomic Energy, Moscow, USSR). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
This paper presents the results of investigations into the possibility and conditions for using glass-crystalline materials for the incorporation of radionuclides. Materials of a cast pyroxene type that are obtained by smelting calcined wastes with acid blast furnace slags are described. A study was also made of materials of a basalt type prepared from wastes with and without alkali metal salt. Changes in the structure and properties of materials in the process of storage at different temperatures have been studied.

663 (CONF-790420--, pp 229-232) USE OF GLASS-CERAMIC MATERIALS FOR THE FIXATION OF RADIOACTIVE WASTES. Minaev, A.A.; Oziraner, S.N.; Prokhorova, N.P. (State Committee on Peaceful Use of Atomic Energy, Moscow, USSR). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
This paper is concerned with the study of the crystallization of phosphate and silicate glasses. It was shown that temperature and time of storage influence considerably the crystallization of glasses and that crystallization very often increases their rates of leaching to a great extent. However, there are glasses in which crystallization does not result in leaching rate increase. It seems reasonable to use these materials for the fixation of radioactive wastes. The main reasons for the increase in the leaching rate during crystallization are the formation of porosity and soluble crystal phases.

664 (CONF-790420--, pp 25-26) PRINCIPAL TRENDS OF INVESTIGATIONS CARRIED ON IN THE USSR ON INCORPORATION OF HIGHLY ACTIVE WASTES INTO GLASS AND CERAMIC TYPE MATERIALS. Polyakov, A.S. (State Committee for the Utilization of Atomic Energy, Moscow, USSR). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Studies in the USSR on incorporation of high level waste into glass and ceramic materials are described.

665 (CONF-791112--17) TECHNICAL FEASIBILITY OF KRYPTON-85 STORAGE IN SODALITE. Benedict, R.W.; Christensen, A.B.; Del Debbio, J.A.; Keller, J.H.; Knecht, D.A. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). 1979. Contract EY-76-C-07-1570. 7p. Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
Based on these experimental results, the process that is technically feasible for a reference 2000 metric ton of heavy metal (MTHM) per year reprocessing plant producing approx. 17 MCi or approx. 190 m^3 at STP would encapsulate krypton at approx. 20 cm^3/g from krypton at temperatures greater than 575°C and pressures greater than 1600 atm with one batch a day in a 58-L high pressure vessel. Based on preliminary measurements at 500°C, the same process also would be feasible for a 70% krypton and 30% xenon mixture. 7 figures.

666 (CONF-791112--43) VITRIFICATION OF HIGH-LEVEL ALUMINA NUCLEAR WASTE. Brotzman, J.R. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). 1979. Contract EY-76-C-07-1570. 10p. Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
Borophosphate glass compositions have been developed for the vitrification of a high-alumina calcined defense waste. The effect of substituting SiO_2, P_2O_5 and CuO for B_2O_3 on the viscosity and leach resistance was measured. The effect of the alkali to borate ratio and the Li_2O:Na_2O ratio on the melt viscosity and leach resistance was also measured.

667 (CONF-791112--57) DEVELOPMENT AND CHARACTERIZATION OF CERMET FORMS FOR RADIOACTIVE WASTE. Aaron, W.S.; Quinby, T.C.; Kobisk, E.H. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 8p. Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
Cermets designed to isolate high-level wastes in a solid form are a composite consisting of various ceramic phase particles uniformly dispersed in and microencapsulated by an iron-nickel base alloy matrix. The metal matrix provides this waste form with many advantageous features including excellent thermal conductivity and mechanical strength. These cermets are formed by first dissolving the waste in molten urea, precipitating and calcining all the constituents, compacting the calcine, and sintering and reduction to form the final product. The exact formulation of cermets through additions to the waste is designed to fix most of the fission products in stable, leach resistant ceramic phases which are subsequently microencapsulated by an alloy matrix. The alloy matrix, which is derived primarily from the waste itself and includes the reducible fission and activation products from the waste, can be compositionally adjusted through additions to optimize its corrosion resistance under conditions existing in various disposal environments. The processes by which cermets are formed include several new and unique materials preparation options that are being developed to permit engineering scale-up and to be compatible with remote operations. Cermets formed by alternate processing methods are being characterized. Initially, cermet samples were prepared using a laboratory scale, batch process developed for the preparation of special ceramics having high compositional uniformity and excellent sinterability. The modification of this batch process to one suitable for scale-up and remote operation is the subject of this paper. Cermet characterization is also discussed.

668 (CONF-791112--63) METHODS FOR SEPARATING ACTINIDES FROM REPROCESSING AND REFABRICATION PLANT WASTES. Tedder, D.W.; Finney, B.C.; Blomeke, J.O. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 8p. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Chemical processing flowsheets have been developed to partition actinides from all actinide-bearing LWR fuel reprocessing and refabrication plant wastes. These wastes include high-activity-level liquids, scrap recovery liquors, HEPA filters and incinerator ashes, and chemical salt wastes such as sodium carbonate scrub solutions, detergent cleanup streams, and alkaline off-gas scrubber liquors. The separations processes that were adopted for this study are based on solvent extraction, cation exchange chromatography, and leaching with Ce^{4+}-HNO_3 solution.

669 (CONF-791112--64) REACTION OF HYDROGEN AND OXYGEN IN THE PRESENCE OF CONCRETES INCORPORATING SIMULATED RADIOACTIVE WASTE. Katz, S. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 16p. Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

The radiolysis of contained water, with the potential of pressurization due to the accumulation of these radiolytically produced gases, has been identified as a major concern for radioactive wastes fixed in cementitious matrices. One estimate of the pressure build-up is that about 100 atmospheres pressure could accumulate in a standard canister containing alpha waste after 100,000 years. Since the radiolysis of concrete is dependent on the amount of unbound or free water present in the system, removal of all or most of this water would greatly reduce this rate. Regardless of the production rate however, pressurization from the accumulation of hydrogen and oxygen would be avoided if there were sufficient recombination of these gases as, or after, they were generated. These studies were undertaken to determine the recombination rates obtained with special cementitious matrices. The basis for this study was the realization that FUETAP concrete containing radioactive waste or perhaps some other added constituent could provide a surface to catalyze the recombination of any radiolytically produced hydrogen and oxygen. In this investigation, the rate of reaction between hydrogen and oxygen was measured by determining the yield of water or the depletion of oxygen, as mixture of these gases flowed through a bed of the test material. Three cementitious mixtures were examined, a neat cement paste and two FUETAP concretes. The data obtained with each of the three experimental systems show that there is a high hydrogen-oxygen recombination rate in presence of FUETAP concretes containing simulated waste. The data suggest that gas pressurization may not be a problem with FUETAP concretes containing waste, if one can ensure that adequate contact is maintained between the gases and the available solid surfaces. (DC)

670 (CONF-791185--1) ORIGIN, MAGNITUDE, AND TREATMENT OF RADIOACTIVE WASTES. Blomeke, J.O. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 27p. Dep. NTIS, PC A03/MF A01.

From ANS student chapter seminar; College Station, TX, USA (5 Nov 1979).

Radioactive wastes in solid, liquid, and gaseous forms are generated wherever radioactive materials are handled. Unlike conventional industrial wastes, most of them are not amenable (within presently available technology) to treatment that can destroy their toxicity. They become innocuous only through natural decay, and many of the isotopes of concern decay so slowly that they must be isolated from the environment for hundreds of thousands of years. The primary objective of nuclear waste management is to protect man and his environment from these materials by providing containment by means that are available within present or near-future technology. The origin and nature of the wastes are reviewed, and the methods of treatment that are in use or that soon can be made available are described.

671 (CONF-791234--7) INEL WASTE CLEANUP. Chapin, J.A. (EG and G Idaho, Inc., Idaho Falls (USA)). 1979. Contract AC07-76ID01570. 41p. NTIS, PC A03/MF A01.

From Environmental decontamination workshop; Oak Ridge, TN, USA (4 Dec 1979).

Decommissioning and decontamination activities at the Idaho National Engineering Laboratory are discussed. The projects planned and completed are presented. Problems encountered on these projects are discussed. A developmental program is recommended. Contaminated areas consist of test reactors, reactor support facilities, a fuel reprocessing facility and various soil areas. One D and D project in 1960 occurred as a result of an accident at a low-power reactor in which 3 persons were killed, the reactor and containment building were destroyed, and large areas of land were contaminated. (DC)

672 (CONF-800211--2(Draft)) PROCESSES FOR THE CONTROL OF $^{14}CO_2$ DURING REPROCESSING. Notz, K.J.; Holladay, D.W.; Forsberg, C.W.; Haag, G.L. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 28p. Dep. NTIS, PC A03/MF A01.

From International symposium on management of gaseous wastes from nuclear facilities; Vienna, Austria (18 Feb 1980).

The fixation of $^{14}CO_2$ may be required at some future time because of the significant fractional contribution of ^{14}C, via the ingestion pathway, to the total population dose from the nuclear fuel cycle, even though the actual quantity of this dose is very small when compared to natural background. The work described here was done in support of fuel reprocessing development, of both graphite fuel (HTGRs) and metal-clad fuel (LWRs and LMFBRs), and was directed to the control of $^{14}CO_2$ released during reprocessing operations. However, portions of this work are also applicable to the control of $^{14}CO_2$ released during reactor operation. The work described falls in three major areas: (1) The application of liquid-slurry fixation with $Ca(OH)_2$, which converts the CO_2 to $CaCO_3$, carried out after treatment of the CO_2-containing stream to remove other gaseous radioactive components, mainly ^{85}Kr. This approach is primarily for application to HTGR fuel reprocessing. (2) The above process for CO_2 fixation, but used ahead of Kr removal, and followed by a molecular sieve process to take out the ^{85}Kr. This approach was developed for use with HTGR reprocessing, but certain aspects also have application to metal-clad fuel reprocessing and to reactor operation. (3) The use of solid $Ba(OH)_2$ hydrate reacting directly with the gaseous phase. This process is generally applicable to both reprocessing and to reactor operation.

673 (CONF-800305--4) CORROSION EXPERIENCE IN CALCINATION OF LIQUID NUCLEAR WASTE. Zimmerman, C.A. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). 1980. Contract EY-76-C-07-1570. 26p. Dep. NTIS, PC A03/MF A01.

From Corrosion/80 NACE meeting; Chicago, IL, USA (6 Mar 1980).

The Waste Calcining Facility (WCF) at the Idaho National Engineering Laboratory became operational in 1963. Since that time, approximately 13,337,137 litres (3,523,375 gallons) of liquid nuclear wastes, generated during the reprocessing of spent nuclear fuel materials, have been reduced to dry granular solids. The volume reduction is about seven or eight gallons of liquid waste to one gallon of dry granular solids. This paper covers some of the corrosion experiences encountered in over fifteen years of operating that calcination facility. 7 figures, 7 tables.

674 (CONF-800313--2) VOLUME REDUCTION OF CONTAMINATED METAL WASTE. Copeland, G.L.; Heestand, R.L. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 9p. Dep. NTIS, PC A02/MF A01.

From Waste management conference; Tucson, AZ, USA (10 Mar 1980).

A conceptual waste treatment plan comprises sorting the metal scrap into alloy types, size reduction of the scrap to fit in the melting equipment, further alloy segregation by sequentially raising the temperature of mixed scrap lots and allowing the low-melting alloys to drip-melt out, induction melting of the high-melting alloys, and casting all alloy type into ingots. Laboratory melts of various metals were made to compare the observed partitioning of uranium to the slag with thermodynamic calculations. An engineering-scale demonstration was also conducted in which typical metal scrap contaminated with UO_2 was processed by mechanical size reduction, drip melting, and induction melting. Results show decontamination was successful. 5 figures, 2 tables. (DLC)

675 (CONF-800313--3) OVERVIEW OF HIGH-LEVEL WASTE MANAGEMENT ACCOMPLISHMENTS. Lawroski, H.; Berreth, J.R.; Freeby, W.A. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). 1980. Contract EY-76-C-07-1570. 14p. Dep. NTIS, PC A02/MF A01.

From Waste management conference; Tucson, AZ, USA (10 Mar 1980).

Storage of power reactor spent fuel is necessary at present because of the lack of reprocessing operations particularly in the U.S. By considering the above solidification and storage scenario, there is more than reasonable assurance that acceptable, stable, low heat generation rate, solidified waste can be produced, and safely disposed. The public perception of no waste disposal solutions is being exploited by detractors of nuclear power application. The inability to even point to one overall system demonstration lends credibility to the negative assertions. By delaying the gathering of on-line information to qualify repository sites, and to implement a demonstration, the actions of the nuclear power detractors are self serving in that they can continue to point out there is no demonstration of satisfactory high-level waste disposal. By maintaining the liquid and solidified high-level waste in secure above ground storage until acceptable decay heat generation rates are achieved, by producing a compatible, high integrity, solid waste form, by providing a second or even third barrier as a compound container and by inserting the enclosed waste form in a qualified repository with spacing to assure moderately low temperature disposal conditions, there appears to be no technical reason for not progressing further with the disposal of high-level wastes and needed implementation of the complete nuclear power fuel cycle.

676 (CONF-800416--4) ORNL DECONTAMINATION AND DECOMMISSIONING PROGRAM. Bell, J.P. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 29p. Dep. NTIS, PC A03/MF A01.

From UCC-ND and GAT waste management seminar program; Portsmouth, OH, USA (22 Apr 1980).

A program has been initiated at ORNL to decontaminate and decommission surplus or abandoned nuclear facilities. Program planning and technical studies have been performed by UCC-ND Engineering. A feasibility study for decommissioning the Metal Recovery Facility, a fuel reprocessing pilot plant, has been completed.

677 (CONF-800607--79) SPENT LWR FUEL ENCAPSULATION AND DRY STORAGE DEMONSTRATION. Bahorich, R.J.; Durrill, D.C.; Cross, T.E.; Unterzuber, R. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Advanced Energy Systems Div.). 1980. Contract AC08-76NV00597. 34p. NTIS, PC A03/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

In 1977 the Spent Fuel Handling and Packaging Program (SFHPP) was initiated by the Department of Energy to develop and test the capability to satisfactorily encapsulate typical spent fuel assemblies from commercial light-water nuclear power plants and to establish the suitability of one or more surface and near surface concepts for the interim dry storage of the encapsulated spent fuel assemblies. The E-MAD Facility at the Nevada Test Site, which is operated for the Department of Energy by the Advanced Energy Systems Division (AESD) of the Westinghouse Electric Corporation, was chosen as the location for this demonstration because of its extensive existing capabilities for handling highly radioactive components and because of the desirable site characteristics for the proposed storage concepts. This paper describes the remote operations related to the process steps of handling, encapsulating and subsequent dry storage of spent fuel in support of the Demonstration Program.

678 (CONF-800743--5) EXPERIMENTAL STUDIES AT THE IDAHO CHEMICAL PROCESSING PLANT ON ACTINIDE PARTITIONING FROM ACIDIC NUCLEAR WASTES. McIssaac, L.D.; Baker, J.D.; Meikrantz, D.H.; Schroeder, N.C. (Idaho National Engineering Lab., Idaho Falls (USA)). 1980. Contract AC07-76ID01570. 24p. NTIS, PC A02/MF A01.

From International conference on nuclear waste transmutation; Austin, TX, USA (22 Jul 1980).

Wastes generated at ICPP and in the reprocessing of LWR fuel is discussed separately. DHDECMP is used as extractant. Studies on DHDECMP purification and toxicity, diluent effects, reaction kinetics, radiolysis, mixer-settler performance, etc. are reported. 10 tables, 3 figures. (DLC)

679 (CONF-800743--12) REMOVAL OF ACTINIDES FROM NUCLEAR FUEL REPROCESSING WASTES: ENGINEERING STUDIES. Maxey, H.R.; McIsaac, L.D.; Chamberlain, D.B.; McManus, G.J. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). 1980. Contract AC07-ID01675. 25p. NTIS, PC A02/MF A01.

From International conference on nuclear waste transmutation; Austin, TX, USA (22 Jul 1980).

The major pilot plant effort has been directed towards understanding the behavior of

the extraction column. This emphasis was placed on extraction because the actinide-free raffinate from this column is the process product. Although actual radioactive feeds have been used only in a very limited number of tests, the combination of simulated column tests, minimixer-settler tests, and pilot plant experiments have shown that an actinide-free raffinate can be produced. A pulsed sieve plate column can achieve this separation in a reasonable height. In the design of an extraction process, there are several tradeoffs that have to be examined. One such tradeoff is that between column capacity and separation efficiency; an increase in column diameter (or capacity) means a faster processing rate, but, unfortunately, it also means a decrease in column efficiency. Therefore, the greater the diameter, the larger the HTU and the higher the column has to be to achieve the desired separation. In nuclear applications this is very important since column height is limited by the size of the process containment building. In increasing the diameter from 3 to 8 inches, an increase in HTU's up to 50% was observed by Sege. For plant operations, the pulse columns could probably be pulsed at 40 CPM, 2.5 cm per pulse. At these conditions, the HTU should be no greater than 0.75 m, even considering changes resulting from scaleup.

680 (CONF-800802--11) MELTING METAL WASTE FOR VOLUME REDUCTION AND DECONTAMINATION. Copeland, G.L.; Heshmatpour, B.; Heestand, R.L. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 11p. NTIS, PC A02/MF A01.
From 89. annual meeting of the American Institute of Chemical Engineers; Portland, OR, USA (17 Aug 1980).
Melt-slagging was investigated as a technique for volume reduction and decontamination of radioactively contaminated scrap metals. Experiments were conducted using several metals and slags in which the partitioning of the contaminant U or Pu to the slag was measured. Concentrations of U or Pu in the metal product of about 1 ppM were achieved for many metals. A volume reduction of 30:1 was achieved for a typical batch of mixed metal scrap. Additionally, the production of granular products was demonstrated with metal shot and crushed slag.

681 (CONF-800814--12) MICROBIAL UPTAKE OF URANIUM, CESIUM, AND RADIUM. Strandberg, G.W.; Shumate, S.E. II; Parrott, J.R. Jr.; McWhirter, D.A. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 35p. NTIS, PC A03/MF A01.
From 180. American Chemical Society meeting/2. chemical congress of the North American Continent; Las Vegas, NV, USA (24 Aug 1980).
The ability of diverse microbial species to concentrate uranium, cesium, and radium was examined. Saccharomyces cerevisiae, Pseudomonas aeruginosa, and a mixed culture of denitrifying bacteria accumulated uranium to 10 to 15% of the dry cell weight. Only a fraction of the cells in a given population had visible uranium deposits in electron micrographs. While metabolism was not required for uranium uptake, mechanistic differences in the metal uptake process were indicated. Uranium accumulated slowly (hours) on the surface of S. cerevisiae and was subject to environmental factors (i.e., temperature, pH, interfering cations and anions). In contrast, P. aeruginosa and the mixed culture of denitrifying bacteria accumulated uranium rapidly (minutes) as dense, apparently random, intracellular deposits. This very rapid accumulation has prevented us from determining whether the uptake rate during the transient between the initial and equilibrium distribution of uranium is affected by environmental conditions. However, the final equilibrium distributions are not affected by those conditions which affect uptake by S. cerevisiae. Cesium and radium were concentrated to a considerably lesser extent than uranium by the several microbial species tested. The potential utility of microorganisms for the removal and concentration of these metals from nuclear processing wastes and several bioreactor designs for contacting microorganisms with contaminated waste streams will be discussed.

682 (CONF-800914--3) MICROWAVE ENERGY FOR POST-CALCINATION TREATMENT OF HIGH-LEVEL NUCLEAR WASTES. Gombert, D.; Priebe, S.J.; Berreth, J.R. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). 1980. Contract AC07-79ID01675. 10p. NTIS, PC A02/MF A01.
From IEEE meeting; Cincinnati, OH, USA (29 Sep 1980).
Portions of document are illegible.
High-level radioactive wastes generated from nuclear fuel reprocessing require treatment for effective long-term storage. Heating by microwave energy is explored in processing of two possible waste forms: (1) drying of a pelleted form of calcined waste; and (2) vitrification of calcined waste. It is shown that residence times for these processes can be greatly reduced when using microwave energy rather than conventional heating sources, without affecting product properties. Compounds in the waste and in the glass frit additives couple very well with the 2.45 GHz microwave field so that no special microwave absorbers are necessary.

683 (CONF-800943--(Summ.), pp 65-67) SPENT-FUEL DISASSEMBLY AND CANNING PROGRAMS AT THE BARNWELL NUCLEAR FUEL PLANT (BNFP). Townes, G.A. (Allied-General Nuclear Services, Barnwell, SC). 1980.

685 (CONF-801038--1(Draft)) ORGANIC IODINE REMOVAL FROM SIMULATED DISSOLVER OFF-GAS STREAMS USING SILVER-EXCHANGED MORDENITE. Jubin, R.T. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 31p. NTIS, PC A03/MF A01.
From 16. DOE nuclear air cleaning conference; San Diego, CA, USA (20 Oct 1980).
The removal of methyl iodide by absorption onto silver mordenite was studied using a simulated off-gas from the fuel dissolution step of a nuclear fuel reprocessing plant. The methyl iodide absorption of silver mordenite was examined for the effects of NO/sub x/, humidity, iodine concentration, filter

temperature, and filter pretreatment. The highest iodine loading achieved in these tests has been 34 mg CH_3I per g of substrate, approximately five times less than the elemental iodine loadings. Results indicate that a filter operating at a temperature of 150°C obtained higher iodine loadings than a similar filter operating at 100°C. Pretreatment of the sorbent bed with hydrogen, rather than dry air, at a temperature of 200°C also improved the loading. Variations in the methyl iodide concentration had minimal effects on the overall loading. Filters exposed to moist air streams attained higher loadings than those in contact with dry air. A study of the regeneration characteristics of silver mordenite indicates limited adsorbent capacity after complete removal of the iodine with 4% hydrogen in the regeneration gas stream at 500°C. 9 figures.

686 (CONF-801038--4) VOLATILITIES OF RUTHENIUM, IODINE, AND TECHNETIUM ON CALCINING FISSION PRODUCT NITRATE WASTES. Rimshaw, S.J.; Case, F.N. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 28p. NTIS, PC A03/MF A01.

From 16. DOE nuclear air cleaning conference; San Diego, CA, USA (20 Oct 1980).

Various high-level nitrate wastes were subjected to formic acid denitration. Formic acid reacts with the nitrate anion to yield noncondensable, inert gases according to the following equation: 4 HCOOH + 2 HNO_3 → N_2O + 4 CO_2 + 5 H_2O. These gases can be scrubbed free of ^{106}Ru, ^{131}I, and ^{99}Tc radioactivities prior to elimination from the plant by passage through HEPA filters. The formation of deleterious NO/sub x/ is avoided. Moreover, formic acid reduces ruthenium to a lower valence state with a sharp reduction in RuO_4 volatility during subsequent calcination of the pretreated waste. It is shown that a minimum of 3% of RuO_4 in an off-gas stream reacts with Davison silica gel (Grade 40) to give a fine RuO_2 aerosol having a particle size of 0.5 μ. This RuO_2 aerosol passes through water or weak acid scrub solutions but is trapped by a caustic scrub solution. Iodine volatilizes almost completely on calcining an acidic waste, and the iodine volatility increases with increasing calcination temperature. On calcining an alkaline sodium nitrate waste the iodine volatility is about an order of magnitude lower, with a relatively low iodine volatility of 0.39% at a calcination temperature of 250°C and a moderate volatility of 9.5% at 600°C. Volatilities of ^{99}Tc were generally <1% on calcining acidic or basic wastes at temperatures of 250 to 600°C. Data are presented to indicate that ^{99}Tc concentrates in the alkaline sodium nitrate supernatant waste, with approx. 10 mg ^{99}Tc being associated with each curie of ^{137}Cs present in the waste. It is shown that lutidine (2,4 dimethyl-pyridine) extracts Tc(VII) quantitatively from alkaline supernatant wastes. The distribution coefficient (K/sub D/) for Tc(VII) going into the organic phase in the above system is 102 for a simulated West Valley waste and 191 for a simulated Savannah River Plant (SRP) waste.

687 (CONF-801038--6) INCINERATION OF CONTAMINATED ORGANIC SOLVENTS IN A FLUIDIZED-BED CALCINER. Schindler, R.E. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). 1980. Contract AC07-79ID01675. 9p. NTIS, PC A02/MF A01.

From 16. DOE nuclear air cleaning conference; San Diego, CA, USA (20 Oct 1980).

The reprocessing of expended reactor fuels at the Idaho Chemical Processing Plant (ICPP) generates contaminated organic solvents. An evaluation of potential management alternatives shows that several are suitable for management of contaminated solvents containing tri-butyl phosphate (TBP): the solvent could be burned in a commercially-available burner which absorbs the phosphorus on a fluidized-bed of limestone leaving a solid product for burial; the solvent could be burned in a small fluidized-bed calciner which solidifies non-radioactive feed by in-bed combustion of the contaminated solvent. The fluidized-bed absorbs the phosphate forming a solid product for burial; the solvents could be solidified with a gel or sorbant for burial if the reprocessing system were modified to reduce the solvent volume; and the contaminated solvent could be burned in an existing fluidized-bed calciner designed for solidifying high-level aqueous wastes. Burning the solvent in the existing calciner was selected for process verification because it provides an existing burner, off-gas system, and solids transfer and storage system. No additional wastes are generated. A set of four pilot-plant tests verified the absence of adverse effects from the phosphorus in the fuel when calcining simulated ICPP aqueous wastes. Essentially all of the phosphorus remained in the calcined solids with only a negligible quantity remaining in the scrubbed off-gas. Combustion efficiency was high (93 to 96%). There were no observable adverse effects on solids in the scrubbing system, corrosion rates, or solids flowability (for retrieval). Conclusions of general applicability are: alternative technologies are available for disposal of contaminated solvents, and the use of an existing fuel-using facility, e.g., calciner or incinerator - designed for contaminated wastes will usually be cost effective.

688 (CONF-801038--7) PRELIMINARY SAFETY EVALUATION OF A COMMERCIAL-SCALE KRYPTON-85 ENCAPSULATION FACILITY. Christensen, A.B.; Tanner, J.E.; Knecht, D.A. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). 1980. Contract AC07-79ID01675. 14p. NTIS, PC A02/MF A01.

From 16. DOE nuclear air cleaning conference; San Diego, CA, USA (20 Oct 1980).

This paper demonstrates that a commercial-scale facility for encapsulating krypton-85 in zeolite-5A or glass at a 2000 MTHM per year nuclear fuel reprocessing plant can be designed to contain fragments and the 340 to 850 kCi krypton-85 inventory from an assumed catastrophic failure of the high pressure vessel. The vessel failure was assumed as a worst case and was not based on a detailed design evaluation or operating experience. The process design is based on existing commercial hot isostatic pressing technology operated at up to 40 times the scale required for krypton encapsulation. From the calculated process gas inventory in the pressure vessel and vessel design, the maximum explosive energy of 8.4 kg TNT and resulting vessel plug and fragment velocities were calculated. The facility Containment Cell housing the high pressure vessel was designed to contain the gases, fragments, and the shock wave energy calculated for a hypothetical vessel failure. The Access Cell located directly above the Containment Cell was designed to be a tertiary confinement of krypton-85, should the access hatch be breached. 3 figures, 2 tables.

689 (CONF-801124--9) ADVANCED METHOD FOR MAKING VITREOUS WASTE FORMS. Pope, J.M.; Harrison, D.E. (Westinghouse Research and

Development Center, Pittsburgh, PA (USA)). 1980. Contract AC08-76NV00597. 8p. NTIS, PC A02/MF A01.

From 3. annual meeting of the Materials Research Society; Boston, MA, USA (17 Nov 1980).

A process is described for making waste glass that circumvents the problems of dissolving nuclear waste in molten glass at high temperatures. Because the reactive mixing process is independent of the inherent viscosity of the melt, any glass composition can be prepared with equal facility. Separation of the mixing and melting operations permits novel glass fabrication methods to be employed.

690 (CONF-801206--2) CORRELATION OF LEACHANT ANALYSES AND WEIGHT LOSS MEASUREMENTS IN THE LEACHING OF HIGH-IRON SYNTHETIC BASALTS. Tallman, R.L. (EG and G Idaho, Inc., Idaho Falls (USA)). 1980. Contract AC07-76ID01570. 5p. NTIS, PC A02/MF A01.

From ORNL conference on the leachability of radioactive solids; Gatinburg, TN, USA (9 Dec 1980).

Materials which simulate the slag product of the Slagging Pyrolysis Incinerator under consideration for the INEL Transuranic Waste Treatment Facility have been characterized. This slag is an iron-rich basalt-like material designed to contain the low-level TRU waste stored at INEL. Leach tests on synthetic compositions have been performed to provide information for process design and to indicate the quality of the waste form. Experiments have been performed to confirm that microbalance weight losses agree with the contents of the leachants as determined by chemical analyses. Deionized water was used as the leachant and the leachants from experiments at 70°C were analyzed by atomic absorption and inductively-coupled plasma and flame emission techniques and by isotopic dilution mass spectrometry (for uranium). Leachant analyses provided both elemental leach rates ad weight loss leach rates. The weight loss leach rates were calculated from the sums of the analytically determined elemental contents of the leachants, converted to weights of oxides. These rates correlate with the elemental leach rates calculated from the microbalance weight loss, measured by a substitution-type electronic microbalance. Sample composition and devitrification effects, including microcracking effects, and comparisons of elemental leachant analyses and leach rates with microbalance weight losses are the most significant results of this work.

691 (COO--2510-15) ADVANCED WASTE FORMS RESEARCH AND DEVELOPMENT. FINAL REPORT, OCTOBER 1, 1978-SEPTEMBER 30, 1979. McCarthy, G.J. (Pennsylvania State Univ., University Park (USA). Materials Research Labs.). Aug 1979. Contract EY-76-S-02-2510-092. 36p. Dep. NTIS, PC A03/MF A01.

Research on supercalcine-ceramics was conducted with the objectives of characterizing the phases and of applying them to fluorine-containing Thorex wastes. This report is concerned with quantitative phase analysis of complex ceramics using x-ray powder diffraction methods and with scanning transmission electron microscopy of these ceramics and its correlation with fluorite structure solid solution phase diagrams. (DLC)

692 (CS-INIS--258, pp 134-140) TECHNIQUE OF MASURING DEACTIVATION EFFICIENCY OF WATER TREATMENT EQUIPMENT IN NUCLEAR POWER FACILITIES BY GAMMA SPECTROMETRIC ANALYSIS. Biheller, J. (Vyzkumny Ustav Vodohospodarsky, Prague (Czechoslovakia)). Sep 1978. (In Czech).

From 9. national conference on radionuclides and ionizing radiation in water management; Liberec, Czechoslovakia (28 Sep 1978).

Gamma spectrometry was chosen for investigating the decontamination efficiency of systems for the treatment of water from nuclear installations. Waste water was modelled by a mixture of fission products dissolved in mineral acids, sampling was carried out at several points of the treatment system. The measuring instruments consisted of multi-channel analyzer CANBERRA 8180 and a Ge-Li detector. The analyzer has a punched tape output which allows automatic spectra evaluation. The gamma spectrometric method used to investigate the decontamination efficiency of waste water treatment plants is cost, energy and labour saving.

693 (CS-INIS--258, pp 39-46) PROBLEMS OF DEACTIVATING LIQUID EFFLUENTS FROM NUCLEAR FACILITIES. Bor, J.; Mikolas, P. (Vyzkumny Ustav Vodohospodarsky, Prague (Czechoslovakia)). Sep 1978. (In Czech).

From 9. national conference on radionuclides and ionizing radiation in water management; Liberec, Czechoslovakia (28 Sep 1978).

Laboratory tests were carried out of various types of semi-permeable membranes for the deactivation of water using reverse osmosis. The equipment consisting of a filter press, a high-pressure piston pump and a fan allows the testing of several membranes with a maximum surface of 0.5 m^2 simultaneously. Various techniques of water pre-treatment were tested to comply with demands on the quality of water coming to the membranes. The aim of the treatment was to remove from the water suspensions, colloidal iron and powerful oxidants, and to adjust the pH level to a neutral or weakly acid. A sorption filter was developed consisting of layers of various sorbents. The tests showed that this filter alone is able to reduce water contamination by an order of 1 to 1.5. In the process, the initial water contamination in the region of 10^5 Bq/l (or 10^3 Bq/l in older mixtures) was reduced by 3 to 4 orders of magnitude.

694 (CS-INIS--258, pp 28-30) DECONTAMINATION AND DISPOSAL OF RADIOACTIVE WASTES FROM NUCLEAR FACILITIES. Dlouhy, Z. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Sep 1978. (In Czech).

From 9. national conference on radionuclides and ionizing radiation in water management; Liberec, Czechoslovakia (28 Sep 1978).

A survey and characteristics are given of the main sources of wastes from the operation of nuclear installations. The amounts of liquid and gaseous wastes from PWR and BWR reactors are compared. The main trends of radioactive waste processing in the world are described. In Czechoslovakia, two methods of waste fixation have been developed: vacuum cementation and bituminization. The demands are summed up on radioactive waste storage sites and it is stated that there are a number of suitable localities, namely abolished granite quarries with a very deep ground water level and a low-permeable overburden and exhausted quarries of kaolinitic clays, which meet all criteria and secure the safe disposal of wastes from Czechoslovak nuclear power plants up to the year 2020.

695 (CS-INIS--258, pp 47-52) DEACTIVATION OF WASTE WATERS IN THE CZECHOSLOVAK URANIUM INDUSTRY. Priban, V. (Ceskoslovensky Uranovy

Prumysl, Straz pod Ralskem. Ustredni Laboratore). Sep 1978. (In Czech).
From 9. national conference on radionuclides and ionizing radiation in water management; Liberec, Czechoslovakia (28 Sep 1978).
Deactivation techniques are described used for the treatment of waste waters from uranium mines and uranium chemical treatment plants. With treatment plant waters this is done either by precipitation of radium with barium sulfate or using multistage evaporating units. Mine waste waters are deactivated by sorption on ion exchangers; strongly basic anion exchangers, mostly Wofatit SBW, Varion AP or Ostion AU are used for uranium, while the strongly acidic Ostion KS is used for radium.

696 (CS-INIS--258, pp 8-15) EXPERIENCE WITH LIQUID RADIOACTIVE WASTE TREATMENT. Ruzicka, J. (Ustredi Statni Vodohospodarske Inspekce, Prague (Czechoslovakia)). Sep 1978. (In Czech).
From 9. national conference on radionuclides and ionizing radiation in water management; Liberec, Czechoslovakia (28 Sep 1978).
The treatment technology of industrial waste waters containing trace amounts of radioisotopes does not principally differ from other techniques used in this sphere. Factors are given affecting waste water radioactivity in uranium ore mining and processing and in radiochemical plants. A survey of recent experience shows that while common technologies are available for the individual plants, the use of novel techniques, such as the membrane technique, ion flotation, etc., has so far been limited.

697 (CS-INIS--258, pp 31-38) DISPOSAL OF LIQUID RADIOACTIVE WASTES FROM NUCLEAR POWER PLANTS. Zizka, B. (Vyskumny Ustav Jadrovych Elektrarni, Jaslovske Bohunice (Czechoslovakia)). Sep 1978. (In Czech).
From 9. national conference on radionuclides and ionizing radiation in water management; Liberec, Czechoslovakia (28 Sep 1978).
Liquid radioactive wastes from nuclear power plants can be classified into three categories, viz., wastes which can be recycled, wastes which can be discharged after treatment, and wastes which cannot be discharged even after treatment and should therefore be processed into a form suitable for long-term storage. The methods of radioactive waste processing are briefly described such as evaporation, ion exchange column treatment and chemical processing as the preparation for fixation.

698 (CS-INIS--258, pp 53-58) POSSIBLE TREATMENT OF RADIOACTIVE WATERS FROM THE URANIUM MINE HAMR U CESKE LIPY. Zvolanek, S. (Ustav Nerostnych Surovin, Kutna Hora (Czechoslovakia)). Sep 1978. (In Czech).
From 9. national conference on radionuclides and ionizing radiation in water management; Liberec, Czechoslovakia (28 Sep 1978).
The method of radium coprecipitation with barium sulfate in combination with clarification hs been developed and tested for the deactivation of mine waste waters. The pilot plant with a performance of 10 l/min consisted of an aerator, a flocculation chamber, a clarifier and a two-layer, two-way filter. Results of some of the tests carried out in the pilot plant are given as are the mathematical relations for computing the dependence of residual activity on initial concentrations of barium and sulfates. It was found that the coprecipitation of radium in combination with clarification allows a high decontamination efficiency. Flocculation does not affect the coprecipitation of radium with barium sulfate and precipitation does not affect the clarification processes. The costs of treating waste waters have been considerably reduced as compared with currently used methods.

699 (DOE/AL/TRU--8003) ECONOMIC COMPARISON OF CENTRALIZING OR DECENTRALIZING PROCESSING FACILITIES FOR DEFENSE TRANSURANIC WASTE. Brown, C.M. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). Jul 1980. Contract AC04-76DP03533. 85p. NTIS, PC A05/MF A01.
This study is part of a set of analyses under direction of the Transuranic Waste Management Program designed to provide comprehensive, systematic methodology and support necessary to better understand options for national long-term management of transuranic (TRU) waste. The report summarizes activities to evaluate the economics of possible alternatives in locating facilities to process DOE-managed transuranic waste. The options considered are: (1) Facilities located at all major DOE TRU waste generating sites. (2) Two or three regional facilities. (3) Central processing facility at only one DOE site. The study concludes that processing at only one facility is the lowest cost option, followed, in order of cost, by regional then individual site processing.

700 (DOE/ET/41900--1) LOW-TEMPERATURE CERAMIC RADIOACTIVE WASTE FORM CHARACTERIZTION OF SUPERCALCINE-BASED MONAZITE-CEMENT COMPOSITES. Roy, D.M.; Wakeley, L.D.; Atkinson, S.D. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 18 Apr 1980. Contract AC09-79ET41900. 21p. Dep. NTIS, PC A02/MF A01.
Simulated radioactive waste solidification by a lower temperature ceramic (cement) process is being investigated. The monazite component (simulated by $NdPO_4$) of supercalcine-ceramic has been solidified in cement and found to generate a solid form with low leachability. Several types of commercial cements and modifications thereof were used. No detectable release of Nd or P was found through characterizing the products of accelerated hydrothermal leaching at 473°K (200°C) and 30.4 MPa (300 bars) pressure.

701 (DOE/ET/41900--T1) DEVELOPMENT OF TAILORED CERAMICS FOR GEOLOGIC STORAGE OF NUCLEAR WASTES. QUARTERLY PROGRESS REPORT, OCTOBER 1, 1979-DECEMBER 31, 1979. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 15 Feb 1980. Contract AC09-79ET41900. 25p. Dep. NTIS, PC A02/MF A01.
Tailored ceramics are crystalline assemblages made by high-temperature and pressure consolidation of a nuclear waste with selected additives. The multitask program includes waste form development and characterizations, and process and equipment development. (DLC)

702 (DOE/EV--0046(Vol.2), pp 224-235) VOLUME REDUCTION OF METALLIC WASTE. Beitel, G.A.; Ortiz, P.G. (Rockwell Hanford Operations, Richland, WA). Sep 1979.
From Environmental control symposium; Washington, DC, USA (28 Nov 1978).
Most metallic waste from nuclear materials processing operations is bulky and awkward to handle. The waste classed as transuranic will have to be placed in containers of limited size

prior to disposal. Maximizing the density of such waste could greatly reduce the cost of disposal in addition to improving the quality of the waste form. The arc saw is being developed to rapidly dismantle large, radioactively contaminated equipment items in preparation for disposal. The arc saw has already been shown to cut materials with a wider variety of shapes and composition, and at higher rates than a plasma torch. A complete saw system has been built to research the full capability of the saw and to assist in the design of a second-generation saw system which will dismantle vessels up to ten feet in diameter and weigh up to ten tons. The performance of the existing saw is discussed, and the design of the next saw is described. Containment of the fumes, equipment maintenance, and safety have been identified as the major obstacles to melting radioactively contaminated steel. A vacuum furnace system which promises to overcome these obstacles has been designed and is being built. The furnace design is described in detail.

703 (DOE/EV--0046(Vol.2), pp 245-257) RADIOACTIVE WASTE: AVAILABILITY OF SOLUTIONS. Meyers, S. (Department of Energy, Washington, DC). Sep 1979.
From Environmental control symposium; Washington, DC, USA (28 Nov 1978).
Prior reviews of the availability of technology to achieve the goals of radioactive waste management have generally concluded that the basic technologies are available and that the tasks at hand can be categorized as those of reducing technology to practical application. The most comprehensive of these reviews was published in 1976 as ERDA-76-43. The availability of technologies for the four basic waste management functions of storage, treatment, transportation, and disposal is summarized, noting whether the technology is commercially available; ready for initiation of design and construction of a full-scale commercial installation, with possible design verification testing needed; or under development. For the waste management functions to be executed by DOE itself, the scope, direction, and timing of the technology implementation program is reviewed, including the status of the Fiscal Year 1979 budget. Considerations of the constraints imposed by public understanding, regulatory and environmental statement procedures, and relations with state and local governments are also reviewed. Assuming the final decision on commercial nuclear fuel reprocessing has not been made by the date of the symposium, the effects of this uncertainty on the program will be covered, i.e., the uncertainty introduces a need for two-contigency planning, but the basic technology is considered available for both contingencies.

704 (DOE/EV--0046(Vol.2), pp 339-355) WASTE TREATMENT RESEARCH AND DEVELOPMENT. Walton, R.D. Jr. (Department of Energy, Washington, DC); Dempsey, J.C.; Brown, R.; Goldberg, E.S.; Lowrey, R.Y. Sep 1979.
From Environmental control symposium; Washington, DC, USA (28 Nov 1978).
In the standard flowsheets for reprocessing of spent nuclear fuel, either for defense or commercial purposes, nearly all the waste radionuclides are isolated from the useful radionuclides in a single waste stream, traditionally known as high-level liquid waste. Although there have been some concepts for geologic disposal of this waste in liquid form, the usual planning assumptions are that it will be solidified and packaged in relatively compact units to facilitate transport and geologic emplacement. In view of the indefinite deferral of commercial spent fuel reprocessing, the current DOE development work on high-level liquid waste treatment is focused on its own sites. By volume, most of this waste is in the form of damp, bulk salt cakes or sludges stored in underground tanks at the Hanford and Savannah River sites. The status of planning for the retrieval, solidification, and packaging of this material, and also on the ongoing solidification work at the Idaho site are reviewed.

705 (DOE/SF/00701--T52) DECONTAMINATION AND DISPOSITION OF FACILITIES PROGRAM. Graves, A.W. (Rockwell International Corp., Pasadena, CA (USA)). 23 Jan 1975. Contract AM03-76SF00701. 85p. (PP--704-990-002). NTIS, PC A05/MF A01.
The Program Plan represents the top level guidance document for stating and performing the objectives of the Decontamination and Disposition (D and D) Program. The program objectives, historical data, and program description are presented, along with the top level planning. The planning includes a statement of the funding basis and the corresponding first and second level activity network schedules. The management plan is included which describes the procedures to be used for cost and schedule control and reporting, purchasing and subcontract control, and program and engineering data control. The requirements for the quality assurance plan, operational safety plan, and training plan are presented.

706 (DOE/SF/00701--T53) PROCEDURE FOR DECONTAMINATION AND DISPOSAL OF THE KINETICS EXPERIMENT WATER BOILER FACILITY, BUILDING 073. Majors, W.K.; Swanson, V.A. (Rockwell International Corp., Pasadena, CA (USA)). 18 Sep 1974. Contract AM03-76SF00701. 25p. NTIS, PC A02/MF A01.
This Detailed Working Procedure describes the step-by-step requirements for the dismantling, decontaminating, packaging, and shipping for disposal of all radioactive or radioactively contaminated items from the Kinetics Experiment Water Boiler Facility at Santa Susana.

707 (DOE/SF/00701--T57) POST-RETIREMENT PLAN FOR RADIOLOGICAL DECONTAMINATION OF THE SRE SITE. Stelle, A.M. (Rockwell International Corp., Pasadena, CA (USA)). 30 Jul 1979. Contract AM03-76SF00701. 56p. (TI--599-19-103). NTIS, PC A04/MF A01.
The Sodium Reactor Experiment (SRE) post-retirement condition is described in the context of a plan to remove all sources of radiation and to remove hazardous or dangerous materials and equipment from the SRE site. Restraints imposed by contractual provisions between the AEC and North American Rockwell Corporation and by the State of California, Bureau of Radiological Health are discussed and applied. The manpower and the material requirements are estimated for the plan.

708 (DOE/SF/00701--T60) SRE ACTIVITY REQUIREMENT NO. 18 AND 19 DECONTAMINATION AND DISMANTLING OF MARK I AND MARK II FUEL HANDLING MACHINES. Ureda, B.F. (Rockwell International Corp., Pasadena, CA (USA)). 20 Nov 1976. Contract AM03-76SF00701. 6p. (N--704ACR990012). NTIS, PC A02/MF A01.
The SRE Mark I and Mark II Fuel Handling Machines will be decontaminated and dismantled.

Disassembled components will be further decontaminated as necessary to permit disposal of the components as salvage. Components that cannot be decontaminated economically will be packaged and shipped to burial. The dismantling will be performed in the SRE High Bay using appropriate techniques for safely handling radioactivity and sodium containing components.

709 (DOE/SF/71053--T1) HTGR REPROCESSING WASTES AND DEVELOPMENT NEEDS. Pence, D.T. (General Atomic Co., San Diego, CA (USA)). Feb 1976. Contract AT03-76SF71053. 34p. NTIS, PC A03/MF A01.

The objectives of this report are: to provide current estimates on quantities and composition of estimated HTGR reprocessing wastes; to compare these with similar data from LWR reprocessing for long-range waste management planning; to identify waste management development needs for HTGR wastes; and to compare these development needs with those of LWR reprocessing for possible consolidation of efforts to reduce development costs. Characterization of the expected types and quantities of HTGR fuel reprocessing waste is not complete but is about as complete as is practicable at the present. The General Atomic computer programs that predict the distribution of fission and activation products are presently undergoing an updating, and the new numbers will probably differ somewhat from from those presented. But the differences are expected to be slight. Improved processing techniques and flow sheets are also expected. Nevertheless, the reported data are generic for HTGR fuel and should provide reliable HTGR reprocessing waste guides for long-range planning. Most of the waste management development issues have been identified and summarized. Further definition of these issues will require some of the results of the ongoing, planned, and recommended Thorium Utilization and other ERDA-sponsored waste management programs. Little attempt was made to include references to the Federal Republic of Germany HTGR development program because of the lack of current and direct knowledge of these programs, albeit their efforts are more extensive than the US program in some areas.

710 (DOE/SR/00968--6) FUNCTIONALIZED GLASS BEADS FOR THE RECOVERY OF WASTE RADIOACTIVE ELEMENTS. FINAL REPORT. Geldard, J.F. (Clemson Univ., SC (USA). Dept. of Chemistry and Geology). Sep 1979. Contract EY-76-C-09-0968. 57p. Dep. NTIS, PC A04/MF A01.

Various substituted ethylenediamine tetraacetic acids and their precursors have been prepared and characterized. In addition to containing groups that can chelate metal ions, these substances also contain groups that can be used to bond them to glass beads. Experiments have shown, however, that a large enough number of active sites cannot be achieved by this route. An alternative scheme was devised, whereby trimethoxysilyl groups are incorporated into molecules that have the necessary functional groups. These silyl compounds can be bonded directly to glass beads; the ethylenediamine tetraacetic acid can then be formed in place. The prognosis for this reaction scheme is good, based on the experiments done so far. Stability constants have been measured for some metal ion complexes of the acids mentioned above.

711 (DOE/SR-WM--79-2) LONG-TERM HIGH-LEVEL WASTE TECHNOLOGY. COMPOSITE QUARTERLY TECHNICAL REPORT, OCTOBER-DECEMBER 1979. Cornman, W.R. (comp.). (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Jun 1980. 233p. NTIS, PC A11/MF A01.

This document summarizes work for the immobilization of high-level radioactive wastes from the chemical reprocessing of nuclear reactor fuels. The progress is reported in two main areas: site technology, and alternative waste form development. (DLC)

712 (DOE/TIC--10228) EVALUATION AND REVIEW OF ALTERNATIVE WASTE FORMS FOR IMMOBILIZATION OF HIGH LEVEL RADIOACTIVE WASTES. (Department of Energy, Aiken, SC (USA). Savannah River Operations Office). 20 Aug 1979. 27p. Dep. NTIS, PC A03/MF A01.

Objective was to review the relative merits and potential of eleven alternative waste forms being considered for the solidification and disposal of radioactive wastes. A numerical rating of the alternative waste forms was arrived at individually by peer review panel members taking into consideration nine scientific and nine engineering parameters affecting the long-term performance and production of waste forms. A group rating for the alternative forms was achieved by averaging the individiual scores and discussing the available data base. Three final ranking lists comparing: (A) Present Scientific Merits or Least Risk for Use Today; (B) Research Priority; and (3) Present and Potential Engineering Practicality were prepared by the Panel. Each waste form in the lists is assigned a value of either (1) Top Rank, (2) Intermediate Rank, or is assigned a value of either (1) Top Rank, (2) Intermediate Rank, or (3) Bottom Rank. Relative strengths and weaknesses of the alternative waste forms and recommendations for future program directions are discussed.

713 (DOE/TIC--11219) EVALUATION AND REVIEW OF ALTERNATIVE WASTE FORMS FOR IMMOBILIZATION OF HIGH LEVEL RADIOACTIVE WASTES. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1 Jun 1980. Contract AC09-76SR00001. 34p. NTIS, PC A03/MF A01.

The objective of this study was to review the relative merits and potential of 15 (fifteen) alternative waste forms being considered for the solidification and disposal of radioactive wastes. The relative merits of 4 (four) alternative pre-solidification processing approaches were also assessed in this study. A Peer Review Panel composed of 8 (eight) scientists and engineers representing independent, non-DOE laboratories from industry, government, and universities and the disciplines of materials science, ceramics, glass, metallurgy, and geology conducted the review. A numerical rating of alternative waste forms was arrived at individually by the panel members taking into consideration 9 (nine) scientific and 9 (nine) engineering parameters affecting the long term performance and production of waste forms. At a meeting on May 9, 1980, a group ranking for the alternative forms was achieved by averaging the individual scores and discussing the available data base. Three final ranking lists comparing: (A) Present Scientific Merits or Least Risk for Use Today; and (B) Research Priority; and (C) Present and Potential Engineering Practicality were prepared by the Panel. Each waste form in the lists is assigned a value of either (1) Top Rank, (2) Intermediate Rank, or (3) Bottom Rank. A discussion of the relative strengths and weaknesses of the alternative waste forms and recommendations for future program directions is presented in the body of the accompanying Peer Review Panel report.

714 (DP--79-157-3) LONG-TERM HIGH-LEVEL WASTE TECHNOLOGY. COMPOSITE QUARTERLY TECHNICAL REPORT, JULY-SEPTEMBER 1979. Cornman, W.R. (comp.). (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Mar 1980. Contract EY-76-C-09-0001. 74p. Dep. NTIS, PC A04/MF A01.

This report summarizes work performed at participating sites (RHO, ORNL, SRP, SRL, PNL, ANL, LLL, etc., to immobilize high-level radioactive wastes from the chemical reprocessing of nuclear reactor fuels. Progress is reported in the following areas: program management and support, waste preparation, waste fixation (in glass, concrete, ceramics, cermet, SYNROC, or metal), and engineered barriers. (DLC)

715 (DP--80-157-1) LONG-TERM HIGH-LEVEL WASTE TECHNOLOGY. COMPOSITE QUARTERLY TECHNICAL REPORT, JANUARY-MARCH 1980. Cornman, W.R. (comp.). (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Jul 1980. Contract AC09-76SR00001. 58p. NTIS, PC A04/MF A01.

This composite quarterly technical report summarizes work performed at participating sites to immobilize high-level radioactive wastes. This work is under the direction of the Savannah River Operations Office of the Department of Energy (DOE-SR). The Savannah River Laboratory, operated by E. I. du Pont de Nemours and Co. for the US Department of Energy, is serving as the lead office for this program to provide technical assistance to DOE-SR and to coordinate work done at the participating sites. This series of reports summarizes research and development studies on the immobilization of high-level wastes from the chemical reprocessing of nuclear reactor fuels. Immobilization of the wastes (defense and commercial) consists of placing them in a high-integrity form with a very low potential for radionuclide release. Immobilization of commercial wastes is being considered on a contingency basis in the event that reprocessing is resumed. The basic plan for meeting the goal of immobilization of the DOE high-level wastes is: (1) to develop technology to support a realistic choice of waste form alternatives for each of the three DOE sites; (2) to develop product and processing technology with sufficient scaleup to provide design data for full-scale facilities; and (3) to construct and operate the facilities.

716 (DP--1521) DESIGN OF AN EXPERIMENTAL INCINERATOR FOR ALPHA WASTE. Warren, J.H. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Aug 1979. Contract EY-76-C-09-0001. 52p. Dep. NTIS, PC A04/MF A01.

An electrically heated controlled-air two-stage incinerator has been designed for burning small volumes (5 kg/h) of solid wastes. Distinguishing features of the design are compactness, relatively lightweight, and ease of assembly made possible by using prefabricated ceramic components to form two combustion chambers surrounded by packed fiber insulation within a steel case. Electric girdle heaters around the two combustion chambers provide 600 to 1000°C. These temperatures combined with controlled air give minimum ash entrainment and long combustion gas residence times to yield approx. 10^9 off-gas decontamination factors with conventional off-gas cleaning equipment. After decommissioning, the design allows for ease of disassembly and convenient disposal of the ceramic components. 24 figures, 1 table.

717 (DP--1535) SMALL-SCALE, JOULE-HEATED MELTING OF SAVANNAH RIVER PLANT WASTE GLASS. I. FACTORS AFFECTING LARGE-SCALE VITRIFICATION TESTS. Plodinec, M.J.; Chisman, P.H. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Oct 1979. Contract EY-76-C-09-0001. 33p. Dep. NTIS, PC A03/MF A01.

A promising method of immobilizing SRP radioactive waste solids is incorporation in borosilicate glass. In the reference vitrification process, called joule-heated melting, a mixture of glass frit and calcined waste is heated by passage of an electric current. Two problems observed in large-scale tests are foaming and formation of an insoluble slag. A small joule-heated melter was designed and built to study problems such as these. This report describes the melter, identifies factors involved in foaming and slag formation, and proposes ways to overcome these problems.

718 (DP--1540) MODELING PRINCIPLES APPLIED TO THE SIMULATION OF A JOULE-HEATED GLASS MELTER. Routt, K.R. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). May 1980. Contract EY-76-C-09-0001. 47p. NTIS, PC A03/MF A01.

Three-dimensional conservation equations applicable to the operation of a joule-heated glass melter were rigorously examined and used to develop scaling relationships for modeling purposes. By rigorous application of the conservation equations governing transfer of mass, momentum, energy, and electrical charge in three-dimensional cylindrical coordinates, scaling relationships were derived between a glass melter and a physical model for the following independent and dependent variables: geometrical size (scale), velocity, temperature, pressure, mass input rate, energy input rate, voltage, electrode current, electrode current flux, total power, and electrical resistance. The scaling relationships were then applied to the design and construction of a physical model of the semiworks glass melter for the Defense Waste Processing Facility. The design and construction of such a model using glycerine plus LiCl as a model fluid in a one-half-scale Plexiglas tank is described.

719 (DP--1545) PRELIMINARY EVALUATION OF ALTERNATIVE FORMS FOR IMMOBILIZATION OF SAVANNAH RIVER PLANT HIGH-LEVEL WASTE. Stone, J.A.; Goforth, S.T. Jr.; Smith, P.K. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Dec 1979. Contract EY-76-C-09-0001. 98p. Dep. NTIS, PC A05/MF A01.

An evaluation of available information on eleven alternative solid forms for immobilization of SRP high-level waste has been completed. Based on the assessment of both product and process characteristics, four forms were selected for more detailed evaluation: (1) borosilicate glass made in the reference process, (2) a high-silica glass made from a porous glass matrix, (3) crystalline ceramics such as supercalcine or SYNROC, and (4) ceramics coated with an impervious barrier. The assessment includes a discussion of product and process characteristics for each of the eleven forms, a cross comparison of these characteristics for the forms, and the bases for selecting the most promising forms for further study.

720 (DP--1553) VITRIFICATION OF TRANSURANIC

AND BETA-GAMMA CONTAMINATED SOLID WASTES. Dukes, M.D. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Jun 1980. Contract AC09-76SR00001. 19p. NTIS, PC A02/MF A01.

Vitrification of solid transuranic contaminated (TRU) wastes alone and with high-level liquid wastes (HLLW) was studied. Homogeneous glasses containing 20 to 30 wt % ash were made by using glass frits previously developed at the Savannah River Plant and Pacific Northwest Laboratories. If the ash is vitrified along with the HLLW, 1.0 wt % as can be added to the waste forms without affecting their quality. This loading of ash is well above the loading required by the relative amounts of HLLW and TRU ash that will be processed at the Savannah River Plant. Vitrification of TRU-contaminated electropolishing sludges and high efficiency particular air filter materials along with HLLW would require an increase in the quantity of glass to be produced. However, if these TRU-contaminated solids were vitrified with the HLLW, the addition of low-level beta-gamma contaminated ash would require no further increase in glass production.

721 (DP-MS--79-26) DEVELOPMENT OF AN ION-EXCHANGE PROCESS FOR REMOVING CESIUM FROM HIGH-LEVEL RADIOACTIVE LIQUID WASTES. Baumgarten, P.K.; Wallace, R.M.; Whitehurst, D.A.; Steed, J.M. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Nov 1979. Contract EY-76-C-09-0001. 14p. (CONF-791112--35). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Methods to determine resin characteristics, i.e., cesium equilibria and diffusion rates, were developed. These parameters can now guide resin selection and aid in interpreting column performance. The K/sub D/ cesium ion concentration relation gives evidence of three different types of ion exchange sites. The countercurrent load/elution/regeneration cycle for the removal of cesium by ion exchange repeatedly reached the goal decontamination factor (DF) of 10,000 at throughputs up to 60 column volumes. Resin backwashing appears feasible, but further development of column geometry will be required. The proposed ammonium elutriant is satisfactory. Regeneration end-point can be controlled by electrical conductivity monitoring.

722 (DP-MS--79-39) ATTACK OF HIGH-STRENGTH, OXIDATION-RESISTANT ALLOYS DURING IN-CAN MELTING OF SIMULATED WASTE GLASSES. Rankin, W.N. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract EY-76-C-09-0001. 31p. (CONF-800305--3). Dep. NTIS, PC A03/MF A01.

From Corrosion/80 NACE meeting; Chicago, IL, USA (6 Mar 1980).

The restistance of candidate canister alloys to penetration under the most severe conditions expected during in-can melting was directly proportional to the chromium content of the alloy, and inversely proportional to the Na_2O content of the glass melt. Specimens were exposed for 24 hours, which is the time required for in-can melting full-size waste-glass forms based on tests carried out at Pacific Northwest Laboratories (PNL) and at SRL. The penetration resistance to Frit 211 at 1150°C for 24 hours of most alloys tested was satisfactory. The amount of penetration would not affect the integrity of the waste form. Inconel 625, Hastelloy X, and Inconel 601 were penetrated < 20 mils. This was considered excellent. Incoloy 801, Type 310 stainless steel, Type 304L stainless steel, Inconel 600, and Type 347 stainless steel were penetrated < 40 mils. This was considered good. Hastelloy C-4 was penetrated > 100 mils by a glass composed of 65 wt % Frit 21 and 35 wt % composite sludge (with uranium) at 1150°C for only 7 hours. This amount of penetration of an in-can melting canister would not be satisfactory. 12 figures.

723 (DP-MS--79-40) OPERATION OF A PROTOTYPE HIGH-LEVEL ALPHA SOLID WASTE INCINERATOR. Hootman, H.E.; Trapp, D.J.; Warren, J.H.; Dworjanyn, L.O. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). 1979. Contract EY-76-C-09-0001. 19p. (CONF-791103--31). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

A full-scale (5 kg waste/hour) controlled-air incinerator is presently being tested as part of a program to develop technology for incineration of Savannah River Plant solid transuranic wastes. This unit is designed specifically to incinerate relatively small quantities of solid combustible wastes that are contaminated up to 10^5 times the present nominal 10 nCi/g threshold value for such isotopes as ^{238}Pu, ^{239}Pu, ^{242}Cm and ^{252}Cf. Automatic feed preparation and incinerator operation and control have been incorporated into the design to simulate the future plant design which will minimize operator radiation exposure. Over 250 kg of nonradioactive wastes characteristic of plutonium finishing operations have been incinerated at throughputs exceeding 5 kg/hr for periods up to 6 hours. Safety and reliability were major design objectives. Upon completion of an initial experimental phase to determine process sensitivity and flexibility, the facility will be used to develop bases for the production unit's safety analysis report, technical standards, and operating procedures. An ultimate use of the experimental unit will be the testing of actual production unit components and the training of Savannah River Plant operating personnel.

724 (DP-MS--79-42) VITRIFICATION OF SAVANNAH RIVER PLANT RADIOACTIVE WASTE: PROCESS DEVELOPMENT STUDIES. Plodinec, M.J. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1979. Contract EY-76-C-09-0001. 20p. (CONF-791061--1). Dep. NTIS, PC A02/MF A01.

From American Ceramic Society fall meeting; Bedford, PA, USA (10 Oct 1979).

The reference process for disposal of radioactive waste from the Savannah River Plant is vitrification into borosilicate glass. The effects of frit composition and frit particle size, batch chemicals, soluble salts, charcoal, argon atmosphere, and viscosity on the melting process are discussed.

725 (DP-MS--79-53) REMOTE EXPERIMENTAL FACILITY TO SOLIDIFY SRP HIGH-LEVEL WASTE. Galloway, R.M.; Plodinec, M.J.; Wilhite, E.L.; Chismar, P.H. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1979. Contract EY-76-C-09-0001. 21p. (CONF-791103--33). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

Small-scale equipment has been developed and installed in a remotely operated experimental facility at the Savannah River Laboratory (SRL) to study immobilization of radioactive waste in glass. The facility has been in operation for nine months. During this period, two 25-liter

batches of high-level waste from different SRP waste storage tanks were processed. The waste was boiled in sodium hydroxide to dissolve alumina trihydrate, washed with water to remove soluble salts, dried in a fluid-bed dryer, and vitrified in a joule-heated melter. Off-gases from the melter were collected for characterization.

726 (DP-MS--79-70) DEVELOPMENT OF SOLID RADIONUCLIDE WASTE FORMS IN THE UNITED STATES. Crandall, J.L. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1979. Contract EY-76-C-09-0001. 15p. (CONF-791112--12). Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
New ways of reworking the wastes require a new classification in terms of the final waste forms. This paper surveys the candidate forms: encapsulation binders, in-place solidification waste forms, glass and ceramic waste forms, mineral waste forms, matrix waste forms, gaseous waste forms (fixation), and canisters and engineered barriers. Participants in the US-high-level waste form development program are listed. Requirements and selection of waste forms are also discussed. 26 references. (DLC)

727 (DP-MS--79-91) ALTERNATIVE SOLID FORMS FOR SAVANNAH RIVER PLANT DEFENSE WASTE. Stone, J.A.; Goforth, S.T.; Smith, P.K. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09O-76SR00001. 14p. (CONF-800460--4). NTIS, PC A02/MF A01.
From 82. annual American Ceramic Society meeting; Chicago, IL, USA (27 Apr 1980).
Solid forms and processes were evaluated for immobilization of SRP high-level radioactive waste, which contains bulk chemicals such as hydrous iron and aluminium oxides. Borosilicate glass currently is the best overall choice. High-silica glass, tailored ceramics, and coated ceramics are potentially superior products, but require more difficult processes.

728 (DP-MS--79-92) CHARACTERIZATION OF OFF-GASES FROM A SMALL-SCALE, JOULE-HEATED CERAMIC MELTER FOR NUCLEAR WASTE VITRIFICATION. Woolsey, G.B.; Wilhite, E.L. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract EY-76-C-09-0001. 30p. (CONF-800460--1). Dep. NTIS, PC A03/MF A01.
From 82. annual American Ceramic Society meeting; Chicago, IL, USA (27 Apr 1980).
This paper confirmed with actual nuclear waste the thermodynamic predictions of the fate of some of the semivolatiles in off-gas. Ruthenium behaves erratically and it is postulated that it migrates as a finely divided solid, rather than as a volatile oxide. Provisions for handling these waste off-gasses will be incorporated in the design of facilities for vitrifying SRP waste.

729 (DP-MS--79-94) HIGH-LEVEL DEFENSE WASTE SOLIDIFICATION AT THE SAVANNAH RIVER PLANT. Rhoad, H.D. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract EY-76-C-09-0001. 13p. (CONF-800303--11). Dep. NTIS, PC A02/MF A01.
From 179. national meeting of the American Chemical Society; Houston, TX, USA (23 Mar 1980).
Radioactive waste management at the Savannah River Plant is described. Their process for solidifying liquid wastes is discussed. Leaching studies of glass were performed and the results are discussed. (DC)

730 (DP-MS--79-103) VITRIFICATION OF SRP WASTE BY A SLURRY-FED CERAMIC MELTER. Wicks, G.G. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract EY-76-C-09-0001. 20p. (CONF-800460--2). Dep. NTIS, PC A02/MF A01.
From 82. annual American Ceramic Society meeting; Chicago, IL, USA (27 Apr 1980).
Savannah River Plant (SRP) high-level waste (HLW) can be vitrified by feeding a slurry, instead of a calcine, to a joule-heated ceramic melter. Potential advantages of slurry feeding include (1) use of simpler equipment, (2) elimination of handling easily dispersed radioactive powder, (3) simpler process control, (4) effective mixing, (5) reduced off-gas volume, and (6) cost savings. Assessment of advantages and disadvantages of slurry feeding along with experimental studies indicate that slurry feeding is a promising way of vitrifying waste.

731 (DP-MS--79-108) DESIGN AND OPERATION OF SMALL-SCALE GLASS MELTERS FOR IMMOBILIZING RADIOACTIVE WASTE. Plodinec, M.J.; Chismar, P.H. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 6p. (CONF-800914--1). NTIS, PC A02/MF A01.
From IEEE meeting; Cincinnati, OH, USA (29 Sep 1980).
A small-scale (3-kg), joule-heated, continuous melter has been designed to study vitrification of Savannah River Plant radioactive waste. The first melter built has been in nonradioactive service for nearly three years. This melter had Inconel 690 electrodes and uses Monofrax K-3 for the contact refractory. Several problems seem in this melter have had an impact on the design of a full-scale system. Problems include uncontrolled electric currents passing through the throat, and formation of a slag layer at the bottom of the melter. The performance of a similar melter in a low-maintenance, radioactive environment is also described. Problems such as halide refluxing, and hot streaking, first observed in this melter, are also discussed.

732 (DP-MS--79-112) SLURRY SPRAY DISTRIBUTION WITHIN A SIMULATED LABORATORY SCALE SPRAY DRYER. Bertone, P.C. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 20 Dec 1979. Contract EY-76-C-09-0001. 50p. Dep. NTIS, PC A03/MF A01.
Thesis. Submitted to Univ. of Virginia, Charlottesville.
It was found that the distribution of liquid striking the sides of a simulated room temperature spray dryer was not significantly altered by the choice of nozles, nor by a variation in nozzle operating conditions. Instead, it was found to be a function of the spray dryer's configuration. A cocurrent flow of air down the drying cylinder, not possible with PNL's closed top, favorably altered the spray distribution by both decreasing the amount of liquid striking the interior of the cylinder from 72 to 26% of the feed supplied, and by shifting the zone of maximum impact from 1.0 to 1.7 feet from the nozzle. These findings led to the redesign of the laboratory scale spray dryer to be tested at the Savannah River Plant. The diameter of the drying chamber was increased from 5 to 8 inches, and a cocurrent flow of air was established with a closed recycle. Finally, this investigation suggested

a drying scheme which offers all the advantages of spray drying without many of its limitations.

733 (DP-MS--80-2) SMALL-SCALE DEMONSTRATION OF HIGH-LEVEL RADIOACTIVE WASTE PROCESSING AND SOLIDIFICATION USING ACTUAL SRP WASTE. Okeson, J.K.; Galloway, R.M.; Wilhite, E.L.; Woolsey, G.B.; Ferguson. R.B. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 33p. (CONF-800802--2). NTIS, PC A03/MF A01.

From 89. annual meeting of the American Institute of Chemical Engineers; Portland, OR, USA (17 Aug 1980).

A small-scale demonstration of the high-level radioactive waste solidification process by vitrification in borosilicate glass is being conducted using 5-6 liter batches of actual waste. Equipment performance and processing characteristics of the various unit operations in the process are reported and, where appropriate, are compared to large-scale results obtained with synthetic waste.

734 (DP-MS--80-17) DIRECT DETERMINATION OF CESIUM IN PILOT PLANT EFFLUENTS BY ISOTOPE DILUTION MASS SPECTROMETRY. Chastagner, P. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 25p. (CONF-800837--1). NTIS, PC A02/MF A01.

From Rocky Mountain conference; Denver, CO, USA (11 Aug 1980).

At the Savannah River Laboratory, stable cesium at the part per billion levels is routinely determined in simulated defense waste supernate by isotope dilution mass spectroscopy. This work is in support of pilot plant studies of waste immobilization process. A direct method was developed in which spiked samples of simulated waste supernate are loaded directly on the sample filament.

735 (DP-MS--80-25) HIGH-LEVEL NUCLEAR WASTE IMMOBILIZATION PROGRAM. Gordon, D.E. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 18p. (CONF-800244--1). NTIS, PC A02/MF A01.

From ASME, IEEE, and Society of Professional Engineer Joint meeting; New London, CT, USA (19 Feb 1980).

Existing high-level nuclear wastes in the United States are described along with current management techniques and long-term disposal options. All of the disposal options involve some type of immobilization operation to restrict radio-nuclide dispersion; the primary option is disposal of immobilized waste packages in deep (500-1000 meter) geological formations. Several immobilized waste forms currently under development are discussed, and form selection factors and regulatory criteria are identified.

736 (DP-MS--80-27) SIGNIFICANCE OF RADIATION EFFECTS IN SOLID RADIOACTIVE WASTE. Permar, P.M.; McDonell, W.R. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 55p. (CONF-800609--5). NTIS, PC A04/MF A01.

From 10. international symposium on effects of radiation on materials; Savannah, GA, USA (3 Jun 1980).

Proposed NRC criteria for disposal of high-level nuclear waste require development of waste packages to contain radionuclide for at least 1000 years, and design of repositories to prevent radionuclide release at an annual rate greater than 1 part in 100,000 of the total activity. The high-level wastes that are now temporarily stored as aqueous salts, sludges, and calcines must be converted to high-integrity solid forms that resist deterioration from radiation and other effects of long-term storage. Spent fuel may be encapsulated for similar long-term storage. Candidate waste forms beside the spent fuel elements themselves, include borosilicate and related glasses, mineral-like crystalline ceramics, concrete formulations, and metal-matrix glass or ceramic composites. these waste forms will sustain damage produced by beta-gamma radiation up to 10^{12} rads, by alpha radiation up to 10^{19} particles/g, by internal helium generation greater than about 0.1 atom percent, and by the atom transmutations accompanying radioactive decay. Current data indicate that under these conditions the glass forms suffer only minor volume changes, stored energy deposition, and leachability effects. The crystalline ceramics appear susceptible to the potentially more severe alterations accompanying metamictization and natural analogs of candidate materials are being examined to establish their suitability as waste forms. Helium concentrations in the waste forms are generally below thresholds for severe damage in either glass or crystalline ceramics at low temperatures, but microstructural effects are not well characterized. Transmutation effects remain to be established.

737 (DP-MS--80-35) RECOVERY OF AM-CM FROM HIGH-ACTIVITY WASTE CONCENTRATE BY IN-CANYON-TANK PRECIPITATION AS OXALATES. Gray, L.W.; Burney, G.A.; Wilson, T.W.; McKibben, J.M. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 23p. (CONF-800814--5). NTIS, PC A02/MF A01.

From 180. American Chemical Society meeting/ 2. chemical congress of the North American Continent; Las Vegas, NV, USA (24 Aug 1980).

Savannah River Laboratory and Savannah River Plant have been separating actinides for more than 25 years. Work continues to upgrade processes and to initiate new processes. This report summarizes work on a precipitation process to separate kg amounts of Am and Cm from hundreds of kilograms of $NaNO_3$ and $Al(NO_3)_3$. The developed process includes formic acid denitration of the Am-Cm bearing streams for acid adjustment; oxalate precipitation of the Am-Cm; and Mn^{+2} catalyzed oxidation of oxalate in both the decanted supernate and the precipitated actinides. The new process generates one fourth the radioactive waste as the solvent extraction process which it replaced, and produces a cleaner feed solution for downstream processing to separate the Am and Cm before conversion to their respective oxides.

738 (DP-MS--80-39) HIGH LEVEL NUCLEAR WASTE. Crandall, J.L. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-DPSR00001. 40p. (CONF-800535--1). NTIS, PC A03/MF A01.

From ASME Idaho section symposium; Idaho Falls, ID, USA (29 May 1980).

The DOE Division of Waste Products through a lead office at Savannah River is developing a program to immobilize all US high-level nuclear waste for terminal disposal. DOE high-level wastes include those at the Hanford Plant, the Idaho Chemical Processing Plant, and the Savannah River Plant. Commercial high-level wastes, for which DOE is also developing

immobilization technology, include those at the Nuclear Fuel Services Plant and any future commercial fuels reprocessing plants. The first immobilization plant is to be the Defense Waste Processing Facility at Savannah River, scheduled for 1983 project submission to Congress and 1989 operation. Waste forms are still being selected for this plant. Borosilicate glass is currently the reference form, but alternate candidates include concretes, calcines, other glasses, ceramics, and matrix forms.

739 (DP-MS--80-48) STARTUP AND OPERATION OF A PLANT-SCALE CONTINUOUS GLASS MELTER FOR VITRIFICATION OF SAVANNAH RIVER PLANT SIMULATED WASTE. Willis, T.A. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 32p. (CONF-801034--6). NTIS, PC A03/MF A01.
From 33. ACS Pacific Coast meeting; San Francisco, CA, USA (28 Oct 1980).
The reference process for disposal of radioactive waste from the Savannah River Plant is vitrification of the waste in borosilicate glass in a continuous glass melter. Design, startup, and operation of a plant-scale developmental melter system are discussed.

740 (DP-MS--80-49) DEVELOPMENT OF THE IN-CAN MELTING PROCESS FOR VITRIFICATION OF SAVANNAH RIVER PLANT WASTE. Becker, G.W. Jr. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 23p. (CONF-801034--4). NTIS, PC A02/MF A01.
From 33. ACS Pacific Coast meeting; San Francisco, CA, USA (28 Oct 1980).
Vitrification is the key step in the reference process for immobilization of high-level radioactive waste generated at the Savannah River Plant. For this step, two types of glass melters are being developed. The design reference is a continuous-pour, joule-heated melter. The backup is an in-can melter. When the in-can melter is used, a canister is placed vertically in a large tube furnace and heated to a temperature as high as the canister can safely tolerate (for stainless steel, about 1050°C). Waste and glass formers are added and melted together until the canister is filled. The canister of glass is then removed from the furnace. The effects of fin design, frit size, waste composition, reductants, and mixing upon the full-scale in-can melter process are discussed.

741 (DP-MS--80-50) EFFECTS OF PROCESSING VARIABLES ON THE PRODUCT QUALITY OF LARGE-SCALE GLASS FORMS CONTAINING SIMULATED SRP WASTE. Plodinec, M.J. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 15p. (CONF-801034--2). NTIS, PC A02/MF A01.
From 33. ACS Pacific Coast meeting; San Francisco, CA, USA (28 Oct 1980).
The reference process for disposal of radioactive waste from the Savannah River Plant is immobilization in borosilicate glass. Full-scale canisters containing simulated waste have been made by two processes: in-can melting and continuous joule-heated melting. For each process, melter atmosphere and the degree of feed mixing have been varied. The effects of these variations on glass quality parameters such as leach rate, degree of fracture and porosity, and amount of crystalline material are discussed.

742 (DP-MS--80-60) SMALL-SCALE INTEGRATED DEMONSTRATION OF HIGH-LEVEL RADIOACTIVE WASTE PROCESSING AND VITRIFICATION USING ACTUAL SRP WASTE. Ferguson, R.B.; Woolsey, G.B.; Galloway, R.M.; Baumgarten, P.M.; Eibling, R.E. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 9p. (CONF-801124--5). NTIS, PC A02/MF A01.
From 3. annual meeting of the Materials Research Society; Boston, MA, USA (17 Nov 1980).
Experiments have been made to demonstrate the feasibility of immobilizing SRP high-level waste in borosilicate glass. Results to date are encouraging. Equipment performance and processing characteristics for solidifying small batches of actual SRP waste have agreed well with previous experience with small- and large-scale tests synthetic waste, and with theoretical predictions.

743 (DP-MS--80-61) THERMAL FRACTURING IN GLASS WASTE FORMS. Smith, P.K.; Wiley, J.R. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 14p. (CONF-8010116--1). NTIS, PC A02/MF A01.
From American Ceramic Society meeting; Bedford, PA, USA (8 Oct 1980).
Fracturing during cooling of large glass waste forms during production has the undesirable potential to increase the surface area available for leaching. Acoustic emission and visual analyses show that cracking in the bulk glass occurs in the annealing range, and that surface cracking occurs at lower temperatures because of canister interactions.

744 (DPE--3584) CONCEPTUAL DESIGN REPORT FOR ALPHA WASTE INCINERATOR. (Du Pont de Nemours (E.I.) and Co., Wilmington, DE (USA). Engineering Dept.). Apr 1979. Contract EY-76-C-09-0001. 102p. Dep. NTIS, PC A06/MF A01.
The Alpha Waste Incinerator, a new facility in the SRP H-Area, will process transuranic or alpha-contaminated combustible solid wastes. It will seal the radioactive ash and scrubbing salt residues in cans for interim storage in drums on site burial ground pads. This report includes objectives, project estimate, schedule, standards and criteria, excluded costs, safety evaluation, energy consumption, environmental assessment, and key drawings. (DLC)

745 (DPST--79-294) GLASS AS A MATRIX FOR SRP HIGH-LEVEL DEFENSE WASTE. Wiley, J.R.; Bibler, N.E.; Dukes, M.D.; Plodinec, M.J. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Jan 1980. Contract EY-76-C-09-0001. 53p. Dep. NTIS, PC A04/MF A01.
Work done at Savannah River Laboratory and elsewhere that has led to development of glass as a candidate for solidifying Savannah River Plant waste is summarized. Areas of development described are glass formulation and fabrication, and leaching and radiation effects.

746 (DPSTD--77-13-3) PRELIMINARY TECHNICAL DATA SUMMARY NO. 3 FOR THE DEFENSE WASTE PROCESSING FACILITY. Landon, L.F. (comp.). (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). May 1980. Contract AC09-76SR00001. 614p. NTIS, PC A99/MF A01.
This document presents an update on the best information presently available for the purpose

of establishing the basis for the design of a Defense Waste Processing Facility. Objective of this project is to provide a facility to fix the radionuclides present in Savannah River Plant (SRP) high-level liquid waste in a high-integrity form (glass). Flowsheets and material balances reflect the alternate CAB case including the incorporation of low-level supernate in concrete. (DLC)

747 (DPSTD--79-34) BETA-GAMMA CONTAMINATED SOLID WASTE INCINERATOR FACILITY. Hootman, H.E. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Oct 1979. Contract AC09-76SR00001. 77p. NTIS, PC A05/MF A01.

This technical data summary outlines a reference process to provide a 2-stage, 400 lb/hour incinerator to reduce the storage volume of combustible process waste contaminated with low-level beta-gamma emitters in response to DOE Manual 0511. This waste, amounting to more than 200,000 ft^3 per year, is presently buried in trenches in the burial ground. The anticipated storage volume reduction from incineration will be a factor of 20. The incinerator will also dispose of 150,000 gallons of degraded solvent from the chemical separations areas and 5000 gallons per year of miscellaneous nonradioactive solvents which are presently being drummed for storage.

748 (EGG--2017) SPI PROJECT CRITICALITY TASK FORCE INITIAL REVIEW AND ASSESSMENT. McKinley, K.B.; Cannon, J.W.; Marsden, R.S.; Worle, H.A. (Idaho National Engineering Lab., Idaho Falls (USA)). Mar 1980. Contract EY-76-C-07-1570. 45p. Dep. NTIS, PC A03/MF A01.

The Slagging Pyrolysis Incinerator (SPI) Facility is being developed to process transuranic waste stored and buried at the Idaho National Engineering Laboratory (INEL) into a chemically inert, physically stable, basalt-like residue acceptable for a Federal Repository. A task force was established by the SPI Project Division to review and assess all aspects of criticality safety for the SPI Facility. This document presents the initial review, evaluations, and recommendations of the task force and includes the following: background information on waste characterization, and criticality control approaches and philosophies, a description of the SPI Facility Waste Processing Building, a review and assessment of potentially relevant codes and regulations; a review and assessment of the present state of criticality and assaying/monitoring studies, and recommendations for changes in and additions to these studies. The review and assessment of potentially relevant codes and regulations indicate that ERDAM 0530, Nuclear Criticality Safety should be the controlling document for criticality safety for the SPI Project. In general, the criticality control approaches and philosophies for the SPI Project comply with this document.

749 (EGG-FM--5041) SUMMARY OF FY 1979 MATERIAL SUPPORT STUDIES FOR SPI - MIGRATION AND IMMOBILIZATION. Flinn, J.E.; Kelsey, P.V.; Seymour, W.C.; Tallman, R.L. (EG and G Idaho, Inc., Idaho Falls (USA)). Sep 1979. Contract EY-76-C-07-1570. 30p. Dep. NTIS, PC A03/MF A01.

Material studies were performed in support of the Slagging Pyrolysis Incinerator Project for characterizing the slag product expected from processing low-level waste. The studies included chemical compositional analysis of slag products from waste feed after pyrolysis, slag/refractory interactions, phase and structure of the slag, and chemical leaching. A series of slag compositions were identified using average waste feed and soil. The slags are termed iron-rich basalt vitrophyre. For the materials tests a series of uranium-doped slags were made in the laboratory. Ruby refractory was observed to be the most compatible with the slag series. Structure studies on the slags disclosed that the primary crystalline phases that develop are diopside ($CaMgSi_2O_6$) and iron oxide. Chemical leach tests performed on the slag series show evidence that the slags have a high resistance to leaching.

750 (EGG-FM--5241) IRON-RICH BASALT-TYPE WASTE FORMS FOR TRANSURANIC AND LOW-LEVEL WASTE CONTAINMENT: EVALUATION OF ELECTROMELT CASTINGS. Flinn, J.E.; Kelsey, P.V. Jr.; Tallman, R.L.; Henslee, S.P.; Seymour, W.C. (Idaho National Engineering Lab., Idaho Falls (USA)). Apr 1980. Contract AC07-76ID01570. 136p. NTIS, PC A07/MF A01.

Seven castings, 90 kg each, were produced by an electromelt process. The melts were solidified in thin-walled mild or galvanized steel containers. The containers showed no evidence of interaction with the slag. Four of the castings, designated as A-series (average INEL transuranic (TRU)/low-level-waste composition plus soil additions), were subjected to more detailed examinations, including sectioning into half pairs and subsequent evaluation. Examinations showed that bulk defects in castings were crust formation, center cavity porosity, and minor cracking. Specimens removed from the castings at selected locations showed that density and chemical composition were relatively uniform within each casting. Casting microstructure showed a 75 to 90% devitrification. Crystalline-phase types were pyroxene (diopside and hedenbergite) and spinel. The amount of spinel in A-series castings was dependent on both the iron content and Fe^{2+}/Fe^{3+} ratio. Leach data on slag specimens showed comparable leach rates, based on weight-loss measurements and elemental analyses of spent leachants. Splitting tensile strengths and fracture toughness values from slag specimens used in this study are less than those measured for borosilicate glass.

751 (EGG-PHYS--5076) ELECTRONICS SYSTEM FOR TRANSURANIC WASTE ASSAYS USING A PHOTON INTERROGATION TECHNIQUE. Johnson, L.O.; Lawrence, R.S. (Idaho National Engineering Lab., Idaho Falls (USA)). Dec 1979. Contract EY-76-C-07-1570. 69p. Dep. NTIS, PC A04/MF A01.

This report documents the development of electronics for a neutron detection system used in experiments to demonstrate the feasibility of a photon interrogation technique for transuranic (TRU) waste assays. The system consists of the neutron detection and signal conditioning circuits, variable time-gate generators, and a data acquisition system. The data acquisition system is configured using commercially available scalers, timers, teletype, and control components. The remainder of the system, with the exception of the neutron detectors, uses components designed in-house. The neutron detection system consists of ^3He proportional counters installed in a polyethylene moderator assembly. The counters are direct-coupled to a high-count-rate, current-sensitive preamplifier. The preamplifier and an additional two-stage amplifier are also installed in the moderator assembly. Signal conditioning includes baseline restoration and fast discrimination. A variable

time-gate generator with logic gates allows for separation of prompt and delayed neutron counts, and generation of prompt and delayed deadtimes. The ^3He proportional counters will detect not only the neutrons from the TRU waste sample, but also the high-energy photons used to induce fission in the sample. The burst of photons (gamma flash) tends to overload and paralyze the electronics. This system has been designed to recover from a worst-case gamma flash overload within 10 microseconds. The system has met all the requirements generated for the photon interrogation experiments.

752 (EGG-RE-M--78-033) IMMOBILIZATION OF INEL LOW-LEVEL RADIOACTIVE WASTES IN CERAMIC CONTAINMENT MATERIALS. Seymour, W.C.; Kelsey, P.V. (EG and G Idaho, Inc., Idaho Falls (USA)). Nov 1978. Contract EY-76-C-07-1570. 22p. Dep. NTIS, PC A02/MF A01.

INEL low-level radioactive wastes have an overall chemical composition that lends itself to self-containment in a ceramic-based material. Fewer chemical additives would be needed to process the wastes than to process high-level wastes or use a mixture containment method. The resulting forms of waste material could include a basalt-type glass or glass ceramic and a ceramic-type brick. Expected leach resistance is discussed in relationshp to data found in the literature for these materials and appears encouraging. An overview of possible processing steps for the ceramic materials is presented.

753 (EGG-RE-M--79-005) LEACHING OF INCINERATOR SLAG FROM MUNICIPAL WASTE. Tallman, R.L.; Flinn, J.E. (EG and G Idaho, Inc., Idaho Falls (USA)). Mar 1979. Contract EY-76-C-07-1570. 21p. Dep. NTIS, PC A02/MF A01.

A leaching study was performed on monoliths obtained by melting iron-rich municipal waste frit. The leachant was distilled water at 363°K. For tests where the leachant was intermittently changed and the specimens weighed, leach rates on the order of 1×10^{-4} $g.cm^{-2}d^{-1}$ were observed. For tests where the samples remained in the unperturbed leachant for the duration, leach rates were on the order of 3×10^{-5} $g.cm^{-2}d^{-1}$. These leach rates are similar to those obtained for other solidified waste forms, and are lower than those reported for concrete.

754 (EGG-TF--5168) BRIEF SUMMARY OF SLAG HANDLING OPTIONS REVIEWED FOR THE SLAGGING PYROLYSIS INCINERATOR IN THE TRANSURANIC WASTE TREATMENT FACILITY (TWIF) AT THE INEL. Darnell, G.R. (EG and G Idaho, Inc., Idaho Falls (USA)). Jun 1980. Contract AC07-76ID01570. 35p. NTIS, PC A03/MF A01.

This report summarizes the technical problems associated with molten transuranic waste slag as it flows from the incinerator shaft (gasifier) of the slagging pyrolysis incinerator. It addresses essential gasifier seals, slag casting and pouring technology, and transportation and packaging problems. Areas requiring further study and testing are identified.

755 (EGG-WM--5103) TRU WASTE PROCESSING COMPARISON: SLAGGING PYROLYSIS VERSUS MODIFIED GLASSMAKER. Bonner, W.F.; Cox, N.D.; Hootman, H.E.; Nelson, D.C.; Pye, D. (EG and G Idaho, Inc., Idaho Falls (USA)). Mar 1980. Contract EY-76-C-07-1570. 114p. Dep. NTIS, PC A06/MF A01.

A task force was assembled to make a technical comparison of the expected performance of two processing systems potentially applicable for treating TRU waste at the Idaho National Engineering Laboratory. One system contained a slagging pyrolysis incinerator; the other a modified Penberthy Electromelt glassmaker. Although the glassmaker technology is essentially undeveloped, it was assumed that the glassmaker could eventually be modified to operate as a combined waste incinerator and melter; that is, to perform the same functions as a slagger. Using a decision analysis methodology to evaluate figures-of-merit, the task force found no significant difference in the performance of the two systems. Some areas for future R and D efforts are recommended for both types of incinerators.

756 (EGG-WM--5116) LOW-LEVEL WASTE INSTITUTIONAL WASTE INCINERATOR PROGRAM. Thompson, J.D. (Idaho National Engineering Lab., Idaho Falls (USA)). Apr 1980. Contract EY-76-C-07-1570. 181p. Dep. NTIS, PC A09/MF A01.

Literature surveyed indicated that institutional LLW is composed of organic solids and liquids, laboratory equipment and trash, and some pathological waste. Some toxic and hazardous chemicals are included in the variety of LLW generated in the nation's hospitals, universities, and research laboratories. Thus, the incinerator to be demonstrated in this program should be able to accept each of these types of materials as feedstock. Effluents from the DOE institutional incinerator demonstration should be such that all existing and proposed environmental standards be met. A design requirement was established to meet the most stringent flue gas standards. LLW incineration practice was reviewed in a survey of institutional LLW generators. Incinerator manufacturers were identified by the survey, and operational experience in incineration was noted for institutional users. Manufacturers identified in the survey were contacted and queried with regard to their ability to supply an incinerator with the desired capability. Special requirements for ash removal characteristics and hearth type were imposed on the selection. At the present time, an incinerator type, manufacturer, and model have been chosen for demonstration.

757 (ENICO--1005) DESCRIPTION OF THE STACK MONITORING SYSTEM AND EFFLUENT MEASURING TECHNIQUES AT THE IDAHO CHEMICAL PROCESSING PLANT. Wong, M.A.; Roberts, R.S. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Aug 1979. Contract AC07-79ID01675. 39p. Dep. NTIS, PC A03/MF A01.

The stack monitoring system used to measure radioactive gas and particulate emissions from the Idaho Chemical Processing Plant is described in detail. The behavior of ^{129}I in the process off-gas and the particulate size distribution from the stack during different plant operations are evaluated. Recommendations for improvements to the system are presented.

758 (ENICO--1006) CALCINING SODIUM-BEARING WASTE BY BLENDING WITH ZIRCONIUM FLUORIDE WASTE. Newby, B.J. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Nov 1979. Contract AC07-79ID01675. 55p. Dep. NTIS, PC A04/MF A01.

A flowsheet, which is a method for converting wastes into granular, free flowing solids, was developed for calcining sodium-bearing waste stored at the Idaho Chemical Processing Plant (ICPP). The flowsheet consists of blending sodium-bearing waste with zirconium-

fluoride waste so that the calcine product contains as much as 5% sodium; calcium nitrate is added to the blend to give a calcium-to-fluoride mole ratio of 0.7. 7 figures, 26 tables.

759 (ENICO--1011) TECHNICAL AND ECONOMIC FEASIBILITY OF ZEOLITE ENCAPSULATION FOR KRYPTON-85 STORAGE. Benedict, R.W.; Christensen, A.B.; Del Debbio, J.A.; Keller, J.H.; Knecht, D.A. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Sep 1979. Contract AC07-79ID01675. 96p. Dep. NTIS, PC A06/MF A01.

This report presents experimental results and analyses to demonstrate the technical and economic feasibility of encapsulation by zeolites as a method to immobilize krypton-85 for safe, long-term storage. The process, which is feasible for a reference 2000 metric ton of heavy metal per year reprocessing plant, would encapsulate krypton at approximately 20 cm^3/g, using temperatures greater than 575°C and pressures greater than 1600 atm. A conceptual design and cost estimate was made for a commercial-scale facility, using well-established technology for building, operating, and containing krypton-85 within such a processing system. Safety considerations to contain any krypton released from the processing equipment are within existing technology. 36 figures, 12 tables.

760 (ENICO--1016) WCF FEED CHEMISTRY STUDIES. Newby, B.J. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Apr 1980. Contract AC07-79ID01675. 103p. Dep. NTIS, PC A06/MF A01.

Two methods using calcium nitrate are reported which effectively suppress fluoride and chloride volatility during calcination of first-cycle zirconium waste with minimum production of solids in calciner feed. Fluoride and chloride volatility suppression was accomplished by either increasing the aluminum concentration of the zirconium waste or blending the zirconium waste with sodium-bearing waste prior to calcium nitrate addition. Both methods were successfully tested in 10-cm diameter, fluidized-bed, pilot-plant calciner runs.

761 (ENICO--1026) PURIFICATION OF DIHEXYL N,N-DIETHYLCARBAMYLMETHYLENEPHOSPHONATE BY MERCURY (II) PRECIPITATION. Schroeder, N.C.; McIsaac, L.D.; Krupa, J.F. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Jan 1980. Contract AC07-79ID01675. 16p. NTIS, PC A02/MF A01.

Dihexyl N,N-diethylcarbamylmethylenephosphonate (DHDECMP) is an important extractant for partitioning actinides from acidic nuclear waste solutions. A new technique for purifying DHDECMP is presented. Reaction of 20% crude DHDECMP in hexane with 1M mercuric nitrate at 40°C precipitates $Hg(DHDECMP)NO_3$. DHDECMP, liberated from the precipitate by treatment with caustic cyanide, is > 95% jpure. The procedue is fast, inexpensive and has a high yield (approx. 85%) compared to previous methods.

762 (ENICO--1032) DESCRIPTION OF A PILOT PLANT TO PRODUCE A PELLETED FORM FROM SIMULATED ICPP HIGH-LEVEL CALCINED WASTES. Priebe, S.J.; Valentine, J.H. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Mar 1980. Contract AC07-79ID01675. 44p. Dep. NTIS, PC A03/MF A01.

The pilot plant uses techniques learned in the laboratory to combine calcine with solid and liquid binders to form hard, leach-resistant pellets. The pilot plant is designed to process up to 25 kg/h of calcine and will provide information necessary to verify the operational feasibility of pelletizing calcined waste. Also, information for the design of a possible full-scale pelletizing plant will be obtained. All components of the pelletizing operations are described. The solids feed system consists of two loss-in-weight feeders: one for calcine and one for solid binders. Intimate mixing of the solids is accomplished in a screw mixer-feeder. A metering pump is used to pump liquid binders to the pelletizer through a spray nozzle. A 12.7 mm mesh, vibro screen separator removes oversize pellets, leaving the pelletizer. A 0-6 kW microwave-heated dryer operating at 150 to 200°C removes moisture from the pellets in about 15 minutes. To impart leach resistance, the pellets are heat treated at 800 to 900°C for 1 to 2 hrs in a kiln. Pellets move down through a set of 6 to 8 stacked, rotating trays inside the kiln. Pellets are collected from the heat treater and tested for strength and leach resistance. An off-gas system cools and removes dust present in the off-gas from the pilot plant. 20 figures.

763 (ENICO--1035) PRODUCT REMOVAL NOZZLES FOR A FLUIDIZED-BED CALCINER. Schindler, R.E.; Cogburn, G.L.; Schrader, J.D. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Jun 1980. Contract AC07-79ID01675. 63p. NTIS, PC A04/MF A01.

Granular solids formed by the fluidized-bed calcination of radioactive liquid wastes are discharged from the calciner into a pneumatic transport line. These solids are discharged at a controlled rate by product removal nozzles consisting of sections of pipe. Dilution air is introduced near the nozzle inlet to dilute the solids and provide an air velocity adequate to prevent solids deposition in the nozzle. Solids discharge rates are controlled by adjusting the dilution air input and the pressure difference across the nozzle. Product removal nozzles designed to remove calcined solids from a fluidized-bed calciner at controlled rates of 1 to 3 kg/min with a pressure drop of 7 to 13 kPa were tested. Major operating parameters are identified and recommended operating conditions established. Graphical capacity correlations are developed for sizing of the product removal nozzles.

764 (ENICO--1036) ROLE OF SEED PARTICLES IN THE PREDICTION AND CONTROL OF PRODUCT PARTICLE SIZE IN FLUIDIZED-BED DRYERS. Grimmett, E.S. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Apr 1980. Contract AC07-79ID01675. 39p. Dep. NTIS, PC A03/MF A01.

Particle size distribution in a fluidized-bed dryer (where a solution is converted to a solid granular particle) depends on several different rate processes taking place. These include particle growth, particle attrition, product rate, feed deposition rate, elutriation rate, and seed attrition rate. While these rate processes are basic, depending on the material being dried, some become more important than others. Few new seed particles are generated within the bed when the physical properties of many materials being dried are such that little particle attrition takes place. Under these conditions, the particle size distribution in the bed continually increases unless some measure is taken to introduce into, or generate within the bed, new seed particles. This paper briefly describes the mathematical model which predicts the particle size distribution

expected when drying solutions in a fluidized bed. The important role that seed particles play in determining the steady-state particle size distribution of the bed is stressed. An experiment is described in which information was obtained that helped determine what seed particles are, and what size particles became seeds.

765 (ENICO--1037) COMPARISON OF HEPA FILTER TEST METHODS IN CORROSIVE ENVIRONMENTS. Murphy, L.P.; Fernandez, S.J.; Motes, B.G. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Jul 1980. Contract AC07-79ID01675. 31p. NTIS, PC A03/MF A01.

An evaluation of the three HEPA filter test methods in corrosive environments was conducted: the dioctyl phthalate (DOP) method (US Standard Method ANSI N-101.1-1972), the sodium chloride method (British Standard 3928:1969), and the soda-fluorescein or uranine method (French Standard AFNOR STD NFX 44-011). The effects of humidity, temperature and oxides of nitrogen (NO/sub x/) on each method was examined. The experimental design used in the evaluation measured and separated both the effect of each variable and any interaction between variables on the test method. Recommendations for changes in the standard methods to reduce erratic online results are presented.

766 (ENICO--1038) PROPERTIES OF VITRIFIED ICPP ZIRCONIA CALCINE. Cole, H.S.; Gombert, D. II; Berreth, J.R. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Jul 1980. Contract AC07-79ID01675. 40p. NTIS, PC A03/MF A01.

Waste glass using a borosilicate frit and simulated zirconia calcine produced at the Idaho Chemical Processing Plant was characterized. Tests included: Soxhlet, acid, and static distilled water leaches, and relative viscosity and crystallinity measurements on both air-quenched and annealed samples. The frit was evaluated to vitrify 10 to 40 wt% calcine. The effects of CaF_2 content on glass viscosity and crystallinity were measured. Changes in viscosity and leach rate caused by other calcines, partially substituted for the zirconia calcine in the glass, were determined. Varying the Na_2O to Li_2O ratio was studied on four modifications of the base glass. Viscosity and leach rates of glasses modified as described above were not significantly altered, but crystalline content of heat-treated glasses significantly increased with increasing CaF_2 content. 10 figures, 11 tables.

767 (ENICO--1040) VITRIFICATION OF HIGH-LEVEL ALUMINA NUCLEAR WASTE. Brotzman, J.R. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Jun 1980. Contract AC07-79ID01675. 23p. NTIS, PC A02/MF A01.

Borosilicate and borophosphate glass compositions have been developed to vitrify simulated high-alumina calcined nuclear defense waste. The effects of the alkali (Li_2O,Na_2O) to borate ratio and the Li_2O to Na_2O ratio on the glass melt viscosity and leach resistance were measured. The effects on the same properties of substituting CaO and P_2O_5 for SiO_2 and of substituting SiO_2, P_2O_5 and CuO for B_2O_3 were measured in the borosilicate and borophosphate glass, respectively.

768 (ENICO--1043) CALCINATION OF SODIUM-BEARING WASTE USING NON-RADIOACTIVE ADDITIVES. Newby, B.J. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Oct 1980. Contract AC07-79ID01675. 69p. NTIS, PC A04/MF A01.

Methods were scoped for converting the sodium-bearing waste stored at the Idaho Chemical Processing Plant into granular, free flowing solids by fluidized-bed calcination at 500°C. The most promising methods were addition of aluminum nitrate or aluminum nitrate, hydrofluoric acid, and calcium nitrate to sodium-bearing waste prior to calcination. These will be used as alternates to a method consisting of adding calcium nitrate to a blend of zirconium fluoride and sodium-bearing wastes prior to calcination. Problems could develop in calcining such a blend, storing the resulting calcine, or in obtaining enough zirconium fluoride waste to blend with sodium-bearing waste.

769 (ENICO--1048) CHARACTERIZATION OF VITRIFIED ICPP ALUMINA WASTE CALCINE. Cole, H.S.; Brotzman, J.R.; Simpson, G.G. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Aug 1980. Contract AC07-79ID01675. 24p. NTIS, PC A02/MF A01.

The properties of one borosilicate and two borophosphate glasses previously developed to vitrify an ICPP alumina nuclear waste calcine are determined. Based on melt viscosity at 1100°C and leach rate, the maximum permissible calcine contents in the borophosphate and borosilicate formulations are 26 and 16 mol%, respectively. Glasses containing lesser amounts of calcine do not develop crystalline compounds upon annealing. Based upon the same viscosity and leach rate criteria, 40 wt % CaO or zirconia calcine can be substituted for alumina calcine in the borophosphate glasses. Ten wt % of either additive can be substituted for alumina calcine in the borosilicate glass. Minor modifications of the alkali or cupric oxide content in the borophosphate glasses does not alter glass characteristics.

770 (ENICO--1051) DEVELOPMENT OF A PELLETED WASTE FORM FOR HIGH-LEVEL ALUMINA WASTES. Kirkbride, R.A. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Sep 1980. Contract AC07-79ID01675. 44p. NTIS, PC A03/MF A01.

A formulation to pelletize simulated high-level ICPP alumina waste calcine was developed. The pellets are formed on a 41-cm-diameter disc pelletizer using 5% bentonite, 2% metakaolin, and 5 wt % calcium hydroxide as a solid binder and a solution of 7M phosphoric acid and 4M nitric acid as a liquid binder. After drying and heat treatment at 800°C for 2 hours, the average crush strength of the pellets is 3.9 MPa and the pellets have a leach resistance of 10^{-3} g/cm^2/day, based on Soxhlet leaching for 48 h at 95°C with distilled water.

771 (ENICO--1062) SOLIDIFICATION OF ICPP ACTINIDE PARTITIONING SOLUTIONS. Schuman, R.P. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Sep 1980. Contract AC07-79ID01675. 23p. NTIS, PC A02/MF A01.

An extensive literature survey has been made of possible methods of solidifying the rare earths and actinides in the solutions from the actinide partitioning columns, and several simple experiments have been run. If both actinides and lanthanides are to be solidified together, direct oxalate precipitation from mildly acid strip solution appears most promising. Oxalate will precipitate Np(IV), Pu(III or IV) and Am(III) from the $NH_2OH.HNO_3$ plus dilute HNO_3 strip solution. Direct evaporation of the solution on a glass frit also appears promising if glass is the final waste form. Many inactive simulated waste

glasses have been prepared and leach tested; highly durable glasses can be prepared at 1100°C. Inorganic titanate, $HTi_2O_5^-$, ion exchanger efficiently sorbs Np and Pu from neutralized strip solution but not from the acid strip solution. Titanate can be pressed to give a durable ceramic waste form.

772 (EUR--5785) COMPARATIVE EVALUATION OF RADIOACTIVE MATERIALS MANAGEMENT BY DIFFERENT METHODS: PT. 1. QUANTITATIVE COMPARISON OF THE DIFFERENT METHODS USED FOR THE REDUCTION OF THE VOLUME OF α CONTAMINATED SOLID WASTES. Ditterich, K.; Schneider, J. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1977. 22p. (In German). Dep. NTIS (US Sales Only), PC A03/MF A01.

In order to estimate the various strategies based on different system structures, a methodology is given. It is applied to the radioactive waste management systems. The base of the methodology is constituted of objective criteria to calculate the validity of the considered method. The validity of this method is demonstrated by application to the evaluation of processes for reducing the volume of Pu contaminated solid wastes.

773 (EUR--6213) TESTING AND EVALUATION OF THE PROPERTIES OF VARIOUS POTENTIAL MATERIALS FOR IMMOBILIZING HIGH ACTIVITY WASTE. FIRST ANNUAL REPORT (1977). Malow, G.; Beran, V.; Lutze, W.; Marples, J.A.C.; Dalton, J.T.; Hall, A.R.; Hough, A.; Boult, K.A. (Commission of the European Communities, Brussels (Belgium)). 1979. 38p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Four borosilicate glasses and one Celsian glass ceramic were tested under strictly identical conditions. This report presents the results of the following test: (a) Leach testing of samples, in the as cast state, annealed at 800°C for up to 100 days; (b) Grain titration test of hydrolytic resistance (DIN 12111); (c) Examination of the glass structure and its changes due to thermal effects, differential thermal analysis, x ray diffraction analysis, scanning electron microscopy, microprobe analysis.

774 (GEFR-SP--215) ACTINIDE RECYCLE IN LMFBRS AS A WASTE MANAGEMENT ALTERNATIVE. Beaman, S.L. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 30 Apr 1980. Contract AM03-76SF00893. 33p. (CONF-800743--2). NTIS, PC A03/MF A01.

From International conference on nuclear waste transmutation; Austin, TX, USA (22 Jul 1980).

A strategy of actinide burnup in LMFBRs has been investigated as a waste management alternative to long-term storage of high level nuclear waste. This strategy has been evaluated because many of the actinides in the waste from spent-fuel reprocessing have half-lives of thousands of years and an alternative to geological storage may be desired. By burning the actinides in LMFBRs the long-lived isotopes can be effectively transmuted to fission products which have significantly shorter half-lives. Actinide burnup in LMFBRs rather than LWRs is preferred because the fission to capture reaction rate ratios are higher in the LMFBR, and the LMFBR performance is not highly sensitive to the addition of the actinide waste material. An actinide target assembly recycle scheme has been analyzed to determine the effects of the actinides on the LMFBR performance, including local power peaking, breeding ratio, and fissile material requirements. The overall efficiency of actinide burnout in LMFBRs has been evaluated, and equilibrium cycle conditions have been determined. The results of the actinide recycle study indicate that the actinide wastes produced by a fission reactor economy could be transmuted in fast reactors with only a two percent penalty in the fissile loading requirements and a one to two percent penalty in the breeding ratio of the host reactors. The actinide target assemblies could be tailored to give a power distribution which is comparable to that of the standard fuel assemblies. However, the total shutdown decay heat from a target assembly would be approximately 43 percent greater than that from a standard assembly.

775 (HEDL-SA--1967) OPERATION OF THE RADIOACTIVE ACID DIGESTION TEST UNIT. Blasewitz, A.G.; Allen, C.R.; Lerch, R.E.; Ely, P.C.; Richardson, G.L. (Hanford Engineering Development Lab., Richland, WA (USA)). 1980. Contract AC14-76FF02170. 19p. (CONF-800611--9). NTIS, PC A02/MF A01.

From International symposium on the management of alpha-contaminated wastes; Vienna, Austria (2 Jun 1980).

The Radioactive Acid Digestion Test Unit (RADTU) has been constructed at Hanford to demonstrate the application of the Acid Digestion Process for treating combustible transuranic wastes and scrap materials. The RADTU with its original tray digestion vessel has recently completed a six-month campaign processing potentially contaminated nonglovebox wastes from a Hanford plutonium facility. During this campaign, it processed 2100 kg of largely cellulosic wastes at an average sustained processing rate of 3 kg/h as limited by the water boiloff rate from the acid feeds. The on-line operating efficiency was nearly 50% on a twelve hour/day, five day/week basis. Following this campaign, a new annular high rate digester has been installed for testing. In preliminary tests with simulated wastes, the new digester demonstrated a sustained capacity of 10 kg/h with greatly improved intimacy of contact between the digestion acid and the waste. The new design also doubles the heat transfer surface, which with reduced heat loss area, is expected to provide at least three times the water boiloff rate of the previous tray digester design. Following shakedown testing with simulated and low-level wastes, the new unit will be used to process combustible plutonium scrap and waste from Hanford plutonium facilities for the purposes of volume reduction, plutonium recovery, and stabilization of the final waste form.

776 (HEDL-SA--2009-FP) REMOTELY OPERATED ORGANIC LIQUID WASTE INCINERATOR FOR THE FUELS AND MATERIALS EXAMINATION FACILITY. Sales, W.L.; Barker, R.E.; Hershey, R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). 1980. Contract AC14-76FF02170. 12p. (CONF-800607--66). NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

The search for a practical method for the disposal of small quantities of oraganic liquid waste, a waste product of metallographic sample preparation at the Fuels and Materials Examination Facility has led to the design of an incinerator/off-gas system to burn organic liquid wastes and selected organic solids. The incinerator is to be installed in a shielded inert-atmosphere cell, and will be remotely operated and maintained. The off-gas system is a wet-scrubber and filter system designed to

release particulate-free off-gas to the FMEF Building Exhaust System.

777 (HEDL-SA--2064) COMBUSTIBLE RADIOACTIVE WASTE TREATMENT BY INCINERATION AND CHEMICAL DIGESTION. Stretz, L.A.; Crippen, M.D.; Allen, C.R. (Los Alamos Scientific Lab., NM (USA); Hanford Engineering Development Lab., Richland, WA (USA)). 28 May 1980. Contract W-7405-ENG-36;AC14-76FF02170. 60p. (CONF-800802--16). NTIS, PC A04/MF A01.
From 89. annual meeting of the American Institute of Chemical Engineers; Portland, OR, USA (17 Aug 1980).
A review is given of present and planned combustible radioactive waste treatment systems in the US. Advantages and disadvantages of various systems are considered. Design waste streams are discussed in relation to waste composition, radioactive contaminants by amount and type, and special operating problems caused by the waste.

778 (IDO--10068(77-1)) WASTE MANAGEMENT ACTIVITIES (NON-PRODUCTION). QUARTERLY REPORT, OCTOBER-DECEMBER 1976. (Idaho National Engineering Lab., Idaho Falls (USA)). Apr 1977. 42p. Dep. NTIS, PC A03/MF A01.
This quarterly report provides current information on the Idaho National Engineering Laboratory (INEL) programs for the management of radioactive wastes (non-production) from the operations at INEL facilities. The report also includes information on development programs for the long-term management of commercial waste including high-level liquid wastes.

779 (INFCE/DEP/WG--7/4) LONG-TERM DISPOSAL OF ENRICHMENT PLANT TAILS. (INFCE (USA)). Aug 1979. 31p. NTIS (US Sales Only), PC A03/MF A01.
Approximately 97% of the uranium fed to the isotope separation plants is recovered as tails containing nominally 0.2 wt percent U-235. Essentially all this tails material produced in the past, as well as that currently being generated, is stored as solidified UF_6 in steel cylinders. This report describes a stand-alone, 10 tU/day facility for converting the UF_6 to a stable uranium oxide powder amenable to long-term storage in steel drums. The conversion is accomplished in a two-step process in which the UF_6 is first reduced to UF_4 with hydrogen in a tower reactor and then the UF_4 is pyrohydrolyzed to UO_2 with steam in a three-stage screw reactor. One reduction reactor supplies the feed for three pyrchydrolysis reactor lines. Included in the process flow sheets and reactor design details are descriptions of the major auxiliary components for vaporizing and feeding the UF_6, a dissociator for ammonia used as a hydrogen source, a system for recovering anhydrous hydrogen fluoride, and a reactor system for the disposal of hydrous hydrogen fluoride. Two of the nominal 10 tU/day plants would be required to handle the tails produced in isotope separation plants supplying enriched uranium to a nuclear power industry with a generation capacity of 50 GWe per year.

780 (INFCE/DEP/WG--7/7) SOLIDIFICATION OF HIGH-LEVEL WASTES FROM REPROCESSING. (INFCE (France)). [nd]. 8p. NTIS (US Sales Only), PC A02/MF A01.
For the solidification of high-level activity liquid wastes, glass has been selected as the best material because of the combination of chemical, radiation and thermal stability. Properties of glass as a barrier are given. The industrial application of the process in the AVM plant at Marcoule (France) is described.

781 (INIS-mf--4551, pp 190-194) NRI'S RESEARCH ON RADIOACTIVE WASTES. Alexa, J.; Dlouhy, Z.; Kepak, F.; Kourim, V.; Napravnik, J.; Razga, J.; Ralkova, J.; Uher, E.; Vojtech, O. 1976. (In Czech).
From Scientific and technical conference commemorating the 20. anniversary of the Nuclear Research Institute's foundation; Rez, Czechoslovakia (10 Jun 1975).
A survey is given (including 41 references) of work carried out at the Nuclear Research Institute. Discussed are sorption processes (a selective sorbent for ^{90}Sr based on $BaSO_4$, etc.), sorption on inorganic ion exchangers (heteropolyacid salts, ferrocyanides for ^{137}Cs capture), on organic cation exchangers (separation of lanthanides), electrocoagulation. The process is described of vitrification of highly radioactive wastes, the arrest of emissions, the deposition of radioactive wastes and surface decontamination.

782 (INIS-mf--4551, pp 195-199) RADIOACTIVE WASTE PROCESSING IN NRI. Dlouhy, Z.; Zaruba, J. 1976. (In Czech).
From Scientific and technical conference commemorating the 20. anniversary of the Nuclear Research Institute's foundation; Rez, Czechoslovakia (10 Jun 1975).
The processing of radioactive wastes from research work carried out at the Nuclear Research Institute is described. The waste processing installation is described as are the technologies used (vacuum concrete casting, bituminization, evaporation). Data on mechanical strength, radiation stability and leaching rate of products obtained by bituminization and concrete casting are listed; no references are given to previous works.

783 (INIS-mf--4637, pp 131) RADIOCHEMICAL SEPARATION OF PLUTONIUM FROM LOW-ACTIVITY WASTE WATERS. Volny, J.; Jasanovsky, P. (Ustav pro Vyzkum, Vyrobu a Vyuziti Radioisotopu, Prague (Czechoslovakia)). Jun 1976. (In Czech).
From 4. national symposium on ionizing radiation dosimetry; Marianake Lazne, Czechoslovakia (8 Nov 1976).
EFFICIENCY;INTERFERING ELEMENTS;LIQUID SCINTILLATION DETECTORS;LIQUID WASTES;LOW-LEVEL RADIOACTIVE WASTES;PLUTONIUM;SEPARATION PROCESSES;RADIOACTIVE WASTE PROCESSING; RADIOMETRIC ANALYSIS;SENSITIVITY;SOLVENT EXTRACTION

784 (INIS-mf--4771) RADIOACTIVITY GENERATION AND CONTROL RADWASTE PROCESSING. Mergan, L.; Storrer, J.; Verbeke, R.; Cordier, J.P. (Societe Belge pour l'Industrie Nucleaire, Brussels). 1978. 12p. (CONF-781022--75). Dep. NTIS (US Sales Only), PC A02/MF A01.
From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).
After a brief recall of the safety problems reported from existing radwaste solidification installations, the paper presents a proposal of safety requirements to be applied to such processes, first, from the standpoint of the installaton features and equipment, second, regarding the properties to be demonstrated for the solidificaton end-products. It also introduces a soidification process which, together with an important waste volume reduction, provides satisfactory answers to above safety aspects.

785 (INIS-mf--5013, pp 3-28) HANDLING OF SPENT NUCLEAR FUEL AND FINAL STORAGE OF NITRIFIED HIGH LEVEL REPROCESSING WASTE. [nd].

Safe handling and storage of high level radioactive waste. A condensed version of the proposals of the Swedish KBS-Project regarding reprocessing waste, spent fuel.

The following stages of handling and transport of the fuel on its way to final storage are dealt with in the report. 1) The spent nuclear fuel is stored at the power station or in the central fuel storage facility awaiting reprocessing. 2) The fuel is reprocessed, i.e. uranium, plutonium and waste are separated from each other. Reprocessing does not take place in Sweden. The highlevel waste is vitrified and can be sent back to Sweden in the 1990s. 3) Vitrified waste is stored for about 30 years awaiting deposition in the final repository. 4) The waste is encapsulated in highly durable materials to prevent groundwater from coming into contact with the waste glass while the radioactivity of the waste is still high. 5) The canisters are emplaced in a final repository which is built at a depth of 500 m in rock of low permeability. 6) All tunnels and shafts are filled with a mixture of clay and sand of low permeability. A detailed analysis of possible harmful effects resulting from normal acitivties and from conceivable accidents is presented in a special section.

786 (INIS-mf--5013) SAFE HANDLING AND STORAGE OF HIGH LEVEL RADIOACTIVE WASTE. A CONDENSED VERSION OF THE PROPOSALS OF THE SWEDISH KBS-PROJECT REGARDING REPORCESSING WASTE, SPENT FUEL. [nd]. 18p. Dep. NTIS (US Sales Only), PC A04/MF A01.

Individual papers are processed for the data base.

787 (INIS-mf--5316) SOLIDIFICATION OF LIQUIDS BY THE USE OF MICROWAVES. Rohrecker, L. (Technische Univ., Vienna (Austria)). Jun 1979. 97p. (In German). Dep. NTIS (US Sales Only), PC A06/MF A01.

Thesis.

A method of heating falling droplets of water by passing them through a microwave resonator excited at 14.5 GHz from a travelling wave tube amplifier is described. Optimum resonator shape is analysed and applications in inducing chemical reactions leading to the solidification of radiactive waste solutions are suggested. A computer program for determining dielectric heating of liquid drops is listed.

790 (INIS-mf--5564, pp 198-207) SOLVENT EXTRACTION OF PALLADIUM WITH SULFUR REAGENTS FROM MINERAL ACID MEDIUM. COMMUNICATION 1. SOLVENT EXTRACTION WITH SYMMETRICAL DIALKYL- AND DIARYL SULFIDES FROM NITRIC ACID MEDIUM. Przhigoda, I. 1977. (In Russian).

From 4. symposium on study into irradiated fuel reprocessing; Karlovy Vary, Czechoslovakia (28 Mar 1977).

Investigated has been the extraction process of divalent palladium, present in liquid solution wastes at reprocessing of irradiated nuclear fuel from nitroacid medium by organic solvents of sulfides in benzol, toluene, nitrobenzene, chloroform, tetrachloroethane, tetrachloromethane, 1,2-dichloroethane, n-octane, methylisobuthylketone, di-n-butylether and benzine. It is detected that distribution coefficient of palladium in the majority of instances depends but slightly on the nitric acid concentration. If palladium and sulfide concentration and also the volume of the two phases are respectively equal, palladium distribution coefficient variates in the vicinity of 1. In case sulfide concentration is at least 2 times higher, than the palladium concentration, the extraction effectiveness reaches almost 100%. Palladium(2) extraction kinetics and the effect of organic additions (dimethylsulfoxide, dimethylformamide, and methanol) and salting-out agents on the distribution coefficients have been studied. A conclusion is made that the compound is being extracted with sulfide-palladium ratio 2:1.

791 (INIS-mf--5564, pp 170-179) METHODS FOR SOLVENT EXTRACTION OF STRONTIUM 90 WITH CARBOXYLIC ACIDS AND SEPARATION OF AMERICIUM AND CURIUM BY QUATERNARY AMMONIUM COMPOUNDS. Korpusov, G.V.; Krylov, Yu.S.; Danilov, N.A. 1977. (In Russian).

From 4. symposium on study into irradiated fuel reprocessing; Karlovy Vary, Czechoslovakia (28 Mar 1977).

Experiments on strontium-90 separation by extraction with various carboxylic acids in transient countercurrent regime were carried out. It is shown by the experiments on the laboratory multistage extraction equipment, that strontium separation may be conducted simultaneously with isotope concentration and its purification from neighbouring alkali-earth elements and other impurities. Various extraction systems based on quaternary ammonium compounds are selective to americium and curium in the trivalent state. The effectiveness of countercurrent process of americium and curium separation was confirmed by the experiments on the laboratory extraction equipment.

792 (INIS-mf--5564, pp 188-197) SOLVENT EXTRACTION OF TECHNETIUM FROM NITRIC ACID SOLUTIONS WITH TRIBUTYL PHOSPHATE AND TRI-N-OCTYLAMINE IN TETRACHLOROMETHANE. Matsashek, F.; Raets, P.; Mikulai, V.; Kopunets, R.; Chekh, R. 1977. (In Russian).

From 4. symposium on study into irradiated fuel reprocessing; Karlovy Vary, Czechoslovakia (28 Mar 1977).

The extraction of pertechnetate, present in liquid wastes of irradiated fuel processing, from nitrate solutions by tributyl phosphate

and tri-n-octylamine solutions in carbon tetrachloride is investigated. The TcO_4^--coextraction with uranium by the TBP solutions is explained by the exchange of the NO_3^---TcO_4^- ions, coordinated by uranyl. The TOA/CCl_4 solutions possess good selectivity. Hydrochloric acid excretion during irradiation and storage of the solution may be considered as their disadvantage.

793 (INIS-mf--5564, pp 248-257) SORPTION OF FISSION PRODUCTS ON HUNGARIAN SYNTHETIC ION EXCHANGERS. Tsegledi, B.; Chovari, M. 1977. (In Russian).
From 4. symposium on study into irradiated fuel reprocessing; Karlovy Vary, Czechoslovakia (28 Mar 1977).
Sorption of fission products and chloride ions from boric acid solutions on Hungarian synthetic ion exchanges is studied. Chloride concentration measurements during selectivity study of ion exchangers was carried out by means of chloroselective membrane electrodes. Sorption of fission products was determined by γ-spectra of ionites, obtained after passing of radioactive solutions. It was determined, that high-basic anionite Varion AT-660 and Varion-ATM were sufficiently selective to chloride ion and may be used for purification of circuit waters of nuclear reactor from traces of these ions. The fission products have different sorption on high-acid and high-basic ionites: rare-earth elements and ruthenium are well sorbated on cationite, zirconium and niobium - on anionites.

794 (INIS-mf--5565, pp 166-177) PROBLEMS OF HIGH-ACTIVE WASTE PROCESSING BEFORE DISPOSAL. Kulichenko, V.V.; Krylova, N.V.; Martynov, Yu.P.; Rakov, N.A. 1977. (In Russian).
From 4. symposium on study into irradiated fuel reprocessing; Karlovy Vary, Czechoslovakia (28 Mar 1977).
The ways of reprocessing and disposal of radioactive wastes with specific activity up to $3.7 \times 10^{14} s^{-1}/l$ formed in the process of regeneration of nuclear fuel are regarded. Glasslike (phosphate and silicate) and basalt like materials were studied. The methods of preparation of such materials applicable for disposal are briefly reviewed. The process of phosphate vitrification developed in the USSR includes two stages: calcination in a fluidized bed and followed by the calcinate melting by high frequency heating in a concrete crucible. The KS-KT-100 device developed on this basis and its technological cycle are described. At the calcination temperature of 400 deg C and fluidization velocity of 1.5m/s the productivity of the installation for the initial solution makes up 100l/h and for the glass-20 kg/h. Shortly regarded is the problem of radioactive waste storage and heat exchange by air blow. The undesirability of all the salts except nitrates in the disposed wastes is pointed out.

795 (INIS-mf--5565, pp 98-121) MODERN STATE OF TECHNOLOGY OF EXTRACTION OF TRANSURANIUM AND CERTAIN FISSION ELEMENTS FROM HIGH-ACTIVITY RAFFINATES. Gorski, B.; Pfrepper, G.; Nebel, D.; Khaine, V. 1977. (In Russian).
From 4. symposium on study into irradiated fuel reprocessing; Karlovy Vary, Czechoslovakia (28 Mar 1977).
Present-day methods of extraction of useful transuranium and fission elements are presented. Mainly Cs,Sr,Tc,Pd,Rh,Np, Am and Cm elements are discussed. The methods are estimated according to technology development state, problems that need further working-out and possible utilization in industry. The scheme of separation of these components is suggested and discussed.

796 (INIS-mf--5565, pp 276-281) RESULTS OF INVESTIGATION INTO CORROSION RESISTANCE OF CERTAIN STRUCTURAL STEELS AND NICKEL IN FLUORIDE PRODUCTS OF FAST REACTOR FUEL REPROCESSING. Kirillovich, A.P.; Gazizov, R.K.; Lavrinovich, Yu.G.; Belokopytov, V.S.; Bushkovskii, V.S.; Stupina, L.N. 1977. (In Russian).
From 4. symposium on study into irradiated fuel reprocessing; Karlovy Vary, Czechoslovakia (28 Mar 1977).
The results of investigation into corrosion resistance of carbon steel (steel-3), steel-Kh18N10T and nickel (NP-1) in the spent fuel reprocessing products of BOR-60 reactor by the fluoride volatility method. The effect of chemical medium, temperature and time on metal corrosion is considered. The effect of gamma radiation on corrosion resistance of steels and nickel in fluoride salts is estimated. It is shown that the corrosion of investigated materials increases with temperature and moisture of the environment. The formation of protective films on the metal surface after the durable contact with the fluoride salts is discovered. The protective properties of these films depend on their structure and environment conditions. The investigation into metal corrosion properties provides the recommendations on conditions of their utilization as construction materials in the fluoride volatility reprocessing of spent fuel.

797 (INIS-mf--5567, pp 268-273) Co^{2+} AND Ni^{2+} ION EXCHANGE ON ZIRCONYL PHOSPHATE FROM AQUEOUS SOLUTIONS. Ruvarats, A.; Atanasova, E. 1975. (In Russian).
From 3. CMEA symposium on investigations in the field of spent fuel reprocessing; Marianske Lazne, Czechoslovakia (24 Apr 1974).
The exchange of Co^{2+} and Ni^{2+} ions, formed in the solutions at reprocessing of the spent fuel as corrosion products is studied. Ion-exchange isotherms on zirconyl phosphate show, that with the increasing of the temperature the value of ion exchange in the Ni^{2+}/H^+ process increases and in the process of Co^{2+}/H^+ exchange the ion exchange value decreases with the increasing of the temperature. The process of the Co^{2+}/H^+ ion exchange is exothermal and the process of Ni^{2+}/H^+ ion exchange is endothermal. The thermodynamic parameters of the ion exchange are calculated.

798 (INIS-mf--5567, pp 274-283) SOME METHODS OF INVESTIGATION OF SOLIDIFICATION PROCESS OF HIGH-ACTIVE WASTES CONTAINING ALUMINIUM OXIDE. Voitekh, O.; Vatskova, E. 1975. (In Russian).
From 3. CMEA symposium on investigations in the field of spent fuel reprocessing; Marianske Lazne, Czechoslovakia (24 Apr 1974).
The methods of electron microanalysis, colorimetry, infrared spectroscopy, neutron diffraction analysis and emanation thermal analysis (ETA) for investigation of solidification process of high-active wastes containing aluminium oxide are studied. The practical application of these methods has been demonstrated in the process of Al_2O_3 inclusion into SIAL grade glass produced in CSSR for commercial purposes. It is shown that the ETA method is the most rational and can play a significant role in the process standartization due to its high sensitivity. The electron microanalysis is useful for investigation of space distribution of various components of the

product. The method of coloured chemical reactions and neutron diffraction analysis have the same application. The last one is an important analytical method for measuring products with actual contents of radioactive substances. The methods of infrared spectroscopy and X-ray diffraction analysis are useful for estimating resultant structure of the product and its chemical composition.

799 (INIS-mf--5567, pp 284-290) TO THE PROBLEM OF NEUTRALIZATION OF LOW- AND MEDIUM-ACTIVE SPENT FUEL REPROCESSING WASTES. Dlougi, Z.; Shafarzh, O. 1975. (In Russian).

From 3. CMEA symposium on investigations in the field of spent fuel reprocessing; Marianske Lazne, Czechoslovakia (24 Apr 1974).

Given is the analysis of technical and economic problems of handling low- and medium-active wastes from spent fuel reprocessing. Two methods are suggested for the solidification of liquid concentrates and used solid sorbents: vacuum carburizing and bituminization. Bituminization seems to look more promising from the economic point of view. Possible ways of solidificated radioactive waste strorage in the surface geological formations are considered such as placing into ordinary trenches or a concrete container followed by placing in a trench. For comparison with the above methods the utilization of a half-sunk closed hall with a light ceiling is considered. It is noted that the reliability and safety of the chosen place for radioactive waste storage should be based on the detailed study of local geological and hydrogeological conditions.

800 (INIS-mf--5567, pp 292-300) RADIOACTIVE CONCENTRATE INCLUSION INTO BITUMEN DURING FILMY EVAPORATION. Napravnik, I. 1975. (In Russian).

From 3. CMEA symposium on investigations in the field of spent fuel reprocessing; Marianske Lazne, Czechoslovakia (24 Apr 1974).

The method of fixing concentrated radioactive wastes into bitumen in a filmy evaporating device is described. The bituminization process was carried out by evaporation of the mixture of an aqueous bituminous emulsion and a concentrate. It is shown that the concentrated radioactive wastes can be reprocessed by aqueous bituminous emulsions in the filmy evaporating device. The recommendations on the use of the method in the general flow sheet of concentrate fixation by the vacuum comentation method are given.

801 (INIS-mf--5569, pp 154-162) PROCESSING OF RADIOACTIVE WASTES FORMED IN THE NUCLEAR FUEL RECYCLE FOR DISPOSAL. Kulichenko, V.V.; Martynov, Yu.P. 1975. (In Russian).

From 3. CMEA symposium on investigations in the field of spent fuel reprocessing; Marianske Lazne, Czechoslovakia (24 Apr 1974).

Different solidification technologies to process highly radioactive liquid wastes are briefly surveyed. Major requirements to solidification processes are considered. General characteristics of evaporation and calcination in a fluidized bed and in a spray drying apparatus as well as of vitrification in furnaces or using heat generated in chemical reactions and/or radioactive decay are given. The effect of a chemical and isotopic composition of highly radioactive wastes on the choice of an adequate processing and disposal technology is also considered. The choice is dominated by decay heat of wastes.

802 (INIS-mf--5570) RESEARCH ON DESACTIVATION OF LIQUID, SOLID AND GASEOUS RADIOACTIVE WASTES AND DECONTAMINATION OF SURFACES. PROCEEDINGS OF THE 4-TH SCIENTIFIC AND TECHNICAL CONFERENCE OF CMEA. MOSCOW, 20 - 23 DECEMBER 1976. PART 1. PROCESSING OF LIQUID RADIOACTIVE WASTES OF LOW AND MEDIUM ACTIVITY. (Sovet Ehkonomicheskoj Vzaimopomoshchi, Moscow (USSR). Postoyanniya Komissiya po Ispol'zovaniyu Atomnoj Ehnergii v Mirnykh Tselyakh). 1978. 137p. (In Russian). (CONF-761260--(Pt.1)). NTIS (US Sales Only), PC A07/MF A01.

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

The results of research works done in the field of desactivation of liquid radioactive wastes of low and medium activity are described. Problems of desactivation of sewage from nuclear power plants and other nuclear installations are discussed. The results of efficiency estimation of different methods of sewage radioactivity lowering are discussed including such chemical methods of purification os coprecipitation and coagulation. Problems of application both the organic and the nonorganic sorbents for separation of radioactive substances from liquid wastes are discussed. Results of research on purification methods by electrodialysis and ion exchange are given. More that this, the results of experiments on evaporation of liquid radioactive wastes and problems of long time storage of highly concentrated liquid wastes are discussed.

803 (INIS-mf--5570, pp 104-106) PURIFICATION OF LOW LEVEL ACTIVITY WATER BY MEANS OF SELECTIVE SORBENTS. Berak, L. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Results are stated of the investigations undertaken to study properties of selective sorbents used for purification of radioactive water. Main efforts were directed towards increase of sorption selectivity of sorbents with respect to radioactive isotopes of strontium and radium. Results of the investigations can find an application for therapeutics in the case of radionuclide penetration into the digestive system of man. Works were done for finding a sorbent capable to lower natural water activity when the water contains radium-226 and some type of wastes containing strontium-90 and also a sorbent for maximum reduction of activity of solutions with high salts content. Properties are given of sorbents on the base of alumosilicates in gel from, alcaline earth metals phosphates, hydrated oxides, barium sulphate, some natural organic compounds and ionites made of sulfated styrene copolymers.

804 (INIS-mf--5570, pp 73-79) OPERATION EXPERIENCE IN PLANTS FOR DESACTIVATION OF RADIOACTIVE WASTES OF LOW AND MEDIUM ACTIVITY IN ROMANIA. Bushile, A.; Oikulesku, A.; Rishnovianu, I.; Roshu, N.H. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Operation experience of the station for processing and deactivation of liquid and solid radioactive wastes of low and medium level of activity is described. List of the equipment in the station, specifications of main

installations, methods applied for wastes processing and results obtained are given. Liquid wastes processing includes: chemical processing of sewage, water evaporation; radionuclides separation from distillate by means of ion exchange; dehydratation of slurries; cementation of radioactive concentrates. Solid combustible wastes are burned and combustion products in gaseous form are filtrated. Solid non combustible wastes are splintered and pressed for reduction of their volume. Chemical and physiacal properties of liquid wastes processed are given.

805 (INIS-mf--5570, pp 61-66) REMOVAL OF FISSION AND CORROSION PRODUCTS FROM ALKALINE SOLUTIONS OF BORIC ACID BY THE ION EXCHANGE METHOD. Chonsnowska, V.; Zentek, R. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Results are given for ion exchange on organic resines method application in experiments on removal of some fission products and corrosion products from solutions containing boric acid. As it is known, presence of boric acid in solution makes it difficult for radioactive wastes processing, concentration and solidification. The main task of the investigation was to develop methods for boric acid regeneration from the coolant of primary coolant circuits of nuclear power plant. Speciel attention was made to investigations on cesium sorption from the boric acid solutions, containing potassium ions. It was shown that by means of acidulation of solutions, increase of efficiency of radioactive wastes containing boric acid by means of ion exchange is gained. But this method is practical only in the case when solution is not returned into the primary coolant circuit after purification. Expediency of preliminary removal of cesium from solution by means of selective nonorganic ionites is shown. Attention is called to the danger of boric acid for natural waters and danger of liquid wastes containing boric acid even after removal of radionuclides from them.

806 (INIS-mf--5570, pp 125-134) INVESTIGATION ON POSSIBILITIES OF APPLICATION OF THE BULGARIAN NATURAL SORBENTS FOR DESACTIVATION OF LIQUID RADIOACTIVE WASTES OF MEDIUM AND LOW LEVEL OF ACTIVITY. Gradev, G.D.; Milanov, M.V; Prodanov, Ya.D.; Stefanov, G.I. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

As a results of preliminary investigations on Bulgarian natural minerals, clinoptilolite, vermiculite and bentonite were selected as perspective natural nonorganic sorbents. Results of investigations on natural sorbents properties and their application for radioactive waters purification are stated. Sorption of cerium, silver, thallium, strontium, cobalt, iron and cesium ions has been investigated. It was shown that the greatest sorption ability have univalent ions on clinoptilolite. Twovalent and polyvalent ions and also cesium are well sorbed on vermiculite but bentonite is the best sorbent for extraction of cobalt and cerium. The data are given for sorbents capacity and selectivity. Influence of heat treatment, gamma irradiation and pH of solution on sorbents capacity are concidered. Influence of alkaline and alkaline earth ions on sorption are investigated. Results are given of experiments of nuclear power plant sewage purification.

807 (INIS-mf--5570, pp 50-54) DEVELOPMENT OF THE CATALOG FOR ORDINARY SORPTION AGENTS FOR LOW ACTIVITY SEWAGE PURIFICATION. Jochansen, K.H. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Sorption and ion exchange with natural materials and synthetic resins are widely used in purification of sewage of low and medium level of activity. Properties of different sorbents are compared by means of the unified method for sorptive properties determination. The data obtained were compiled as a catalog of sorbents. This unified method was applied to determine properties of sorbents used for purification of low and medium activity sewage. The unified method includs determination of common and special properties of sorbents. Common properties are: grain size, humidity, mechanical strength, and chemical stability. These properties are presented as standards of the CMEA member-countries for sorbents and ion exchange materials. Determination of special properties is relevant to estimation of efficiency of sorbents in radioactive sewage purification and removal of substances dissolved in water. Substantial effict on the sorbents effeciency is made by the chemical composition of the wates processed. As a sample for determination of sorbent properties three solutions were selected. These sample solutions contain non active salts with additions of cesium-134, cesium-137, strontium-89, strontium-90, sulfur-35 in the form of sulfates and chlorine-36 in the form of chlorides. Methods for determination other sorbents' properties as ion exchange rate, distribution factor, exchange factor and regeneration ability in unified conditions. Catalog of sorbents produsedin member-countries of CMEA is given.

808 (INIS-mf--5570, pp 41-44) EXPERIENCE ON OPERATION OF PILOT PLANT FOR CONCENTRATION OF LIQUID RADIOACTIVE WASTES BY MEANS OF EVAPORATION AT THE TEMPERATURE BELOW BOILING POINT. Liptak, L.; Takach, F. 1976. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Experience of the pilot plant operation for evaporation of the liquid radioactive wastes from atomic power station is described. Evaporation is done at the temperature below boiling point. The installation used for experiments provides opportunity to verify two differentversions of technology, namely: application of the tank-concentrator hawing double walls permitting to use it for transportation wastes to bureal place outside of the site and use of a single walled tank. Following parameters were measured and registered: medium temperature in different points; qooling water and air expenditure; condensate accumulation; air heater power. On determining the heat engineering parameters of the insatllation the main task of experiments performed was determination of heat and mass transfer laws ower the surface of water in condition of vortical movement of air and development of the mathematical model for computation of installation's operation conditions and development of design calculation methodology. Influence of substances with densities less than the density of solution, especially of lubricants, with

productivity of the device. Methods of removal of these substances from the solution surface were investigated. Also the results of investigation on salts crystallization in course of long time operation of the device are given.

809 (INIS-mf--5570, pp 135-237) PURIFICATION OF THE HIGH ACTIVITY WATER FROM LONG TIME STORAGE POOL FOR FUEL ELEMENT CLUSTERS. Ludovit, T. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
Problems of corrosion of spent fuel elements clusters on their storage in storage pool are concidered. It was found that cooling solution of potassium bichromates filling containers with clusters do not have enough inhibitive properties with respect to clusters cans of beryllium and magnesium alloy. Especially great influence is caused on corrosion acceleration by presence of carbonic acid. Destruction of fuel elements clusters leads to going out of active solution from containers to cooling water. Radioactivity of cooling water is conditioned by presence of cesium-134 and cesium-137. Investigations were made on different sorbents application for cooling water purification and cesium removal. The best results were obtained in the case of bentonite application. Then, investigations were dane on the possibilities for cesium radionuclides precipitation by means of potassium ferricyanide and copper sulfate. Method of sorption by means of ionites was considered the best.

810 (INIS-mf--5570, pp 64-72) APPLICATION OF HETEROGENEOUS FLOTATION FOR SEPARATION OF SOME LONG LIVING FISSION PRODUCTS. Ogtaza, J. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
The purpose of the research work was investigation of flotation separation of colloidal ferricyanides of heavy metals with precipitated cesium and determination of process conditions and possibilities for its practical application. In experiment, as floating collector some surfactants were used. Results of investigations on flotation separation of heavy metals ferricyanides were used for estimation of practical fitness of the method for cesium-137. Influence of pH of medium and different concentrations of reagents with cesuim-137 separation was determined. The method proved to be practically applicable for separation of main quantities of cesium-137 (about 97%) with comparatively small expenditure of ferricianide.

811 (INIS-mf--5570, pp 27-33) INVESTIGATION ON NATURAL CALCIUM CLINOPTILOLITE INTENDED FOR ITS APPLICATION FOR PURIFICATION OF WATER CONTAINING CESIUM, STRONTIUM AND COBALT ISOTOPES. Peskov, G.I.; Daiev, Kh.T.; Gradev, G.D.; Milenov, M.V. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
The results of investigations on behaviour of the natural calcium clinoptilolite in sorption of the radioactive nuclides of cesium, strontium and cobalt from liquid radioactive wastes are discussed. The results of determination of calcium clinoptilolite capacity with respect to cesium, strontium and cobalt are given. Capacity determination was made by the methods of radiometry and complexometry. Research was done in static and dynamic conditions. The results obtained has shown that in contrary to the sodium-potassium clinoptilolite, the calcium clinoptilolite has high sorption capacity with respect not only to cesium but also with respect to strontium. There is increase of capacity by 50% with respect to cobalt. The investigations were made on the natural sorbent selectivity with respect to three elements in presence of sodium, which normally presents in substantial amounts in liquid ra. dioactive wastes. The results obtained has shown the high selectivity of the sorbent with respect to cesium and strontium. Sorption of cobalt in presence of substantial amounts of sodium is reduced. If all three elements together are present in liquid wastes, the sorbent selectivity remains high with respect to cesium and substentially decrease with respect to ctrontium and remains low wit respect to cobalt. The results are given of investigations on effects of presence of ions of different elements and some compounds on sorption properties of calcium clinoptilolite.

812 (INIS-mf--5570, pp 79-82) RESULTS OF NEW INVESTIGATIONS ON THE PROCESS OF LIQUID WASTES PURIFICATION BY MEANS OF ION EXCHANGE AND WAYS OF IT'S IMPROVEMENT. Rauzen, F.V.; Trushkov, N.P.; Tugolukov, V.V. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
Results are given of research on optimisation of filtration processes of solutions through ion exchange column and improvement of ion exchange resines regeneration process. Basic equation of ion sorption by ionites loaded in the column and expressions for determination of the contact time and purification ratio deduced from this equation are given. Some recommendations are given for the optimum concentration of nitric acid for regeneration of KU-2 kationite depending on composition of solution purified.

813 (INIS-mf--5570, pp 34-40) CONCENTRATION OF LIQUID RADIOACTIVE WASTES BY EVAPORATION AT THE TEMPERATURE BELOW BOILING POINT. Scivos, K.; Lovass, D.; Liptak, L.; Takach, F.; Hirling, J.; Pavlik, O.; Hardy, D.; Putjrskaja, G. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
The results are given of research on concentration of liquid radioactive wastes of low and medium activity containing salts in amounts from 1 to 10 g/l. These wastes are produced during nuclear power plants operation. Depending on chemical composition of these liquid wastes they are concentrated by means of water evaporation up to salts concentration of 100-400 g/l. Residues can be stored either in liquid from or solidified by cementation ore bitumenisation. These processes are complicated as technology is concerned and need special equipment. Storage of concentrated wastes in liquid from is not expedient. The most rationally is to reduce volume of wastes by means of evaporation up to solid salt state. The methods of the liquid wastes evaporation by hot ear at the temperature below boiling point are discussed. In this case, the tank for the wastes evaporation is at the same time the container for wastes disposal simplifying

subsequent operations connected with wastes reloading. The process discussed is safe and needs not expensive heat source. As a result of this process in the evaporator tank used as a container for wastes disposal dry mixture of salts is obtained.

814 (INIS-mf--5570, pp 112-116) ELABORATION AND OPERATION EXPERIENCE OF TWO CHAMBER PLANT FOR WASTES BURNING. Sobolev, I.A.; Khomchik, L.M.; Karataev, B.A.; Dmitriev, S.A.; Makarchenko, G.V. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
Results are stated of investigations on process of wastes burning in device consisting of two-chamber furnace with liquid fuel and off-gas system of ''dry'' type. Solid wastes are burned in plumes of the first chamber fuel burner but smoke gases finally are burned in plumes of the second chamber. The heat source is disel oil and cobustible liquid radioactive wastes. Dependance is given of solid state phase concentration in the smoke gases on the chamber temperature. The low temperature limit of the process of burning is 900 centigrade. Heat engineering properties of burning furnace are given and some data about ''dry'' cleaning of smoke gases are presented. Design of the device and its designed parameters are described.

815 (INIS-mf--5570, pp 55-60) APPLICATION OF SORPTION METHODS FOR LIQUID RADIOACTIVE WASTES PROCESSING. Tomaczak, W. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
Results of laboratory investigations on determination of optimum conditions for removal of cesium-137, strontium-86, cobalt-60 and ruthenium-106 from solution are given. Sorption method on mixture of barium carbonates and copper ferricyanides was investigated. Results of liquid radioactive wastes purification are given and economic effect of this method's application is considered. Copper ferricianide is used as a specific sorbent for cesium, and barium carbonate is the reagent for obtaining the sorbent in the form of barium sulfate having good sorption properties in freshly precipitated form. Dependences of concentrations of sodium sulfates, calcium, sodium chloride ions on strontium, cesium and cobalt sorption and dependence of physical state of sorbent on sorption properties are given. Nonorganic synthetic sorbents of the composition mentioned were tested in radioisotope laboratory sewage purification. Sewage waters contain 0,95 gramme per liter of salts with pH 3; alpha, beta and gamma emitting radionuclides; strontium-90; iodine-133; xenon-133; ruthenium-108; cesim-134; cesium-137; niobium-95; zinc-65; cobalt-60; lanthanum-140; manganese-54; antimony-124. As a result of sewage purification, sorption more than 95% of the radionuclides was obtained. Four times lowering of the purification expenses was gained.

816 (INIS-mf--5570, pp 91-95) NONORGANIC SELECTIVE ADSORPTION AGENTS AND EXPERIENCE OF THEIR APPLICATION FOR DESACTIVATION OF LOW ACTIVITY WASTES HAVING HEIGHTENED SALTS CONCENTRATION. Zajtsev, B.A.; Poznyakov, A.N.; Malinina, E.I.; Plisko, V.N.; Shinkina, M.A. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
Possibility is considered of application of nonorganic selective sorbents for purification of low activity wastes especially in the case when they have elevated salts concentration. In selection of nonorganic sorbents folloving demands are made: selectivity, good sorptive properties, low cost and simplicity of the sorbent preparation. Ferricyanide of iron precipitated on activated carbon surface, copper sulfide in addition of zinc powder as a reduction agent and pyroluzite with more than 90% content of manganese dioxide were used. It was shown that in simultaneous application of these sorbents, great values of distribution ratio for every radionuclide is ensured. Sorption of antimony-125 and cobalt-60 is registred for sulfide sorbent. As a shortcoming of the selective sorption, impossibility of removal from wastes radionuclides with stable analogs present in big inough amounts in wastes and removal of chemical impurities with relatively high concentrations are marked.

817 (INIS-mf--5570, pp 67-90) DEVELOPMENT OF SORPTION AGENTS ON THE BASIS OF TRANSITITION METALS HYDROXIDES AND INVESTIGATIONS ON THE MACHANISMS OF THE FIRST AND SECOND GROUP ELEMENTS SORPTION FROM SOLUTIONS WITH HIGH SALT CONTENT BY MEANS OF THESE SORBENTS. Zakharov, M.A.; Balukova, V.D.; Ermolaev, B.M. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
Method of preparation of sorbents on the basis of hydroxides of metals, niobium hydroxide and zirconium hydroxides is considered. Niobium hydroxide is reacting with sodium, strontium and barium contained in slightly alkaline solutions and can be treated as a concenrator of alkaline earth elements. It is shown that increase of sodium nitrate content in the solution cause reduction of the strontium absorption by niobium hydroxide. Analogous investigations were made on zirconium hydroxide. Mechanism of niobium hydroxide interaction with strontium compounds in aqueous solutions is described.

818 (INIS-mf--5570, pp 107-111) OPERATION EXPERIENCE OF RADIOACTIVE WASTES PURIFICATION STATION AT THE INSTITUTE FOR NUCLEAR RESEARCH IN REZ (CZECHOSLOVAKIA). Zaruba, J.; Petran, M. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
Structure of equipment for the radioactive wastes processing in the Institute of nuclear research in Rez is stated. Technology of liquid radioactive wastes includes chemical processing, filtration, evaporation in vacuum, processing in ion exchange columns, dehydratation of slurries. Radioactive liquid wastes are processed separately depending on radionuclides type. Concentrated slurries are solidified by means of cementation or bitumnisation. Solid wastes are either compacted in waste transportation containers or are cemented in them. Wastes processing station parameters and amounts of radioactive wastes processed are given.

819 (INIS-mf--5571, pp 94-102) COMPARISON OF SOME PROPERTIES OF PHOSPHATE AND SILICATE

GLASSES INTENDED FOR VITRIFICATION OF ALUMINIUM CONTAINING RADIOACTIVE WASTES. Oziraner, S.N.; Minaev, A.A.; Kuznetsov, D.G.; Prokhorova, N.P. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Prospects of application of boronsilicate and phosphate glasses for solidification of liquid high-level of activity wastes containing as main components ions of sodium and aluminium are considered. $Na_2O - Al_2O_3 - CaO - B_2O_3 - SiO_2$ and $Na_2O - Al_2O_3 - P_2O_5$ systems have been examined and also comparison of some properties of glasses has been done for these systems. Cross-sections of the four-component system $Na_2O - Al_2O_3 - B_2O_3 - SiO_2$ with constant content of B_2O_3 equal to 5, 10, 15 and 20% have been examined. Regions of glass formation at different temperatures have been investigated. It has been shown that because of the fact that according to sodium oxide content, region of the optimum glasses lay in narrow interval but sodium oxide content in wastes was changing in the wide limits, glasses of this system could not be used for solidification of wastes containing sodium and aluminium. For phosphate glasses the system $Na_2O - Al_2O_3 - P_2O_5$ turned to be the most perspective. Data are given for chemical resistance phosphate and silicate glasses. Crystallization ability of the glasses examined and crystallization influence with their chemical stability were investigated. Influence of additives with chemical stability of glasses were examined. The conclusion has been made that both types of glass had nearly the same properties and could be used for fixation of radioactive wastes.

820 (INIS-mf--5571, pp 21-24) METHOD OF SIMULTANEOUS EVAPORATION AND CEMENTATION OF RADIOACTIVE WASTES. Pavlik, O.; Fridrik, W. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Method of liquid wastes transformation into unsoluble form by cementation is considered. Cementation is done in conditions of evaporation at the temperature below 100 centigrades. Peculiarity of the method considered is that solidification and burial of the wastes is done at the same tank. Because of big size of the tank it is impossible to mix cement mixture in it. The method is that in course of evaporation, at the moment of crystallization of salts, in supersaturated solution feeding of cement into the tank is started. Solution in the tank is set in rotation which facilitates precipitation of cement on the tank's bottom. Concrete is formed on the tank's bottom consisted of cement and crystallizated salts. The condition for obtaining strong enough concrete is that solution evaporated has to be neutral or alkaline with pH not less than 7. Scheme of the evaporator installation is given for that used on experiment. Design of the experimental installation permitted to take off the concrete block from the evaporator tank for further testing. Composition of the solution used for evaporation and composition of concrete blocks obtained after evaporation an cementation are given. The concrete obtained was subject to testing for leaching, homogenity and strength. The results of testing are given in the paper. The results obtained were compared with the results of testing the concrete blocks of approximately the same composition but obtained by the method of mechanical mixing.

821 (INIS-mf--5571, pp 79-82) APPLICATION OF THE SOLIDIFICATION METHOD FOR DESACTIVATION OF NUCLEAR POWER PLANT WASTES IN CZECHOSLOVAKIA. Shojmir, Sh. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

The problem of disposal of the radioactive wastes from the nuclear power plants situated in densely populated regions is considered. In the conditions of the Czechoslovakia it is considered necessary to transform liquid radioactive wastes into the solid form for long time storage with the purpose to satisfy demands of safety and environment protection. Methods of bituminization and cementation of liquid radioactive wastes from nuclear power plants as waste solidification processes are considered. When solidification of wastes by cementation, method of the vacuum cementation is applied. The product obtained as to its properties are conserned, offers to avoid further packing of blocks. Applicability of the method depends on the salts composition of the wastes solidified. This method can not be aplied to solidification of cation exchange resins. Parameters of the cement blocks and conditions of cementation are given. The bituminization method consists of getting salt-bitumen compound in the film evaporator. This method is applicable for fixation of the all liquid radioactive wastes, including ion exchange resins. Exclusion is for the alcaline metals nitrates causing dangerous oxidation of bitumen at the temperature ower 300 centigrades.

822 (INIS-mf--5571, pp 67-73) DEVELOPMENT AND OPERATION EXPERIENCE FROM PILOT-PLANT FOR BITUMINIZATION OF LIQUID RADIOACTIVE WASTES (UBD-200). Sobolev, I.A.; Khomchik, L.M.; Karataev, B.A.; Lifanov, F.A.; Kulichenko, V.V.; Fomin, Yu.K. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

The results are given for investigations of liquid radioactive wastes bituminization on the pilot-plant of continious operation. The bituminization process is divided into two stages. On the first stage salts with definite moisture content are obtained. On the second stage, wet salts are mixed with melted bitumen. In this process the salts are finally dried and bitumen compound produced is transported towards the discharge assembly. Design of the dryer and mixer is described and their technical parameters are given. Salt-bitumen compound is discharged in moulding bogies with volume of 0.5 m^3. After hardening, salt-bitumen compound blocks are removed for burial. Average composition of liquid radioactive wastes coming for solidification is given. Dependences of the salt-bitumen compound characteristics on the parameters of the technological process of bituminization are given as well as the results of analysis of filling of compound by salts at the block height of 0.3 m. It is shown that division of the bituminization process into two stages do not affect on the chemical stability of compound.

823 (INIS-mf--5571, pp 62-66) INVESTIGATIONS OF POSSIBILITIES FOR IMPROVEMENT OF PROPERTIES OF ORGANIC BINDERS. Volkova, O.I.; Zakharova, K.P.; Karataeva, T.M.; Kulichenko, V.V.; Neroda, A.A.; Sobolev, I.A.; Khomchik, L.M. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

The results are stated of investigations directed to search of ways for improvement of bitumen binders properties ore replacement of bitumens by other binders having definite advantages in comparison with them. The possibility of inclusion of radioactive wastes into different types of resins; solidificated at the room temperature were investigated. Polyester resins having good water resistance and fire resistance were investigated. The results are given for determination of water resistance of samples containing sodium nitrate as a filler and also for chemical compositions of real wastes used for experiment and water resistance characteristics of the samples obtained. The results gained has shown that polyester resines had low water resistance and their application is too complicated. Epoxy resins have much higher water resistance but just as the polyester resines are complicated for use and demand preliminary dehydration of wastes. Thermoplastic materials were investigated too, - styrene derivatives having high radiation resistance but low water resistance. From the oil processing products, asphalts has been investigated beeng a perspective material for waste solidification. Data are given for improvement of bitumens properties by means of introduction of additives (diluters).

824 (INIS-mf--5571, pp 114-121) INVESTIGATIONS IN THE FIELD OF HIGH-ACTIVITY WASTES DESACTIVATION. Woiteh, O.; Napravnik, J.; Steiskal, J.; Neumann, L. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Results are stated of investigations done for development of industrial equipment for high-activity wastes fixation. Different reagents and technological processes of radioactive wastes fixation and also structural materials for devices are examined. Laboratory-scale investigations are directed towards selection of the fixing material and determination of its physical and chemical properties. Special laboratory device has been developed for investigation of the denitration and calcination processes. Lay-out of the devite and the results of structural materials selection are given in the paper. It has sown that combination of the processes of denitration and calcination in the single device made parameters of these processes proceeding worse. More than this, in the case of dosing glass-forming substances at the beginning of the process strong corrosion occures. Description is given of the device for melting of the products of fixation in the vertical furnace with electric heating. Characteristics are stated of different methods of denitration. Properties of calcination products and conditions for these products fixation are given. Pilot-plant installation is described intended for solidification of high-activity wastes. This installation has been build on the basis of analysis of the results of experiments and was destined for verification of technology and equipment.

825 (INIS-mf--5571) RESEARCH ON DESACTIVATION OF LIQUID, SOLID AND GASEOUS RADIOACTIVE WASTES AND DECONTAMINATION OF SURFACES. PROCEEDINGS OF THE 4TH SCIENTIFIC AND TECHNICAL CONFERENCE OF CMEA. MOSCOW, 20-23 DECEMBER 1976. PART 2. IMPROVEMENT OF METHODS AND EQUIPMENT FOR PROCESSING, SOLIDIFICATION AND BURIAL OF RADIOACTIVE WASTES, INCLUDING HIGH-ACTIVITY WASTES. (Sovet Ehkonomicheskoj Vzaimopomoshchi, Moscow (USSR). Postoyanniya Komissiya po Ispol'zovaniyu Atomnoj Ehnergii v Mirnykh Tselyakh). 1978. 152p. (In Russian). (CONF-761260--(Pt.2)). NTIS (US Sales Only), PC A08/MF A01.

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Survey of investigations in the field of radioactive concentrates solidification is given. Low and highe temperature processes of radioactive wastes solidification are described on the basis of last years works. Different designs of apparatus for radioactive wastes solidification by low temperature methods and properties of bitumen compounds and ways for their quality improvement are widely presented. Description is given of vitrification process in the furnace with direct electric heating. Technical and economic estimations of radioactive wastes solidification for the nuclear power plant wastes are given.

826 (INIS-mf--5571, pp 48-55) TECHNOLOGICAL INVESTIGATIONS OF BITUMINIZATION PROCESS FOR LIQUID RADIOACTIVE WASTES. Borzunov, A.I.; Kulichenko, V.V.; Fomin, Yu.K. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Research was carrying on in laboratory scale and pilot-plant scale for solution of some physical and mechanical problems of the technological processes of bituminization of radioactive wastes. The research was carrying on the model and ""universal"" compositions and with use of different sorts of bitumen. The research was intended for development of industrial installations for bituminization of liquid radioactive wastes of low and intermediate-level of activity and with productivity of 200 l/s and more. Investigation of the process of inclusion of humid wastes into bitumens has shown that in the course of process temporary increase of viscosity can take place. The increase of viscosity must be taken into account in calculations of mixers. Examination of reological properties of binders is showing that it is preferably at the stage of mixing to use binders with low viscosity, but at the stage of storage, binders with high viscosity. It seems to be expedient to ensure control properties of binders on different stages of technological chain apparatus - pipeline - burial place by means of introduction of additions, changing of shear forces, changing temperature ore by means of the agregate of the methods mentioned, for influence on the reological properties of compounds. It has been shown that in presence of considerable amounts of surfactants in wastes it was possible to rise water stableness of compounds by means of wastes processing by sorbents.

827 (INIS-mf--5571, pp 34-40) DESIGN AND OPERATION PRINCIPLE OF PILOT-PLANT FOR BITUMINIZATION OF RADIOACTIVE WASTES. Dagen, A.; Kerner, V.; Knappe, I.; Veber, V. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Pilot plant for radioactive wastes

bituminization by the methods of ''hot incorporation'' and continious evaporation of emulsion is described. The pilot plant has been tested by utilization of sediments obtained as a result of the nuclear power plant sewage evaporation. Bituminization by the method of ''hot incorporation'' is characterictic by evaporation of water from the concentrates with dosed feeding of concentrates into bitumen, mixing and simultaneous addition of solid substances into bitumen. The emulsion evaporation method is characteristic by evaporation of water from preliminry prepared emulsion of bitumen and concentrate. Descriptions of the technological processes on the pilot plant and the technological flow-chart of the bituminization methods for radioactive wastes are given. Characteristics of the concentrates subject to bituminization; mixtures of bitumen 845 and solid substances and also results of bituminization of wastes and their concentrates by the method of periodic evaporation of emulsion are given.

828 (INIS-mf--5571, pp 74-78) DEVELOPMENT OF EQUIPMENT FOR PILOT-PLANTS FOR RADIOACTIVE WASTES BITUMINIZATION. Davydov, V.I.; Votintsev, A.F.; Germanyuk, O.M.; Karasev, V.V.; Kulikov, V.A.; Maslova, L.G.; Kozubskii, M.A. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Design of the apparatus for bituminization of liquid radioactive wastes in rotary film-bitumizer is described. Filling of the bitumen compound by salts up to 50% is reached, with high enough fluidity of compound at the temperature of 140-150 centigrades. The results of stand-testing of experimental bitumizers with productivity of 90 and 500 l/hour are given. Technological processes of the model wastes bituminization are described. Characteristics of the pilot-plant bitumizers with productivity of 200 and 550-600 l/hour, developed on the basis of the experiments are given.

829 (INIS-mf--5571, pp 25-33) CONSTRUCTION OF NEW INSTALLATION FOR PROCESSING AND BURIAL OF RADIOACTIVE WASTES IN HUNGARIAN PEOPLES REPUBLIC. Fener, L.; Hirling, I.; Kasa, I. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Facility for desactivation and burial of radioactive wastes has been built in the site with cley soil and has been intended for desactivation liquid radioactive wastes and biological wastes and for burial of solid wastes and solidificated liquid wastes. Data are given concerning types and amounts of wastes and ways for their collection. Collection of wastes is done in centralised mode. Wastes can be solid, ore liquid. Liquid wastes can be collected either in the non processed form or in the form of concentrates. Description of the technology applied in the facility and design of the building for radioactive wastes processing are given. The technological process includes: reception of the wastes collected; decontamination of equipment and rooms, contaminated during wastes handling; unloading, storage and purification of liquid wastes; discharge of surplus clean water; cementation of concentrates; bituminization of biological wastes. The method used for concentration of liquid wastes includes precipitation and ion exchange. For final burial of wastes four types of underground stores are used: the store for solid wastes where wastes in containers and polyethylene bags and also bituminized biological wastes are laid with cement mixture containing radioactive concentrates; store for solidificated liquid organic wastes; store for closed radiation sources of low activity; store for closed radiation sources of high activity.

830 (INIS-mf--5571, pp 56-61) RADIOACTIVE WASTES BITUMINIZATION BY THE PILOT-PLANT EQUIPMENT. Golinsky, M.; Ferenc, M.; Ksendzak, Z.; Tikal, A. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Operation experience of pilot-plant for bituminization of radioactive wastes by the method of hot mixing is described. The results obtained have conffirmed parameters of the process gained in laboratory conditions for asphalts D-35 and P-60. The results are stated for experiments of bituminization of still residuums obtained as a result of distillation of low and intermediate-level of activity sewage waters. Chemical composition of the still residuums and characteristics of the P-60 asphalt are given. Bituminization of crystal sodium nitrate and supersaturated solutions at 200 centigrades up to 30% contents of salt in the compound was performed. It is shown that bituminization results depend on salts composition of radioactive wastes subject to solidification. The results are described of investigations of bituminization by the method of hot mixing of still residuums of radioactive wastes containing sodium nitrates on the pilot-plant. Parameters are given of bituminization process and characteristics of compounds obtained in bituminization of still residuums in a form of concentrates. Leachind process for wastes solidificated by the method of bituminization has been investigated. Leaching rate for radionuclides incorporated into bituminization products depending on time of storage is given. Results of the spectrometric analysis of solidificated concentrates, bituminization product and gaseous products of radioactive wastes processing by the method of hot mixing are given.

831 (INIS-mf--5571, pp 90-93) INVESTIGATIONS OF RADIONUCLIDES BEHAVIOUR DURING VITRIFICATION OF WASTES. Konstantinovich, A.A.; Kulichenko, V.V.; Bel'tyukov, V.A.; Nikiforov, A.S.; Nikipelov, B.V.; Stepanov, S.E.; Baskov, L.I.; Kulakov, S.I. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Behaviour of radionuclides at some stages of the vitrification process was investigated, in particular radionuclides volatilization both during the process of vitrification and from ready glass. Investigations were done at laboratory and experimental installations. It has been shown that in conditions of dehydration, calcination and vitrification strontium was entrained in the form of aerosols and relative entrainment of strontium was at the level of entrainment of main components of solution (sodium, aluminium, phosphor). The highest volatility had ruthenium forming gaseous fouroxide. The results are given for investigations of behaviour of some radionuclides during vitrification of the model high-activity wastes at the electric furnace with direct heating. Behaviour of cesium-137,

strontium-90 and ruthenium-106 during vitrification was examined. Composition of the model solution and information about entrainment of radionuclides are given. Performance parameters of the electric furnace and characteristics of the glass produced are given. Some peculiarities of ruthenium behaviour during vitrification are stated. It has been determined that minimum entrainement of radionuclides was observed during edding molasses into the solution. It has been shown that radionuclides were firmly fixed in phosphate glass.

832 (INIS-mf--5571, pp 110-113) PECULARITIES OF CARRYING OUT RADIOACTIVE WASTES VITRIFICATION PROCESS WITHOUT PRELIMINARY CALCINATION OF WASTES. Konstantinovich, A.A.; Kulichenko, V.V.; Bel'tyukov, V.A.; Nikiforov, A.S.; Nikipelov, B.V.; Stepanov, S.E.; Baskov, L.I.; Kulakov, S.I. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Vitrification technology is considered for liquid radioactive wastes by means of electric furnace where heating of glass-paste is done by electric current passing through the melt. Continious process of gehydration, calcination and vitrification is going on in one apparatus. Testing if the method has been performed by use of a model solution, containing sodium and aluminium nitrates. To obtain phosphoric acid has been added into the solution. Lay-out of the device and its description as well as technical parameters of the electric furnace are given. The results are stated for determination of the optimum operation conditions for the device. To reduce entrainment of solid components, molasses has been added in the solution. Parameters are given for the process of the solution containing 80 g/l molasses processing. It has been shown that edding molasses to the solution permitted to reduse power consumption of the process due to the heat generation during oxidation-reduction reaction on the melt surface. The results are given for investigations of the nitrogen oxides catching in scrubbers. These results have shown that introduction of molasses reduces nitrigen oxides concentration. The results of the experimental works have shown the possibility of the continious process of dehydration, calcination and vitrification in single device with application of remote control and monitoring by means of automatics.

833 (INIS-mf--5571, pp 5-21) DEVELOPMENT OF METHODS FOR SOLIDIFICATION OF RADIOACTIVE CONCENTRATES. Malasek, E.; Voiteh, O. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Survey is given for development of solidification methods for radioactive concentrates. Methods are considered for solidification of radioactive concentrates formed during processing of liquid radioactive wastes of low and intermediate activity. Solidification of wastes reduses possibility for leakage of radionuclides to environment and facilitates wastes management and wastes transportation. Solidification of liquid wastes of high level of activity is necessary not only for rasing safety but by economic reasons is advantageous for prolonged storage. The most wide-spread methods of solidification of wastes of low and intermediate-level of activity, cementation and bituminization are considered. The list is given of the most well-known processes of cementation and bituminization of wastes and also of chemical compositions and properties of portland cement, properties of bitumens and bitumen-base materials used for wastes solidification. List of installations for wastes bituminization and their parameters is given for operational ones. Such processes of high-level activity wastes solidification as calcination, melting and alumothermic process are considered.

834 (INIS-mf--5572, pp 3-10) TECHNOLOGICAL LYNE FOR RECEPTION AND STORAGE OF LIQUID CONCENTRATED RADIOACTIVE WASTES AND SPENT SORBENTS FOR THE LOVIISA NUCLEAR POWER PLANT AND FOR SERIAL BLOCKS OF NUCLEAR POWER PLANTS WITH WWR-440 TYPE REACTORS (SYSTEM TW). Matskevich, G.V.; Novikov, V.D. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Grounds are given for selected schemes of reception and storage of the radioactive wastes from nuclear power plant and technological principles having been assumed as the base for the project are described. Technological process of purification and processing liquid radioactive mediums at the nuclear power plant has been projected assuming that as a result of processing of liquid radioactive mediums, 2 types of wastes, different by their properties, accure: ion exchange resins mixed with different sorbents and dispersion sediments (heterogeneous phase); highly concentrated salt solutions (homogeneous phase). Main volume of radionuclides is absorbed by ion exchange resins during purification of the primary circuit coolant from reactor. According to the scheme proposed, radioactive wastes - concentrates are divided into 3 groups: high-level of activity ion exchange resines and dispersion sediments; low-level of activity ion exchange resines, sorbents and dispersion sediments; highly concentrated salts solutions. Description is given of technological elements of the TW system and parameters of equipment and sewage coming into the system. Water and chemical conditions of radioactive wastes storage are given.

Selected papers are processed separately.

837 (INIS-mf--5574, pp 3-7) INVESTIGATIONS ON METHODS AND MEANS FOR REMOVAL OF RADIOACTIVE AEROSOLS AND GASES FROM AIR DISCHARGES FOR PERIOD OF 1971 - 1975. Nakhutin, I.E.; Teverovskij, E.N.; Smirnova, N.M. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
Review is given of works carried on in the CMEA member-states in the field of investigations on the methods and means of the radioactive aerosols and gases removal from air discharges from nuclear installations in the period of 1971-1975. Works are stated in the field of catching and analysis of radioactive iodine in the gas discharges of nuclear power plants. Works are described on the search for the sorbents suitable for the iodine organic compounds and on investigations of the sorptive ability of activated carbon. Data are given of the investigations of carbons impregnated by the iodides of metals. Works are listed in the field of investigations of the dynamic adsorption of radioactive noble gases and the clathrate compounds of krypton with hydroquinone. The problem is considered of catching and storage of krypton-85. Works are stated in the field of investigation of cleaning gaseous discharges from aerosols with liquid and solid disperse phase and in the field of development of effective filtration materials and aerosol filters. Brief desription of the works in the field of investigation of the radioactive contamination spreading in the atmosphere is given. General situation in the field of gases cleaning at nuclear power plants in the CMEA member-states and tasks for solution of the problem of nuclear power plants gaseous discharges cleaning from the radioactive contaminations are stated.

836 (INIS-mf--5574, pp 49-53) CATCHING OF RADIOACTIVE IODINE AND IODINE COMPOUNDS BY NONORGANIC SORBENTS. Pietrik, I.; Gladki, Eh. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
Problems are considered of the radioactive iodine catching from the atmosphere discharges of the nuclear power plant. Two non-organic sorbents have been investigated: aluminium oxide and diatomite having thermal and rediation resistance properties; resistance against acids and oxidants and non-inflammability. To catch the radioactive iodine and its compounds, the sorbents were impregnated by the silver nitrate or the potassium iodide. Dependance were investigated of the elementary iodine and the methyliodide catching efficiency on the iodine or its compounds concentration; on the relative humidity; on the degree of the sorbents impregnation by the silver nitrate and the potassium iodide; on the time of gas and sorbent contact and on the oil vapors concentration. The possibilities of the pure and impregnated alluminium oxide application for catching of the radioactive iodine in the form of the elementary iodine and the methyliodide have been confirmed.

839 (INIS-mf--5574, pp 58-61) INCLUSION OF KRYPTON INTO CLATHRATES. Schumann, F. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
The structure of the hydroquinone clathrate and its modifications and also the clathrate composition $3C_6H_4(OH)_2 \times Kr$ is considered. Description of the experimental part of the research is given and the results obtained are stated. Dependance of the hydroquinone clathrates filling degree on pressure and dependance of krypton content in the clathrates on its content in the gaseous phase and also the temperature and enthalpy of some clathrate decontamination are given. The experiments on investigations of the physical and chemical stability of clathrates have shown that at the room temperature they have long life time if influence of such factors as humidity and oxidity substances is excluded. Calculations have shown that it is possible to neglect selfheating due to inclusion of krypton-85 if the sutable geometry of the containers used is preserved.

840 (INIS-mf--5574, pp 33-39) CAPTURE OF RADIOACTIVE IODINE FROM AIR DISCHARGE OF THE ISOTOPE PRODUCTION LABORATORIES OF THE CENTRAL INSTITUTE FOR NUCLEAR RESEARCH. Schvarzbach, R. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
The problem of the discharge air from the hot chambers for radioactive iodine processing cleaning is discussed. The results are given of investigations on some non-organic materials fitness as the sorbtive material for the radioactive iodine aerosols. Diaphorite, porolite, silica gel and aluminium oxide were tested. All the non-organic materials were coated by the silver nitrate. The tests were done with use of CH_3J containing iodine-131 because of the difficulty of its capture in comparison with the elementary iodine. To determine fitness of the sorbents, analysis were made of: influence of the silver content; influence of the temperature; influence of the iodine concentration; influence of the time of a test-gas stay in the filter; influence of the filtering material aging in the affectiviness of the methyliodide catching. It has been shown that application of one of the sorbents tested at the temperature from 80 to 100 deg C caused considerable onloading of the hot cell filtering system.

841 (INIS-mf--5574) RESEARCH ON DESACTIVATION OF LIQUID, SOLID AND GASEOUS RADIOACTIVE WASTES AND DECONTAMINATION OF SURFACES. PART 5. (Sovet Ehkonomicheskoj Vzaimopomoshchi, Moscow (USSR). Postoyanniya Komissiya po Ispol'zovaniyu Atomnoj Ehnergii v Mirnykh Tselyakh). 1978. 116p. (In Russian). (CONF-761260--(Pt.5)). NTIS (US Sales Only), PC A06/MF A01.
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
Problems of cleaning air discharges from radioactive gases and aerosols are considered. Methodology is elucidated of the efficiency determination for aerosol filters and

determination of the granulometric composition of aerosols and of filters testing. Problems are stated of iodine, krypton, xenon and ruthenium catching. Problems of the atmosphere air pollution forecasting around nuclear installations; estimation of the Gaussian model accuracy for the pollution spreading and determination of the pollution distribution for those discharged from the nuclear reactors chimneys are discussed.

842 (INIS-mf--5574, pp 62-66) SORPTION OF KRYPTON-85 ON MOLECULAR SIEVES. Vardashko, T.; Nidetska, Yu. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
The results are presented of the sorptive properties investigations of the molecular sieves with respect to krypton-85. The investigations have been done for impravement of the methodology for measuring of krypton-85 concentration in the atmosphere air and for determination of small volumes of concentrate activity. The molecular sieve with the grain size of 1.0 - 1.5 mm was used. Krypton adsorption was going on at the liquid nitrogene temperature (-196 deg C). Description is given of the devices for krypton-85 adsorption and measuring of the gases activity and also of the methodology for the experiment conducting. Dependances are given of the desorbed krypton amounts on different factors of the process proceeding.

843 (INIS-mf--5574, pp 70-71) CAPTURE OF RUTHENIUM, IODINE AND TRIYIUM FROM DISCHARGE GASES, PRODUCED DURING THE PROCESS OF DISSOLUTION AT THE DEVICE SU-2 OF SPENT FUEL ELEMENTS FROM NUCLEAR POWER PLANT WITH WWR REACTORS. Alimova, N.I.; Veselov, V.K.; Gajduk, G.I. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
Problem of ruthenium, iodine-129 and tritium removal from the gas discharges on nuclear fuel reprocessing is considered. Separatelly the problems of the ruthenium tetraoxide are considered, because its separation presents the main difficulty during the purification process of uranium and plutonium. To prevent reduction of ruthenium and its irreversible sorption on the equipment surfaces, all devices and pipelines of the distillation and absorption assemblies are made of titanium. On investigation of the process of fuel dissolution, ruthenium dissolution and its catching from the gas flow and behaviour of iodine and tritium in this conditions were examined too. Investigations were done on the spent fuel elements from the Novovoronezh nuclear power plant. These fuel elements had 4 and 1 year of exposure. The results are stated of experiments on dissolution, distillation and adsorption of ruthenium. The method is developed for cleaning gas discharges, produced during the process of nuclear fuel dissolution and subsequent.ruthenium distillation, based on adsorption of volatile compounds by means of alkaline solutions and reducers. This methods permits to catch practically all ruthenium and iodine.

844 (INIS-mf--5574, pp 67-69) INVESTIGATION OF KRYPTON AND XENON CAPTURE FROM DISCHARGE GASES, PRODUCED DURING THE PROCESS OF DISSOLUTION AT THE DEVICE SU-2 SPENT FUEL ELEMENTS FROM THE NUCLEAR POWER PLANT WITH WWR REACTORS. Gaiduk, G.I.; Galkin, B.Ya.; Gusev, Yu.K.; Kirin, I.S.; Lazarev, L.N.; Lyubtsev, R.I.; Trofimov, A.M. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
The results are stated of investigations on krypton-85 and xenon stable isotopes separation from the discharge gases, produced during dissolution of the spent fuel elements from the Novovoronezh nuclear power plant. The investigations were done on the laboratory-scale device SU-2. Process of the fuel elements dissolution and the discharge gases cleaning is described. Ruthenium and iodine are catched in the trap with caustic soda and a reducer. To adsorbe krypton and xenon, activated carbon was used. Chemical composition of the discharge gases and the curve of xenon and krypton emittance during dissolution of the spent fuel elements are given.

845 (INIS-mf--5574, pp 8-15) DETERMINATION OF THE AEROSOL FILTERS EFFICIENCY BY MEANS OF THE TRACER TECHNIQUES. Hirling, J. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
Estimation of the nonradioactive methods of filters efficiency determination and tracer techniques are given. The methods are stated and discriptions of the instrumentation for estimation of the filters efficiency are given, in particular: methodology of production of the radioactive synthetic test-aerosols by means of the disperse and steamcondensation aerosol generators; the radio isotope method of the aerosol filters investigations; the methodology of filtartion efficiency determination. The results are given of the radioisotope investigations of filters; properties of the artificial radioactive test-aerosols; characteristics of filters, determined by the tracer techniques. Curves are given for the filtration efficiency of the viscose filtering nozzles of different density depending on the filters load.

846 (INIS-mf--5574, pp 16-20) INVESTIGATION ON ELECTROSTATIC INTERACTION OF AEROSOLS PARTICLES AND AEROSOL FILTERS MATERIALS. Hirling, J. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
The results are given of investigations on the electrostatic effects influence on the radioactive aerosols filtration. The investigations were performed by means of the radioisotope method. Filters were investigated bouth in the charged state and in the conditions of the electrostatic charge removal by means of the radioisotope eliminator. Filter's charge polarity as well as the filtering nozzles with different degree of compaction of the saim amount of filtering material were changed. Changes of the relative filter efficiency depending on the filtering material density as well as the dependance of penetration and capture of aerosols in the electrically excited and neutral filters of different designe have been investigated.

847 (INIS-mf--5574, pp 21-27) GRANULOMETRIC COMPOSITION ANALYSIS OF RADIOACTIVE AEROSOLS BY MEANS OF THE CENTRIFUGAL AEROSOL SPECTROMETER. Hirling, J. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

The application of a conical aerosol centrifuge - the conifuge is described as an aerosol spectrometer for investigation of the granulometric composition of radioactive aerosols. Application of the radioisotope method of measurement permits to determine the particles distribution according to their mass, analogous to their granulometric composition, quickly and with the great thrustworthiness. Discription of the improved conifuge and the changes in the aerosol-spectrometric method of analysis are given. The improved radioisotope methodology of analysis essentialy raised precision and thrustworthiness of the results obtained. The experimental results are given of the radioisotope analysis of granulometric composition of aerosols by means of the improved conifuge.

848 (INIS-mf--5574, pp 72-76) ADSORPTION-CLATHRATES SYSTEM FOR CLEANING DISCHARGE GASES ON REGENERATION OF SPENT REACTOR FUELS. Kazankin, Yu.N.; Palladiev, A.A.; Trofimov, A.M. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Problems are considered of the gaseous discharges from the installations for nuclear fuels reprocessing cleaning from krypton 85. It has been established that the most effective sorbent for krypton and xenon, activated carbon is at the temperature of 195 K. At the last stage of the gas cleaning process it is practical to use the clathrate compounds for binding stable nuclides of xenon and krypton 85 from the concentrates produced at the preliminary stages of enrichment. It makes possible to obtain reprocessing products in the form suitable for subsequent handling. The results are stated of investigations on the adsorption-clathrates scheme of catching, separation and enrichment of noble gases. The process is going on in 3 stages. 1 stage - adsorption at 195 K; 2 stage - desorption at heating of the sorbent; 3 stage - clathrates forming. Main parameters and dependances of the process are given.

849 (INIS-mf--5574, pp 54-57) CLEANING OF GASEOUS WASTES PRODUCED DURING OPERATION OF THE INSTALLATION FOR DESACTIVATION OF RADIOACTIVE WASTES. Kepak, F.; Binek, B.; Razda, J.; Uger, E. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Problems are considered of the gaseous radioactive wastes catching, produced during the high-activity wastes processing by the calcination method. During the calcination process, besides gaseous wastes, solid state phase dispersed in gases and the ruthenium tetrachloride vapours are produced. Influence of temperature, composition of gases and their chemical agressiveness on the process of filtration is investigated. The results of analysis of the composition of disperse phase of gaseous wastes from the calcination process are given. The results are stated of different filtering materials testing and of investigations of influence of different factors on the filtration and sorption processes. It has been shown that sorption of the ruthenium tetraoxide at great extent was reduced in the presence of the nitrogen oxides in the gases, ''poisoning'' the sorbent.

850 (INIS-mf--5574, pp 46-48) INVESTIGATIONS OF RADIOACTIVE IODINE CATCHING BY VENTILATION SYSTEM OF THE EWA AND MARILA REACTORS. Kostyrko, A.; Filipak, B.; Gladovsky, K. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Problems are concidered of the iodine sorbtion on the filter at a research reactor ventilation system. It is assumed that the radioactive iodine can have the form of the elementary iodine, can be sorbed on the aerosol particles and can have the form of organic compounds. The methodology is described of experiments on the radioactive iodine catching. The sorbents activity according to iodine-131 was determined by the method of gamma-spectroscopy. Lowering of the sorbents efficiency in course of time and also in the case of the air humidity rise were noted.

852 (INKA-Conf--78-396-000, pp 123-127) REMOVING RADIO-ACTIVE WASTES FROM NUCLEAR POWER STATIONS BY THE STEAG SYSTEM. EXPERIENCE IN OPERATION. Baatz, H. (Gesellschaft fuer Nuklearservice, Essen (Germany, F.R.)). 1978. (In German).

From International VGB conference on power plant auxiliaries with information exhibition; Essen, F.R. Germany (8 Mar 1978).

The mobile STEAG System for conditioning radio-active wastes from nuclear power stations represents a particularly safe and economic method of removing them in present day conditions. Cementation by the FAFNIR System is used for the greater part of the waste, the liquid concentrate (evaporator concentrate and filter slurry). For the special case of the medium active resin balls from the primary circuits, embedding in plastic by the FAMA process has proved to be the only available successful process so far. The highly active solid waste from the reactor core is decomposed by the MOSAIK System, is packed in transportable and storable containers and is removed from the fuel element storage pond. The systems are so safe that faults or interruptions of power station operation due to faults in removing radio-active wastes can be excluded.

853 (INKA-Conf--79-003-004) ACTINIDE DIFFUSION IN WASTE GLASSES. Matzke, H. (Commission of the European Communities, Karlsruhe (Germany, F.R.). European Inst. for Transuranium Elements). (Commission of the European Communities, Karlsruhe (Germany, F.R.). European Inst. for Transuranium Elements). 1979. 5p. (CONF-790111--14; IAEA-SM--236/5). Fachinformationszentrum, Karlsruhe, Germany.

From International symposium on thermodynamics of nuclear materials; Julich, F.R. Germany (29 Jan 1979).

The diffusion of U-233 and of Pu-238 was

investigated in phosphate glass, in different borosilicate glasses and in glass ceramics. Glasses with and without added simulated fission products were used. Some glasses also contained Gd_2O_3 as neutron poison. The method of thin tracer layers and high resolution alpha-spectroscopy were used to measure both depth and time dependence of diffusion. Above the softening points, the diffusion profiles became distorted due to plastic flow of the glass. Further complications arose due to nucleation of crystallites and subsequent crystallisation of part of the glass at long annealing times and high diffusion temperatures. The kinetics of the crystallisation process could be obtained from the time dependence of tracer penetration since differently crystallized glasses show different diffusion behaviour. In the glass ceramics, frequently composite tracer penetration profiles were observed which could be unfolded to a set of up to three Gaussians yielding different diffusion coefficients for different components of the glass ceramics. The effects of α-radiation damage and radiation enhancement of diffusion were also studied by using Cm- and Am-containing glasses. In all cases, the measured D-values were small, indicating that from the diffusion point of view, the glasses are a safe medium to store actinides.

854 (INKA-Conf--79-003-015) VOLATILITY OF ALKALI FISSION PRODUCTS DURING SOLIDIFICATION PROCESS. Odoi, R. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Chemische Technologie). (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Chemische Technologie). 1979. 7p. (IAEA-SM--236/23). Dep. NTIS (US Sales Only), PC A02/MF A01.

The fixation of High-Level Waste (HLW) in a glass matrix needs melting temperatures of about 1200°C. Volatilization has been established as the predominant mechanism of fission product release from the solidification process. The pressure and composition of the atmosphere above the samples is important, since CO_2 and H_2O will raise the vaporization by some orders of magnitude. The degree of evaporation of alkali metals like Na and Cs is very high, because their oxides begin to react with SiO_2 on reaching temperatures of about 600°C, i.e. after transformation of $\alpha \rightarrow \beta$ quartz. The stability of the final glass products is lower than that of the pure crystalline phases of the same composition. The silicate glasses, however, are of remarkably high solubility for all of the 40 fission products. This universality is particularly significant for radioactive waste disposal.

855 (INR--1740/13/C/A) TREATMENT OF SOLID RADIOACTIVE WASTES BY BALING. Golinski, M. (Institute of Nuclear Research, Warsaw (Poland)). 1977. 31p. (In Russian). Dep. NTIS (US Sales Only), PC A03/MF A01.

In the first part of the paper, the literature data on the solid radioactive waste treatment problem are presented. The second part contains description of hydraulic press, 1.6 MNM (160 t) and capacity of 1200 m^3/y. This press will be used in the first Polish nuclear power plant.

856 (JAERI-M--7852) PRESENT STATUS OF PARTITIGNING DEVELOPMENTS. Nakamura, H.; Kubota, M.; Tachimori, S. (Japan Atomic Energy Research Inst., Tokyo). Sep 1978. 42p. (In Japanese). Dep. NTIS (US Sales Only), PC A03/MF A01.

Evolution and development of the concept of partitioning of high-level liquid wastes (HLLW) in nuclear fuel reprocessing are reviewed historically from the early phase of separating useful radioisotopes from HLLW to the recent phase of eliminating hazardous nuclides such as transuranium elements for safe waste disposal. Since the criteria in determining the nuclides for elimination and the respective decontamination factors are important in the strategy of partitioning, current views on the criteria are summarized. As elimination of the transuranium is most significant in the partitioning, various methods available of separating them from fission products are evaluated.

857 (JAERI-M--8158) COLLECTION EFFICIENCY OF TEDA-IMPREGNATED ACTIVED CHARCOAL FOR LOW CONCENTRATION OF METHYL IODIDE IN AIR. Ohata, T.; Matsui, H.; Naritomi, M.; Yoshida, Y. (Japan Atomic Energy Research Inst., Tokyo). Mar 1979. 10p. (In Japanese). NTIS (US Sales Only), PC A02/MF A01.

In order to collect effectively airborne radioiodine of low concentration released to the atmosphere from nuclear facilities, the collection efficiency of active charcoals with three different grain sizes, impregnated with 5% TEDA was studied as a function of airbone methyl iodide concentration (bed depth 1 cm and face velocity 20 cm/sec). Following are the results: Collection efficiencies are nearly constant in the concentration range of 10^{-8} to 10^{-19} $CH_3I.g/cm^3$. Collection efficiency values are over 99% in 28 -- 60 mesh, 99% in 12 -- 30 mesh and 90% in 4 -- 10 mesh in the experimental conditions.

858 (JAERI-M--8240) SEPARATION METHODS USED FOR LARGE-SCALE PRODUCTION OF TRANSPLUTONIUM ELEMENTS. LITERATURE SURVEY OF THE CHEMICAL PROCESSES OF PARTITIONING TRANSPLUTONIUM ELEMENTS IN THE HIGH-LEVEL LIQUID WASTES OF FUEL REPROCESSING, (1). Tachimori, S. (Japan Atomic Energy Research Inst., Tokyo). May 1979. 88p. (In Japanese). NTIS (US Sales Only), PC A05/MF A01.

The production of transplutonium elements by fission reactor in countries of the world is by combination of reactor technology and chemical engineering. A review is made of the chemical processes for production of transplutonium elements on a large scale from neutron-irradiated actinoids; first, historical progress of the production in macro quantities of transplutonium elements in the world, and then the principal processes developed in respective countries and organizations. Finally, these methods are discussed with emphasis placed on the possibility of application to the partitioning of high-level liquid wastes in fuel reprocessing.

859 (JAERI-M--8339) RECOVERY OF ACTINOIDS FROM WASTE SOLUTIONS OF FUEL REPROCESSING. LITERATURE SURVEY OF THE CHEMICAL PROCESSES OF PARTITIONING TRANSPLUTONIUM ELEMENTS IN THE HIGH-LEVEL LIQUID WASTES OF FUEL REPROCESSING, 2. Tachimori, S. (Japan Atomic Energy Research Inst., Tokyo). Jul 1979. 89p. (In Japanese). NTIS (US Sales Only), PC A05/MF A01.

In part II of the literature survey, characteristics of the principal separation methods, i.e., solvent extraction and ion exchange, for plutonium(IV), americium(III) and lanthanoids(III) are first described to help understand essentials in the actual examples of applications of the methods. Then, some examples of recoverying actinoids from liquid wastes, especially on a large scale, are

presented. Finally, flowsheets being developed in the world for partitioning high-level liquid wastes in fuel reprocessing are given with discussion on their respective problems.

860 (Juel--1593) CONTRIBUTION TO THE TREATMENT OF LOW LEVEL RADIOACTIVE WASTE SOLUTIONS FROM THE FABRICATION OR REFABRICATION OF NUCLEAR FUEL CONTAINING AMMONIUM NITRATE. Mueller, B. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Chemische Technologie; Technische Hochschule Aachen (Germany, F.R.)). May 1979. 94p. (In German). Dep. NTIS (US Sales Only), PC A06/MF A01.

Thesis.

During the fabrication of nuclear fuel a great quantity of low level radioactive waste is produced which can be neither released directly into the environment nor stored for a long period. This waste consists mainly of NH_4NO_3-solutions and can be destroyed by thermal decomposition in a suitable reactor. A process is described for the decomposition of these waste solutions in a spray tower. After the waste solution has been concentrated the heavy metals which are present in small amounts are filtered off to about 99.8%. The concentrate is then sprayed into a heated tower (300°-600°C) to decompose of the ammonium nitrate. The products which are generated in the decomposition tower are mainly N_2, N_2O, NO, NO_2 and H_2O depending on the decomposition conditions. The condensate contains nitric acid. If ammonia or urea is added to the concentrate the pH of the concentrate increases to a value between 6 and 8 and the off-gas does not contain NO_2 any longer. The generation of NO can probably be avoided by slightly varying the flow sheet. The ammonium nitrate remaining amounts to less than 0.1%. In a bench scale apparatus, 6 kg of a waste solution containing 60% by weight ammonium nitrate were continuously decomposed per hour. Since the process equipment is relatively simple a scale-up to an industrial plant can easily be accomplished.

861 (K--2007) ANALYSIS OF A GAS ABSORPTION SYSTEM WITH SOLUBLE CARRIER GAS AND VOLATILE SOLVENT. Kanak, B.E. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). Jan 1980. Contract W-7405-ENG-26. 186p. Dep. NTIS, PC A09/MF A01.

The effects of column diameter, carrier gas coabsorption, and solvent vaporization on the performance of a packed gas absorption column are examined. The system investigated employs dichlorodifluoromethane as a solvent to remove krypton from a nitrogen stream and is characterized by substantial nitrogen coabsorption. Three columns with diameters of 2, 3, and 4 inches were constructed and packed with 34.5 inches of Goodloe packing. In addition to the more conventional data, the experimental evaluation of these columns included the use of a radioisotope and a gamma scanning technique which provided direct measurement of the columns' molar krypton profiles. A multicomponent gas absorption model was developed, based on the two-film mass transfer theory, that allows the fluxes of all species to interact. Verification of this model was achieved through comparison of the calculated results with experimental data. With the feed gas flow rate between 6 and 36 lb moles/hr-ft^2 and the solvent feed rate between 40 and 400 lb moles/hr-ft^2, column diameter was found to have no significant impact on the mass transfer efficiency of this system when carried out in columns with diameters of 2 inches or greater. The absorption of krypton was found to be enhanced and inhibited, respectively, by carrier gas coabsorption and solvent vaporization. An injector system to add gaseous solvent to the feed gas stream prior to its introduction into the packed bed was proposed to eliminate the detrimental effects of solvent vaporization. Using this injector to supersaturate the feed gas stream with solvent enhanced absorber performance in the same manner as carrier gas coabsorption.

862 (K/C--1383) WASTE OIL DISPOSAL AT THE DEPARTMENT OF ENERGY FACILITIES AT OAK RIDGE, TENNESSEE. Jones, J.R.; Mitchell, M.E.; Oakes, T.W.; Sanders, M. Stroud, D.D.; Tate, M.B. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). 22 Apr 1980. Contract W-7405-ENG-26. 9p. Dep. NTIS, PC A02/MF A01.

The disposal of waste oil generated at the USDOE facilities in Oak Ridge has become a significant problem in recent years. The presence of radioactivity and other contaminants in some oils prohibits the use of commercial disposal and oil reclamation firms, and thus, often necessitates on-site disposal. Recent and proposed federal regulations have and will continue to control all waste oil disposal operations, including those of the Department of Energy. In order to ensure adequate and acceptable disposal of waste oils, a special committee of UCC-ND personnel located in Oak Ridge was established in December 1978 and asked to make appropriate recommendations for both near-term and long-range operations. Included in this paper is a brief description of the efforts of the committee, the associated efforts of development and engineering personnel, and conclusions and recommendations pertaining to UCC-ND waste oil disposal.

863 (K/ET--174) ANALYSIS OF A NON-ISOTHERMAL GAS STRIPPER WITH VOLATILE SOLVENT. Stephenson, M.J. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). Aug 1979. Contract W-7405-ENG-26. 31p. (CONF-791108--13). Dep. NTIS, PC A03/MF A01.

From 72. AICHE meeting; San Francisco, CA, USA (25 Nov 1979).

The experimental and theoretical analysis of a non-isothermal packed column is given. A soluble gas concentration peak was found in all tests resulting from gross internal column condensation and reflux of the stripping vapor. A model is presented based on the conventional two-film mass and heat transfer theory. A combination absorber-stripper column is described that is based on the internal peaking phenomenon.

864 (K/ET--5010) ADVANCES IN THE FLUOROCARBON PROCESS FOR DECONTAMINATION OF NUCLEAR FACILITY OFF-GAS. Kanak, B.E. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). 1979. Contract W-7405-ENG-26. 20p. (CONF-791144--1). Dep. NTIS, PC A02/MF A01.

From Annual MRS meeting; Boston, MA, USA (27 Nov 1979).

A selective adsorption process using R-12 was developed for removing noble gas fission products, ^{14}C, etc., from gaseous wastes of nuclear facilities. Its reliability has been proven by 10 years, operation of a 3-column process at ORGDP. A third generation pilot plant has undergone initial testing, which has showed that the combination column can perform essentially as well as the 3-column process. (DLC)

865 (K/ET--5017) SOLID WASTE DISPOSAL STUDY. McGinnis, C.P.; Housley, D.A. (Oak

Ridge Gaseous Diffusion Plant, TN (USA)). 21 May 1980. Contract W-7405-ENG-26. 17p. NTIS, PC A02/MF A01.

Solidification studies conducted on sludge from the K-1407C Retention Basin confirm that cement fixation is a viable method for disposal of waste solids. A model is presented relating cement requirements and sludge moisture level to the final storage volume required for cement fixation. The sludge volume and ultimate disposal cost are strongly related to the moisture of the processed sludge. Dewatering efforts with the sludge using polymer dewatering aides and centrifugation are discussed.

866 (K-L--2397) MOBILE PROCESSING UNIT FOR KRYPTON-XENON ABSORPTION. Merriman, J.R. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). 16 Jun 1967. Contract W-7405-ENG-26. 18p. NTIS, PC A02/MF A01.

One process being considered for the removal of krypton and xenon involves the continuous absorption of the gases in a low temperature solvent such as dichlorodifluoromethane. A preliminary review of the hardware requirements for a mobile unit using this process has been completed and is summarized.

867 (KBS-TR--39) STUDY OF THE ENCAPSULATION OF SPENT NUCLEAR FUELS FOR FINAL STORAGE WITHOUT REPROCESSING. Loennerberg, B. (Kaernbraenslesaekerhet, Stockholm (Sweden)). Sep 1978. 138p. (In Swedish). Dep. NTIS (US Sales Only), PC A08/MF A01.

The second part of the KBS project deals with final storage of spent nuclear fuel without reprocessing. ASEA-ATOM has contributed to this part with a study of the incapsulation process before the final storage in bedrock. The complete handling process is described in the main KBS report. On the following pages a short process description is given, to a certain extent supplementing the KBS report and commenting some of the chosen process stages. Additional detailed studies regarding the various process steps are reported in the enclosed appendices. The description includes the following process steps: - spent fuel cask reception from the central storage - unloading of casks - dismantling of fuel bundles - insertion of fuel rods in copper racks - placing of racks in copper capsules - filling of capsules with lead - welding of capsule lids - capsule transport to the underground final storage The handling of remaining metal parts from the fuel bundles are described as well as collection of lossed particles from damaged fuel in the process.

868 (KBS-TR--111) RADIONUCLIDE INVENTORIES IN SPENT FUEL FROM LWR AND IN HIGH-LEVEL WASTE FROM PLUTONIUM RECYCLE IN PWR. Kjellbert, N. (Kaernbraenslesaekerhet, Stockholm (Sweden)). Jul 1978. 104p. (In Swedish). (STUDSVIK-SM--78/25). Dep. NTIS (US Sales Only), PC A07/MF A01.

An investigation of the importance of physical simplification in the ORIGEN code has been made by comparison with the BEGAFIP and CASMO codes. The most significant discrepancy seems to be due to the ORIGEN overestimation of the self-shielding effect on the neutron capture resonance integral of plutonium-240. This leads to an underestimation of the inventories of heavy nuclides with masses 241 through 246. In connection with the investigation, a recalculation of earlier presented inventories in spent fuel has been made, including studies of helium pressure build-up due to alpha decay, and neutron-induced activity in fuel rod construction materials. A rough estimation of plutonium recycle impact on radionuclide inventories in high-level waste has also been made. It is shown that recycling will have no dramatic effects on the inventories of radiologically significant nuclides.

869 (KEK--78-21) RADIOACTIVE LIQUID WASTE TREATMENT PLANT IN KEK. Yamaguchi, C.; Nishizaka, Y. (National Lab. for High Energy Physics, Oho, Ibaraki (Japan)). Nov 1978. 35p. NTIS (US Sales Only), PC A02/MF A01.

The outline and flow diagram of the low level ($<10^{-5}$ $\mu Ci/cm^3$) radioactive liquid waste treatment plant in the National Laboratory for High Energy Physics are presented. The detailed description of the individual facilities or equipments is given. The decontamination factors (DF) for the flocculation system and evaporation-condensation system have been obtained experimentally using stable $Sr(NO_3)_2$.

870 (KFK--2600, pp 170-222) SEPARATION OF KRYPTON AND XENON FROM THE OFFGAS OF NUCLEAR FACILITIES. von Ammon, R.; Bumiller, W.; Burkhardt, H.G.; Franz, G.; Hutter, E.; Knittel, G.; Neffe, G.; Penzhorn, R.D. May 1978. (In German).

Nuclear safety project. Second semiannual report 1977.

During the test runs of the KRETA plant with the three-component system N_2-Kr-Xe the concentration range of Kr and Xe in the feed gas could be determined where desublimation in the vicinity of the feed entry into the column takes place. This range decreases with decreasing total gas flow and increasing column pressure. The Kr recycle stream which is being planned for the improved offgas specification system of the WAK (project AZUR) was simulated by increasing the Kr feed concentration. The tendency of xenon to freeze out also decreases by this means. Analysis and control of H_2 during the catalytic reduction of O_2 and NO/sub x/ is achieved best using the method of measuring combustion heats. The cell of Leeds and Northrup operates at room temperature and is insensitive towards NO/sub x/. CO_2 is partially reduced by H_2 on the Ru-catalyst, but only if there is no O_2 present. Acid resistant molecular sieves (e.g. Norton Zeolen) adsorb Krypton almost twice as well as the type 5A. The same is true with NO. However, NH_3 and NO_2 are adsorbed less strongly on Zeolen as on 5A.

871 (KFK--2721) PREPARATION AND CHARACTERIZATION OF AN IMPROVED BOROSILICATE GLASS MATRIX FOR THE INCORPORATION OF HIGH LEVEL RADIOACTIVE WASTE (HAW). PT. 1. ANALYSIS OF 25 BORON SILICATE GLASS PRODUCTS FOR THE SELECTION OF AN IMPROVED BORON SILICATE GLASS. Guber, W.; Hussain, M.; Kahl, L.; Ondracek, G.; Saidl, J.; Dippel, T. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Entsorgungstechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Aug 1979. 17p. (In German). NTIS (US Sales Only), PC A03/MF A01.

On the basis of laboratory and technical experience with the preparation and the characterization of borosilicate glasses as solidification matrix for high level radioactive waste solution (HAW), a borosilicate glass composition with optimum properties has been developed. Keeping in view the technical and final storage requirements, a

number of glass compositions with varying proportions of influential components as Al, Mg, Na were prepared and thoroughly investigated for certain parameters as specific gravity, thermal conductivity, impact resistance, thermal expansion, viscosity, characteristic temperature points, specific heat, evaporation losses from the melt, electrical conductivity, leach resistance, tendency toward recrystallization and second phase formation. All the compositions (some with different amounts of Gd_2O_3, an expected neutron poision) contained 15 wt. % simulated HAW oxides. Samples for investigation were fabricated very close to the actual process conditions of vitrification. Two glass products GP12 and GP26 (3.7% Gd_2O_3) have been selected out of 25 glasses as the optimised products for further thorough investigations. Leach resistance, viscosity at 1420 K, tendency towards recrystallization and second phase formation were the most important deciding factors.

872 (KFK--2750, pp 4600-4-4600-8) TECHNICAL DEVELOPMENT OF THE FILTER SYSTEM FOR DISSOLVER OFF GAS CLEANUP. Jannakos, K.; Hoffmann, H.; Jochim, H.; Lange, W.; Mock, H.; Potgeter, G.; Zabel, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Ingenieurtechnik); Amend, J. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Kerntechnische Betriebe). Oct 1979. (In German).

Semiannual report 1978/2.

PASSAT System: All operating data necessary for implementation of the experiments were set with the PASSAT system. The test cycles, which ran continuously over a period of four weeks, proceeded without any incidents. The performance data measured corresponded to the design data, except for the electric output of the trace heating. The overall pressure losses of the system at design data were lower than the differential pressure generated by the blower, which is in accordance with the design. Iodine Filter and Remote Operating Systems: The filters and remote operating systems were mechanically ready for use throughout the experiment. The filter exchanges performed and bagging-out of the spent filter elements together with the attachment of the screw lid of the waste drum (approx. 20 times) proceeded according to expectations and corroborated the correctness of the concept chosen. The required tightness of the iodine filter, which is to be $< 10^{-3}$ Torr l/s (external leak and tightness between the filter drum with the filter housing, i.e., on the polluted and clean air sides), was always checked after filter exchanges and during operation. It always corresponded to the level referred to above.

873 (KFK--2765) DESCRIPTION OF THE R + D-WORK AND THE INACTIVE AND ACTIVE TEST PERIOD OF THE EUROBITUM/EUROSTORAGE FACILITY. Kowa, S. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Entsorgungstechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Jan 1979. 59p. (In German). Dep. NTIS (US Sales Only), PC A04/MF A01.

This report gives a survey of the R and D work, regarding the solidification of medium level waste concentrates in bitumen from the reprocessing of spent fuels. It describes the inactive and active test period of the Eurobitum/Eurostorage facility at Eurochemic, related to the KfK/Eurochemic cooperation program. It is known, that special components of radioactive concentrates can lead to an exothermic reaction with bitumen in the temperature range of 160-200°C (working temperature of the bituminization). To investigate the influence of these special components, differential thermal analyses were carried out and calculated. The leaching behaviour of bitumen/waste mixture under static and dynamic conditions was investigated. The leaching rates had been calculated and discussed. The Eurobitum/Eurostorage facility and the difficulties during the inactive and active start-up period are described and discussed in detail.

874 (KFK--2796) SURVEY ON PRODUCT PROPERTIES OF BITUMINIZED WASTE CONCENTRATES FROM REPROCESSING, NUCLEAR INSTALLATIONS AND NUCLEAR POWER PLANTS. Kluger, W.; Koester, R.; Krause, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Entsorgungstechnik). Mar 1979. 29p. (In German). Dep. NTIS (US Sales Only), PC A03/MF A01.

This report contains a brief survey on the product properties after solidification with bitumen of waste concentrates from reprocessing plants, nuclear research installations and nuclear power plants. The leach behaviour of bitumen products in water and saturated salt solutions is described as well as the radiolytic and thermal stability of the products. The reports also contain some data on sedimentation of salts fixed in bitumen.

875 (KFK--2842) MATERIAL INVESTIGATIONS ON SOLIDIFICATION OF INTERMEDIATE-LEVEL WASTE SOLUTIONS IN CEMENT: LEACHABILITY OF STRONTIUM AND CESIUM. Rudolph, G.; Koester, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Entsorgungstechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Aug 1979. 38p. (In German). (PWA--18/79). NTIS (US Sales Only), PC A03/MF A01.

Investigations are reported on reducing cesium and strontium leachability from products formed at the cementation of intermediatelevel waste solutions from reprocessing plants. The leach tests used were the IAEA method and an accelerated test. One particular natural calcium bentonit lowers the cesium leaching by a factor up to 100, depending on the amount added. Strontium leaching is decreased, to a lesser extent, by addition of a barium silicate hydrate; this effect is found mainly at elevated temperatures. Leaching in a salt brine in equilibrium with carnallite and other salts is significantly lower than in distilled water. Excess cesium enhances cesium leaching. Other parameters such as type of cement, setting time, water reducing agents, salt content, have little, if any, effect. Tests on bleeding of cement grouts containing simulated waste solution showed an unfavorable behavior of blast furnace slag cement.

876 (LA--8052-MS) EVALUATION PROCEDURE FOR RADIOACTIVE WASTE TREATMENT PROCESSES. Whitty, W.J. (Los Alamos Scientific Lab., NM (USA)). Nov 1979. Contract W-7405-ENG-36. 28p. Dep. NTIS, PC A03/MF A01.

An aspect of the Los Alamos Scientific Laboratory's nuclear waste management R and D programs has been to develop an evaluation procedure for radioactive waste treatment processes. This report describes the process evaluation method. Process worth is expressed as a numerical index called the Figure-of-Merit (FOM), which is computed using a hierarchial, linear, additive, scoring model with constant

criteria weights and nonlinear value functions. A numerical example is used to demonstrate the procedure and to point out some of its strengths and weaknesses. Potential modifications and extensions are discussed, and an extensive reference list is included.

877 (LA-UR--80-692) USDOE RADIOACTIVE WASTE INCINERATION TECHNOLOGY: STATUS REVIEW. Borduin, L.C.; Taboas, A.L. (Los Alamos Scientific Lab., NM (USA); Department of Energy, Albuquerque, NM (USA). Albuquerque Operations Office). 1980. Contract W-7405-ENG-36. 25p. (CONF-800334--5). Dep. NTIS, PC A02/MF A01.

From 2. DOE environmental control symposium; Reston, VA, USA (17 Mar 1980).

Early attempts were made to incinerate radioactive wastes met with operation and equipment problems such as feed preparation, corrosion, inadequate off-gas cleanup, incomplete combustion, and isotope containment. The US Department of Energy (DOE) continues to sponsor research, development, and the eventual demonstration of radioactive waste incineration. In addition, several industries are developing proprietary incineration system designs to meet other specific radwaste processing requirements. Although development efforts continue, significant results are available for the nuclear community and the general public to draw on in planning. This paper presents an introduction to incineration concerns, and an overview of the prominent radwaste incineration processes being developed within DOE. Brief process descriptions, status and goals of individual incineration systems, and planned or potential applications are also included.

878 (LA-UR--80-696) OVERVIEW OF THE INCINERATOR OFFGAS SYSTEM STUDY. Stretz, L.A. (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 5p. (CONF-800313--6). Dep. NTIS, PC A02/MF A01.

From Waste management conference; Tucson, AZ, USA (10 Mar 1980).

The wide range of incineration designs under development or in operation for treatment of a variety of radioactive wastes has resulted in numerous offgas cleanup systems. A study has been undertaken to review current incineration and offgas systems, categorize the waste-incinerator-effluent cases, identify common offgas treatment problems and criteria, and establish class of readily available and required technology. This presentation discusses the general approach of the study and preliminary results from the incinerator and offgas systems review efforts.

879 (LA-UR--80-835) PLUTONIUM SCRAP PROCESSING AT THE LOS ALAMOS SCIENTIFIC LABORATORY. Nixon, A.E.; McKerley, B.J.; Christensen, E.L. (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 24p. (CONF-800303--12). Dep. NTIS, PC A02/MF A01.

From 179. national meeting of the American Chemical Society; Houston, TX, USA (23 Mar 1980).

The Los Alamos Scientific Laboratory currently has the newest plutonium handling facility in the nation. Los Alamos has been active in the processing of plutonium almost since the discovery of this man-made element in 1941. One of the functions of the new facility is the processing of plutonium scrap generated at LASL and other sites. The feed for the scrap processing program is extremely varied, and a wide variety of contaminants are often encountered. Depending upon the scrap matrix and contaminants present, the majority of material receives a nitric acid/hydrofluoric acid or nitric acid/calcium fluoride leach. The plutonium nitrate solutions are then loaded onto an anion exchange column charged with DOWEX 1 x 4, 50 to 100 mesh, nitrate form resin. The column is eluted with 0.48 M hydroxyl amine nitrate. The $Pu(NO_3)_3$ is then precipitated as plutonium III oxalate which is calcined at 450 to 500°C to yield a purified PuO_2 product.

880 (LA-UR--80-1168) PLUTONIUM RECOVERY AT THE LOS ALAMOS SCIENTIFIC LABORATORY. Christensen, E.L. (Los Alamos Scientific Lab., NM (USA)). Jun 1980. Contract W-7405-ENG-36. 27p. (CONF-800611--5). NTIS, PC A03/MF A01.

From International symposium on the management of alpha-contaminated wastes; Vienna, Austria (2 Jun 1980).

Portions of document are illegible.

Research programs have led to the adoption of procedures for all phases of plutonium recovery and purification. This report discusses some of the many procedures required to recover and purify the plutonium contained in the residues generated by LASL research, process development, and production activities. The report also discusses general plant facilities, the liquid and gaseous effluents, and solid waste management practices at the New Plutonium Facility, TA-55. Many of the processes or operations are merely steps in preparing the feed for one of the purification systems. For example, the plutonium is currently removed from noncombustibles in the pickling operation with an HNO_3 leach. The HNO_3 leach solution is the product of this operation and is sent to one of the nitrate anion-exchange systems for concentration and purification.

881 (LA-UR--80-1265) PERFORMANCE AND IMPROVEMENTS OF THE TRITIUM HANDLING FACILITY AT THE LOS ALAMOS SCIENTIFIC LABORATORY. Nasise, J.E. (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 7p. (CONF-800427--10). NTIS, PC A02/MF A01.

From Tritium technology in fission, fusion, and isotopic applications; Dayton, OH, USA (29 Apr 1980).

A major problem facing todays nuclear energy industry is the release of radioactive waste products to the atmosphere. The DP-East Tritium Handling Facility at the Los Alamos Scientific Laboratory (LASL), activated December 5, 1974 has processed 3.8×10^8 curies of tritium with a total stack release of 704.5 curies as of December 12, 1979. This averages only 11.7 Ci/month which to our knowledge is the lowest stack release any major tritium facility has achieved. The facility includes an 11.5 m^3 dry box with associated gas purification system (GPS) and an effluent treatment system (ETS). The system performance, problems, and improvements are discussed with special emphasis given to the ETS, the new dry box waste disposal system, and the new automated logic control system, all of which contribute significantly to the low level tritium release at this facility.

882 (LA-UR--80-1408) RADIOACTIVE WASTE INCINERATION STUDIES AT THE LOS ALAMOS SCIENTIFIC LABORATORY. Stretz, L.A.; Borduin, L.C.; Draper, W.E.; Koenig, R.A.; Newmyer, J.M. (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 20p. (CONF-800607--53). NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

Development and demonstration of a transuranic (TRU) waste volume-reduction process is described. A controlled-air incinerator, based upon commercially available equipment and technology, was modified for radioactive service and was successfully tested and demonstrated with contaminated waste. Demonstration of the production-scale unit was completed in May 1980 with the incineration of 272 kg of waste with an average TRU content of about 20 nCi/g. Weight and volume reduction factors for the demonstration run were 40:1 and 120:1, respectively.

883 (LA-UR--80-1428) CONTROLLED-AIR INCINERATION OF ALPHA-BEARING SOLID WASTES. Koenig, R.A.; Draper, W.E.; Neuls, A.S.; Newmyer, J.M. (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 23p. (CONF-800611--8). NTIS, PC A02/MF A01.

From International symposium on the management of alpha-contaminated wastes; Vienna, Austria (2 Jun 1980).

The Los Alamos Scientific Laboratory is completing a study of controlled-air incineration (CAI) as a technique for volume reduction and stabilization of combustible transuranic-contaminated solid wastes. To demonstrate feasibility, a process has been assembled and operated on synthetic and contaminated combustibles. This paper summarizes the CAI project history, process design, provisions for radioactive operation, experimental results to date, and future plans. Achievements include operation at the design feed rate as well as combustion of separate feed compositions including cellulosics, polyethylene, polyvinyl chloride (PVC) and latex rubber. Refractory life has been satisfactory to date, with studies continuing. The offgas cleanup system has proven to be extremely effective; the final high-efficiency filters showing virtually no pressure drop increase. The ability of the system to process high concentrations of PVC has been demonstrated with no chloride-induced degradation detected. Chloride and sulfate removal from the offgas has been excellent with concentrations reaching 8 and 10 ppM maximum, respectively, in the process condensate.

884 (MLM--2644) POLYMER IMPREGNATED TRITIATED CONCRETE. FINAL REPORT. Wieneke, R.E.; Dauby, J.J.; Abell, G.C.; Tadlock, W.E.; Lamberger, P.H.; Gibbs, G.E. (Mound Facility, Miamisburg, OH (USA)). 27 Sep 1979. Contract EY-76-C-04-0053. 31p. Dep. NTIS, PC A03/MF A01.

Mound Facility investigated the polymer-impregnated tritiated-concrete process (PITC) for aqueous tritiated waste as developed by Brookhaven National Laboratory. This technique involves the solidification of tritiated aqueous waste in concrete. The solidified block is then soaked in styrene monomer which permeates the concrete and, when polymerized, effectively microencapsulates the tritium bearing concrete, thus providing added protection in case of a broken package. Small scale samples (in 500-ml polyethylene bottles) were fabricated and tested in order to determine their characteristics in relation to differences in tritium release from the package due to variation of process parameters, radiation effects on the polystyrene, and gas generation. It was determined that varying the factors that increase the polymerization rate of the styrene (higher temperature or more catalyst) will increase the tritium permeation rate because the porosity of the polystyrene layer has been increased. Compressive strength tests, conducted after 75 weeks, showed that the tritiated blocks were consistently weaker than their nonradioactive counterparts, and that the gas release rate from PITC samples was nearly the same as that from nonpolymer impregnated samples. To date, two full-scale, nonradioactive packages have been successfully produced by the following procedure: inject 27 liters of water into the center of the waste package that contains 112 kg of Portland Type III cement inside a 30-gal, open-head steel drum and a 27-gal polyethylene drum liner; cure the cement at ambient temperature for 3 to 5 days, then heat the package to 45°C and soak the cement with 24 kg of styrene monomer containing 3/4 wt % catalyst; increase the heat until 70°C is obtaind at the cement-liner interface. In approximately 7 hr, polymerization will occur.

885 (MLM--2646) MOUND CYCLONE INCINERATOR PRELIMINARY DESIGN CRITERIA: BATCH MODE OPERATION. Klingler, L.M.; Alexander, B.M.; Todd, J.E. (Mound Facility, Miamisburg, OH (USA)). 28 Sep 1979. Contract EY-76-C-04-0053. 24p. Dep. NTIS, PC A02/MF A01.

A cyclone incinerator has been developed at Mound Facility for use in the disposal of radioactive wastes. Although simple in design and operation, the incinerator is capable of high quality combustion and excellent volume reduction. The use of the incinerator for Mound generated waste has demonstrated the effectiveness of the incinerator system. Design simplicity will aid in adapting the incinerator tc a wide variety of applications.

886 (MLM--2667) COMMERCIAL CYCLONE INCINERATOR DEMONSTRATION PROGRAM: APRIL-SEPTEMBER 1979. Alexander, B.M. (Mound Facility, Miamisburg, OH (USA)). 7 Dec 1979. Contract EY-76-C-04-0789. 11p. Dep. NTIS, PC A02/MF A01.

The commercial cyclone incinerator program was designed to study the effects of burning low-level waste contaminated with beta and gamma emitters in a cyclone system. The ultimate program goal is the demonstration of a cyclone incinerator at a nuclear power plant. During the past six months, the first program objective, NRC review of the Feasibility Plan, was achieved, and work began on the second objective, Complete Incinerator Feasibility Plan. Potential applications for the cyclone incinerator have been investigated. The feasibility plan for the incinerator system was reviewed with the Nuclear Regulatory Commission (NRC). Following a series of cold checkout burns, implementation of the feasibility plan was begun with the start of laboratory-scale experiments. Inconel 601 is being investigated as a material of construction for the incinerator burn chamber.

887 (MLM--2670) PELLETIZED WASTE FORM DEMONSTRATION PROGRAM: APRIL-SEPTEMBER 1979. Lewis, E.L.; Herbert, R.F. Jr. (Mound Facility, Miamisburg, OH (USA)). 7 Dec 1979. Contract EY-76-C-04-0053. 25p. Dep. NTIS, PC A02/MF A01.

During the last half of FY-1979, feasibility studies involving hot pilot-scale experiments were conducted. Sludge from the defense cyclone incinerator system was calcined and then successfully immobilized in a Portland cement matrix. This was accomplished mainly through a designed experiment in which the effects of seven variables upon compressive strength were studied. Physical and chemical properties of the sludge were also determined. Leachability

and radiolysis testing of ash/cement and sludge/cement pellets was done at Mound Facility, and offsite radiolysis tests were completed at Savannah River Laboratory. Leachability data obtained indicate that leach rates are greater at ambient temperature than at 70°C. The leach rates were very small with < 0.01% of the PuO_2 leached after 20 days. Radiolysis results from SRL indicated a very low hydrogen gas generation rate, G/sub(H_2)/, caused by radiolysis of water present in pellets. Recent irradiation tests at Mound verify these results, and pressed waste/cement pellets appear to be an excellent waste form based on low gas generation rates.

888 (MLM--2672) DEFENSE WASTE CYCLONE INCINERATOR DEMONSTRATION PROGRAM: APRIL-SEPTEMBER 1979. Klingler, L.M. (Mound Facility, Miamisburg, OH (USA)). 14 Dec 1979. Contract EY-76-C-04-0053. 20p. Dep. NTIS, PC A02/MF A01.

Efforts to demonstrate the versatility of the Mound cyclone incinerator have continued during the last half of FY-1979. Design changes have been made or are in progress to correct known system problems. Work is being directed toward successfully demonstrating liquid burning and continuous feed burning. Preliminary test burning of liquid feed, scintillation vials, and LSA-type shredded solid waste have proved very encouraging. A preliminary conceptual design for a scintillation vial feed system has been prepared. Basic design criteria for a cyclone incinerator system to burn in a batch type mode have been published.

889 (MLM--2684) DEVELOPMENT OF ULTRAFILTRATION AND ADSORBENTS: APRIL-SEPTEMBER 1979. Roberts, R.C.; Herald, W.R. (Mound Facility, Miamisburg, OH (USA)). 14 Mar 1980. Contract EY-76-C-04-0053. 61p. Dep. NTIS, PC A04/MF A01.

Tests were begun on influent from the radioactive waste disposed plant spiked with other actinides, but problems with the laboratory-scale reverse osmosis (RO) unit led to postponement of these tests. Laboratory-scale RO tests on solution spiked with fission products showed very good rejection (98 to 100%) of ^{60}Co, ^{137}Cs, and ^{131}I. A literature search was made for references to actinide and fission product removal from waste streams by adsorbents. A table lists adsorbents and what elements they remove. A cross reference of adsorbents was compiled in a series of tables so that data from different waste treatment reports can be compared. Laboratory column experiments on Co, Cs, and I gave decontamination factors (DF) for several adsorbers. Engineering tests on Am, Pu, U, and Np are reported at several flow rates and at pH values of 3, 7, and 10. DFs for these actinides are reported.

890 (MLM--2692) PLUTONIUM ADSORPTION BY SELECTED INORGANIC COMPOUNDS. Silver, G.L. (Mound Facility, Miamisburg, OH (USA)). 10 Oct 1980. Contract AC04-76DP00053. 44p. NTIS, PC A03/MF A01.

Plutonium may be removed from aqueous solution by adsorption on inorganic materials. Hydroxylapatite, dibasic and tribasic calcium phosphate, calcium cyanamide, and sodium titanate are particularly noteworthy for their ability to concentrate plutonium. The extent of adsorption and pH of maximum adsorption depend upon the chemical form of the dissolved plutonium.

891 (MLM--2697) PELLETIZED WASTE FORM DEMONSTRATION PROGRAM: FINAL DESIGN CRITERIA FOR WASTE PELLETIZATION. Lewis, E.L. (Mound Facility, Miamisburg, OH (USA)). 28 Mar 1980. Contract AC04-76DP00053. 9p. Dep. NTIS, PC A02/MF A01.

A cement fixation process was developed for immobilizing incinerator ash with a radionuclide concentration approx. 200 nCi/g ash. The design criteria include process descriptions for sizing, calcination, blending, pelletization, and packaging-storage operations and performance data for the sizing equipment, calciner, blending apparatus, and press.

892 (MLM--2713) COMMERCIAL CYCLONE INCINERATOR DEMONSTRATION PROGRAM: OCTOBER 1979-MARCH 1980. Alexander, B.M. (Mound Facility, Miamisburg, OH (USA)). 21 May 1980. Contract AC04-76DP00053. 15p. NTIS, PC A02/MF A01.

The commercial cyclone incinerator program was designed to study the effects of burning low-level waste contaminated with beta and gamma emitters in a cyclone system. The ultimate program goal is the demonstration of a cyclone incinerator at a nuclear power plant. During the past six months, progress was made toward achieving the second program objective, Complete Incinerator Feasibility Plan. Forty-one laboratory-scale experiments were completed, with five more experiments remaining to be performed. Sample analysis from completed experiments continues. A promising scrub liquor was identified and is now being used for improved absorption of iodide and chloride from incinerator offgas. Inconel 601 continues to perform well as the material of construction for the laboratory-scale burn chamber.

893 (MLM--2716) DEFENSE WASTE CYCLONE INCINERATOR DEMONSTRATION PROGRAM: OCTOBER 1979-MARCH 1980. Klingler, L.M. (Mound Facility, Miamisburg, OH (USA)). 6 Jun 1980. Contract AC04-76DP00053. 25p. NTIS, PC A02/MF A01.

An improved offgas system is being designed. Significant system modifications will be required for the commercial incinerator full-scale experimentation program planned for later this year. Cost estimates indicated that a number of desired system improvements can be made at the same time for little additional cost. The new system layout will also provide needed space for possible future expansion of incinerator throughput capabilities. Continuous solid and liquid feed experimentation is in progress. Continuous burning is presently being initiated by means of a small batch burn. As the batch burn nears completion, continuous solid feeding is begun. In the limited burning done to date, the feed system has worked extremely well. Liquid burning has been conducted in coordination with continuous solid feed burning. As the solids feed rate is reduced, a liquid stream is introduced to the chamber at another air inlet. Limited burning indicated that both feed systems will work as expected. Combustion quality appears to be excellent, and the burning is smooth and controllable. Efforts are being made to upgrade the offgas sampling program for the incinerator. System changes will include provisions for good sampling procedure.

894 (MLM--2717) PELLETIZED WASTE FORM DEMONSTRATION PROGRAM, OCTOBER 1979-MARCH 1980. Lewis, E.L.; Herbert, R.F. Jr. (Mound Facility, Miamisburg, OH (USA)). 6 Jun 1980. Contract AC04-76DP00053. 12p. NTIS, PC A02/

MF A01.

The main objective of this task is to evaluate several transuranic waste immobilization methods. During the first half of FY-1980, ash/cement and sludge/cement pellets were performance tested. In short-term radiolysis experiments with sludge/cement pellets, a very low hydrogen generation rate of 0.01 molecule/100 eV was obtained. Leachability testing of ash/cement and sludge/cement pellets containing plutonium-238 oxide in both brine and deionized water yielded a very low leach rate of $< 10^{-5}$ (fraction leached) (g) $(cm)^{-2}$ $(day)^{-1}$. Pressed waste/cement pellets, therefore, appear to be an excellent final waste form based on leachability and radiolysis results. Design criteria were developed for the production waste pelletization line (PWPL) and documented. Equipment procurement for the PWPL was started, and installation will be continuing for several months.

895 (MLM--2731) COMMERCIAL CYCLONE INCINERATOR DEMONSTRATION PROGRAM: OCTOBER 1979-MARCH 1980. Alexander, B.M. (Mound Facility, Miamisburg, OH (USA)). 21 May 1980. Contract EY-76-C-04-0053. 15p. NTIS, PC A02/ MF A01.

The commercial cyclone incinerator program was designed to study the effects of burning low-level waste contaminated with beta and gamma emitters in a cyclone system. The ultimate program goal is the demonstration of a cyclone incinerator at a nuclear power plant. During the past six months, progress was made toward achieving the second program objective, Complete Incinerator Feasibility Plan. 896 (MLM--2735) DEVELOPMENT OF ULTRAFILTRATION AND ADSORBENTS: OCTOBER 1979-MARCH 1980. Roberts, R.C.; Colvin, C.M. (Mound Facility, Miamisburg, OH (USA)). 2 Jul 1980. Contract AC04-76DP00053. 18p. NTIS, PC A02/MF A01.

Tests on a sample of trench water from the Maxey Flats burial ground effectively demonstrated the new Reverse Osmosis Pilot Plant. The effluent from the 50% salt-rejection membrane was decontaminated well enough with the exception of tritium to be discharged to the environment. The performance of the 97% salt-rejection membrane was superior to that of the 50% membrane. A breakthrough and capacity experiment was conducted with Durasil 10 on a simulated Three Mile Island solution. The maximum decontamination factor was extrapolated to be 10^6, which would reduce the cesium level of TMI water to below the discard limit. Capacity (1/DF = 0.5) was reached at 1260 column volumes. Several adsorbents were tested in the engineering columns for decontamination of cesium-bearing solutions. Under the conditions of the experiment, these adsorbents were ineffective in removing cesium from the solution.

897 (MLM--2774) COMBINED ELECTROLYSIS CATALYTIC EXCHANGE (CECE). Ellis, R.E.; Mills, T.K.; Rogers, M.L. (Mound Facility, Miamisburg, OH (USA)). 30 Sep 1980. Contract AC04-76DP00053. 19p. NTIS, PC A02/ MF A01.

Starting from an effort to control airborne emissions, the Mound tritium containment program has evolved to include development of the Combined Electrolysis Catalytic Exchange (CECE) process. This process separates tritiated aqueous streams into detritiated water and an enriched hydrogen stream that is suitable for use by other tritium recovery processes. Experimentation has shown that the process performs as predicted by bench-scale measurements, and that available process components exhibit acceptable resistance to damage by radiation from tritium exposure. Planned future efforts are concentrated on finalizing automatic control of the process and on developing feed treatment methods for the protection of process components.

898 (MLM--2775(OP)) INCINERATION OF LWR-TYPE WASTE AT MOUND FACILITY. Alexander, B.M.; Grimm, R.S.; Doty, J.W. Jr. (Mound Facility, Miamisburg, OH (USA)). 1980. Contract AC04-76DP00053. 9p. (CONF-801038--2). NTIS, PC A02/MF A01.

From 16. DOE nuclear air cleaning conference; San Diego, CA, USA (20 Oct 1980).

The Mound Cyclone Incinerator, demonstrated over several years for the combustion of radwaste containing plutonium, is now being developed for volume reduction of radwaste containing mixed beta- and gamma-emitters, from LWR facilities. To this end, a laboratory-scale feasibility study was developed and executed. Development of the feasibility study was based on known characteristics of LWR waste and on operating data compiled for the Mound Cyclone Incinerator since 1975. Feed spiked with several isotopes found in LWR waste was burned in the laboratory-scale cyclone incinerator, and samples were collected and analyzed. From these data, the applicability of cyclone incineration was demonstrated, and an efficient scrub liquor composition was chosen for the offgas treatment system. A Health Physics survey of the incinerator system after incineration of 220 μCi of beta/gamma activity showed no exposure readings above background level. Future work planned includes incineration of simulated LWR waste in the full-scale Mound Cyclone Incinerator to begin later this year.

899 (NUREG--0643) RADIOACTIVE WASTE PROCESSING AND DISPOSAL. (Nuclear Regulatory Commission, Washington, DC (USA)). Jan 1980. 942p. (TID--3311-S8-P2). Dep. NTIS, PC A99/ MF A01.

This compilation contains 4144 citations of foreign and domestic reports, journal articles, patents, conference proceedings, and books pertaining to radioactive waste processing and disposal. Five indexes are provided: Corporate Author, Personal Author, Subject, Contract Number, and Report Number.

900 (NUS--3245) LOW-LEVEL RADIOACTIVE WASTE MANAGEMENT. VOLUME IV. RADIOACTIVE WASTE SOLIDIFICATION AND HANDLING PRACTICES. Feizollahi, F. (NUS Corp., Palo Alto, CA (USA)). Aug 1979. 84p. California Energy Commission, 1111 Howe Ave., Sacramento, CA 95825.

This study evaluates low-level waste management technology for light water reactors and identifies the problems that must be solved within the next few years to allow for the orderly development of large-scale management of low-level radioactive wastes generated at nuclear power facilities and by the nuclear power industry in California. This study

provides an independent assessment of current and projected low-level waste management techniques, technology, and advanced volume reduction schemes. This assessment, when evaluated, will become part of the California Energy Commission's policy for licensing sites and facilities for proposed nuclear power plants in California. The results of the study are published in five volumes: Current Power-Reactor Low-Level Radwaste Management Practices; Forecast of Low-Level Radwaste Management Requirements; Feasibility of Volume-Reduction Processes; Radioactive Waste Solidification and Handling Practices; and Policy Recommendations, Conclusions, and Summary.

901 (ONWI--20-NUS-3314) WASTE INVENTORY REPORT FOR REACTOR AND FUEL-FABRICATION FACILITY WASTES. Phillips, J.; Feizollahi, F.; Martineit, R.; Bell, W.; Stouky, R. (NUS Corp., Rockville, MD (USA)). Mar 1979. Contract EY-76-C-06-1830. 417p. Dep. NTIS, PC A18/MF A01.

The physical and chemical characteristics of wastes (other than spent fuel) that are generated at light-water-cooled nuclear reactor (LWR) power plants and nuclear fuel-fabrication facilities are described. The information used to define these characteristics is based on a survey of 30 nuclear power plants and 7 facilities involved in LWR fuel-fabrication. Information on volumes and activity levels of five major categories of LWR and fuel fabrication facility waste was collected. The major categories of waste are spent resin, concentrated liquids, precoat filter sludge (including ground ion-exchange resin), cartridge filters, and compactible and non-compactible trash. The volumes and activity levels of these wastes were used to determine the average waste-generation rates for LWRs and fuel-fabrication facilities, and the typical waste-generation rates for LWRs. Average gross radioactive concentrations were calculated, including concentrations of transuranics, to determine annual activity-generation rates and the total radioactivity of the waste shipped. These generation rates were used in conjunction with projected increases in the gross electrical generating capacity of nuclear power plants to determine annual waste volumes through 2000. A determination of the effect of a broad application of current volume-reduction systems on the waste volumes is also included. The overall waste burial capacity of currently licensed burial site areas was examined and fuel-cycle wastes and nonfuel-cycle wastes were considered.

902 (ONWI--62) PROCEEDINGS OF THE NATIONAL WASTE TERMINAL STORAGE PROGRAM INFORMATION MEETING. (Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). 30 Oct 1979. Contract AC06-76RL01830. 235p. (CONF-791033--). NTIS, PC A11/MF A01.

From 1. annual ONWI information meeting; Columbus, OH, USA (30 Oct 1979).

This document is a compilation of papers presented at an NWTS information meeting designed to provide a comprehensive review of the progress of the ONWI program as well as an overview of the BWIP (Basalt Waste Isolation Project) program and NNWSI (Nevada Nuclear Waste Storage Investigations). The papers are arranged into seven sections: overview of NWTS program, science/technology studies, geologic studies for site identification program, process/equipment program, systems analysis, site/repository licensing, and facilities engineering. (DLC)

903 (ORNL--5562) VOLATILITY OF RUTHENIUM-106, TECHNETIUM-99, AND IODINE-129, AND THE EVOLUTION OF NITROGEN OXIDE COMPOUNDS DURING THE CALCINATION OF HIGH-LEVEL, RADIOACTIVE NITRIC ACID WASTE. Rimshaw, S.J.; Case, F.N.; Tompkins, J.A. (Oak Ridge National Lab., TN (USA)). Feb 1980. Contract W-7405-ENG-26. 58p. Dep. NTIS, PC A04/MF A01.

The nitrate anion is the predominant constituent in all high-level nuclear wastes. Formic acid reacts with the nitrate anion to yield noncondensable, inert gases (N_2 or N_2O), which can be scrubbed free of ^{106}Ru, ^{129}I, and ^{99}Tc radioactivities prior to elimination from the plant by passing through HEPA filters. Treatment of a high-level authentic radioactive waste with two moles of formic acid per mole of nitrate anion leads to a low RuO_4 volatility of about 0.1%, which can be reduced to an even lower level of 0.007% on adding a 15% excess of formic acid. Without pretreatment of the nitrate waste with formic acid, a high RuO_4 volatility of approx. 35% is observed on calcining a 4.0 N HNO_3 solution in quartz equipment at 350°C. The RuO_4 volatility falls to approx. 1.0% on decreasing the initial HNO_3 concentration to 1.0 N or lower. It is postulated that thermal denitration of a highly nitrated ruthenium complex leads to the formation of volatile RuO_4, while decarboxylation of a ruthenium-formate complex leads to the formation of nonvolatile RuO_2. Wet scrubbing with water is used to remove RuO_4 from the off-gas stream. In all glass equipment, small amounts of particulate RuO_2 are formed in the gas phase by decomposition of RuO_4. The ^{99}Tc volatility was found to vary from 0.2 to 1.4% on calcining HNO_3 and HCOOH (formic acid) solutions over the temperature range of 250 to 600°C. These unexpectedly low volatilities of ^{99}Tc are correlated to the high thermal stability limits of various metal pertechnetates and technetates. Iodine volatilities were high, varying from a low of 30% at 350°C to a high of 97% at 650°C. It is concluded that with a proper selection of pretreatment and operating conditions the ^{106}Ru and ^{99}Tc activities can be retained in the calcined solid with recycle of the wet scrubbing solution.

904 (ORNL--5618) EVALUATION OF THE LOW-LEVEL WASTE TREATMENT PLANT AT OAK RIDGE NATIONAL LABORATORY, AND SUGGESTED CHANGES IN THE DESIGN AND OPERATION. Chilton, J.M. (Oak Ridge National Lab., TN (USA)). Mar 1980. Contract W-7405-ENG-26. 31p. Dep. NTIS, PC A03/MF A01.

The operation of the Low-Level Waste Treatment (LLWT) Plant was monitored for one month to determine why the precipitation-filtration step failed to remove the normal amount of hardness. Each of the three resin beds loaded with Duolite CS-100 resin was taken through one loading-elution cycle. The primary radioactivity in this waste is ^{90}Sr and ^{137}Cs, and, under optimum conditions, the plant discharges about 0.015 dpm/ml of ^{90}Sr and 0.06 dpm/ml of ^{137}Cs. Although no strontium breakthrough was noted, the results showed that cesium broke through each of the beds after the passage of about 550 bed volumes. Development work for this process had indicated a useful capacity of about 2000 bed volumes, however, and the plant has routinely operated using this value. Resin samples showed that the static volumetric distribution coefficient (DC) for cesium had dropped from 3900 for new resin to about 475 for used resin. Also, the DC for strontium dropped from 20,000 to about 5500. The optimum loading of cesium was found at pH 11.9. No clear-cut cause could be established for the occasional incomplete calcium

precipitation. Even using exhausted resin, however, the exit stream is below the permissible concentration for all radionuclides in public streams. Recommendations from this study are immediate replacement of all three resin columns, relocation of the pH-sensing electrode in the precipitation step, use of a more dilute caustic solution for regeneration, institution of a sampling routine to determine more promptly the breakthrough of cesium from the resin, and relocation and possible modification of the gamma detector in the exit stream.

905 (ORNL--5687) PROCESS FOR THE RECOVERY OF CURIUM-244 FROM NUCLEAR WASTE. Posey, J.C. (Oak Ridge National Lab., TN (USA)). Oct 1980. Contract W-7405-ENG-26. 100p. NTIS, PC A05/MF A01.

A process has been designed for the recovery of curium from purex waste. Curium and americium are separated from the lanthanides by a TALSPEAK extraction process using differential extraction. Equations were derived for the estimation of the economically optimum conditions for the extraction using laboratory batch extraction data. The preparation of feed for the extraction involves the removal of nitric acid from the Purex waste by vaporization under reduced pressure, the leaching of soluble nitrates from the resulting cake, and the oxalate precipitation of a pure lanthanide-actinide fraction. Final separation of the curium from americium is done by ion-exchange. The steps of the process, except ion-exchange, were tested on a laboratory scale and workable conditions were determined.

906 (ORNL/EIS--133/V2) LOW-LEVEL RADIOACTIVE WASTE TECHNOLOGY: A SELECTED, ANNOTATED BIBLIOGRAPHY. Fore, C.S.; Vaughan, N.D.; Hyder, L.K. (Oak Ridge National Lab., TN (USA)). Oct 1980. Contract W-7405-ENG-26. 310p. NTIS, PC A14/MF A01.

This annotated bibliography of 447 references contains scientific, technical, economic, and regulatory information relevant to low-level radioactive waste technology. The bibliography focuses on environmental transport, disposal site, and waste treatment studies. The publication covers both domestic and foreign literature for the period 1952 to 1979. Major chapters selected are Chemical and Physical Aspects; Container Design and Performance; Disposal Site; Environmental Transport; General Studies and Reviews; Geology, Hydrology and Site Resources; Regulatory and Economic Aspects; Transportation Technology; Waste Production; and Waste Treatment. Specialized data fields have been incorporated into the data file to improve the ease and accuracy of locating pertinent references. Specific radionuclides for which data are presented are listed in the Measured Radionuclides field, and specific parameters which affect the migration of these radionuclides are presented in the Measured Parameters field. In addition, each document referenced in this bibliography has been assigned a relevance number to facilitate sorting the documents according to their pertinence to low-level radioactive waste technology. The documents are rated 1, 2, 3, or 4, with 1 indicating direct applicability to low-level radioactive waste technology and 4 indicating that a considerable amount of interpretation is required for the information presented to be applied. The references within each chapter are arranged alphabetically by leading author, corporate affiliation, or title of the document. Indexes are provide for (1) author(s), (2) keywords, (3) subject category, (4) title, (5) geographic location, (6) measured parameters, (7) measured radionuclides, and (8) publication description.

907 (ORNL/EIS--154/V1) NUCLEAR FACILITY DECOMMISSIONING AND SITE REMEDIAL ACTIONS. VOLUME 1. A SELECTED BIBLIOGRAPHY. Faust, R.A.; Fore, C.S.; Knox, N.P. (Oak Ridge National Lab., TN (USA)). Sep 1980. Contract W-7405-ENG-26. 463p. (RHO/SFM--80/5). NTIS, PC A20/MF A01.

This bibliography of 633 references represents the first in a series to be produced by the Remedial Actions Program Information Center (RAPIC) containing scientific, technical, economic, and regulatory information concerning the decommissioning of nuclear facilities. Major chapters selected for this bibliography are Facility Decommissioning, Uranium Mill Tailings Cleanup, Contaminated Site Restoration, and Criteria and Standards. The references within each chapter are arranged alphabetically by leading author, corporate affiliation, or title of the document. When the author is not given, the corporate affiliation appears first. If these two levels of authorship are not given, the title of the document is used as the identifying level. Indexes are provided for (1) author(s), (2) keywords, (3) title, (4) technology development, and (5) publication description. An appendix of 123 entries lists recently acquired references relevant to decommissioning of nuclear facilities. These references are also arranged according to one of the four subject categories and followed by author, title, and publication description indexes. The bibliography was compiled from a specialized data base established and maintained by RAPIC to provide information support for the Department of Energy's Remedial Actions Program, under the cosponsorship of its three major components: Surplus Facilities Management Program, Uranium Mill Tailings Remedial Actions Program, and Formerly Utilized Sites Remedial Actions Program. RAPIC is part of the Ecological Sciences Information Center within the Information Center Complex at Oak Ridge National Laboratory.

908 (ORNL/MIT--300) ANALYSIS OF BARIUM HYDROXIDE AND CALCIUM HYDROXIDE SLURRY CARBONATION REACTORS. Patch, K.D.; Hart, R.P.; Schumacher, W.A. (Massachusetts Inst. of Tech., Oak Ridge, TN (USA). School of Chemical Engineering Practice; Oak Ridge National Lab., TN (USA)). May 1980. Contract W-7405-ENG-26. 41p. NTIS, PC A03/MF A01.

The removal of CO_2 from air was investigated by using a continuous-agitated-slurry carbonation reactor containing either barium hydroxide [$Ba(OH)_2$] or calcium hydroxide [$Ca(OH)_2$]. Such a process would be applied to scrub $^{14}CO_2$ from stack gases at nuclear-fuel reprocessing plants. Decontamination factors were characterized for reactor conditions which could alter hydrodynamic behavior. An attempt was made to characterize reactor performance with models assuming both plug flow and various degrees of backmixing in the gas phase. The $Ba(OH)_2$ slurry enabled increased conversion, but apparently the process was controlled under some conditions by phenomena differing from those observed for carbonation by $Ca(OH)_2$. Overall reaction mechanisms are postulated.

909 (ORNL/Sub--80/31038/1) ACTINIDE PARTITIONING-TRANSMUTATION PROGRAM. FINAL REPORT. VII. LONG-TERM RISK ANALYSIS OF THE GEOLOGIC REPOSITORY (APPENDIX). Logan, S.E.; Conarty, R.L.; Ng, H.S.; Rahal, L.J.; Shirley,

C.G. (Los Alamos Technical Associates, Inc., NM (USA)). Jan 1980. Contract W-7405-ENG-26. 612p. NTIS, PC A99/MF A01.

The Chemical Technology Division of ORNL has prepared a set of documents that evaluate a partitioning-transmutation (PT) fuel cycle relative to a reference cycle employing conventional fuel-material recovery methods. The PT cycle uses enhanced recovery methods so that most of the long-lived actinides are recycled to nuclear power plants and transmuted to shorter-lived materials, thereby reducing waste toxicity. Data pertaining to the long-term risk analysis of waste generated from the PT fuel cycle are presented. (DC)

910 (ORNL/TM--6445) SEPARATION OF AMERICIUM, CURIUM, AND RARE EARTHS FROM HIGH-LEVEL WASTES BY OXALATE PRECIPITATION: EXPERIMENTS WITH SYNTHETIC WASTE SOLUTIONS. Forsberg, C.W. (Oak Ridge National Lab., TN (USA)). Jan 1980. Contract W-7405-ENG-26. 103p. Dep. NTIS, PC A06/MF A01.

The separation of trivalent actinides and rare earths from other fission products in high-level nuclear wastes by oxalate precipitation followed by ion exchange (OPIX) was experimentally investigated using synthetic wastes and a small-scale, continuous-flow oxalic acid precipitation and solid-liquid separation system. Trivalent actinide and rare earth oxalates are relatively insoluble in 0.5 to 1.0 M HNO_3 whereas other fission product oxalates are not. The continuous-flow system consisted of one or two stirred-tank reactors in series for crystal growth. Oxalic acid and waste solutions were mixed in the first tank, with the product solid-liquid slurry leaving the second tank. Solid-liquid separation was tested by filters and by a gravity settler. The experiments determined the fraction of rare earths precipitated and separated from synthetic waste streams as a function of number of reactors, system temperature, oxalic acid concentration, liquid residence time in the process, power input to the stirred-tank reactors, and method of solid-liquid separation. The crystalline precipitate was characterized with respect to form, size, and chemical composition. These experiments are only the first step in converting a proposed chemical flowsheet into a process flowsheet suitable for large-scale remote operations at high activity levels.

911 (ORNL/TM--6802) RECOVERY OF PLUTONIUM FROM HEPA FILTERS BY CE(IV): PROMOTED DISSOLUTION OF PuO_2 AND RECYCLE OF THE CERIUM PROMOTER. Scheitlin, F.M.; Bond, W.D. (Oak Ridge National Lab., TN (USA)). May 1980. Contract W-7405-ENG-26. 58p. NTIS, PC A04/MF A01.

Studies carried out in this investigation included (1) electrolytic production of Ce(IV) from Ce(III), (2) leaching of refractory PuO_2 from HEPA filters with maintenance of Ce(IV) by anodic oxidation during leaching, and (3) evaluation of methods for contacting the HEPA solids with the leaching solution and for separating the solid residue from the leaching liquor. Anodic oxidation of Ce(III) was accomplished with an electric current efficiency of about 85% at current densities of 0.04 to 0.4 A/dm^2 at Pt anode. Refractory PuO_2 was dissolved by a 4.0 M HNO_3 - 0.1 M Ce(IV) solution in 1.5 h at 100°C using stirred-contact leaching of the solids or by recirculating the leachant through a packed column of the solids. Cerium(IV) concentrations were maintained continuously by anodic oxidation throughout leaching. Dissolution times up to 10 h were required unless the HEPA media were oxidized initially in air at 300°C to destroy carbonaceous species which consumed Ce(IV) more rapidly than it could be regenerated be anodic oxidation. Leaching solids in packed columns avoided the relatively difficult liquid-solids separation by centrifugation which was required after stirred-contact leaching; however, the solids handling difficulties remain. A flowsheet is proposed for the recovery of actinides from HEPA filters. A 4 M HNO_3 - 0.1 M Ce(IV) nitrate solution is used as the leachant and the Ce(III) is recycled to the leaching operation using bidentate solvent extraction.

912 (ORNL/TM--6983) ACTINIDE PARTITIONING-TRANSMUTATION PROGRAM FINAL REPORT. III. TRANSMUTATION STUDIES. Wachter, J.W.; Croff, A.G. (Oak Ridge National Lab., TN (USA)). Jul 1980. Contract W-7405-ENG-26. 59p. NTIS, PC A04/MF A01.

Transmutation of the long-lived nuclides contained in fuel cycle wastes has been suggested as a means of reducing the long-term toxicity of the wastes. A comprehensive program to evaluate the feasibility and incentives for recovering the actinides from wastes (partitioning) and transmuting them to short-lived or stable nuclides has been in progress for 3 years under the direction of Oak Ridge National Laboratory (ORNL). This report constitutes the final assessment of transmutation in support of this program. Included are (1) a summary of recent transmutation literature, (2) a generic evaluation of actinide transmutation in thermal, fast, and other transmutation devices, (3) a preliminary evaluation of ^{99}Tc and ^{129}I transmutation, and (4) a characterization of a pressurized-water-reactor fuel cycle with and without provisions for actinide recovery and transmutation for use in other parts of the ORNL program. The principal conclusion of the report is that actinide transmutation is feasible in both thermal and fast reactors, subject to demonstrating satisfactory fuel performance, with relatively little impact on the reactor. It would also appear that additional transmutation studies are unwarranted until a firm decision to proceed with actinide transmutation has been made by the responsible authorities.

913 (ORNL/TM--7065) REMOVAL OF HAZARDOUS RADIONUCLIDES FROM URANIUM ORE AND/OR MILL TAILINGS. PROGRESS REPORT, OCTOBER 1, 1978-SEPTEMBER 30, 1979. Scheitlin, F.M.; Bond, W.D. (Oak Ridge National Lab., TN (USA)). Jan 1980. Contract W-7405-ENG-26. 68p. Dep. NTIS, PC A04/MF A01.

The leaching of uranium ore and mill tailings to remove radium was studied. A few scouting tests were performed to obtain data on the recovery of radium, thorium, and uranium from leach liquors and on the recycle of leaching agents. Nitric acid, hydrochloric acid, ethylenediaminetetraacetic acid (EDTA), and diethylenetriaminepentaacetic acid (DTPA) were evaluated as leachants using one sample of a western US ore and two samples of tailings obtained from different uranium mills that employ the sulfuric acid leach process. Leached solids with radium contents approaching 10 pCi/g (98% radium removal) were obtained after six stages of batch, crosscurrent leaching with 3 M HNO_3 at 33% concentration of solids and a temperature of 60°C. On the basis of two-stage tests on mill tailings, 0.5 M EDTA solutions at pH values of 8.2 to 11.6 were found to be more effective, while hydrochloric acid in two- or three-stage tests was less effective than nitric acid. Solutions of 0.3 M EDTA and 0.05 M

DTPA were ineffective. No important differences were observed in the leaching behavior of ore and of mill tailings derived from the same ore. The residue remaining after six stages of nitric acid leaching was relatively intractable to radium leaching with water or additional nitric acid leaching. Tests indicated that the recycle of nitric acid is chemically feasible by evaporating the leach liquors to recover unused acid and then thermally decomposing the metal salts to recover consumed acid. Radium recoveries of 99+% by carrying on barium sulfate were shown to be chemically feasible in a series of experiments with leach liquors, but processing applications would probably require methods for barium recycle and barium-radium separation. Recovery of ^{230}Th and uranium from nitrate leach liquors by tri-n-butyl phosphate extraction appears promising in initial tests.

914 (ORNL/TM--7102) SCRUBBING OF IODINE FROM GAS STREAMS WITH MERCURIC NITRATE-CONVERSION OF MERCURIC IODATE PRODUCT TO BARIUM IODATE FOR FIXATION IN CONCRETE. Rogers, G.C.; Moore, J.G.; Morgan, M.T. (Oak Ridge National Lab., TN (USA)). Jun 1980. Contract W-7405-ENG-26. 19p. NTIS, PC A02/MF A01.

A bench-scale model of a mercuric nitrate scrubber for removal of iodine from off-gas streams was constructed and operated in conjunction with a mercuric iodate-to-barium iodate conversion system to determine the feasibility of total recycle of all processing solutions. The two main aspects of the system examined were (1) the extent of contamination of the barium iodate product, and (2) the effect of cross-contamination of various process solutions on the efficiency of the process. The experimental evidence obtained indicates that, with appropriate control, all solutions can be recycled without significant contamination of the product that would be harmful to the host concrete or to the environment. Mercury contamination was found to be less than or equal to 0.5 wt % of the barium iodate product. The most significant effect on system efficiency was determined to be barium hydroxide contamination of the sodium hydroxide solution used to convert mercuric iodate to sodium iodate. A mole ratio of barium hydroxide to sodium hydroxide of about 1:225 caused a decrease in conversion efficiency of about 45%.

915 (ORNL/TM--7130) IN-SITU STABILIZATION OF RADIOACTIVELY CONTAMINATED LOW-LEVEL SOLID WASTES BURIED IN SHALLOW TRENCHES: AN ASSESSMENT. Arora, H.S.; Temura, T.; Boegly, W.J. (Oak Ridge National Lab., TN (USA)). Sep 1980. Contract W-7405-ENG-26. 67p. NTIS, PC A04/MF A01.

The potential effectiveness of materials for in-situ encapsulation of low-level, radioactively contaminated solid waste buried in shallow trenches is enumerated. Cement, clay materials, and miscellaneous sorbents, aqueous and nonaqueous gelling fluids and their combinations are available to solidify contaminated free water in trenches, to fill open voids, and to minimize radionuclide mobility. The success of the grouting technique will depend on the availability of reliable geohydrologic data and laboratory development of a mix with enhanced sorption capacity for dominant radionuclides present in the trenches. A cement-bentonite-based grout mix with low consistency for pumping, several hours controlled rate of hardening, negligible bleeding, and more than 170 kPa (25 psi) compressive strength are a few of the suggested parameters in laboratory mix development. Cost estimates of a cement-bentonite-based grout mix indicate that effective and durable encapsulation can be accomplished at a reasonable cost (about $113 per cubic meter). However, extensive implementation of the method suggests the need for a field demonstration of the method. 53 references.

916 (ORNL/TM--7371) HIGH-LEVEL WASTE PROGRAM PROGRESS REPORT, JANUARY 1, 1980-MARCH 31, 1980. (Oak Ridge National Lab., TN (USA)). May 1980. Contract W-7405-ENG-26. 31p. NTIS, PC A03/MF A01.

FUETAP concretes cured at 100°C and 0.1 or 0.6 MPa had essentially the same physical properties as those cured at higher temperatures and pressures. Standard specimens containing high concentrations of ^{244}Cm showed little gasification after 1 month. The large (23-cm ID) spray calciner has been completed and is operating satisfactorily. Construction was completed on a sphere-forming system capable of producing 100-g batches of Synroc spheres by internal gelation, and several runs were made. Preparations for the compatibilty tests are underway. (DLC)

917 (ORNL/TM--7427) STATE-OF-THE-ART REPORT ON LOW-LEVEL RADIOACTIVE WASTE TREATMENT. Kibbey, A.H.; Godbee, H.W. (Oak Ridge National Lab., TN (USA)). Sep 1980. Contract W-7405-ENG-26. 155p. NTIS, PC A08/MF A01.

An attempt is made to identify the main sources of low-level radioactive wastes that are generated in the United States. To place the waste problem in perspective, rough estimates are given of the annual amounts of each generic type of waste that is generated. Most of the wet solid wastes arise from the cleanup of gaseous and liquid radioactive streams prior to discharge or recycle. The treatment of the process streams and the secondary wet solid wastes thus generated is described for each type of government or fuel cycle installation. Similarly, the institutional wet wastes are also described. The dry wastes from all sources have smilar physical and chemical characteristics in that they can be classified as compactible, noncompactible, combustible, noncombustible, or combinations thereof. The various treatment options for concentrated or solid wet wastes and for dry wastes are discussed. Among the dry-waste treatment methods are compaction, baling, and incineration, as well as chopping, cutting, and shredding. Organic materials can usually be incinerated or, in some cases, biodegraded. The filter sludges, spent resins, incinerator ashes, and concentrated liquids are usually solidified in cement, urea-formaldehyde, or unsaturated polyester resins prior to burial. Asphalt has not yet been used as a solidificaton agent in the United States, but it probably will be used in the near future. The treatment of radioactive medical and bioresearch wastes is described, but the waste from radiochenmical, pharmaceutical, and other industries is not well defined at the present time. Recovery of waste metals and treatment of hazardous contaminated wastes are discussed briefly. Some areas appearing to need more research, development, and demonstration are specifically pointed out.

918 (ORNL/TM--7476) HIGH-LEVEL WASTE PROGRAM PROGRESS REPORT, APRIL 1, 1980-JUNE 30, 1980. (Oak Ridge National Lab., TN (USA)). Aug 1980. Contract W-7405-ENG-26. 26p. NTIS, PC A03/MF A01.

The highlights of this report are on: waste management analysis for nuclear fuel cycles; fixation of waste in concrete; study of ceramic

and cermet waste forms; alternative high-level waste forms development; and high-level waste container development.

919 (ORO--777) DESCRIPTION OF THE FORMERLY UTILIZED SITES REMEDIAL ACTION PROGRAM. (Department of Energy, Oak Ridge, TN (USA). Oak Ridge Operations Office). Sep 1980. 85p. NTIS, PC A05/MF A01.

The background and the results to date of the Department of Energy program to identify and evaluate the radiological conditions at sites formerly utilized by the Corps of Engineers' Manhattan Engineer District (MED) and the US Atomic Energy Commission (AEC) are summarized. The sites of concern were federally, privately, and institutionally owned and were used primarily for research, processing, and storage of uranium and thorium ores, concentrates, or residues. Some sites were subsequently released for other purposes without radiological restriction. Surveys have been conducted since 1974 to document radiological conditions at such sites. Based on radiological surveys, sites are identified in this document that require, or are projected to require, remedial action to remove potential restrictions on the use of the property due to the presence of residual low-level radioactive contamination. Specific recommendations for each site will result from more detailed environmental and engineering surveys to be conducted at those sites and, if necessary, an environmental impact assessment or environmental impact statement will be prepared. Section 3.0 describes the current standards and guidelines now being used to conduct remedial actions. Current authority of the US Department of Energy (DOE) to proceed with remedial actions and the new authority required are summarized. A plan to implement the Formerly Utilized Sites Remedial Action Program (FUSRAP) in accordance with the new authority is presented, including the objectives, scope, general approach, and a summary schedule. Key issues affecting schedule and cost are discussed.

920 (PB--80-122740) ABSORPTION OF RADIUM AND THORIUM FROM WYOMING AND UTAH URANIUM MILL TAILINGS SOLUTIONS. REPORT OF INVESTIGATIONS. Beard, H.R.; Nichols, I.L.; Seidel, D.C. (Bureau of Mines, Salt Lake City, UT (USA). Salt Lake City Metallurgy Research Center). 1979. 21p. NTIS, PC A02/MF A01.

The Federal Bureau of Mines investigated the absorption of radium and thorium from waste uranium leach liquor by clays and other materials. This work was conducted in support of the Bureau's goal of minimizing the environmental conflicts, impacts, and occupational hazards associated with mining and mineral processing operations. Tailings and soil samples from Wyoming and Utah were contacted with tailings liquors to determine the degree of absorption. Absorption ranged from 0 to 99 percent for radium and from 0 to 31 percent for thorium. Some samples, which readily absorbed radium, were contacted with various salt solutions that could be present in tailings solutions to determine their effectiveness as desorbents. The desorption of radium ranged from 0.06 to 100 percent. An alpha-spectrometric method was used to determine the radium and thorium concentrations in the solutions and the solids.

921 (PB--290865) CLEANING UP COMMINGLED URANIUM MILL TAILINGS: IS FEDERAL ASSISTANCE NECESSARY. (General Accounting Office, Washington, DC (USA). Energy and Minerals Div.). 5 Feb 1979. 30p. NTIS, PC A03/MF A01.

Commingled uranium mill tailings are the sand-like radioactive wastes produced as a result of the processing of uranium for both Government and commercial purposes. This report primarily addresses the need for the Federal Government to assist active uranium mill owners in cleaning up commingled uranium mill tailings.

922 (PB--296947) A STUDY OF REVERSE OSMOSIS APPLICABILITY TO LIGHT WATER REACTOR RADWASTE PROCESSING. TECHNICAL REPORT. Markind, J.; Van Tran, T. (Oregon Univ., Portland (USA)). Apr 1979. 147p. NTIS, PC A07/MF A01.

The use of membrane technology has demonstrated significant process potential in nuclear radioactive waste applications. Reverse osmosis and ultrafiltration can provide filtration capability without the need of filter aids, minimize the requirements of chemical regeneration and/or disposal of expensive resins and can preconcentrate wastes without requiring major process equipment with large auxiliary heat supplies. Because of these capabilities, a study was undertaken to review, evaluate and document the existing experience, both nuclear and appropriate non-nuclear, of the membrane industry as it applies to the processing of reactor radwaste by membrane technology and, in particular, reverse osmosis and ultrafiltration. Relevant information was collected from both the literature and extensive communications with users and suppliers of membrane equipment. The systems reviewed ranged from experimental laboratory units to full scale process units.

923 (PB--295214) A SURVEY OF THE AVAILABLE METHODS OF SOLIDIFICATION FOR RADIOACTIVE WASTES. Holcomb, W.F. (Office of Radiation Programs, Washington, DC (USA). Technology Assessment Div.). Nov 1978. 99p. NTIS PC A05/MF A01.

This report reviews the numerous solidification techniques and related matrix materials that are presently being offered or proposed for incorporating the radionuclides into an immobile materials. Both high- and low-level waste solidification processes are covered. Key features of the equipment used in individual solidification processes are described. At present the high-level waste solidification methods are being developed by the Government, while the low-level waste solidification methods are being developed commercially.

924 (PB--296164) AVAILABLE METHODS OF SOLIDIFICATION FOR LOW-LEVEL RADIOACTIVE WASTES IN THE UNITED STATES. TECHNICAL NOTE. Holcomb, W.F.; Goldberg, S.M. (Office of Radiation Programs, Washington, DC (USA). Technology Assessment Div.). Dec 1976. 49p. NTIS PC A03/MF A01.

This paper reviews the numerous solidification systems and related matrix materials that are presently being offered, or proposed, to the commercial nuclear power industry. Included, where possible, is the nature of how these materials and/or systems are affected by the physical, chemical, and radiolytic characteristics of the treated radioactive waste materials. Key features of the equipment used in individual solidification processes are discussed in order to clarify the relative utility of these processes for either power plant or fuel cycle application.

925 (PB--296642) IMMOBILIZATION OF HAZARDOUS RESIDUALS BY ENCAPSULATION. FINAL TECHNICAL REPORT. Subramanian, R.V.; Mahalingam, R. (Washington State Univ., Pullman (USA)). Feb 1979. 212p. NTIS, PC A10/MF A01.

Laboratory and pilot plant studies are reported which demonstrate the feasibility of encapsulating hazardous aqueous wastes in a water-extensible polyester matrix for land burial. Laboratory experiments were conducted to determine the leachability of encapsulated wastes. Results indicate that the polyester matrix can be used safely to immobilize low-level radioactive wastes. In addition, acceptable low levels of leachabilities can be achieved for solid wastes incorporated in the matrix. A polyester matrix is much more efficient than cement or urea-formaldehyde polymers in containing wastes. A pilot plant was conducted to handle 15 gal/hr liquid waste. Polymerization was readily controllable, and process upsets were easily handled. An economic evaluation of the polyester process shows it to be two-and-one-half times more expensive than its nearest competitor, the cement silicate process, the major cost item being the polyester resin. It is anticipated that the polyester process will become a viable, if not the sole, process for immobilizing dangerous wastes for underground disposal.

926 (PB--296947, pp 196-202) ACTIVITY MEASUREMENTS AT A WASTE VOLUME REDUCTION FACILITY. Richardson, J.; Lee, D.A. (Ontario Hydro, Tiverton, Canada). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

The monitoring program for Ontario Hydro's radioactive waste management site will be described, several aspects of which will be discussed in detail. The program at this facility includes categorization, volume reduction processing, and storage of solid radioactive wastes from nuclear generating stations of the CANDU type. At the present time, two types of volume reduction process are in operation - incineration and compaction. Following categorization and processing, wastes are stored in in-ground concrete trenches or tile-holes, or in above-ground quadricells. The monitoring program is divided into three areas: public safety, worker safety, and structural integrity. Development projects with respect to the monitoring program have been undertaken to achieve activity accounting for the total waste management program. In particular, a field measurement for the radioactivity content of radioactive ash containers and compacted waste drums.

927 (PB--296947, pp 74-81) RADIOACTIVE SLUDGE TREATMENT BY THE CENTRIFUGAL DEHYDRATION METHOD. Hwang, S.L.; Tsai, C.M. (Inst. of Nuclear Energy Research, Lun-Tan, Taiwan). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

The radioactive sludge produced after chemical treatment of radioactive liquid waste usually contains 0.3 to 3% of solid by weight. The gross β activity of sludge produced at the Institute of Nuclear Energy Research (INER) varies 10^{-4} to 10^{-3} μCi/g, and the use of centrifugal method for dehydration is justified. The effluent from the decanter goes through the precipitation and concentration stage and then the supernatant is pumped so that a stable concentration of liquid waste can be maintained during separation stage. The decanter used at INER for treating low level radioactive waste is a Westfalia SD8230 decanter which is of solid-bowl type. The liquid waste from a 40MW(th) Taiwan Research Reactor (TRR) and its associated hot laboratories is described in this report. The treatment capacity is about $2 m^3/h$ and the characteristics of the separator and the associated systems are discussed. As a result of improvement the solid in concentrated sludge is about 20% by weight, and the production rate is about 240 to 250 kg/h. Furthermore, no water is added to the concentrated sludge. The solidification can be done in a closed type sludge-cement premixing system, and the homogeneous concrete can be obtained.

928 (PB--296947, pp 82-90) REDUCTION IN WASTE HANDLING AND TRANSPORTATION. Stewart, J.E. (Werner and Pfleiderer Corp., Waldwick, NJ). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

The radioactive waste process of volume reduction and solidification is discussed. The following topics are covered: operator exposure reduction, equipment separation; operating reliability; component design; less end product; system design philosophy; process upset; end product benefits, processing and transportation safety; net result at burial site; and the human factor. (DC)

929 (PB--296947, pp 91-100) SOLIDIFICATION OF LOW-LEVEL RADIOACTIVE LIQUID WASTE USING A CEMENT-SILICATE PROCESS. Grandlund, R.W. (Pennsylvania State Univ., University Park); Hayes, J.F. May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

Extensive use has been made of silicate and Portland cement for the solidification of industrial waste and recently this method has been successfully used to solidify a variety of low level radioactive wastes. The types of wastes processed to date include fuel fabrication sludges, power reactor waste, decontamination solution, and university laboratory waste. The cement-silicate process produces a stable solid with a minimal increase in volume and the chemicals are relatively inexpensive and readily available. The method is adaptable to either batch or continuous processing and the equipment is simple. The solid has leaching characteristics similar to or better than plain Portland cement mixtures and the leaching can be further reduced by the use of ion-exchange additives. The cement-silicate process has been used to solidify waste containing high levels of boric acid, oils, and organic solvents. The experience of handling the various types of liquid waste with a cement-silicate system is described.

930 (PNL--2622) ASSESSMENT OF WATER/GLASS INTERACTIONS IN WASTE GLASS MELTER OPERATION. Postma, A.K.; Chapman, C.C.; Buelt, J.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Apr 1980. Contract AC06-76RL01830. 88p. NTIS, PC A05/MF A01.

A study was made to assess the possibility of a vapor explosion in a liquid-fed glass melter and during off-standard conditions for other vitrification processes. The glass melter considered is one designed for the vitrification of high-level nuclear wastes and is comprised of a ceramic-lined cavity with electrodes for joule heating and processing equipment required to add feed and withdraw

glass. Vapor explosions needed to be considered because experience in other industrial processes has shown that violent interactions can occur if a hot liquid is mixed with a cooler, vaporizable liquid. Available experimental evidence and theoretical analyses indicate that destructive glass/water interactions are low probability events, if they are possible at all. Under standard conditions, aspects of liquid-fed melter operation which work against explosive interactions include: (1) the aqueous feed is near its boiling point; (2) the feed contains high concentrations of suspended particles; (3) molten glass has high viscosity (greater than 20 poise); and (4) the glass solidifies before film boiling can collapse. While it was concluded that vapor explosions are not expected in a liquid-fed melter, available information does not allow them to be ruled out altogether. Several precautionary measures which are easily incorporated into melter operation procedures were identified and additional experiments were recommended.

931 (PNL--2668-3) MULTIBARRIER WASTE FORMS. PART III: PROCESS CONSIDERATIONS. Lokken, R.O. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Oct 1979. Contract EY-76-C-06-1830. 32p. Dep. NTIS, PC A03/MF A01.

The multibarrier concept for the solidification and storage of radioactive waste utilizes up to three barriers to isolate radionuclides from the environment: a solidified waste inner core, an impervious coating, and a metal matrix. The coating and metal matrix give the composite waste form enhanced inertness with improvements in thermal stability, mechanical strength, and leach resistance. Preliminary process flow rates and material costs were evaluated for four multibarrier waste forms with the process complexity increasing thusly: glass marbles, uncoated supercalcine, glass-coated supercalcine, and PyC/Al_2O_3-coated supercalcine. This report discusses the process variables and their effect on optimization of product quality, processing simplicity, and material cost. 11 figures, 2 tables. (DLC)

932 (PNL--2786) PROCESSING OF WASTE SOLUTIONS FROM ELECTROCHEMICAL DECONTAMINATION. Charlot, L.A.; Allen, R.P.; Arrowsmith, H.W.; Hooper, J.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Sep 1979. Contract EY-76-C-06-1830. 52p. Dep. NTIS, PC A04/MF A01.

The use of electropolishing as a decontamination technique will be effective only if we can minimize the amount of secondary waste requiring disposal and economically recycle part of the decontamination electrolyte. Consequently, a solution purification method is needed to remove the dissolved contamination and metal in the electrolyte. This report describes the selection of a purification method for a phosphoric acid electrolyte from the following possible acid reclamation processes: ion exchange, solvent extraction, precipitation, distillation, electrolysis, and membrane separation.

933 (PNL--2904) VITRIFICATION OF HANFORD WASTES IN A JOULE-HEATED CERAMIC MELTER AND EVALUATION OF RESULTANT CANISTERIZED PRODUCT. Chapman, C.C.; Buelt, J.L.; Slate, S.C.; Katayama, Y.B.; Bunnell, L.R. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Aug 1979. Contract EY-76-C-06-1830. 74p. Dep. NTIS, PC A04/MF A01.

Experience gained in the week-long vitrification test and characterization of the glass produced in the run support the following conclusions: The Hanford waste simulated in this test can be readily vitrified in a joule-heated ceramic melter. Physical properties of the molten glass were entirely compatible with melter operation. The average feed rate of 106 kg/h is high enough to make the ceramic melter a feasible piece of equipment for vitrifying Hanford wastes. The glass produced in this trial had good chemical durability, $6(10)^{-5}$ g/cm^2-d. When one of the canisters was purposely dropped onto a steel pad, the damage was limited to deformation of the steel can in the impact area, cracking of a weld, and fracturing of glass in the immediate vicinity of the impact area. No glass was released from the canister as a result of the drop test. The results of this vitrification test support the technical feasibility of vitrifying Hanford wastes by means of a joule-heated ceramic melter. Surface area for large glass castings is equivalent to the mass median particle diameters between 4.27 cm (1.75 in.) and 8.91 cm (3.51 in.) even when allowed to cool rapidly by standing in ambient air. Large canisters (up to 0.91 m in dia) can be cast without large voids while standing in air if the fill rate is over 100 kg/h. 34 figures, 10 tables.

934 (PNL--2925) IN-CAN MELTING PROCESS AND EQUIPMENT DEVELOPMENT FROM 1974 TO 1978. Blair, H.T. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Aug 1979. Contract EY-76-C-06-1830. 160p. Dep. NTIS, PC A08/MF A01.

Both the defense HLLW stores in tanks presently and the HLLW from proposed reprocessing of commercial LWR fuel can be vitrified as borosilicate glass in containers made of 300-series stainless steel by the ICM (in-can melting) process. Melting rates of 50 kg/h in 12-in.-dia cans and 117 kg/h in 28-in.-dia cans can be achieved in the ICM by using the rising-level charging method and internal heat-transfer plate assemblies in the cans. The ICM process can be monitored and remotely controlled without the aid of instrumentation attached to the waste can. The ICM process is compatible with both heated-wall spray calciners and fluidized-bed calciners. The ICM process causes residual tensile stresses as high as the yield strength in vitrified product containers made of 300-series stainless steel. Spall due to oxidation of the exterior of the can during an ICM process can be prevented by using an inert cover gas, by putting a protective coating on the can surface, or by using an oxidation-resistant alloy. Processing problems are minimized and product quality is improved when the complete can is located inside the furnace chamber by setting it on the hearth. A maximum of 24 kW and an average of 15 kW is required per 15-in.-high furnace zone to melt waste borosilicate glass at a rate of 117 kg/h in a 28-in.-dia ICM.

935 (PNL--2999(Pts.1-4)) RESEARCH AND DEVELOPMENT ACTIVITIES: HIGH-LEVEL WASTE IMMOBILIZATION PROGRAM. QUARTERLY PROGRESS REPORTS, JANUARY-DECEMBER 1978. McElroy, J.L.; Mendel, J.E.; Bonner, W.F.; Henry, M.H. (Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1979. Contract EY-76-C-06-1830. 142p. Dep. NTIS, PC A07/MF A01.

This document contains the four quarterly reports for 1978. Accomplishments of each quarter are described separately. Emphasis is on the glass route of solidification. (DLC)

936 (PNL--3027) DESIGN FEATURES OF THE LABORATORY-SCALE RADIOCHEMICAL IMMOBILIZATION SYSTEM. Hansen, M.S.; Knox, C.A.; Berger, D.N. (Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1980. Contract AC06-76RL01830. 46p. NTIS, PC A03/MF A01.

Under the High-Level Waste Immobilization Program, the Pacific Northwest Laboratory (PNL) is studying various ways to solidify high-level nuclear wastes. A variety of waste forms and processes are being investigated, with the most highly developed process being spray calcination coupled with in-can melting. This report describes a remote laboratory-scale system that was designed for the purpose of investigating the effects of different operating conditions and waste compositions on the product and on the effluents generated. It is termed laboratory-scale because of its nominal 1 L/h feed rate as compared to well over 300 L/h for full-scale equipment at PNL. The equipment currently consists of a feed system, a spray calciner, an in-can melter, and an effluent control system. It is operated in a shielded radiochemical hot cell using radioactive high-level liquid waste (HLLW) to answer questions on the deposition of radiochemicals during actual waste processing. The effluent control system can be modified in order to test different effluent systems, one of which has been proposed by the Savannah River Laboratories (SRL) for use in the Savannah River Plant vitrification system. The laboratory-scale system can also be used to test alternative immobilization processes, since spray calcination is a common processing step in many alternative waste form flowsheets. Thus, only the addition of a specific forming step such as pelletizing or sintering is necessary.

937 (PNL--3050-1) RESEARCH AND DEVELOPMENT ACTIVITIES: HIGH-LEVEL WASTE IMMOBILIZATION PROGRAM. QUARTERLY PROGRESS REPORT, JANUARY-MARCH 1979. McElroy, J.L.; Mendel, J.E.; Bonner, W.F.; Henry, M.H. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Nov 1979. Contract EY-76-C-06-1830. 50p. Dep. NTIS, PC A03/MF A01.

Liquid waste, made from zirconium-clad UO_2 power reactor fuel with an average burnup of 25,000 MWd/MT, was converted to glass by the in-can melting process. An intrinsic-gamma melt-level detection system was tested during the NWVP demonstrations; results showed that if a sufficient number of collimators are used the system will track the melt surface with a precision of 1 in. during the filling of cans with waste glass. The two canisters filled in the NWVP are both 8 in. in diameter and contain borosilicate glass of very similar compositions. One canister contains 116 kg of glass that generated 0.38 kW of self-heat when produced; the other contains 145 kg of glass, and generates 1.01 kW. Spray calcination of simulated Savannah River Plant liquid waste at a rate of 400 L/h was demonstrated in the 36-in.-dia. calciner. Five waste forms are being compared: concrete-containing waste calcine, sintered waste glass, glass-ceramic, Synroc B (a crystalline assemblage of titanates), and borosilicate waste glass (composition 76-68). Results of initial tests indicate that the reaction rate of carbon with water, previously found to be very low, may be increased in a radiation field.

938 (PNL--3050-2) RESEARCH AND DEVELOPMENT ACTIVITIES: HIGH-LEVEL WASTE IMMOBILIZATION PROGRAM. QUARTERLY PROGRESS REPORT, APRIL-JUNE 1979. McElroy, J.L.; Mendel, J.E.; Bonner, W.F.; Henry, M.H. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Dec 1979. Contract EY-76-C-06-1830. 48p. Dep. NTIS, PC A03/MF A01.

Test results are available on 21 out of a total of 65 glass compositions in a generic study of composition effects on waste glass properties such as Soxhlet leach rate, viscosity, electrical conductivity, and volatility. Preliminary results indicate the leaching behavior of a Cermet waste form prepared at ORNL is similar to that of waste glass and supercalcine. Scanning transmission electron microscopy has confirmed that supercalcine contains up to 10 vol% glassy phase and that small fractions of Cs, Sr, and rare earth reside in the glassy phase. Two long-term runs were completed in the ceramic melter coupled directly to the full-scale spray calciner. Two new ceramic melters were put into operation. A preliminary test in the small spray calciner indicates that coal, which is present in some Savannah River Plant wastes, is only partially decomposed during spray calcination. 15 figures, 11 tables.

939 (PNL--3060) DEVELOPMENT AND CHARACTERIZATION OF SOLIDIFIED FORMS FOR HIGH-LEVEL WASTES: 1978. ANNUAL REPORT. Ross, W.A.; Mendel, J.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Dec 1979. Contract EY-76-C-06-1830. 108p. Dep. NTIS, PC A06/MF A01.

Development and characterization of solidified high-level waste forms are directed at determining both process properties and long-term behaviors of various solidified high-level waste forms in aqueous, thermal, and radiation environments. Waste glass properties measured as a function of composition were melt viscosity, melt electrical conductivity, devitrification, and chemical durability. The alkali metals were found to have the greatest effect upon glass properties. Titanium caused a slight decrease in viscosity and a significant increase in chemical durability in acidic solutions (pH-4). Aluminum, nickel and iron were all found to increase the formation of nickel-ferrite spinel crystals in the glass. Four multibarrier advanced waste forms were produced on a one-liter scale with simulated waste and characterized. Glass marbles encapsulated in a vacuum-cast lead alloy provided improved inertness with a minimal increase in technological complexity. Supercalcine spheres exhibited excellent inertness when coated with pyrolytic carbon and alumina and put in a metal matrix, but the processing requirements are quite complex. Tests on simulated and actual high-level waste glasses continue to suggest that thermal devitrification has a relatively small effect upon mechanical and chemical durabilities. Tests on the effects radiation has upon waste forms also continue to show changes to be relatively insignificant. Effects caused by decay of actinides can be estimated to saturate at near 10^{19} alpha-events/cm^3 in homogeneous solids. Actually, in solidified waste forms the effects are usually observed around certain crystals as radiation causes amorphization and swelling of th crystals.

940 (PNL--3094) HIGH-LEVEL WASTE IMMOBILIZATION PROGRAM: AN OVERVIEW. Bonner, W.R. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Sep 1979. Contract EY-76-C-06-1830. 46p. Dep. NTIS, PC A03/MF A01.

The High-Level Waste Immobilization Program is providing technology to allow safe, affordable immobilization and disposal of

nuclear waste. Waste forms and processes are being developed on a schedule consistent with national needs for immobilization of high-level wastes stored at Savannah River, Hanford, Idaho National Engineering Laboratory, and West Valley, New York. This technology is directly applicable to high-level wastes from potential reprocessing of spent nuclear fuel. The program is removing one more obstacle previously seen as a potential restriction on the use and further development of nuclear power, and is thus meeting a critical technological need within the national objective of energy independence.

941 (PNL--3109) SPRAY CALCINATION/IN-CAN MELTING: EFFLUENT CHARACTERIZATION AND TREATMENT. Hanson, M.S. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Mar 1980. Contract EY-76-C-06-1830. 105p. Dep. NTIS, PC A06/MF A01.

According to data obtained during calcination of nonradioactive, simulated waste, ruthenium and cesium losses from the spray calciner are small, on the order of 3.5×10^{-2}% and 3.4×10^{-2}%, respectively. Calciner-melter and filter decontamination factors for ruthenium and cesium averaged 3.6×10^{4} and 3.9×10^{4}, respectively. Particulate decontamination factors of 10^{3} to 10^{4} have been obtained using sintered stainless steel filters. A significant portion of the ruthenium and cesium lost to the process off-gas system was due to particle penetration of the filters. The particles penetrating the filters have a mass distribution centering about a size large enough to control with available technology. Processing wastes containing fluoride will probably volatilize a portion of the fluoride to the off-gas system, thus increasing the probability of corrosion problems. 34 figures, 30 tables.

942 (PNL--3137) NUMERICAL MODELING OF LIQUID FEEDING IN THE LIQUID-FED CERAMIC MELTER. Hjelm, R.L.; Donovan, T.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Oct 1979. Contract EY-76-C-06-1830. 28p. Dep. NTIS, PC A03/MF A01.

A modeling scheme developed by the Pacific Northwest Laboratory numerically simulates the behavior of the Liquid-Fed Ceramic Melter (LFCM) during liquid feeding. The computer code VECTRA (Vorticity Energy Code for TRansport Analysis) was used to simulate the LFCM in the idling and liquid feeding modes. Results for each simulation include molten glass temperature profiles and isotherm contour plots, stream function contour plots, heat generation rate contour plots, refractory isotherms, and heat balances. The results indicated that the model showed no major deviations from real LFCM behavior and that high throughput should be attainable. They also indicated that reboil was a possibility as a steady liquid feeding state was approached, very steep temperature gradients exist in the Monofrax K-3, and that phase separation could occur in the bottom corners during liquid feeding and over the entire floor while idling.

943 (PNL--3145) VITRIFICATION OF RADIOACTIVE HIGH-LEVEL WASTE BY SPRAY CALCINATION AND IN-CAN MELTING. Hanson, M.S.; Bjorklund, W.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jul 1980. Contract AC06-76RL01830. 87p. NTIS, PC A05/MF A01.

After several nonradioactive test runs, radioactive waste from the processing of 1.5 t of spent, light-water-reactor fuel was successfully concentrated, dried and converted to a vitreous product. A total of 97 L of waste glass (in two stainless steel canisters) was produced. The spray calcination process coupled to the in-can melting process, as developed at Pacific Northwest Laboratory, was used to vitrify the waste. An effluent system consisting of a variety of condensation of scrubbing steps more than adequately decontaminated the process off gas before it was released to the atmosphere.

944 (PNL--3181) CHARACTERIZATION OF GASEOUS AND PARTICULATE EFFLUENTS FROM THE NUCLEAR VITRIFICATION PROJECT. Goles, R.W.; Hamilton, D.C.; Brauer, F.P.; Rieck, H.G. Jr.; Robertson, D.M.; Gordon, R.L.; Kaye, J.H. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Oct 1979. Contract EY-76-C-06-1830. 39p. Dep. NTIS, PC A03/MF A01.

Samples were taken during the second high-level liquid waste vitrification campaign associated with the NWVP. Sample analysis established the following total average emission levels in the undiluted vitrification off-gas stream: ^{3}H - 1.2 $\mu Ci/m^3$, ^{14}C - 0.2 $\mu Ci/m^3$, ^{129}I - 1 nCi/m^3, NO/sub x/ - 0.5%, ^{99}Tc - 1.6 pCi/m^3, and γ-emitters - $10^{5}(\gamma/s)/m^3$. The aerosol size distribution is composed almost entirely of particles exhibiting smaller diameters than the minimum value for which absolute filters are rated, with an empirical geometric mean diameter of 0.13 μm and a particle mass concentration of 84.7 pg/cm^3. The particulate matter was composed of ^{106}Ru, ^{125}Sb, /sup 125m/Te, ^{134}Cs, ^{137}Cs, ^{144}Ce, ^{154} ^{155}Eu and ^{241}Am. The particulate emission levels in the undiluted process off-gas stream were: ^{106}Ru - 44 nCi/m^3, ^{125}Sb - 0.52 nCi/m^3, /sup 125m/Te - 1.7 nCi/m^3, ^{134}Cs - 7.8 nCi/m^3, ^{137}Cs - 52 nCi/m^3, ^{144}Ce - 0.8 $\mu Ci/m^3$, ^{154}Eu - 0.3 nCi/m^3, ^{155}Eu - 0.18 nCi/m^3, and ^{241}Am - 0.19 nCi/m^3. All these environmental gaseous and airborne emissions level liquid waste were well within PNL waste management guidelines.

945 (PNL--3186) TECHNICAL REQUIREMENTS FOR THE CONTROL OF ^{129}I IN A NUCLEAR FUELS REPROCESSING PLANT. Burger, L.L.; Burns, R.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Nov 1979. Contract EY-76-C-06-1830. 34p. Dep. NTIS, PC A03/MF A01.

A proposed regulation would limit the release of ^{129}I to the environment to 0.005 Ci/GWe-yr of nuclear power produced. This corresponds to an overall ^{129}I retention factor of about 250 for the LWR fuel cycle. Technologies available and under development for removing iodine from off-gas and waste water streams in an LWR nuclear fuel reprocessing plant and for converting iodine to stable forms and retaining it for interim and long-term storage, transportation and isolation are discussed. Possible developments are reviewed. Technologies available for retaining iodine from off-gas and excess water streams appear adequate, when properly combined, to meet the proposed regulation in an LWR fuel reprocessing plant, though additional work on solid sorbents is needed. Demonstrations under plant conditions are needed to define and resolve problems not met in laboratory experiments and to define practical operating conditions. Criteria for storage and disposal forms for retained iodine are needed to guide effective development of such forms. Because no disposal form for ^{129}I is likely to survive in any environment for even one half-life (1.6×10^{7} yr), work on a disposal form should seek forms that disintegrate as slowly as possible to maximize dilution before the isotope reaches the biosphere.

946 (PNL--3244) PRELIMINARY EVALUATION OF ALTERNATIVE WASTE FORM SOLIDIFICATION PROCESSES. VOLUME I. IDENTIFICATION OF THE PROCESSES. Treat, R.L.; Nesbitt, J.F.; Blair, H.T.; Carter, J.G.; Gorton, P.S.; Partain, W.L.; Timmerman, C.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Apr 1980. Contract AC06-76RL01830. 535p. NTIS, PC A23/MF A01.

This document contains preconceptual design data on 11 processes for the solidification and isolation of nuclear high-level liquid wastes (HLLW). The processes are: in-can glass melting (ICGM) process, joule-heated glass melting (JHGM) process, glass-ceramic (GC) process, marbles-in-lead (MIL) matrix process, supercalcine pellets-in-metal (SCPIM) matrix process, pyrolytic-carbon coated pellets-in-metal (PCCPIM) matrix process, supercalcine hot-isostatic-pressing (SCHIP) process, SYNROC hot-isostatic-pressing (SYNROC HIP) process, titanate process, concrete process, and cermet process. For the purposes of this study, it was assumed that each of the solidification processes is capable of handling similar amounts of HLLW generated in a production-sized fuel reprocessing plant. It was also assumed that each of the processes would be enclosed in a shielded canyon or cells within a waste facility located at the fuel reprocessing plant. Finally, it was assumed that all of the processes would be subject to the same set of regulations, codes and standards. Each of the solidification processes converts waste into forms that may be acceptable for geological disposal. Each process begins with the receipt of HLLW from the fuel reprocessing plant. In this study, it was assumed that the original composition of the HLLW would be the same for each process. The process ends when the different waste forms are enclosed in canisters or containers that are acceptable for interim storage. Overviews of each of the 11 processes and the bases used for their identification are presented in the first part of this report. Each process, including its equipment and its requirements, is covered in more detail in Appendices A through K. Pertinent information on the current state of the art and the research and development required for the implementation of each process are also noted in the appendices.

947 (PNL--3290) ASPHALT EMULSION SEALING OF URANIUM MILL TAILINGS. 1979 ANNUAL REPORT. Hartley, J.N.; Koehmstedt, P.L.; Esterl, D.J.; Freeman, H.D. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jun 1980. Contract AC06-76RL01830. 86p. NTIS, PC A05/MF A01.

Uranium mill tailings are a source of low-level radiation and radioactive materials that may be released into the environment. Stabilization or disposal of these tailings in a safe and environmentally sound way is necessary to minimize radon exhalation and other radioactive releases. One of the most promising concepts for stabilizing uranium tailings is being investigated at the Pacific Northwest Laboratory: the use of asphalt emulsion to contain radon and other potentially hazardous materials in uranium tailings. Results of these studies indicate that radon flux from uranium tailings can be reduced by greater than 99% by covering the tailings with an asphalt emulsion that is poured on or sprayed on (3.0 to 7.0 mm thick), or mixed with some of the tailings and compacted to form an admixture seal (2.5 to 15.2 cm) containing 18 wt % residual asphalt.

948 (PNL--3343) HIGH-TEMPERATURE VITRIFICATION OF HANFORD RESIDUAL-LIQUID WASTE IN A CONTINUOUS MELTER. Barnes, S.M. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Apr 1980. Contract AC06-76RL01830. 39p. NTIS, PC A03/MF A01.

Over 270 kg of high-temperature borosilicate glass have been produced in a series of three short-term tests in the High-Temperature Ceramic Melter vitrification system at PNL. The glass produced was formulated to vitrify simulated Hanford residual-liquid waste. The tests were designed to (1) demonstrate the feasibility of utilizing high-temperature, continuous-vitrification technology for the immobilization of the residual-liquid waste, (2) test the airlift draining technique utilized by the high-temperature melter, (3) compare glass produced in this process to residual-liquid glass produced under laboratory conditions, (4) investigate cesium volatility from the melter during waste processing, and (5) determine the maximum residual-liquid glass production rate in the high-temperature melter. The three tests with the residual-liquid composition confirmed the viability of the continuous-melting vitrification technique for the immobilization of this waste. The airlift draining technique was demonstrated in these tests and the glass produced from the melter was shown to be less porous than the laboratory-produced glass. The final glass produced from the second test was compared to a glass of the same composition produced under laboratory conditions. The comparative tests found the glasses to be indistinguishable, as the small differences in the test results fell within the precision range of the characterization testing equipment. The cesium volatility was examined in the final test. This examination showed that 0.44 wt % of the cesium (assumed to be cesium oxide) was volatilized, which translates to a volatilization rate of 115 mg/cm^2-h.

949 (PNL--3375) ENGINEERING-SCALE VITRIFICATION OF COMMERCIAL HIGH-LEVEL WASTE. Bonner, W.F.; Bjorklund, W.J.; Hanson, M.S.; Knowlton, D.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Apr 1980. Contract AC06-76RL01830. 40p. NTIS, PC A03/MF A01.

To date, technology for immobilizing commercial high-level waste (HLW) has been extensively developed, and two major demonstration projects have been completed, the Waste Solidification Engineering Prototypes (WSEP) Program and the Nuclear Waste Vitrification Project (NWVP). The feasibility of radioactive waste solidification was demonstrated in the WSEP program between 1966 and 1970 (McElroy et al. 1972) using simulated power-reactor waste composed of nonradioactive chemicals and HLW from spent, Hanford reactor fuel. Thirty-three engineering-scale canisters of solidified HLW were produced during the operations. In early 79, the NWVP demonstrated the vitrification of HLW from the processing of actual commercial nuclear fuel. This program consisted of two parts, (1) waste preparation and (2) vitrification by spray calcination and in-can melting. This report presents results from the NWVP.

950 (PNL--3405) IN-CAN MELTING DEMONSTRATION OF WASTES FROM THE IDAHO CHEMICAL PROCESSING PLANT. Bjorklund, W.J.; Chick, L.A.; Hollis, H.H.; Mellinger, G.B.; Nelson, T.A.; Petkus, L.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jul 1980. Contract AC06-76RL01830. 58p. NTIS, PC A04/MF A01.

The immobilization of Idaho Chemical Processing Plant (ICPP) zirconia calcine using Idaho glass composition (ICPP-127) was evaluated at Pacific Northwest Laboratory (PNL) in two engineering-scale in-can melter tests. The glass was initially characterized in the laboratory to verify processing parameters. Glass was then produced in a pilot-scale melter and then in a full-scale melter to evaluate the processing and the resultant product. Potential corrosion problems were identified with the glass and some processing problems were encountered, but neither is insurmountable. The product is a durable leach-resistant glass. The glass appears to be nonhomogeneous, but chemically it is quite uniform.

951 (PNL--3406) INVESTIGATION OF CORROSION EXPERIENCED IN A SPRAY CALCINER/CERAMIC MELTER VITRIFICATION SYSTEM. Dierks, R.D.; Mellinger, G.B.; Miller, F.A.; Nelson, T.A.; Bjorklund, W.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Aug 1980. Contract AC06-76RL01830. 173p. NTIS, PC A08/MF A01.

After periodic testing of a large-scale spray calciner/ceramic melter vitrification system over a 2-yr period, sufficient corrosion was noted on various parts of the vitrification system to warrant its disassembly and inspection. A majority of the 316 SS sintered metal filters on the spray calciner were damaged by chemical corrosion and/or high temperature oxidation. Inconel-601 portions of the melter lid were attacked by chlorides and sulfates which volatilized from the molten glass. The refractory blocks, making up the walls of the melter, were attacked by the waste glass. This attack was occurring when operating temperatures were >1200°C. The melter floor was protected by a sludge layer and showed no corrosion. Corrosion to the Inconel-690 electrodes was minimal, and no corrosion was noted in the offgas treatment system downstream of the sintered metal filters. It is believed that most of the melter corrosion occurred during one specific operating period when the melter was operated at high temperatures in an attempt to overcome glass foaming behavior. These high temperatures resulted in a significant release of volatile elements from the molten glass, and also created a situation where the glass was very fluid and convective, which increased the corrosion rate of the refractories. Specific corrosion to the calciner components cannot be proven to have occurred during a specific time period, but the mechanisms of attack were all accelerated under the high-temperature conditions that were experienced with the melter. A review of the materials of construction has been made, and it is concluded that with controlled operating conditions and better protection of some materials of construction corrosion of these systems will not cause problems. Other melter systems operating under similar strenuous conditions have shown a service life of 3 yr.

952 (PNL--3477) PRELIMINARY EVALUATION OF ALTERNATIVE WASTE FORM SOLIDIFICATION PROCESSES. VOLUME II. EVALUATION OF THE PROCESSES. (Johnson (E.R.) Associates, Inc., Reston, VA (USA)). Aug 1980. Contract AC06-76RL01830. 222p. NTIS, PC A10/MF A01.

This Volume II presents engineering feasibility evaluations of the eleven processes for solidification of nuclear high-level liquid wastes (HHLW) described in Volume I of this report. Each evaluation was based in a systematic assessment of the process in respect to six principal evaluation criteria: complexity of process; state of development; safety; process requirements; development work required; and facility requirements. The principal criteria were further subdivided into a total of 22 subcriteria, each of which was assigned a weight. Each process was then assigned a figure of merit, on a scale of 1 to 10, for each of the subcriteria. A total rating was obtained for each process by summing the products of the subcriteria ratings and the subcriteria weights. The evaluations were based on the process descriptions presented in Volume I of this report, supplemented by information obtained from the literature, including publications by the originators of the various processes. Waste form properties were, in general, not evaluated. This document describes the approach which was taken, the developent and application of the rating criteria and subcriteria, and the evaluation results. A series of appendices set forth summary descriptions of the processes and the ratings, together with the complete numerical ratings assigned; two appendices present further technical details on the rating process.

953 (PNL--3493) SAFETY ASSESSMENT OF THE LIQUID-FED CERAMIC MELTER PROCESS. Buelt, J.L.; Partain, W.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Aug 1980. Contract AC06-76RL01830. 113p. NTIS, PC A06/MF A01.

As part of its development program for the solidification of high-level nuclear waste, Pacific Northwest Laboratory assessed the safety issues for a complete liquid-fed ceramic melter (LFCM) process. The LFCM process, an adaption of commercial glass-making technology, is being developed to convert high-level liquid waste from the nuclear fuel cycle into glass. This safety assessment uncovered no unresolved or significant safety problems with the LFCM process. Although in this assessment the LFCM process was not directly compared with other solidification processes, the safety hazards of the LFCM process are comparable to those of other processes. The high processing temperatures of the glass in the LFCM pose no additional significant safety concerns, and the dispersible inventory of dried waste (calcine) is small. This safety assessment was based on the nuclear power waste flowsheet, since power waste is more radioactive than defense waste at the time of solidification, and all accident conditions for the power waste would have greater radiological consequences than those for defense waste. An exhaustive list of possible off-standard conditions and equipment failures was compiled. These accidents were then classified according to severity of consequence and type of accident. Radionuclide releases to the stack were calculated for each group of accidents using conservative assumptions regarding the retention and decontamination features of the process and facility. Two recommendations that should be considered by process designers are given in the safety assessment.

954 (PNL-SA--6768) FULL-SCALE IN-CAN MELTER DEMONSTRATION FOR VITRIFICATION OF NUCLEAR WASTE. Blair, H.T. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jan 1979. Contract EY-76-C-06-1830. 19p. (CONF-780622--82). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

A full-scale, nonradioactive in-can melter was made operational in April of 1977 at Pacific Northwest Laboratory (PNL). The furnace's six independently controlled hot zones are capable of providing 30 kW each at 1200°C and are able to accommodate canisters up

to 28 in. in dia and 7.5 ft tall. Several new system concepts were demonstrated with this equipment. These included supporting the canister from the bottom, placing the entire can within the furnace, and charging the melter through a water-cooled spout. These new concepts allowed one to eliminate accumulations both of batch over the top of the heat transfer plates and of unvitrified waste in the top of the can by using a test batch of simulated acid waste composition combined with borosilicate glass former; one was able to attain a melting rate of 117 kg/h in a 28-in.-dia canister. A 10-day continuous run was also made in conjunction with a heated wall spray calciner to demonstrate equipment reliability and operability. In addition, the operation of the in-can melting process was demonstrated using only remote monitoing equipment outside of the canister.

955 (PNL-SA--7292) DEVELOPMENT OF MULTIBARRIER NUCLEAR WASTE FORMS. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Mar 1979. Contract EY-76-C-06-1830. 14p. Dep. NTIS, PC A02/MF A01.

The multibarrier concept aims to separate the radionuclide-containing inner core material and the environment by the use of coatings and matrices. Two options were developed for the inner core of the multibarrier concept: supercalcine pellets and glass marbles. Supercalcine is a crystalline assemblage of mutually compatible, refractory, and leach-resistant solid solution phases incorporating high-level liquid waste ions. Supercalcine powder is produced by spray calcining the liquid waste stream to which Al_2O_3, CaO, SiO_2, and SrO have been added. Supercalcine pellets are produced by disc pelletizing. The amorphous supercalcine crystallizes into solid solution phases after subsequent heat treatment. Based on the multibarrier processes described, several conclusions can be made: gravity sintering and vacuum casting are both applicable methods for metal matrix encapsulation. The multibarrier concept of glass marbles encapsulated in a vacuum-cast lead alloy provides enhanced inertness at a minimum increase in technological complexity. If it were desirable to develop a crystalline multibarrier waste form, uncoated sintered supercalcine pellets would offer enhanced inertness at a much lower level of technological complexity than glaze- or CVD-coated supercalcine. The 16-inch diameter pelletizer unit has enough capacity to handle the output of a large PNL spray calciner (52.5 kg of calcine/hr) and it can form spray-calcined material into pellets with diameters of 2 mm to 20 mm having strength enough to withstand handling without significant breakage.Chemical vapor deposition coating of supercalcine should be pursued only if a very high level of inertness is required.

956 (PNL-SA--7414) PROCESSES FOR PRODUCTION OF ALTERNATIVE WASTE FORMS. Ross, W.A.; Rusin, J.M.; McElroy, J.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1979. Contract EY-76-C-06-1830. 14p. (CONF-790204--11). Dep. NTIS, PC A02/MF A01.

From Symposium on waste management and fuel cycles 1979; Tucson, AZ, USA (28 Feb 1979).

During the past 20 years, numerous waste forms and processes have been proposed for solidification of high-level radioactive wastes (HLW). The number has increased significantly during the past 3 to 4 years. At least five factors must be considered in selecting the waste form and process method: 1) processing flexibility, 2) waste loading, 3) canister size and stability, 4) waste form inertness and stability, and 5) processing complexity. This paper describes various waste form processes and operations, and a simple system is proposed for making comparisons. This system suggests that one goal for processes would be to reduce the number of process steps, thereby providing less complex processing systems.

957 (PNL-SA--7499) COMPARISON OF BITUMEN AND CEMENT IMMOBILIZATION OF INTERMEDIATE- AND LOW-LEVEL RADIOACTIVE WASTE. Voss, J.W. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1979. Contract EY-76-C-06-1830. 26p. (CONF-790204--12). Dep. NTIS, PC A03/MF A01.

From Symposium on waste management and fuel cycles 1979; Tucson, AZ, USA (28 Feb 1979).

This paper discusses a systems comparison of two available immobilization processes for intermediate- and low-level radioactive wastes -- bitumen and cement. This study examines a conceptual coprocessed UO_2 - PuO_2 fuel cycle. Radioactive wastes are generated at each stage of this fuel cycle. This study focuses on these transuranic (TRU) wastes generated at a conceptual Fuel Coprocessing Facility. In this report, these wastes are quantified, the immobilization systems conceptualized to process these wastes are presented, and a comparison of the systems is made.

958 (PNL-SA--8014) DECOMMISSIONING OF COMMERCIAL SHALLOW-LAND BURIAL SITES. Murphy, E.S.; Holter, G.M. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1979. Contract AC06-76RL01830. 15p. (CONF-790923--13). NTIS, PC A02/MF A01.

From Decontamination and decommissioning of nuclear facilities conference; Sun Valley, ID, USA (16 Sep 1979).

Estimated costs and safety considerations for decommissioning LLW burial grounds have been evaluated. Calculations are based on a generic burial ground assumed to be located at a western and an eastern site. Decommissioning modes include: (1) site stabilization followed by long-term care of the site; and (2) waste relocation. Site stabilization is estimated to cost from $0.4 million to $7.5 million, depending on the site and the stabilization option chosen. Long-term care is estimated to cost about $100,000 annually, with somewhat higher costs during early years because of increased site maintenance and environmental monitoring requirements. Long-term care is required until the site is released for unrestricted public use. Occupational and public safety impacts of site stabilization and long-term care are estimated to be small. Relocation of all the waste from a reference burial ground is estimated to cost more than $1.4 billion and to require more than 20 years for completion. Over 90% of the cost is associated with packaging, transportation, and offsite disposal of the exhumed waste. Waste relocation results in significant radiation exposure to decommissioning workers.

959 (PNL-SA--8085) HIGH LEVEL WASTE PROPERTIES. Turcotte, R.P. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1979. Contract AC06-76RL01830. 36p. (CONF-7910184--1). NTIS, PC A03/MF A01.

From IAEA evaluation of solidified high level radioactive waste products workshop; Berlin, F.R. Germany (15 Oct 1979).

Devitrification and leaching analyses of four waste glasses were made to compare non-radioactive compositions to compositions made using fully radioactive waste calcine.

Microstructural analyses of the phase behavior of glasses were performed by means of optical microscopy, x-ray diffraction, x-ray fluorescence, scanning electron microscopy, and electron microprobe analysis. The author's summary of the major findings are: Melt insoluables and crystallization products were found to the same extent in both radioactive and non-radioactive glasses of similar composition. High radiation field appeared to have no effect on the crystallization behavior. The results of long-term IAEA static leach tests indicated no significant difference between the average leach rates of the fully radioactive and non-radioactive glass formulations. Glass composition was more important in determining leach rates than was the extent of devitrification. In both short time tests at 75°C or longer leach tests at 25°C elemental analyses suggested that congruent dissolution did not occur.

960 (PNL-SA--8414) URANIUM MILL TAILINGS STABILIZATION. Hartley, J.N.; Koehmstedt, P.L.; Esterl, D.J.; Freeman, H.D. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Feb 1980. Contract AC06-76RL01830. 16p. (CONF-800313--9). NTIS, PC A02/MF A01.

From Waste management conference; Tucson, AZ, USA (10 Mar 1980).

Uranium mill tailings pose a potential radiation health hazard to the public. Therefore, stabilization or disposal of these tailings in a safe and environmentally sound way is needed to minimize radon exhalation and other environmental hazards. One of the most promising concepts for stabilizing U tailings is the use of asphalt emulsion to contain radon and other hazardous materials within uranium tailings. This approach is being investigated at the Pacific Northwest Laboratory. Results of these studies indicate that a radon flux reduction of greater than 99% can be obtained using either a poured-on/sprayed-on seal (3.0 to 7.0 mm thick) or an admixture seal (2.5 to 12.7 cm thick) containing about 18 wt % residual asphalt. A field test was carried out in June 1979 at the Grand Junction tailings pile in order to demonstrate the sealing process. A reduction in radon flux ranging from 4.5 to greater than 99% (76% average) was achieved using a 15.2-cm (6-in.) admix seal with a sprayed-on top coat. A hydrostatic stabilizer was used to apply the admix. Following compaction, a spray coat seal was applied over the admix as the final step in construction of a radon seal. Overburden was applied to provide a protective soil layer over the seal. Included in part of the overburden was a herbicide to prevent root penetration.

961 (PPGM-L--165-78) COPRECIPITATION PROCESS STUDIES OF LIQUID URANIUM WASTE BY USING MANY KINDS FLOCCULENTS. Suroto. (Gama Research Centre, Jogyakarta (Indonesia)). 1978. 18p. (In Indonesian). NTIS (US Sales Only), PC A03/MF A01.

The formation of flocs, will be expected to surface adsorption and interval adsorption to uranium compounds in the solution. When occured the formation of precipitated of hydroxides, the excess of tawas caused to decreasing of the decontamination-factor. However when the phosphate precipitated will be taking place, excessing of mettalic-cations of Al^{+3} and Fe^{+3}, caused to increasing of the decontamination factor.

962 (PPGM-L--181-78) EFFECTS STUDIES OF H_2SO_4/NA_2SO_4 ON SEPARATION OF SR-90 FROM LIQUID SR-90 WASTE BY COPRECIPITATION METHOD USING $BASO_4$ AS A CARRIER. Soetjipto. (Gama Research Centre, Jogyakarta (Indonesia)). 1978. 15p. (In Indonesian). NTIS (US Sales Only), PC A02/MF A01.

Treatment of radioactive liquid waste of Sr-90 less than 10^{-3} Uci/ml by coprecipitation method using $BaSO_4$ as carrier has been studied. The experiment shows that the removal efficiency of Sr-90 is high, if the molarity of H_2SO_4/Na_2SO_4 is high. If Na_2SO_4 is used as source SOsub(4)sup(2-), the removal efficiency is higher than H_2SO_4 as source SOsub(4)sup(2-). The high value of pH which is equivalent to the low concentration of HCl will result in the high removal efficiency of Sr-90 in the waste treatment using H_2SO_4 as source SOsub(4)sup(2-).

963 (PRAV--1.22) PROPERTIES OF BITUMINOUS-EMBEDDED RADIOACTIVE WASTES FROM BARSEBACK NUCLEAR POWER STATION, SWEDEN. (Programraadet foer Radioaktivt Avfall, Stockholm (Sweden)). 1979. 207p. NTIS (US Sales Only), PC A10/MF A01.

A separate abstract was prepared for each section of the report. (HDR)s with fast sodium-cooled reactors which are being planned for the future.

964 (PRAV--1.22, pp 1-13) SOLIDIFICATION OF LOW AND MEDIUM LEVEL WASTES IN BITUMEN AT BARSEBAECK NUCLEAR POWER STATION. Harfors, C. (Sydsvenska Kraft AB, Malmoe (Sweden)). 1979.

Properties of bituminous-embedded radioactive wastes from Barseback Nuclear Power Station, Sweden.

Operating experience is presented from 4 years of bitumen solidification of wastes coming from two boiling water reactors. Methods used to sample, analyse and document the wastes are described. Transport and storage methods without remote handling have been adopted. The risk of fire is discussed and a description is given of the measures taken for fire protection.

965 (PRAV--1.32) COMBUSTION OF ION-EXCHANGE MATERIALS IN FLUIDIZED BED. FINAL REPORT. Bjerle, I.; Svensson, O. (Programraadet foer Radioaktivt Avfall, Stockholm (Sweden)). Sep 1979. 24p. (In Swedish). NTIS (US Sales Only), PC A02/MF A01.

Volume reduction of ion exchange material by combustion in fluidized beds at low temperatures is seriously hampered by the production of inflammable gases, which are combusted uncontrollably above the bed. The addition of platinum catalysts inhibits the gasproduction and confines the combustion to the bed, but increases the production of coke, which means that the volume reduction is less efficient. (L.E.).

966 (PRAV--3-19) SYSTEM FOR THE TRANSFER OF LONG-LIVED RADIOACTIVE NUCLIDES FROM SPENT ORGANIC ION-EXCHANGE RESINS FROM NUCLEAR POWER STATIONS TO ZEOLITES -TITANATES. Arnek, R.; Forberg, S. (Programraadet foer Radioaktivt Avfall, Stockholm (Sweden)). Oct 1979. 21p. NTIS (US Sales Only), PC A02/MF A01.

In order to immobilise radioactive wastes bound in organic ion exchange resin more safely and compactly a simple method for transferring them to zeolites and titanates has been developed. The study has been concentrated on Cs-137, Sr-90 and Co-60. These were eluted from the resins by solutions of sodium citrate or tartarate with an effectiveness of well over 99.9 percent, for Cs-137 and Sr-90 and 97-98 percent for Co-60. Sorption in zeolite and

titanate appears to be more effective than elution, and a ten-fold volume reduction from the spent resins to the final sintered products seems to be a reasonable expectation.

967 (RFP--2798) WASTE MANAGEMENT ANALYSIS FOR THE NUCLEAR FUEL CYCLE: ACTINIDE RECOVERY FROM COMBUSTIBLE WASTE, OCTOBER 1977-MARCH 1978. Thompson, G.H.; Smith, C.M.; Childs, E.L.; Kochen, R.L. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 18 Sep 1979. Contract EY-76-C-04-3533. 12p. Dep. NTIS, PC A02/MF A01.

Evaluation of the Ce(IV)-HNO_3 system for recovery of actinides from incinerator ash is continuing. High-fired americium-traced plutonium oxide was completely solubilized in this system and recovery of actinides from incinerator ash was greater than or equal to 95%. Recovery of solubilized plutonium was done by solvent extraction using tributyl phosphate. Tervalent actinides will be recovered by a bidentate organophosphorus solvent extractant. The Ce(IV)-HNO_3 system was compared with the F--HNO_3 system now in common use. Advantages of the former include less equipment corrosion, no volatilization of silica, and better recovery of actinide in the initial contact. However, additional contacts do not significantly improve recovery (because silica is not solubilized), and the system requires a large liquid/solid ratio for efficient actinide recovery.

968 (RFP--2870) CHEMISTRY RESEARCH AND DEVELOPMENT PROGRESS REPORT, MAY-OCTOBER, 1978. Miner, F.J. (Atomics International Div., Golden, CO (USA). Rocky Flats Plant). 30 Aug 1979. Contract EY-76-C-04-3533. 35p. Dep. NTIS, PC A03/MF A01.

Work in progress includes: calorimetry and thermodynamics of nuclear materials; americium recovery and purification; optimization of the cation exchange process for recovering americium and plutonium from molten salt extraction residues, photochemical separations of actinides; advanced ion exchange materials and techniques; secondary actinide recovery; removal of plutonium from lathe coolant oil; evaluation of tributyl phosphate-impregnated sorbent for plutonium-uranium separations; plutonium recovery in advance size reduction facility; plutonium peroxide precipitation; decontamination of Rocky Flats soil; soil decontamination at other Department of Energy sites; recovery of actinides from combustible wastes; induction-heated, tilt-pour furnace; vacuum melting; determination of plutonium and americium in salts and alloys by calorimetry; plutonium peroxide precipitation process; silica removal study; a comparative study of annular and Raschig ring-filled tanks; recovery of plutonium and americium from a salt cleanup alloy; and process development for recovery of americium from vacuum melt furnace crucibles.

969 (RFP--2907) ACTINIDE RECOVERY FROM COMBUSTIBLE WASTE: THE CE(IV)-NHO_3 SYSTEM. FINAL REPORT. Thompson, G.H.; Childs, E.L.; Kochen, R.L.; Schmunk, R.H.; Smith, C.M. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 14 Sep 1979. Contract EY-76-C-04-3533. 22p. Dep. NTIS, PC A02/MF A01.

Actinides in ash can be leached effectively by refluxing with Ce(IV) in HNO_3; solubilization of actinide in ash was greater than or equal to 95% at ash concentrations to 30 g/l in stirred leachant. Plutonium and americium were the actinides present in the ash. Solubilized plutonium and americium were recovered from Ce(IV)-HNO_3 solution by solvent extraction. Extraction of plutonium into 30% tributyl phosphate in n-dodecane gave 99.99% recovery. The plutonium-depleted solution was then extracted with 30% dihexyl-N,N-diethylcarbamolylmethylenephosphonate (DHDECMP). Americium recovery was 99.64%. The Ce(IV)-HNO_3 system was compared with the HF-HNO_3 system now in common use. Advantages of the former included less equipment corrosion, no volatilization of silica, safe oxidation of carbon residues, minimal secondary waste (Ce is recycled), and better solubilization of actinide in the initial contact. However, additional contacts do not significantly improve solubilization, and a small fraction of actinide is not solubilized with Ce(IV)-HNO_3 that can be solubilized by HF-HNO_3. The effect of the fission product ruthenium on the dissolution of actinides in the Ce(IV)-HNO_3 system was investigated briefly, and a method for removing the ruthenium electrolytically was developed. Several process flowsheets were also considered. Actinide recovery requirements will suggest which of these might best be used. 6 figures, 7 tables.

970 (RFP--2945) FLUIDIZED BED INCINERATION PROCESS DESIGN FOR TRANSURANIC WASTE. Johnson, A.J.; Meyer, F.G.; Anderson, D.L.; Bell, B.A.; Feng, P.K. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 19 Jul 1980. Contract AC04-76DP03533. 21p. NTIS, PC A02/MF A01.

A fluidized bed incineration facility has been installed at the Rocky Flats Plant to develop and demonstrate a process for the combustion of transuranic waste. The unit's capacity is about 82 kg/hr of combustible solid waste, which is nine times higher than the rate for the operating pilot-scale unit. The facility utilizes nonaqueous, in situ neutralization of acid gases. These gases are generated during the combustion of halogen-containing materials. The low-temperature (550 °C) operation eliminates refractory-lined equipment.

971 (RFP--2952) CHEMISTRY RESEARCH AND DEVELOPMENT. PROGRESS REPORT, NOVEMBER 1978-APRIL 1979. Miner, F.J. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 5 Oct 1979. Contract EY-76-C-04-3533. 35p. Dep. NTIS, PC A03/MF A01.

The status of the following studies is given: calorimetry and thermodynamics of nuclear materials; americium recovery and purification; optimization of the cation exchange process for recovering americium and plutonium from molten net extraction residues; evaluation and comparison of bidentate extractants and methods for actinide recovery; a combined anion exchange-bidontate organophosphorus extraction process for molten salt extraction residues; a combined anion exchange-extraction chromatography technique for secondary recovery; plutonium recovery in the Advanced Size Reduction Facility; decontamination of Rocky Flats soil; separating lead and calcium from americium by chromate and oxalate precipitation; demonstration of the pyroredox process in the induction-heated, tilt-pour furnace; process development for recovery of americium from vacuum melt furnace crucibles; plutonium peroxide precipitation process; and a comparative study of annular and Raschig ring-filled tanks.

972 (RFP--2969) EVALUATION OF REFRACTORY MATERIALS FOR A NUCLEAR WASTE INCINERATOR. Grotzky, V.K.; Kneale, P.A.; Teter, A.R.

(Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 21 Jul 1980. Contract AC04-76DP03533. 45p. NTIS, PC A03/MF A01.

An experiment to find a suitable refractory lining for a nuclear waste incinerator has been completed. Eleven brick and six castable products were analyzed by optical and scanning microscopy. All the materials were fashioned into cup shapes and subjected to temperatures ranging from 800 to 1200°C for as long as six weeks. Some of the cups were charged weekly with pellets made from ash materials that would contact an incinerator liner. Refractory products containing a high percentage of aluminum oxide had the greatest resistance to cracking and slag buildup. 35 figures.

973 (RFP--2972) ELECTRODECONTAMINATION USING A BASIC ELECTROLYTE. Childs, E.L. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 1979. Contract EY-76-C-04-3533. 17p. (CONF-791103--72). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

A decontamination procedure for stainless steel is described that has the following advantages: rapid decontamination, one minute of time to reach nonretrievable level; easy to separate contamination by filtration; contamination is easy to recover in nitric acid; the electrolyte has an extended life - can be reused; and the waste generated from spent electrolyte is compatible with Rocky Flats waste processing.

974 (RFP--3013) DATA ACQUISITION AND CONTROL INSTRUMENTATION FOR FLUIDIZED BED INCINERATION SYSTEM. Tosney, W.F.; Johnson, A.J. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 20 Jun 1980. Contract AC04-76DP03533. 13p. NTIS, PC A02/MF A01.

A fluidized bed incinerator facility utilizing in situ neutralization of acid gases that are generated has been designed, constructed, and is now in operation. Computer process control and data acquisition are provided by an on-line minicomputer that has been integrated successfully with the incineration system. Analog controllers also are used at specific control points for intrasystem interaction.

975 (RFP--3030) FLUIDIZED BED INCINERATION OF TRANSURANIC WASTE. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 1980. Contract AC04-76DP03533. 12p. (CONF-800611--7). NTIS, PC A02/MF A01.

From International symposium on the management of alpha-contaminated wastes; Vienna, Austria (2 Jun 1980).

Fluidized bed incineration has been developed and is being evaluated at the Rocky Flats Plant (RFP) as an alternative to conventional incineration for processing transuranic (TRU) combustible waste. Fluidized bed technology development at RFP began in 1970. Laboratory and bench-scale equipment was used to determine basic fluidizing characteristics and parameters. Sufficient information was obtained so that by 1974, a metal vessel system with a 9 kh/hour (20 lb/hour) throughput was built. Operating success was rapidly achieved and in 1975 a decision was made to scale-up this 9 kg/hour pilot plant to a full scale 82 kg/hour (180 lb/hour) facility. In the subsequent four years, the process was developed beginning with a system analysis including mass and energy balances, process layouts, operating constraints and flow diagrams. Engineering uncertainties in the larger scale equipment and processes were identified, and an integrated laboratory development program was initiated to solve specific scale-up problems. Detailed engineering design then proceeded, followed by construction. By the summer of 1978, the facility was installed and component and systems testing begun. By the summer of 1979, the facility achieved its operational goal of 100 continuous hours of operation including 16 hours of operation on contaminated waste.

976 (RFP--3079) RECOVERY AND PURIFICATION OF AMERICIUM FROM MOLTEN SALT EXTRACTION RESIDUES. Navratil, J.D.; Martella, L.L.; Thompson, G.H. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 1980. Contract AC04-76DP03533. 7p. (CONF-800918--2). NTIS, PC A02/MF A01.

From International solvent extraction conference; Liege, Belgium (6 Sep 1980).

Americium recovery and purification development at Rocky Flats involves the testing of a combined anion exchange - bidentate organophosphorus liquid - liquid extraction or extraction chromatography process for separating americium from molten salt extraction residues. Laboratory-scale and preliminary pilot-plant results have shown that americium can be effectively recovered and purified from impurity elements such as aluminum, calcium, magnesium, plutonium, potassium, sodium, and zinc. The purified americium oxide product from the liquid - liquid extraction process contained greater than 95% AmO_2 with less than 1% of any individual impurity element.

977 (RHO-CD--394) DOUBLE SHELL SLURRY PROCESS TEST EVALUATION. Honeyman, J.O.; Solbakken, M. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Apr 1978. Contract EY-77-C-06-1030. 25p. Dep. NTIS, PC A02/MF A01.

This report discusses results of a plant demonstration of the double shell slurry process which was conducted April 25 to 28, 1977. 274,000 gallons of double shell slurry were produced from 365,000 gallons of Hanford Defense Residual Liquor. The volume reduction was 25%. Process control was maintained near the proper zone in the early part of the run. However, the feed was underconcentrated in the latter part of the run. Hydroxide concentrations of the product samples ranged from 2.1 to 5.9 M. The aluminum to caustic ratio varied from 0.33 to 1.07. The solids were primarily sodium nitrate, carbonate, aluminate, and nitrate. All samples were totally water soluble. The double shell slurry product increased in volume by 19,000 gallons from April to October 1977, probably caused by organic chelating agents.

978 (RHO-CD--739) LABORATORY EVALUATION OF AN ION EXCHANGE PROCESS FOR REMOVING CESIUM FROM PUREX ACID WASTE SOLUTIONS. Buckingham, J.S. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Jun 1979. Contract EY-77-C-06-1030. 106p. Dep. NTIS, PC A06/MF A01.

A laboratory investigation was made of an ion exchange process for removing radioactive cesium from acidic Purex waste. Twenty-seven laboratory ion exchanger runs are reported. Parameters investigated include comparison of Zeolon-900, AW-500 and Duolite ARC-359 ion exchangers, pH of feed solutions, composition of sodium scrub solutions, composition of

eluting solutions and overflow versus downflow elution. The cause and rate of zeolite degradation was investigated.

979 (RHO-CD--783) THEORETICAL CONSIDERATIONS IN SOLID BOWL CENTRIFUGATION. Hamilton, R.T. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 24 Aug 1979. Contract EY-77-C-06-1030. 25p. Dep. NTIS, PC A02/MF A01.

A combination of literature survey and independent analysis determined three relationships for the prediction of the critical (or minimum recoverable) particle size in a solid bowl centrifuge. The relationships were derived based on three different theories of fluid behavior within the centrifuge; (1) laminar film flow (laminar film model), (2) plug flow (Sharples Model), and parabolic flow (modified Sharples Model). The critical particle size for the centrifuge used in Cs-PTA recovery in the CAW process predicted by the three relationships range from 0.19 to 0.34 μm (1 μm = 10^{-6}m). The laminar film model gives the most conservative estimate of critical particle size (0.34 μm) and the resulting relationship is recommended for use to predict solid bowl centrifuge performance. Three correction factors are incorporated into the predictive equations to account for the effects of fluid turbulence near the centrifuge feed point, fluid lag and hindered settling. Of these factors, turbulence near the feed point (which is accounted for by using an effective centrifuge length) has the greatest impact, increasing the predicted critical particle size by 15%, while the combination of fluid lag and hindered settling factors increase the recoverable particle size by 4%. The overall effect of the correction factors is an approximately 20% decrease in centrifuge effectivity. The fraction of solids smaller than the critical size range has not been reliably determined for laboratory or plant prepared Cs-PTA. In addition, the density of Cs-PTA crystals is reported tc vary from 3.2 to 12 grams per cubic centimeter.

980 (RHO-F--7) CELL 18 ION EXCHANGE FLOWSHEET. Poling, W.E. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). Jan 1980. Contract AC06-77RL01030. 54p. NTIS, PC A04/MF A01.

Objective is to remove cation impurities from the crude cesium nitrate waste solutions currently stored in B Plant in preparation for final purification in the Cell 38 cesium purification process. Clarified solutions from the crude product centrifugation, solids leach process, and flushes are processed through the ion exchange column in Cell 18 to separate cesium from metallic cation impurities, and to produce a cesium carbonate solution acceptable for final cesium purification feed. Process losses in the ion exchange portion of less than 0.05% are projected. Product generated by the ion exchange process is concentrated and transferred to Cell 37 as cesium carbonate solution. This product is solids free, and has a pH of about 10.5, which is within the desired purification feed pH range. Aluminum and iron decontamination in the clarification process from the cesium is expected to be sufficient to preclude solids formation in the concentrated ion exchange product and hence in the feed makeup step in the purification process. The carbonate solution will be sampled after concentration to verify low solids content. If excessive solids are detected, the product may be clarified for solids removal prior to final purification in Cell 38.

981 (RHO-F--8) ION EXCHANGE FLOWSHEET FOR FINAL PURIFICATION OF B PLANT CESIUM. Carlstrom, R.F. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). Jan 1980. Contract AC06-77RL01030. 42p. NTIS, PC A03/MF A01.

The primary objective of the final cesium purification process is to produce a cesium carbonate product suitable for the encapsulation process. The encapsulation specifications are designed to minimize the volume of material to be encapsulated and control corrosion rates by assuring that the salt remains in the solid form. The feed for the cesium purification process is transferred from storage in Cell 37 to Cell 38. The feed is diluted with demineralized water and is loaded onto the ion exchange bed. The impurity cations (sodium, potassium, and rubidium) are removed (scrubbed) from the bed with a dilute ammonium carbonate-ammonium hydroxide solution passed through the bed in the same flow direction as the loading step. The cesium is removed from the ion exchange bed with a concentrated ammonium carbonate-ammonium hydroxide solution passed counterflow through the bed and the resulting product is concentrated. The concentrated cesium product is transferred to storage as available feed for the cesium encapsulation process.

982 (RHO-LD--80-101-A) LONG-TERM HIGH-LEVEL DEFENSE WASTE TECHNOLOGY PROGRESS REPORT, OCTOBER-DECEMBER 1979. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Feb 1980. Contract AC06-77RL01030. 25p. NTIS, PC A02/MF A01.

The highlights of the quarter in program management and support, waste preparation, and waste fixation are reported. Technical progress in environmental and safety assessments, in situ storage, waste retrieval, separation and concentration, waste form development and characterization, and process and equipment development is discussed. (DC)

983 (RHO-SA--51) REMOVAL OF RADIONUCLIDES FROM HANFORD DEFENSE WASTE SOLUTIONS. Schulz, W.W. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Jan 1980. Contract EY-77-C-06-1030. 82p. (CONF-800607--30). Dep. NTIS, PC A05/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

The Hanford high-level defense wastes were characterized by their large volume (190,000 m^3) and varying content of inert and radioactive constituents. The water-soluble portion (140,000 m^3) of these wastes, which consists mainly of $NaNO_3$, $NaAl(OH)_4$, Na_2CO_3 and other sodium salts, contains a few milligrams of long-lived (t/sub 1/2/ greater than or equal to 10 years) radionuclides per 1000 kilograms. There is probable economic incentive for long-term management of Hanford defense wastes to partition them into a small volume of highly radioactive material requiring high integrity immobilization and storage and a much larger fraction of low level (e.g., < 10 nCi/g) waste which can be economically and safely stored in bulk form. To aid in achieving this latter objective, an integrated series of aqueous separations processes (precipitation, ion exchange, and solvent extraction methods) was designed to remove ^{137}Cs, ^{90}Sr, actinides, other multivalent cationic fission and activation products, and ^{99}Tc from the water-soluble wastes. Results of generally satisfactory laboratory-scale tests of radionuclide removal technology with actual

Hanford wastes are described.

984 (RHO-SA--91) VOLUME REDUCTION OF METALLIC WASTE. Beitel, G.A.; Ortiz, P.G. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 24 Oct 1978. Contract EY-77-C-06-1030. 15p. (CONF-791114--1). Dep. NTIS, PC A02/MF A01.
From USDOE environmental control symposium; Washington, DC, USA (29 Nov 1979).
A meltdown system using a direct arc heated vacuum furnace is proposed for equipment disposal. This concept promises to achieve volume reduction factors of 20 to 40 when applied to the large process vessels typically used in nuclear reprocessing facilities. It is believed that the furnace can be remotely operated and maintained safely, with close to absolute fume containment. Furnace size dictates that all feed material be cut into pieces small enough to charge the crucible. Use of a newly developed metal cutting tool, the arc saw, is proposed to reduce the large vessels and equipment to the necessary small sizes. The furnace and systems have been designed. The saw is ready for preliminary testing, and the furnace is to be tested next year.

985 (RHO-SA--98) OZONATION OF HANFORD NUCLEAR DEFENSE WASTE. Lutton, T.W.; Schulz, W.W.; Strachan, D.M.; Bollyky, L.J. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Mar 1980. Contract EY-77-C-06-1030. 27p. (CONF-791182--1). Dep. NTIS, PC A03/MF A01.
From 4. international ozone conference; Houston, TX, USA (26 Nov 1979).
High (e.g., 0.1 to 0.5M) concentrations of ethylenediaminetetraacetate (EDTA), 2-hydroxyethylethylenediaminetriacetate (HEDTA), and other organic complexing agents are present in some of the nuclear waste solutions currently stored at the US Department of Energy Hanford Site in southeastern Washington State. Ozonolysis of these alkaline solutions smoothly and efficiently destroys the organic material thereby facilitating ion exchange removal of ^{90}Sr and other long-lived cationic radionuclides. Successful bench-scale ozonation tests have been performed with both synthetic and actual waste liquids.

986 (RHO-SA--116) RAPID PETROGRAPHIC DIFFERENTIATION OF THE MAJOR CRYSTALLINE COMPONENTS OF SYNTHETIC HANFORD EVAPORATOR SLURRY. Starr, J.L. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). May 1979. Contract EY-77-C-06-1030. 7p. (CONF-790666--6). Dep. NTIS, PC A02/MF A01.
From 34. Northwest regional meeting of the American Chemical Society; Richland, WA, USA (13 Jun 1979).
The four major crystalline components of these synthetic slurry samples were shown to be differentiable by examining their morphology, habits, and interference figures. Since morphology and habit are plainly visible under crossed Nichols and a full wave plate, and since observation of interference figures may be accomplished at the push of a button; differentiation between each of the major crystalline phases present in this system was performed rapidly while observing those same crystals microscopically. Finally, crystal growth was shown to be dramatically affected by the presence of complexants.

987 (RHO-SA--123) CYCLOHEXANONE SOLVENT EXTRACTION OF $^{99}TcO_4$ FROM ALKALINE NUCLEAR WASTE SOLUTIONS. Schulz, W.W. (Rockwell International Corp., Richland, WA (USA). Energy Systems Group). Jan 1980. Contract AC06-77RL01030. 36p. (CONF-800918--4). NTIS, PC A03/MF A01.
From International solvent extraction conference; Liege, Belgium (6 Sep 1980).
Although the ^{99}Tc cyclohexanone solvent extraction process is still in the bench-scale development stage, the process appears well suited for engineering-scale removal of ^{99}Tc from alkaline Hanford waste solutions. The most pressing process development need is to resolve the phase disengaging problems encountered during water stripping operations. Stripping tests in pulse columns and/or centrifugal contactors are particularly needed to determine the magnitude of the phase disengaging problem in engineering-scale equipment and to find suitable remedies. 5 figures, 7 tables.

988 (RHO-SA--145) REMOVAL OF RADIONUCLIDES FROM THE WATER-SOLUBLE FRACTION OF HANFORD NUCLEAR DEFENSE WASTES. Strachan, D.M.; Schulz, W.W. (Battelle Pacific Northwest Labs., Richland, WA (USA); Atomics International Div., Richland, WA (USA). Rockwell Hanford Operations). Feb 1980. Contract AC06-77RL01030. 33p. (CONF-800313--8). NTIS, PC A03/MF A01.
From Waste management conference; Tucson, AZ, USA (10 Mar 1980).
The current Hanford Waste Management Program has operated since 1968 to remove the bulk of the long-lived heat emitters ^{90}Sr and ^{137}Cs from stored high-level wastes. The liquid waste remaining after removal of ^{90}Sr and ^{137}Cs is returned to underground tanks for eventual evaporation to damp solid salt cake. Hanford salt cake is an admixture of large amounts of $NaNO_3$ with minor amounts of $NaAl(OH)_4$, Na_2CO_3, Na_2CrO_4, Na_3PO_4, Na_2SO_4, and NaOH. Small amounts of ^{90}Sr, ^{137}Cs, ^{99}Tc and other radionuclides are also associated with the salt cake. Results of successful bench-scale radionuclide removal tests with various actual salt cakes and certain liquid waste solutions representative of residual liquids were reported earlier. This paper describes conditions and results of recent hot cell tests of the complete Hanford Radionuclide Removal Process. These advanced tests, made with actual residual liquid containing large concentrations of ethylenediaminetetraacetic acid (EDTA) and other organic compounds, provided a rigorous and convincing proof of the process flowsheet.

989 (RHO-SA--173) INTERACTIONS BETWEEN CANDIDATE MELTER ELECTRODE MATERALS AND DEFENSE WASTE GLASS MELTS. Palmer, R.A. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Sep 1980. Contract AC06-77RL01030. 28p. (CONF-801034--3). NTIS, PC A03/MF A01.
From 33. ACS Pacific Coast meeting; San Francisco, CA, USA (28 Oct 1980).
Because electric glass melters for vitrification of nuclear wastes will be operated remotely, the expected lifetime of each component must be maximized. Four candidate electrode materials (two types of tin oxide, molybdenum, and Inconel 690) have been tested in various Hanford Defense waste glasses at temperatures up to 1400°C. The corrosive interaction was characterized by corrosion rates at the melt line and within the melt measured over a 1-week experiment. Molybdenum and Inconel 690 proved to have superior corrosion resistance over tin oxide. Glass chemistry had more of an effect on the corrosion of the metals than either temperature

or glass viscosity. Microscopic examination of changes in the microstructure of the electrode material as well as in the glass are reported. Correlation of these results with the composition and viscosity of the glasses is also made. 8 figures.

990 (RHO-SA--174) TRANSMUTATION OF RADWASTE USING ACCELERATORS. Bruns, L.E. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Jun 1980. Contract AC06-77RL01030. 18p. (CONF-800743--9). NTIS, PC A02/MF A01.

From International conference on nuclear waste transmutation; Austin, TX, USA (22 Jul 1980).

A concept was proposed by Rockwell Hanford Operations, a prime contractor for the Department of Energy (DOE), to deactivate specified nuclear wastes. Work to date was first reviewed which included literature and meetings. Criteria for feasibility were established. Accelerator concepts to meet the criteria centered on the spallation accelerator with added moderation and boost mode. Optimum target was envisioned to be a combination actinide blanket with center fission product core. A figure plotting fraction transmuted vs. time in days showed what fluxes and cross-sections were necessary to achieve practicality. Problems that need to be faced were discussed. The Rockwell proposal was reviewed followed by conclusions and future work proposed.

991 (RHO-ST--30) HANFORD RADIOACTIVE TANK CLEANOUT AND SLUDGE PROCESSING. Rasmussen, O.R. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Mar 1980. Contract AC06-77RL01030. 44p. Dep. NTIS, PC A03/MF A01.

The Hanford Site has successfully applied sluicing for the large-scale removal of radioactive sludges from underground storage tanks. The majority of the sludge recovery effort has been focused on retrieving relatively small quantities of sludge (2000 to 4000 gallons) for batchwise dissolution and shipment to uranium or fission product separation plants. Other efforts have involved transferring sludges between million-gallon tanks. The Hanford sluicing system uses a recirculating water inventory to carry sludge from underground storage tanks to the receiver. Equipment includes a medium pressure sluice pump (175 psi) in the slurry receiver tank, and a mechanical sluicing assembly and a slurry pump in the tank being sluiced. For batchwise sludge recovery, the water/slurry mixture is recirculated until the concentration reaches the 10 to 20 percent solids range. The solids are then settled, the supernatant decanted to the sluice tank, and the solids remaining in the sludge receiver shipped to a dissolution tank for further processing. Seventy-five foot diameter underground storage tanks have been cleaned out to 2000 to 4000-gallon sludge heels.

992 (RHO-ST--33) SYSTEM FOR RETRIEVAL OF SOLIDIFIED HANFORD HIGH-LEVEL DEFENSE WASTES: A DESIGN DESCRIPTION. Strickler, J.K.; Wallskog, H.A.; Wetch, J.R. (Rockwell International Corp., Richland, WA (USA). Energy Systems Group). Jul 1980. Contract AC06-77RL01030. 166p. NTIS, PC A08/MF A01.

The major objective of the Hanford defense waste retrieval activity is to design, develop, demonstrate, and qualify the equipment, staff, and methods required for the safe retrieval of solidified high-level radioactive wastes from the 133 large (75-foot-diameter) single-shell, underground storage tanks at Hanford. The program is currently limited to research, development, and demonstration of systems and technology in support of selecting an alternative for disposal of Hanford high-level defense waste. This report relates the requirements and sets forth much of the data and criteria currently known. It describes the preliminary design of a remotely operated, self-contained, mobile system which incorporates a mechanical, articulated mining boom. This boom, when equipped with a variety of suitable tools, can remotely cut up in-tank equipment, remove the debris, recover the solid wastes, clean the tank walls, and deposit the waste into a bucket elevator. The bucket elevator automatically removes the waste from the tank and deposits it into shielded shipping containers. The containers are remotely sealed, washed, and deposited into sealing containers. The containers are remotely sealed, washed, and deposited into sealing containers which are sealed and placed on a transfer vehicle for transport. All of the retrieval equipment is installed on a mobile platform which bridges the tank domes to avoid loading the dome structure. Mobility provides for progressing from tank to tank until all of the 75-foot-diameter, single-shell tanks have been emptied. Ancillary equipment includes in-tank viewing and lighting systems, positive filtered ventilation equipment for contamination control, equipment for washing tools and mining equipment, and includes provisions for remote maintenance of contaminated equipment, and quick removal and replacement of parts.

993 (RISLEY-Trans--3373) VITRIFICATION OF NUCLEAR WASTE. Barrere, M. (UKAEA Risley Nuclear Power Development Establishment). 1978. 5p. British Library Lending Division, Boston Spa, Wetherby, West Yorkshire, England.

The vitrification of high-level nuclear waste is described. Problems are discussed concerning the long-term stability of the product, particularly when fission products and actinides are vitrified together. Behaviour of the glass under various conditions is considered.

994 (SAI--78-904-LJ) R AND D FOR AN OFF-GAS TREATMENT SYSTEM FOR A SLAGGING PYROLYSIS RADIOACTIVE WASTE INCINERATOR. FINAL REPORT FOR PHASE II. Christian, J.D.; Girton, R.C.; Kirstein, B.E.; Pence, D.T. (Science Applications, Inc., San Diego, CA (USA)). 27 Oct 1978. Contract EY-76-C-07-1570. 134p. Dep. NTIS, PC A07/MF A01.

An analysis of the transport rates for volatilized species in off-gas from the slagging pyrolysis incinerator proposed for the incineration of buried and stored INEL radioactive wastes showed that the only major species that may interfere with operation of the incinerator will be lead oxide vapor and possibly hydrochloric acid. From the regulatory point of view, a decontamination factor (DF) of 10^8 for particulates would appear to satisfy present and anticipated radioactive species control requirements. No emission controls appear to be required for HCl, NO/sub x/, or SO_2 based on existing federal and state regulations. Off-gas treatment processes utilizing both dry and wet system designs are proposed, either of which would satisfy the expected control requirements. Cost estimates were prepared for each design, and the systems were compared. The merits of the dry system design outweighed those of the wet system for this particular application, so the dry system design is the one recommended.

995 (SAI--132-79-764-LJ) R and D FOR AN OFF-GAS TREATMENT SYSTEM FOR A SLAGGING PYROLYSIS RADIOACTIVE WASTE INCINERATOR. FINAL REPORT FOR PHASE III. Kirstein, B.E.; Paplawsky, W.J.; Pence, D.T.; Snow, B.D.; Spaeth, M.E. (Science Applications, Inc., San Diego, CA (USA)). 30 Jun 1979. Contract EY-76-C-07-1570. 210p. Dep. NTIS, PC A10/MF A01.

Results of engineering-scale tests to obtain sintered metal filter particulate removal performance data with fly ash to simulate the expected incinerator particulate are reported. Efficiencies of greater than 99.9999% were obtained at the conditions of the tests. An evaluation of expected spray dryer performance indicated that a commercial unit should provide the desired removal for HCL and SO_2. An off-gas treatment system safety analysis was performed, and no credible postulated accident could be identified that would result in a significant radioactivity exposure to the public. An updated cost estimate for the OGTS is also provided. Several areas were identified in which additional technical data are considered desirable to ensure efficient operation of the proposed OGTS, but nothing was identified that would indicate that the OGTS would not perform satisfactorily as designed.

996 (SAND--79-0199) RADIATION STABILITY OF SODIUM TITANATE ION EXCHANGE MATERIALS. Kenna, B.T. (Sandia Labs., Albuquerque, NM (USA)). Feb 1980. Contract EY-76-C-04-0789. 22p. Dep. NTIS, PC A02/MF A01.

Sodium titanate and sodium titanate loaded macroreticular resin are being considered as ion exchangers to remove ^{90}Sr and actinides from the large volume of defense waste stored at Hanford Site in Washington. Preliminary studies to determine the radiation effect on Sr^{+2} and I^- capacity of these ion-exchange materials were conducted. Samples of sodium titanate powder, sodium titanate loaded macroreticular resin, as well as the nitrate form of macroreticular anion resin were irradiated with up to 2 x 10^9 Rads of ^{60}Co gamma rays. Sodium titanate cation capacity decreased about 50% while the sodium titanate loaded macroeticular resin displayed a dramatic decrease in cation capacity when irradiated with 10^8-10^9 Rad. The latter decrease is tentatively ascribed to radiation damage to the organic portion which subsequently inhibits interaction with the contained sodium titanate. The anion capacity of both macroreticular resin and sodium titanate loaded macroreticular resin exhibited significant decreases with increasing radiation exposure. These results suggest that consideration should be given to the potential effects of radiation degradation if column regeneration is to be used. 5 figures, 2 tables.

997 (SAND--80-1376C) TITANATE WASTE FORMS FOR HIGH LEVEL WASTE: AN EVALUATION OF MATERIALS AND PROCESSES. Dosch, R.G.; Lynch, A.W.; Headley, T.J.; Hlava, P.F. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 9p. (CONF-801124--4). NTIS, PC A02/MF A01.

From 3. annual meeting of the Materials Research Society; Boston, MA, USA (17 Nov 1980).

Emphasis in this titanate work is directed toward process simplicity as well as enhanced waste form stability. Titanate-based ceramics containing 25% by weight of waste oxides were prepared by a straightforward process involving direct batch contact of an acidic, high level liquid waste with a precursor powder, calcining to volatilize water and nitrates, and hot pressing (1250 to 1275°) to produce a fully dense ceramic. The ceramic has a rutile matrix containing waste constituents distributed in three crystalline oxide phases - with structure types of the mineral analogues perovskite, zirconolite, hollandite - and in metallic phases present in minor amounts as metallic blebs. Addition of boron lowered processing temperatures for both hot pressing and atmospheric pressure sintering to the 925 to 975°C range. Leach rates were less than 10 µg/day.cm^2 for waste constituents and matrix attack was negligible at 250°C.

998 (SGAE--2864) CONDITIONING OF HLW-CALCINES. 1. PYROCARBON COATING. Kofler, O.; Neuman, W. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Vienna). Dec 1977. 21p. (In German). (ME--126/77). Dep. NTIS (US Sales Only), PC A03/MF A01.

PyC-coating of simulated HLW-calcines from a fluidized bed calciner was studied. As the wellknown properties of PyC layers meet the demands, which were made in HTR fuel production, for the similar problems a suitable protection of granules by such coating is expected. To avoid volatilization of radioactive components the coating temperature should not exceed 1300 K in regard of the thermal stability of granules, too. Therefore, acetylene was used as coating gas. The obtained low efficiency caused a great content of hydrocarbons and soot in the off gas. Since disturbing effects by deposition of its can occur, a device was designed for burning off these substances. Ceramographical and microoptical controls were performed on each layer. Density and thickness were determined (ρ approximately 1,88 g/cm^3, d 140 µ) and leaching behaviour and mechanical strength were tested, too. The obtained results showed an excellent stability of waste products conditioned by PyC-coating, but you have to consider the suitable temperature range is limited and, therefore, calcines have to be heat esistant up to 1220 K.

999 (SGAE--2932) CONDITIONING OF HLW-CALCINES. 2. NICKEL COATING. Neumann, W.; Kofler, O. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Vienna). Jun 1978. 24p. (In German). (ME--133/78). Dep. NTIS (US Sales Only), PC A03/MF A01.

Our program on waste conditioning alternatives includes the study of coatings of simulated highly radioactive waste granules with nickel. From pyrolytical decomposed nickeltetracarbonyl nickel was deposited by chemical vapor deposition in a fluidized bed. Advantages of this method are the low coating temperatures (at about 470 K), at which suitable coatings could be obtained by a special adaption of the performance. Pure nickel layers were deposited, of which the tightness, thickness, mechanical stability, crystallite size and its characterization in optical and microoptical examinations were tested. The results of the quality control showed a remarkable increase in mechanical stability, leach resistance and thermal conductivity of the coated waste granules. Therefore the obtained ductile and well adherent nickel-coatings are preferably applicable as one of protective shells in a multibarrier waste concept.

1000 (SGAE--3006) STUDIES ON THE STABILITY OF BITUMEN SALT MIXTURES. 3. MIXTURES OF BITUMEN AND SIMULATED STEEL CORROSION PRODUCTS.

Zeger, J.; Knotik, K.; Schopper, G. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Vienna). Dec 1978. 21p. (In German). (CH--244/78). Dep. NTIS (US Sales Only), PC A03/MF A01.

In connection with the embedding of low - to intermediate active waste, coming from reprocessing plants, into bitumen further studies have been undertaken in continuation of already published tests using samples consisting of bitumen and simulated steel corrosion products. To get these high-quality steels have been submitted to a leaching with nitric acid. The acidic solutions have been evaporated to dryness and embedded into bitumen. The thermogravimetric measurements have been carried out in air and saturated water vapour. It could be shown that, at the embedding temperatures between 180°C and 250°C, weight losses in air or water vapour resulting out of thermic stress are negligible if the embedded salt concentrate has been adjusted to a pH of 9 to 10 prior to the evaporation.

1001 (SGAE--3012) THERMAL CONDUCTIVITY OF GRANULES. Neumann, W.; Huebner, F. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Vienna). Dec 1978. 24p. (In German). (ME--151/78). Dep. NTIS (US Sales Only), PC A03/MF A01.

Thermal conductivity measurements of granules became more important particular in regard to their technical application in thermal isolation. Safety considerations in waste management of high level waste need thermal conductivity data of granules also, since a sufficient heat (induced by radiation) release of HLW containing granules have to be guaranteed. The investigations performed based on materials related to the waste management problems. The main task was to study how you can measure thermal conductivity of granule by a longitudinal, comparative heat flow method. Various container materials and forms were used and results obtained were compared. Container made of teflon were found to be most suitable for measurements at temperatures <450°K and therefore most of the investigations of calcines were carried out in it. Some estimations based on empirical results or theoretical models are published in this field but none of them corresponds to the conductivity data measured of uncoated and Nickel- or Pyrocarboncoated granules ($AlPO_4$ based, grain size <3 mm). On the other hand complementary measurements of stainless steel balls, in which the parameters are well defined, show a fairly good agreement with results calculated using the equation of Woodside and Messmer. The application of these equations and models developed for porous materials and granules in a gas environment, were tested for metal granules-composites.

1002 (SGAE--3038) SEPARATION, CONDITIONING, STORAGE AND DISPOSAL OF KRYPTON-85. Patek, P. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Vienna). Apr 1979. 39p. (In German). (AV--1/79). NTIS (US Sales Only), PC A03/MF A01.

A review is given on the technical possibilities to remove the gaseous fission product ^{85}Kr from the off-gas streams of nuclear facilities, as reactors and reprocessing plants. The conditioning, storing and disposing methods are described. Safety considerations are showing, that it is not necessary to remove krypton from reactor off-gases, only at reprocessing plants it should be provided. For final disposal deep-sea-dumping is recommended, best in gas cylinders with pressure compensation. Also disposing in geological formations is possible, but only for pressureless conditioned products.

1003 (SKBF/KBS-TR--79-19) DIFFUSION IN THE ROCK MATRIX - AN IMPORTANT FACTOR IN RADIONUCLIDE RETARDATION. Neretnieks, I. (Kaernbraenslesaekerhet, Stockholm (Sweden); Svensk Kaernbraenslefoersoerjning AB, Stockholm). May 1979. 63p. NTIS (US Sales Only), PC A04/MF A01.

This paper analyses the accessiblity of the rock matrix to the radio-nuclides. The transport mechanisms are shown to be flow of water and nuclides in the fissures and transport of nuclides from the water in the fissures into the microfissures of the rock by diffusion. The diffusion of the nuclides into the rock and their sorption is the main retarding mechanism. The diffusivity of the nuclide is as important as its sorption equilibrium constant. Diffusivities in the pores and microfissures in such dense rocks as granite under confining pressure of hundreds of bars can be expected to be 6 - 20% of the diffusivity in water. (author).

1004 (STUDSVIK/K1--79/4) PLANS FOR THE WASTE MANAGEMENT AT STUDSVIK, SWEDEN. Linder, P.; Lindskog, A.; Thegerstroem, C. (Studsvik Energiteknik AB, Nykoeping (Sweden)). Mar 1979. 13p. (In Swedish). Dep. NTIS (US Sales Only), PC A02/MF A01.

The plans for the management of radioactive waste at Studsvik, Sweden, are given in this report. Thus measures, which will be necessary during the next 3 to 4 years in order to continue the waste management, are discussed as well as alternatives for the final waste storage at Studsvik in the future.

1005 (STUDSVIK/K1/3--79/11) SURVEY OF THE ARRANGEMENTS FOR WASTE MANAGEMENT AT STUDSVIK, SWEDEN. Lindskog, A. (Studsvik Energiteknik AB, Nykoeping (Sweden)). Mar 1979. 22p. (In Swedish). Dep. NTIS (US Sales Only), PC A02/MF A01.

A survey of the arrangements at Studsvik, Sweden, for waste management is given. It summarizes the conditions, which are valid, and the principles which have been applied when designing the system. The different units in the total equipment are described together with their functions.

1006 (STUDSVIK/K1/4--79/31) CLEANING OF STACK GASES FROM COMBUSTION OF LOW LEVEL RADIOACTIVE WASTE IN STUDSVIK, SWEDEN. Haard, E. (Studsvik Energiteknik AB, Nykoeping (Sweden)). Jan 1979. 14p. (In Swedish). Dep. NTIS (US Sales Only), PC A02/MF A01.

The plant for combustion of low-level radioactive waste at Studsvik, Sweden, is described. The waste that is treated comes from nuclear power plants, industry, hospitals and universities. It is estimated to be about 270 ton/year in a few years time. The waste consists of plastic, cloth, wood, paper, rubber, biological material and unburnable components such as glass and metals. The bags with waste may have a maximum surface dose rate of 10 mrem/h. For 5 % of the bags the maximum dose rate may be 100 mrem/h. During the combustion, samples of the stack gases are collected. The release of radioactivity is reported to the Swedish authorities. During 1978 three different stack gas cleaning systems, wet cleaning, electrostatic filters and textile filters were investigated. The wet cleaning gave a radioactive sludge which was difficult to take care of. In the electrostatic

filters it was difficult to change components due to radioactivity. Therefore the textile filters were chosen. A textile filter will be installed during 1979. The cleaning capacity of the filter is expected to be 90 % and will decrease the collective doses from stack gases with 6.7 manrem/year. The cost is estimated to 450 000 Sw kr/year (100 000 US dollar).

1007 (UCRL--15147) NUCLEAR WASTE IMMOBILIZATION. PROGRESS REPORT. Ringwood, A.E.; Sinclair, W.; McLaughlin, G.M. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 20 Nov 1979. Contract W-7405-ENG-48. 68p. Dep. NTIS, PC A04/MF A01.

Portions of document are illegible.

United States defense nuclear wastes are presently in tank storage, largely as sludges comprising Fe, Mn, Ni, U and Na oxides and hydroxides, together with 0.5 to 5 percent of fission products and actinides (exclusive of uranium). The relative proportions of Al, Fe, Mn, Ni, U and Na in the sludges from different tanks vary considerably, except that (Fe + Al + Mn) are by far the major components and Fe is more abundant than Mn. Typical compositions of some calcined sludges from Savannah River are given. This paper briefly describes how the SYNROC process, utilizing straightforward technology, can be readily adapted to the problem of defense waste immobilization, yielding a dense, inert, ceramic waste-form, SYNROC-D. Two classes of processes are discussed - one designed to immobilize sludges containing normal amounts of sodium and the other designed for otherwise similar sludges which are, however, strongly depleted in sodium as a result of more efficient washing procedures.

1008 (UCRL--15253) TRANSURANIC CONTAMINATED WASTE CONTAINER CHARACTERIZATION AND DATA BASE. REVISION I. Kniazewycz, B.G. (TERA Advanced Services Corp., Berkeley, CA (USA)). May 1980. Contract W-7405-ENG-48. 330p. NTIS, PC A15/MF A01.

The Nuclear Regulatory Commission (NRC) is developing regulations governing the management, handling and disposal of transuranium (TRU) radioisotope contaminated wastes as part of the NRC's overall waste management program. In the development of such regulations, numerous subtasks have been identified which require completion before meaningful regulations can be proposed, their impact evaluated and the regulations implemented. This report was prepared to assist in the development of the technical data base necessary to support rule-making actions dealing with TRU-contaminated wastes. An earlier report presented the waste sources, characteristics and inventory of both Department of Energy (DOE) generated and commercially generated TRU waste. In this report a wide variety of waste sources as well as a large TRU inventory were identified. The purpose of this report is to identify the different packaging systems used and proposed for TRU waste and to document their characteristics. This document then serves as part of the data base necessary to complete preparation and initiate implementation of TRU waste container and packaging standards and criteria suitable for inclusion in the present TRU waste management program. It is the purpose of this report to serve as a working document which will be used as appropriate in the TRU Waste Management Program. This report, and those following, will be compatible not only in format, but also in reference material and direction.

1009 (UCRL--84356) CRITIQUE OF RATIONALE FOR TRANSMUTATION OF NUCLEAR WASTE. Smith, C.F.; Cohen, J.J. (California Univ., Livermore (USA). Lawrence Livermore National Lab.). Jul 1980. Contract W-7405-ENG-48. 11p. (CONF-800743--3). NTIS, PC A02/MF A01.

From International conference on nuclear waste transmutation; Austin, TX, USA (22 Jul 1980).

It has been suggested that nuclear transmutation could be used in the elimination or reduction of hazards from radioactive wastes. The rationale for this suggestion is the subject of this paper. The objectives of partitioning-transmutation are described. The benefits are evaluated. The author concludes that transmutation would appear at best to offer the opportunity of reducing an already low risk. This would not seem to be justifiable considering the cost. If non-radiological risks are considered, there is a negative total benefit. (DC)

1010 (UCRL--84405) POTENTIAL OF PYROPROCESSING FOR PARTITIONING PUREX WASTES. Coops, M.S.; Sisson, D.H. (California Univ., Livermore (USA). Lawrence Livermore National Lab.). 23 Jul 1980. Contract W-7405-ENG-48. 16p. (CONF-800743--10). NTIS, PC A02/MF A01.

From International conference on nuclear waste transmutation; Austin, TX, USA (22 Jul 1980).

The processes are extremely compact. The process reagents are highly resistant to radiation damage and, therefore, can be used to handle short-cooled, highly concentrated waste with negligible degradation. Most reagents can be recycled back through the process many times, thereby minimizing the generation of waste products, and also reducing the process cost. Fission-product wastes are discharged from the process as concentrated, solid wastes, typically in a metal matrix suitable for permanent disposal. Long cooling periods are not needed prior to conversion to a suitable waste form. The recovered actinides are obtained as metals and can be easily stored or shipped. Pyrochemical processing of nuclear fuels should be considered as a second generation technology.

1011 (UJV--4113-Ch) APPLIED LABORATORY RESEARCH OF HIGH-LEVEL WASTE DENITRATION AND CALCINATION TECHNOLOGIES. PROGRESS REPORT. Napravnik, J. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Jan 1977. 21p. (In Czech). Ustav jaderneho vyzkumu CSKAE, Rez, Czechoslovakia.

Denitration and calcination processes are assessed for model solutions of high-level radioactive wastes. The kinetics was studied of the reaction of HNO_3 with HCOOH with respect to the final composition of the gaseous product. A survey is presented of used denitration agents and of reaction processes. Calcination was studied both as associated with denitration in a single technological step and separately. Also studied was the pyrolysis and chemical decomposition of sodium nitrate which forms an indecomposable melt in the temperature region of 320 to 850 degC under normal conditions. Based on the experiments a laboratory unit was designed and produced for the denitration and calcination of model solutions of high-level radioactive wastes operating in a temperature range of 100 to 550 degC with a capacity of 1000 ml/h. A boiler type stirred evaporator with electric heating (3 kW) was chosen for the denitration unit while a vertical calcinator modified from a film evaporator with a thermal

input of 4 kW was chosen for the calcination unit.

1012 (UJV--4663-Ch) STUDY OF PHOSPHATE SYSTEMS FOR HIGH-LEVEL WASTE SOLIDIFICATION. PART I. Vojtech, O.; Santarova, M.; Stejskal, I.; Suesmilch, I. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Jan 1979. 34p. (In Russian). NTIS (US Sales Only), PC A03/MF A01.

The results of the investigation of the system fission products - corrosion products - sodium, in a phosphate matrix used as a medium for high-level wastes solidification are presented. Solidification products were obtained by the thermal treatment of the initial solutions of radioactive wastes (calcination and melting procedures) with only phosphoric acid as an admixture. Final solidification products were tested for their hydrolytic resistance and structure. Standard methods for leaching and dissolution were used; for the structural analysis most results were obtained by electron microprobe analysis. The orthogonal factorial analysis was used for the mathematical interpretation.

1013 (VTT-REA--40) SUITABILITY OF USING CONCRETE FOR SOLIDIFICATION OF LIQUID RADIOACTIVE WASTES. Boesoek, Tommy; Aittola, J.-P. (Valtion Teknillinen Tutkimuskeskus, Otaniemi (Finland). Reaktorilaboratorio). Dec 1978. 23p. (In Swedish). Dep. NTIS (US Sales Only), PC A03/MF A01.

This critical review discusses the solidification of intermediate and low-level radioactive wastes. Feasibility studies of the incorporation of radioactive wastes from nuclear power plants into concrete has been done especially considering Finnish conditions. Many different types of cements and admixtures have been studied. The reported results in the literature have been somewhat conflicting and because of that the authors proposed research activities in analysing the properties of different types of cements.

1014 EPR INVESTIGATIONS OF GD^{3+} IN SINGLE CRYSTALS AND POWDERS OF THE ZIRCON--STRUCTURE ORTHOPHOSPHATES YPO_4, $SCPO_4$, AND $LUPO_4$. Rappaz, M.; Boatner, L.A.; Abraham, M.M. (Solid State Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). Journal of Chemical Physics, The ; 73: No. 3, 1095-1103(1 Aug 1980).

The tetragonal xenotime (YPO_4) and monoclinic monazite ($CePO_4$) orthophosphates are known to be chemically and physically stable in geological environments and are also radiation resistant. For these reasons, materials of this type are currently candidates for the primary containment of radioactive actinide solid wastes. Single crystals of the tetragonal orthophosphates YPO_4, $ScPO_4$, and $LuPO_4$ doped with Gd^{3+} were grown by slowly cooling a $Pb_2P_2O_7$ flux. Finely divided (<0.1 μ), rare-earth-doped powders of these materials were also prepared using a technique of precipitation in molten urea. Electron paramagnetic resonance investigations have shown that the Gd^{3+} impurities occupy identical substitutional sites in both single crystal and powder specimens of the tetragonal-symmetry orthophosphates. These results provide a basis for future investigations of the effects of heavy-particle radiation damage in the lanthanide orthophosphates.

1015 APPARATUS FOR EXTREME EVAPORATION OF SPECIAL SOLUTIONS. Lehmann, E.; Hladik, O.; Friedrich, H. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Isotopenpraxis ; 16: No. 8, 260-262(Aug 1980). (In German).

A procedure is described for extreme evaporation with good yields of dissolved matter. Some problems and the construction of the equipment are discussed in detail. Radioactive solutions from nuclear processes are used for demonstrating the efficiency of the procedure.

1016 SELECTIVE CATION-EXCHANGE SEPARATION OF CESIUM(I) ON CHROMIUM FERRICYANIDE GEL. Jain, A.K.; Agrawal, S.; Singh, R.P. (Univ. of Roorkee, India). Analytical Chemistry ; 52: No. 8, 1364-1366(Jul 1980).

The removal of ^{137}Cs from liquid streams of nuclear power plants and from processed radioactive waste of nuclear fission has received increasing attention from ion-exchange chemists. A desirable exchanger (adsorbent) for ^{137}Cs removal is one which can adsorb it significantly and selectively in the presence of appreciable amounts (approx. $2 mol L^{-1}$) of Na^+, NH_4^+, and H^+. This paper deals with the exchange properties of the inorganic exchanger, chromium ferricyanide gel (CFiC). The stability of the gel in both acid and salt solutions and its high specificity for cesium are responsible for its good scavanger properties in removing long lived ^{137}Cs from radioactive waste. The chromium ferricyanide exchanger is highly selective for monovalent cations, the order being $Ag^+ > Tl^+ > Cs^+ > Rb^+ > K^+ > Na^+$. It does not adsorb any bivalent, trivalent, and tetravalent ions even when present in trace amounts. (2 figures, 3 tables) (DP)

1017 EVOLUTION OF LOW LEVEL RADWASTE SOLIDIFICATION SYSTEMS IN THE USA. Stewart, J. Nuclear Engineering International ; 25: No. 301, 12-14(Jul 1980).

Disposal of low level radioactive waste in the USA is discussed. Rising operating costs make it essential for newer technologies to employ volume reduction techniques. Solidification systems and volume reduction systems are reviewed. Two systems which both solidify and reduce volume are described. One of these is the wiped or thin film evaporation and the other is the extender-evaporator. They both use asphalt, or bitumen, as the binder and are based on mechanical rather than chemical principles.

1018 VITRIFICATION PROCESS IMPROVES PRODUCT. Nuclear Engineering International ; 25: No. 301, 42-44(Jul 1980).

The development at the Pacific Northwest Laboratory in the USA of a new experimental technique on the vitrification of highly active liquid waste is described. In tests on non-radioactive simulated material, the liquid waste is mixed directly with glass forming matter to create a slurry which is then fed into a special liquid feed ceramic-lined electrically-heated melter. A description is given of the method of operation, together with other features including off-gas production, thermal shock, and vapour explosions.

1019 SORPTION OF ^{106}RU AND ^{95}ZR FROM PUREX SOLVENT ON ORGANIC AND INORGANIC ION EXCHANGERS. Turcanu, C.N.; Radu, D. (Institute for Nuclear Reactors, Bucharest (Romania)). Radiochemical and Radioanalytical Letters ; 43: No. 4, 245-254(15 May 1980).

The removal of ^{106}Ru and ^{95}Zr from degraded 30% TBP-dodecane system, by means of ion-

exchange resins (Dowex 1-X8, Dowex 50 W-X8, IRA-400, CS-3, CS-32, CC-11, AS-13, AT-1) and inorganic ion exchangers (iron(III) hydroxide, aluminium hydroxide and ammonium diuranate microspheres; manganese(IV) hydroxide, uranyl and aluminium phosphates; zirconium(IV), tin(II), titanium(IV) hydroxide and phosphates) has been investigated.

1020 (LA-tr--80-17) RECOVERY, PURIFICATION, AND CONCENTRATION OF PLUTONIUM AND AMERICIUM FROM THE AQUEOUS WASTES DISCHARGED IN THE REPROCESSING STUDIES. Tsujino, T.; Hoshino, T.; Yasu, S.; Kawashima, Y. (Japan Atomic Energy Research Inst., Tokyo). May 1980. Translation of JAERI-M--6106, April 1975 50p. NTIS, PC A03/MF A01.

A standard procedure has been established for use in the laboratory where plutonium and americium, from the aqueous wastes occurring in process studies on reprocessing, are recovered and purified through preliminary tests of the precipitation as hydroxides and the anion exchange in nitrate media. The procedure was proven in the treatment of actual process wastes, of which the results were contributed to determine the process conditions in the plutonium purification and product concentration of the JAERI Reprocessing Test Plant. The preliminary tests also include washing of U and Am recovery from the anion-exchanger in nitrate media, direct ion-exchange recovery of Pu from the TBP phase and elution of Am from the cation-exchanger.

1021 HIGH-LEVEL WASTE SOLIDIFICATION: WHY WE CHOSE GLASS. Grover, J.R. (Radioactive Waste R and D, Harwell, England). Radioactive Waste Management (New York) ; 1: No. 1, 1-12(May 1980).

This paper considers the desirable properties and factors to be assessed in the selection of a solidified waste product, surveys the possible product options and then analyzes in detail their suitability in meeting the criteria. It concludes that glasses are currently the preferred choice for the following reasons: their ability to fix the full spectrum of elements contained in the waste; their tolerance of the composition variations that will occur on a day to day basis in practice; their relatively low formation temperatures that lead to simpler and hence safer processing; their radiation stability; and their adequate leach rates. Suitable compositions are available for the wastes that will arise in the UK and techniques are available for manufacture on a production scale. Lower leach rates might be obtained by choosing glasses with higher formation temperatures or ceramics. However, these latter generally also have higher formation temperatures, have less tolerance for composition variations and their radiation stability is unproven. Supercalcines and synthetic rocks (SYNROC) may eventually be demonstrated to have some advantageous properties, but present indications are that these could be major disadvantages which more than offset any gains. Other advanced concepts (for example, the dispersion of glass beads in a metal matrix) have lower leach rates, but lead to additional complexity in manufacture.

1022 EXTRACTION CHROMATOGRAPHIC REMOVAL OF NP AND PU DURING THE REPROCESSING OF SPENT TH-U FUEL. Wenzel, U.; Merz, E.; Ritter, G. (Inst. of Chemical Tech., Juelich, Germany). Separation Science and Technology ; 15: No. 4, 733-743(May 1980).

Spent high enriched U-Th mixed oxide fuels contain small amounts of the actinides Np and Pu. Although these elements cannot be economically recovered for fuel value, current fuel cycle and waste treatment concepts tend to require that processes be developed to include both elements in one of the Thorex reprocessing effluent streams. Chromatographic separation is described as a method to isolate Pu and Np for subsequent disposal.

1023 APPLICATION OF EXTRACTION CHROMATOGRAPHY TO THE RECOVERY OF NEPTUNIUM, PLUTONIUM AND AMERICIUM FROM AN INDUSTRIAL WASTE. Madic, C.; Kertesz, C.; Sontag, R.; Koehly, G. (Centre d'Etudes Nucleaires, Fontenay aux Roses, France). Separation Science and Technology ; 15: No. 4, 745-762(May 1980).

A pilot scale investigation was made to evaluate the possible application of the extraction chromatographic method (LLC) to the partitioning of alpha emitters from liquid wastes containing traces of transuranium elements. A secondary purpose was to obtain pure AmO_2, which is used to produce alpha, gamma, and neutron sources. The process developed for alpha partitioning consists essentially of the extraction of macro amounts of uranium with 30% TBP in dodecane in mixer-settlers, then coextraction of Np-237, Pu-239, and Am-241 by LLC on a macro column filled with di-n-hexyl-octoxy-methyl-phosphine oxide (POX.11) adsorbed on an inert support. In each run about 200 liters of initial waste are decontaminated of alpha emitters. The loading step is followed by selective elution of americium, neptunium, and plutonium. The americium eluate is then subjected to the following operations: (1) separation of Am from Fe and Cd by LLC on a TBP column and (2) separation of Am from lanthanide traces by LLC on an HD(DiBM)P column after oxidation of Am(III) to Am(VI). The Am in the eluate is subsequently reduced to Am(III) and precipitated as oxalate with oxalic acid. The oxalate is then filtered and calcined to yield pure AmO_2.

1024 REDUCING THE LONG-TERM HAZARD OF REACTOR WASTE THROUGH ACTINIDE REMOVAL AND DESTRUCTION IN NUCLEAR REACTORS. Liljenzin, J.O.; Rydberg, J.; Skarnemark, G. (Chalmers Univ. of Tech., Goeteborg, Sweden). Separation Science and Technology ; 15: No. 4, 799-824(May 1980).

Public opposition to nuclear power has focused on the long-term risks from reactor waste. In the Purex process used in Europe, this waste is a concentrated nitric acid solution containing all nonvolatile fission products and the actinides Np, Am, and Cm, plus smaller amounts of U and Pu. Techniques have recently been described which guarantee an absolutely safe containment of this high-active waste (HAW) for about 1000 years. At longer times, the risk to the biosphere is dominated by the actinides. If these actinides are isolated from the rest of the HAW and destroyed through nuclear incineration, the long-term risks of the HAW will be dramatically reduced. This paper presents a detailed scheme for removing the actinides from the Purex-HAW solution. In principle, the process consists of three different solvent extraction cycles, using HDEHP and TBP in three successive steps. The scheme has been tested on a synthetic HAW solution containing all fission products and actinides (except Z greater than or equal to 96, Cm) using laboratory-scale mixer-settler batteries. Results from runs on old Purex waste are also presented. If applied to fresh Purex waste, the process will encounter problems due to radiation damage to the reagents. In

practice, this difficulty can be circumvented by using short contact times in the solvent extraction process. Extremely rapid multistage solvent extraction separations can be carried out by theSISAK technique (i.e., batteries of static mixers and special centrifugal separators). This technique is also described.

1025 DESORPTION KINETICS OF METHYL IODIDE FROM IMPREGNATED CHARCOAL. Jonas, L.A. (Army Research and Development Command, Aberdeen Proving Ground, MD); Deitz, V.R.; Romans, J.B. Nuclear Technology ; 48: No. 1, 77-83(Apr 1980).

The effect of outdoor weathering of impregnated charcoal beds used for the trapping and retention of methyl ^{127}I vapor was studied under various dynamic flow conditions. The data showed that the first or inlet segment of the bed suffered the greatest degradation in its role as a guard layer for the remaining segments of the bed. Test results were analyzed in terms of the parameters of adsorption capacity and adsorption and desorption rate constants. As was expected, the desorption rate constant was much smaller than the adsorption rate constant. The dimensionless ratio of the adsorption to the desorption rate constant can be considered as a retentivity index for any particular charcoal.

1026 ASSESSMENT OF THE ACCEPTABILITY OF PERFORMANCE OF INSTALLED IODINE TRAPPING PLANT: COMMENTS ON THE PAPER BY HYAM AND MANLEY IN NUCLEAR ENERGY, FEBRUARY 1979, AND A REPLY FROM THESE AUTHORS. May, F.G. (Australian Atomic Energy Commission, New South Wales. Aerosol Physics Group, Safety Dept.). Nuclear Energy (Formerly Nuclear Energy Engineer) ; 19: No. 2, 123-127(Apr 1980).

It is claimed that the article by Hyam and Manley 'Assessment of the acceptability of performance of installed iodine trapping plant', appearing in the February 1979 issue of Nuclear Energy, is based on at least three false premises. These are defined and are discussed. A reply by the authors then follows.

1027 CONFINEMENT OF RUTHENIUM OXIDES VOLATILIZED DURING NUCLEAR FUELS REPROCESSING. Maas, E.T. Jr.; Longo, J.M. (Exxon Research and Engineering Co., Linden, NJ). Nuclear Technology ; 47: No. 3, 451-456(Mar 1980).

While many materials have been suggested and employed as trapping agents for gaseous oxides of fission product ruthenium volatilized during nuclear fuels reprocessing, none that is known to form thermodynamically stable compounds with rutheniunm has been utilized. We have employed alkaline earth metal compounds for this purpose because of their ability to form stable mixed metal oxide phases with ruthenium. Results of experiments in which RuO_4 was volatilized from either a solid source ($RuO_2.xH_2O$) or from solution [$Ru(NO)(NO_3)_3$] in HNO_3 and passed through beds of alkaline earth metal carbonates and calcium oxide held at 600 to 750°C have demonstrated that compounds of formulation $MRuO_3$ (M = calcium, strontium, barium) are formed. Under oxidizing conditions, these materials exist as stable ceramic phases, whereas under reducing conditions, they are transformed into intimate mixtures of the alkaline earth metal oxide and nonvolatile ruthenium metal.

1028 RECOVERING ACTINIDE VALUES. Horwitz, E.P.; Mason, G.W. (to Department of Energy, Washington, DC (USA)). British Patent 2,027,257/A/. 13 Feb 1980. 5p.

Actinide values are recovered from sodium carbonate scrub waste solutions containing these and other values along with organic compounds resulting from the radiolytic and hydrolytic degradation of neutral organophosphorus extractants such as tri-n butyl phosphate (TBP) and dihexyl-N, N-diethyl carbamylmethylene phosphonate (DHDECMP) which have been used in the reprocessing of irradiated nuclear reactor fuels. The scrub waste solution is made acidic with mineral acid, to form a feed solution which is then contacted with a water-immiscible, highly polar organic extractant which selectively extracts the degradation products from the feed solution. The feed solution can then be processed to recover the actinides for storage or recycled back into the high-level waste process stream. The extractant can be recycled after stripping the degradation products with a neutral sodium carbonate solution.

1029 PROCEDURE TO CONVERT MEAN AND LOW ACTIVITY RADIOACTIVE WASTES. Taponier, J.; Pierlas, R. (to Societe Generale pour les Techniques Nouvelles S.G.N., 78 - Saint-Quentin-en-Yvelines (France)). French Patent 2,431,167/A/. 8 Feb 1980. 8p. (In French).

A procedure to convert mean and low activity radioactive effluents into a suitable solid is described. Radioactive compounds are precipitated in this procedure in which 0.6 to 2 parts (by weight) of cement are mixed with 0.5 to 5% (by weight) of asbestos (relative to the cement) together with the necessary quantity of water for the cement to set, and in addition, with 5 to 30% (by weight) of bitumen (relative to the cement).

1030 (PNL-TR--386) FABRICATION AND CHARACTERIZATION OF AN IMPROVED BOROSILICATE GLASS FOR SOLIDIFICATION OF HIGH-LEVEL FISSION-PRODUCT SOLUTIONS (HLW). PART 1. STUDIES OF 25 BOROSILICATE-GLASS PRODUCTS FOR SELECTION OF AN IMPROVED BOROSILICATE GLASS. Guber, W.; Hussain, M.; Kahl, L.; Ondracek, G.; Saidl, J.; Dippel, T. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). 4 Feb 1980. Translation of KFK--2721, August 1979 52p. Dep. NTIS, PC A04/MF A01.

The proportion of the glass constituents in the glass were varied. Taking gadolinia-containing waste into account, this approach led to 25 different basis glasses. Using the basic glasses and 15 wt % of inactive HLW oxides in each case, 25 borosilicate-glass products were melted in the laboratory, under conditions approximating the industrial fabrication process. The density, thermal conductivity, thermal expansion, characteristic temperatures, viscosity, specific heat, vaporization losses from the glass melt, electrical conductance, mechanical strength, hydrolytic resistance, crystallization behavior and tendency towards formation of additional phases were determined. On the basis of the individual values obtained, the glass products GP 98/12 (without Gd_2O_3) and GP 98/26 (with Gd_2O_3) were selected as improved matrix glasses for further characterization. The hydrolytic resistance, viscosity at 1420°K, crystallization tendency and tendency towards formation of further phases proved to be the most important.

1031 TREATMENT AND DISPOSAL OF RADIOACTIVE WASTES FROM THE VIEWPOINT OF THE NUCLEX 78. Koerner, W. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin

(German Democratic Republic)). Kernenergie ; 23: No. 2, 44-48(Feb 1980). (In German).
The results and consequences of the NUCLEX 78 are considered in form of a progress report on treatment and disposal of radioactive wastes from the nuclear fuel cycle. Investigations performed in the USA, Western Europe, and Japan are concerned with rationalization of the treatment processes for low-level and intermediate-level radioactive wastes and with the development of industrial methods of high-level waste solidification. In the field of ultimate storage, utilization of stable rock layers in the deep underground - especially of salt rocks - is evaluated to be the only available method of long-term isolation of high-level radioactive wastes and wastes containing long-lived alpha emitters. After technical and economical as well as safety works will have been concluded, commissioning of repositories in the underground is to be expected in the mid nineties.

1032 FURTHER DEVELOPMENTS OF BOROSILICATE GLASS FOR THE NITRIFICATION OF HIGH-LEVEL FISSION PRODUCT SOLUTIONS. Dippel, T.; Kahl, L.; Saidl, J. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Entsorgungstechnik). Atomwritschaft, Atomtechnik ; No. 2, 81-82(Feb 1980). (In German).
BORON SILICATES;CHEMICAL COMPOSITION;GLASS; HIGH-LEVEL RADIOACTIVE WASTES;OPTIMIZATION; VITRIFICATION;BOROSILICATE GLASS;RADIOACTIVE WASTE PROCESSING;SOLIDIFICATION

1033 INFLUENCE OF VARIOUS POLLUTIONS ON THE EFFICIENCY OF NOBLE METAL CATALYSTS. Berndt, M.; Ksinsik, D. (Duerrwaechter (E.) Doduco K.G., Pforzheim (Germany, F.R.)). Chemische Technik (Berlin) ; 9: No. 2, 63-65(Feb 1980). (In German).
In many processes where there is the danger of an oxyhydrogen gas formation, the oxygen or hydrogen concentration may be reduced by catalytic combustion to residual contents way below the explosion limit. This process step is also used in nuclear power plants to mainly decompose the hydrogen arising from radiolysis in normal operation. Under certain conditions, the hydrogen could be removed even in the presence of various impurities. The dependence of the catalyst effect on the concentration of the materials admitted was investigated.

1034 REDUCTION IN THE TOXICITY OF FISSION PRODUCT WASTES THROUGH TRANSMUTATION WITH DEUTERIUM-TRITIUM FUSION NEUTRONS. Parish, T.A.; Davidson, J.W. (Tex AandM Univ, College Station). Nuclear Technology ; 47: No. 2, 324-342(Feb 1980).
A waste management concept that employs irradiation of fission products in fusion reactor blankets is evaluated. The purpose of the irradiation is to reduce the toxicity of the material to be committed to geologic disposal. Extensive chains were employed in the depletion calculations performed to quantify the toxicity of the products. A sharp reduction in the short-term toxicity of the fission wastes could not be accomplished due to the small capture cross sections of /sup 90/Sr and /sup 137/Cs and limitations on the neutron flux.

1035 METHOD AND APPARATUS FOR SEPARATING MATERIALS. Moody, B.R. (to Taylor Hitec Ltd., Chorley (UK)). British Patent 2,025,268/A/. 23 Jan 1980. 6p.
A method and apparatus is described for the separation of individual constituents from an aggregation of materials, for example, the separation of metals from non-metals or of different metals from one another using magnetic fields. It is claimed that the system is of particular use in the breakdown of scrap for recycling and disposal in particular for the automatic, safe sorting of radioactive waste prior to storage or disposal.

1036 METHOD AND EQUIPMENT TO STRIP TRACES OF NOBLE GAS, PARTICULARLY KRYPTON, FROM A GAS MIXTURE HAVING CARBON DIOXIDE AS A COMPONENT. Laser, M.; Beaujean, H. (to Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,131,507/C/. 10 Jan 1980. 5p. (In German).
The separation of krypton traces of about 200 ppm from the CO_2-contained waste gases of a processing plant for graphite nuclear fuel, is carried out by condensing the CO_2 until liquefaction begins and washing with liquid CO_2 as washing agent. The washing process takes place at temperatures between -50°C and +30°C. The washing process is combined with rectification of the washing agent.

1037 METHOD OF TREATING RADIOACTIVE WASTE MATERIAL. Allison, W. (to B and R Engineering Ltd., Chorley (UK)). British Patent 2,024,498/A/. 9 Jan 1980. 2p.
A method of treating radioactive waste material, particularly a radioactive sludge, is described comprising separating solid material from liquid material, compressing the solid material and encapsulating the solid material in a hardenable composition such as cement, bitumen or a synthetic resin. The separation and compaction stages are conveniently effected in a tube press.

1038 (PNL-TR--377) PRESENT STATUS OF TECHNIQUES USED FOR HIGH-LEVEL LIQUID-WASTE SOLIDIFICATION. Sombret, C. 8 Jan 1980. Translated from Annual meeting of IAEA Technical Committee on Alpha-Bearing Waste, Cadarache, France, October 1979 55p. Dep. NTIS, PC A04/MF A01.
Many nations have pursued research on the solidification of high-level liquid wastes. The different waste forms under consideration are distinguished. Techniques used in making calcinates, glass-metal composites, modified calcinate-metal composites, and glasses (batch and continuous processes) are discussed, particularly the latter. Developments achieved in different countries are summarized. 17 figures. (DLC)

1039 (PNL-TR--387) MATERIAL STUDIES ON SOLIDIFICATION OF MEDIUM-LEVEL WASTE SOLUTIONS WITH CEMENT: LEACHABILITY OF CESIUM AND STRONTIUM. Rudolph, G.; Koester, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Jan 1980. Translation of KFK--2842, August 1979 50p. Dep. NTIS, PC A03/MF A01.
Two leaching techniques, i.e., the IAEA method and an accelerated test, were used to search for methods of reducing the leachability of cesium and strontium from products formed during cementation of medium-level waste solutions from reprocessing plants. A certain natural calcium bentonite lowers the leachability of cesium by a factor of up to 100. This effect increases with the quantity added. Strontium leachability can be reduced to a smaller extent by addition of a barium silicate hydrate. This effect is found particularly at high temperature. Leaching into

a salt brine which is in equilibrium with carnallite and other salts is significantly lower than into distilled water. Excess cesium increases the leachability of cesium. Other parameters such as cement type, curing time, fluidizers and salt content have little or even no influence. Tests on the settlement behavior of cement mortars containing simulated waste solution revealed very unfavorable behavior of blast-furnace slag cement.

1040 UNCONVENTIONAL WASTE TREATMENT AND DISPOSAL METHODS. Bobleter, O. (Innsbruck Univ. (Austria). Inst. fuer Radiochemie und Angewandte Physikalische Chemie). Atomkernenergie/Kerntechnik ; 35: No. 2, 125-127(1980). (In German).

The relative toxicity index (RTI) of geologically deposited light water reactors wastes is given as an ascertained basis of comparison for other waste treatment and disposal methods. On the other hand, it is doubtful whether an 'exhausting extraction' of U, Np, Pu and Am is technically feasible, or even advantageous from a safety point of view. The transmutation of fission products and actinides into short-lived nuclides is in most expensive and, compared with geological disposal, hardly brings a gain in safety. The disposal of separated actinides in outer space could be achieved with a justified increase in the electricity price. By using high active waste of reactors to fuel heating rods, considerable amounts of oil could be saved.

1041 CERAMIC ENCAPSULATION OF NUCLEAR FUEL WASTES. Larker, H.T. (ASEA, Robertfors (Sweden)). Jernkontorets Annaler ; No. 1, 59-61(1980). (In Swedish).

Methods for encapsulation of high level radioactive wastes or spent fuel elements are described. Ceramic materials of very high corrosion resistance are produced through the process of hot isostatic pressing (typcally 1000 bar at 1300 deg C) 3 m high containers of synthetic corundum are suggested for the disposal of fuel elements.

1042 VITRIFICATION OF ACTUAL HIGH-LEVEL WASTE FROM LIGHT WATER REACTOR FUEL. Bjorklund, W.J.; Hansen, M.S. (Battell Pacific Northwest Lab., Richland, WA). pp 396-401 of Proceedings of the 27th conference on remote systems technology. Wallin, D.R. (ed.). La Grange Park, IL; American Nuclear Society, Inc. (1980).

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

The high-level waste from the processing of 1.5 MT of spent light water reactor fuel has been successfully concentrated, dried, and converted to a vitreous product consisting of 94 l of glass contained in two stainless-steel canisters. The spray-calcination process coupled to the in-canister vitrification process as developed at Pacific Northwest Laboratory was used to solidify the waste. An effluent system consisting of a variety of condensation and scrubbing steps gave more than adequate cleanup to the process off-gas before it was released to the atmosphere.

1043 HIGH LEVEL WASTE CONTAINING GRANULES COATED AND EMBEDDED IN METAL AS AN ALTERNATIVE TO HLW GLASSES. Neumann, W. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Seibersdorf. Inst. fuer Metallurgie). Atomkernenergie/Kerntechnik ; 35: No. 4, 297-299(1980). (In German).

Simulated high level waste containing granules were overcoated with pyrocarbon or nickel respectively. The coatings were performed by the use of chemical vapour deposition in a fluidized bed. The coated granules were embedded in an aluminium-silicon-alloy to improve the dissipation of radiation induced heat. The metal-granules-composites obtained were of improved product stability related to the high level waste containing glasses.

1044 ACTINIDE PARTITIONING FLOWSHEETS. Tedder, D.D.; Finney, B.C.; Blomeke, J.O. (Oak Ridge National Lab., TN). pp 381-393 of Actinide separations. Navratil, J.D.; Schulz, W.W. (eds.). Washington, DC; American Chemical Society (1980).

From 177. national meeting of the American Chemical Society; Honolulu, HI, USA (1 Apr 1979).

The actinide partitioning program will show that alpha-bearing wastes can probably be partitioned to a level that would significantly reduce the acitinide concentrations in the resulting wastes. Also, the waste quantities would not be greatly increased because of waste treatment facility (WTF) operation. No increase in HL glass quantities is anticipated. The LL and IL fuel reprocessing concrete wastes would increase about 25% in volume while the fuel fabrication waste volumes would increase about 16% with these flowsheets. However, the WTF that partitions fuel reprocessing wastes may actually be larger in size than the main reprocessing plant itself. It appears technically feasible to develop chemical systems for dealing with all types of alpha wastes, but these treatment systems are themselves highly complex. A simple Purex plant only uses one solvent (i.e. TBP); a WTF would utilize at least three different solvents (i.e. TBP, CMP, and 2-ethylhexanol). In addition, the WTF would require complex mechanical hot cells to treat HEPA filter wastes and incinerator ashes, as well as operate a bank of cation exchange chromatography columns. Although the CEC system might be replaced with an equivalent solvent extraction cycle, this improvement would be small since the resulting WTF would then be utilizing four different solvents.

1045 FLOWSHEET DEVELOPMENT WORK AT THE IDAHO CHEMICAL PROCESSING PLANT FOR THE PARTITIONING OF ACTINIDES FROM ACIDIC NUCLEAR WASTE. McIsaac, L.D.; Baker, J.D.; Krupa, J.F.; Meikrantz, D.H.; Schroeder, N.C. (Allied Chemical Corp., Idaho Falls, ID). pp 395-410 of Actinide separations. Navratil, J.D.; Schulz, W.W. (eds.). Washington, DC; American Chemical Society (1980).

From 177. national meeting of the American Chemical Society; Honolulu, HI, USA (1 Apr 1979).

The chemical composition of acid ICPP waste is discussed. The ICPP actinide partitioning program and its latest findings are summarized. DHDECMP and DBDECMP were evaluated as extractants. The problem of mercury extraction and stripping is considered. The flowsheet is outlined. Mini-mixer-settler tests were run, and cold pilot-plant tests are in progress. 6 tables, 3 figures. (DLC)

1046 RECOVERY OF BY-PRODUCT ACTINIDES FROM POWER REACTOR FUELS AND PRODUCTION OF HEAT SOURCE ISOTOPES. Koch, G. (Kernforshungszentrum Karlsruhe, Germany). pp 411-425 of Actinide separations. Navratil, J.D.; Schulz, W.W. (eds.). Washington, DC; American Chemical Society (1980).

From 177. national meeting of the American

Chemical Society; Honolulu, HI, USA (1 Apr 1979).

This paper reviews the processes which were designed by Institut fuer Heisse Chemie for the recovery of raw-material actinides from power reactor fuels and for the production of heat-source isotopes, and describes the state of development which has been reached. These processes include ^{237}Np recovery in WAK plant, recovery of $^{241-243}Am$ and ^{244}Cm from high-level waste, ^{241}Am recovery from Pu scrap, ^{238}Pu recovery from irradiated ^{237}Np, and production of medical-grade ^{238}Pu from irradiated ^{241}Am. 3 figures. (DLC)

1047 SEPARATION OF ACTINIDES FROM PUREX-TYPE HIGH ACTIVE WASTE RAFFINATES: DEVELOPMENT OF EXPERIMENTAL STUDIES AT JRC-ISPRA ESTABLISHMENT. Cecille, L.; Dworschak, H.; Girardi, F.; Hunt, B.A. (JRC-ISPRA Establishment, Varese, Italy). pp 427-440 of Actinide separations. Navratil, J.D.; Schulz, W.W. (eds.). Washington, DC; American Chemical Society (1980).

From 177. national meeting of the American Chemical Society; Honolulu, HI, USA (1 Apr 1979).

On the basis of the laboratory indications presently available, all three proposed partitioning processes appear to be feasible and to have the potential for removing actinides from HAW (TBP, HDEHP, OXAL) up to the necessary level. Additional data on the actinide losses to the various secondary waste streams, on the radiation stability of the chemicals used for stripping operations, as well as on their recycle or removal as wastes still need to be obtained on laboratory scale for fully active HAW. The obtained results will provide the basis for deciding whether to proceed or not to a pilot plant scale experimentation. Until such experiments are performed it will be impossible to demonstrate the overall feasibility of the selected partitioning process with an acceptable degree of reliability. 3 figures, 4 tables.

1048 SEPARATION OF ACTINIDES FROM HIGH ACTIVE WASTE BY MEANS OF COUNTER CURRENT ION MIGRATION. Bilal, B.A.; Herrmann, F.; Metscher, K.; Muehlig, B.; Reichmuth, C.; Schwarz, B. (Hahn-Meitner-Insitut fuer Kernforshung, Berlin, Germany). pp 561-569 of Actinide separations. Navratil, J.D.; Schulz, W.W. (eds.). Washington, DC; American Chemical Society (1980).

From 177. national meeting of the American Chemical Society; Honolulu, HI, USA (1 Apr 1979).

In the countercurrent ion migration process, the actinides in the waste are separated in one stage with a high decontamination factor (approx.10^6). The aqueous medium is less radiosensitive. Principles of the migration process and the processing of high active waste are discussed. Discontinuous and continuous separation of the actinides from the waste are considered. The energy necessary for this separation is estimated to be approx.10^{-5} of the energy gained in the fuel in a LWR. (DLC)

1049 SOLVENT EXTRACTION OF TRANSPLUTONIUM ELEMENTS FROM ACID SOLUTIONS BY POLYDENTATE NEUTRAL ORGANOPHOSPHORUS COMPOUNDS AND FROM ALKALINE SOLUTIONS BY QUATERNARY AMMONIUM BASES AND BY ALKYLPYROCATECHOLS. Myasoedov, B.F.; Chmutova, M.K.; Karalova, Z.K. (Inst. of Geochemistry and Analytical Chemistry, Moscow). pp 101-115 of Actinide separations. Navratil, J.D.; Schulz, W.W. (eds.). Washington, DC; American Chemical Society (1980).

From 177. national meeting of the American Chemical Society; Honolulu, HI, USA (1 Apr 1979).

Polydentate organophosphorus compounds appear to be efficient extractants of trivalent transplutonics (TPE) from acidic solutions. Full-scale use of these compounds in TPE extraction from nuclear acidic waste solutions seems likely in the future. It may be possible to develop highly selective extractants capable of TPE separation from each other as well as from rare earth elements. Some of the reagents described may be used for extraction chromatography separation of certain TPE whose separation factors are high enough. Studies have shown that in the presence of complex-forming agents, actinides and lanthanides can be extracted from alkaline solution by using aliquat 336 and 4 (α,α-dioctylethyl)pyrocatechol, preferably the latter.

1059 DESCRIPTION OF AN INCINERATOR FOR PHOSPHORUS-CONTAINING RADIOACTIVE SOLVENTS. Gale, L.G. (Energy Inc, Idaho Falls, Idaho). pp 615-621 of Proceedings of National Waste Processing Conference, 9th Biennial Resource recovery Today and Tomorrow, 1980. New York, NY: American Society of Methanical Engineers (1980).
From 9. biennial national waste process conference: Washington, DC, USA (11 May 1980).
This paper describes the design and development of an incinerator to process waste solvents containing phosphorus from nuclear fuel reprocessing facilities. A unique feature is a fluidized bed composed of limestone in which combustion occurs and, simultaneously, phosphorus combines with calcium to form a stable, solid product. Solid separators and adsorbers clean the exhaust gas before release to the atmosphere.

1060 APPARATUS AND PROCESS FOR RECOVERING NUCLEAR FUEL FROM SCRAP MATERIAL. Divins, L.A.; Short, L.E. (to General Electric Co.). US Patent 4,177,241. 4 Dec 1979. Filed date 8 Sep 1977. 8p.
A process for recovering compounds of enriched nuclear fuel from scrap materials is disclosed. The process yields an acid solution with the nuclear fuel dissolved therein. Except for spent filter media, the scrap materials are calcined to produce an oxidized material, which is reduced to a particulate material and leached in an acid bath that contains some recycled acid to yield an acid solution of the nuclear fuel material. The scrap materials comprised of spent filter media are mulched and contacted with the acid solution. The insoluble materials are separated from the acid solution, and at least a portion of the acid solution is recycled to the leaching step, while the remainder of the acid solution is collected for subsequent treatment to recover the dissolved nuclear fuel material. Apparatus for performing the foregoing process is also disclosed.

1061 SAFETY ASPECTS OF LIGHT WATER REACTOR RADWASTE SOLIDIFICATION PROCESSES. Mergan, L.; Storrer, J.; Verbeke, R.; Cordier, J.P. (Belgonucleaire Rue du Champ de Mars, Brussels,

Belgium). Nuclear Technology ; 46: No. 3, 606-610(Dec 1979).

Safety problems have been reported from existing radwaste solidification installations (unsetting, free water, decontamination difficulties, outage, etc.). Safety requirements to be applied to such processes are proposed, first from the standpoint of installation features and equipment (i.e., proven process, simplicity, equipment choice, remote decontamination, layout, remote control, backup means) and second, as regards the properties of the solidified end products. The volume reduction technique (four different types of processes are mentioned) offers appreciable safety improvements and important cost savings. Given figures (experimental and calculated) indicate that solidified end product volumes are reduced by a factor of 7 to 8.5 or more.

1062 METHOD FOR ENCAPSULATION OF HIGH LEVEL RADIOACTIVE NUCLEAR FUELS OR WASTES. Larker, H. (to ASEA-ATOM AB, Vaesteraas (Sweden)). Swedish Patent 7,704,488-1/B/. Dec 1979. 7p. (In Swedish).

A method for the encapsulation of spent fuel elements or vitrified high-level radioactive wastes is described. The spent fuel elements or vitrified wastes are placed in a cylindrical pre-sintered aluminium oxide container. The upper end of the cylinder and the lid have conical closing surfaces, which are pickled or sandblown to improve cohesion to a layer of aluminium oxide powder between the surfaces. This layer is sintered in a special oven in which insulation on the outer surface and bottom of the closely fitting gas-tight steel container in which the sintered container is placed restricts the heating mainly to the lid and closure. The oven is pressurised by gas. An alternative form with a convex hemispherical lid is also shown and the patent also covers a bottle-shaped configuration.

1063 METHOD AND EQUIPMENT TO EXTRACT AND RECOVER TRITIUM FROM LIGHT AND HEAVY WATER. Butler, J.P.; Hammerli, M.M. (to Atomic Energy of Canada Ltd., Ottawa, Ontario). German(FRG) Patent 2,900,912/A/. 22 Nov 1979. 17p. (In German).

A combined electrolysis-catalysis exchange process is proposed to extract tritium, with the aim of being able to reduce the tritium value in the heavy water moderation and cooling system of nuclear power plants. The tritium-contained water is brought into contact in a catalyst column in countercurrent with electrolytically produced hydrogen in this process, the hydrogen is then fed to a catalyst-containing separation column whilst the tritium-contained water flows to the electrolysis cell which produces the hydrogen gas. The process is described in detail.

1064 RADIOACTIVE LIQUID WASTE PROCESSING METHOD. Kubota, M.; Fukase, T. (to Japan Atomic Energy Research Inst., Tokyo; Mitsubishi Chemical Industries Ltd., Tokyo (Japan)). Japanese Patent 54-149,000/A/. 21 Nov 1979. 4p. (In Japanese).

Purpose: To separate molybdenum or zirconium together with tellurium efficiently by adding tellurium compounds to a nitric acid solution containing radioactive substances and molybdenum or zirconium. Method: Tellurium compounds (for example telluric acid) are added to a nitric acid solution containing radioactive substances and molybdenum or zirconium. The solution is heated to boil by a heater. This heating completes the precipitating reactions for molybdenum, zirconium and tellurium, and facilitates the succeeding operations such as filtration for the resulted precipitates. The resulted precipitates are separated by way of filtration and centrifugal separation to thereby separate molybdenum or zirconium. The removal rate for molybdenum or the like from the solution can be increased to more than 80% by processing the solution containing the radioactive substances by this method.

1065 PROCESS FOR DISPOSAL OF AQUEOUS SOLUTIONS CONTAINING RADIOACTIVE ISOTOPES. Colombo, P.; Neilson, R.M. Jr.; Becker, W.W. (to Dept. of Energy). US Patent 4,174,293. 13 Nov 1979. Filed date 12 Oct 1977. 8p. PAT-APPL-841,410.

A process for disposing of radioactive aqueous waste solution in which the waste solution is utilized as the water of hydration to hydrate densified powdered portland cement in a leakproof container is described. The waste solution is dispersed without mechanical inter-mixing in situ in the bulk cement. Thereafter the hydrated cement body is impregnated with a mixture of a monomer and polymerization catalyst to form polymer throughout the cement body. The entire process is carried out while the temperature of the components during the process is maintained at a temperature below 99°C. The container containing the solid polymerimpregnated body is thereafter stored at a radioactive waste storage dump such as an underground storage dump.

1066 PROCESS FOR PROCESSING AND CONDITIONING RADIOACTIVE EFFLUENTS OF LOW AND MEDIUM ACTIVITY. Taponier, J.; Pierlas, R. (to Societe Generale pour les Techniques Nouvelles S.G.N., 78 - Saint-Quentin-en-Yvelines (France)). French Patent 2,423,035/A/. 9 Nov 1979. 14p. (In French).

A procedure is described for processing radioactive effluents of low and medium activity. It consists of an effluent pre-treatment: of radioactive compounds by purification to form a stable suspension that can be concentrated. Then a mix is made of 0.6 to 2 parts of cement by weight for one part by weight of suspension, from 0.5 to 5% by weight, of asbestos fibre in relation to the cement, and, if necessary, add water to tthe cement to set, this suspension containing from 15 to 75% by weight of dry extract and a suspension agent. The homogeneous mix achieved is poured into a container.

1067 EXTRACTION METHOD OF TRITIUM. Shimizu, M. (to Doryokuro Kakunenryo Kaihatsu Jigyodan). US Patent 4,173,620. 6 Nov 1979. Priority date 27 Dec 1976, Japan, 6p.

An extraction method of a high purity tritium gas from tritium-containing heavy water is disclosed. Tritium-containing heavy water is led from a heavy water source into an exchange reaction column wherein the heavy water is brought into contact with a tritium-containing heavy hydrogen to thereby transfer tritium in the heavy hydrogen into the heavy water by way of the exchange reaction to obtain a tritium-enriched heavy water. The resulting tritium-enriched heavy water is then led to a heavy hydrogen gas generator such as an electrolytic cell to generate a tritium-enriched heavy hydrogen, a part of which is recycled to the exchange reaction column and the remaining part thereof is led into a hot-wire type thermal diffusion column, e.g. cascade to enrich tritium. The thus enriched tritium gas is

withdrawn from the thermal diffusion column cascade. The tritium-depleted heavy hydrogen withdrawn from the exchange reaction column is burnt to produce a tritium-depleted heavy water which is then recycled to both the heavy water source and the exchange reaction column.

1068 METHOD OF TREATING WASTE MATERIAL CONTAINING RADIOACTIVE CESIUM ISOTOPES. Hayes, J.F. US Patent 4,173,546. 6 Nov 1979. Filed date 26 Apr 1978. 10p.

A method is described for treating waste materials containing radioactive cesium isotopes. The process involves mixing an aqueous solution of an alkali metal silicate (sodium is the most desireable alkali metal), a hardening agent (Portland cement is readily available), and a plurality of shale particles with the waste materials. Once the mass has solidified, it may then be exposed to the leaching action of an aqueous environment. Results have shown that the leachability of cesium from a solidified mass is greatly reduced when shale is present in the solidified material. 14 claims.

1069 COMPARISON OF ANION EXCHANGE RESINS FOR RECOVERING PLUTONIUM FROM NITRIC ACID WASTE. Navratil, J.D.; Martella, L.L. (Rockwell International, Golden, CO). Nuclear Technology ; 46: No. 1, 105-109(Nov 1979).

Microreticular and macroreticular anion exchange resins were compared for their capability of recovering plutonium from nitric acid waste streams. Plutonium breakthrough capacity and elution behavior of the resins were determined as a function of resin properties. Small-bead microreticular resins with a polystyrene matrix containing 4% divinylbenzene cross-linkage showed the best performance. Of the 20- to 50-mesh resins, the macroreticular resin, Amberlite IRA-938, gave the highest plutonium breakthrough capacity and eluted plutonium the fastest.

1070 EXPERIMENTAL EQUIPMENT FOR THE STUDY OF HIGH-LEVEL WASTE FIXATION. Stejskal, J.; Vojtech, O.; Pacovsky, V.; Konarek, F. Nukleon ; No. 3, 25-27(Nov 1979). (In Czech).

Experimental equipment is described for the research of high-level radioactive waste solidification. The main part of the equipment consists of a resistance furnace of a cylindrical shape with six superkanthal heating coils placed vertically. The furnace outer diameter is 600 mm, its outer height is 1200 mm, its weight approx. 450 kg. The maximum power consumption is 8.5 kW. In long-term operation, operating temperatures of up to 1450 degC may be reached. The whole equipment is installed in a hot cell and is remotely controlled.

1071 SEPARATION OF NOBLE GAS MIXTURES BY LOW TEMPERATURE RECTIFICATION: DEVELOPMENT FOR THE PURIFICATION OF THE OFFGAS OF NUCLEAR FACILITIES. von Ammon, R.; Burkhardt, H.G.; Hutter, E.; Neffe, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Berichte der Bunsengesellschaft fuer Physikalische Chemie ; 83: No. 11, 1143-1147(Nov 1979). (In German).

A separation process is under development for the retention of the gaseous radioactive fission isotope Kr-85 from the offgas of nuclear facilities on the basis of the air liquefaction process which is used for the commercial isolation of noble gases. Contrary to the krypton-xenon mixtures obtained in air liquefaction the noble gas mixtures obtained in nuclear fission contain almost the reciprocal molar ratio Kr/Xe(0.104 compared to 13.1). In addition, the carrier gas for the accumulation of the noble gases is nitrogen instead of oxygen as in air liquefaction, because oxygen is separated in a previous step to minimize radiolytic formation of ozone. Both facts enhance the tendency of xenon to freeze out in cryogenic mixtures and thus demand for alterations in the conventional air liquefaction process. - The conditions for the successful operation of a cryogenic column with the desired separation factor are discussed on the basis of the available lqiuid-vapor and liquid-solid equilibrium data in the three-component systems O_2-Kr-Xe and N_2-Kr-Xe. Calculated temperature- and concentration-profiles in the column for the components N_2, Ar, Kr, Xe, and O_2 are compared with experimental profiles obtained in a semiscale pilot plant. (orig.) 891 HK/orig. 892 MKO.

1072 INCINERATION OF WASTES FROM NUCLEAR INSTALLATIONS WITH THE JUELICH INCINERATION PROCESS. Wilke, M. (Kraftanlagen A.G., Heidelberg (Germany, F.R.). Bereich Anlagentechnik). Atom und Strom ; 25: No. 6, 152-155(Nov-Dec 1979). (In German).

In the Juelich Research Center a two-stage incineration process has been developed which, due to an integral thermal treatment stage, is most suitable for the incineration of heterogeneous waste material. The major advantages of this technique are to be seen in the fact that mechanical treatment of the waste material is no longer required and that off gas treatment is considerably facilitated.

1073 INCINERATION OF RADIOACTIVE WASTES IN SHAFT FURNACES. Witte, H.; Bregulla, E. (Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.)). Atom und Strom ; 25: No. 6, 155-159(Nov-Dec 1979). (In German).

Nuclear installations generate considerable amounts of combustible waste. Maximum volume reduction of this waste is achieved by combustion. At the Kernforschungszentrum Karlsruhe, a nuclear waste incinerator was put into active operation in 1971 and has produced excellent results since. The system developed in Karlsruhe has been adopted by the nuclear industry and now is being offered as an efficient volume reduction system for combustible radioactive waste.

1074 METHOD TO SOLIDIFLY HIGHLY AND MEDIUM RADIOACTIVE AND/OR ACTINIDE-CONTAINING AQUEOUS WASTE CONCENTRATES OR OF FINE-GRAIN SOLID WASTES SLURRIED IN WATER, SO THAT THESE ARE READY FOR ULTIMATE STORAGE AND DO NOT HARM THE ENVIRONMENT. Koester, R. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). German(FRG) Patent 2,819,085/A/. 31 Oct 1979. 7p. (In German).

Granulates or pelletes of approx. 1 cm diameter are manufacured by means of a pelleting device and made of 1 kg portland cement with 10% bentonite and 230 g MAW simulate solution. The through-put in adjusted by selecting the diameter of the pelleting plate.

1075 METHOD FOR ANCHORING RADIOACTIVE SUBSTANCES IN A BODY RESISTANT TO LEACHING BY WATER. Larker, H. (to ASEA AS). US Patent 4,172,807. 30 Oct 1979. Priority date 2 Nov 1976, Sweden, 8p.

A method is described for containing high-

level radioactive waste in a body resistant to leaching by water. The process includes steps for mixing the radioactive substances with a material which is resistant to leaching by water, or a material which when heated becomes resistant to leaching. Examples of such materials include insoluble salts or compounds of the radioactive substances such as titanates, silicates, zeolites, aluminium oxide, titanium oxide, quartz and rocks existing in nature. The mass is then to be enclosed in a capsule, evacuated, and subjected to isostatic pressing at a temperature and pressure required for the formation of a coherent mass. The capsule material should be matched to the resistant material so that it has a sufficiently high melting point for the capsule to fulfill its duties, and essentially the coefficient of thermal expansion in the cases when the capsule is left to provide a reinforced containment. The pressure during the isostatic pressing should be between 50 and 300 MPa. The temperature may vary from 700°C to 1300°C. 19 claims, 2 figures.

1076 (MLM--2663(TR)) COMBUSTION OF WASTE IN A 60-LITER DRUM. STATUS REPORT, MARCH 1978. Matteman, J. (Keuring van Electrotechnische Materialen N.V., Arnhem (Netherlands)). 25 Oct 1979. Translation source information not available 18p. Dep. NTIS, PC A02/MF A01.

A pilot experiment on combustion of wastes from nuclear power plants was conducted using a 60-liter drum in place of a 200-liter drum. It is possible to feed waste to it without producing smoke. Continuous stoking produces conditions approaching complete combustion. Volume reduction factors are 25 to 75. HCl and fly ash can be removed using a dry gas cleaning system. The use of the installation for low-level radwaste is discussed. (DLC)

1077 METHOD OF SOLIDIFYING RADIOACTIVE WASTES. Suzuki, K.; Yamamoto, M.; Fujiwara, T.; Yoshimoto, M.; Kawai, M. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 54-130,798/A/. 11 Oct 1979. 7p. (In Japanese).

Purpose: To compression mold, sinter and solidify the calcined bodies of radioactive wastes together with a metal, thereby to form solidified bodies having good heat conductivity and excellent mechanical strength, thermal shock resistance, and mechanical shock resistance, and durable in permanent storage. Method: Powders of calcined bodies of radioactive wastes and metal powders (Pb, Zn, Sn, Cu, Ag, Al, Fe and Ni or alloys of these metals) of more than 10% in apparent volume are mixed with each other and thereafter the mixtures are compression molded into a compression density of more than 40%. Subsequently, the compression molded bodies are sintered at a temperature of below 600°C. Alternatively, the powders of the calcined bodies are granulated and sintered beforehand, and metal coated layers are formed on the surfaces of particles by the non-electrolytic plating method, evaporating method or the like. If necessary, metal powders may be mixed therein, and thereafter the mixtures may be compression molded and sintered in the reducing atmosphere.

1078 APPARATUS TO FILTER, DRY, AND FILL RADIOACTIVE SUSPENSIONS IN PARTICULAR. Pfeifer, K.; Gebauer, R.; Koch, K.H. (to Alpha Chemie und Metallurgie G.m.b.H. (ALKEM), Hanau (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,618,232/B/. 4 Oct 1979. 3p. (In German).

The Am $(NO_3)_4$ occurring in the processing of Pu is converted into HNO_3 and $Am(C_2O_4)_2$ which is suspended in the acid solution. This suspension is introduced into a heated, cylindrical filter vessel via a sampling funnel. Inside the filter vessel is a stirrer. A crushing and a dosing device are attached to the sampling funnel. AmO_2 pieces are crushed here. Sampling funnel, filter vessel, dosing device and stirrer are part of one unit which can be swivelled around a shaft.

1079 REMOVAL OF LOW-LEVEL RADIOACTIVITIES FROM AQUEOUS WASTE SOLUTIONS WITH ACTIVATED CARBON. Litman, R.; Ott, Ch.R.; Gingras, R.; Lowell Univ., MA ;USA)). Radiochemical and Radioanalytical Letters ; 40: No. 5, 309-318(3 Oct 1979).

Activated carbon has been used to remove various radionuclides from the liquid waste from the University of Lowell Reactor's waste tanks. The type and amount of radionuclides removed were determined using γ-ray spectroscopy.

1080 UPDATING RADWASTE PROCESSING, STORAGE. Oyen, L.C.; Tucker, R.F. (Sargent and Lundy). Power ; 123: No. 10, 81-87(Oct 1979).

A brief survey of past and present systems for radioactive waste treatment and storage is presented. Today's systems have improved capability for handling the low-level wastes generated at nuclear stations. Stressing reliability and safety, they feature volume reduction to minimize overall disposal cost for liquid and solid waste. It is concluded that because of the high cost of radwaste processing and disposal, maximum effort must be made to reduce the waste volumes generated. This will probably require installation of some type of volume reduction equipment at most nuclear stations. If the trend toward eliminating shallow land burial of waste continues, the possibility of long-term on-site storage must be taken into account.

1081 PROCEDURE IN ENCAPSULATION OF RADIOACTIVE WASTES. Larker, H. (to ASEA-ATOM AB, Vaesteraas (Sweden)). Swedish Patent 7,704,487-3/B/. Oct 1979. 10p. (In Swedish).

A method is described whereby high-level radioactive waste or spent fuel elements, which have been sintered into a container of corrosion resistant material, e.g. aluminium oxide, may be provided with radiation shielding which itself is protected against corrosion. The sintered block containing the radioactive waste or spent fuel elements is placed in a cylindrical steel container. The sintered block has discs of mild steel plate shielding above and below it and is encased in a mild steel plate shielding. Between the mild steel shielding and the steel container is a layer of corrosion resistant material, e.g. stainless steel, in powder form. The container is then evacuated and the stainless steel powder sintered in a special press-oven.

1082 OPERATION PERFORMANCE OF CONTINUOUS BITUMINIZATION PLANT FOR SOLIDIFYING RADIOACTIVE WASTE AT TSURUGA NUCLEAR POWER STATION. Sano, K. (Ebara Mfg. Co. Ltd., Tokyo (Japan)). Ebara Jiho (Ebara Times) ; No. 110, 50-56(Oct 1979). (In Japanese).

A series of performance survey runs of the bituminization plant was conducted with actual radioactive concentrated waste. This plant reduced the volume to several times smaller

than is achieved by a cement solidification plant. Regular operation with actual radioactive concentrate has begun. Operation of this plant has so far produced 86 drums containing 200 liters each. The bitumen product has demonstrated suitable properties for sea dumping.

1083 METHOD OF PROCESSING LAUNDRY DRAIN. Sugimoto, Y.; Oda, A.; Yusa, H.; Kitamura, M.; Horiuchi, S. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 54-125,400/A/. 28 Sep 1979. 5p. (In Japanese).

Purpose: To subject the laundry drain to flocculation precipitation treatment in the prior stage of an inverse osmotic treatment, and subject only the supernatant to the inverse osmotic treatment and the precipitate directly to the condensation treatment, thereby decreasing the frequency of exchange of the inverse osmotic membranes, and reducing the quantity of purifying water. Method: The laundry drain is supplied to a flocculation precipitation tank, and added and mixed with a flocculant and a neutralizing agent, thus being subjected to a flocculation precipitation treatment. The supernatant is transported to a circulation tank through a transportation pipe, and is subjected to an inverse osmotic treatment in inverse osmotic module through the circulation tank, a filter and a high tension pump, and then returned to the circulation tank. The supernatant is thus concentrated to a predetermined concentration by repeating such operations. On the other hand, the precipitate at the bottom part of the flocculation precipitation tank is supplied through the transportation pipe to an evaporator supply tank together with the concentrate from the drain circulation tank, and evaporated and concentrated in the evaporator.

1084 METHOD TO SOLIDIFY A RADIOACTIVE OR TOXIC AQUEOUS SOLUTION CONTAINING WASTE MATERIALS. Knieper, J.; Printz, H.; May, K. (to Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,531,056/B/. 20 Sep 1979. 2p. (In German).

Stucco with a carbonate content of less than 1% is mixed with pumice stone in a ratio of 1:1 and filled into 200l barrels. A mineral acid, alkalis or water-soluble organic compound is added to this filling. The binding takes place practically without latent heat.

1085 BIDENTATE ORGANOPHOSPHORUS SOLVENT EXTRACTION PROCESS FOR ACTINIDE RECOVERY AND PARTITION. (to Department of Energy, Washington, DC (USA)). British Patent 1,552,956/A/. 19 Sep 1979. 12p.

A liquid-liquid extraction process is described for the recovery and partitioning of actinide values from acidic nuclear waste aqueous solutions, the actinide values including trivalent and tetravalent oxidation states, comprising the steps of contacting the aqueous solutions with a bidentate organophosphorus extractant to extract essentially all of the actinide values into the organic phase, contacting the actinide-loaded organic phase with an aqueous dilute nitric acid solution to extract essentially all of the trivalent actinide values into the aqueous phase, and contacting the organic phase containing the tetravalent actinide values with a dilute aqueous solution of nitric-hydrofluoric acid to extract essentially all of the tetravalent actinide values into the aqueous phase. The process covers Am(III), Cm(III), Pu(IV), Np(IV), and U(VI); and, as the extractant, covers dihexyl-N,N-diethylcarbamylmethylene phosphonate dissolved in dodecane diluent.

1086 SYSTEM FOR DISPOSING OF RADIOACTIVE WASTE. Gablin, K.A.; Hansen, L.J. (to Nuclear Engineering Co.). US Patent 4,168,243. 18 Sep 1979. Filed date 24 Mar 1976. 18p.

A system is described for disposing of radioactive waste material from nuclear reactors by solidifying the liquid components to produce an encapsulated mass adapted for disposal by burial. The method contemplates mixing of radioactive waste materials, with or without contained solids, with a setting agent capable of solidifying the waste liquids into a free standing hardened mass, placing the resulting liquid mixture in a container with a proportionate amount of a curing agent to effect solidification under controlled conditions, and thereafter burying the container and contained solidified mixture. The setting agent is a water-extendable polymer consisting of a suspension of partially polymerized particles of urea formaldehyde in water, and the curing agent is sodium bisulfate. Methods are disclosed for dewatering slurry-like mixtures of liquid and particulate radioactive waste materials, such as spent ion exchange resin beads, and for effecting desired distribution of non-liquid radioactive materials in the central area of the container prior to solidification, so that the surrounding mass of lower specific radioactivity acts as a partial shield against higher radioactivity of the non-liquid radioactive materials. The methods also provide for addition of non-radioactive filler materials to dilute the mixture and lower the overall radioactivity of the hardened mixture to desired Lowest Specific Activity counts. An inhibiting agent is added to the liquid mixture to adjust the solidification time, and provision is made for adding additional amounts of setting agent and curing agent to take up any free water and further encapsulate the hardened material within the container. 30 claims.

1087 METHOD AND APPARATUS FOR PROCESSING LIQUID SODIUM WASTES. Nishizawa, Y. (to Mitsubishi Atomic Power Industries, Inc., Tokyo (Japan)). Japanese Patent 1954-117,900/A/. 12 Sep 1979. 4p. (In Japanese).

Sodium wastes from an LMFBR type reactor are heated to generate sodium aerosols. The sodium aerosols are introduced into a reaction vessel and mixed with reactive gas such as gaseous carbon dioxide, air or the mixture thereof. The sodium aerosols and the reactive gases are thus reacted to produce chemically stable reaction products. The reaction products, which are sodium carbonate or sodium oxide depending on whether gaseous carbon dioxide or air is used as the reactive gas, are accumulated in the bottom of the reaction vessel.

1088 RADIOACTIVE WASTE DISPOSAL. Gablin, K.A.; Hansen, L.J. (to Nuclear Engineering Co.). US Patent 4,167,491. 11 Sep 1979. Filed date 7 Jun 1976. 8p.

A method of disposing of wet radioactive waste materials such as those generated in the water used to cool atomic reactors, comprises combining the waste material with a hydrophilic resin in proportions sufficient to provide a solid mass of the resin with the radioactive waste component distributed within. In its preferred form, the waste material is

concentrated by separating water from the radioactive portions thereof by methods such as evaporation, taking up the waste components with an ion exchange resin and separating the resin from the bulk of the water, or by the addition of flocculating agents or the like and filtering. The preferred hydrophilic resinous material is a conventional urea-formaldehyde dispersion, which is partially polymerized and capable of taking up water and fully polymerizing upon the addition of an acidic curing agent. The method also contemplates adding a substantially waterproof resinous material to the surface of the solid block, or enclosing it in a waterproof container, or both.

1089 METHOD TO PROCESS AMMONIUM NITRATE SOLUTION OCCURRING IN THE MANUFACTURE OF FUEL AND/OR BREEDER MATERIALS FOR NUCLEAR REACTORS. Morschl, P.; Zimmer, E. (to Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,617,968/8/. 6 Sep 1979. 2p. (In German).

The ammonium nitrate is converted to metal nitrate at temperatures of 100° to 110°C and may then be harmlessly subjected to calcination at high temperatures. The calcium oxide used can be fully recycled. Environmentally harmful materials are not set free.

1090 METHOD AND DEVICE FOR SOLIDIFYING RADIOACTIVE DRY POWDER. Irie, H. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 1954-114,700/A/. 6 Sep 1979. 3p. (In Japanese).

Radioactive liquid wastes or slurries are dried in a drier, and pulverized and introduced into a mixer. This powder is mixed with a solidifying agent such as asphalt, plastics or the like, and is solidified. Vapor generated in the drier is introduced into a cooler, and exhausted as condensed water. This cooler is connected with an ejector through a vent pipe, and the drier and mixer are retained in a negative pressure by the ejector effect and the ejector outlet pipe is water-sealed by a tank. The vent pipe led from the mixer is also connected to the cooler and the cooler outlet pipe is water-sealed by a condensing tank.

1091 USE OF A BACTERIA POLYMER COMPOSITE TO CONCENTRATE PLUTONIUM FROM AQUEOUS MEDIA. Meyer, H.R. (Oak Ridge National Lab., TN (USA)); Johnson, J.E.; Tengerdy, R.P.; Goldman, P.M. Health Physics ; 37: No. 3, 359-363(Sep 1979).

Viable Pseudomonas aeruginosa, in stable association with fine-spun polypropylene web, were shown to be capable of significant concentration of PuO_2 or $PuCl_4$ from aqueous media. These observations confirm previous studies with free-living Pseudomonas and suggest that such a system may be useful for the removal of plutonium from aqueous waste streams. Optimum cell loading of the fine-spun polymer web used in these studies occurred with monolayer filament coverage, resulting in maximum plutonium fixation. Removal of an average of 34% of suspended PuO_2 particles and 94% of soluble $PuCl_4$ was observed under these conditions.

1092 PRECIPITATION OF URANIUM FROM LOW-LEVEL LIQUID WASTES. Bullard, J.E. (Babcock and Wilcox Co., Lynchburg, VA (USA). Research and Development Div.); Baughman, J.C. Talanta ; 26: No. 9, 904-905(Sep 1979).

A method for the recovery of uranium from low-level liquid wastes is described. Uranium(VI) is reduced to uranium(IV) in sulphuric-phosphoric acid solution with iron(II). The uranium(IV) is precipitated as the double fluoride with sodium. The uranium content of the filtrate is in the low ppm range. Possible modifications to the procedure are discussed.

1093 VITRIFICATION OF HIGHLY ACTIVE LIQUID WASTE. PT. 2. THE THERMAL DECOMPOSITION OF HARVEST FEED SLURRIES AND THE CHARACTERIZATION OF THE PRODUCT. Chun, K.S. (Korea Atomic Energy Research Inst., Seoul (Republic of Korea)); Morris, J.B. (Atomic Energy Research Establishment, Harwell (UK)). Journal of the Korean Nuclear Society ; 11: No. 3, 203-212(Sep 1979).

The thermal decomposition of simulated magnox highly active waste and of harvest feed slurries (SN and SG) which include the glass forming chemicals has been studied. The waste and the slurries are almost completely calcined by 500 to 550°C. The colour of the solids from the slurries varies little until about 900°C when it darkens considerably. The slurries begin to vitrify at this temperature and are completely vitrified at 1000 to 1050°C. On the other hand, the sulphate impurity in SN slurry causes a yellow phase to separate above 750°C. The density of the intermediate solids is fairly low until 650°C-700°C is reached. This temperature seems to mark the onset of fluxing as the density rises quickly to 2g/cm³ at 700°-800°C is reached. This temperature seems to mark the onset of fluxing as the density rises quickly to 2g/cm³ at 700°-800°C. The strength of the solids decreases with temperature up to 500°C, and then rises as the solids begin to sinter. Below 500°C the SN solids are the stronger, suggesting that the impurity renders this silica more reactive.

1094 PROCESSING OF HIGH LEVEL RADIOACTIVE WASTES BY A SOLIDIFICATION TECHNIQUE. Chun, K.S. (Korea Atomic Energy Research Inst., Seoul (Republic of Korea)). Journal of the Korean Nuclear Society ; 11: No. 3, 231-239(Sep 1979). (In Korean).

Current status and techniques of solidification of high level radioactive waste are outlined. The source of generation of radioactive wastes, actual process of solidification, properties of the solidified high level wastes and the status of the technique in various countries are reviewed and discussed.

1095 FUNDAMENTAL STUDY ON DECONTAMINATION OF TRITIUM FROM GASEOUS PHASES BY COPPER OXIDE. Kawabata, H.; Yanagi, T.; Tabuchi, T.; Shinagawa, M. (Osaka Univ., Suita (Japan). Faculty of Engineering). Radioisotopes (Tokyo) ; 28: No. 9, 542-545(Sep 1979).

Some fundamental studies on removal of tritium from gaseous streams by a small column of copper oxide were carried out. An about 10 cm length of column packed with 100 g of copper oxide was examined on the conversion ratios of hydrogen and tritium into water. The experiment with hydrogen of 0.1 per cent in argon showed that the logarithmic plot of remaining ratio of hydrogen by passing through the column in proportional to the reciprocal of gas flow rate and to the length of oxide column. The oxide column was also used for treating tritium-bearing waste gas from an evacuating system of a D-T neutron generator. It was observed that at column temperatures lower than 450°C the conversion ratio of tritium in the waste gas into water is considerably smaller than that of hydrogen of 0.1 per cent in argon.

1096 PROCESSING OF RADIOACTIVE RUTHENIUM WITH ALUMINOSILICATE GELS. Kanno, T.; Ichinose, Y.; Ito, K. (Tohoku Univ., Sendai (Japan). Research Inst. of Mineral Dressing and Metallurgy). Nippon Genshiryoku Gakkaishi (Journal of the Atomic Energy Society of Japan) ; 21: No. 9, 732-737(Sep 1979). (In Japanese).

Coprecipitation of radioactive Ru with hydroxides has been studied for the purpose of the management of the high level waste from the nuclear fuel reprocessing. Aluminosilicate gel used as coprecipitant was prepared by addition of aqueous sodium hydroxide to sodium aluminate-sodium silicate solution containing ruthenium nitrate. Ruthenium quantitatively precipitates under the conditions, aluminate > 4 x 10^{-2} M, Al/Si < 0.5 and pH = 6 -- 9. Thermal transformations of aluminosilicate gels were examined by means of DTA and X-ray powder diffraction. Ruthenium is volatilized from aluminosilicate gel above 600°C. However, volatilization rate of Ru is suppressed by coating with mullite phase into which aluminosilicate gel transforms above 900°C. The amount of Ru volatilized in Ar-flow was reduced to about 10% of that in air-flow.

1097 METHOD AND EQUIPMENT TO SOLIDIFY PUMPABLE RADIOACTIVE WASTES IN A WASTE CONTAINER. Baatz, H.; Rittscher, D. (to STEAG Kernenergie G.m.b.H., Essen (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,720,342/B/. 30 Aug 1979. 4p. (In German).

Dry cement is filled into the waste container and a partial vacuum is generated. This subpressure gives rise to a dosed uptake of the pumpable substances in the waste container. An intimate mixture of cement and the wastes is achieved by rotation of the vessel around an axis after decoupling the supply pipes and subpressure pump. The waste container is in a box with drive capstans for the rotational movement.

1098 METHOD AND APPARATUS FOR PROCESSING RADIOACTIVE LAUNDRY WASTE. Shirai, T.; Suzuki, T.; Inami, I. (Nippon Atomic Industry Group Co. Ltd., Tokyo). (to Nippon Atomic Industry Group Co. Ltd., Tokyo; Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 1954-109,600/A/. 28 Aug 1979. 3p. (In Japanese).

Stored liquid wastes are sent to a cyclone to remove particles of greater specific weight and sludges are accumulated in a sludge reservoir. The liquid wastes are sent to a self-cleaning strainer to remove thread dusts, hairs and the likes, and then sent to a storage tank. The liquid wastes are further sent to a self-cleaning type centrifugal settler. Fine clads separated there are stored in a sludge reservoir and cleaned liquid wastes are sent to ultrafilter and an ion exchange resin column to remove radioactive components. The concentration liquid wastes from the ultrafilter are dried in a drier and the resin wastes from the ion exchange column are subjected to solidification. Sludges in the sludge reservoirs are solidified in a solidifier and then packed in drum can.

1099 METHOD FOR THE DENITRATION OF HIGHLY RADIOACTIVE WASTE SOLUTIONS. Gattys, F.J. (to Ingenieurbuero fuer Chemische Maschinen- und Apparatebau, Neu-Isenburg (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,807,324/A/. 23 Aug 1979. 12p. (In German).

The radioactive solution is mixed with formaldehyde solution or para-formaldehyde and sodium nitrate, as well as ortho-phosphoric acid solution or NaH_2PO_4 and is denitrated at 100°C. Furthermore, $C_6H_8O_7 \times H_2O$ phosphate can be used as buffer. The para-formaldehyde is in powder form.

1100 METHOD FOR CALCINING NUCLEAR WASTE SOLUTIONS CONTAINING ZIRCONIUM AND HALIDES. Newby, B.J. (to Dept. of Energy). US Patent 4,164,479. 14 Aug 1979. Filed date 12 Jan 1978. 6p.

PAT-APPL-868,953.

A reduction in the quantity of gelatinous solids which are formed in aqueous zirconium-fluoride nuclear reprocessing waste solutions by calcium nitrate added to suppress halide volatility during calcination of the solution while further suppressing chloride volatility is achieved by increasing the aluminum to fluoride mole ratio in the waste solution prior to adding the calcium nitrate.

1101 METHOD OF PROCESSING RADIOACTIVE WASTES. Kinoshita, M.; Kikuchi, M.; Oda, A.; Yusa, H.; Hirano, M. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1954-101,100/A/. 9 Aug 1979. 6p. (In Japanese).

Radioactive detergent liquid wastes are passed through an ejector by means a pump. By the operation of the ejector spent ion-exchange resins stored in a separation tank are sucked up and mixed, and then introduced into a tank. The mixture solution is stirred to cause a surfactant in the liquid wastes to be adsorbed to the resin, and thereafter transferred to a centrifugal film drier, and pulverized and dried.

1102 MAGNOX SLUDGE ENCAPSULATION PLANT. Nuclear Engineering International ; 24: No. 289, 54(Aug 1979).

United Kingdom. CONCRETES;ENCAPSULATION;FUEL PINS;LOW-LEVEL RADIOACTIVE WASTES;MAGNOX TYPE REACTORS;SLURRIES;SPENT FUEL ELEMENTS;SPENT FUEL STORAGE;RADIOACTIVE WASTE PROCESSING

1103 HIGH LEVEL FISSION PRODUCT WASTE FORMS FOR FINAL STORAGE. COMPARATIVE EVALUATION OF THE PRODUCTS. Merz, E. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Chemische Technologie). Atomwirtschaft, Atomtechnik ; 24: No. 8/9, 409-413(Aug-Sep 1979). (In German).

In the Federal Republic of Germany, as in other countries, work has been conducted for years on the development of solidification products for high level wastes. The decisive criterion for the quality of the form of waste product is the leaching resistance of radionuclides in final storage. Final intercomparison and evaluation of the best waste form is not yet possible for lack of some specific information. However, it is certain that borosilicate glasses are among the suitable products, judging by the minimum criteria to be fulfilled. Negative consequences in the geological repository can be safely avoided by the proper choice of the fission product concentration in the matrix material, the vessel concept and sufficiently long periods of interim storage above ground. Theoretically, synthetic crystallized rock promises certain advantages. However, it is very doubtful whether it will be possible to make a useful, uniform product of comparable or even better quality from a mixture of more than 40 different elements. The decision in favor of borosilicate glasses as the first choice must

be upheld until there is hard proof of better products and methods of their fabrication on a large technical scale backed up by demonstrations on real hot material.

1104 DECONTAMINATION OF ELLIOT LAKE URANIUM TAILINGS. Raicevic, D. (Department of Energy, Mines and Resources, Ottawa, Ontario (Canada). Canada Centre for Mineral and Energy Technology). CIM (Canadian Institute of Mining and Metallurgy) Bulletin ; 72: No. 808, 109-115(Aug 1979).

After more than 93 percent of the uranium is extracted from Elliot Lake ores by a sulphuric acid leaching process, the leach residue (tailings) contains small amounts of uranium and radioactive isotopes, particularly radium-226, which is the most serious health hazard. Heavy metal components and pyrite are also present, along with the gangue minerals. Currently, over 1000 acres of the Elliot Lake area are covered with these tailings, which contain over five million tons of pyrite. Because of constant oxidation of the pyrite by bacteria (thiobacillus) and the presence of moisture, pyrite slowly generates sulphuric acid, which steadily leaches the metal-bearing constituents from the tailings. The seepage flows of the dissolved contaminants, although often quite low in volume, have an environmental impact on the Elliot Lake area. Although these seepages are treated and most of the contaminants removed and impounded, a small amount of the radioactive contaminants reaches Lake Huron via the Serpent River. A flotation approach for treatment of the Elliot Lake uranium tailings was investigated. It produced decontaminated tailings which were practically free of pyrite, with radium, thorium, and uranium contents considerably reduced. The tailings produced comprise about 75 percent by weight of the current tailings and appears to be suitable for mine backfill. Surface storage of about half of the uranium tailings would be eliminated by this process. Mine backfilling would also increase the mine production and thus enlarge the overall uranium resources due to recovery of the ore from pillars. The pyrite concentrate produced from the current uranium tailings would be suitable for sulphuric acid production.

1105 CURRENT VIEWS ON THE IMPORTANCE OF SEPARATING LONG-LIVED ALPHA EMITTERS FROM HIGH-LEVEL WASTES FROM SPENT FUEL REPROCESSING. Kyrs, M.; Neumann, L. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Jaderna Energie ; 25: No. 8, 289-293(Aug 1979). (In Czech).

The benefits and constraints are compared of alpha emitters separation from high-level radioactive wastes. It is found that so far it has not been possible to unequivocally answer the question of the justification of alpha emitters separation aimed at reducing the risks and costs of high-level radioactive waste processing.

1106 MANAGEMENT OF HIGH-LEVEL RADIOACTIVE WASTES. Lennemann, Wm.L. (International Atomic Energy Agency, Vienna (Austria). Div. of Nuclear Safety and Environmental Protection). International Atomic Energy Agency Bulletin ; 21: No. 4, 2-16(Aug 1979).

The definition of high-level radioactive wastes is given. The following aspects of high-level radioactive waste management are discussed: fuel reprocessing and high-level waste; storage of high-level liquid waste; solidification of high-level waste; interim storage of solidified high-level waste; disposal of high-level waste; disposal of irradiated fuel elements as a waste.

1107 LIQUID EFFLUENT TREATMENT IN NUCLEAR POWER PLANTS WITH LIGHT WATER REACTORS. Kongsted, T. Brown Boveri Review ; 66: No. 8, 526-530(Aug 1979).

A radioactive waste treatment system for the purification of radioactively contaminated liquid effluents of nuclear power plants is presented. The choice of the process plant components, the design of the control and instrumentation systems are outlined. Efficient purification processes ensure that the major part of the effluent can be re-used in the power plant. The filter residues and evaporator concentrates arising during purification can be solidified with bitumen or cement in the solid radwaste system for final storage.

1108 PLASTIC SOLIDIFICATION SYSTEM FOR RADIOACTIVE WASTE. Kani, J.; Irie, Hiromitsu; Obu, E. (Toshiba Corp., Kawasaki, Kanagawa (Japan)); Nakayama, Yasuyuki; Matsuura, Hiroyuki. Toshiba Rebyu (Toshiba Review) ; 34: No. 8, 707-710(Aug 1979). (In Japanese).

The establishment of a new solidification system is an important theme for recent radioactive-waste disposal systems. The conditions required of new systems are: (1) the volume of the solidified product to be reduced, and (2) the property of the solidified product to be superior to the conventional ones. In the plastic solidification system developed by Toshiba, the waste is first dried and then solidified with thermosetting resin. It has been confirmed that the property of the plastic solidified product is superior to that of the cement-or bitumen-solidified product. Investigation from various phases is being carried on for the application of this method to commercial plants.

1109 METHOD FOR SOLIDIFYING LIQUID RADIOACTIVE WASTES. Berreth, J.R. (to Department of Energy, Washington, DC (USA)). Canadian Patent 1,059,307/A/. 31 Jul 1979. 8p.

The liquid wastes generated by the reprocessing of spent fuel can be converted into solid form by using several known processes. When the wastes contain nitrates and nitrites large quantities of noxious nitrogen oxide gases are formed, which are at present released to the atmosphere. Their evolution may be suppressed by adding urea to the waste solution before the solution is heated, so that upon heating the urea reacts wth the nitrates and nitrites to evolve elemental nitrogen, carbon dioxide and ammonia. The addition of urea does not add any additional materials to the solids being formed from the waste solution. A slight excess of a stoichiometric amount of urea relative to the nitrates and nitrites present is added to the liquid waste, and the solution is heated to at least 130° C while bubbling carbon dioxide through the solution. This method can be used with the pot calcination process of waste solidification, or in the fluidized bed calcination process.

1110 SEE-THROUGH SOLUTION TO NUCLEAR WASTE. Morris, B.; Marples, A. (UKAEA, Harwell. Atomic Energy Research Establishment). New Scientist ; 83: No. 1165, 276-278(26 Jul 1979).

The consensus of opinion within the nuclear industry is that the first step in the safe disposal of liquid high-level radioactive waste is the conversion of this waste into a solid such as a block of glass cast in a stainless

steel canister. Steps in the vitrification process are considered. Research being carried out in the UK to obtain chemical engineering information on the vitrification process and to develop and evaluate the best glass for each type of highly active waste is discussed. Work being undertaken in France, India, USA and West Germany to turn the vitrification concept into a working industrial process is described.

1111 METHOD OF PROCESSING RADIOACTIVE WASTES. Horiuchi, S.; Taniguchi, T.; Hirano, M.; Hyakutake, H.; Takamura, Y. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 54-93,800/A/. 25 Jul 1979. 6p. (In Japanese).

Purpose: After removing clads from radioactive wastes, to dry and pulverize the same thereby to reduce hazard of radiation exposure and to obtain a large volume reduction ratio. Method: Regenerated liquid wastes, sludges and spent ion-exchange resin slurries within the tanks are respectively introduced into separation tanks, and the regenerated liquid wastes are sent into a mixing tank after clads within the separation tanks have been precipitated and separated. The sludges are applied with a supersonic wave in the separation tanks, and thereafter are passed through an electromagnetic filter. Then, clads are removed from the sludges, and thereafter the sludges are sent into the mixing tank. The spent ion-exchange resin slurries are applied with a supersonic wave and stirred in the separation tanks, and sent into the mixing tank after the clads have been precipitated and separated. The mixture which has been prepared in the mixing tank is dried and pulverized by a centrifugal film drier, and mixed with burnt ashes discharged from a hopper. Then, the mixture is pelletized and asphalt-hardened.

1112 METHOD FOR RECOVERING PALLADIUM AND TECHNETIUM VALUES FROM NUCLEAR FUEL REPROCESSING WASTE SOLUTIONS. Horwitz, E.P.; Delphin, W.H. (to Dept. of Energy). US Patent 4,162,231. 24 Jul 1979. Filed date 28 Dec 1977. 4p.

PAT-APPL-865,347.

A method is described for recovering palladium and technetium values from nuclear fuel reprocessing waste solutions containing these and other values by contacting the waste solution with an extractant of tricaprylmethylammonium nitrate in an inert hydrocarbon diluent which extracts the palladium and technetium values from the waste solution. The palladium and technetium values are recovered from the extractant and from any other coextracted values with a strong nitric acid strip solution.

1113 METHOD OF IMMOBILIZING CARBON DIOXIDE FROM GAS STREAMS. Holladay, D.W.; Haag, G.L. (to Dept. of Energy). US Patent 4,162,298. 24 Jul 1979. Filed date 9 Aug 1978. 10p.

PAT-APPL-932,152.

This invention comprises a method for rapidly and continuously immobilizing carbon dioxide contained in various industrial off-gas streams, the carbon dioxide being immobilized as dry, stable, and substantially water-insoluble particulates. Briefly, the method comprises passing the gas stream through a fixed or fluidized bed of hydrated barium hydroxide to remove and immobilize the carbon dioxide by converting the bed to barium carbonate. The method has several important advantages: it can be conducted effectively at ambient temperature; it provides a very rapid reaction rate over a wide range of carbon dioxide concentrations; it provides high decontamination factors; and it has a high capacity for carbon dioxide. The invention is especially well suited for the removal of radioactive carbon dioxide from off-gases generated by nuclear-fuel reprocessing facilities and nuclear power plants.

1114 METHOD FOR THE RECOVERY OF ACTINIDE ELEMENTS FROM NUCLEAR REACTOR WASTE. Horwitz, E.P.; Delphin, W.H.; Mason, G.W. (to Dept. of Energy). US Patent 4,162,230. 24 Jul 1979. Filed date 28 Dec 1977. 10p.

PAT-APPL-865,346.

A process is described for partitioning and recovering actinide values from acidic waste solutions resulting from reprocessing of irradiated nuclear fuels by adding hydroxylammonium nitrate and hydrazine to the waste solution to adjust the valence of the neptunium and plutonium values in the solution to the +4 oxidation state, thus forming a feed solution and contacting the feed solution with an extractant of dihexoxyethyl phosphoric acid in an organic diluent whereby the actinide values, most of the rare earth values and some fission product values are taken up by the extractant. Separation is achieved by contacting the loaded extractant with two aqueous strip solutions, a nitric acid solution to selectively strip the americium, curium and rare earth values and an oxalate and oxalic acid or trimethylammonium hydrogen oxalate to selectively strip the neptunium, plutonium and fission product values. Uranium values remain in the extractant and may be recovered with a phosphoric acid strip. The neptunium and plutonium values are recovered from the oxalate by adding sufficient nitric acid to destroy the complexing ability of the oxalate, forming a second feed, and contacting the second feed with a second extractant of tricaprylmethylammonium nitrate in an inert diluent whereby the neptunium and plutonium values are selectively extracted. The values are recovered from the extractant with formic acid.

1115 SEPARATION OF IODINE FROM MERCURY CONTAINING SCRUBBING SOLUTIONS. Burger, L.L.; Scheele, R.D. (to Dept. of Energy). US Patent 4,162,206. 24 Jul 1979. Filed date 16 Nov 1978. 4p.

PAT-APPL-961,174.

Radioactive iodines can be recovered from a nitric acid scrub solution containing mercuric nitrate by passing a current through the scrub solution to react the iodine with the mercuric nitrate to form mercuric iodate which precipitates out. The mercuric iodate can then be reacted to recover the radioiodine for further processing into a form suitable for long-term storage and to recover the mercury for recycling.

1116 ACADEMY SQUABBLES OVER RADWASTE REPORT. Carter, L.J. Science ; 205: 287-289(20 Jul 1979).

The National Academy of Science presented a report to the US Nuclear Regulatory Commission (NRC) on evaluating alternative technologies for solidifying high-level radioactive wastes. The waste management staff at the NRC was pleased with the report, but some members of the Academy were not satisfied. Some felt the report was narrow in focus and highly technical. The fact that glass was an inferior waste form was considered bad news by some leaders of the nuclear enterprise because most of the past research and development work in waste solidification in the US and Europe has centered on glass. Others felt the report would

be seized upon by opponents of nuclear power. Parts of the panel report were rewritten several times. however, in 1978, the report was reviewed by six members of the National Academy of Sciences. In general, their comments on the report were quite favorable. The report offered no coherent discussion comparing the characteristics of glass, ceramics, cement, and other materials in relation to multiple barriers or to any other strategy. The main flaws in the report stemmed from the failure to deal forthrightly with the conflicts in the radwaste committee by means of majority and minority reports. Also, the report review process seems to have been entirely too casual. (DP)

1117 METHOD AND DEVICE TO PACKAGE SOLID RADIOACTIVE OR POISONOUS WASTE MATERIALS. Herzog, J. (to Nuklear-Chemie und - Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.)). German(FRG) Patent 2,243,136/B/. 19 Jul 1979. 3p. (In German).

Solid radioactive wastes should be pressed solid as far as possible before ultimate storage. On the other hand, the number of working stages should be kept as small as possible. A suggestion is made to insert a pipe into the vessel, to then fill it with the wastes, to press these together by means of a piston and then to remove the pipe again. Suitable measures to prevent radioactivity from escaping are necessary (low-pressure chamber, suction devices etc.).

1118 PROCESS FOR TREATING WASTE WATER CONTAINING RADIOACTIVE SUBSTANCES. Kojima, K. (to Daicel Ltd.). US Patent 4,161,447. 17 Jul 1979. Priority date 13 Jun 1974, Japan, 6p.

A process for treating waste water containing radioactive substances comprising treating the waste water by reverse osmosis in the presence of at least one organic surfactant selected from the group consisting of anionic surfactants, cationic surfactants and nonionic surfactants.

1119 RADIOACTIVE GASEOUS WASTE PROCESSING FACILITIES IN NUCLEAR POWER PLANTS. Kako, T. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 1954-99199/A/. 14 Jul 1979. 3p. (In Japanese).

In a gaseous waste processing system, a sub-cooler and a dryer are directly connected, and a damping tube and a sand filter are disposed between the dryer and an activated carbon tower. This can eliminate the energy loss due to temperature increase in the damping tube and the sand filter. Moreover, a pipeway is provided for passing the off-gas not through the sub-cooler but directly to the dryer at the low flow rate of the off-gas. This can save the operation of the sub-cooler upon low flow rate, by which the energy can be economized.

1120 PROCESS FOR THE REMOVAL OF IODINE AND IODINE COMPOUNDS FROM GASES AND VAPOURS AND SORPTION AGENTS IMPREGRATED WITH SILVER NITRATE TO CARRY OUT THE PROCESS. Wilhelm, J.; Schuettelkopf, H.; Dorn, L.; Heinze, G. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Bayer A.G., Leverkusen (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,109,146/B/. 12 Jul 1979. 6p. (In German).

The gases and vapours containing the radioactive fission product iodine - in elementary form or as an organic compound, e.g. CH_3I, are led through a loosely packed bed of granulated metal. The granulated metal may be molded into porous plates or cylinders. The granulates consist mainly of amorphous silica gel impregnated with silver nitrate, with a volume porosity of 50 to 70% and a specific surface of 70 to 250 m^2/g according to BET. The silica gel may contain fractions of Al_2O_3 and/ or oxides of alkaline earth metals. (DG) 891 HP/ DG 892 MBE.

1121 SOLIDIFICATION PROCESS FOR AN AQUEOUS SOLUTION CONTAINING RADIOACTIVE OR TOXIC WASTES. Knieper, J.; Printz, H.; May, K. (to Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,559,724/B/. 12 Jul 1979. 2p. (In German).

The binder gypsum, with a content of constitutional water of 4.7 to 6.6% and a carbonate content smaller than 1%, is mixed with water glass. After this, one adds the waste-containing solution with HF, H_2SO_4, $HClO_4$, HCl, HNO_3, or KOH, NaOH, NE_3, CaOH up to content of 40% by weight or with water-soluble organic compounds. (DG) 891 HP/DG 892 MBE.

1122 METHOD FOR THE RECOVERY OF PALLADIUM AND TECHNETIUM. Horwitz, E.P.; Delphin, W.H. (to Department of Energy, Washington, DC (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,855,821/A/. 12 Jul 1979. 10p. (In German).

The Pd (incl. Pd 107) and Tc (incl. Tc 99) are recovered from waste solutions of reprocessing plants for e.g. LWR fuel. For this purpose one brings the waste solution into contact with the extracting agent 0 x 1 M TCMA x NO_3 in DEB. Pd and Tc are recovered from the extracting agent and from all other co-extracted values by means of an 8 m HNO_3 strip solution.

1123 RECOVERY OF PALLADIUM AND TECHNETIUM VALUES. Horwitz, E.P.; Delphin, W.H. (to Department of Energy, Washington, DC (USA)). British Patent 2,011,696/A/. 11 Jul 1979. 3p.

A method is described for recovering palladium and technetium values from nuclear fuel reprocessing waste solutions containing these and other values by contracting the waste solution with an extractant of tricaprylmethylammonium nitrate in an inert hydrocarbon diluent which extracts the palladium and technetium values from the waste solution. The palladium and technetium values are recovered from the extractant and from any other coextracted values with a strong acid strip solution.

1124 RECOVERY OF ACTINIDE VALUES. Horwitz, E.P.; Delphin, W.H.; Mason, G.W. (to Department of Energy, Washington, DC (USA)). British Patent 2,011,697/A/. 11 Jul 1979. 8p.

A process is described for partitioning and recovering actinide values from acidic waste solutions resulting from reprocessing of irradiated nuclear fuels by adding hydroxylammonium nitrate and hydrazine to the waste solution to adjust the valence of the neptunium and plutonium values in the solution to the +4 oxidation state, thus forming a feed solution and contacting the feed solution with an extractant of di-hexoxyethyl phosphoric acid in an organic diluent whereby the actinide values, most of the rare earth values and some fission product values are taken up by the

extractant. Separation is achieved by contacting the loaded extractant with two aqueous strip solutions, a nitric acid solution to selectively strip the americium, curium and rare earth values and an oxalate solution of tetramethylammonium hydrogen oxalate and oxalic acid or trimethylammonium hydrogen oxalate to selectively strip the neptunium, plutonium and fission product values. Uranium values remain in the extractant and may be recovered with a phosphoric acid strip. The neptunium and plutonium values are recovered from the oxalate by adding sufficient nitric acid to destroy the complexing ability of the oxalate, forming a second feed, and contacting the second feed with a second extractant of tricaprylmethylammonium nitrate in an inert diluent whereby the neptunium and plutonium values are selectively extracted. The values are recovered from the extractant with formic acid.

1125 METHOD OF PROCESSING RADIOACTIVE WASTES. Horiuchi, S.; Taniguchi, T.; Hirano, M.; Hyakutake, H.; Takamura, Y. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1954-87400/A/ . 11 Jul 1979. 5p. (In Japanese).

Ion exchange resin re-generation liquid wastes, used precoat filter aids and used ion exchange resin slurries in tanks are supplied through pipeways to the inside of a centrifugal thin film dryer. They are mixed with miscellaneous solid burning ashes stored in a hopper into pellets. The pellets are charged in drum cans, and the cans are closed after injection of asphalt. The centrifugal thin film dryer consists of a barrel containing therein a revolutional shaft attached with revolutional blades. The supplied slurries are forced to the inner surface of the barrel by the revolutional blades and heated to dry by the steams in jackets.

1126 PROCESS FOR SOLIDIYING NUCLEAR MATERIALS. Dosch, R.G. (to Department of Energy, Washington, DC (USA)). Canadian Patent 1,057,947/A/. 10 Jul 1979. 30p.

A process is described for solidifying radioactive liquid waste which employs complex anions having the general formula (M sub(x) O sub(y) H sub(z)), where M is titanium, niobium, tantalum or zirconium and x is at least two. Water-insoluble materials containing the radioactive components are formed which may be subsequently heated at from about 100 deg C to 1000 deg C to form chemically stable complex oxide mixtures. Four specific complex anions which may be employed are $(Ti_2O_5H)^-$, $(Zr_2O_5H)^-$, $(Nb_2O_6H)^-$, and $(Ta_2O_6H)^-$, referred to respectively as titanate, zirconate, niobate, and tantalate. Instructions for their preparation are given. They may be contacted with radioactive waste containing ions of selenium, rubidium, strontium, yttrium, zirconium, niobium, molybdenum, technetium, ruthenium, rhodium, palladium, silver, cadmium, indium, tin, antimony, tellurium, cesium, barium, lanthanum, cerium, praseodymium, neodymium, promethium, samarium, europium, gadolinium, terbium, or dysprosium either in one batch equilibration contacting step, or by passing the radioactive solution through an ion exchange column containing $Na(Ti_2O_5H)$ or a similar material, or using a combination of these processes. The stable solid formed is dried by heating from about 100 deg C to 500 deg C in an atmosphere of air, inert gas, or reducing gas at reduced pressure. After drying the solid may be compressed and sintered to form a chemically stable, inert oxide ceramic product. It is claimed that greater than about 99.9 percent of multivalent radioactive elements are removed from aqueous solution using this process.

1127 BEHAVIOURS OF TRINITRATONITROSYL COMPLEXES OF RUTHENIUM IN DILUTE NITRIC ACID SOLUTIONS. Sugimoto, S. (Radia Industry Co. Ltd., Takasaki (Japan)). Radioisotopes (Tokyo) ; 28: No. 7, 425-430(Jul 1979). (In Japanese).

This study aimed to elucidate the protolysis and condensation processes of the Ru complexes in relation to the concentration of nitric acid. The compositions of the dissociated and undissociated complexes were determined by the extraction with tributyl phosphate (TBP) and absorption spectroscopy in order to follow the rather rapid protolysis reaction of the complexes. The test solutions were prepared by dissolving the freshly obtained complexes into 0.50 - 0.001 M nitric acid solutions. The amounts of the undissociated complexes were determined at different elapses of time in the test solutions. The protolysis became significant when the concentration was below 0.15 M, and the dissociation rate suddenly increased at this concentration. At the concentrations above 0.2 M, the absorption peak of the complexes at 480 nm survived even after 144 hours. But below 0.15 M, the formation of dissociation products by protolysis was observed after the disappearance of the absorption peak. The amount of dissociation products rapidly increased after the preparation of the test solution as the concentration decreased below 0.15 M.

1128 SETTING UP OF REACTION MODEL FOR THE DENITRATION OF EFFLUENTS FROM THE PROCESSING OF NUCLEAR FUELS. Holze, K.; Finke, H.D.; Deckwer, W.D. (Hannover Univ. (Germany, F.R.). Inst. fuer Technische Chemie); Kelm, M. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Entsorgungstechnik). Chemie-Ingenieur-Technik ; 51: No. 7, 754-755(Jul 1979). (In German).

DENITRATION;FORMIC ACID;ISOTHERMAL PROCESSES; NITRIC ACID;NUCLEAR FUELS;REPROCESSING;TIME DEPENDENCE;RADIOACTIVE WASTE PROCESSING

1129 CONTINUOUS BITUMINIZATION PLANT FOR SOLIDIFYING RADIOACTIVE WASTES. Ishikawa, T.; Hamano, M.; Misawa, H.; Hidaka, Tsukasa; Negishi, I. (Ebara Mfg. Co. Ltd., Tokyo (Japan)). Ebara Jiho (Ebara Times) ; No. 109, 49-52(Jul 1979). (In Japanese).

Following the delivery of two units to BWR power stations, another continuous bituminization plant of the same capacity has been delivered to Kansai Electric Power Co., Inc.'s Mihama Nuclear Power Station and is now operating smoothly. This unit is the first in the world for a PWR power station on an industrial scale and has been designed to solidify mainly radioactive boric acid waste solution, using a vertical centrifugal thin film evaporator. This equipment has demonstrated a rated water evaporation capacity of more than 200 kg/h with actual radioactive concentrated waste.

1130 STUDIES ON THE REMOVAL OF HYDROPHILIC RADIOACTIVE SUBSTANCES FROM RADIOACTIVE WASTE. Kojima, S. (Teikyo Univ., Tokyo (Japan)); Kubodera, A. Radioisotopes (Tokyo) ; 28: No. 7, 447-449(Jul 1979). (In Japanese).

CALCIUM CHLORIDES;CARBON 14;DECONTAMINATION; DEHYDRATION;RADIOACTIVE WASTE PROCESSING; DISTILLATION;LIQUID SCINTILLATORS;LIQUID WASTES; RADIOACTIVE WASTE DISPOSAL;RADIOACTIVE WASTES; TRITIUM

1131 DEVELOPMENT AND VERIFICATION TEST ON REMOTE PLASMA CUTTING OF LARGE METALLIC WASTE. Ozawa, T.; Yamada, K.; Abe, T. (Kawasaki Heavy Industries Ltd., Kobe (Japan)). FAPIG (Tokyo) ; No. 92, 37-40(Jul 1979). (In Japanese).

Plasma cutting is the cutting method to melt and scatter cut objects by generating arc between an electrode in a nozzle and the cut objects and making working gas fed to surround it into high temperature, high speed plasma jet. In case of remote plasma cutting, a torch for the plasma cutting is operated remotely with a manipulator from the outside of a cell. At the time of planning the method of breaking up solid wastes, the type of cutting machines and the method of remote operation of the cutting machines and cut objects were examined. It was decided to adopt plasma cutting machines, because their cutting capability such as materials, thickness and cutting speed is excellent, and the construction and handling are simple. The form of the solid wastes to be cut is not uniform, accordingly the method of manipulator operation was adopted to respond to various forms flexibly. Cut objects are placed on a turntable to change the position successively. In case of remote plasma cutting, the controls of torch speed and gap must be made with a manipulator. The use of light-shielding glasses reduces largely the watchability of cut objects and becomes hindrance in the operation. As for the safety aspect, the suitable gas for cutting, which does not contain hydrogen, must be selected. The tests carried out for two years since November, 1977, are reported in this paper, and most of the problems have been solved.

1132 METHOD OF PROCESSING RADIOACTIVE LIQUID WASTES. Matsuura, H.; Kuribayashi, N.; Minami, Y.; Kamiyama, H. (Nippon Atomic Industry Group Co. Ltd., Tokyo). (to Nippon Atomic Industry Group Co. Ltd., Tokyo; Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 1954-81499/A/. 28 Jun 1979. 3p. (In Japanese).

Radioactive liquid wastes within a storage tank are supplied to a drier where the wastes are subjected to evaporation treatment, and pulverized. The thus dried powders are temporarily stored in a hopper by means of a screw feeder. The dry powders which have reached a predetermined quantity are supplied to a stirrer-granulator by means of a quantitative screw feeder, and mixed and stirred with a binder sent from a binder storage tank through a binder quantity determining device, whereby the powders are granulated. After the granulation, the granulated powders are extruded by a centrifugal force, and filled in the storage vessel by way of a conduit.

1133 METHOD AND DEVICE FOR CONTROLLING THE RADIOACTIVE LIQUID WASTES PROCESSING SYSTEMS. Watanabe, T. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 1954-74999/A/. 15 Jun 1979. 26p. (In Japanese).

A method is claimed to conduct sampling for liquid wastes and processing water with no overlaps in a nuclear power plant by scattering the starting time for the sampling in each of a plurality of pure water cleaning systems by an interval exceeding a predetermined of time in a nuclear power plant. Among output signals from level meters of liquid wastes tanks, the signal selection station of a control unit selectively issues a liquid level signal from a liquid waste tank now in collecting liquid wastes to a precasting station for the start of sampling and a liquid level signal from a liquid waste tank now in conducting water cleaning procession for the liquid wastes to an output station for sampling instruction. The signal from each of the output stations for sampling instruction is issued to the inlet valve of a liquid waste tank to determine if the tank is in collecting the liquid wastes. While on the other hand, the output station for the sampling instruction combines the precast time for the start of water cleaning procession in each of the systems inputted from the precasting station for the start of sampling and each of the signals inputted from a processing amount operating station to conduct logic operation and issues output signal for the sampling operation.

1134 METHOD OF PROCESSING RADIOACTIVE WASTES. Horiuchi, S.; Hirano, M.; Yusa, H.; Chino, K.; Hayashi, T. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 54-75,000/A/. 15 Jun 1979. 4p. (In Japanese).

The purpose is to dry and pulverize radioactive solid wastes by a centrifugal thin film dryer provided with a revolutional blade to reduce their volume. Exhausted ion exchange resins in a storage tank are added to the main body of centrifugal thin film dryer. The main body is inserted with a revolutional shaft with blades and heated by steam from a boiler. The slurry with ion exchange resins are deposited into the inner wall of the main body under the centrifugal force of the rotation of the revolutional shaft, dried while falling along the inner wall and then finely pulverized by the rotation of the blades. The resulting dry powder is pelletized in a pelletizer.

1135 TREATMENT OF RADIOACTIVE SLUDGE. Allison, W.; Payne, B.J.; Pegler, G.E. (to Central Electricity Generating Board, London (UK)). British Patent 2,009,486/A/. 13 Jun 1979. 12p.

Radioactive sludge e.g. that which may accumulate in irradiated nuclear fuel element storage ponds, is treated by pumping it from a settling tank to a particle separator, conveniently a hydrocyclone and a sloping plate separator, the liquid being returned to the settling tank and the solids being metered into a drum pre-lined with dry cement. The drums are in a containment box in which they are transferred to a mixing station where the particles and cement are mixed and thence to a curing station. After curing the drums are embedded in cement in outer containers for transport to a long-term storage site.

1136 SOLIDIFICATION DEVICE FOR RADIOACTIVE GASEOUS WASTES. Shimada, M.; Terasawa, M. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 54-74,100/A/. 13 Jun 1979. 3p. (In Japanese).

The purpose is to improve the efficiency of the solidifying process of radioactive gaseous wastes by ionizing radioactive gases, and then injecting them ina storing terget opposing to a sputtering target thereby solidifying them. Gaseous wastes such as radioactive gases, are ionized by an ion source into ion beams, accelerated in an accelerator and then injected to an ion injection chamber. A storing target and a sputtering target are placed opposite each other in the ion injection chamber. When the ion beams are injected into the sputtering target, atoms are discharged and deposited in storing target. Since ion injection and the solidification of the injected ions can be effected simultaneously, the efficiency of the solidifying process can be improved.

1137 METHOD OF PROCESSING ORGANIC MATERIALS CONTAINING RADIOACTIVE ELEMENTS. Kitazato, H.; Hashimoto, S.; Asakura, Y. (to Chiyoda Chemical Engineering and Construction Co. Ltd., Tokyo (Japan)). Japanese Patent 54-71,300/A/. 7 Jun 1979. 4p. (In Japanese).

The purpose is to bond radioactive organic wastes containing ^{3}H and ^{14}C from laboratories and hospitals to inorganic solids by a sample and safe method so that they are inflammable and are easily transpoiled and stored. The solid components of the liquid waste separated in a sedimentation tank and a solid-liquid separator are then added a closed type burner reactor. The condensed water of the flammable gas is separated in a vapor-liquid separator, and the gas is sent to a solidification section. The solidification section consists of a reveral of towers absorbing or adsorbing respective components of the gas, to purify it. Solids from the sedimentation tank, and the solid-liquid separator are stored in a tank, later burned in a solid burner reactor, and the resulting residue and condensed water from the vapor-liquid separating tank are collected in the storage tank and sent to the solidification device and solidified with cement.

1138 METHOD AND DEVICE FOR REMOVING VOLATILE COMPONENTS IN RADIOACTIVE LIQUID WASTES. Suzuki, T.; Inami, I.; Shirai, T.; Sakurai, M. (Nippon Atomic Industry Group Co. Ltd., Tokyo). (to Nippon Atomic Industry Group Co. Ltd., Tokyo; Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 54-69,700/A/. 4 Jun 1979. 4p. (In Japanese).

The purpose is to cool and condense vapor obtained from concentrating radioactive liquid wastes at temperature in the range of from 60 to 80 C, and to blow a carrier gas into the condensed water to cause the water to carry out vapor-liquid contact and to remove volatile components mixed in the condensed water. A volatile component removing device consists of a cooler for cooling vapor containing volatile components generated in a vapor concentrator, in the range of from 60 to 80 C, a device for aerating condensed water in the cooler, a device for supplying a carrier gas such as nitrogen to be blown in the aeration device, and a device for treating volatile components and carrier gas removed in accompaniment with the blown-in gas. In this case, the interior of the aeration device is formed by a tank partitioned into several chambers by baffle boards, and both sides of the tank are provided with an inlet and an outlet with thermocouples. Gas from the carrier gas supplying device some into the tank through a flowmeter and an air blow-off part.

1145 DRY RECOVERY OF CERAMIC URANIUM DIOXIDE WASTE MATERIAL. Schwartz, I.; Mintz, M.H.; Hadari, Z. (Ben-Gurion Univ. of the Negev, Beersheba (Israel). Dept. of Nuclear Engineering). Journal of Nuclear Materials (Journal des Materiaux Nucleaires) ; 82: No. 1, 54-59(Jun 1979).

Three dry recovery routes of ceramic uranium dioxide waste material were studied: (a) calcination of waste material to U_3O_8 and blending with the original UO_2 powder; (b) calcination to U_3O_8 then reduction to UO_2 and blending with the original UO_2 powder; (c) grinding the waste material to a fine powder and blending with the original UO_2 powder. The first route resulted in an increased open porosity and decreased closed porosity of the sintered UO_2 pellets. The second recovery route had almost no effect on the quality of the sintered pellets, while the third route caused an increase in open porosity up to about 15 to 18 wt% of the added scrap material and increased closed porosity for higher concentrations of the added recovery material.

Effects of sieving the recovered scrap powders were also investigated. No effects were observed for the first and second recovery routes, while for the third route more pronounced effects were obtained for coarsely ground powders.

1146 GLASSES WITH AMORPHOUS STRUCTURE USED FOR THE PACKAGING OF RADIO-ACTIVE WASTE. Sombret, C. (CEA Centre de Marcoule, 30 - Bagnols-sur-Ceze (France). Service des Ateliers Pilotes). Journal of Nuclear Materials (Journal des Materiaux Nucleaires) ; 82: No. 1, 163-171(Jun 1979). (In French).

The vitrification of solutions of fission products enables them to be stored in solid form, which is most important for the safety of this type of highly radio-active waste. The glasses used have a silica base. Their physico-chemical properties affecting their workability and their behaviour during long-term storage are reviewed. The accent is particularly on their chemical and thermal stability. Fabrication techniques are described. One of these, a continuous process using a preliminary calcination stage, has been employed in an industrial unit. This unit, called AVM (Atelier de Vitrification de Marcoule), after a test period, was put into commercial use in June 1978. It has been provided for treatment of the production of the Marcoule works and for treatment of the stock in less than ten years. This work re-treats the fuel and graphite from experimental reactors, the glasses used being of the alumino-boro-silicate and boro-silicate types, respectively.

1147 DISPOSAL OF RADIOACTIVE WASTES BY VITRIFICATION. Mukerji, J. (Central Glass and Ceramic Research Inst., Calcutta (India)). Science Reporter (New Delhi) ; 16: No. 6, 371-378(Jun 1979).

Disposal of the three catagories of radioactive wastes viz. low level, intermediate level and high level is discussed. Low level wastes are generally diluted and dispersed in the environment. Intermediate level wastes are chemically treated for disposal. High level wastes are stored in underground stainless steel tanks with concrete casing. There are some drawbacks with storage of annually increasing liquid radioactive waste, such as space, storage time, corrosion etc. Various methods of immobilisation of wastes are stated, however immobilisation in a glassy matrix offers a safe method for long term storage of high level radioactive wastes. Disposal of waste by vitrification is described in brief. Advantages of immobilisation of fission products in a glassy matrix are given. In India, Central Glass and Ceramic Research Institute (CGCRI), Calcutta took up the project on development of glass composition for high level waste. Several glass compositions have been examined by CGCRI for containment of fuel reprocessing wastes. Four component glass forming systems are represented in a trial diagram at fixed level of 20 percent $Na_2B_4O_7$ and 13 percent of Fe_2O_3. Release of ^{90}Sr, ^{137}Cs and ^{144}Ce by the glass when it comes into contact with distilled water or sea water over extended period is shown with diagrams. Ways to prevent the escape of ^{106}Ru and ^{137}Cs from the glass melt in glass fixation plant are mentioned. Changes which may occur in the glass during storage of the sealed pot are briefly discussed.

1148 DECOMMISSIONING AND REBUILDING ACTIVE REPROCESSING PLANT. Barrett, T.R.; Thom, D. (UKAEA, Dounreay. Nuclear Power Development Establishment). Atom (London) ; No. 272, 142-145(Jun 1979).

The Fast Reactor Irradiated Fuel Reprocessing Plant at Dounreay, built originally to reprocess fuel from the experimental Dounreay Fast Reactor, is being recommissioned for the purpose of servicing the 250 MWe Prototype Fast Reactor fuel cycle. This marks the culmination of a remarkable exercise in the modification of active plant.

1149 EFFECTS OF NITRITE ON DENITRATION OF NUCLEAR FUEL REPROCESSING WASTE WITH ORGANIC REDUCTANTS. Kubota, M.; Yamaguchi, I.; Nakamura, H. (Japan Atomic Energy Research Inst). Journal of Nuclear Science and Technology (Tokyo) ; 16: No. 6, 426-432(Jun 1979).

Denitration with an organic reductant, such as formic acid or formaldehyde, to control the acidity of high radioactive nuclear fuel reprocessing waste, cannot suppress vigorous chemical reactions. To overcome this problem, nitrite was added to nitric acid solution before denitration, reducing the induction period to almost zero and the maximum gas evolution rate to less than 60% of the rate obtained in the absence of nitrite. The effective nitrite concentration was ¹m gr ¹e 0.01 mol/l in the reaction mixture. (1 diagram, 10 graphs, 9 references, 1 table)

1150 CHARACTERIZATION AND DISPOSAL OF RADIOACTIVE EFFLUENTS FROM URANIUM MINING. Moffett, D. (Rio Algom Limited, Elliot Lake, Ontario). CIM (Canadian Institute of Mining and Metallurgy) Bulletin ; 72: No. 806, 152-156(Jun 1979).

Rio Algom has mined uranium at Elliot Lake, Ontario for 20 years. The production of this energy-generating element results in the need to dispose of low-level radioactive solid wastes and liquid effluents. Because of the wet-temperate climate at Elliot Lake, the liquid effluents are of particular importance. Radium-226 is the isotope which requires most attention, and the current practice for its control is by addition of barium chloride and retention of the resultant precipitates in large settling ponds. Analyses of typical effluents and waste streams are discussed and typical levels of radium-226, thorium-230, thorium-232, thorium-228, lead-210, polonium-210, and uranium isotopes are presented. (author).

1151 STUDY ON DECONTAMINATION OF RADIOACTIVE RUTHENIUM BY STEEL WOOL IN WASTE SOLUTION. Sugimoto, S.; Sakaki, T. (Radia Industry Co. Ltd., Takasaki, Gunma (Japan)). Radioisotopes (Tokyo) ; 28: No. 6, 361-366(Jun 1979). (In Japanese).

Tracer experiments were done in order to establish a decontamination process of ^{106}Ru in radioactive waste solution by column method paying special attention on the solution of nitrato-nitrosyl complex of Ru which is often encountered as a low level radioactive solution. It turned out that metallic iron was the most effective decontaminating agent among the several tens of materials tested. The decontamination factor (DF) of ^{106}Ru increased in proportion to the total surface area of iron and it sensitively depended on the oxidation state of the surface as revealed by the batchwise and columnwise tests. Iron samples with high corrosiveness gave a much larger DF than those with low corrosiveness. The decontamination process proceeded as iron was being oxidized via Fe(metal) → Fe(II) → Fe(III). As the results, the DF initially

increased after initiating the passage of water through the column but it then decreased as the oxidation process became inactive. An excellent durability up to 10000 bed volumes was demonstrated by the column method at a high average DF of 150.

1152 PHASE SEPARATION IN THE GLASS CONTAINING HIGH LEVEL RADIOACTIVE WASTE. Yamane, M.; Nakao, Y. (Tokyo Inst. of Tech. (Japan). Faculty of Engineering). Yogyo Kyokai Shi (Journal of the Ceramic Association of Japan) ; 87: No. 1006, 327-332(Jun 1979). (In Japanese).

The phase separation in the glass of the system Na_2O-B_2O_3-SiO_2-MoO_3 has been investigated as the basic study on the solidification of high level radioactive waste with glass. The amount of MoO_3 or sham-waste to be introduced without phase separation into the glass increased with the substitution of B_2O_3 for SiO_2 in the basic glass composition. Parameters for estimating the limiting amount of MoO_3 to be introduced into a glass of given composition were determined from experimental data, assuming the melt of the system Na_2O-B_2O_3-SiO_2-MoO_3 to be the regular solution of pseudo-binary system consists of two end members, Na_2MoO_4 and the remaining oxides. The limiting amount of waste to be introduced, estimated using the parameter for respective structural unit which is expected for a melt of given composition, agreed to the experimental result.

1153 SEPARATION OF TRANSPLUTONIUM AND RARE-EARTH ELEMENTS BY EXTRACTION WITH DI-ISODECYL PHOSPHORIC ACID FROM DTPA SOLUTION. Tachimori, S.; Sato, A.; Nakamura, H. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Journal of Nuclear Science and Technology (Tokyo) ; 16: No. 6, 434-440(Jun 1979).

The distribution ratio Df and the separation factor β for Nd(III) to Am(III) were studied in DIDPA-DTPA systems to determine optimum conditions for applying DIDPA to the TALSPEAK type extraction process to separate transplutonides from lanthanoids in the partitioning of high-level waste of nuclear fuel reprocessing. Extraction of lanthanoids from 0.05 -- 0.1 M DTPA-1 M lactic acid (pH 3.0) aqueous solution into 0.2 -- 0.3 M DIDPA in DIPB gives the separation factor of 20 revealing practicability of this system in the partitioning. The nature of diluent affects greatly Df, and DIPB proved to be the most appropriate one for the separation of transplutonides from lanthanoids. The presence of lactic acid in the aqueous phase improved the extraction kinetics in DIDPA-DTPA system.

1154 REMOVAL PROCESSES FOR RADIOACTIVE RARE GAS OF FUEL REPROCESSING PLANT. Nakajima, K.; Nakanishi, Y. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Nippon Genshiryoku Gakkaishi (Journal of the Atomic Energy Society of Japan) ; 21: No. 6, 463-470(Jun 1979). (In Japanese).

With the advance in atomic energy utilizations, the problem of environmental radiation is attracting more attention. For radioactive rare gases from nuclear power plants and fuel reprocessing plants, therefore, efforts are being made world-wide to develop the techniques of reducing their releases to the environment as far as practically possible. First, the world situation of the removal and also storage techniques for krypton is described as follows: liquefaction-distillation, low-temperature active carbon adsorption, solvent absorption, and membrane. Then, a Kr recovery facillity planned by Power Reactor and Nuclear Fuel Development Corporation (PNC) for its fuel reprocessing plant is explained. Construction of the Kr recovery facility in PNC will start in fiscal 1979, and the completion in fiscal 1981. Its gas treatment capacity is 1,200 Nm^3/d, and the facility is based on air separation, i.e. liquefaction-distillation process. Special emphasis in the design is placed on the careful treatment of gas to improve safety and the leakage prevention of radioactive gas.

1155 EFFECTS OF NITRITE ON DENITRATION OF NUCLEAR FUEL REPROCESSING WASTE WITH ORGANIC REDUCTANTS. Kubota, M.; Yamaguchi, I.; Nakamura, H. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Journal of Nuclear Science and Technology (Tokyo) ; 16: No. 6, 426-433(Jun 1979).

Denitration with organic reductant such as formic acid is exclusively used for controlling acidity of the highly radio-active liquid waste (HLW) from nuclear fuel reprocessing. This method, however, has a problem in suppressing a vigorous chemical reaction. The present study aimed at overcoming the disadvantage by the addition of nitrite to nitric acid solution before denitration. As a result, the nitrite addition in the denitration of simulated HLW could reduce the induction period to almost zero and the maximum gas evolution rate to less than 60% of that obtained in the absence of nitrite. Effectiveness of nitrite addition was enhanced especially for HNO_3 concentration higher than 8 mol/l. The effective nitrite concentration was over 0.01 mol/l in the reaction mixture.

1156 REMOVAL OF PLUTONIUM AND AMERICIUM FROM ALKALINE WASTE SOLUTIONS. Schulz, W.W. (to Dept. of Energy). US Patent 4,156,646. 29 May 1979. Filed date 16 Jun 1978. 12p.

High salt content, alkaline waste solutions containing plutonium and americium are contacted with a sodium titanate compound to effect removal of the plutonium and americium from the alkaline waste solution onto the sodium titanate and provide an effluent having a radiation level of less than 10 nCi per gram alpha emitters.

1157 METHOD TO IMPROVE THE LEACHING RESISTANCE OF BITUMEN SOLIDIFICATION PRODUCTS. Hild, W.; John, E.; Kluger, W. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). German(FRG) Patent 2,748,098/A/. 10 May 1979. 11p. (In German).

The method to stabilize radioactive slurries intercalated in bitumen described in the main patent 2628286 is improved upon by having an insert of inorganic structure material for the used container which has been impregnated with bitumen or similar water-resistant materials. Tissues of glass fibre, mineral fibres or asbestos fibres, thin structured metal foils are suitable. When the hot bitumen has been filled in the container, the insert forms a unit with the content which is very resistant to leaching.

1158 METHOD OF TREATING DISCHARGE WATER FROM PREPARATION PLANTS OF URANIUM ORES. Klicka, V.; Mitas, J.; Vacek, J. Canadian Patent 1,053,912/A/. 8 May 1979. 10p.

A process is described for the treatment of radioactively contaminated waste water emitted from an installation for chemically preparing

uranium ore by an alkaline process, which comprises evaporating the waste water to increase its concentration, crystallizing an inorganic salt (sodium sulfate) from the resulting concentrated solution, separating the crystallized salt from the mother liquor, returning the mother liquor to the installation and feeding condensate distilled from the waste water during the evaporation back to the installation to provide fresh water for use in the ore treatment.

1159 GASIFICATION OF GRAPHITE. Sugikawa, S. (to Japan Atomic Energy Research Inst., Tokyo). Japanese Patent 1954-55,297/A/. 2 May 1979. 3p. (In Japanese).

Purpose: To process the waste contaminants of graphite moderated reactors by gasifying the moderator and fuel can graphite in the presence of carbon dioxide. Method: Graphite blocks used as moderator and reflector are impregnated with a solution containing $Co(NO_3)_2$ (0.6 - 1.5 M), $NaNO_3$ (0.5 - 1.5M), and HNO_3 (1 - 18M) at about 20 - 80°C. After dehydration and denitration in air or nitrogen at a temperature above 100°C, the fuel compacts or graphite blocks are added with Co-Na catalyst. The graphite matrix or block is then gasified by contact with a stream of 100% CO at about 850°C.

1160 NUCLEAR ENERGY AND THE FUEL CIRCUIT. Dejonghe, P. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). Atom und Strom ; 25: No. 3, 71-77(May-Jun 1979). (In German).

The author gives a review of the nuclear fuel circuit and discusses the final storage of the conditioned waste from the Belgian point view.

1161 IONIC FLOTATION OF STRONTIUM 89. Berezyuk, V.G.; Evtyukhova, O.V. (Ural'skij Politekhnicheskij Inst., Sverdlovsk (USSR)). Zhurnal Prikladnoi Khimii (Leningrad) ; 52: No. 5, 1038-1042(May 1979). (In Russian).

The experimental results are given on ^{89}Sr ionic flotation out of sewage after deactivation using sodium dodecylbenzene sulfonate (DBSNa) as a foamer. Strontium was used in the form of $SrCl_2$ at the 1.5-2.0 μCi/l isotopic concentration. It is established that the best condition of ^{89}Sr flotation is the 2.0-2.5 pH range. During ionic flotation interaction of ^{89}Sr microquantities with DBSNa has in the main an ion exchange character. The experimental data satisfactorily obey the equation being a consequence of the law of mass action. The process kinetics can be described by the equation of the first-order reaction.

1162 PRESENT STATE AND POLICY OF LOW-LEVEL RADIOACTIVE MANAGEMENT. Yonemoto, H. (Science and Technology Agency, Tokyo (Japan). Nuclear Safety Bureau). Kogai To Taisaku (Journal of Environmental Pollution Control) ; 15: No. 5, 643-649, 660(May 1979). (In Japanese).

Radioactive wastes can be grouped broadly in those from nuclear fuel cycle and those from radioisotope utilizations. In the former group, low-level wastes arise from nuclear power plants, and from fuel reprocessing plants, low-level wastes and also small quantities of high-level ones arise. In the latter group, wastes are mostly low-level ones in small quantities, but the sources, kinds and properties are various. In view of the rapidly rising quantities of such wastes in future, their management in proper and adequate manners is essential for sakes of safety and environment protection. The following matters are described: the laws and regulations on radioactive wastes; the sources of radioactive wastes and their treatments and disposals in nuclear power generation, uranium fuel fabrication and RI utilizations; future quantities of radioactive wastes; the policy of radioactive waste management for low-level solid wastes, sea disposal and land disposal.

1163 SOLIDIFICATION OF HIGHLY ACTIVE WASTES GENERATED BY REPROCESSING: REALIZATION AND FORECASTING. Amaury, P. (Compagnie Generale des Matieres Nucleaires (COGEMA), La Boursidiere, 92 - Le Plessis-Robinson ; France)). Techniques de l'Energie ; No. 26, 57-59(May 1979). (In French).

Cogema operates two major reprocessing plants in France - one at Marcoule, the other at La Hague. The Commissariat a l'Energie Atomique has developed for Cogema a continuous industrial process for solidifying highly active wastes coming from these and any future plants. After several years of development at the pilot levels, this industrial process has been working on a large-scale demonstration plant since June last year. The plant is called the 'Marcoule Vitrification Workshop' (Atelier de Vitrification de Marcoule AVM).

1164 DEHYDRATION OF CONTAMINATED ANIMAL CARCASSES WITH A COMMERCIAL LYOPHILIZER. Suda, H.; Ishige, K.; Yokota, S.; Fujita, H.; Mori, T. (Tokai Univ., Tokyo (Japan)). Radioisotopes (Tokyo) ; 28: No. 5, 319-321(May 1979). (In Japanese).

AERIAL MONITORING;AIR FILTERS;CARBON 14; CUTTING;DEHYDRATION;DRYING;LYOPHILIZATION; RADIOACTIVE WASTE DISPOSAL;RADIOACTIVE WASTES; TEMPERATURE DEPENDENCE;TIME DEPENDENCE;TRITIUM; LABORATORY ANIMALS;RADIOACTIVE WASTE PROCESSING

1165 EXPERIENCES OF RADIOACTIVE WASTE PROCESSING AND STORAGE. Feher, L.; Kasza, J. (Fovarosi Kozegeszsegugyi es Jarvanyugyi Allomas, Budapest (Hungary)). Izotoptechnika ; 22: No. 3, 127-136(May 1979). (In Hungarian).

The experiences in the field of radioactive waste disposal after two and a half year long operation period are reviewed. Detailed data are given on the quantity and origin of deposited solid phase wastes, sealed radiation sources (alpha, beta, gamma, neutron), biological materials, radioactive sewage and organic solvents. The methods of waste processing and deposition and the control of environmental contamination are also discussed.

1166 FILTRATION OF RADIOACTIVE WATER. Mueller, H. Informations Chimie ; No. 189, 213-216(May 1979). (In French).

The Funda filters developed for nuclear uses are fitted with a certain number of conical discs whose upper side is covered with a filtering mesh. These discs are mounted horizontally on the hollow vertical shaft that supports the entire filtering package. The spaces between the discs can vary with the spacers used and depend on the type and volume of cake to be achieved. The filtering of the waste waters and radioactive sludge has two purposes. The filter withholds the solids (suspended matter) and if an adequate filtering additive is used, it also withholds the dissolved components (salts) by adsorption and/or ion exchange. In this way the waste waters are decontaminated.

1167 TREATMENT OF ANIMAL WASTES CONTAMINATED WITH RADIOISOTOPES. Morikawa, N. (Tokyo Univ.

(Japan)). Kogai To Taisaku (Journal of Environmental Pollution Control) ; 15: No. 5, 661-666(May 1979). (In Japanese).

With increase of isotope utilizations as tracers in medicine, pharmacy, agriculture, biology and others, the management of resultant organic waste liquids and animal wastes is becoming a major problem. For the animal wastes contaminated with radioisotopes, numbers of studies and tests showed that drying them fully and the subsequent suitable disposal would be the most feasible procedures. This new method is being carried out since last year, which will shortly take the place of the keeping in formalin. For the drying, two alternative processes in particular are being investigated. As the one, freeze-drying apparatuses consist of refrigerating and freeze-drying devices. As the other, microwave-drying apparatuses feature rapid dehydration. The following matters are described: problems emerged in the course of studies and test; the drying processes, i.e. freeze-drying and microwave-drying, and their respective characteristics; and views of the Nuclear Safety Bureau, Science and Technology Agency, on animal waste drying. (J.P.N.).

1168 ELIMINATION OF MANGANESE-54 IN WASTE WATER BY OXINE-IMPREGNATED ACTIVATED CHARCOAL. Motojima, K.; Tachikawa, E.; Kamiyama, H. (Japan Atomic Energy Research Inst., Oarai, Ibaraki. Oarai Research Establishment). Journal of Nuclear Science and Technology (Tokyo) ; 16: No. 5, 356-362(May 1979).

Manganese ion in solution has been adsorbed in a column packed with oxine-impregnated activated charcoal. In an initial stage, the distribution of Mn ion along the column follows a first order kinetic equation, and the apparent rate constant was determined. With an additional supply of the solution, however, the distribution tends to deviate from the first order kinetic plots. A bed depth/service time relation has been determined experimentally. By introducing a concept of the effective ''adsorption capacity'' and ''adsorption rate constant of the adsorbent, an equation has been presented for estimating the feed application time for breakthrough at any given experimental conditions. With the assumption of a simple first order kinetic adsorption, a bed depth/service time relation was also determined by a numerical calculation, for further examining the characteristics of the relation.

1169 RADIOACTIVE ORGANIC SOLVENT WASTES. Nakano, E. (Nagoya Univ. (Japan)). Kogai To Taisaku (Journal of Environmental Pollution Control) ; 15: No. 5, 657-660(May 1979). (In Japanese).

In recent years, the tracer experiments using low-energy β-ray nuclides such as ^{3}H and ^{14}C have been increasingly performed in biological sciences. For the measurements involved, liquid scintillation counters are used, so that large amounts of liquid scintillator wastes arise in the organizations concerned. The radioactivity level in environment is insignificantly low; but they must be disposed of properly because of their inflammable as well as radioactive properties. It is then preferable not to collect the wastes, but to treat and dispose of them in respective places where they were used. As indications, the organic wastes containing ^{3}H or ^{14}C beyond a certain level are separated into the organic solvent and the radioactive residue by suitable means, then the solvent is burned off. The organic wastes containing ^{3}H or ^{14}C below the level are burned off as they are. The following matters are described: the amounts of such wastes and the radioactive concentrations, treatments of the wastes by distillation, incineration, solidification and adsorption; and so on. (J.P.N.).

1170 RADIATION DAMAGE OF ORGANIC EXTRACTANT IN PARTITIONING OF HIGH-LEVEL LIQUID WASTE, (2). CALCULATION OF RADIATION DOSE ABSORBED IN ORGANIC SOLVENT IN EXTRACTION PROCESS. Tachimori, S.; Nakamura, H. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Journal of Nuclear Science and Technology (Tokyo) ; 16: No. 5, 363-370(May 1979).

Radiation dose absorbed in the organic extractant was estimated for the countercurrent extraction with mixer-settler in the partitioning of the high-level liquid waste of fuel reprocessing. The radiation dose due to the absorption of α- and β-particles was calculated to be 10, 5.0 and 0.42 Wh/l for 150 days, 1 year and 10 years after fuel discharge from the reactor, respectively. About 70 -- 90% of the total dose was due to the absorption of β-particles. These values were discussed in comparison with the published data for the fuel reprocessing. On the basis of the calculated data, the radiolytic effects upon the extraction of strontium, lanthanoids and transplutonium elements in partitioning were estimated be sufficiently small.

1171 METHOD OF PROCESSING RADIOACTIVE WASTES. Kizawa, H.; Nakai, Y.; Funakoshi, T.; Izumoji, Y. (to Mitsubishi Heavy Industries Ltd., Tokyo (Japan)). Japanese Patent 54-50,798/A/. 20 Apr 1979. 5p. (In Japanese).

The purpose is to feed tritium-eliminated water to a cooling system by providing a tritium separator at the downstream of a chemical volume control system or a liquid waste processing system. Method: A chemical volume control system consists of a coolant storage tank, a desalting tower and boric acid recovery system and a monitor tank, which maintains quality and quantity of coolants in the primary cooling system of a PWR type reactor. Coolants outgoing from the reactor cooling system are processed in the chemical volume control system and recovered in a primary purified water tank. A liquid waste processing system consists of a liquid waste storage tank, an evaporator, a desalting tower and a monitor tank, which processes the liquid wastes so as to be usable as supplemental water to the primary cooling system and recovers it to the primary purified water tank. Water from these processing systems is separated with tritium in a tritium separator and then returned to the primary purified water tank.

1172 DEVICE TO DRAW OFF ONE OR SEVERAL PHASES. Finsterwalder, L. (to Gesellschaft zur Wiederaufarbeitung von Kernbrennstoffen m.b.H., Eggenstein-Leopoldshafen (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,624,936/B/. 12 Apr 1979. 4p. (In German).

The self-controlling of the phase boundary with proportional characteristics between the light and heavy phase (e.g. TBP/dodecane mixture and H_3PO_4) can be performed by means of the airlift principle. An extraction funnel with ascending pipe on one side is placed on the mixer-settler suitable for use in phosphoric acid adduct processes to treat organic solvent wastes of reprocessing plants. The ascending pipe is pulled up to the level of the light phase and contains the air lift. (orig./RW).

1173 METHOD TO FIX IRRADIATED FUEL ELEMENTS OF NUCLEAR REACTORS INTO FUEL CANS. Wehmeier, J. (to Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,745,175/A/. 12 Apr 1979. 7p. (In German).

In order to intermediately store fuel elements, e.g. of LWR, the latter are stored in fuel element casks. There is a binder between the fuel element and the inner walling of the cask in order to protect the fuel element cladding from e.g. oxygen. This binder consists of burnt lime, slaked calcium hydroxide and/or partly slaked lime. Fillers of sand and alkaline earth salts of carbonic acids are added to the binder. These convert fast to CO_2 or H_2O under radiolytic or thermal effect. The carbonates hardening is hence accelerated.

1174 REMOVING RADIONUCLIDES FROM WATER. Silver, G.L. (to Department of Energy, Washington, DC (USA)). British Patent 2,004,857/A/. 11 Apr 1979. 3p.

The invention relates to a process for decontaminating or removing radionuclides from aqueous solution, by contacting the aqueous solution with comminuted chitin.

1175 METHOD OF CEMENT-SOLIDIFICATION OF RADIOACTIVE LIQUID WASTES CONTAINING SURFACTANT. Sugimoto, Y.; Yusa, H. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 54-45,499/A/. 10 Apr 1979. 4p. (In Japanese).

Purpose: To provide the subject method comprising the steps of adjusting the concentration of the surfactant to a value less than the predetermined value even when the concentration of the surfactant is high, and rendering the uniaxial compression strength of the cement-solidification body into more than the defined fabrication reference value. Method: To radioactive liquid wastes there are applied means for boiling and heating liquid wastes by addition of sulfuric acid, means for cracking surfactants by the addition of oxidants and means for precipitating and arresting surfactants. After suppressing the hindrance of the cement hydration reaction by surfactants, the radioactive liquid wastes are cement-solidified. (Nakamura, S.).

1176 REMOVAL OF RADIONUCLIDES FROM WATER. Silver, G.L. (to Department of Energy, Washington, DC (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,842,050/A/. 5 Apr 1979. 8p. (In German).

The actinides contained in waste water, in particular Pu, are contacted and absorbed by crushed chitin. This chitin is then separated from the aqueous solution, e.g. with pH 5 to 10, and reduced to ash.

1177 METHOD TO ENCAPSULATE SPENT FUEL ELEMENTS OR HIGH-LEVEL RADIOACTIVE WASTES. Larker, H. (ASEA-ATOM AB, Vaesteraas (Sweden)). Swedish Patent 7,614,376-7/B/. Apr 1979. 5p. (In Swedish).

A method to encapsulate radioactive waste through isostatic pressing is described. The capsules are to be made of a aluminumoxidepowder or a aluminumsilicatepowder, such as mullite. The pressing is performed at about 1 kbar and at a temperature of 1350 C.

1178 METHOD FOR THE COVERING OF A BODY INCLUDING RADIOACTIVE WASTES WITH A LAYER OF SOME CORROSION RESISTANT MATERIAL. Larker, H. (ASEA-ATOM AB, Vaesteraas (Sweden)). Swedish Patent 7,614,375-9/B/. Apr 1979. 7p. (In Swedish).

A method for the covering of a body including radioactive wastes with a layer of some corrosion resistant material is described. The method is especially applicable to high-level radioactive wastes obtained from nuclear fuel reprocessing. The body is embedded in a mass including particles of the corrosion resistant material. The whole of it is enclosed in a gas-light sealed can and is then isostatically pressed at a temperature and a pressure suitable for the certain corrosion resistant material in order to obtain a continuous and compact layer of this material. Tantalum, titanium, zirconium, tungsten and molybdenum are corrosion resistant elements of interest in this connection.

1179 REMOVAL OF ACTINIDES FROM SELECTED NUCLEAR FUEL REPROCESSING WASTES. Navratil, J.D.; Thompson, G.H. (Rockwell International, Golden, CO). Nuclear Technology ; 43: No. 2, 136-145(Apr 1979).

The US Department of Energy awarded Oak Ridge National Laboratory a program to develop a cost-risk-benefit analysis of partitioning long-lived nuclides from waste and transmuting them to shorter lived or stable nuclides. Two subtasks of this program were investigated at Rocky Flats. In the first subtask, methods for solubilizing actinides in incinerator ash were tested. Two methods appear to be preferable: reaction with ceric ion in nitric acid or carbonate-nitrate fusion. The ceric-nitric acid system solubilizes 95% of the actinides in ash; this can be increased by 2 to 4% by pretreating ash with sodium hydroxide to solubilize silica. The carbonate-nitrate fusion method solubilizes greater than or equal to 98% of the actinides, but requires sodium hydroxide pretreatment. Two additional disadvantages are that it is a high-temperature process, and that it generates a lot of salt waste. The second subtask comprises removing actinides from salt wastes likely to be produced during reactor fuel fabrication and reprocessing. A preliminary feasibility study of solvent extraction methods has been completed. The use of a two-step solvent extraction system - tributyl phosphate (TBP) followed by extraction with a bidentate organophosphorous extractant (DHDECMP) - appears to be the most efficient for removing actinides from salt waste. The TBP step would remove most of the plutonium and > 99.99% of the uranium. The second step using DHDECMP would remove > 99.91% of the americium and the remaining plutonium (> 99.98%) and other actinides from the acidified salt waste. 8 figures, 11 tables.

1180 EXPERIENCE WITH THE USE OF RECYCLE PLUTONIUM IN MIXED-OXIDE FUEL IN LIGHT WATER REACTORS IN THE FEDERAL REPUBLIC OF GERMANY. Schenk, H.J. (Kernkraftwerk Obrigheim GmbH, Orbrigheim/Neckar, Germany); Huppert, K.L.; Stoll, W. Nuclear Technology ; 43: No. 2, 174-185(Apr 1979).

In the Federal Republic of Germany (FRG), the reprocessing of spent fuel assemblies and the recycling of the recovered plutonium are essential for the final disposal of high-level nuclear waste. In addition, the recycling of uranium and plutonium is an effective measure to avoid proliferation of plutonium for weapons and to reduce the needs of uranium. Therefore, the technology of recycling has been developed in the FRG since 1966. In the prototype boiling water reactor (BWR) of Kahl, in the BWR nuclear

power plant at Gundremmingen, and the pressurized water reactor plant at Obrigheim mixed-oxide fuel (MOX) assemblies have been operated with good success. Also, the experience gained at Alkem's MOX fuel fabrication plant is very positive. Reprocessing tests of spent MOX fuel rods have indicated that a nearly homogeneous mixture of PuO_2 and UO_2 should be used to achieve a good solubility of MOX fuel in nitric acid. In all, very important experience in safeguarding plutonium and MOX fuel material was gained. 7 figures, 3 tables.

1181 LIQUID WASTE HANDLING FACILITIES FOR A CONCEPTUAL LIGHT WATER REACTOR SPENT FUEL REPROCESSING COMPLEX. Witt, D.C.; Bradley, R.F. (E.I. duPont de Nemours and Co., Aiken, SC). Nuclear Technology ; 43: No. 2, 244-258(Apr 1979).

One alternative for closing the nuclear fuel cycle is efficient, high decontamination separation of uranium and plutonium and fabrication of a Pu-U mixed-oxide fuel. Detailed flowsheets were prepared by Savannah River Laboratory for a conceptual 10 MT/day reprocessing facility. The generation of liquid waste and the associated liquid waste handling facilities for the reprocessing plant were defined. Over 40 individual waste streams were identified. The reference facility generates 6.4 m^3 (1700 gal) of high-level liquid waste (HLLW) per day, which is converted to 0.5 m^3 (130 gal) of glass contained in three packages, each 0.3 m (12 in.) in diameter x 3 m (10 ft) high. Each operating day, the process converts 2.9 m^3 (775 gal) of concentrated intermediate-level liquid waste (ILLW) to 4 m^3 (1050 gal) of cemented solid in 21 carbon steel drums. Large-scale underground tank storage of liquid waste is eliminated by prompt solidification of the HLLW and ILLW. Each container of glass contains 30 kW nuclear decay heat and must be stored in water for an interim period prior to shipment to a federal repository. 10 figures, 1 table.

1182 WIPED-FILM EVAPORATORS FOR EVAPORATING ALKALINE LIGHT WATER REACTOR RADIOACTIVE WASTES. Goodlett, C.B. (E.I. du Pont de Nemours and Co., Aiken, SC). Nuclear Technology ; 43: No. 2, 259-267(Apr 1979).

Evaporation tests with synthetic alkaline wastes typical of intermediate-level waste streams from the processing of spent reactor fuel were made at the Savannah River Laboratory (SRL) with two small wiped-film evaporators [0.93 and 0.46 m^2 (10 and 5 ft^2) heat transfer area]. Each feed (six total) was processed separately within the operating range of each evaporator. Feed flows varied from 0.026 to 0.24 l/min (0.1 to 0.9 gal/min) in increments of 0.026 to 0.013 l/min (0.1 or 0.05 gal/min). Steam chest temperatures were maintained at 130, 150, 170, or 182°C. Rotor-tip speed was maintained at 10.7 m/s (35 ft/s). Concentrate and process condensate from the evaporator were sampled at each set of operating conditions. The concentrate sample was analyzed for density (at exit temperature), volume percent of solids at room temperature, weight percent of water, and sodium concentration. Each evaporator condensate sample was analyzed for sodium to calculate entrainment from the evaporator based on sodium carryover. All concentrates from waste feeds high in NaOH and $NaAlO_2$ flowed freely in liquid form out of the evaporator. Concentrates from waste feeds containing Na_2SO_4 and Na_2CO_3 included appreciable amounts of precipitated solids at high boildowns. The tests showed that all of the feeds could be converted in one pass to a free-flowing slurry that solidifies upon cooling to ambient temperature. 11 figures, 2 tables.

1183 METHODS FOR DECONTAMINATION OF RADIOACTIVE WASTES. Schaf, R. (VEB Chemiekombinat Bitterfeld (German Democratic Republic)). Energia es Atomtechnika ; 32: No. 4, 169-171(Apr 1979). (In Hungarian).

The treatments for decontamination of radioactive sewage are discussed. The following methods can be used for the decontamination of radioactive sewage: precipitation, vaporization and ion-exchange. The ion-exchange method is discussed in details. The regeneration process of ion-exchange resins is treated. Decontamination by ion-exchange is suggested to be used at low ionic contents of sewages.

1184 STRUCTURAL ANALYSIS AND EVALUATION OF A HORIZONTAL RESERVOIR. Matsuda, F. (Kobe Steel Ltd. (Japan). Central Research and Development Lab.). 29: No. 2, 77-82(Apr 1979). (In Japanese).

The structural strength of a horizontal water reservoir is analysed by a finite element analysis program for general purpose, MARC. Prior to analysis, an automatic mesh generator program is developed and some test runs are performed to check the accuracy of the analysis. The stresses in the reservoir are evaluated according to ASME Sec. III, and the results have shown that the design of this type of reservoir is in compliance with the design requirements of ASME.

1185 VOLUME REDUCTION SYSTEM OF RADIOACTIVE WASTE BY ELECTRODIALYSIS. Miyagawa, M.; Mizutani, T.; Miki, M. (Chubu Electric Power Co. Inc., Nagoya (Japan)); Ohuchi, I. Karyoku Genshiryoku Hatsuden (Thermal and Nuclear Power) ; 30: No. 4, 351-364(Apr 1979). (In Japanese).

It is significantly important to attempt the volume reduction of radioactive wastes produced in nuclear power stations. Observing that the main component of radioactive wastes produced in BWR nuclear power stations is the reproduction liquid waste from condensate demineralizers and waste treatment system demineralizers, the volume reduction by electrodialysis has been studied. As the concrete system, the decrease of Glauber's salt remaining in neutralized waste liquid, the resulting raising of the concentration rate of the neutralized waste liquid and the drastic reduction of radioactive wastes produced as concentrated waste liquid were investigated, considering the recovery of high purity sulphuric acid and caustic soda by means of electrodialysis using ion exchange membranes from the waste liquids of sulphuric acid and caustic soda produced at the time of the above reproduction processes. The results of electrodialysis experiments demonstrated that the recovery rate reached 91% in case of sulphuric acid and 92% in case of caustic soda. This paper details on the electrode reaction and electrolysis conditions, decontamination of deposition in a bath, the shape and conditions of the bath and gas processing system, and discusses the operation and safety measures. The features of this system are the capability of volume reduction to 1/5 of the concentrated liquid wastes mainly composed of reproduction agent, large effect expected by combining the system with intermediate volume reduction and asphalt solidification, small amount of secondary wastes, and highly safe operation and system.

1186 RADIOACTIVE SUBSTANCE SOLIDIFYING

DEVICE. Sakoda, Kotaro. (to Babcock Hitachi K.K., Tokyo (Japan)). Japanese Patent 54-41,000/A/. 31 Mar 1979. 4p. (In Japanese).

The purpose is to easily solidify radioactive substances adhering to the surfaces of solid wastes without scattering in the circumference by paints, and further to reduce surface contamination concentrations. Constitution: Solid wastes are placed on a hanging plate, and dipped in paints within a paint dipping treatment tank installed at the lower part of a treatment tank by means of a monorail hoist, and the surfaces of said solid wastes are coated with paints, thereby to solidify the radioactivity on the surfaces of the solid wastes. After dipping, the solid wastes are suspended up to a paint spraying tank to dry the paints. After drying, non-contaminated paints are atomized to apply through an atomizing tube onto the solid wastes. After drying the atomized paints, the solid wastes are carried outside the treatment tank by means of the monorail hoist.

1187 METHOD TO RECOVER NUCLEAR FUEL FROM WASTE MATERIAL AND DEVICE TO CARRY OUT THE METHOD. Divins, L.A.; Short, L.E. (to General Electric Co., Schenectady, NY (USA)). German(FRG) Patent 2,839,010/A/. 22 Mar 1979. 20p. (In German).

The waste materials of interest here are ventilator filters, combustion ashes of clothes and working gloves, particle-formed material. In order to obtain nuclear fuels again (in dissolved form) from these materials, the latter are subjected to calcination, crushing, acid extraction, the insoluble separated off and the acid solution can be further processed. Additional steps are necessary for the filters (crushing, rolling-out). The nuclear fuels are uranium oxide or a mixture of uranium and plutonium oxide. The equipment required and the single steps are described in detail.

1188 HIGH LEVEL NUCLEAR WASTE ISOLATION: BOROSILICATE GLASS VERSUS CRYSTALS. De Marsily, G. (Arizona Univ., Tucson (USA)). Nature (London) ; 278: No. 5701, 210-212(15 Mar 1979).

The leachability and stability in a geological environment of glass and Synroc, an artificial rock proposed by Ringwood et al (Nature, 278(5701) 15 March 1979, pp 219-223), are briefly compared.

1189 IMMOBILISATION OF HIGH LEVEL NUCLEAR REACTOR WASTES IN SYNROC. Ringwood, A.E.; Kesson, S.E.; Ware, N.G.; Hibberson, W.; Major, A. (Australian National Univ., Canberra. Inst. of Advanced Studies). Nature (London) ; 278: No. 5701, 219-223(15 Mar 1979).

It is stated that the elements occurring in high-level nuclear reactor wastes can be safely immobilised by incorporating them within the crystal lattices of the constituent minerals of a synthetic rock (SYNROC). The preferred form of SYNROC can accept up to 20% of high level waste calcine to form dilute solid solutions. The constituent minerals, or close structural analogues, have survived in a wide range of geochemical environments for periods of 20 to 2,000 Myr whilst immobilising the same elements present in nuclear wastes. SYNROC is unaffected by leaching for 24 hours in pure water or 10 wt % NaCl solution at high temperatures and pressure whereas borosilicate glasses completely decompose in a few hours in much less severe hydrothermal conditions. The combination of these leaching results with the geological evidence of long-term stability indicates that SYNROC would be vastly superior to glass in its capacity to safely immobilise nuclear wastes, when buried in a suitable geological repository. A dense, compact, mechanically strong form of SYNROC suitable for geological disposal can be produced by a process as economical as that which incorporates radioactive waste in borosilicate glasses.

1190 SCREW MIXER. Meintker, M.; Puthawala, A.; Schabert, H.P. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,740,490/A/. 15 Mar 1979. 11p. (In German).

The screw mixer is used to introduce low or intermediate level radioactive wastes from cooling water treatment of a PWR into bitumen filled in drums for final storage. The machine has a steam outlet leading from a steam dome to a condenser. The steam dome is designed as a pipe and is surrounded by the condenser, the connection between the two units being made by an annular gap. Through this annular gap the steam can enter the condenser on a large area.

1191 PLANT FOR SEPARATING GASEOUS HYDROCARBONS AND RADIOACTIVE IODINE ISOTOPES FROM WASTE AIR. Mathewes, W. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,625,275/C/. 15 Mar 1979. 5p. (In German).

In order to raise the efficiency of the filter plant for waste air in nuclear plant, it is proposed to precede and succeed the usual suspension filter in the waste air line by an activated charcoal filter. Measuring equipment which responds to gaseous impurities is situated between the first filter and the suspension filter, which causes a partial exchange of the activated charcoal in the filters. Details of the pipework are described.

1192 SYSTEM FOR PROCESSING GASEOUS WASTE OF RESIN-REGENERATION. Tsuruoka, R.; Ishihara, S.; Ikeda, K.; Mitani, S. (to Hitachi Ltd., Tokyo ;Japan)). Japanese Patent 54-30,399/A/. 6 Mar 1979. 3p. (In Japanese).

Purpose: To introduce a gas generated upon regeneration of an ion-exchange resin into a main condensator and processing it together with radioactive waste gas generated from the main condensator. Method: Radioactive waste gases generated from a cation exchange resin regeneration tower enter through an exhaust gas conduction path provided with a control valve, a pressure gauge and a check valve into a main condensator. The waste gases are extracted together with the exhaust gas generated in the main condensator by an air extractor, passed through an off-gas condensator, a decay pipe and multiple stages of active carbon adsorption towers, whereby the radioactivity is decayed, and then discharged from an exhaust tower to the atmosphere.

1193 METHOD OF SOLIDIFYING RADIOACTIVE WASTES. Saito, N.; Matsuura, H. (to Nippon Atomic Industry Group Co. Ltd., Tokyo). Japanese Patent 54-29,000/A/. 3 Mar 1979. 3p. (In Japanese).

Purpose: To improve toughness and water impermeability of asphalts used as waste binders. Method: Waste binders used are prepared by incorporating from several to abou 20% synthetic rubber into asphalt and further adding a small amount of resin or plastic therein. The asphalt compound is melted by

heating, to which radioactive wastes are mixed and dried to obtain solid wastes. Since the asphalt compound shows no embrittlement even at a low temperature, it is highly impact resistant and convenient in the handling such as upon transportation.

1194 SUCCESSFUL ENCAPSULATION OF NUCLEAR WASTE. Metal Powder Report ; 34: No. 3, 119(Mar 1979).
CONTAINERS;CORUNDUM;ENCAPSULATION;HOT PRESSING;RADIOACTIVE WASTE STORAGE;SPENT FUEL ELEMENTS;SPENT FUELS;SWEDEN;RADIOACTIVE WASTES

1195 PYROLYSIS MODEL FOR AN ALPHA WASTE INCINERATOR PROTOTYPE. Orloff, D.I. (duPont, Aiken, SC). Journal of Energy ; 3: No. 2, 90-94(Mar-Apr 1979).
The development of a theoretical model of the pyrolysis stage of a Savnnah River Laboratory prototype alpha waste incinerator is discussed. pyrolysis rates for single-component porous bed of Teflon (registered trademark of Du Pont de Nemours and Co.) have been measured on a bench-scale furnace. Experimental pyrolysis rates compare favorably to the predictions of a quasisteady regression model. In addition, the pyrolysis rate is shown to be a weak function of the thermal diffusivity of the porous polymer bed. 13 refs.

1196 EFFECTS OF VARIOUS CARRIER GASES, TEMPERATURE AND INTRAPARTICLE DIFFUSIVITY ON BREAKTHROUGH CHARACTERISTICS OF KRYPTON IN CHARCOAL BED. Kobayashi, S. (Hitachi Engineering Co. Ltd., Ibaraki (Japan)); Takashima, Y. Nippon Genshiryoku Gakkaishi (Journal of the Atomic Energy Society of Japan) ; 21: No. 3, 268-275(Mar 1979). (In Japanese).
The breakthrough characteristics of Kr gas in charcoal bed were studied at the temperature of 30 -- -75°C, and theoretically analyzed taking account of the Kr, carrier gas-charcoal equilibrium, and the intraparticle diffusivity. It was found that the effects of various carrier gases on the breakthrough characteristics of Kr, and the effect of temperature on the dynamic equilibrium coefficient and the selectivity of adsorption can be explained by modifying the langmuir's equation for binary gas mixtures. The intraparticle diffusivity was affected by the surface diffusion, and its temperature dependence could be explained by considering the parallel pore model for the gas phase diffusion and the equation of surface diffusivity by Sladek and Gilliland et al.

1197 ADSORPTION OF RADIONUCLIDES IN WASTE WATER ON OXINE-IMPREGNATED ACTIVATED CHARCOAL. ADSORPTION CHARACTERISTICS OF MANGANESE-54 ION. Motojima, K.; Tachikawa, E.; Kamiyama, H. (Japan Atomic Energy Research Inst., Oarai, Ibaraki. Oarai Research Establishment). Journal of Nuclear Science and Technology (Tokyo) ; 16: No. 3, 200-206(Mar 1979).
Radio-cobalt and -manganese constitute more than 90% of the radionuclides in waste water released from various nuclear facilities. The adsorption characteristics of Mn ion on oxine-impregnated activated charcoal have been examined. In the adsorption, Mn ion will be in the chemical interaction with oxine on activated charcoal. Thus, the impregnation of oxine on activated charcoal considerably improves the adsorption properties of the latter, although the adsorption shows a strong pH-dependence. Two important parameters of the adsorption, initial adsorption rate constant and adsorption capacity, have been experimentally determined at various ion concentrations and have been discussed in a comparison with those for Co ion.

1198 STUDIES ON TREATMENT OF RADIOACTIVE ANIMAL CARCASS, (1). A PROPOSAL OF MULTI-STEP PROCESSING AND ITS PROSPECT. Matsuoka, O.; Koizumi, A.; Fukuda, S. (National Inst. of Radiological Sciences, Chiba (Japan)). Hoken Butsuri (Journal of Japan Health Physics Society) ; 14: No. 1, 11-17(Mar 1979). (In Japanese).
A new method of waste treatment of animal carcass contaminated with plutonium was proposed. A multi-step process was designed and tested at a laboratory scale which was composed of the following processes; microwave dehydration, heat decomposition and ashing. Microwave dehydration was found the most adequate as the first step of the treatment because of the negligible release of nonvolatile radioactivity. About 70% of body weight was reduced by microwave dehydration. Dehydrated animal carcass was decomposed by graded electric heating under anaerobic condition. Burnable gas and vapour produced by the heat decomposition were oxidized by passing through a reheating tube with excess air. The exhaust gas had no significant radioactivity. The residue of charred carcass was oxidized by heating with excess air. The weight of final product was up to 8% of original wet weight. The proposed multi-step process provided to be adequate for the waste disporsal of Pu contaminated animal carcass.

1199 METHOD OF RECOVERING AND REGENERATING ORGANIC SOLVENTS USED FOR THE REPROCESSING OF RADIOACTIVE WASTES. Kuroda, Y.; Ogi, K. (to Mitsubishi Metal Corp., Tokyo ;Japan)). Japanese Patent 54-23,900/A/. 22 Feb 1979. 4p. (In Japanese).
Purpose: To perform solidification for extractants used for the treatment of radioactive isotopes and containing tributyl phosphate as a main ingredient resulted from nuclear fuel reprocessing facility or the like. Method: One or more oxides, hydroxides, basic carbonates or carbonates of alkaline earth metals are added to radioactive organic solvent wastes containing tributyl phosphate as a basic ingredient and containing decomposition products of tributyl phosphate which are used as the extractant for radioactive isotopes. The amount of these additives used is such as sufficient for neutralizing P-OH groups of the decomposition products of tributyl phosphate contained in the above solvent (from neutralizing equivalent to ten times of that equivalent). The mixture thus obtained is distilled under a reduced pressure or using water vapor at a temperature below the decomposition point of tributyl phosphate to recover tributyl phosphate as a distillation fraction and solidify and separate the decomposition products of tributyl phosphate as the salts of alkaline earth metals.

1200 STIRRING VESSEL FOR CEMENT SOLIDIFICATION OF RADIOACTIVE WASTES. Hattori, K. (to Hitachi Ltd., Tokyo ;Japan)). Japanese Patent 54-19,100/A/. 13 Feb 1979. 2p. (In Japanese).
Purpose: To make it possible to omit a step of filling the upper space portion required for the drum-filled solidification treatment of radioactive liquid wastes. Constitution: When a kneading and stirring liquid of radioactive wastes and cements are stirred in a drum, a splash guard for accommodating a compensation

stirring liquid in a volumetric part corresponding to the case of taking out stirring vanes installed in the drum is attached liquid-tightly to the opening part of the drum.

1201 SLUDGE RECOVERY APPARATUS. Marmo, A.R. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). British Patent 2,014,482/A/. 12 Feb 1979. 4p.

An improved design of a sludge recovery apparatus used in the fabrication of nuclear fuel is described. This apparatus provides for automatic separation of sludge from the grinder coolant, drying of the sludge into a flowable powder and transfer of the dry powder to a salvage container. It can be constructed to comply with criticality-safe-geometry requirements and to obviate need for operating personnel in its immediate vicinity. (UK).

1202 COMBUSTION FURNACE FOR WASTES. Mallek, H.; Jablonski, W. (to Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,735,107/A/. 8 Feb 1979. 16p. (In German).

As an improvement of the method for burning wastes described in the patent 2604407 there is proposed for the design of the combustion furnace to provide, below the transition between central shaft and combustion furnace, for a baffle in the form of a partition wall. By this means in the range of the narrow point there may be achieved temperatures of about 1500°C, resulting in melting of the slag. The variations in pipe connections caused by that measure are described.

1203 METHOD AND COMBUSTION FURNACE FOR BURNING WASTE. Mallek, H.; Ermisch, D.; Jablonski, W. (to Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,734,973/A/. 8 Feb 1979. 17p. (In German).

The method described in patent no. 2604405 provides for a furnace that has got between the space containing the waste and the combustion chamber a narrow spot where the waste is stowed. This additional application describes that part of the burnable gases produced is branched off at the narrow spot and that from this point pipes lead to a suction device.

1204 METHOD FOR CALCINING RADIOACTIVE WASTES. Bjorklund, W.J.; McElroy, J.L.; Mendel, J.E. (to Exxon Nuclear Co., Inc., Bellevue, WA (USA)). British Patent 1,539,999/A/. 7 Feb 1979. 5p.

High level radioactive wastes are calcined by a process using a fluidized bed of glass particles, spraying the liquid waste into the bed and melting the resulting product to give a low leaching solid.

1205 PROCESS FOR DRAINING OFF RADIOACTIVE WASTES MIXED WITH BITUMEN. Stegmaier, W.; Kluger, W.; Boden, H.; Schneider, F. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Werner und Pfleiderer Maschinenfabrik, Stuttgart (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,732,031/A/. 1 Feb 1979. 9p. (In German).

The process is to be improved by lowering the temperature of the mixture leaving a spiral evaporator, which was previously about 160°C quite considerably. According to the invention, an additional outlet case is added after the extruder, which has heating and cooling ducts, so that the temperature can be controlled, without blocking the spiral. Details are shown.

1206 RADIOACTIVE KRYPTON AND XENON IN NUCLEAR POWER PLANT FUEL CYCLE. Wilhelmova, L.; Cejnar, F. Jaderna Energie ; 25: No. 2, 67-74(Feb 1979). (In Czech).

Data are summed up characterizing the production and behaviour of radioactive krypton and xenon in nuclear power plant operation and in fuel reprocessing. Separation processes and block diagrams of facilities for the treatment of the waste radionuclides are briefly described.

1207 WASTE DISPOSAL FOR LIQUID SCINTILLATOR 'COCKTAIL', SOLIDIFICATION OF THE EVAPORATED 'COCKTAIL'. Kaneko, T.; Matsuo, M. (Tokyo Metropolitan Inst. of Gerontology (Japan)). Radioisotopes (Tokyo) ; 28: No. 2, 92-94(Feb 1979). (In Japanese).

DISTILLATION;EPOXIDES;LIQUID SCINTILLATORS; LIQUID WASTES;POLYURETHANES;RADIOACTIVE WASTE PROCESSING;RESINS;SOLIDIFICATION;SURFACTANTS; YOUNG MODULUS

1208 PROCESS AND PLANT FOR MANIPULATING RADIOACTIVE WASTE. Baatz, H.; Rittscher, D. (to STEAG Kernenergie G.m.b.H., Essen (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,731,548/A/. 25 Jan 1979. 9p. (In German).

To prepare waste for engineered storage, it is vitrified or calcined (pelleted) into solid pieces in a hot cell. Subsequently the pieces are filled into a radiation protection container made of spherulite cast iron, in which there is a liquid metal. The pieces are embedded in this metal matrix. During the embedding process, the radiation protection container may be heated externally or internally (lost heat device).

1209 DEVICE FOR SOLIDIFICATION OF GASEOUS WASTES. Shimada, M.; Kamei, H. (to Toshiba Corp., Kawasaki, Kanagawa ;Japan)). Japanese Patent 54-8,299/A/. 22 Jan 1979. 4p. (In Japanese).

Purpose: To provide the subject device wherein gaseous wastes such as krypton 85 and the like are ionized and accelerated to be injected into solid targets and stored therein, thereby removing the rediscarge of gas and making it possible to treat a large quantity of said gas. Constitution: Krypton gas is ionized and accelerated to high energy by an accelerator, and then introduced into an ion injection chamber. In the ion injection chamber a band-shaped target is delivered from a first take-up roll, and krypton ions are injected to said target. Thereafter, other band-shaped target delivered from a second take-up roll is brought into contact with the target in which krypton ions have been injected, and both targets are taken up together while compressing these targets. In this way, even when injected energy is small, the injected gas is not redischarged and can be continuously treated.

1210 SOLIDIFICATION METHOD OF RADIOACTIVE WASTE ORGANIC SOLVENTS. Tsunoda, N.; Nemoto, S.; Ikeda, S.; Kobayashi, H.; Kobayashi, S. (to Power Reactor and Nuclear Fuel Development Corp., Tokyo ;Japan)). Japanese Patent 54-8,300/A/. 22 Jan 1979. 3p. (In Japanese).

Purpose: To convert liquefied radioactive waste organic solvents into stable solidified

state by a compact device and simple operations. Method: This treatment method is to solidify radioactive waste organic solvents generated from nuclear fuel retreatment facilities and other various related facilities, and to a radioactive waste organic solvents consisting essentially of organic phosphoric acid esters there is added a solidification agent consisting essentially of one member or more than two members selected from the group consisting of hydroxides such as calcium and the like, basic carbonates thereof and carbonates thereof, and stirred and mixed, thereby converting the above described waste organic solvents into stable solidified bodies. In this case, when cement and sodium silicate are added to the waste organic solvents together with said solidification agent, the solvents can be converted in more stable solidified bodies.

1211 METHOD FOR SOLIDIFICATION OF HIGH LEVEL RADIOACTIVE LIQUID WASTES. Tanaka, Y.; Tsukumo, K. (to Kawasaki Heavy Industries Ltd., Kobe ;Japan)). Japanese Patent 54-7,099/A/. 19 Jan 1979. 4p. (In Japanese).

Purpose: To calcine high level radioactive liquid wastes without crystallizing it, and to subject nitric acid contained in the liquid wastes to thermal cracking and stabilize it, thereby improving so-called calcination efficiency and preventing corrosion of the canister due to nitric acid. Method: A predetermined quantity of a crude solution supplied from a storage tank to a feedwater control tank is introduced in an evaporation condenser thereby to evaporate the water content and volume reduce it. The water contents of the thus treated high level radioactive liquid wastes are further evaporated in a spray drying tower to be formed in powdery state. The powdery liquid wastes are supplied to a calcining melter, heated uniformly to decomoose nitrate, and glassified.

1212 LIQUID WASTE CONCENTRATING SYSTEM. Kodama, K.; Nishimizu, S. (to Mitsubishi Heavy Industries Ltd., Tokyo (Japan)). Japanese Patent 1954-5200/A/. 16 Jan 1979. 4p. (In Japanese).

The stored radioactive liquid wastes are poured into a round flask by means of a pump. Vapor evaporated in the round flask by heating using a mantle heater is condensed by cooling water in a cooler, and introduced into a storage tank. Vapor exhausted by a vacuum pump is exhausted to the exhaust system. In this case, in treating the concentrated liquid wastes which have been completely treated in the flask, the connector is removed and then the insertion plug is also removed. Thereafter, a slight amount of a solidifying agent is charged into the flask through the opening to harden the same. After solidifying the same, the flask is thrown away. Accordingly, the operation of taking out the concentrated liquid is not required, and the ratio of concentration can be improved.

1213 METHOD FOR THE INCLUSION OF RADIOACTIVE FISSION PRODUCTS. Thiele, D. (to Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,611,689/C/. 11 Jan 1979. 3p. (In German).

The invention concerns the composition of the glass melt with the purpose of closing in radioactive fission products so that they can be stored for a long time resistant to water and without signs of devitrification. Highly radioactive wastes from processing spent fuel elements from nuclear reactors are concerned. For one part weight of active material, 4 parts weight of melt are taken which is composed of the following: 45 - 52 wt% SiO_2, 26 - 32wt% B_2O_3, 3 - 7 wt% Na_2O and 13 - 20 wt% CaO. The method may also be applied with the presence of fluorides, sulphates or phosphates.

1214 PROCESS AND DEVICE FOR CONCENTRATING LIQUID RADIOACTIVE WASTE. Szivos, K.; Lovass, G.; Liptak, L.; Hirling, J.; Pavlik, O. (to Magyar Tudomanyos Akademia Izotop Intezete, Budapest; Eroemue es Halozattervezoe Vallalat Eroeterv, Budapest (Hungary); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,400,123/C/. 4 Jan 1979. 8p. (In German).

The process envisages concentration liquid radioactive waste in a container by guiding air over it (in the form of tangential turbulent flow.). The heated air is taken out of the circuit, and the water picked up from the surface of the condensate is separated. The invention concerns the technical details of air guidance.

1215 METHOD AND EQUIPMENT OF SOLIDIFICATION ESPECIALLY OF RADIOACTIVE HARMFUL AND WASTE MATERIALS. Strecker, J. (to Ingenieurbuero Stecker, Koeln (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,728,469/A/. 4 Jan 1979. 19p. (In German).

It is proposed to take up radioactive waste materials present as solution or suspension in a precoated filter, to free the latter from the liquid by freeze-drying and to then completely enclose it with a solidifying agent. Hardening plastics as well as alkali silicates are suitable for this purpose. An appropriate system is described in great detail.

1216 DECONTAMINATION AND RECOVERY OF 1,4 DIOXANE-BASED LIQUID SCINTILLATOR. Sachan, S.E.; Soman, S.D. (Bhabha Atomic Research Centre, Bombay (India). Health Physics Div.). Health Physics ; 36: No. 1, 67-68(Jan 1979).

DECONTAMINATION;DIOXANE;ECONOMICS; EXPERIMENTAL DATA;GRAPHS;HEAVY WATER;LIQUID SCINTILLATORS;PERFORMANCE;RADIOACTIVE WASTE PROCESSING;SODIUM HYDROXIDES;TABLES;TOLUENE; TRITIUM;TRITIUM OXIDES

1217 PROBLEM OF DETOXICATION OF CYANIDE-CONTAINING RADIOACTIVE WASTE. A BIBLIOGRAPHIC SURVEY. Roos, H.; Schmidt, M. (Wuerzburg Univ. (Germany, F.R.). Inst. fuer Anorganische Chemie). Chemie-Ingenieur-Technik ; 51: No. 1, 41(Jan 1979). (In German).

1218 MICROWAVE EVAPORATION SYSTEM FOR THE WASTE TREATMENT OF RADIOACTIVE ANIMALS. APPLICATION TO THE WASTE ANIMALS CONTAINING TRITIUM OR CARBON-14. Saito, T.; Nishiyama, Y.; Hikita, A. (Sagami Chemical Research Center, Sagamihara, Kanagawa (Japan)); Takaoka, A.; Nakamura, A. Radioisotopes (Tokyo) ; 28: No. 1, 15-20(Jan 1979). (In Japanese).

A microwave evaporation system was developed for the waste treatment of animal wastes contaminated with tritium or carbon-14. The apparatus composed of a 2450 MHz microwave range, a cooling unit, a receiver, a ^{3}H and ^{14}C sampler, an evacuating system and an automatic controller unit gave satisfactory results. The extent of evaporation can be optionally

controlled in the range of 80% to 100%. The maximum rate of evaporation under reduced pressure reaches 10 g of water per minute at 480 W high frequency power level and 12.5 g per minute at 600 W. The evaporation of water in the carcass weighing 1 kg is generally completed in about 1 hour, and the weight is reduced by approximately 70%. The distribution in the apparatus of tritium or carbon-14 released from carcass by the microwave evaporation was studied using such labelled compounds as [^{3}H] water, [6-^{3}H] thymidine, [methyl-^{3}H] thymidine, [2-^{14}C] thymidine, [U-^{14}C] glutamic acid, [U-^{14}C] fructose and [U-^{14}C] glucose. The difference in activity trapped by the cooler and sampler was observed between the case of aqueous solutions of labelled compounds and that of animals administered with the same labelled compounds. The reason for this difference probably lies in metabolism of labelled compounds or exchange of tritium atoms within the animal body.

1219 OPERATION PERFORMANCE OF THE BITUMINIZATION PLANT AT TSURUGA NUCLEAR POWER STATION. Sano, K.; Hayashi, T. (Ebara Mfg. Co. Ltd., Tokyo (Japan)). Ebara Jiho (Ebara Times) ; No. 107, 36-41(Jan 1979). (In Japanese).

A series of test runs of the bituminization plant was conducted at Tsuruga Nuclear Power Station, at first with a simulated waste solution of sodium sulfate only, next with a simulated waste solution of sodium sulfate and an anti-swelling agent and finally with radioactive concentrate. Approximately 200 drums of bitumen product were made with the simulated waste and more than 25 drums of bitumen product were produced with radioactive waste. Radiation dose rate was throughly measured on the drum surface. The plant is now running at the water evaporation rate of 180 to 200 kg/h. Oil content in the condensate is 5 to 15 ppm before oil separation and 2 to 7 ppm after oil separation.

1220 COST-EFFICIENCY ANALYSIS AND RADIOPROTECTION OF THE PUBLIC. THE APPLICATION TO THE CASE OF RADIOACTIVE EFFLUENTS BY THE U.S. ENVIRONMENTAL PROTECTION AGENCY. Lochard, J.; Peges, P. (Centre d'Etude sur l'Evaluation de la Protection dans le Domaine Nucleaire, 92 - Fontenay-aux-Roses (France)). Revue Generale Nucleaire ; No. 1, 43-53(Jan-Feb 1979). (In French).

The authors make the cost-efficiency analysis and describe the general methodological framework applied to the retained topic. They then present the study work carried out by the U.S. Environmental Protection Agency and describe the main steps in the analysis. Finally, they comment on the method used and the results recorded.

1221 RADIATION DAMAGE OF ORGANIC EXTRACTANT IN PARTITIONING OF HIGH-LEVEL LIQUID WASTE, (1). RADIOLYSIS OF DI(2-ETHYLHEXYL)PHOSPHORIC ACID BY IRRADIATION WITH COBALT-60 GAMMA-RAYS. Tachimori, S. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Journal of Nuclear Science and Technology (Tokyo) ; 16: No. 1, 49-56(Jan 1979).

Di(2-ethylhexyl)phosphoric acid (DEHPA), which is a useful extractant for the treatment of high-level liquid waste, was exposed to ^{60}Co γ-rays and the radiolysis products and their yields were determined. The major radiolytic decomposition process of DEHPA was found to be a stepwise splitting of two alkyl groups resulting in MEHPA and H_3PO_4. 1-Methyl-1-ethylpentyl radical, C_4H_9-C*(CH_3)-C_2H_5, was found to form with a large G value in the γ-irradiated DEHPA. Reactions involving 1-methyl-1-ethylpentyl radical were also discussed.

1222 SCIENTIFIC BASIS FOR NUCLEAR WASTE MANAGEMENT. McCarthy, G.J. (ed.). Contract ET-78-C-02-5009. New York, NY; Plenum Press (1979). 581p. (CONF-781121--(Vol.1)). Plenum Press, 227 West 17th Street, New York, NY.

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

Seventy-two papers were presented. Sessions were held on waste solidification, waste isolation, cement and concrete in solidification and isolation, and modeling and safety assessment. Individual papers were processed for the data base.

1223 METAL ENCAPSULATION OF CERAMIC NUCLEAR WASTE. Jardine, L.J.; Steindler, M.J. (Argonne National Lab., IL). pp 181-189 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

A conceptual flowsheet is presented for encapsulating a ceramic waste form in solid lead, using existing or developing technologies. Unresolved and potential problem areas of the flow sheet are outlined, and suggestions are made on how metal encapsulation might be applied to other solid radioactive wastes from the nuclear fuel cycle. It is concluded that metal encapsulation is a technique applicable to many forms of solid wastes and is likely to meet future waste isolation criteria and regulations.

1224 RAMAN SPECTRA OF CESIUM ALUMINOSILICATE WASTE FORMS. Hartwig, C.M. (Sandia Labs., Livermore, CA). pp 219-225 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

Raman spectra have been obtained from pollucite and similar aluminosilicate materials. Pollucite is used to fix radioactive cesium in the supercalcine reactor waste form and in beneficial-use, radioactive sources. Vibrational modes of Cs in an oxygen atom cage are identified at 141 and 201 cm^{-1}. Stretching vibrations of the Si-O bond are at 1120 cm^{-1} and of the Si-O-Al bond at 1040 cm^{-1}. Fifteen of the 28 Raman active modes of crystalline pollucite have been distinguished. Monomeric water molecules are shown spectroscopically to exist in mineral pollucite. The use of Raman spectroscopy to identify structural changes is demonstrated.

1225 TECHNIQUES FOR HIGH LEVEL WASTE SOLIDIFICATION IN EUROPE. Heimerl, W. (Deutsche Gesellschaft fuer Wiederaufarbeitung von Kernbrennstoffen GmbH, Hanover, Germany). pp 21-29 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

A review of progress toward the development and demonstration of a solidification process for high level waste solutions on an industrial scale in four European countries (France, United Kingdom, Germany and Belgium) is given. Historical development, present status and

future plans are presented. Three of the processes which seem to be of major importance are described (AVM-France, HARVEST-United Kingdom, PAMELA-Germany).

1226 PREPARATION AND CHARACTERIZATION OF AN IMPROVED HIGH LEVEL RADIOACTIVE WASTE (HAW) BOROSILICATE GLASS. Guber, W.; Hussain, M.; Kahl, L.; Ondracek, G.; Saidl, J. (Kernforschungszentrum, Karlsruhe, Germany). pp 37-42 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

Five series of modified glasses based on a reference borosilicate formulation (GP 98) have been prepared and investigated. On the basis of comparisons of properties of the different glasses, two compositions have been selected for more detailed investigations and for technical application in the future. Simultaneously, glass products with real HAW oxides from German fuel reprocessing have been investigated. No structural change caused by irradiation has been detected after two year shortage.

1227 VITRIFICATION OF HIGH SODIUM-ALUMINUM WASTES: COMPOSITION RANGES AND PROPERTIES. Brezneva, N.E.; Minaev, A.A.; Oziraner, S.N. (Institute of Physical Chemistry, Moscow, USSR). pp 43-50 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

Studies of the vitrification of wastes that contain sodium and aluminum are summarized. High Na-Al-wastes can be vitrified to form both phosphate and borosilicate glasses having suitably low leaching rates. Up to 50 wt % waste oxides can be vitrified. From the technological viewpoint, phosphate glasses have two advantages over borosilicate types: they have low melting ranges and the glass-forming additives can be liquid. Cs volatility depends on a diffusion mechanism and is about 5% at 1000°C. All Ru volatilizes during melting but Ru volatility can be reduced to 5 to 10% by addition of reducing agents to the melt.

1228 NON-RADIOACTIVE OPERATION EXPERIENCE WITH A JOULE HEATED CERAMIC MELTER FOR VITRIFICATION OF HIGH-LEVEL LIQUID WASTE. Weisenburger, S. (Kernforschungszentrum, Karlsruhe, Germany). pp 51-56 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

A ceramic-lined melter for HLLW-vitrification has been tested at Karlsruhe Nuclear Research Center. The results of these tests look very promising and are described in detail. Further development of the vitrification unit are outlined in respect to remote operation and process control.

1229 NATURAL GLASSES: ANALOGUES FOR RADIOACTIVE WASTE FORMS. Ewing, R.C. (Univ. of New Mexico, Albuquerque). pp 57-68 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

The long-term effects of alteration and radiation damage on waste glass forms are difficult to assess in time-limited laboratory experiments. It is important to evaluate the long-term stability of naturally occurring analogues. Age distributions and alteration effects observed in natural glasses in different geologic environments provide insight into variables controlling the rates of devitrification, alteration and radiation damage. Volcanic glasses are often altered by weathering and leaching, crystallizing to their fine-grained compositional equivalents (rhyolites and felsites). The oldest reliably dated volcanic glasses are 40 million years old, but the majority of the dated glasses are much younger. Experimental studies have produced devitrification textures; and laboratory experiments, as well as empirical measurements, have determined hydration rates for volcanic glasses as a function of composition, temperature and climate. The presence of water and the temperature are the most important rate controlling variables. Even material that still may be described as glassy often exhibits evidence of alteration and crystallization. Of the volcanic glasses that are preserved in the geologic record it would be rare to describe such a glass as pristine. Glasses formed as a result of impact, tektites and lunar glasses, may occur in a substantially unaltered form. In the case of tektites, their resistance to alteration is a result of their high SiO_2 and low alkali content. Lunar glasses have been preserved for hundreds of millions of years because they exist in a dry environment. Direct comparisons between the stabilities of natural glasses and waste glasses are inappropriate because their compositions and thermal histories are very different; however, natural glasses may serve as standards of comparison, and they suggest experimental techniques that allow the evaluation of the long term stability of glass waste forms.

1230 CHARACTERIZATION OF GLASS AND GLASS CERAMIC NUCLEAR WASTE FORMS. Lutze, W.; Borchardt, J.; De, A.K. (Hahn-Meitner-Institut fuer Kernforschung, GmbH, Germany). pp 69-81 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

Characteristics of solidified nuclear waste forms, glass and glass ceramic compositions and the properties (composition, thermal stability, crystallization, phase behavior, chemical stability, mechanical stability, and radiation effects) of glasses and glass ceramics are discussed. The preparation of glass ceramics may be an optional step for proposed vitrification plants if tailored glasses are used. Glass ceramics exhibit some improved properties with respect to glasses. The overall leach resistance is similar to that of glasses. An increased leach resistance may become effective for single radionuclides being hosted in highly insoluble crystal phases mainly when higher melting temperatures are applicable in order to get more leach resistant residual glass phases. The development of glass ceramic is going on. The technological feasibility is still to be demonstrated. The potential gain of stability when using glass ceramics qualifies the material as an alternative nuclear waste form.

1231 THERMAL, CHEMICAL AND RADIATION STABILITY OF VITREOUS RADIOACTIVE WASTES. Nikiforov, A.S.; Kulichenko, V.V.; Krylova, N.V.; Mustatov, N.D.; Polyakov, A.S. (All-Union Scientific Research Inst. of Inorganic Materials, Moscow, USSR). pp 117-121 of

Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
Some USSR studies of the chemical, thermal, and radiation stability of silicate glasses and glass-like products are reviewed briefly. Compositional effects on chemical stability of nuclear waste glasses correspond to well known commercial glass behavior, namely that chemical stability increases with increasing SiO_2 and Al_2O_3 content and decreases with increased alkali metal oxides. The rate of ^{137}Cs leaching varied according to the chemical composition, with the high SiO_2 materials showing the lowest rates at 10^{-8} g $cm^{-2}d^{-1}$. The leachability of ^{90}Sr followed similar trends. Release of radioisotopes from glass-like products can also occur without contact with water, namely by evaporation or disintegration of the materials. Contamination through a gas phase is also observed in the process of storage of glass-like samples at room temperature. Radiation induced sublimates are not only observed after the storage of radioactive materials, but also after the irradiation of inactive ones using a ^{60}Co source. Effects of storage of glass-like products at elevated temperatures on their subsequent chemical stability in water are described. A variety of materials was studied, and they showed increases, decreases, and no change in stability. Three classes of materials were studied in order to explore the effects of structural changes resulting from heat treatment on chemical stability in water.

1232 DEVELOPMENT OF MULTIBARRIER NUCLEAR WASTE FORMS. Rusin, J.M. (Battelle Pacific Northwest Labs., Richland, WA); Browning, M.F.; McCarthy, G.J. pp 169-180 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
The multibarrier concept aims to separate the radionuclide-containing inner core material and the environment by the use of coatings and metal matrices. The resultant composite waste form exhibits enhanced inertness due to improved thermal stability and mechanical strength, and the added barriers greatly improve leach resistance. Two options were developed for the inner core of the multibarrier concept: supercalcine pellets and glass marbles. The development of coatings for supercalcine was pursued to provide an additional protective layer between the radionuclides and the environment. The coatings include the application of a 40 μm pyrolytic carbon layer as a barrier to enhance leach resistance and a 60-μm Al^2O^3 layer as a barrier to increase oxidation resistance. Glass coating of supercalcine by frit and glaze was also investigated.

1233 CLAY-PHOSPHATE CERAMICS AND VITROMETS: ALTERNATIVES TO MONOLITHIC HIGH LEVEL WASTE GLASS PRODUCTS. Zemlyanukhin, V.I.; Kuznetsov, Y.V.; Lazarev, L.N.; Lyubtsev, R.I.; Shashukov, E.A.; Khlopin, V.C. (Radium Institute, Leningrad, USSR). pp 195-200 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
Some of the results from investigations on high level waste incorporated into ceramic, cermet, and vitromet products are reported.

1234 SYNTHETIC RUTILE MICROENCAPSULATION: A RADIOACTIVE WASTE SOLIDIFICATION SYSTEM RESULTING IN AN EXTREMELY STABLE PRODUCT. Forberg, S. (Royal Inst. of Tech., Stockholm, Sweden); Westermark, T.; Larker, H.; Widell, B. pp 201-215 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
Results of the investigations indicate that: using titanate ion exchangers it is feasible to adsorb most of the active species in high level liquid waste; hot isostatic pressing has been successfully employed for crystallization and consolidation of the loaded exchangers; and extremely low radionuclide release rates are indicated by the Soxhlet leaching studies performed so far.

1235 HOT ISOSTATIC PRESSING FOR THE CONSOLIDATION AND CONTAINMENT OF RADIOACTIVE WASTE. Larker, H.T. (High-Pressure Lab. ASEA AB, Robertsfors, Sweden). pp 207-210 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
Hot isostatic pressing has been applied for making synthetic mineral blocks from several types of simulated high-level radioactive waste. In addition, a method to make synthetic corundum canisters for spent fuel by a similar technique has been developed. Full scale canisters (0.5 m outside diameter by 3 m) have been made and an irradiated fuel rod has been enclosed successfully in a monolithic half scale synthetic corundum canister.

1236 INVESTIGATIONS OF THE VOLATILITY OF CESIUM FROM ALUMINOSILICATES BY MASS SPECTROMETRY. Odoj, R.; Hilpert, K.; Gerads, H. (Kernforschungsanlage, Juelich, Germany). pp 227-229 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
The different volatility of cesium from the crystalline compounds of the ternary system Cs_2O-Al_2O_3-SiO_2 is demonstrated. Three different crystalline compounds $CsAlSiO_4$, $CsAlSi_2O_6$, and $CsAlSi_5O_{12}$ were found.

1237 ROLE OF ADMIXTURES IN PREPARING DENSE CEMENTS FOR RADIOACTIVE WASTE ISOLATION. Roy, D.M.; Daimon, M.; Scheetz, B.E.; Wolfe-Confer, D.; Asaga, K. (Pennsylvania State Univ., University Park). pp 461-466 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
Sulfonated naphthalene and melamine formaldehyde condensates have been studied as superplasticizing admixtures used to reduce the necessary water content of cement mixes. Their role in producing dense low porosity composites in nuclear waste isolation applications is discussed. Zeta potential, flow, adsorption characteristics, viscosity, setting time and compressive strength data are reported.

1238 IMMOBILIZATION OF STRONTIUM AND CESIUM IN INTERMEDIATE-LEVEL LIQUID WASTES BY SOLIDIFICATION IN CEMENTS. Rudolph, G.; Koester, R. (Kernforschungszentrum, Karlsruhe, Germany). pp 467-470 of Scientific

basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
An accelerated leach test at elevated temperature has been developed which gives intercomparable results within one day. It is very useful for product quality control at large throughputs. Using this test, it has been shown that cesium leachabilities from cement products containing a simulated waste typical of fuel reprocessing plants can be reduced by addition of a bentonite. Addition of barium silicate hydrate retards strontium leaching in these cements. Leach rates in tap water and in salt brine are lower than in distilled water and sodium chloride solution.

1239 CONFINEMENT OF VOLATILIZED RUTHENIUM OXIDES. Maas, E.T. Jr.; Longo, J.M. (Exxon Research and Engineering Co., Linden, NJ). pp 487-490 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
Fission product ruthenium poses unique problems in nuclear fuels reprocessing due to the volatility of RuO_4. Results are presented from studies that demonstrate the ability of alkaline earth metal carbonates and calcium oxide to form thermodynamically stable ruthenium compounds and thus fix the volatile ruthenium oxides.

1240 SEPARATION OF URANIUM AND PLUTONIUM FROM AN AQUEOUS SOLUTION CONTAINING PHOSPHORIC, SULFURIC, AND NITRIC ACIDS BY SOLVENT EXTRACTION. Thiagarajan, R.; Swarup, R.; Patil, S.K. (Bhabha Atomic Research Centre, Bombay, India). Separation Science and Technology ; 14: No. 8, 749-755(1979).
A solvent-extraction method has been developed to separate uranium and plutonium from an aqueous solution containing phosphoric, sulfuric, and nitric acids by extracting them into 0.5 M TOPO in xylene followed by stripping with ammonium carbonate solution. In the case of plutonium, spectral evidence reveals that the complex species extracted into TOPO is predominantly the neutral nitrate complex of Pu(IV).

1241 BONDING OF METAL OXIDES IN SODIUM SILICATE GLASS. Lam, D.J.; Veal, B.W.; Chen, H.; Knapp, G.S. (Argonne National Lab., IL). pp 97-107 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
X-ray photoelectron spectroscopy (XPS) and extended x-ray absorption fine structure (EXAFS) studies have been undertaken on sodium disilicate glasses containing varying amounts of Fe_2O_3 and UO_2. The XPS results enable one to distinguish the different bonding characteristics of iron and uranium in these glasses. A three dimensional model for the iron coordination in the sodium disilicate glass is inferred from the combined XPS and EXAFS results.

1242 DISTRIBUTION RATIOS AND EMPIRICAL EQUATIONS FOR THE EXTRACTION OF ELEMENTS IN PUREX HIGH LEVEL WASTE SOLUTION. 1. TBP. Svantesson, I.; Hagstroem, I.; Persson, G.; Liljenzin, J.O. (Chalmers Tekniska Hoegskola, Goeteborg (Sweden)). Journal of Inorganic and Nuclear Chemistry ; 41: No. 3, 383-389(1979).
Distribution ratios for nitric acid, actinides, fission products and corrosion products between PUREX HLW-solution and 50% tributylphosphate in an aliphatic diluent have been investigated in the range 0.1 to 6 M nitric acid. Comparable measurements for some of the elements have been made in pure HNO_3 in the range 0.05 to 11 M. Empirical equations have been derived for elements with distribution ratios above 0.01 in the investigated acidity range.

1243 EXPERIENCE IN DECONTAMINATION AND WASTE HANDLING AT A SHUT-DOWN PLANT FOR REGENERATION OF SPENT FUEL ELEMENTS. Detilleux, E.; Eschrich, H. Atomnaya Tekhnika za Rubezhom ; No. 1, 28-33(1979). (In Russian).
Described is the program executed at the ''Eurochemic'' plant, which included washing away and decontamination of the equipment as well as processing and temporary storage of radioactive wastes of different types taking into account safety requirements. Described are several processes of waste treatment, permitting to obtain solidified products and to fix non-volatile high-active wastes. Ways of storage of solid or solidificated wastes are described.

1244 RADIATION EFFECTS ON THE SEPARATION OF LANTHANIDES AND TRANSPLUTONIDES BY THE TALSPEAK-TYPE EXTRACTION. Tachimori, S.; Nakamura, H. (Japan Atomic Energy Research Inst., Tokyo). Journal of Radioanalytical Chemistry ; 52: No. 2, 343-354(1979).
Effects of radiation of the extraction system composed of DEHPA extractant and DTPA aqueous solution containing nitrate were studied by measuring distribution ratios of Am(III) and Nd(III) with the extractant and DTPA solution either one of which was irradiated with ^{60}Co γ-rays or the organic-aqueous mixed phase irradiated under continuous stirring. The irradiation causes an increase of Df and a decrease of the Nd/Am separation factor β, to an especially large extent in the mixed phase system. These effects are due firstly to the radiolytic decomposition of DTPA and secondarily to the formation of MEHPA. The replacement of nitrate with lactate stops the degradation of DTPA and DEHPA resulting in the retardation of the increase of Df and a decrease of the separation factor. The DEHPA - DTPA - lactic acid system is concluded to sustain absorption of radiation at an absorbed dose up to 200 $Whxl^{-1}$ in the partitioning of transplutonium elements in HLW.

1245 IRON BEHAVIOUR X-RAYING DURING VITRIFICATION OF RADIOACTIVE WASTES. Minaev, A.A.; Prokhorova, N.P.; Kozlov, A.A.; Gavrish, A.A.; Shakh, G.E. Radiokhimiya ; 21: No. 1, 28-33(1979). (In Russian).
The X-ray method has been used for studying the iron behaviour in the process of vitrification of radioactive wastes with the aid of a reducer. Iron in a different valent crystal phases and the rates of their separation upon cooling of the phosphates melts. Iron (2) accelerates their crystallization. Analysis of X-ray diffraction patterns of different melts with iron and oxides of other elements (Cr, Ni, Mn, et.al.) and without them has shown that upon caking of melts with molasses as a reducer iron is present in bivalent state. Acceleration of melt crystallization caused by bivalent iron positivety affects the properties of the melt: thermal stability increases without deterioration of their chemical stability as

compared with glasses.

1246 Systemanalyse und Prozessstrategie. (SYSTEMS ANALYSIS AND PROCESS STRATEGY). Ditterich, K.; Schneider, H. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). Muenchen, Germany, F.R.; Thiemig (1979). 215p. (In German).
Using the methods of systems analysis presented in the main chapters, the system of 'radioactive waste management' is chosen in order to show how to deal with such problems and to outline the principle of the method.

1247 SEPARATION OF ^{137}CS FROM NUCLEAR WASTE. Kenna, B.T.; Murphy, K.D. (Sandia Labs., Albuquerque, NM (USA)). Journal of Inorganic and Nuclear Chemistry ; 41: No. 11, 1535-1540(1979).
Sodium zirconate is one member of a family of new inorganic ion exchange materials which have high affinity for all actinides and fission product cations except for Cs^+. A combination of cold, tracer and high level liquid waste experiments with sodium zirconate has shown that 70 to 80 and 80 to 100% of the Cs^+ in high level liquid waste remains in solution following batch or column equilibration, respectively. The fact that ^{137}Cs can be obtained in relatively pure form permits subsequent conversion directly to an insoluble radiation source. This is of prime importance in areas such as sewage sludge sterilization via γ-ray irradiation.

1270 RADIOACTIVE WASTES. CHAPTER 9. George, D. (UKAEA Atomic Energy Research Establishment, Harwell. Chemical Technology Div.). pp 259-311 of Developments in environmental control and public health - 1. Porteous, A. (Open Univ., Milton Keynes (UK)) (ed.). London; Applied Science (1979).
The three kinds of radioactivity and their units of measurement are briefly described, and the principles of control and the legislation governing the disposal of radioactive waste are explained, including the critical group approach, registration of users, authorisation for disposal, and site licensing. Examples are given to illustrate the ways in which these controls are put into effect. The various types and origins of the wastes which arise as a result of the production and use of

radioactive materials and the nuclear power programme are described, together with their treatment and disposal. Research which is in progress and future developments are both discussed.

1271 TREATMENT OF LOW RADIOACTIVE LIQUID WASTE BY COMPOUNDS HAVING AN ENHANCED AFFINITY FOR THE CONTAMINANTS. Iten, D.; Loewenschuss, H. (Eidgenoessisches Inst. fuer Reaktorforschung, Wuerenlingen (Switzerland)). pp 297-307 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

This paper describes a study carried out on an alternative method based on precipitation followed by centrifugation. Tests have been carried out on samples of liquid RADWASTE from the Swiss Reactor Research Institute (EIR) and also on primary coolant water samples from a Swiss P.W.R. at Beznau. Radioactive heavy metals are removed from the liquid by inducing precipitation of ferric hydroxide. The heavy metals are both adsorbed and coprecipitated. The addition of potassium zinc ferrocyanide affects the removal of cesium by the formation of a cesium zinc ferrocyanide complex of low solubility. Strontium is removed in a similar fashion by adding a specially prepared phosphate resin. The study has shown that the sequence in which the reagents are added is important. The contaminated precipitates were all removed with an on-line centrifuge. The activity level of the resulting effluent was below the limit prescribed by the Swiss Authorities concerned with environmental release.

1272 SOLIDIFICATION OF WASTE WATER CONCENTRATES USING A ROLLER DRIER. Laser, M.; Mallek, H.; Jablonski, W. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Abt. Dekontamination). pp 373-377 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

Because of the relatively high costs for package material, transportation and final disposal of radioactive waste the final volume of the waste must be reduced. In the case of waste water concentrates it is econmical to install an additional step to dry the waste before monolithization with cement. In the Nuclear Research Centre in Juelich a roller drier is in operation since 9 years with very good results. The final volume of the solidified waste is lower by a factor of 5 compared with the direct solidification of the concentrate with cement. This results in a remarkable reduction of the costs.

1273 VOLUME REDUCTION AND SOLIDIFICATION OF LIQUID AND SOLID LOW-LEVEL RADIOACTIVE WASTE. May, J.R. (Newport News Industrial Corporation, VA (USA)). pp 419-437 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

This paper presents a brief background of the development of a method of radioactive waste volume reduction using a unique fluidized bed calciner/incinerator. The volume reduction system is capable of processing a variety of liquid chemical wastes, spent ion exchange resin beads, filter treatment sludges, contaminated lubricating oils, and miscellaneous combustible solids such as paper, rags, protective clothing, wood, etc. All of these wastes are processed in one chemical reaction vessel. Detailed process data is presented that shows the system is capable of reducing the total volume of disposable radioactive waste generated by light water reactors by a factor of 10. Equally important to reducing the volume of power reactor radwaste is the final form of the stored or disposable radwaste. This paper also presents process data related to a new radwaste solidification system, presently being developed, that is particularly suited for immobilizing the granular solids and ashes resulting from volume reduction by calcination and/or incineration.

1274 VOLUME REDUCTION, A SAFER AND CHEAPER WAY OF RADWASTE MANAGEMENT. Mergan, L.M.; Cordier, J.P.; Storrer, J.A. (Societe Belge pour l'Industrie Nucleaire, Brussels). pp 407-418 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

Development of 'Volume Reduction' has demonstrated that it is a safer and cheaper radwaste management method. Safer, because of several advantages: decrease of solidified product volume, satisfactory product properties, absence of free water, better control of process parameters, increased encapsulation efficiency ... The corresponding impact on the waste management costs, results in important savings on different factors, as well as regards the operational costs as the investment expenses. Economy in the range of BF 35.000 per m^3 of incoming waste is achievable. The main volume reduction techniques readily available are briefly reviewed.

1275 DECOMMISSIONING OF A ^{239}PU CONTAMINATED INCINERATOR FACILITY. Harper, J.; Garde, R. (Los Alamos Scientific Lab., NM (USA)). pp 601-607 of Decommissioning of nuclear facilities. Proceedings of an international symposium jointly organized by the IAEA and the OECD NEA and held in Vienna, 13-17 November 1978. Vienna; IAEA (1979).

From International symposium on the decommissioning of nuclear facilities; Vienna, Austria (13 Nov 1978).

In early 1978, a plutonium contaminated incinerator facility at the Los Alamos Scientific Laboratory (LASL), Los Alamos, New Mexico, was decommissioned. The project involved dismantling the facility and disposal by burial or by retrievable storage of the debris at an on-site waste disposal area. Contaminated soil from the 0.5 hectare area was buried. The facility was constructed in 1951 to incinerate plutonium contaminated wastes. It was later used as a decontamination facility. The major features included a 185 m^2 control building, incinerator, cyclone dust collector, spray cooler, venturi scrubber, air filter bank, ash separator, and two 140,000 litres ash storage tanks. Preliminary soil contamination surveys were performed by a LASL developed portable phoswich detector system. Final soil

contamination levels were measured with a zinc sulphide gross alpha scintillation system. Six hundred cubic metres of debris and 1200 m^3 of soil contaminated with less than 10 nCi ^{239} Pu/g were buried at the LASL disposal area. Five cubic metres of ^{239} Pu contaminated ash residues were packed and stored to meet the Department of Energy's 20 year retrievable storage criteria.

1276 TOXIC AND HAZARDOUS WASTE DISPOSAL. VOLUME 1. PROCESSES FOR STABILIZATION/SOLIDIFICATION. Pojasek, R.B. (ed.). Ann Arbor, MI; Ann Arbor Science Publishers, Inc. (1979). 408p. $36.00.

Processes for the stabilization and/or solidification of toxic, hazardous, and radioactive wastes are reviewed. The types of wastes classified as hazardous are defined. The following processes for the solidification of hazardous wastes are described: lime-based techniques; thermoplastic techniques; organic polymer techniques; and encapsulation. The following processes for the solidification of high-level radioactive wastes are described: calcination; glassification; and ceramics. The solidification of low-level radioactive wastes with asphalt, cement, and polymeric materials is also discussed. Other topics covered include: the use of an extruder/evaporator to stabilize and solidify hazardous wastes; effect disposal of fine coal refuse and flue gas desulfurization slurries using Calcilox additive stabilization; the Terra-Tite Process; the Petrifix Process; the SFT Terra-Crete Process; Sealosafe Process; Chemfix Process; and options for disposal of sulfur oxide wastes. (DMC)

1277 ZERO RELEASE FOR LIQUID RADIOACTIVE WASTES. PROCESSING OF WASTES FROM NUCLEAR POWER PLANTS USING THE ACEREN EVAPORATOR. Arod, J.; Chauvet, P. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Service de Chimie Appliquee); Monboeuf, M. (Societe Ducatel, Vinon-sur-Verdon (France)). pp 281-295 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 Mars 1979. Paris, France; OECD (1979). (In French)

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

Zero release for the liquid radioactive wastes of the power reactors is not an utopic position. The ACEREN evaporator is able to concentrate the liquid wastes without distillate formation. In this apparatus, the liquid waste flows down on vertical canvas in synthetic tissue (CPV); at counter-current an insaturated air is blowing and increases its hygrometric degree. Some liquid wastes were treated with good results on a pilot plant (250 l/h). An industrial apparatus, with a flow-rate of 1 m3/h is described.

1278 DECONTAMINATION OF LARGE COMPONENTS AT ECN. Koning, C. (Stichting Energieonderzoek Centrum Nederland, Petten). pp 517-527 of Decommissioning of nuclear facilities. Vienna, Austria; IAEA (1979).

From International symposium on the decommissioning of nuclear facilities; Vienna, Austria (13 Nov 1978).

A description of the decontamination facility at ECN, Petten, is given. The layout of the low-level decontamination and the in-cell decontamination of high-level contaminated objects is explained. The results of the recent decontamination of large components, such as boxes used for handling of active materials, and reactor pool equipment, are presented.

1279 TREATMENT OF METALLIC WASTES BY SMELTING. Cavendish, J.H. (National Lead Co. of Ohio, Cincinnati (USA)). pp 611-630 of Decommissioning of nuclear facilities. Vienna, Austria; IAEA (1979).

From International symposium on the decommissioning of nuclear facilities; Vienna, Austria (13 Nov 1978).

A programme designed to promote the constructive re-use of metal scrap slightly contaminated with radioactive nuclides is described. This programme is being conducted by the Oak Ridge Operations Office of the U.S. Department of Energy. Its primary impetus was the generation of large quantities of potentially valuable metal scrap by an extensive renovation and improvement of the three U.S. gaseous diffusion enrichment plants. The programme includes three phases: (1) to characterize the type and quantity of scrap being generated; (2) to develop techniques for decontamination of the scrap to insignificant levels of radioactivity; (3) to obtain amendments to current federal regulations which would permit commercial sale and use of the decontaminated metal.

1280 VITRIFICATION OF RADIOACTIVE WASTES. van Iseghem, P.; de Batist, R. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). Consensus ; No. 3-4, 79-96(1979). (In French).

A review of the different techniques of radioactive waste conditioning is given (vitrification, Lotes and Pamela procedures). The incorporation of radioactive products in glass is treated more thoroughly. The chemical and physical stability of the glasses, and the influence of radiation on the vitrified waste is carefully examined.

1281 ATTEMPT TO OPTIMIZE THE CONDITIONS FOR CLEANING WASTE SOLUTIONS FROM TISSUE DECONTAMINATION. Simova, G.; Boyadzhiev, A.; Shopov, N.; Mikhajlov, M. (Meditsinska Akademiya, Sofia (Bulgaria). Nauchen Inst. po Rentgenologiya i Radiobiologiya). Rentgenologiya i Radiologiya ; 18: No. 3, 187-191(1979). (In Bulgarian).

The perspective use of Bulgarian natural calcium clinoptilolite for cleaning liquid wastes from decontamination of work clothes encouraged the authors to study the possibilities for improvement of the effectiveness of the sorption process, by applying four factors of presorption treatment. Experiments were carried out on liquids, obtained from decontamination of embolene from strontium and cesium radionuclides. The effect was studied of acidity of medium, reduction factor (diminution of radioactive waste volume), ageing time and incorporated gamma radiation dose in the tested liquids upon the degree of their sorption decontamination under static conditions and room temperature. Reduction factor 250, pH of medium 10, ageing time 14 days and incorporated dose 250 kilorad were considered optimal. After this presorption treatment the degree of decontamination of the tested liquids was increased by an average of 20 per cent.

1282 ION CHROMATOGRAPHIC DETERMINATION OF DIBUTYLPHOSPHORIC ACID IN NUCLEAR FUEL REPROCESSING STREAMS. Lash, R.P.; Hill, C.J. (Allied Chemical Corp., Idaho Falls, ID). pp 67-74 of Ion chromatographic analysis of

environmental pollutants. Volume 2. Mulik, J.D.; Sawicki, E. (eds.). Ann Arbor, MI; Ann Arbor Science Publishers, Inc. (1979).

From 2. national symposium of ion chromatographic analysis of environmental pollutants; Research Triangle Park, NC, USA (11 Oct 1978).

A rapid method was developed for the determination of dibutylphosphoric acid (DBP), a degradation product of tributylphosphate (TBP), which is used in a solvent extraction process for recovery of uranium. DBP, along with any monobutylphosphoric acid (MBP) and phosphoric acid, are extracted from the organic phase into dilute sodium hydroxide. DBP is separated from MBP and phosphoric acid by ion chromatography (IC) and is determined on a peak height ratio basis. The method required only 30 minutes per analysis as compared to the conventional alumina column separation-colorimetric determination procedure, which requires eight hours to complete. DBP has been quantified to a lower limit of 1.5 mg/l. Relative standard deviations ranging from 5.7 to 0.4% were obtained for DBP concentrations ranging from 1.5 to 500 mg/l, respectively.

1283 PROCESS FOR AN ULTIMATE STORAGE-MATURE, ENVIRONMENTALLY HARMLESS SOLIDIFICATION OF HIGHLY AND MEDIUM RADIOACTIVE AND/OR ACTINIDES-CONTAINING AQUEOUS WASTE CONCENTRATES OR OF FINE-GRAINED SOLID WASTES IN WATER SLURRIES. Scheffler, K.; Riege, U. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,726,087/C/. 21 Dec 1978. 6p. (In German).

The aqueous solutions or slurries of highly and medium radioactive materials are mixed with absorbent or hydraulically binding inorganic materials in definite ratios, ceramic burned, so that a solid sinter body is formed. The invention claims a combination of advantageous process steps in which exact mixing ratios and additions are given in order that the end products all meet with the requirements for ultimate storage.

1284 METHOD OF PROCESSING RADIOACTIVE LIQUID WASTES. Sugimoto, Y.; Kikuchi, M.; Funabashi, K.; Yusa, H.; Horiuchi, S. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 53-147,200/A/. 21 Dec 1978. 6p. (In Japanese).

Purpose: To decrease the volume of radioactive liquid wastes essentially consisting of sodium hydroxide and boric acid. Method: The concentration ratio of sodium hydroxide to boric acid by weight in radioactive liquid wastes essentially consisting of sodium hydroxide and boric acid is adjusted in the range of 0.28 - 0.4 by means of a pH detector and a sodium concentration detector. Thereafter, the radioactive liquid wastes are dried into powder and then discharged.

1285 METHOD OF SOLIDIFYING RADIOACTIVE WASTES. Matsuura, H.; Kuribayashi, N.; Kamiyama, H.; Saito, N. (to Nippon Atomic Industry Group Co. Ltd., Tokyo). Japanese Patent 53-146,100/A/. 19 Dec 1978. 3p. (In Japanese).

Purpose: To enable solidification of asphalt at relatively low temperature (100 -- 120°C), as well as prevent asphalt from intruding into condensates. Method: Radioactive wastes discherged from the nuclear facility are dry-processed in a dryer and the powder thus resulted is fed by way of a powder feeder to an extruding kneader. The powder and asphalt previously supplied in a predetermined amount are compounded in the extruding kneader to form solidified asphalt products at a low temperature.

1286 METHOD FOR FIXING ORGANIC RADIOACTIVE SOLVENT WASTES. Ichinose, S.; Masuda, T.; Murata, M.; Tsunoda, N.; Nemoto, S. (to Topy Industries Ltd., Tokyo (Japan)). Japanese Patent 53-143,900/A/. 14 Dec 1978. 7p. (In Japanese).

Purpose: To process organic radioactive solvent wastes of a high concentration by causing them to absorb and fix in swelling synthetic mica. Method: Organic radioactive solvent wastes are contacted and adsorbed to swelling synthetic mica and absorbed therein. Then, the synthetic mica is subjected to hydrophobic treatment with a hydrophobic agent (for example, quarternary ammonium salt) so that the absorbed organic solvent may not leach out into water. The mica is further calcinated and then the powdered products are molded and sintered.

1287 GAS-ABSORPTION PROCESS. Stephenson, M.J.; Eby, R.S. (to Dept. of Energy). US Patent 4,129,425. 12 Dec 1978. Filed date 18 Jul 1977. 12p.

PAT-APPL-816,575.

A gas-absorption process for the recovery of a desired component from a feed-gas mixture is described. The process is conducted in a closed-loop system including a gas-liquid contacting column which has upper, intermediate, and lower contacting zones. A liquid absorbent for the desired component is circulated through the loop, passing downward through the column, is regenerated and then withdrawn from a boiler, and returned to the column. The desired component is concentrated in a narrow section of the intermediate zone.

1288 ASEA HAVE DEVELOPED A NEW SAFE CONTAINER FOR NUCLEAR FUEL WASTE. CORUNDUM CONTAINER WHICH TAKES ABOUT 400KG OF URANIUM. Elektro ; 91: No. 22, 31(12 Dec 1978). (In Norwegian).

The method of encapsulating spent fuel elements in corundum, processed by isostatic pressing at high temperature, which has been developed by ASEA, has now been tested using spent fuel elements from the Oskarshamn nuclear power plant. Ultrasonic testing showed complete fusion of the corundum container and lid. The capacity of such coatainers is about 400kg unreprocessed fuel.

1289 SOME STUDIES OF NUCLIDE LOSSES. 2. COLD FINGER. Ghattas, N.K. (Atomic Energy Establishment, Cairo (Egypt)); Hild, W.; Guber, W. Journal of Applied Chemistry and Biotechnology (England) Supersedes J. Appl. Chem. ; 28: No. 12, 847-853(Dec 1978).

The vaporisation behaviour during vitrification of simulated high active waste containing radioactive isotopes of special interest was studied using the cold-finger technique. Relatively high loss was observed for both caesium and tellurium as compared with ruthenium, strontium and cerium. The losses were significantly increased starting from 900°C. Heat fractionation results in low losses of radioactive nuclides. A simple formula was proposed for predicting and comparing the vaporisation losses of similar melts using different installations.

1290 IMPROVEMENT OF BWR RADIOACTIVE WASTE DISPOSAL SYSTEM. Kani, J.; Amoh, K; Irie, H.

(Toshiba Corp., Kawasaki, Kanagawa (Japan)); Nakayama, Yasuyuki. Toshiba Rebyu (Toshiba Review) ; 33: No. 12, 1009-1012(Dec 1978). (In Japanese).

Descriptions of thehe improvements of the disposal systems for liquid and solid radioactive waste in recent BWR plants. Regarding the improvement of liquid waste disposal systems in Toshiba, emphasis was laid on crud removal and laundry drain treatment; as a result, a crud removal system utilizing a centrifugal separation mechanism and an evaporative enriching system using anti-foaming agent have been practicalized. An important problem left for solution is the method of volume reduction of solid waste. A method attracting attention of late is the plastic solidification which is far superior to the conventional cement and bitumen solidification. In Toshiba, this method is promising to be practicalized, in which the waste is dried and then solidified with thermosetting resin.

1291 DISTRIBUTION OF CS, SR, CE, EU AND TB INTO NA- AND H-TYPE ZEOLITES. Mimura, H.; Kanno, T. (Tohoku Univ., Sendai (Japan). Research Inst. of Mineral Dressing and Metallurgy). Tohoku Daigaku Senko Seiren Kenkyusho Iho (Bulletin of the Research Inst. of Mineral Dressing and Metallurgy, Tohoku University) ; 34: No. 2, 85-94(Dec 1978). (In Japanese).

Effects of pH on the distribution of radioisotopes, ^{137}Cs, ^{85}Sr, ^{144}Ce, sup(152,4)Eu and ^{160}Tb, into synthetic zeolites (A, X and Y), synthetic mordenite, natural mordenite and clinoptilolite have been investigated. Cesium ion was preferentially distributed into mordenite with a high distribution coefficient (K sub(cs) = 10^4) from acidic aqueous solution of pH 1 to 3. As for strontium, the K sub(sr) values into zeolites A, X and Y attained about 10^4 in the neutral region, but markedly decreased with increasing acidity. The distributions of rare earth elements at tracer-level concentrations into six kinds of Na-type zeolites were shown by the curves with a maximum at a different equilibrium pH. In the presence of carrier (10 ppm), these distribution curves broadened and overlapped. In the case of H-type zeolites, the cesium ion was also captured by zeolite in the acidic region (K sub(cs) = 10^4), while the multivalent cations had low distribution coefficients less than 10^2 at pH 2 and the K values decreased with increase in acidity.

1292 DRYING EQUIPMENT FOR RADIOISOTOPE-TREATED ANIMALS. Fujikake, T. (Fuji Electric Co. Ltd., Kawasaki, Kanagawa (Japan)); Ohmori, A.; Takada, Y.; Nakano, S.; Tamai, S. Fuji Jiho (The Fuji Electric Journal) ; 51: No. 12, 697-701(Dec 1978). (In Japanese).

The animal experiments using radioisotopes have been carried out over wide fields, accordingly, the number of radioisotope-contaminated animal cadavers has been increasing rapidly. It was decided that each establishment employing radioiosotopes dries those cadavers to such state as to be able to burn up with the device in Japan Atomic Energy Research Institute. The animal waste-drying device meeting the above mentioned purpose was developed by the joint work of Fuji Electric General Devices Co. and Fuji Electric Co. It is known as the micro-wave drying device for animals (its nickname is Microdry). This device dehydrates at high speed by micro-wave drying method. By using along with a moisture detector, it gives the drying state as requested regardless of the water content of each animal. The animal wastes after perfect dehydration are reduced to the weight of about one-third, and the dried animal cadavers can be preserved for a long time at room temperature because of the sterilizing effect of the micro-wave heating. This device is noted for its excellent safeness, simple operation, and low treatment cost. It is anticipated that it can be further applied to other fields such as excreta, breeding materials, etc.

1293 RADIOACTIVE LIQUID WASTES PROCESSING SYSTEM. Funabashi, K.; Kikuchi, M.; Kamiya, K.; Yusa, H. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 53-137,400/A/. 30 Nov 1978. 7p. (In Japanese).

Purpose: To decrease the amount of drum cans stored in the site by ionizing radioactive substances adsorbed on solids while adjusting pH value and selectively eliminating these ions by inorganic ion exchangers. Method: Concentrated liquid wastes stored in a concentrated liquid waste tank are sent into a pH adjusting tank for pH adjustment and, thereafter, to a reaction and settling separation tank for elutriation of cobalt and separation of most of clads. The liquid wastes completely separated with clads in the filter and containing only ions are sent to another pH adjusting tank for pH adjustment. Then, they are sent to a reaction and settling separation tank, where they are treated with inorganic ion exchangers and separated into clads and ion exchangers, which are packed respectively in drum cans.

1294 METHOD AND DEVICE FOR FIXING RADIOACTIVE GASES. Ozaki, S. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 53-136,200/A/. 28 Nov 1978. 3p. (In Japanese).

Purpose: To enable stable and long storage for radioactive gases by converting the radioactive gases into neutral particles and injecting them into a substrate to solidify. Method: Radioactive gases such as Kr-85 separated in a rare gas separator are introduced into a gas reservoir to store and then sent by way of a flow rate control valve to an ion source to ionize. Then, ionized rare gas in an accelerator is accelerated to a high energy and injected to a neutral particle cell containing diluted Kr gas from the gas reservoir to convert the same into neutral particles. They are further introduced in a high speed particle injection chamber and injected into a substrate disposed in the chamber to thereby reduce the diversion of the high speed particle beams and be solidified.

1295 CHARGING FACILITY FOR DRUMS WITH RADIOACTIVE CONTENT. Hempelmann, W. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,659,691/A/. 16 Nov 1978. 14p. (In German).

The facility has a packing press which at least partly is contained within an alpha-tight box. The waste can be made compact and fixed in the 200 l iron-hooped drums by means of concrete. The press consists of two tie rods with a press cylinder and a press die acting downwards and fitting into the drum opening. The drum is standing on a pressing table fastened to the ends of the tie rods. The pressing table can be raised against the press die together with the drum. The lifting mechanisms to do this consist of hydraulic cylinders mounted at the lower end of the tie rods and whose piston rods, acting axially in extension of the tie rods, are hinged on the

pressing table. In addition there may be mounted a bottom plate in the drum for reinforcement.

1296 METHOD FOR PROCESSING RADIOACTIVE WASTES. Nakayama, Y. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 53-131,400/A/. 16 Nov 1978. 4p. (In Japanese).

Purpose: To make it possible to carry out the cement solidification treatment of radioactive wastes by compact facilities. Method: Predetermined quantities of radioactive wastes, cement and water are fed in a drum, and stirring vanes are inserted therein thereby stirring and mixing these substances. Then, an empty drum is carried to the lower parts of said stirring vanes, and a predetermined quantity of cleaning water is fed into the drum to clean the stirring vanes. After cleaning, the drum is left standing, and the cement parts contained in the cleaning water are precipitated to exhaust the water content within the drum into other drum, thereafter the precipitate being measured. After the measurement, wastes, cement and water to be added are supplied into the drum, and they are stirred and mixed as described above.

1297 METHOD OF PROCESSING RADIOACTIVE GAS. Saito, M. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 53-131,399/A/. 16 Nov 1978. 2p. (In Japanese).

Purpose: To reduce the quantity of radioactive gas discharged at the time of starting a nuclear power plant. Method: After the stoppage of a nuclear power plant air containing a radioactive gas is extracted from a main condenser by operating an air extractor. The air is sent into a gaseous waste disposal device, and then introduced into the activated carbon adsorptive tower of a rare gas holdup device where xenon and krypton are trapped. Thereafter, the air passes through pipelines and returned to the main condenser. In this manner, the radioactive gas contained in air within the main condenser is removed during the stoppage of the operation of the nuclear power plant. After the plant has been started, when it enters the normal operation, a flow control valve is closed and another valve is opened, and a purified gas exhausted from the rare gas holdup device is discharged into the atmosphere through an exhaust cylinder.

1298 METHOD AND APPARATUS FOR RECOVERING LEAKED RADIOACTIVE KRYPTON GAS. Otsuka, N.; Tsukui, K. (to Japan Atomic Energy Research Inst., Tokyo). Japanese Patent 53-129,800/A/. 13 Nov 1978. 4p. (In Japanese).

Purpose: To surely recover and purify Kr-gas leaked from Kr-85 gas processing device. Method: If Kr-85 gas leaks from a Kr-85 gas processing device into an air tight vessel previously displaced with helium gas, the gas mixture of Kr-85 and He is recycled through a flow meter, a cold trap, a radioactive instrument, an activated carbon column and a pump, in the course of which the Kr-85 gas is selectively adsorbed to collect in the activated carbon column. Then, the gas mixture of Kr-85 desorbed from the activated carbon column and small amount of He is caused to flow through a liquid helium purifier, a cold trap and a vacuum pump. Since a pipe way is immersed in the liquid helium in the above purifier, the Kr-85 gas is recovered to solidify.

1299 METHOD FOR PROCESSING POWDERY RADIOACTIVE WASTES. Yasumura, K.; Matsuura, H.; Tomita, T.; Nakayama, Y. (to Nippon Atomic Industry Group Co. Ltd., Tokyo). Japanese Patent 1953-126,498/A/. 4 Nov 1978. 2p. (In Japanese).

Purpose: To solidify radioactive wastes with ease and safety at a high reaction speed but with no boiling by impregnating the radioactive wastes with chlorostyrene. Method: Beads-like dried ion exchange resin, powdery ion exchange resin, filter sludges, concentrated dried waste liquor or the like are mixed or impregnated with a chlorostyrene monomer dissolving therein a polymerization initiator such as methyl ethyl ketone peroxide and benzoyl peroxide. Mixed or impregnated products are polymerized to solid after a predetermined of time through curing reaction to produce solidified radioactive wastes. Since inflammable materials are used, this process has a high safety. About 70% wastes can be incorporated. The solidified products have a strength as high as 300 - 400 kg/cm^3 and are suitable to ocean disposal. The products have a greater radioactive resistance than other plastic solidification products.

1300 METHOD FOR SOLIDIFYING POWDERY RADIOACTIVE WASTES. Yasumura, K.; Matsuura, H.; Tomita, T. (to Nippon Atomic Industry Group Co. Ltd., Tokyo). Japanese Patent 1953-126,500/A/. 4 Nov 1978. 2p. (In Japanese).

Purpose: To solidify powdery radioactive wastes through polymerization in a vessel at a high impregnation speed with no cloggings in pipes. Method: A drum can is lined with an inner liner layer of a predetermined thickness made of non-flammable material such as glass fiber. A plurality of pipes for supplying liquid plastic monomer are provided in adjacent to the upper end face of the non-flammable material or inserted between the vessel and the non-flammable material. Then powdery radioactive wastes are filled in the vessel and the liquid plastic monomer dissolving therein a polymerization initiator is supplied through the pipes. The liquid plastic monomer impregnates through the non-flammable material layer into the radioactive wastes and the plastic monomer is polymerized by the aid of the polymerization initiator after a predetermined of time to produce solidified plastic products of radioactive wastes.

1301 METHOD FOR REMOVING TRITIUM. Shinpo, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 53-126,497/A/. 4 Nov 1978. 4p. (In Japanese).

Purpose: To remove tritium produced in a nuclear power plant facility by reaction with an intermetallic compound. Method: Gaseous tritium and gas containing tritium compound are introduced into an oxidation device, where the tritium compounds are converted through oxidation into ^3H_2O. Then, they are subjected to reduction in a gas generating device into gaseous tritium. The gaseous tritium is introduced in a tritium absorption device and absorbed to fix therein. The tritium absorption device is filled with an intermetallic compound of rare earth element and Ni (or Co), preferably, $LaNi_5$. 430 g $LaNi_5$ can absorb about 56 litre hydrogen in the form of $LaNi_5H_5$.

1302 APPARATUS FOR REDUCING RADIOACTIVE GASEOUS WASTES. Mitani, S.; Ishihara, S. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1953-125,599/A/. 1 Nov 1978. 3p. (In Japanese).

Exhaust gas is highly purified by reducing the radioactive waste therein discharged from a pump of a vacuum pump processing system operated upon start-up and stopping of a

nuclear power plant. An exhaust gas processor in a vacuum pump system and an exhaust gas processor in a tank ventilation system are connected by way of a vacuum pump exhaust surge tank and a vacuum exhaust dehydrator. The vacuum degree in a main condensator is kept at a predetermined value by the operation of a vacuum pump upon start-up and stopping of a turbine. After storing the exhaust gas in the vacuum pump exhaust surge tank, the exhaust gas is dehydrated by the dehydrator. Then, the dehydrated exhaust gas is sent by way of a pre-filter to the processor and removed with iodine radioactivity.

1303 METHOD OF REFINING URANIUM-CONTAINING WASTE OILS. Nagayama, Y. (Power Reactor and Nuclear Fuel Development Corp., Tokai, Ibareki (Japan). Tokai W.). (to Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Japanese Patent 1953-123,800/A/. 28 Oct 1978. 5p. (In Japanese).

Purpose: To economically refine radioactive waste oils containing uranium fluorides as reprocessed oils usable as lubricating oils for an oil-lubricated rotational vacuum pump. Method: Waste lubircating oils containing uranium fluorides are filtered through column-like filtration material in a shape of ultra-fine long fibers such as α-cellulose or the like to remove contamination substances of a size above several microns. Then, the filtered waste oils are incorporated with active white clay, stirred and filtered again. Since the white clay used in the above processing is inexpensive, reprocessed oils reusable as lubricating oils for the oil-lubricated rotational vacuum pump can be refined economically from radioactive waste oils containing uranium fluorides.

1304 PROCESS FOR DECOMPOSING NITRIC ACID AND/OR NITRIC ACID IONS. Yamaguchi, I.; Kubota, M. (to Japan Atomic Energy Research Inst., Tokyo). Japanese Patent 1953-120,100/A/. 20 Oct 1978. 4p. (In Japanese).

Purpose: To provide the subject process comprising shortening the induction period of a reduction reaction in decomposing nitric acid or nitric acid ions contained in liquid wastes from a nuclear fuel retreatment plant, and reducing the maximum gas generating velocity. Method: A solution containing nitric acid or nitric acid ions is boiled, and nitrite or nitrous acid is added to this solution. Nitrous acid which is an initiator for the decomposition reaction is caused to be present in advance in the reaction system. When a reducing agent such as formic acid or formalin is injected in this solution, the concentration of nitrous acid increases autocatalytically to maintain the nitric acid decomposition reaction.

1305 INVESTIGATION OF THE UTILITY OF CHEMICALLY TREATED INDIGENOUS MINERALS IN RADIOACTIVE WASTE TREATMENT. Satya Brat (Bhabha Atomic Research Centre, Bombay (India)). Journal of the Indian Institute of Science ; 60: No. 10, 185-194(Oct 1978).

Ion exchange studies have been carried out on two indigenous micaceous minerals treated with: (i) sodium cobaltinitrite and (ii) sodium chloride + hydrogen peroxide, and their utility in radioactive liquid waste treatment assessed.

1306 EFFECT OF PLATINUM GROUP ELEMENTS ON DENITRATION OF HIGH-LEVEL LIQUID WASTE WITH FORMIC ACID. Nakamura, H.; Yamaguchi, I.; Kubota, M. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Journal of Nuclear Science and Technology (Tokyo) ; 15: No. 10, 760-764(Oct 1978).

High-level waste (HLW) from nuclear fuel reprocessing containing platinum group elements could be denitrated effectively with formic acid, and the solution indicated neutral even after the addition of excess formic acid. Platinum group elements, rhodium above all, were found to decompose formic acid and the action was more effective in the decomposition of excess formic acid in HLW. When HLW did not contain platinum group elements, both of unaltered nitric and formic acids remained after addition of stoichiometric amount of formic acid, leaving the solution slightly acidic. Excess formic acid in HLW not containing platinum metals was decomposed almost completely by irradiation with ^{60}Co γ-rays up to 2 x 10^8R.

1307 REMOVAL OF RADIOACTIVE IONS FROM NUCLEAR WASTE SOLUTIONS BY ELECTRODIALYSIS. Sugimoto, S. (Radia Industries Co. Ltd., Takasaki, Gunma (Japan)). Journal of Nuclear Science and Technology (Tokyo) ; 15: No. 10, 753-759(Oct 1978).

Removal of radioactive ions was studied from low and medium level radioactive waste solutions by electrodialysis using ion exchange membranes. The test solutions contained $^{137}Cs^+$, $^{106}Ru^{3+}$ or fission products (F.P.) as active ions and NaCl, Na_2SO_4 or $Ca(NO_3)_2$ as inactive coexisting salts. The decontamination factor of the active ions was in the order: $^{137}Cs^+$ (greater than 99%) > $^{90}Sr^{2+}$ > F.P. > $^{106}Ru^{3+}$. The dialysis time required to attain the saturation was the shortest for monovalent cations K^+, Cs^+ and Na^+, intermediate for divalent cation Sr^{2+}, and the longest for trivalent cation Ru^{3+}. The ratio of the decontamination factor of an active ion eta sub(a) to the desalination factor of an inactive ion eta sub(b) was nearly equal to unity for ^{24}Na, ^{42}K, ^{137}Cs and ^{90}Sr. On the other hand, the apparent selective permeability of an active ion (A^+) against Na^+ ion, T sub(Na^+) sup(a) was higher than unity for all the active ions tested, and was in the order of ^{137}Cs > ^{90}Sr > ^{42}K > ^{24}Na, where T sub(Na^+) sup(a) is defined by the ratio of γsub(a) to γsub(Na^+) with γsub(a) being the ratio of dilution of A in the diluate the γsub(Na^+) being that of Na^+ in the same diluate. The decontamination factor of the active ions did not depend significantly on the species and concentration of the coexistent salts or on the concentration of the active ions.

1308 EXPERIMENTS ON THE ADSORPTIVE REMOVAL OF RARE GASES FROM THE GASEOUS WASTE OF A FUEL REPROCESSING PLANT. Juentgen, H.; Schroeter, H.J. (Bergbau-Forschung G.m.b.H., Essen (Germany, F.R.)); Ammon, R. von; Leichsenring, C.H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Kerntechnik Vereinigt mit Atompraxis. The Journal for Nuclear Engineers and Scientists ; 20: No. 10, 450-456(Oct 1978). (In German and English).

It has been shown in laboratory experiments that it is technically possible to separate radioactive krypton from inactive xenon by means of activated charcoal, at room temperature and without a change in temperature between adsorption and desorption, as a preliminary step before low temperature distillation. Adsorption can take place atmospheric pressure. Desorption takes place by evacuation in the same direction of flow as the adsorption, followed by flusing under low pressure. During evacuation and flusing, krypton and xenon are desorbed separately from

each other. By appropriately controlling the level of the xenon front in the adsorber during the adsorption phase, the swith-over from krypton flushing to xenon flushing can be defined sufficiently sharply to ensure that neither fraction is unduly contaminated by the other. (orig.) 891 HP 892 EKI.

1309 THE STORY OF NUKEY POO. Wilkes, O.; Mann, R. (Intl Peace Research Inst, Norway; Univ of Auckland, New Zeal). B Atomic Scientists; 34: No. 8, 32-36(Oct 1978).

Under the terms of the Arctic Treaty, the U.S. Navy has shut down and dismantled a portable, medium-power nuclear reactor at McMurdo Base. The U.S. Navy has shipped out 8000 tons of earth contaminated as a result of the reactor's inadequate design and numerous malfunctions. Removal disclosed that leaks had occurred. Cracks had appeared three times during 11 years of operation. Throughout the entire period of operation, slightly radioactive effluent had run down a drain pipe and soaked into the soil. The Navy has dug a 9000 cu m hole to restore the site to its original condition. The contaminated soil has been shipped to California and Georgia. (1 photo, 10 references)

1310 METHOD FOR INCORPORATING WATER-CONTAINING RADIOACTIVE WASTE IN CEMENT. Puthawala, A.; Stuenkel, H. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,648,263/A/. 28 Sep 1978. 7p. (In German).

Low- to intermediate-activity wastes, as e.g. spent resins from ion exchange filters in LWR's, are pourably dried and, in dosed quantities, filled into a storage drum in which dry cement is contained. By means of a stirrer, mounted on a hood which can be put on the drum, cement and wastes are mixed together while adding an amount of water - also in dosed quantities. The hood can be removed again from the drum which then may be closed by means of a cover. Subsequently the drum is brought to the ultimate storage.

1311 METHOD FOR RETENTION OF TRITIUM RELEASED DURING REPROCESSING SPENT NUCLEAR FUEL AND STORING THE LIQUID RADIOACTIVE WASTE PRODUCED THEREBY. Hesky, H.; Wunderer, A. (to Farbwerke Hoechst A.G., Frankfurt am Main (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,711,373/A/. 21 Sep 1978. 6p. (In German).

The highly active liquid waste and the tritium water produced in recovering HNO_3 are mixed with oxygen Subsequently the oxygen charged with tritium is supplied to a reduction facility where the O_2 is reduced with NO and the higher nitric oxides are converted to HNO_3. The resulting tritium is stored; the bottom product HNO_3 is recycled into the reprocessing process. The same process may be applied to Rb forming hydrides respectively tridides with tritium.

1312 METHOD OF PURIFYING GASES FROM REPROCESSING OF SPENT FUEL ELEMENTS CONTAINING RADIOACTIVE SUBSTANCES. Hesky, H.; Wunderer, A. (to Farbwerke Hoechst A.G., Frankfurt am Main (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,711,374/A/. 21 Sep 1978. 9p. (In German).

During reprocessing there are produced gases consisting of H_2O vapor, N, NO, higher NO, HNO_3 vapor, Xe, Kr, I, and ^3H. From this gas mixture Kr and I are quantitatively separated. For this purpose a carrier gas with nearly equal separating performance is admixed to the gases, this mixture is split up into a fraction containing the radioactive substances and another one free of them and then the carrier gas us separated again from the fraction with the substances. As a carrier gas there may be used NO (for Kr) and CO (for Ar). The carrier gas is e.g. oxidized before separation and the higher oxides are separated by condensation, distillation, or washing. The separation of the gas/carrier gas mixture is done by distillation, thereby receiving fractions with carrier gas plus substances respectively without substances. The admixture of the carrier gas is achieved e.g. by disproportionation of higher NO. Thereby the iodine is preferably absorbed and separated and desorbed again. By means of the drag gas O_2 the desorbed iodine then is conducted towards filtration.

1313 RADIOACTIVE RARE GAS SEPARATION PERFORMANCE OF A TWO-UNIT SERIES-TYPE SEPARATION CELL. Ohno, M.; Heki, H.; Ozaki, O. (Toshiba Corp., Kawasaki, Kanagawa (Japan). Research and Development Center); Miyauchi, T. Journal of Nuclear Science and Technology (Tokyo) ; 15: No. 9, 668-677(Sep 1978).

Enhancement of the separation factor in a separation cell has been desired as one means of reducing the cascade scale required for a radioactive rare gas membrane separation. It is already known that the separation factor of the separation cell increases as cut increases. Hence, in a series-type separation cell which consists of two-unit cells, an appropriate selection of cuts for each unit cell can be expected to provide a marked improvement in separation factor under symmetric separation. This paper presents analytical and experimental results for separation characteristics of a series-type separation cell whose separation factors are far from unity. It was found that the series-type separation cell has a larger separation factor than other types of separation cells, such as recycle separation cell and conventional separation cell. The series-type separation cell requires less power consumption and membrane area than the recycle separation cell while it requires more than the conventional separation cell. As both the two-unit series-type separation cell and the conventional separation cell have individual merits and demerits, a comparison is also made between the cascade consisting of series-type separation cells and that of conventional separation cells. The cascade of series-type separation cells requires fewer stages and less power consumption but somewhat more membranearea than that of conventional separation cells. Based on results of this study, the scale of a cascade can be reduced by using series-type separation cell.

1314 METHOD TO FABRICATE BODIES CONTAINING RADIOACTIVE MATERIALS. Heimerl, W.; Schiewer, E.; Kumar, A. de. (to Gelsenberg A.G., Essen (Germany, F.R.); Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,704,147/A/. 10 Aug 1978. 5p. (In German).

To secure the ultimate storage of highly radioactive wastes, it is suggested to transfer the radioactive substances enclosed in glass in the known manner, into a glass ceramic by tempering in a metal bath. The glass particles are brought to crystallize in a specific manner in a metal melt (lead and its alloys or

aluminium and its alloys). It is preferable to temper directly the container for ultimate storage.

1315 OUTLINE OF THE CHEMICAL PROCESSING FACILITY (CPF). Arita, K. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Doryokuro Giho (Power Reactor Technology (Tokyo)) ; No. 27, 105-110(Aug 1978). (In Japanese).

Concerning the Chemical Processing Facility (CPF), a high level radioactive material research facility, to be installed in Tokai Works of Power Reactor and Nuclear Fuel Development Corporation (PNC), the detailed design and the governmental safety inspection were finished. The construction has been already started, and it will be completed in 1980. Under the national policy of establishing a nuclear fuel cycle, PNC is now carrying out the development of its downstream technology. The objects of the Chemical Processing Facility are the researches of the treatment techniques of high level radioactive liquid wastes from fuel reprocessing and of the reprocessing of fast reactor fuel. The following matters are described: purpose of the CPF, i.e. fast reactor fuel reprocessing and high-level liquid waste treatment; construction of the CPF, i.e. buildings, cells and an exhaust stack; test systems, i.e. fuel reprocessing and liquid waste vitrification; and facility safety.

1316 SOLIDIFICATION OF HIGH-LEVEL RADIOACTIVE WASTES. Grover, J.R. (International Atomic Energy Agency, Vienna (Austria). Div. of Nuclear Safety and Environmental Protection). International Atomic Energy Agency Bulletin ; 20: No. 4, 23-29(Aug 1978).

A summary is presented of the IAEA Technical Reports Series No.176 ''Techniques for the Solidification of High-Level Radioactive Wastes'' covering mainly the basic features of the many processes that are being developed to illustrate the wide variety of potential solutions to the problem. The paper concludes with a review of the current status and future prospects for waste solidification in the wider context of the management of wastes in the nuclear fuel cycle.

1317 NUCLEAR WASTE VITRIFICATION. Barrere, Martine. Recherche, La (Paris) (France) Supersedes Atomes (Paris) and Nucleus ; 9: No. 91, 698-702(Jul-Aug 1978). (In French).

The first industrial facility of vitrification started at Marcoule, last June. The principle of the continuous nuclear waste vitrification envisaged by France is briefly recalled together with both main functions of this vitrification: waste compaction and radioactivity confinement in time.

1318 GAS FILTER AND DEVICE INTENDED FOR REMOVING FROM THE HOUSING THE ABSORBANT AND GRANULAR MATTER. Revell, A.E. (to American Air Filter Co., Inc., Louisville, KY). French Patent 2,395,062/A/. 20 Jun 1978. 16p. (In French).

This invention concerns separators in general and in particular those intended for separating from a gas the impurities it contains by means of a solid absorbant substance. Before filling the gas filters, particularly those employed in the nuclear industry, with the solid absorbant substance for cleaning the gas, it is necessary from time to time to remove the filtering substance that has been soiled or contaminated by the radioactive elements separated from the gas flow. The description is given of an apparatus for removing from the housing of a gas filter the solid granular and absorbant matter with which the gas was treated. This apparatus is not only reliable but also inexpensive to build and maintain.

1319 STUDY ON THE FIXATION OF CESIUM-137 IN CLINOPTILOLITE. Lee, S.H.; Sung, N.J.; Park, W.J. (Korea Atomic Energy Research Inst., Seoul (Republic of Korea)). Bangason Bango Hakhoe Chi ; 3: No. 1, 1-5(Jun 1978). (In Korean).

Low level liquid radioactive wastes consisted of long half-life nuclide such as cesium-137 were treated by using the Korean clinoptilolite, a kind of zeolites. Column operation using a activated clinoptilolite shows good results in terms of break-through curves comparing with the clinoptilolite classified by the WARD in U.S. Korean clinoptilolite shows a tailing phenomena longer than those of the WARD. The fixation quantity of the radioactivity in the Korean clinoptilolite was about 75 μCi/100g in the case of using a 2.5×10^{-3} μCi/ml solution. (author).

1320 REMOVAL OF TRITIATED SPECIES FROM GAS STREAMS COMPRISED THEREOF. Collins, M.F.; Michalek, R. (to Engelhard Minerals and Chemicals Corp., Newark, NJ (USA). Engelhard Industries Div). Australian Patent 492,850/B/ . 5 May 1978. 25p.

A process is described for the removal of radioactive tritium, and/or compounds of tritium compounds such as tritiated water, and/or tritiated hydrocarbons (hereinafter the 'tritiated species') over a precious metal catalyst with sufficient air or oxygen to convert all of the tritiated species to tritiated water and, in the case of hydrocarbons, to carbon dioxide. At this point in time, all of the tritium has been converted to tritiated water. The tritiated water, and any other moisture that might be present in the gas stream, is then absorbed by a desiccant dryer to less than about one part per million total water. Preferably, the effluent from the desiccant dryer is next swamped of flooded with ordinary non-radioactive water (protium oxide, or even deuterium oxide for that matter) to dilute the tritiated water by a factor of at least about 1,000:1.

1321 INFLAMMABILITY AND EXPLOSIVENESS IN BITUMINIZATION. Zakharova, K.P.; Kulichenko, V.V.; Nazin, E.R.; Sadovnikov, Yu.N.; Ukke, O.V. Atomnaya Energiya ; 44: No. 3, 436-437(May 1978). (In Russian).

Results of a study of safety in the bituminization of radioactive wastes and storage of the final product are presented. The temperature of interaction of bitumen with one of the basic waste components, i.e. sodium nitrate, is 385-408 deg C. A noticeable decrease in this value is observed only in the presence of an alkali. The introduction of an additive in bitumen does not increase its inflammability as measured by a number of indicators. Bituminous substances containing less than 15% bitumen are capable of detonating, while those with a higer percentage are not.

1322 RADIOISOTOPE WASTE PROCESSING SYSTEMS. Machida, T. (Japan Radioisotope Association, Tokyo). Proceedings of the Japan Conference on Radioisotopes ; No. 13, 315-317(May 1978). (In Japanese).

From 13. Japan conference on radioisotopes;

Tokyo, Japan (7 - 9 Dec 1977).

The Atomic Energy Safety Bureau established the policy entitled "On Common Processing System of Radioactive Wastes" consulting with the Liaison Committee of Radioactive Waste Processing. Japan Atomic Energy Research Institute (JAERI) and Japan Radioisotope Association (JRIA) had been discussing the problems required for the establishment of the common disposal facilities based on the above policy, and they started the organization in spring, 1978. It is a foundation borrowing equipments from JAERI though installing newly some of them not available from JAERI, and depending the fund on JRIA. The operation expenses will be borne by those who want to dispose the wastes produced. The staffs are sent out from JAERI and JRIA. For animal wastes contaminated with RI, formaldehyde dipping should be abolished, but drying and freezing procedures will be taken before they are burnt up in a newly planned exclusive furnace with disposing capacity of 50 kg/hour. To settle the problems of other wastes, enough understanding and cooperation of users are to be requested.

1323 PRESENT SITUATION OF TREATMENT OF RADIOACTIVE WASTES IN RESEARCH INSTITUTIONS. Matsuo, M. (Tokyo Metropolitan Inst. of Gerontology (Japan)). Proceedings of the Japan Conference on Radioisotopes ; No. 13, 310-314(May 1978). (In Japanese).

From 13. Japan conference on radioisotopes; Tokyo, Japan (7 - 9 Dec 1977).

The quantities of unsealed radioisotopes used in educational organizations and research institutions and radioactive wastes collected from each category of organization in fiscal year 1975 are presented. These data show that main radioisotopes used in hospitals and clinics, educational organizations, research institutions and industrial firms are ^{3}H, ^{14}C, ^{32}P, ^{35}S and ^{45}Ca as beta ray-emitting radioisotopes, and ^{51}Cr, ^{59}Fe, ^{85}Kr, ^{125}I, ^{131}I, ^{133}Xe and ^{198}Au as gamma ray-emitting radioisotopes. The number of containers of the collected radioactive wastes is about 5,700. Although radioactive wastes are dealt with according to the law, the treatment system is meager and many problems have arisen. In this paper, the several points are analyzed, and solutions to the problems are pointed out.

1324 METHOD TO DRY BORIC ACID AND/OR BORATE-CONTAINING SOLUTION CONCENTRATES. Cordier, J.P.; Vandorpe, M. (to Societe Belge pour l'Industrie Nucleaire, Brussels; Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,705,470/8/. 20 Apr 1978. 3p. (In German).

The patent deals with an improvement of the method to dry solutions containing concentrates of boric acid or borates. These kind of solutions occur during operation of pressurized-water nuclear reactors where boron compounds are used as absorbant for neutrons. The concentrates are mixed with lime prior to drying to improve the consistency. An oxidizing agent - preferably hydrogen peroxide - is also added. It prevents polymerization during drying by forming unsoluble peroxyborates and thus results in a further increase of the decontamination factor for radioactive impurities in the evaporation of water from the concentrates. The dried concentrates are stabilized with bitumen or similar solidification agents before storing.

1325 FIXATION OF RADIOACTIVE MATERIALS IN A GLASS MATRIX. Macedo, P.B. de; Litovitz, T.A. Danish Patent 1,468/78/A/. 3 Apr 1978. 29p. (In Danish).

A patent description is given of a non-porous glass composition containing radioactive material encapsulated and immobilized in the glass matrix, said composition being characterized by: (a) at least 75 mol percent SiO_2, (b) a radiation activity above one millicurie per cubic centimeter of said composition, and (c) high chemical durability to aqueous solution.

1326 FIXATION OF RADIOACTIVE MATERIALS IN A GLASS MATRIX. Macedo, P.B.; Litovitz, T.A.; Simmons, J.H. South African Patent 1978/1,888/A/. 3 Apr 1978. Priority date 4 Apr 1977, United States of America (USA), 54p.

A non-porous glass composition containing radioactive material encapsulated and immobilized in the glass matrix has a composition characterized by: (a) at least 75 mol percent SiO_2, (b) a radiation activity above one millicure per cubic centimeter of said composition, and (c) high chemical durability to aqueous solution.

1327 PURIFICATION OF OFF-GASES IN A METAL-CLOTH FILTER WHILE BURNING SOLID WASTES. Lokotanov, N.S.; Nosyrev, O.A. Atomnaya Energiya ; 44: No. 4, 370-371(Apr 1978). (In Russian).

AIR FILTERS;ASBESTOS;COMBUSTION;EFFICIENCY; FLOW RATE;GAS FLOW;HIGH TEMPERATURE; PURIFICATION;RADIOACTIVE WASTE PROCESSING; FILTRATION;OFF-GAS SYSTEMS;SOLID WASTES;TIME DEPENDENCE

1328 FIXATION OF RADIOACTIVE SUBSTANCES IN A GLASS MATRIX. Macedo, P.B.; Litovitz, T.A.; Simmons, J.H. French Patent 2,386,889/A/. 31 Mar 1978. 32p. (In French).

This invention concerns the fixing of radioactive substances in a glass matrix. The composition is given of non-porous glass containing a radioactive substance enclosed and immobilised in the glass matrix, this composition being characterized by (a) not less than 75 moles per cent of SiO_2, (b) a radiation activity exceeding around 1 millicurie per cm^3 of the composition and (c) a high chemical durability in an aqueous solution.

1329 IODINE ABSORPTION IN MIXED SOLUTION OF SODIUM HYDROXIDE-BORIC ACID. Eguchi, W.; Adachi, M.; Miyake, Y. (Kyoto Univ., Uji (Japan). Inst. of Atomic Energy). Kyoto Daigaku Genshi Enerugi Kenkyusho Iho (Bulletin of the Institute of Atomic Energy, Kyoto University) ; No. Suppl. 1, 66-69(Mar 1978). (In Japanese).

In the absorption solution used for the removal of radioactive iodine in the exhaust gas from nuclear facilities by washing with water, boron compounds with large neutron capture cross section are mixed in many cases as nuclear reaction inhibitor. Generally sodium hydroxide aqueous solution in which boric acid is dissolved is employed. Therefore in practical point of view, absorption of iodine in the mixed solution of sodium hydroxide - boric acid is important, and the partition equilibrium of iodine in sodium hydroxide - boric acid, vapor - liquid overall dissolution equilibrium coefficient between the mixed solution and decarboxilated air, and iodine absorption rate in the mixed solution were experimented and discussed. Boric acid partly becomes ions by hydrolysis in the mixed solution of sodium hydroxide - boric acid and acts as a pH control agent. It only affects the partition of iodine in liquid phase through its

dissociation and electric charge equilibrium. Overall absorption rate of iodine decreases by adding the boric acid. Alkaline water of 9.5 to 10 pH containing boric acid of 1 to 3 g-boron/kg-water is very often used as the absorption solution for the removal of radioactive iodine by washing with alka- line water. This condition of boric acid concentration is higher than the condition in this investigation, and hence the detailed examination by the experiments over a wide range of concentration will be necessary. (Wakatsuki, Y.

1330 KINETICS OF ABSORPTION OF TRACE IODINE VAPOR IN AQUEOUS SOLUTION OF SODIUM HYDROXIDE, (2). EFFECT OF REACTION OF LIQUID PHASE MATERIAL IN CONSTANT INTERFACE AREA TYPE STIRRED ABSORPTION TANK. Eguchi, W.; Adachi, M.; Miyake, Y. (Kyoto Univ., Uji (Japan). Inst. of Atomic Energy). Kyoto Daigaku Genshi Enerugi Kenkyusho Iho (Bulletin of the Institute of Atomic Energy, Kyoto University) ; No. Suppl. 1, 59-61(Mar 1978). (In Japanese).

A liquid column was used for the experiments reported in Part 1. However, it only gives the observation of the effect of fast reaction because the liquid flow was controlled to uniform laminar flow and the contact is limited to short time of around 10 ms. In practical absorbing operation, turbulence is involved in liquid flow, and the residence time for contact is long. Hence, the absorption of trace iodine in the purified air has been experimented by using a constant interface area type stirred absorption tank. Prior to the experiment, the characteristics of the absorption tank was investigated by conducting pure carbon dioxide absorption test with purified water. It gave the conclusion that the tank was sufficiently usable for fundamental researches. In short contact time absorption, the iodine dissolved and absorbed in liquid phase is affected by reaction of hypoiodous acid and poly-iodide ion formation due to hydrolysis by basic catalyst, proceeding in the laminar film. In longer contact absorption, however, the reaction of iodic acid ion formation due to the oxidation-reduction of hypoiodous acid in liquid phase material also affects the absorption rate, in addition to the above reactions.

1331 EFFECT OF CARBON DIOXIDE ON THE RATE OF IODINE VAPOR ABSORPTION BY AQUEOUS SOLUTION OF SODIUM HYDROXIDE. Eguchi, W.; Adachi, M.; Miyake, Y. (Kyoto Univ., Uji (Japan). Inst. of Atomic Energy). Kyoto Daigaku Genshi Enerugi Kenkyusho Iho (Bulletin of the Institute of Atomic Energy, Kyoto University) ; No. Suppl. 1, 62-65(Mar 1978). (In Japanese).

There is always carbon dioxide in the atmosphere as an impurity. Since this is an acid gas similar to iodine, each absorption rate seems to be affected by the other due to the coexistence of these two. Experiments have been conducted to clarify the absorption rate and absorption mechanism of iodine in the simultaneous absorption of iodine and carbon dioxide. Carbon dioxide coexisting with gas phases as an impurity decreases the absorption rate of iodine in the removal by washing with water of iodine mixed in the air. The first cause of this is that the diffusion coefficient of iodine in gas phase decreases with the carbon dioxide content in the gas phase. The second cause is that coexistent carbon dioxide is an acid gas, dissociates by dissolving into the absorbing solution, increases hydrogen ion concentration together with the formation of negative ions of bicarbonate and carbonate, and reduces hydroxyl ion concentration as a result. It is more important that existence of iodine has a catalytic effect to the rate of basic catalytic hydrolysis of carbon dioxide simultaneously dissolved in water phase, and accelerates this reaction rate. The mechanism of catalytic effect of iodine for the hydrolysis of carbon dioxide can not be clarified in detail only by this experiment, but the simultaneous absorption rate of iodine and carbon dioxide can be explained satisfactorily. (Wakatsuki, Y.

1332 KINETICS OF IODINE REMOVAL BY WASHING WITH WATER. Adachi, M. (Kyoto Univ., Uji (Japan). Inst. of Atomic Energy). Kyoto Daigaku Genshi Enerugi Kenkyusho Iho (Bulletin of the Institute of Atomic Energy, Kyoto University) ; 2: 100-102(Mar 1978). (In Japanese).

From Meeting on nuclear safety problems; Kyoto, Japan (14 - 15 Mar 1977).

Removal of iodine vapor by washing with water is an important problem in the safety and protection of environmental air in the surrounding of nuclear facilities. Investigations on its development and practical use have been conducted in Japan. However, it seems to be important that the theoretical proof for these experimental results should be fully made through the fundamental researches. From the above described point of view, absorption mechanism and absorption rate have been investigated concerning iodine removal by washing with water as seen in the previous report. In the investigation, the effect of carbon dioxide on the vapor-liquid equilibrium of iodine in air-sodium hydroxide solution system has been measured by using semi-continuous type and batch type vapor-liquid equilibrium measuring apparatuses. Over-all vapor-liquid partition coefficient of iodine significantly reduced with the increase of carbon dioxide concentration. This is due to the fact that the existence of carbon dioxide greatly decreases the iodine and iodate ions. These experimental results can be explained by considering carbon dioxide reaction in sodium hydroxide solution together with iodine reaction.

1333 WASTE WATER TREATMENT INSTALLATION. Stuenkel, H. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,612,510/B/. 2 Feb 1978. 4p. (In German).

Modifications in a plant for the decontamination of liquid waste, i.e. the washing-out of volatile radioactive substances with the aid of an acid and an alkaline washing liquid are proposed. The modifications will make the process more efficient by using washing liquids of different pHs in one evaporator. They refer mainly to the arrangement of the evaporator bottom plates and the installation of a pump.

1334 RADIOACTIVE WASTE TREATMENT SYSTEM FOR TSURUGA NUCLEAR POWER STATION. Taniguchi, T.; Takeshima, M.; Saito, T.; Kikkawa, R. (Hitachi Ltd., Ibaraki (Japan). Hitachi Works). Hitachi Hyoron (The Hitachi Review) ; 60: No. 2, 137-140(Feb 1978). (In Japanese).

The augmentation of the radioactive waste treatment system in the Tsuruga Nuclear Power Station was planned in 1973, and this enlarged facility was completed in June, 1977. The object of this augmentation is to increase the storage capacity for wastes and to enlarge the treating capacity utilizing the newly installed facility. The operating experience in the facility having been already constructed was fed back for the engineering of this new

facility. This new facility contains the newly developed vacuum forced circulation type concentrator, the exclusive storage pool for solid wastes, etc. At the design stage of this new system, the pilot plant test of slurry transportation and the corrosion test of long hours were carried out as the research and developmental works for the confirmation of correct design condition. The measures for augmenting this radioactive waste treatment system are the installation of a long time storage tank with the capacity of 350 m^3, the sit bunker facility and the drum storage as the storage facility, and the vacuum forced circulation type concentrator with the circulating flow rate more than 200 times as much as the treating flow rate and vacuum level of 0.255 ata. The augmented system is shown with the flow sheet of whole waste disposal system. The flow sheet of the concentrator is separately shown, and the relating research and developmental works, for example, the test of the cause of corrosion, the surface finishing test, the material test, the blockage test for heat transfer tubes and the inhibiter test, are explained with the test results. The ion exchange resin is transported by air and water as the slurry state, and the long distance transport of about 250 m is required in this new system. As clogging has to be avoided in this transportation, the experimental work was conducted to obtain the flow characteristics of slurry, and the test result is outlined.

1335 DEVELOPMENT OF A LAUNDRY WASTE TREATMENT SYSTEM FOR NUCLEAR POWER PLANTS. Kikuchi, M.; Sugimoto, Y.; Yusa, H.; Ebara, K. (Hitachi Ltd., Ibaraki (Japan). Hitachi Research Lab.); Horiuchi, S. Hitachi Hyoron (The Hitachi Review) ; 60: No. 2, 141-144(Feb 1978). (In Japanese).

The test for putting the treatment of laundry waste containing very low radioactivity from 10^{-7} to 10^{-8} μCi/ml in practical use was carried out utilizing the new process combining reverse osmosis method and evaporation process. The special feature of this process is to use cleaning sponge balls for preventing the decrease of process capacity caused by the deposit of scale on reverse osmosis diaphragms and also to apply the newly developed, heat resistant and bubble-extinguishing silicon chemicals to control bubble generation which is caused by surfactant in evaporators. The test utilizing the practical scale model plant with the capacity of 200 l/h was carried out using dummy waste liquid. As the result of this test, it was recognized that the key operational characteristics including efficiency of eliminating radioactivity and concentration factor were satisfactory for practical use. The main specifications of the test facility are as follows: tubular type, diaphragm surface area 6.8 m^2, treated liquid temperature 25 deg C, treated liquid pH 5, and pressure 40 kg/cm^2g for the reverse osmosis system; and the forced circulation type, heat transfer area 4 m^2, and treated liquid pH 8 to 9 for the evaporator. The characteristic parameters of laundry waste liquid are as follows: cleanser 200 to 500 ppm, surfactant 30 to 60 ppm, suspending material 10 to 30 ppm, ion (Ca^{++}) 2 to 5 ppm, electric conductivity 100 to 300 μmho/cm, pH 7 to 8, and radioactivity 10^{-7} μCi/ml. The flow sheet for this experimental facility system is shown, and the outline of the test, the features of the reverse osmosis facility and the evaporator are introduced. (Nakai, Y.).

1336 FIXATION MECHANISM BETWEEN ZEOLITE AND SOME RADIOACTIVE ELEMENTS. Hafez, M.B.; Nazmy, A.F.; Salem, F.; Eldesoki, M. (Atomic Energy Establishment, Cairo (Egypt)). Journal of Radioanalytical Chemistry ; 47: No. 1, . 115-119(1978).

Fixation of some fission products and actinide elements from aqueous solutions on zeolite was investigated. Studies showed that the interaction between the radionuclides and zeolite followed the exchange and the adsorption mechanism. The relative importance of each depends on the type, the nature, and the size of the radioelement.

1337 WEST GERMAN R + D ACTIVITIES, IN THE FIELD OF LWR FUEL ELEMENT REPROCESSING AND DISPOSAL. STATUS AND OUTLOOK. Kroebel, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Kernphysik). pp 26-32 of Die Problematik des radioaktiven Abfalls in der Kerntechnik. Essen, Germany, F.R.; Vulkan-Verl. (1978). (In German)

From Conference on the problems of radioactive wastes in nuclear technology; Essen, F.R. Germany (20 Oct 1977).

Report on tasks and goals of the 'Projekt Wiederaufarbeitung und Abfallbehandlung (PWA)', founded in 1974 by the Federal Government with the aim of coordinating all R + D activities in this field with a view to the erection of a large waste management centre for reactor fuels. There are already a number of laboratories and test benches for the testing of important subfields of waste management; further plants for the testing of systems and components are in the planning stage or under construction.

1338 EXPERIENCE WITH CEMENT USAGE AS THE BINDING AGENT FOR RADWASTE. Brownstein, M.; Levesque, R.G. (ATCOR, Inc, Peekskill, NY). American Society of Mechanical Engineers, [Paper] ; No. 78-NE-15, 1-10(1978).

Much of the confusion that exists in the radwaste solidification field is due to poor communication between chemists, who propose exotic solidification agents and the design engineers, who have had to incorporate them into working systems. An explanation is given as to how cement systems function in solidifying typical radioactive waste streams. Through understanding these basic principles, the design of a highly efficient waste system has been possible. Experience has shown this system to be extremely reliable in the operating environment of nuclear power plants and has produced a product which has been universally accepted at commercial burial sites.

1339 APPLICATION OF EUROPEAN RADWASTE TECHNOLOGY IN NORTH AMERICA. Stewart, J.E. (Warner and Pfleiderer Corp, Waldwick, NJ). American Society of Mechanical Engineers, [Paper] ; No. 78-NE-16, 1-9(1978).

The technology initially developed in Europe for treating radioactive wastes is now being used in Canada, Mexico, and the United States. While North America led in the development of Light Water Reactors (LWR) and Heavy Water Reactors (HWR), the Europeans focused on other technologies, one of which is radwaste treatment. The methods discussed include offgas treatment by charcoal absorption, liquid effluent treatment by solidification, incineration of combustible wastes, and storage/disposal methods.

1340 CANADIAN DEVELOPMENT PROGRAM FOR CONDITIONING CANDU REACTOR WASTES FOR DISPOSAL. Charlesworth, D.H.; Bourns, W.T.; Buckley, L.P. (AECL, Chalk River Nucl Lab, Ont). American

Society of Mechanical Engineers, [Paper] ; No. 78-NE-18, 1-11(1978).

Currently, radioactive wastes arising from the operation of Canadian nuclear reactors are placed in interim storage in concrete containment structures except for gaseous and liquid wastes containing small amounts of radioactivity which are dispersed. With the objective of replacing storage by permanent disposal, a program is underway to develop and demonstrate an integrated process for converting all reactor wastes to a stable, leach-resistant form which will immobilize the radionuclides in the waste repository. The major tool for this development is a Waste Treatment Center, now being constructed at Chalk River Nuclear Laboratories, which will combine reverse-osmosis, incineration, evaporation and bituminizing processes.

1341 BIOLOGICAL REMOVAL OF METAL IONS FROM AQUEOUS PROCESS STREAMS. Shumate, S.E. II; Strandberg, G.W.; Parrott, J.R. Jr. (Oak Ridge National Lab., TN). Contract W-7405-ENG-26. Biotechnology and Bioengineering Symposium ; No. 8, 13-20(1978).

Resting (washed, resuspended) microbial cells have been shown to effect rapid removal of uranium from aqueous solution. The rate and degree of uranium isolation from solution make this approach to heavy-metal removal quite promising as a means for the decontamination of process wastewaters from the nuclear fuel cycle. The complexed, concentrated uranium could conceivably be removed from the microbial cells and recycled. A bench-scale process is being developed to test this concept for the removal of radioactive heavy metals from aqueous process steams. 5 figures.

1342 GLASS AS A MATERIAL FOR THE FINAL DISPOSAL OF FISSION PRODUCTS. Jacquet-Francillon, N.; Bonniaud, R.; Sombret, C. (CEA Centre de Marcoule, 30 - Bagnols-sur-Ceze (France). Dept. de Genie Radioactif). Radiochimica Acta ; 25: No. 3;4, 231-240(1978).

High-level liquid waste solutions from nuclear fuel reprocessing plants occupy a central position in radioactive waste disposal. Conversion of fission products and actinides into a vitreous solid is a trend that many nations have chosen for waste disposal. This paper sums up the state of knowledge of the properties of glasses used for the ultimate disposal of wastes.

1343 ION-IMPLANTATION AND STORAGE OF RADIOACTIVE WASTE IN METAL MATRIX. Terasawa, M.; Ozaki, S.; Mawatari, K.; Shinya, K.; Kamei, H. (Toshiba Corp., Kawasaki, Kanagawa (Japan). Research and Development Center). pp 131-132 of Dai-ni-kai shinpojiumu; ion-gen to sono oyo. Tokyo, Japan; Institute of Electrical Engineers of Japan (1978).

From 2. symposium on ion sources and application technology; Tokyo, Japan (16 Feb 1978).

1344 KRYPTON-85 ABSORPTION AND DESORPTION IN DIFFERENT LIQUIDS. Butkus, D.V.; Styro, B.I. pp 27-31 of Chemical and radioactive pollution of the atmosphere and hydrosphere. V. 4. Atmospheric physics. Styro, B.I. (ed.). Vil'nyus; Mokslas (1978). (In Russian)

The results of the experiment on the ^{85}Kr absorption and desorption in distilled water, toluene and kerosene as well as in the mixture of coal (1.25% by weight) with the liquids are given. The scheme of the experiment is presented. The best absorbent among the materials investigated is found to be the mixture of BAU type coal aerosol particles (0.4-2 mkm in diameter) with kerosene. The highest desorption rate is observed in kerosene and the lowest one - in the distilled water. A conclusion is drawn that ^{85}Kr is absorbed by different liquids and is in dynamic equilibrium with the concentration in the air. The quantity of absorbed ^{85}Kr depends on chemical content of the liquid as well as on its purity.

1345 RUBIDIUM RB AND CESIUM CS. Busev, A.I.; Tiptsova, V.G.; Ivanov, V.M. pp 47-56 of Rukovodstvo po analiticheskoj khimii redkikh ehlementov. Moscow, USSR; Khimiya (1978). (In Russian)

Methods for determining cesium in the presence of rubidium and ions of other alkaline metals are summarized. It is suggested to determine cesium by way of extraction with solutions of 2-thenoyltrifluoroacetone in nitromethane or nitrobenzene at pH=8.7-9.0. The method is recommended for separating cesium from uranium fission products in the production of highly active preparations of ^{137}Cs and for separating Cs from the effluents produced by reprocessing of nuclear fuel, prior to their burial. In this way, 99.5% of cesium can be extracted. Also suggested is a titrametric method of determining Cs in pollucite, i.e. aluminium-cesium silicate. The technique is based on the ability of cadmium hexacyanoferrate to quantitatively exchange Cd ions with Cs ions. Cs is determined from the amount of cadmium titrated with a $K_4[Fe(CN)_6]$ solution. The determination is hindered by Rb, Cu, Zn, Fe, K ions and not hindered by Na, Mg, Ca, Al ions. According to still another method, $>=10^{-3}$% Cs can be determined by flame photometry with respect to the 852.1 nm line in a low-temperature flame (a mixture of illuminating gas with air).

1346 APPLICATION OF ION EXCHANGERS WITH CROWN ETHERS AS ANCHOR GROUPS IN ANALYTICAL AND PREPARATIVE CHEMISTRY. Blasius, E.; Janzen, K.P.; Luxenburger, H.; Nguyen, V.B.; Klotz, H.; Stockemer, J. (Universitaet des Saarlandes, Saarbruecken (Germany, F.R.). Inst. fuer Analytische Chemie und Radiochemie). pp P63-P81 of Chromatography 1978. Schomburg, G.; Rohrschneider, L. (eds.). Amsterdam, Netherlands; Elsevier (1978).

From 12. international symposium on chromatography; Baden-Baden, F.R. Germany (25 Sep 1978).

A number of exchangers with cyclic polyethers as anchor groups is prepared by condensation, substitution and polymerisation reactions. The exchangers show high resistance to chemicals, temperatures and radiolyses. The selectivity for different salts depends on the cation, anion, solvent and size of the ring as well as on the type and basicity of the heteroatom (O, N, S). In analytical chemistry the new exchangers have a very extensive field of application. The preparative application of the exchangers includes salt conversions and the activation of anions for organic syntheses. A number of reactions can be carried out or improved in anhydrous solutions with the help of the exchangers. They can easily be recovered by filtration and the solvent is not contaminated. Just as the exchanger with dibenzo-24-crown-8 as anchor group, adducts of the crown ether with dodecaolybdatophosphoric acid are suitable for the extraction of ^{137}Cs

from medium-active waste solutions. Liquid exchangers are also used to separate ^{137}Cs from medium-active waste solutions.

1347 RADIATION SHIELD INTEGRITY TESTING AT THE NEW WASTE CALCINING FACILITY. Henry, R.N.; Olson, N.C. (Idaho Chemical Corp., Idaho Falls (USA)). pp 235-241 of Radiation protection in nuclear power plants and the fuel cycle. Vol. 1. London; British Nuclear Energy Society (1978).

From Conference on radiation protection in nuclear power plants and the fuel cycle; Bristol, UK (27 Nov 1978).

A New Waste Calcining Facility for processing high-level liquid radioactive waste is being built at the Idaho National Engineering Laboratory. The integrity of the facility's radiation shielding is being tested prior to 'hot' operations. A two phase program consisting of spot and large area surveys was developed and applied to the testing. Phase I testing has identified several shield deficiencies. Some work on phase II has begun.

1348 EFFECT OF GAMMA RADIATION ON YIELDS OF METHANE GAS FROM THE ANAEROBIC BACTERIAL DIGESTION OF SEWAGE SLUDGE. Guerrero, J. (ed.). Golden, CO; Colorado School of Mines Publications Department (1978). 33p. (NP--25149). Colorado Energy Research Inst., 2221 East Street, Golden, CO.

Anaerobic digestion is widely employed to degrade soluble and insoluble organic materials in sewage sludge into the gaseous products carbon dioxide and methane. Previous research has established that gamma radiation at sufficiently high dose levels sterilizes the irradiated material and interacts with high molecular weight organic substrates to produce crosslinking or degradation, or both. Considering the increased scarcity and price of natural gas, investigators in this preliminary research program explored the interaction of two wastes, sewage sludge and spent nuclear fuel rods, to determine if a combination of processes could increase the yield or production rate of gas from sewage sludge. The study was designed to determine enhancement of methane production when radiation was used in conjunction with microbial action. Several conclusions can be stated as a result of the experiments in this research program. Treatment of anaerobically digested sewage sludge with gamma radiation from a cobalt 60 source for 24 hours at a dose of approximately 0.4 M rad per hour produces very little methane from direct scission of the organic material in the sludge. Sludge suspensions treated with the same radiation dose in the presence of excess oxygen consistently increased gas yield, up to 50%, from anaerobic bacterial digestion. Gas production increased up to 16% when air dried sludge was treated in an air atmosphere. When sludge suspensions were treated with a restricted access to air, decreases in gas production, though small (up to 26%), were noted in every case.

1349 SAFE ENCAPSULATION OF NUCLEAR FUEL WASTE. ASEA PLANT SOON IN FULL SCALE PRODUCTION. Ingenioer-nytt ; 13: No. 104, 1, 4, 15(30 Dec 1977). (In Norwegian).

Some details are given of the processing of spent fuel elements for final disposal, in a plant nearing completion. It is expected that the plant will be ready to demonstrate the process in 1978. Of the three methods previously described, that in which unreprocessed spent fuel elements are encapsulated is that concentrated on. The fuel pins are placed in flat stainless steel tubes and rolled into discs which are packed in a container. This container is placed in an outer container of aluminium oxide and the whole isostatically compressed at 900-1300°C, to corundum.

1350 METHOD TO PROCESS THE AMMONIUM NITRATE OCCURING IN THE MANUFACTURE OF FUELS OR BREEDER MATERIALS FOR NUCLEAR REACTORS. Morschl, P.; Zimmer, E. (to Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,617,968/A/. 3 Nov 1977. 8p. (In German).

The ammonium nitrate occuring in the manufacture of nuclear fuels is radioactively contaminated; it is thus necessary to subject it to special processing. According to the invention, the NH_4NO_3-containing solution is mixed with a basic metal oxide or hydroxide at about 100°C, the ammonia formed is evaporated off and the nitrate solution is dried. The solid metal nitrate is thermally decomposed to metal oxide and nitrogen oxide. The thus obtained compounds can be used again in the manufacture of nuclear fuels.

1351 METHOD TO SOLIDIFY WASTE MATERIALS SUCH AS AQUEOUS SOLUTIONS CONTAINING RADIOACTIVE OR TOXIC SUBSTANCES. Knieper, J.; Printz, H.; May, K. (to Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,559,724/A/. 27 Oct 1977. 7p. (In German).

A method is proposed to solidify aqueous solutions containing radioactive or toxic substances. The aqueous solution which may also be strongly acidic or basic, is mixed with gypsum and water glass (1kg gypsum : 100 to 500ml water glass) and poured into a container for solidification. One example on a laboratory scale is given.

1352 VITRIFICATION PROCESS OF WASTES CONTAINING RADIOACTIVE SUBSTANCES. Bjorklund, W.J.; MacElroy, J.L.; Mendel, J.E. (to Exxon Nuclear Co., Inc., Richland, WA (USA)). French Patent 2,371,046/A/. 19 Oct 1977. Priority date 10 Nov 1976, United States of America (USA), 10p. (In French).

A process is described for the vitrification of wastes containing radioactive substances. A heated bed is created of particles forming glass in a reactor, a gaseous agent is used to fluidise the bed; the waste matter containing radioactive substances in the fluidised bed is sprayed so that the metals and fission products in the waste are calcinated on the particles of the substance forming the bed and the remaining part of the waste is vaporised. The particles forming glass and the calcinated wastes are then removed from the reactor.

1353 METHOD AND EQUIPMENT TO PREPARE AQUEOUS RADIOACTIVE WASTE FOR NON-POLLUTING AND SAFE HANDLING, TRANSPORT, AND FINAL STORAGE. Drobnik, S.; Hild, W.; Kaufmann, F.; Koschorke, H. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,609,299/A/. 15 Sep 1977. 15p. (In German).

A system is proposed which allows the joint execution of the process steps of denitration, drying and calcination necessary for the treatment of radioactive waste and the subsequent injection of superheated water vapor into the reaction chamber so as to also clean

the offgases produced and discharge them from the facility through a filter system without polluting the environment. Several design variants are described which mainly relate to the arrangement of the spray nozzle and its environment. The vitrified radioactive materials are then put into repositories.

1354 METHOD AND EQUIPMENT FOR THE DRY PROCESSING OF URANIUM DIOXIDE NUCLEAR FUEL WASTES. Pirk, H.; Roepenack, H.; Goeldner, U. (to Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 1,667,851/C/. 1 Sep 1977. 5p. (In German).

The patent deals with the dry reprocessing of scrap wastes occuring in the manufacture of ceramic sinter bodies of uranium dioxide to be used as nuclear fuel. One obtains by oxidation at 350-500°C a very pure, fine U_3O_8 powder if during the oxidation process one vibrationally sieves it. A suitable equipment is described.

1355 USE OF ELECTROCOAGULATION TECHNIQUE IN WASTE DISPOSAL. Napravnik, J. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Nukleon ; No. 3, 45(Sep 1977). (In Czech).

ELECTRODES;FISSION PRODUCTS;FLOCCULATION; LIQUID WASTES;LOW-LEVEL RADIOACTIVE WASTES; RADIOACTIVE WASTE PROCESSING;SUSPENSIONS

1356 REMOVAL OF RADIOACTIVE WASTE DURING IN-SITU LEACHING OF URANIUM. Learmont, R.P. (to USS Engineers and Consultants, Inc., Pittsburgh, PA (USA)). Australian Patent 77/28,001/A/. 17 Aug 1977. vp.

In the process for the in-situ leaching of mineral values from an underground formation, wherein an aqueous solution of a leaching agent is delivered to the formation through an injection well, the solution remains in contact with the formation for a period of time sufficient to effect the solubilization of the mineral values, but the contact also effects the solubilization of undesirable mineral values including radium ion containing radioactive waste. An improved process is described for abating the contamination and minimizing the problem of waste disposal, which comprises passing the solution through a sand pack, the graded size pack containing a graded size fraction of a barium containing ion exchange material in an amount sufficient to decrease the radium-ion concentration of said pregnant solution to a level which is no greater than 0.1 the level of the incoming unexchanged pregnant solution in said formation.

1357 METHOD TO SOLIDIFY AND DISPOSE RADIOACTIVE BORATE-CONTAINING LIQUIDS. Iffland, N.; Isensee, H.J.; Wagner, G.; Witte, H. (to Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,603,116/A/. 11 Aug 1977. 10p. (In German).

A suggestion is made to add quenched lime and cement to solidify radioactive boron-containing solutions. It is advantageous to also add silicic acid or kieselguhr to the cement part; likewise the addition of water glass or phosphoric acid or hydrogen phosphate. The two latter additions increase the solidity of the resulting blocks and accelerate the binding. 4 examples illustrate that the amount of additive is very large. Example 1: 200l solution + 40kg lime + 120kg cement + 40kg water glass.

1358 METHOD TO DISPOSE OF SOLID RADIOACTIVE WASTES. Liehmann, G. (to Deutsche Schachtbau und Tiefbohrgesellschaft m.b.H., Lingen (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,603,916/A/. 4 Aug 1977. 6p. (In German).

Contaminated metallic nuclear reactor components must be divided into handy transportable parts before one can take them to a place of ultimate storage. A suggestion is made to grout these waste products with concrete and to cover them and then to divide the concrete blocks into the required sizes. One thus avoids radiation exposure to the personnel performing this work. The concrete body can be divided by powder flame cutting or powder melt cutting. In order to simplify this procedure, one can add exothermal oxidizable materials such as Al or Fe powder to the concrete.

1359 METHOD FOR THE DISPOSAL OF ESPECIALLY RADIOACTIVE WASTES. (to Siempelkamp Giesserei K.G., Krefeld (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,600,790/A/. 14 Jul 1977. 9p. (In German).

It is proposed to solidify high level radioactive wastes from nuclear power plants in the known way, to fill the parts in a container within a hot cell, and to enclose this container there immediately by means of a shielding shell of sufficient thickness, cast from gray cast iron or cast steel, and to seal the shell gas tight. These shielded containers there are brought into a service-heat power plant as a thermal source of energy, used as an intermediate storage facility for decay as well as for economically utilizing the decay heat produced. This is followed by ultimate storage.

1360 PROCESS FOR PACKAGING FISSION PRODUCTS RESULTING FROM REPROCESSING BY DRY METHODS. Blum, Jacques; Verot, J.L. (to Compagnie de Produits Chimiques et Electrometallurgiques Pechiney-Ugine Kuhlmann, 75 - Paris (France)). French Patent 2,395,573/A/. 24 Jun 1977. 5p. (In French).

A process is described for packaging fission products obtained by the dry method with a view to making a resulting product that offers great innocuousness with respect to the environment, the characteristic being that a mix is made comprising a major proportion of a zeolite of formula $nSiO_2$, mAl_2O_3, MO, zH_2O and a minor proportion of processed primary fission products; this mix is brought to its melting temperature at an appropriate temperature rise rate, this temperature being maintained until a homogeneous phase is obtained, after which it is allowed to cool.

1361 BITUMINIZATION OF BIOLOGICALLY HARMFUL WASTES. Freund, M.; Magyar, M.; Mozes, G.; Csikos, R.; Kristof, M.; Toth, L.; Hima, G. Czech Patent 169,880/B/. 15 Jun 1977. 6p. (In Czech).

The invention claims the bitumenization of biologically harmful wastes, such as industrial wastes containing radioactive materials. These wastes containing water are transported from sludge basins, this either by gravity or by mechanical stirring, into a suitably adapted absorption zone or to several parallel zones filled with bitumen heated to 100 to 250 degC. An inert gas is forced into the system foaming the zone contents. The foam phase is decomposed by the action of heat while water is evaporated

and condensed. Bitumen containing dry matter of the radioactive wastes is discharged from the bottom part of the absorption zone and stored in a tank.

1362 CONVERSION OF RADIOACTIVE CYANIDE COMPOUNDS. Schulz, W.W.; Dressen, A.L. (to Energy Research and Development Administration, Washington, DC (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,652,858/A/. 2 Jun 1977. 11p. (In German).

The invention deals with the conversion of radioactive ferrocyanide compounds into practically insoluble glass. Cs^{137} is one of the fission products obtained during the chemical reprocessing of nuclear fuel. It is extremely radioactive and is therefore separated from lower-activity components. This is done by precipitation from alkali solutions by adding potassium ferrocyanide. A caesium-containing ferrocyanide precipitate is obtained which is nearly insoluble but not completely and must therefore be converted into an insoluble product for ultimate storage. According to the invention, the ferrocyanide precipitate is therefore converted into hard-to-dissolve glass by melting the ferrocyanide with sodium carbonate and a mixture of a) basalt and boron trioxide, or b) silicon dioxide and lime. The fine-grained components are mixed in the dry state and melted at 1250 - 1350°C. The batch may contain 10-30% of the ferrocyanide.

1363 ORGANIC WASTE PROCESS CONTAINING AT LEAST ONE RADIOACTIVE ELEMENT. Le Roy, F. (to Rockwell International Corp., El Segundo, CA (USA)). French Patent 2,350,668/A/. 26 Apr 1977. Priority date 3 May 1976, United States of America (USA), 21p. (In French).

The description is given of an organic waste process containing at least one element from the group comprising strontium, cesium, iodine and ruthenium. It comprises the introduction of the organic waste and gaseous oxygen in a bath of melted salt containing an alkaline carbonate, the bath being maintained at a high temperature between 400 and 1000°C and at a pressure of 0.5 to 10 bars, so that the organic waste is burnt and oxidised at least partly, the element selected being retained by the bath of melted salt.

1364 STORAGE PREPARATION PROCESS OF FRACTIONATED SOLID MATERIALS. Archer, J. (to Novatome Industries, 92 - Le Plessis-Robinson (France)). French Patent 2,388,379/E/. 18 Apr 1977. 8p. (In French).

Encasing fractionated solid materials in a cylindrincal metal container, by vibration in finite length tubes with leaktight side walls and both ends sealed by seaming and welding; compacting these fractionated solid materials in their cylindrical metal containers by extrusions, flattening, etc. Placing the product thereby obtained in a continuous medium.

1365 METHOD AND EQUIPMENT FOR EVAPORATION BELOW BOILING POINT AND FINAL STORAGE OF LIQUID RADIOACTIVE WASTES. Szivos, K.; Lovass, G.; Liptak, L.; Hirling, J.; Pavlik, O. Czech Patent 168,687/B/. 15 Apr 1977. 8p. (In Czech).

Liquid radioactive waste is evaporated on the storage site by a flowing gas medium (air, nitrogen) at a pressure of 0.5 to 1.5 at transporting heat and steam. The medium flows in a closed circuit. Steam is blown into the medium condensing with the medium vapour. Following concentration the radioactive waste is wrapped with self-hardening watertight material, eg., bitumen. Radioactive waste concentration proceeds in a jacketed tank where the space between the two tank walls is filled with watertight material.

1366 PROCESS FOR DECONTAMINATING A RADIOACTIVE EFFLUENT IN PARTICULAR RUTHENIUM. Berton, Y.; Chauvet, P. (to CEA, 75 - Paris (France)). French Patent 2,379,141/A/. 27 Jan 1977. 11p. (In French).

Process for decontaminating a radioactive effluent containing ruthenium at least. Under this process, in an effluent containing radioactive elements, a certain number of precipitates are formed which exhibit absorbent and/or co-precipitant properties with respect to the radioactive elements contained in the effluent, the precipitates being formed without intermediate phase separation. It is characterised in that a cobalt sulphide precipitate is formed in the effluent to be processed.

1367 PROCESS FOR REDUCING THE VOLUME OF RADIOACTIVE ORGANIC WASTES. Tanaka, H. (to JGC Corp., Tokyo (Japan)). Japanese Patent 1953-88,500/A/. 14 Jan 1977. 3p. (In Japanese).

A process is claimed to reduce the volume of radioactive organic wastes with no generation of SO sub(x) and NO sub(x) by decomposing them with concentrated sulfuric acid and hydrogen peroxide. Method: Upon feeding radioactive organic wastes in a stirrer type reaction vessel containing concentrated sulfuric acid, the radioactive wastes are partially decomposed by the heated concentrated sulfuric acid, and the decomposition is further promoted by the dropwise addition of an aqueous solution of hydrogen peroxide. Carbon dioxide and steam resulting from the chemical decomposition are cooled by cooling water into recovered water. After distillation, it is recycled by way of a cooler and a separator. Gas leaving a cooling adsorption tower is purified in an adsorption tower and then discharged.

1368 METHOD OF PROCESSING RADIOACTIVE WASTES. Hattori, K.; Fujii, M. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1953-85,300/A/. 5 Jan 1977. 4p. (In Japanese).

A method is claimed to attain a more complete processing for radioactive wastes by settling radioactive waste-containing cement in a cleaning can after being cleaned with a mixer settler by effectively utilizing the settling nature of the cement. After mixing radioactive wastes, water and solidifying agent in a solidification can using a mixer, the stirring vanes of the mixer are pulled out from the solidification can and then transferred to a cleaning can. When the cement is settled and accumulated to a predetermined amount in the cleaning can by repeatedly cleaning the stirring vanes for required number of times in the cleaning can, the supernatant liquid is sucked up by a sucker to a metering tank for addition water, which is reused as cement solidification water. The cement slurry in the cleaning can is further incorporated with cement and solidified in the cleaning can. Then, the can is capped for disposal.

1369 PROCESSING RADIOACTIVE WASTES FROM NUCLEAR POWER PLANTS IN CZECHOSLOVAKIA. Seliga, M. Spravodajstvo SEP ; 3: No. 2, 26-29(1977). (In Slovak).

In view of the high population density of

Czechoslovakia and the country's lack of big rivers, salt mines or other geologic formations suitable for permanent storage of radioactive wastes, wastes from nuclear power plants should be treated prior to their permanent disposal and long-term storage; of radioactive wastes in liquid form should thus be excluded. Cementation and bituminization processes are envisaged for liquid radioactive waste fixation. Suitable sites were found for permanent storage of solidified radioactive wastes. Their nature will be that of regional storage sites. Currently, feasibility studies are under way for first regional storage sites for the A-1, V-1 and V-2 nuclear power plants.

1370 FILTERS USED IN THE PROCESSING OF RADIOACTIVE FLUIDS. French Patent 2,333,329/A/. 25 Nov 1976. Priority date 25 Nov 1975, Spain, 15p. (In French).

The description is given of an improvement to the filters used in the processing of radioactive fluids and comprising interchangeable filtering elements. In the proposed installation, the exposure to radiation of the personnel in charge of handling during the changing of the filtering element is made very weak and the cost of these operations is reduced. The filter is of the type comprising a casing containing the filter element, a lid, and it is housed inside an anti-radiation protection chamber, provided with access openings in the form of anti-radiation protection doors or slabs; one of these openings faces the filter. The lid of the filter case, which forms a hermetic seal by means of seals or screws, includes an anti-radiation protection which is integral with it and has an appropriate shape to fit into the opening of the protection chamber that faces the filter, to act as cover or closure slab for this opening and to serve as upper part to ensure the hermetic closure of the upper part of a bell used as anti-radiation protection during the extraction of the filter element and to serve as cover for the protective transport case for the filter element.

1371 PULVERULENT BODY CHANGE-OVER DEVICE IN RADIOACTIVE WASTE PROCESSING FACILITIES. Akiyama, K.; Kawagoe, T.; Tadokoro, M. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1953-65,600/A/. 22 Nov 1976. 5p. (In Japanese).

A pulverulent body change-over device is described which selectively switches and feeds the pulverulent body to granulating means or reproduction line in compliance with the moisture content in the pulverulent body supplied from drying means, wherein its reliability is increased and a safe and precise waste liquid capacity decreasing and solidifying treatment is possible. After the waste liquid has been concentrated, it is made into a pulverulent body by a drier and reaches a hopper where the moisture content is detected by neutron at a moisture detector. When the percentage of the moisture content has been detected to be less than 3%, a change-over motor is driven to rotate a main change-over structure, and as a result, the first path of the main change-over structure communicates with a granulating machine and the pulverulent body is sent to the granulating line. On the other hand, when the percentage of the moisture content exceeds 3%, the second path of the main change-over structure communicates with the reproduction line and the flow of the pulverulent body is changed over to the reproduction line.

1372 DEVICE FOR PROCESSING RADIOACTIVE LIQUID WASTE. Some, E.; Hashimoto, T. (to Japan Steel Works Ltd., Tokyo). Japanese Patent 1953-64,200/A/. 18 Nov 1976. 2p. (In Japanese).

A device is provided for processing a radioactive liquid waste, wherein, in a bitumen treatment of middle and low level waste, a port for feeding waste liquid is provided at a position closer to the discharge port side than a port for feeding asphalt thereby to prevent the liquid waste from counterflowing in the direction of the ground sealed part and leaking therefrom. Radioactive waste water is fed in the feeding portion cylinder through the feed port closer to the discharge port side, and asphalt for solidifying is fed through the feed port disposed farther from the discharge port side. By the rotation of a screw shaft both waste liquid and asphalt are pushed forward in the direction of the discharge port while being mixed with each other, and the mixing and dehydration operations are carried out in the dehydration and extrusion part cylinder. The water content is evaporated and taken up through a vent hole, and bitumen containing radioactive salts is exhausted out of the discharge port. The solidified bitumen is put in an adequate vessel and thrown away in the seawater.

1373 METHOD FOR SOLIDIFYING AND DISPOSING RADIOACTIVE LIQUID WASTE. Nakayama, Y.; Matsumoto, K.; Kamiyama, H.; Takiguchi, Y.; Irie, H. (to Nippon Atomic Industry Group Co. Ltd., Tokyo). Japanese Patent 1953-62,100/A/. 15 Nov 1976. 4p. (In Japanese).

A method is claimed to store solid waste, which has been obtained by vaporizing and drying radioactive waste, in the form of a stable solidified body, and to re-use separated water. Constitution: Enriched liquid waste, waste resin and sludge are respectively stored in a storage tank, after which they are fed into an adjusting tank at the rate suitably determined. The thus adjusted liquid waste is extracted by a pump and fed to a vertical-type film scraper and dryer to subject to heating, vaporizing and drying. The vaporized steam is formed into condensed water by means of a condenser and recovered into a sample tank for re-use. On the other hand, dried powder is fed to a powder storage tank until it reached a predetermined level of quantity, after which they are fed to a cement, asphalt or plastic solidifying device. Slurry-like material not sufficiently dried and washing water of dryer are collected tin a drain tank, and they are re-dried by the adjusting tank through the pump or returned to the waste disposal system.

1374 DEVICE FOR RADIOACTIVE WASTES PROCESSING. Wase, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1953-60,499/A/. 10 Nov 1976. 3p. (In Japanese).

A device for radioactive waste disposal comprises a dryer for forming radioactive liquid waste into powdery material, a hopper through which the powdery material is guided and having means for measuring water contents within said powdery material, a granulator to which said powdery material having a predetermined percentage of water content within said hopper, and means for preventing said powdery material having water contents in excess of the predetermined percentage of water content from being guided into said granulator. Said dryer, said preventing means, said hopper and said granulator are arranged on a vertical line.

1375 CLEANING PROCESS FOR SOLIDIFICATION APPARATUS OF RADIOACTIVE LIQUID WASTE. Hirano, M.; Horiuchi, S. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1953-56,500/A/. 1 Nov 1976. 4p. (In Japanese).

A process is claimed to facilitate the maintenance of solidifying equipment for drying radioactive liquid waste and rendering it into solid by granulation by arranging such that when the water content of the powder before granulation is not a predetermined water content, rinsing liquid is forced into the powder to permit the powder to be readily excluded from the system. Radioactive liquid wastes mainly composed of Na_2SO_4 produced in a nuclear power plant are dried by a centrifugal thin film drier and is rendered into powder. The powder thus produced is stored in a hopper, and the water content of the powder within the hopper is measured by batch measurement. When the water content of the powder is within a predetermined range, the powder within the hopper is supplied to a granulating machine and rendered into granules, which are then charged into a drum can. When the water content of the powder is outside the predetermined range, rinsing liquid such as hot water is forced into a hopper from below to dissolve the powder. In this way, the powder is efficiently rendered into granules with the water content held within a predetermined range.

1376 PROCESS FOR THE STORAGE PREPARATION OF FRACTIONISED SOLID MATERIALS. Archer, Jacques. (to Novatome Industries, 92 - Le Plessis-Robinson (France)). French Patent 2,353,117/A/. 25 May 1976. 7p. (In French).

A process is described for the storage preparation of fractionated nuclear materials; it comprises the three following operations: wrapping the materials in a metal cylindrical envelope and then welding it, draw the envelope and place the wire obtained in a continuous environment. The two first operations at least are carried out automatically in an enclosure separate from the outside environment. The nuclear materials wrapped in this manner are wound into coils.

1377 RADIOACTIVE WASTE PROCESSING. Curtiss, D.H.; Heacock, H.W. (to United Nuclear Industries, Inc., Richland, WA (USA)). French Patent 2,349,194/A/. 20 Apr 1976. 7p. (In French).

The description is given of a process for treating radioactive waste whereby a mud of radioactive waste and cementing material is formed in a mixer. This mud is then transferred from the mixer to a storage and transport container where it is allowed to harden. To improve transport efficiency an alkali silicate or an alkaline-earth metal silicate is added to the mud. For one hundred parts by weight of radioactive waste in the mud, twenty to one hundred parts by weight of cementing material are added and five to fifty parts by weight of silicate, the amount of waste in the mud exceeding the combined amount of cementing and silicate material.

1378 ORGANIC BOND FOR RADIOACTIVE WASTES. Volkova, O.I.; Zakharova, K.P.; Kopylov, E.B.; Neroda, A.A. USSR Patent 556,665/A/. 19 Mar 1976. 2p. (In Russian).

The aim of the invention is to reduce the danger of the environment deterioriation by the radioactive isotopes being produced at a NPP. As an organic binding substance for the radioactive wastes proposed is the application of cubic residue, forming at sublimation of dimethylpereftalate (DMT) in the evaporation chamber (EC) at the ratio of dry residue of radioactive wastes in DMT from 2:3 up to 3:2. The process goes at 140-160 deg and may go in the apparatus for bitumization. The DMT (EC) application permits to increase the per cent of filling that reduces the usage of the binding substance in one and a half times and decreases the volume of expensive storages of radioactive wastes, and permits to decrease the price of the waste solidification process in 11 times in accordance with bitumization and to improve waterproofness of solidified radioactive wastes.

1379 METHOD OF HANDLING RADIOACTIVE ALKALI METAL WASTE. Wolson, R.D.; McPheeters, C.C. US Patent Application 043,855. [nd]. 21p.

Radioactive alkali metal is mixed with particulate silica in a rotary drum reactor in which the alkali metal is converted to the monoxide during rotation of the reactor to produce particulate silica coated with the alkali metal monoxide suitable as a feed material to make a glass for storing radioactive material. Silica particles, the majority of which pass through a 95 mesh screen or preferably through a 200 mesh screen, are employed in this process, and the preferred weight ratio of silica to alkali metal is 7 to 1 in order to produce a feed material for the final glass product having a silica to alkali metal monoxide ratio of about 5 to 1.

1380 ELECTRIC CONTROLLED AIR INCINERATOR FOR RADIOACTIVE WASTES. Warren, J.H.; Hootman, H.E. US Patent Application 058,420. [nd]. 15p.

A two-stage incinerator is provided which includes a primary combustion chamber and an afterburner chamber for offgases. The latter is formed by a plurality of vertical tubes in combination with associated manifolds which connect the tubes together to form a continuous tortuous path. Electrically-controlled heaters surround the tubes while electrically controlled plate heaters heat the manifolds. A gravity-type ash removal system is located at the bottom of the first afterburner tube while an air mixer is disposed in that same tube just above the outlet from the primary chamber. A ram injector in combination with rotary magazine feeds waste to a horizontal tube forming the primary combustion chamber.

Waste Disposal and Storage

1381 (AD-B--024442/6) BOREHOLE PLUGGING PROGRAM (WASTE DISPOSAL). REPORT 1. INITIAL INVESTIGATIONS AND PRELIMINARY DATA. MISCELLANEOUS PAPER. Boa, J.A. Jr. (Army Engineer Waterways Experiment Station, Vicksburg, MS (USA)). Jan 1978. 39p. NTIS, PC A03/MF A01.

This report covers efforts during the first year of the program. A study was initiated to find competent grouts to be used in stemming boreholes associated with radioactive waste disposal. The grouts must be durable for several thousand years and be essentially impermeable. In addition, the grouts should be pumpable to depths of several thousand feet into environments of high temperature. Grouts for use in both salt and nonsalt formations are to be studied. This program is still underway.

1382 (AECB--1120) RADIOACTIVE WASTE STORAGE AND DISPOSAL: THE CHALLENGE. Prince, A.T. (Atomic Energy Control Board, Ottawa, Ontario

(Canada)). Mar 1978. 18p. NTIS (US Sales Only), PC A02/MF A01.

Solutions to waste management problems are available. After radium is removed, tailings from uranium ores can be disposed of safely in well-designed retention areas. Work is being done on the processing of non-fuel reactor wastes through incineration, reverse osmosis, and evaporation. Spent fuels have been stored safely for years in pools; dry storage in concrete cannisters is being investigated. Ultimate disposal of high-level wastes will be in deep, stable geologic formations.

1383 (AECL--6188-1) RADIOACTIVE WASTE REPOSITORY STUDY. PART 1. (Acres Consulting Services Ltd., Toronto, Ontario (Canada); Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). Nov 1978. 189p. Dep. NTIS (US Sales Only), PC A10/MF A01.

This is the first part of a report of a preliminary study for Atomic Energy of Canada Limited. It considers the requirements for an underground waste repository for the disposal of wastes produced by the Canadian Nuclear Fuel Program. The following topics are discussed with reference to the repository: 1) underground layout, 2) cost estimates, 3) waste handling, 4) retrievability, decommissioning, sealing and monitoring, and 5) research and design engineering requirements.

1384 (AECL--6188-2) RADIOACTIVE WASTE REPOSITORY STUDY. PART 2. (Acres Consulting Services Ltd., Toronto, Ontario (Canada); Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). Nov 1978. 198p. Dep. NTIS (US Sales Only), PC A11/MF A01.

This is the second part of a report of a preliminary study for AECL. It considers the requirements for an underground waste repository for the disposal of wastes produced by the Canadian Nuclear Fuel Program. The following topics are discussed with reference to the repository: 1) geotechnical assessment, 2) hydrogeology and waste containment, 3) thermal loading and 4) rock mechanics.

1385 (AECL--6188-3) RADIOACTIVE WASTE REPOSITORY STUDY. PART 3 (SUMMARY). (Acres Consulting Services Ltd., Toronto, Ontario (Canada); Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). Nov 1978. 20p. Dep. NTIS (US Sales Only), PC A03/MF A01.

This is the third part of a report of a preliminary study for AECL. It summarizes the topics considered in reports AECL-6188-1 and AECL-6188-2 as requirements for an undergpound repository for disposal of wastes produced by the Canadian Nuclear Fuel Program.

1386 (AECL--6308) PRELIMINARY ASSESSMENT OF TEMPERATURE DISTRIBUTIONS ASSOCIATED WITH A RADIOACTIVE WASTE VAULT. Tammemagi, H.Y. (Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). 1978. 46p. Dep. NTIS (US Sales Only), PC A03/MF A01.

The temperature distributions of models which simulated radioactive waste vaults were determined, using a finite difference computer code to solve the transient heat conduction equation. Input parameters to the code included thermal properties for granitic rock and heat generation decay data for wastes that would be separated from CANDU fuel if it were recycled. Due to the preliminary nature of the study, only simple models were analyzed. A disc source was utilized to approximate a one-level repository. Various parmeters were investigated such as depth of disc, thermal properties of rock, and long-term effects. It was shown that, for a vault at 500 m depth with an initial areal heat flux of 31 W/m^2, a maximum temperature increase of about 80°C occurs at the vault level about 30 years after waste emplacement; maximum increases near the earth's surface occur after about 1000 years and are less than 1°C. Modelling the vault by a number of vertical waste boreholes on one horizontal level, instead of by a disc, with the gross areal heat flux again 31 W/m^2, did not cause serious local temperature increases as long as the initial heat generation rate of each container was less than about 750 W. It was also shown that, by using the vertical dimension available in granitic plutons and constructing either multiple-level vaults or very deep boreholes, initial areal heat fluxes greater than 31 W/m^2 can be utilized without exceeding the 80°C maximum temperature increase anywhere in the vault. 14 figures, 8 tables.

1387 (AECL--6353) PROGRESS IN WASTE MANAGEMENT TECHNOLOGY. Hart, R.G. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Aug 1978. 11p. (CONF-7806125--7). Dep. NTIS (US Sales Only), PC A02/MF A01.

From 1978 annual conference of the Canadian Nuclear Association; Ottawa, Canada (11 Jun 1978).

In a previous paper by the same author, emphasis was placed on the role that 'pathways analysis' would play in providing 'beyond reasonable doubt' that a particular method and a particular formation would be suitable for the safe geologic disposal of nuclear wastes. Since that paper was released, pertinent pathways analyses have been published by Bernard Cohen, de Marsily et al., the American Physical Society's Special Study Group on Nuclear Fuel Cycles and Waste Management, and KBS of Sweden. The present paper reviews and analyses the strengths and weaknesses of each of these papers and their implications for the Canadian plan for the geologic disposal of nuclear waste. The conclusion is that the Canadian plan is on the right track and that the disposal of nuclear wastes is not an intractable problem. Indeed the analyses show that several options, each with large safety factors, are likely eventually to be identified.

1388 (AERE-R--8301) MEASUREMENT SYSTEM FOR USE IN THE SELECTION OF PLUTONIUM CONTAMINATED WASTE FOR DISPOSAL. Leake, J.W.; Lambert, K.P.; Warner, M.C. (UKAEA Atomic Energy Research Establishment, Harwell). Apr 1979. 11p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Calculations have been carried out for a total neutron counting system which show that it may be used to sentence for disposal solid waste contaminated with low levels of plutonium of unspecified origin and burn up.

1389 (AERE-R--9343) PRACTICAL ASPECTS OF HEAT TRANSFER IN RADIOACTIVE-WASTE REPOSITORY DESIGN. Deane, J.S.; Hollis, A.A. (UKAEA Atomic Energy Research Establishment, Harwell). Jan 1979. 19p. Dep. NTIS (US Sales Only), PC A02/MF A01; Also available from H.M. Stationery Office, price Pound1.00.

An assessment has been made of the effect on temperature rises of the practical features associated with the disposal of high-level

radioactive wastes in a repository constructed within a granite formation. Encapsulation, the use of a backfill material, and reduction in the axial spacing between blocks to 8m will have little effect on temperature rises. On the other hand thermal conductivity does have a marked effect on the temperature rises in the granite, and there is clear need for the measurement of granite thermal conductivity at selected sites.

1390 (AERE-R--9445) RADIOACTIVE WASTE DISPOSAL BY UKAEA ESTABLISHMENTS DURING 1978 AND ASSOCIATED ENVIRONMENTAL MONITORING RESULTS. Flew, E.M. (UKAEA Atomic Energy Research Establishment, Harwell. Environmental and Medical Sciences Div.). May 1979. 24p. NTIS (US Sales Only), PC A03/MF A01.

This report gives details of the amounts of solid and liquid radioactive waste disposed of by the principal establishments of the UKAEA during 1978. Waste arising at the UKAEA Nuclear Power Development Laboratories at Windscale and Springfields, which are both situated on British Nuclear Fuels Ltd. (BNFL) sites, is disposed of by BNFL and included in their authorisations. Discharges to atmosphere of airborne radioactive waste are also included in the report. A summary of the results of the environmental monitoring programmes carried out in connection with the radioactive waste discharges is given.

1391 (AERE¬R--9518) PREDICTED PEAK TEMPERATURE-RISES AROUND A HIGH-LEVEL RADIOACTIVE WASTE CANISTER EMPLACED IN THE DEEP OCEAN BED. Kipp, K.L. (UKAEA Atomic Energy Research Establishment, Harwell. Chemical Technology Div.). Jun 1978. 20p. NTIS (US Sales Only), PC A03/MF A01.

A simple mathematical model of heat conduction was used to evaluate the peak temperature-rise along the wall of a canister of high-level radioactive waste buried in deep ocean sediment. Three different amounts of vitrified waste, corresponding to standard Harvest, large Harvest, and AVM canisters, and three different waste loadings were studied. Peak temperature-rise was computed for the nine cases as a function of canister geometry and storage time between reprocessing and burial. Lower waste loadings or longer storage times than initially envisaged are necessary to prevent the peak temperature-rise from exceeding 200°C. The use of longer, thinner cylinders only modestly reduces the storage time for a given peak temperature. Effects of stacking of waste canisters and of close-packing were also studied.

1392 (AERE-R--9548) DEVELOPMENT OF A HIGH LEVEL RADIOACTIVE WASTE MANAGEMENT STRATEGY. Beale, H. (UKAEA Atomic Energy Research Establishment, Harwell. Chemical Technology Div.). Nov 1979. 11p. NTIS (US Sales Only), PC A02/MF A01.

The management of high level radioactive waste, from the removal of spent fuel from reactors to final disposal of vitrified waste, involves a complex choice of operational variables which interact one with another. If the various operations are designed and developed in isolation, a suboptimal choice will almost certainly result. Management of highly active waste should therefore be viewed as a complete system and analysed in such a way that account is taken of the interactions between the various operations. This system must have clearly defined and agreed objectives as well as criteria against which performance can be judged. A thorough analysis of the system will provide a framework within which the necessary research and development can be carried out in a co-ordinated fashion and lead to an optimised strategy for managing highly active wastes.

1393 (ALO--0789-T12) TEST RESULTS AND SUPPORTING ANALYSIS OF A NEAR-SURFACE HEATER EXPERIMENT IN THE ELEANA ARGILLITE. McVey, D.F.; Lappin, A.R.; Thomas, R.K. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 21p. Dep. NTIS, PC A02/MF A01.

A preliminary evaluation of the in-situ thermomechanical response of argillite to heating was obtained from a near-surface heater test in the Eleana Formation, at the United States Department of Energy, Nevada Test Site. The experiment consisted of a 3.8 kW, 3-m long x 0.3-m diameter electrical heater in a central hole surrounded by peripheral holes containing instrumentation to measure temperature, gas pressures, and vertical displacement. A thermal model of the experiment agreed well with experimental results; a comparison of measured and predicted temperatures indicates that some nonmodeled vertical transport of water and water vapor occurred near the heater, especially at early times. A mechanical model indicated that contraction of expandable clays in the argillite produced a region 1.5 - 2.0 m in radius, in which opening of preexisting joints occurred as a result of volumetric contraction. Results of thermal and mechanical modeling, laboratory property measurements, experimental temperature measurements, and post-test observations are all self-consistent and provide preliminary information on the in-situ response of argillaceous rocks to the emplacement of heat-producing nuclear waste.

1394 (ANL--78-81) FEASIBILITY OF UNDERGROUND STORAGE/DISPOSAL OF NOBLE GAS FISSION PRODUCTS. Winar, R.M.; Trevorrow, L.E.; Steindler, M.J. (Argonne National Lab., IL (USA)). Aug 1979. Contract W-31-109-ENG-38. 87p. Dep. NTIS, PC A05/MF A01.

The quantities of ^{85}Kr that can be released to the environment from nuclear energy production are to be limited after 1983 by Federal regulations. Although procedures for collecting the ^{85}Kr released in the nuclear fuel cycle have been developed to the point that they are commercially available, procedures for terminal disposal of the collected gas are still being examined for their feasibility. In this work, the possibilities of underground disposal of ^{85}Kr by several techniques were evaluated. It was concluded that (1) disposal of ^{85}Kr as a solution in water or other solvents in deep wells would have the major disadvantages of liquid migration and the requirement of extremely large volumes of solvent; (2) disposal as bubbles entrained in cement grout injected underground presents the uncertainty of gaseous migration through permeable solid grout; (3) disposal by injection into abandoned oil fields would be favored by solubility of krypton in residual hydrocarbons, but has the disadvantages that such fields contain numerous shafts offering avenues of escape and also that the fields may be reworked in the future for their hydrocarbon residues; (4) underground retention of ^{85}Kr injected as a gas may be promising, given the right lithology, through entrapment in interstices between fine sand grains held together by the interfacial tension of wetted surfaces. 9 figures, 5 tables.

1395 (ANL--80-36) STUDIES OF NUCLEAR WASTE

MIGRATION IN GEOLOGIC MEDIA. ANNUAL REPORT, OCTOBER 1978-SEPTEMBER 1979. Seitz, M.G.; Rickert, P.G.; Couture, R.A.; Williams, J.; Meldgin, N.; Fried, S.M.; Friedman, A.M.; Steindler, M.J. (Argonne National Lab., IL (USA)). 1980. Contract W-31-109-ENG-38. 66p. NTIS, PC A04/MF A01.

Experimental results obtained this year confirm the results obtained in previous years - that nuclides migrating by fluid flow in rock often exhibit complex behavior not predicted by simple chromatographic-type models. A phenomenon found previously to lead to complex behavior for leached radionuclides is that the amount of adsorbed nuclide was not proportional to the nuclide concentration in solution (nonlinear adsorption isotherm). For cesium adsorption on limestone and on basalt, nonlinear isotherms were found this year to occur in the range of cesium concentrations in the groundwater of about 10^{-3} to 10^{-9}M. Because cesium concentrations in this range can readily be attained by the leaching of solid waste by groundwater, the effects of nonlinear isotherms are germane to nuclide migration. This dependence of cesium migration on the leached concentration of cesium emphasizes the importance of treating the leaching and migration processes simultaneously such as is done in the leach-migration experiments performed in this work. The existence of nonlinear isotherms precludes the use of a single partition coefficient (K_d) to describe cesium migration at an arbitrary cesium concentration above 10^{-9}M. Nonetheless, nonlinear isotherms can be studied experimentally (e.g., to give K_d as a function of concentration) and effects of nonlinear adsorption can be predicted quantitatively. Comparison of results from column and batch tests indicate that, in addition to nonlinear adsorption, kinetic effects need to be considered in predicting nuclide migration from the partition coefficients measured in batch tests. Results of batch experiments of 2 weeks or longer duration pertained to migration expected only at the very lowest (< 50 m/y) groundwater flow rates of interest.

1396 (ANL/EES-TM--68) REVIEW OF THE NUCLEAR WASTE DISPOSAL PROBLEM. Poch, L.A.; Wolsko, T.D. (Argonne National Lab., IL (USA)). Oct 1979. Contract W-31-109-ENG-38. 18p. Dep. NTIS, PC A02/MF A01.

Regardless of future nuclear policy, a nuclear waste disposal problem does exist and must be dealt with. Even a moratorium on new nuclear plants leaves us with the wastes already in existence and wastes yet to be generated by reactors in operation. Thus, technologies to effectively dispose of our current waste problem must be researched and identified and, then, disposal facilities built. The magnitude of the waste disposal problem is a function of future nuclear policy. There are some waste disposal technologies that are suitable for both forms of HLW (spent fuel and reprocessing wastes), whereas others can be used with only reprocessed wastes. Therefore, the sooner a decision on the future of nuclear power is made the more accurately the magnitude of the waste problem will be known, thereby identifying those technologies that deserve more attention and funding. It is shown that there are risks associated with every disposal technology. One technology may afford a higher isolation potential at the expense of increased transportation risks in comparison to a second technology. Establishing the types of risks we are willing to live with must be resolved before any waste disposal technology can be instituted for widespread commercial use.

1397 (ARH-CD--304) FUNCTIONAL DESIGN CRITERIA: ADDITIONAL HIGH-LEVEL WASTE STORAGE AND HANDLING FACILITIES. Tanaka, K.H. (Atlantic Richfield Hanford Co., Richland, WA (USA)). May 1975. Contract EY-77-C-06-1030. 14p. Dep. NTIS, PC A02/MF A01.

For liquid and slurry wastes. HIGH-LEVEL RADIOACTIVE WASTES;LIQUID WASTES;UNDERGROUND STORAGE;TANKS;HANFORD RESERVATION;PIPES;PUMPS; VENTILATION;QUALITY ASSURANCE;DESIGN; RADIOACTIVE WASTE STORAGE;SEISMIC EFFECTS; SAFETY;REGULATIONS

1398 (ARH-CD--362) FUNCTIONAL DESIGN CRITERIA ADDITIONAL HIGH-LEVEL WASTE STORAGE FACILITIES. Tanaka, K.H. (Energy Research and Development Administration, Richland, WA (USA). Richland Operations Office). 30 Jun 1975. Contract EY-77-C-06-1030. 17p. Dep. NTIS, PC A02/MF A01.

Six one-million-gallon double shell waste storage tanks will be constructed for safe and reliable containment and storage of high-level radioactive wastes. The design and safety features of these tanks are discussed including: architecture; structure; primary and secondary tanks; reinforced concrete tank; tank dome penetrations; processing and transfer facilities; piping; auxiliary equipment; pumps; slurry distributors; and ventilation. (DC)

1399 (ARH-CD--549) FUNCTIONAL DESIGN CRITERIA ADDITIONAL HIGH-LEVEL WASTE HANDLING AND STORAGE FACILITIES. Tanaka, K.H. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 1 Mar 1976. Contract EY-77-C-06-1030. 14p. Dep. NTIS, PC A02/MF A01.

Four one-million-gallon underground tanks will be constructed for safe and reliable containment and storage of high-level radioactive wastes. Transfer facilities and encased, insulated, and heat traced piping will provide transport connections to the existing evaporator-crystallizer and storage tank systems. Flushing facilities and associated utilities will be provided for tank farm operation. The tank, pumping, and ventilation equipment and controls will be provided with instrumentation and alarms. Instrumentation will monitor the waste and facilities to detect high temperatures, waste levels, radiation, and process leakages. Gaseous radioactive containment will be provided by the high efficiency ventilation filtration. The tank farm facilities will provide personnel radiation protection.

1400 (ARH-CD--719) OPERATIONAL SAFETY ANALYSIS REPORT: DOUBLE-SHELL WASTE STORAGE TANKS. Mirabella, J.E.; Willis, N.P. (Atlantic Richfield Hanford Co., Richland, WA (USA)). 20 May 1977. Contract EY-77-C-06-1030. 65p. Dep. NTIS, PC A04/MF A01.

RADIOACTIVE WASTE STORAGE;TANKS;SAFETY; ACCIDENTS;STORAGE FACILITIES;TORNADOES; RADIATION DOSES

1401 (ARH-CD--743-4Q) RADIOACTIVE LIQUID WASTES DISCHARGED TO GROUND IN THE 200 AREAS DURING 1976. Mirabella, J.E. (Atlantic Richfield Hanford Co., Richland, WA (USA)). 9 May 1977. Contract AC06-77RL01030. 229p. NTIS, PC A11/MF A01.

An overall summary is presented giving the radioactive liquid wastes discharged to ground during 1976 and since startup (for both total and decayed depositions) within the Production

and Waste Management Division control zone (200 Area plateau). Overall summaries are also presented for 200 East Area and for 200 West Area. The data contain an estimate of the radioactivity discharged to individual ponds, cribs and specific retention sites within the Production and Waste Management Division during 1976 and from startup through December 31, 1976; an estimate of the decayed activities from startup through 1976; the location and reference drawings of each disposal site; and the usage dates of each disposal site. The estimates for the radioactivity discharged and for decayed activities dicharged from startup through December 31, 1976 are based upon Item 4 of the Bibliography. The volume of liquid discharged to the ponds also includes major nonradioactive streams. The wastes discharged during 1976 to each active disposal site are detailed on a month-to-month basis, along with the monthly maximum concentration and average concentration data. An estimate of the radioactivity discharged to each active site along with the remaining decayed activities is given.

1402 (ARH-CD--745) INPUT AND DECAYED VALUES OF RADIOACTIVE LIQUID WASTES DISCHARGED TO THE GROUND IN THE 200 AREAS THROUGH 1975. Anderson, J.D. (Atlantic Richfield Hanford Co., Richland, WA (USA)). 8 Jul 1976. Contract AC06-77RL01030. 61p. NTIS, PC A04/MF A01.

Low and intermediate level liquid wastes from chemical separations processing of spent reactor fuel elements have been discharged to the ground in the 200-Areas since 1944. Large volumes of process cooling water, normally free of radioactive contaminants, are discharged to surface ditches or natural surface depressions (ponds). Lesser volumes of liquid waste such as steam condensates; process condensates; scavenged process waste supernatants, and plutonium processing wastes have been, or are being discharged to subsurface disposal sites (cribs). Only input volumes and radioactivity discharged to each disposal site have been reported periodically.

1403 (BARC--947) STUDY OF SEEPAGE BENEATH A MODEL WASTE DISPOSAL CRIB. Umesh Chandra; Balu, K.; Nagaraja, S.H.; Panikar, J.T. (Bhabha Atomic Research Centre, Bombay (India)). 1978. 27p. Dep. NTIS (US Sales Only), PC A04/MF A01.

For the proper evaluation of the safety aspects of disposal of radioactive liquid wastes through cribs, it is necessary to know seepage of liquid and total discharge beneath a crib. With this objective in view, seepage of liquid and total discharge beneath a model waste disposal crib has been studied taking into consideration the various parameters, namely, permeability of the subsurface strata; boundaries of the waste disposal site; depth and slope of the rock; water table - its depth, slope and fluctuations; level of liquid wastes in the crib and dimensions of the crib. Three approaches, namely, analytical, numerical and analog model simulations have been followed in the study. Exact analytical solution developed by using Schwarz-Christoffel transformation to compute discharge revealed the significant effect of crib width on discharge. Curves thus obtained are useful in predicting the discharge from a crib. Potential lines and stream lines (flownets) constructed theoretically by solving boundary value problem numerically using the computer code POTAL help in establishing migration route of the pollutants. Numerical results of the flownets compare reasonably well with the experimentally observed plots. Conductive liquid model based on electrical analogy and Hele-Shaw model based on viscous flow analogy were set up in the laboratory experimentally to determine the flow nets and discharge, after simulating the field conditions in the model. The study is, however, more useful in a homogeneous viz., sandy aquifer, as there is a limitation to simulate varying permeability in a heterogeneous strata. Hele-Shaw model study reveals that for a given condition of the initial water table, the slope of the impervious bed has negligible effect on discharge and free surface slopes.

1404 (BNL--26455) STRAIN RELATED RADIATION DAMAGE MEASUREMENTS IN ROCK SALT FOR WASTE DISPOSAL APPLICATIONS. QUARTERLY REPORT, APRIL 1, 1979-JUNE 30, 1979. Swyler, K.J.; Teutonico, L.J.; Levy, P.W. (Brookhaven National Lab., Upton, NY (USA)). 10 Jul 1979. Contract EY-76-C-02-0016. 23p. (ONWI/Sub--78/E511-01000-8). Dep. NTIS, PC A02/MF A01.

Radiation damage in natural rock salt, synthetic NaCl crystals, and other minerals of interest for radioactive waste disposal application was studied. The following topics were covered: (1) temperature dependence of radiation induced F-center formation in rock salt from drill hole AEC-8, (2) temperature dependence of the radiation induced colloid formation in AEC-8 rock salt, (3) thermally induced colloid formation, (4) radiation induced colloid and color-center formation in different regions of non-uniformly colored crystals, (5) comment on differences in colloid formation between natural and synthetic rock salt, and (6) theoretical studies on dislocations in rock salt. (DMC)

1405 (BNL--26555) RECENT RADIATION EFFECT STUDIES ON NATURAL AND SYNTHETIC ROCK SALT FOR WASTE DISPOSAL APPLICATIONS. Swyler, K.J.; Klaffky, R.W.; Levy, P.W. (Brookhaven National Lab., Upton, NY (USA)). 1979. Contract EY-76-C-02-0016. 5p. Dep. NTIS, PC A02/MF A01.

The spectra (F band and colloid band) of irradiated synthetic rock salt were studied. Differences between synthetic and natural salt were found and are discussed. (DLC)

1406 (BNL--26931) STRAIN RELATED RADIATION DAMAGE MEASUREMENTS IN ROCK SALT FOR WASTE DISPOSAL APPLICATIONS. QUARTERLY REPORT, JULY 1-SEPTEMBER 30, 1979. Swyler, K.J.; Teutonico, L.J.; Levy, P.W. (Brookhaven National Lab., Upton, NY (USA)). 10 Oct 1979. Contract EY-76-C-02-0016. 26p. (ONWI/Sub--78/E511-01000-11). Dep. NTIS, PC A03/MF A01.

Radiation damage in natural rock salt, synthetic NaCl crystals, and other minerals of interest for radioactive waste disposal application was studied. The following topics were covered: (1) the role of strain applied prior to irradiation on the radiation-induced defect formation in natural rock salt from Drill Hole AEC-8, (2) studies to determine why synthetic and natural rock salt exhibit different radiation damage characteristics, (3) new yield point measurements on Alt Aussee natural rock salt, and (4) theoretical studies on the role of dislocations in the nucleation of colloidal sodium particles in the irradiated rock salt. (DC)

1407 (BNL--27841) RADIATION DAMAGE MEASUREMENTS ON ROCK SALT AND OTHER MINERALS FOR WASTE DISPOSAL APPLICATIONS. QUARTERLY REPORT, JANUARY 1, 1980-MARCH 31, 1980. Swyler, K.J.; Loman, J.M.; Teutonico, L.J.;

Elgort, G.E.; Levy, P.W. (Brookhaven National Lab., Upton, NY (USA)). 10 Apr 1980. Contract AC02-76CH00016. 31p. (ONWI/Sub--78/E511-01000-17). NTIS, PC A03/MF A01.

Different aspects of radiation damage in both synthetic NaCl crystals and various natural rock salt samples as well as granite, basalt and other minerals which will be important for radioactive waste disposal applications are being investigated. The principal means of measuring radiation damage is the determination of F-center concentrations, and the concentration and size of sodium metal colloid particles. Formation of these and other defects during irradiation and the annealing of defects and characterization of other processes occurring after irradiation are being studied as a function of dose rate, total dose, sample temperature during irradiation, strain applied prior to and during irradiation, etc. Measurements are being made on synthetic NaCl and natural rock salt samples from different geological locations, including some potential repository sites. It will be necessary to determine if radiation damage in the minerals from different localities is similar. If non-negligible differences are observed a detailed study must be made for each locality under consideration. Almost all current studies are being made on rock salt but other minerals particularly granite and basalt are being phased into the program. It is now established that radiation damage formation in both natural and synthetic rock salt is strongly dependent on strain. The strain related effects strongly indicate that the damage formation processes and in particular the colloid nucleation processes are related to the strain induced disolcations. A temporary theoretical effort has been started to determine which dislocation related effects are important for radiation damage processes and, most importantly, what dislocation interactions are most likely to create nucleation sites for colloid particles. If these preliminary studies indicate that additional theoretical studies will be useful an effort will be made to have them extended.

1408 (BNL-NUREG--27235) CHARACTERIZATION OF ORGANICS IN LEACHATES FROM LOW-LEVEL RADIOACTIVE WASTE DISPOSAL SITES. Francis, A.J.; Iden, C.R.; Nine, B.; Chang, C. (Brookhaven National Lab., Upton, NY (USA); State Univ. of New York, Stony Brook (USA)). 1979. Contract EY-76-C-02-0016. 18p. (CONF-790602--93). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

Low-level radioactive wastes generated by the nuclear industry, universities, research institutions, and hospitals are disposed of in shallow-land trenches and pits. In 1962 the first commercial disposal site was opened in Beatty, Nevada. Since then, the industry has grown to include three private companies operating six disposal areas located in sparsely populated areas: at Maxey Flats (Morehead), Kentucky; Beatty, Nevada; Sheffield, Illinois; Barnwell, South Carolina; West Valley, New York; and Richland, Washington. Although the facilities are operated by private industry, they are located on public land and are subject to federal and state regulation. Although inventories of the radioactive materials buried in the disposal sites are available, no specific records are kept on the kinds and quantities of organic wastes buried. In general, the organic wastes consist of contaminated paper, packing materials, clothing, plastics, ion-exchange resins, scintillation vials, solvents, chemicals, decontamination fluids, carcasses of experimental animals, and solidification agents. Radionuclides such as ^{14}C, ^{3}H, ^{90}Sr, ^{134} ^{137}Cs, ^{60}Co, ^{241}Am, and ^{238} ^{239} ^{240}Pu have been identified in leachate samples collected from several trenches at Maxey Flats and West Valley. The purpose of this report is to identify some of the organic compounds present in high concentrations in trench leachates at the disposal sites in order to begin to evaluate their effect on radionuclide mobilization and contamination of the environment.

1409 (CEA-R--4937) GEOCHEMICAL ASPECT FOR THE EVALUATIONS OF RADIOELEMENTS TRANSFERS IN SUBTERRANEAN POROUS MEDIA. Rancon, D. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). Oct 1978. 46p. (In French). Dep. NTIS (US Sales Only), PC A03/MF A01.

Radiological safety studies upon radioactivity transfers in soils and subterranean waters need geochemical studies to evaluate the retention of radionuclides by the solid matrix of porous media. The interaction between radionuclides water and substratum allow determination of the retention term in the transfer equation and estimation of relative speeds of the pollutant and the water which carries it. The retention, characterized by the distribution coefficient or by the soption isotherms, can be due to several mechanisms: precipitation, adsorption, ions exchange which have to be determined because they introduce the important concepts of reversibility, irreversible fixation and saturation. Retention is a function of various factors which can have a great influence: temperature, nature and texture of the solid, composition and pH of the solution, presence of complexing agent. This report is illustrated by original examples chosen among well know elements (Cs, Sr) and mainly among less studied elements (Co, Ba, Ra, U, Th, Np, Pu). Recommendations are proposed to make these transfer measurements more realistic and more adapted to the natural conditions of subterranean media.

1410 (CONF-790420--, pp 4-8) MATERIALS ASPECTS OF NUCLEAR WASTE DISPOSAL IN CANADA. Cameron, D.J.; Strathdee, G.G. (Whiteshell Nuclear Research Establishment, Pinawa, Manitoba). May 1979.

From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).

The concept of disposal of nuclear waste in a deep, hard-rock vault raises a number of questions concerning the behavior of materials. The man-made materials under consideration are the waste form, engineered containment, and the buffer and backfill materials. The general approach to developing each of these barriers is presented.

1411 (CONF-790420--, pp 47-51) GLASSY AND CRYSTALLINE HIGH-LEVEL NUCLEAR WASTE FORMS: AN ATTEMPT AT CRITICAL EVALUATION. Lutze, W. (Hahn-Meitner-Institut fuer Kernforschung GmbH, Berlin, Germany). May 1979.

From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).

Pros and cons of glassy and crystalline nuclear waste forms are discussed. An evaluation is given in terms of technological simplicity and safety-relevant product properties, i.e., thermal, chemical, mechanical, and radiation stability, showing that glasses are the first choice and

alternatives are either the backup solution or second-generation products.

1412 (CONF-790420--, pp 66-72) CHARACTERIZATION AND EVALUATION OF MULTIBARRIER NUCLEAR WASTE FORMS. Rusin, J.M.; Lokken, R.O.; Wald, J.W. (Battelle Pacific Northwest Labs., Richland, WA). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Four multibarrier concepts using coatings and metal matrices were developed and demonstrated on a 1-liter scale. The effect of volatility, leachability, and impact resistance on product integrity is discussed. Results of radiation stability tests are also included.

1413 (CONF-790420--, pp 238-242) EVALUATION OF LONG-TERM LEACHING OF BOROSILICATE GLASS IN PURE WATER. Lanza, F.; Parnisari, E. (CEC, Joint Research Centre, Ispra, Italy). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
In order to confirm the validity of the model of the dissolving sphere, a series of tests of leaching of borosilicate glasses has been performed. The leaching rate is followed by measurements of weight loss and analysis of the surface composition. An accumulation at the surface of the less soluble cations is observed.

1414 (CONF-790420--, pp 243-247) DEVELOPMENT OF ALUMINOSILICATE AND BOROSILICATE GLASSES AS MATRICES FOR CANDU HIGH-LEVEL WASTE. Strathdee, G.G.; McIntyre, N.S.; Taylor, P. (Atomic Energy of Canada Ltd., Pinawa, Manitoba). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
This paper covers the results of analyses of two radioactive nepheline syenite glass blocks recovered from in-ground leaching experiments at the Chalk River Nuclear Laboratories. Current research on borosilicate glasses for immobilization of high-level waste is also described.

1415 (CONF-790420--, pp 248-255) LEACHING OF RADIOACTIVE WASTE STORAGE GLASSES. Boult, K.A.; Dalton, J.T.; Hall, A.R.; Hough, A.; Marples, J.A.C. (Atomic Energy Research Establishment, Harwell, England). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Results are reported of leach tests under various conditions on glass compositions proposed for the vitrification of the highly radioactive waste from the reprocessing of Magnox fuel. Among the variables studies are waste composition, glass devitrification, the source and pH of the water, temperature, and radiation dose to the glass.

1416 (CONF-790420--, pp 256-262) CORROSION BEHAVIOR OF ZINC BOROSILICATE SIMULATED NUCLEAR WASTE GLASS. Clark, D.E.; Yen-Bower, E.L.; Hench, L.L. (Univ. of Florida, Gainesville). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The corrosion behavior of a zinc borosilicate glass containing simulated nuclear wastes (SNWG) is evaluated in acidic, neutral, and basic solutions. Auger electron spectroscopy coupled with argon ion milling (AES-IM) and infrared reflection spectroscopy (IRRS) coupled with sequential polishing are used to determine the depth of the leached layers. Leaching rates based on solution analyses are calculated for several species including cesium and strontium. The leaching rates of some species from the glass are at least an order of magnitude greater in acidic than in neutral and basic solutions. Scanning electron microscopy in conjunction with energy dispersive X-ray spectroscopy (SEM-EDS) is used to monitor surface morphological changes that accompany glass corrosion.

1417 (CONF-790420--, pp 263-268) CHEMICAL DURABILITY OF NUCLEAR WASTE GLASSES. Simmons, J.H.; Barkatt, A.; Macedo, P.B.; Pehrsson, P.E.; Simmons, C.J.; Barkatt, A.; Tran, D.C.; Sutter, H.; Saleh, M. (Catholic Univ. of America, Washington, DC). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Test methods are presented for the measurement of chemical durability of glass media proposed for nuclear waste fixation. The release rates of individual components are measured to determine matrix dissolution rates, possible transport of components through the matrix, and the corrosion mechanism. Measurement on a model glass, a borosilicate, and a high-silica glass fixation medium are reported. The extrapolation of short-term laboratory tests to long-time storage is discussed, and the essential parameters for accurate long-term predictions are determined and evaluated.

1418 (CONF-790420--, pp 269-273) CHEMICAL DURABILITY AND CHARACTERIZATION OF NUCLEAR WASTE FORMS IN A HYDROTHERMAL ENVIRONMENT. Braithwaite, J.W.; Johnstone, J.K. (Sandia Labs., Albuquerque, NM). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The chemical durability of a simulated copper borosilicate waste glass and titanate waste ceramic has been studied in hydrothermal environments which could possibly be encountered in a bedded salt or sub-sealed waste isolation repository. The major parameters investigated which affect matrix corrosion and cesium solubilization include solution saturation and equilibrium phenomena, solution composition (especially the Mg^{+2} ion concentration), pH, particle size, temperature, and time.

1419 (CONF-790420--, pp 274-276) HYDROTHERMAL STABILITY OF SPENT FUEL AND HIGH-LEVEL WASTE CERAMICS IN THE GEOLOGIC REPOSITORY ENVIRONMENT. McCarthy, G.J.; White, W.B.; Komarneni, S.; Scheetz, B.E.; Freeborn, W.P.; Smith, D.K. (Pennsylvania State Univ., University Park). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
The stability trends for four simulated waste forms (stent fuel, a reference glass, a supercalcine ceramic) under hydrothermal conditions (100 to 300°C; 400°C for the coated ceramic; 300 bars) with solutions alone and in contact with basalt and shale are summarizd. 2 tables.

1420 (CONF-790420--, pp 277-283)
DEVITRIFICATION AND LEACHING EFFECTS IN HLW GLASS: COMPARISON OF SIMULATED AND FULLY RADIOACTIVE WASTE GLASS. Wald, J.W.; Westsik, J.H. Jr. (Battelle Pacific Northwest Labs., Richland, WA). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
A detailed examination of four fully radioactive nuclear waste glass compositions has been conducted and includes microstructural characterization and leaching behavior. All results have indicated that the fully radioactive glasses are quite stable under the temperature conditions studied, and their behavior can be typified by nonradioactive products of similar compositions. 2 figures, 6 tables.

1421 (CONF-790420--, pp 284-288) LONG-TERM LEACH RATES OF GLASSES CONTAINING ACTUAL WASTE. Wiley, J.R.; LeRoy, J.H. (E.I. du Pont de Nemours and Co., Aiken, SC). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
Leach rates of borosilicate glasses that contained actual Savannah River Plant waste were measured. Leaching was done by water and by buffer solutions of pH 4, 7, and 9. Leach rates were then determined from the amount of ^{137}Cs, ^{90}Sr, and plutonium released into the leach solutions. The cumulative fractions leached were fit to a mathematical model that included leaching by diffusion and glass dissolution. 5 figures, 3 tables.

1422 (CONF-790420--, pp 349-353) IODIDE AND IODATE SODALITES FOR THE LONG-TERM STORAGE OF IODINE-129. Strachan, D.M.; Babad, H. (Rockwell Hanford Operations, Richland, WA). May 1979.
From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).
There exist several proposals for the storage of ^{129}I. None of these propose the use of a mineral with demonstrated geologic stability. The work described in this paper has identified the minerals iodide and iodate sodalites [$Na_8(AlSiO_4)_6I_2/(IO_3)_2$] as good candidates for the long-term storage of ^{129}I. 4 tables.

1423 (CONF-790881--1) MAGNETIC SUSCEPTIBILITY OF SODIUM DISILICATE GLASSES CONTAINING PuO_2. Aldred, A.T. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 12p. Dep. NTIS, PC A02/MF A01.
From 5. university conference on glass science: electrical, magnetic and optical properties of glass; Troy, NY, USA (22 Aug 1979).
A solubility limit of approx. 6 mol % PuO_2 in sodium disilicate ($Na_2O.2SiO_2$) glass has been determined. Magnetic susceptibility measurements on these glasses yield approximate Curie-Weiss behavior, in contrast to the temperature-independent susceptibility of crystalline PuO_2. This result is interpreted to indicate that the local site symmetry around the Pu ion in the sodium disilicate glass is much different than in crystalline PuO_2. The effective paramagnetic moments determined from the temperature dependence of the susceptibility are found to be consistent with calculated free-ion values based on the most likely 5f electron configurations.

1424 (CONF-790938--5) UNITED STATES NATIONAL WASTE TERMINAL STORAGE ARGILLACEOUS ROCK STUDIES. Brunton, G.D. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 6p. Dep. NTIS, PC A02/MF A01.
From Workshop on the use of argillaceous materials for the isolation of radioactive wastes; Paris, France (10 Sep 1979).
The past and present argillaceous rock studies for the US National Waste Terminal Storage Program consist of: (1) evaluation of the geological characteristics of several widespread argillaceous formations in the United States; (2) laboratory studies of the physical and chemical properties of selected argillaceous rock samples; and (3) two full-scale in-situ surface heater experiments that simulate the emplacement of heat-generating radioactive waste in argillaceous rock.

1425 (CONF-790938--6) INVESTIGATION OF THE REGIONAL CHARACTERISTIC OF THE DEVONIAN SHALES FOR THE STORAGE/DISPOSAL OF RADIOACTIVE WASTES. Lomenick, T.F.; Laughon, R.B. (Oak Ridge National Lab., TN (USA); Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). 1979. Contract W-7405-ENG-26. 6p. Dep. NTIS, PC A02/MF A01.
From Workshop on the use of argillaceous materials for the isolation of radioactive wastes; Paris, France (10 Sep 1979).
Devonian-age shales underlie a large portion of the northeastern quadrant of the country and are abundantly thick and relatively near to the land surface within the Appalachian, Illinois and Michigan basins of that area. Although these thick accumulations of argillaceous sediments are best-known for their natural gas production and potential, they would also appear to be good candidate rocks for radioactive waste repositories as the shale is generally impermeable, and therefore, relatively free of circulating ground waters to disperse any waste emplacements.

1426 (CONF-791103--42) SUBSURFACE-MIGRATION STUDIES AT THE RADIOACTIVE WASTE MANAGEMENT COMPLEX, IDAHO. Humphrey, T.G. (EG and G Idaho, Inc., Idaho Falls (USA)). 1979. Contract EY-76-C-07-1570. 16p. Dep. NTIS, PC A02/MF A01.
From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).
Based on core drilling and subpit data, it appears that radionuclide migration has been restricted to a few centimeters below the waste and apparently poses no hazard to the Snake River Plain aquifer. Preliminary results of the modeling study tend to support this conclusion. The model does indicate, however, that some migration to the surface will occur over long periods of time.

1427 (CONF-791103--98) INTERRELATION OF SHORT-TERM LEACH TESTS AND LONG-TERM LEACHING. Compere, E.L.; Godbee, H.W. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 6p. Dep. NTIS, PC A02/MF A01.
From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).
A standard leach test must permit accumulation of sufficient data to determine material parameters, such as figures of merit (FOMs) in a short time. Leach test results should be extended to other sizes, longer times, other temperatures, and other leaching solutions. This paper provides insights into the complexities in interpreting leach tests. (DLC)

1428 (CONF-791112--24) ENVIRONMENTAL EFFECTS FROM DISPOSAL OF DEFENSE HIGH-LEVEL RADIOACTIVE WASTES IN A GENERIC GEOLOGIC REPOSITORY. Chipman, N.; Simpson, G.; Rodger, W.; Frendberg, R.; Lawroski, H. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA); Nuclear Safety Associates, Bethesda, MD (USA)). 1979. Contract EY-76-C-07-1570. 7p. Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

High-level radioactive wastes generated during the reprocessing of defense-related nuclear fuels are presently stored as calcined solids at the Idaho Chemical Processing Plant (ICPP). This method of handling nuclear waste has proved to be both safe and cost effective. However, for permanent disposal, the waste form and/or disposal location may need to be altered. Many plans for nuclear waste management can be advanced; however, the preferered alternatives for the ICPP waste are in these general categories: (1) Continue current operations, (2) Modify the waste form and dispose at the Idaho National Engineering Laboratory (INEL), (3) Modify the waste form and dispose at an off-site geologic repository, (4) Remove actinides from the waste, dispose of the actinide-depleted waste at the INEL, and dispose of the acitinide waste at an off-site geologic repository. The environmental impacts of disposing of the waste at the INEL and transporting it to an off-site repository have been previously reported. The radiological consequences of disposing of the wastes in a generic geologic repository are reported here. The calculations are based on the scenarios used in the preparation of the Draft Environmental Impact Statement; Management of Commerically Generated Radioactive Waste. Calculations were completed for both the calcine and glass waste forms. Calcine will be stabilized by a heating process to remove residual nitrates and/or water; all other properties remain the same. The glass waste form has two sub-options, the actinide fraction of the waste made into a glass, and the calcine made into a glass.

1429 (CONF-791112--28) CONTROL OF RADIONUCLIDE MIGRATION IN SOIL BY THE APPLICATION OF DC ELECTRIC CURRENT. Case, F.N.; Cutshall, N.H. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 5p. Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Shallow land burial in humid regions as a disposal method for low-level solid waste provides the potential for water-driven migration of leachable radionuclides present in the waste. A number of methods to control this migration have been suggested and studied. One such method involves the use of a dc electric current to move ions countercurrent to the water flow. Laboratory studies using trays of soil indigenous to the Oak Ridge National Laboratory (ORNL) low-level burial grounds have shown ^{137}Cs, ^{90}Sr, and ^{99}Tc ions can be moved countercurrent to a water flow using small dc currents of 20 mA at 40 volts. A field test of the method has been under way for over one year in an ORNL low-level waste disposal area. Results of the field test are given in this paper.

1430 (CONF-791112--45) GENERAL CRITERIA FOR RADIOACTIVE WASTE DISPOSAL. Maxey, M.N.; Musgrave, B.C.; Watkins, G.B. (Detroit Univ., MI (USA); Idaho National Engineering Lab., Idaho Falls (USA); New York State Dept. of Health, Albany (USA)). 1979. Contract EY-76-C-07-1570. 6p. Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Techniques are being developed for conversion of radioactive wastes to solids and their placement into repositories. Criteria for such disposal are needed to assure protection of the biosphere. The ALARA (as low as reasonably achievable) principle should be applicable at all times during the disposal period. Radioactive wastes can be categorized into three classes, depending on the activity. Three approaches were developed for judging the adequacy of disposal concepts: acceptable risk, ore body comparison, and three-stage ore body comparison. (DLC)

1431 (CONF-791112--49) RADIOLYTIC OXIDATION AND REDUCTION OF PLUTONIUM. Fried, S.; Friedman, A.; Sullivan, J.C.; Nash, K.; Cohen, D.; Sjoblom, R. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 23p. Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

It has been shown on several occasions that all other things being equal, the rate of migration of plutonium through an aquifer is greatly influenced by its oxidation state. It is a reasonable expectation that other actinides exhibiting multiple oxidation states will behave similarly. By and large the more highly charged ions in solution move through rock strata more slowly than those of lesser charge. Thus for comparative experiments on the relative migration rates of Pu(IV) and Am(III) one would expect Pu(III) to move about 10 times faster than Pu(IV) and it has been shown that PuO_2^{2+} moves about 250 times more rapidly than Pu(IV). Since one of the more important parameters of safety assessment is radionuclide migration rate it can be seen that it becomes important to know the oxidation states of radionuclides (actinides for the purpose of this report) existing in possible leachates from the material originally emplaced in a repository. It was with this in mind that a study of the intrinsic stability of plutonium oxidation states in ground water solutions was undertaken. One of the most prominent proposals for a waste repository in WIPP (Waste Isolation Pilot Project) which intends to utilize bedded salt strata as the isolating medium. Ground water in that context is saturated brine and is made up to specifications issued by Sandia Laboratories and designated as Solution A. The net result of these series of reactions is that plutonium may undergo a cycle of oxidation and reduction. This is a composite effect since it is the sum of radiolytic oxidation and reduction and disproportionation and reproportionation reactions. The period of the cycle must depend on concentration of Pu, radiation field intensity, pH of solution, temperature, and formation of complexes. Thus the migration characteristics of all of the oxidation states of Pu (with the possible exception of Pu(VII) will have to be considered.

1432 (CONF-791112--52) MEASUREMENT OF PENETRATION DEPTHS OF PLUTONIUM AND AMERICIUM IN SEDIMENT FROM THE OCEAN FLOOR. Fried, S.; Friedman, A.; Hines, J.; Sjoblom, R.; Schmitz, G.; Schreiner, F. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 17p. Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

The clay-like sediment covering the ocean floor constitutes the last barrier that shields

the biosphere from contamination by radionuclides stemming from the nuclear wastes of a subseabed repository. In the event of a failure of the engineered barriers the mobility of the released radionuclides in the sediment determines the rate and the extent of entry into the water of the ocean. The initial results of measurements designed to determine the mobility of transuranium elements in sediment from the ocean floor are presented. Data indicate very low migration rates and imply strong chemisorptive interaction with the sediment.

1433 (CONF-791112--58) CHEMICAL REACTIONS IN THE BEDROCK-GROUNDWATER SYSTEM OF IMPORTANCE FOR THE SORPTION OF ACTINIDES. Beall, G.W.; Allard, B.; Krajewski, T.; O'Kelley, G.D. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 7p. Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Most suggested alternatives for deep underground disposal of high-level radioactive wastes rely upon several independent barriers like resistant canister materials, waste forms of low solubility in groundwaters and the use of back-fill material of low permeability and with nuclide retaining capacity. These barriers would retard the eventual release of radionuclides from the repository into the groundwater/bedrock system. The final and the only non-engineered barrier would be the host-rock itself. It would be desirable if the rock alone would be able to retain the long-lived radionuclides coming from the waste for long enough times to allow decay to harmless activity levels before they might reach the biosphere. The biological hazards from high-level reprocessng waste as well as from unreprocessed spent uranium fuel are dominated by the actinides and their daughter products (americium, plutonium, neptunium, thorium, radium) from about three hundred years after discharge from the reactor up to millions of years. In order to allow predictions of the migration of the actinides in the ground, the chemical behavior of these elements in groundwater under environmental conditions and their interactions with geologic media must be studied in detail. In this paper, studies of the sorption of americium (trivalent) and neptunium (pentavalent under oxic conditions) on some major rock-forming minerals of igneous rocks and accessory minerals are reported.

1434 (CONF-800313--1) RISK EVALUATIONS OF TRANSURANIC WASTE AT THE IDAHO NATIONAL ENGINEERING LABORATORY. Smith, T.H.; Keneshea, F.J. (EG and G Idaho, Inc., Idaho Falls (USA); Nuclear Services Corp., Campbell, CA (USA)). 1980. Contract EY-76-C-07-1570. 38p. Dep. NTIS, PC A03/MF A01.

From Waste management conference; Tucson, AZ, USA (10 Mar 1980).

Approximately 75% of the defense low-level transuranic (TRU) waste stored in the United States and 25% of the buried TRU waste is located at the Idaho National Engineering Laboratory (INEL). Studies have been performed to identify and evaluate technical alternatives for the long-term management of this waste. (The alternatives range from leaving the waste in place as is to reviewing, processing, and shipping it to an offsite geological repository.) Among the evalations that have been performed were preliminary risk evaluations. The dose commitment and risk of hypothetical, near-term, accidental or uncontrolled releases of radionuclides have been evaluated for each alternative. The following potential causes of radionuclide release have been studied: process and handling accidents, shipping accidents, natural events (e.g., earthquakes), man-caused events (e.g., airplane crashes), and future intrusion by individuals or small populations after loss of societal control over the waste. The hypothetical releases have been evaluated, in terms of dose commitment and (if pertinent) probability and risk, for all operational steps making up each concept. The dominant scanerios in terms of near-term risk are (1) lava flow up through or over the waste, leading to airbone releases; (2) an explosion or a criticality accident in the waste-processing facility; and (3) a tornado strike or a fire during waste retrieval. The dominant long-term releases are (1) volcanic action; and (2) intrusion of people on the waste site.Although substantial dose commitments to individual members of the public were calculated for the lava flow and intrusion scenarios, no prompt health effects would be expected from the exposures. The effects would be in the form of a slightly increased likelihood of latent cancer induction.

1435 (CONF-800334--3) ADVANCED BIOLOGICAL TREATMENT OF AQUEOUS EFFLUENT FROM THE NUCLEAR FUEL CYCLE. Pitt, W.W. Jr.; Hancher, C.W.; Patton, B.D.; Shumate, S.E. II. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 15p. Dep. NTIS, PC A02/MF A01.

From 2. DOE environmental control symposium; Reston, VA, USA (17 Mar 1980).

Many of the processing steps in the nuclear fuel cycle generate aqueous effluent streams bearing contaminants that can, because of their chemical or radiological properties, pose an environmental hazard. Concentration of such contaminants must be reduced to acceptable levels before the streams can be discharged to the environment. Two classes of contaminants, nitrates and heavy metals, are addressed in this study. Specific techniques aimed at the removal of nitrates and radioactive heavy metals by biological processes are being developed, tested, and demonstrated. Although cost comparisons between biological processes and current treatment methods will be presented, these comparisons may be misleading because biological processes yield environmentally better end results which are difficult to price. The fluidized-bed biological denitrification process is an environmentally acceptable and economically sound method for the disposal of nonreusable sources of nitrate effluents. A very high denitrification rate can be obtained in a FBR as the result of a high concentration of denitrification bacteria in the bioreactor and the stagewise operation resulting from plug flow in the reactor. The overall denitrification rate in an FBR ranges from 20- to 100-fold greater than that observed for an STR bioreactor. It has been shown that the system can be operated using Ca^{2+}, Na^{+}, or NH_4^{+} cations at nitrate concentrations up to 1 g/liter without inhibition. Biological sorption of uranium and other radionuclides (particularly the actinides) from dilute aqueous waste streams shows considerable promise as a means of recovering these valuable resources and reducing the environmental impact, however, further development efforts are required.

1436 (CONF-800416--1) CHEMICAL TREATMENTS OF SOIL TO DECREASE RADIOSTRONTIUM LEACHABILITY. Spalding, B.P. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 22p. Dep. NTIS, PC A02/MF A01.

From UCC-ND and GAT waste management seminar program; Portsmouth, OH, USA (22 Apr 1980).

The ready leachability of radiostrontium from radioactive waste is one of the most salient problems with shallow-land burial as a disposal method. The continuous leaching of buried waste at the Oak Ridge National Laboratory, for periods up to thirty years, has led to contamination of significant volumes of soil with ^{90}Sr. The goal of the present investigation was to evaluate methods to effect the in situ fixation or decrease the leachability of ^{90}Sr from soil. Small columns of three soils, collected from the solid waste disposal areas at ORNL, were labelled with ^{85}Sr as a convenient tracer for ^{90}Sr. After this labelling but prior to leaching, the soil columns were percolated with equivalent amounts of sodium salt solutions of hydroxide, fluoride, carbonate, phosphate, silicate, or aluminate. Leaching was then initiated with 0.1 N $CaCl_2$ (calcium chloride), and fractions of the leachate were analyzed for ^{85}Sr. The $CaCl_2$ solution was selected to qualitatively simulate groundwater which contains Ca as the dominant dissolved cation. With two soils which were high in indigenous exchangeable Ca, only 30 to 35% of the ^{85}Sr could be leached from the carbonate-treated columns. Presumably, the ^{85}Sr was coprecipitated with the nascent $CaCO_3$ formed during this treatment. In contrast, greater than 98% of the ^{85}Sr was readily leached from all untreated soils. Other anions fixed variable but generally less ^{85}Sr than the carbonate treatment. Thus, sodium carbonate appears to have potential application to immobilize ^{90}Sr in situ in contaminated soil.

1437 (CONF-800607--6) LONG-TERM SUBSURFACE MIGRATION OF RADIONUCLIDES FROM BURIED INEL TRANSURANIC WASTE. Humphrey, T.G.; Smith, T.H. (EG and G Idaho, Inc., Idaho Falls (USA)). 1980. Contract EY-76-C-07-1570. 12p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

Studies have been conducted to project long-term subsurface migration of radionuclides from transuranic (TRU-contaminated solid waste buried at the Idaho National Engineering Laboratory (INEL). Projections are given for several conceptual methods of waste confinement.

1438 (CONF-800607--80) EQUIPMENT DESIGNS FOR THE SPENT LWR FUEL DRY STORAGE DEMONSTRATION. Steffen, R.J.; Kurasch, D.H.; Hardin, R.T.; Schmitten, P.F. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Advanced Energy Systems Div.). 1980. Contract AC08-76NV00597. 41p. NTIS, PC A03/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

In conjunction with the Spent Fuel Handling and Packaging Program (SFHPP) equipment has been designed, fabricated and successfully utilized to demonstrate the packaging and interim dry storage of spent LWR fuel. Surface and near surface storage configurations containing PWR fuel assemblies are currently on test and generating baseline data. Specific areas of hardware design focused upon include storage cell components and the support related equipment associated with encapsulation, leak testing, lag storage, and emplacement operations.

1439 (CONF-800611--1) MANAGEMENT OF ALPHA-CONTAMINATED WASTES AT THE RADIOACTIVE WASTE MANAGEMENT COMPLEX AT THE IDAHO NATIONAL ENGINEERING LABORATORY. McCormack, M.A. (EG and G Idaho, Inc., Idaho Falls (USA)). 1980. Contract EY-76-C-07-1570. 3p. Dep. NTIS, PC A02/MF A01.

From International symposium on the management of alpha-contaminated wastes; Vienna, Austria (2 Jun 1980).

Problems related to above ground storage of radioactive wastes at the Idaho National Engineering Laboratory and steps taken to resolve these difficulties are discussed. The quantity of wastes now in storage and the amount forecasted to be in place by 1985 are disclosed. The condition of containers placed for storage between 1954 and 1970 is described. Programs for retrieval and repackaging for shipment to federal repositories are discussed. (DC)

1440 (CONF-800918--3) REMOVAL OF ACTINIDES FROM NUCLEAR REPROCESSING WASTES: A PILOT PLANT STUDY USING NON-RADIOACTIVE SIMULANTS. Maxey, H.R.; McIsaac, L.D.; Chamberlain, D.B.; McManus, G.J. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). 1980. Contract AC07-76ID01570. 11p. NTIS, PC A02/MF A01.

From International solvent extraction conference; Liege, Belgium (6 Sep 1980).

Nuclear fuel reprocessing wastes generated at the ICPP contain small amounts of actinides, primarily Pu and Am. Removal of these actinides reduces the long term storage hazards of the waste. The development of a flowsheet to remove trivalent actinides is discussed in this paper. Pilot plant studies used actinide simulants. As a result of these studies, the Height of a Transfer Unit (HTU) was selected as the better measure of pulse column separation efficiency.

1441 (CONF-800987--1) LEACHING PROPERTIES AND CHEMICAL COMPOSITIONS OF CALCINES PRODUCED AT THE IDAHO CHEMICAL PROCESSING PLANT. Staples, B.A.; Paige, B.E.; Rhodes, D.W.; Wilding, M.W. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). 1980. Contract AC07-79ID01675. 18p. NTIS, PC A02/MF A01.

From Workshop on comparative leaching behavior of radioactive waste forms; Argonne, IL, USA (3 Sep 1980).

No significant chemical differences were determined between retrieved and fresh calcine based on chemical and spectrochemical analyses. Little can be derived from the amounts of the radioisotopes present in the retrieved calcine samples other than the ratios of strontium-90 to cesium-137 are typical of aged fission product. The variations in concentrations of radionuclides within the composite samples of each bin also reflect the differences in compositions of waste solutions calcined. In general the leaching characteristics of both calcines by distilled water are similar. In both materials the radionuclides of cesium and strontium were selectively leached at significant rates, although cesium leached much more completely from the alumina calcine than from the zirconia calcine. Cesium and strontium are probably contained in both calcines as nitrate salts and also as fluoride salts in zirconia calcine, all of which are at least slightly soluble in water. Radionuclides of cerium, ruthenium, and plutonium in both calcines were highly resistant to leaching and leached at rates similar to or less than those of the matrix elements. These elements exist as polyvalent metal ions in the waste solutions before calcination and they probably form insoluble oxides and fluorides in the calcine. The relatively slow leaching of nitrate ion from zirconia calcine and radiocesium from both calcines suggests that the calcine matrix in some manner prevents complete or immediate contact of the soluble ions with water. Whether

radiostrontium forms slightly fluoride salts or forms nitrate salts which are protected in the same manner as radiocesium is unknown. Nevertheless, selective leaching of cesium and strontim is retarded in seme manner by the calcine matrix.

1442 (COO--4917-1) LEGAL, POLITICAL, AND INSTITUTIONAL IMPLICATIONS OF THE SEA-BED PROGRAM FOR RADIOACTIVE WASTE DISPOSAL. ANNUAL TECHNICAL PROGRESS REPORT. Doty, P. (Harvard Univ., Cambridge, MA (USA). Center for Science and International Affairs). 19 Apr 1979. Contract EW-78-S-02-4917. 5p. Dep. NTIS, PC A02/MF A01.

Both domestic and international political feasibility studies are being conducted for sub-seabed disposal. (DLC)

1443 (CS-INIS--258, pp 59-69) REDUCING RADIOACTIVE CONTAMINATION BY SORPTION ON IMPREGNATED WATER WORKS SAND. Zacek, L. (Vyzkumny Ustav Vodohospodarsky, Prague (Czechoslovakia)). Sep 1978. (In Czech).

From 9. national conference on radionuclides and ionizing radiation in water management; Liberec, Czechoslovakia (28 Sep 1978).

The feasibility was studied of using a sand filter bed for the deactivation of waste waters. This procedure is mainly suitable for the treatment of water into potable water. The advantage of the method is that it allows partial regeneration of the sand fill. Results of pilot plant trials show that the effectiveness of the deactivation method depends on the composition of the sand fill, mainly on the MnO_2 content, and increases with the increased content of this substance. It has also been shown that sands with a higher $CaCO_3$ content are not only less effective but also more difficult to regenerate. The trapping of radium in the sand bed is not even and it was shown that the upper layers have a higher activity than corresponds to computations.

1444 (DOE/EDP--0063) ENVIRONMENTAL DEVELOPMENT PLAN. LWR COMMERCIAL WASTE MANAGEMENT. (Department of Energy, Washington, DC (USA)). Aug 1980. 123p. NTIS, PC A06/MF A01.

This Environmental Development Plan (EDP) identifies the planning and managerial requirements and schedules needed to evaluate and assess the environmental, health and safety (EH and S) aspects of the Commercial Waste Management Program (CWM). Environment is defined in its broadest sense to include environmental, health (occupational and public), safety, socioeconomic, legal and institutional aspects. This plan addresses certain present and potential Federal responsibilities for the storage, treatment, transfer and disposal of radioactive waste materials produced by the nuclear power industry. The handling and disposal of LWR spent fuel and processed high-level waste (in the event reprocessing occurs) are included in this plan. Defense waste management activities, which are addressed in detail in a separate EDP, are considered only to the extent that such activities are common to the commercial waste management program. This EDP addresses three principal elements associated with the disposal of radioactive waste materials from the commercial nuclear power industry, namely Terminal Isolation Research and Development, Spent Fuel Storage and Waste Treatment Technology. The major specific concerns and requirements addressed are assurance that (1) radioactivity will be contained during waste transport, interim storage or while the waste is considered as retrievable from a repository facility, (2) the interim storage facilities will adequately isolate the radioactive material from the biosphere, (3) the terminal isolation facility will isolate the wastes from the biosphere over a time period allowing the radioactivity to decay to innocuous levels, (4) the terminal isolation mode for the waste will abbreviate the need for surveillance and institutional control by future generations, and (5) the public will accept the basic waste management strategy and geographical sites when needed.

1445 (DOE/EIS--0015(Vol.1)) FINAL ENVIRONMENTAL IMPACT STATEMENT: US SPENT FUEL POLICY. EXECUTIVE SUMMARY. (Department of Energy, Washington, DC (USA)). May 1980. 94p. NTIS, PC E03/MF E03.

The analysis of the environmental impacts for storage of domestic fuel shows that the impacts for the full range of alternatives considered are relatively small compared with available resources or background exposure of the population from natural radiation sources. The differences in impacts of storage of domestic fuel are attributed to the amount of fuel stored in Independent Spent Fuel Storage (ISFS) facilities, the storage time, and, to a lesser degree, the differences in spent fuel transportation. The differences between comparable alternatives of implementing the policy or not implementing the policy are small. The difference in impacts of storage of foreign fuel are attributed to the amount of fuel received under the policy and to the disposition mode analyzed. The impact of storage of foreign fuel (a small fraction of the amount of domestic fuel considered) is also small. As a result of the small differences in environmental impacts of all cases considered for foreign fuel, environmental impacts probably will not strongly influence the selection of the case that best meets US nonproliferation goals. Proliferation benefits of the various cases analyzed vary significantly. The structure and level of fee charged for storage of spent fuel will affect the degree of participation in the spent fuel storage program by utilities. However, the range of participation is within the range of alternatives analyzed in the draft EISs on storage of US and foreign fuels, for which the environmental effects were found to be relatively small. The fee computed on the basis of full recovery of government costs should not significantly affect the cost of generating nuclear power.

1446 (DOE/EIS--0015(Vol.2)) FINAL ENVIRONMENTAL IMPACT STATEMENT: US SPENT FUEL POLICY. STORAGE OF US SPENT POWER REACTOR FUEL. (Department of Energy, Washington, DC (USA)). May 1980. 303p. NTIS, PC E05/MF E05.

The activities associated with implementing or not implementing the proposed policy are similar for a given disposition facility startup date, and environmental impacts vary with the amount of fuel received, the number of Interim Spent Fuel Storage (ISFS) facilities required, the storage time, and to a lesser degree to the amount of spent fuel transported. The environmental impacts from all alternatives considered, either from implementing or not implementing the spent fuel storage policy, are small. The decreased resource consumptions and environmental impacts of alternatives that assume reactor discharge basin operation at less than full-core reserve must be balanced against the reduced flexibility in reactor operation and the possibility of forced

shutdowns which could lead to the use of higher-cost substitute power or reduction of electrical power generation. Providing full-core reserve capacity is prudent and economical to avoid reactor outages due to inspections or emergency situations. The impacts for decentralized ISFSs providing full-core reserve are considered the same for either government or private facilities. Nevertheless, utilities have operated without full-core reserve rather than shut down. At-reactor storage increases environmental effects compared with ISFS basin storage because additional storage basins are constructed and operated. However, the impacts are relatively small compared with available resources and risks from natural radiation sources.

1447 (DOE/EIS--0015(Vol.3)) FINAL ENVIRONMENTAL STATEMENT: US SPENT FUEL POLICY. STORAGE OF FOREIGN SPENT POWER REACTOR FUEL. (Department of Energy, Washington, DC (USA)). May 1980. 227p. NTIS, PC E03/MF E03.

In October 1977, the Department of Energy (DOE) announced a Spent Fuel Storage Policy for nuclear power reactors. Under this policy, as approved by the President, US utilities will be given the opportunity to deliver spent fuel to US Government custody in exchange for payment of a fee. The US Government will also be prepared to accept a limited amount of spent fuel from foreign sources when such action would contribute to meeting nonproliferation goals. Under the new policy, spent fuel transferred to the US Government will be delivered - at user expense - to a US Government-approved site. Foreign spent fuel would be stored in Interim Spent Fuel Storage (ISFS) facilities with domestic fuel. This volume of the environmental impact statement includes effects associated with implementing or not implementing the Spent Fuel Storage Policy for the foreign fuels. The analyses show that there are no substantial radiological health impacts whether the policy is implemented or not. In no case considered does the population dose commitment exceed 0.000006% of the world population dose commitment from natural radiation sources over the period analyzed. Full implementation of the US offer to accept a limited amount of foreign spent fuel for storage provides the greatest benefits for US nonproliferation policy. Acceptance of lesser quantities of foreign spent fuel in the US or less US support of foreign spent fuel storage abroad provides some nonproliferation benefits, but at a significantly lower level than full implementation of the offer. Not implementing the policy in regard to foreign spent fuel will be least productive in the context of US nonproliferation objectives. The remainder of the summary provides a brief description of the options that are evaluated, the facilities involved in these options, and the environmental impacts, including nonproliferation considerations, associated with each option.

1448 (DOE/EIS--0015(Vol.4)) FINAL ENVIRONMENTAL IMPACT STATEMENT: US SPENT FUEL POLICY. CHARGE FOR SPENT FUEL STORAGE. (Department of Energy, Washington, DC (USA)). May 1980. 104p. NTIS, PC E03/MF E03.

The United States Government policy relating to nuclear fuel reprocessing, which was announced by President Carter on April 7, 1977, provides for an indefinite deferral of reprocessing, and thus commits light water reactor (LWR) plants to a once-through fuel cycle during that indefinite period. In a subsequent action implementing that policy, the Department of Energy (DOE) on October 18, 1977 announced a spent fuel policy which would enable domestic, and on a selective basis, foreign utilities to deliver spent fuel to the US Government for interim storage and final geologic disposal, and pay the Government a fee for such services. This volume addresses itself to whether the fee charged for these services, by its level or its structure, would have any effect on the environmental impacts of implementing the Spent Fuel Policy itself. This volume thus analyzes the fee and various alternatives to determine the interaction between the fee and the degree of participation by domestic utilities and foreign countries in the proposed spent fuel program for implementing the Spent Fuel Policy. It also analyzes the effect, if any, of the fee on the growth of nuclear power.

1449 (DOE/EIS--0015(Vol.5)) FINAL ENVIRONMENTAL IMPACT STATEMENT: US SPENT FUEL POLICY. COMMENT LETTERS ON DRAFT STATEMENTS AND MAJOR COMMENTS WITH DOE RESPONSES. (Department of Energy, Washington, DC (USA)). May 1980. 496p. NTIS, PC E05/MF E05.

Notice of availability of the draft environmental impact statement for storage of US spent power reactor fuel was published by DOE in the Federal Register on September 6, 1978. A subsequent notice was published in the Federal Register on December 14, 1978, on the availability of the draft EISs on storage of foreign fuel, on charge for spent fuel storage, and a supplement to the draft EIS on storage of US fuel. Copies of the draft EISs were distributed for review and comment by appropriate Federal agencies, state governments, and other organizations and individuals who were known to have an interest in spent fuel storage activities and those who requested them. Comments and views concerning the draft EISs were requested from other interested agencies, organizations, and individuals by means of the Federal Register notices. Approximately 1600 copies each of the draft Domestic, Foreign, and Charge EISs were distributed for comment. The closing date for comments to be received on the draft EISs was February 15, 1979. Copies of the EISs (upon publication) and comment letters received were placed for public inspection in DOE public document rooms at 10 locations throughout the country. To the extent practicable, comments received after the closing date were also considered in the preparation of the final EIS. A total of 78 comment letters (some with supplements) were received. These comment letters are reproduced in their entirety in Section I of this volume. Approximately 600 specific comments were identified in these letters.

1450 (DOE/EIS--0023) FINAL ENVIRONMENTAL IMPACT STATEMENT. LONG-TERM MANAGEMENT OF DEFENSE HIGH-LEVEL RADIOACTIVE WASTES (RESEARCH AND DEVELOPMENT PROGRAM FOR IMMOBILIZATION), SAVANNAH RIVER PLANT, AIKEN, SOUTH CAROLINA. (Department of Energy, Washington, DC (USA)). Nov 1979. 304p. Dep. NTIS, PC A14/MF A01.

The present statement explores the environmental implications of a large research and development (R and D) program aimed at developing the proposed continuation of technology for removing the wastes from the tanks and immobilizing the radionuclides in solid forms for subsequent disposal. The proposed R and D program is directed toward developing technology for converting the waste into two fractions: a durable waste form containing over 99% of the radioactivity, and decontaminated salt, with storage or disposal of the waste form, e.g., in an off-site

geological repository, an on-site surface storage vault, or an on-site geological repository (bedrock cavern) and storage of the salt in: decontaminated waste tanks at SRP, an on-site surface vault, or an off-site geologic repository. The following alternatives to the proposed immobilization R and D program are assessed for environmental impact: continue storing high-level waste in subsurface storage tanks, which is a continuation of the present management practice, or, slurry the high-level waste into bedrock caverns, an on-site geological repository. (This alternative has been designated as environmentally unacceptable by the US EPA).

1451 (DOE/EIS--0026(Vol.1)) FINAL ENVIRONMENTAL IMPACT STATEMENT. WASTE ISOLATION PILOT PLANT. (Department of Energy, Washington, DC (USA). Assistant Secretary for Defense Programs). Oct 1980. 649p. NTIS, PC E08/MF E08.

In accordance with the National Environmental Policy Act (NEPA) of 1969, the US Department of Energy (DOE) has prepared this document as environmental input to future decisions regarding the Waste Isolation Pilot Plant (WIPP), which would include the disposal of transuranic waste, as currently authorized. The alternatives covered in this document are the following: (1) Continue storing transuranic (TRU) waste at the Idaho National Engineering Laboratory (INEL) as it is now or with improved confinement. (2) Proceed with WIPP at the Los Medanos site in southeastern New Mexico, as currently authorized. (3) Dispose of TRU waste in the first available repository for high-level waste. The Los Medanos site would be investigated for its potential suitability as a candidate site. This is administration policy and is the alternative preferred by the DOE. (4) Delay the WIPP to allow other candidate sites to be evaluated for TRU-waste disposal. This environmental impact statement is arranged in the following manner: Chapter 1 is an overall summary of the analysis contained in the document. Chapters 2 and 4 set forth the objectives of the national waste-management program and analyze the full spectrum of reasonable alternatives for meeting these objectives, including the WIPP. Chapter 5 presents the interim waste-acceptance criteria and waste-form alternatives for the WIPP. Chapters 6 through 13 provide a detailed description and environmental analysis of the WIPP repository and its site. Chapter 14 describes the permits and approvals necessary for the WIPP and the interactions that have taken place with Federal, State, and local authorities, and with the general public in connection with the repository. Chapter 15 analyzes the many comments received on the DEIS and tells what has been done in this FEIS in response. The appendices contain data and discussions in support of the material in the text.

1452 (DOE/EIS--0026(Vol.2)) FINAL ENVIRONMENTAL IMPACT STATEMENT. WASTE ISOLATION PILOT PLANT. (Department of Energy, Washington, DC (USA). Assistant Secretary for Defense Programs). Oct 1980. 808p. NTIS, PC E08/MF E08.

This volume contains the appendices for the Final Environmental Impact Statement for the Waste Isolation Pilot Plant (WIPP). Alternative geologic environs are considered. Salt, crystalline rock, argillaceous rock, and tuff are discussed. Studies on alternate geologic regions for the siting of WIPP are reviewed. President Carter's message to Congress on the management of radioactive wastes and the findings and recommendations of the interagency review group on nuclear waste management are included. Selection criteria for the WIPP site including geologic, hydrologic, tectonic, physicochemical compatability, and socio-economic factors are presented. A description of the waste types and the waste processing procedures are given. Methods used to calculate radiation doses from radionuclide releases during operation are presented. A complete description of the Los Medanos site, including archaeological and historic aspects is included. Environmental monitoring programs and long-term safety analysis program are described. (DMC)

1453 (DOE/ER/04972--2) MICROCRACK TECHNOLOGY. PROGRESS REPORT, 1 APRIL 1979-29 FEBRUARY 1980. Simmons, G.; Caruso, L.; Padovani, E. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Earth and Planetary Sciences). Mar 1980. Contract AC02-78ER04972. 62p. Dep. NTIS, PC A04/MF A01.

Microcracks in samples of core from a 3000-foot hole in the Conway granite, near North Conway, New Hampshire, are abundant and most of them are sealed with siderite, chlorite, quartz, hematite, clay, or microbreccia. The sealed cracks are 1 to 100μ wide, intersect many grain boundaries, often coincide with grain boundaries, and both intersect and contain minerals that are normally rich in U and Th. The abundances of U and Th in 100-gm-bulk samples range from 0.1 to 30 ppM and from 6 to 100 ppM, respectively. The working hypothesis that U and Th have migrated through the microcracks in CO_2-rich waters is proposed. In the Redstone Quarry core, the presently open microcracks are preferentially oriented; most open cracks have horizontal surfaces. Samples of Devonian shales have been obtained for the purpose of examining microcracks in relation to the production of natural gas. The problems of sample preparation for fissile shale have been largely solved. Samples from the NTS have been prepared for the examination of microcracks in relation to possible disposal sites for radioactive waste.

1454 (DOE/ER/10412--2) [RELATIVE MOBILITIES AND TRANSPORT MECHANISMS OF TRACE ELEMENTS DURING CONTACT METAMORPHISM OF CARBONATE ROCKS]. PROGRESS REPORT. (State Univ. of New York, Stony Brook (USA). Research Foundation). [nd]. Contract AC02-79ER10412. 15p. NTIS, PC A02/MF A01.

The main objective of this study is to investigate the relative mobilities and transport mechanisms of major, minor, and trace elements during the contact metamorphism of carbonate rocks. The large contrasts in chemical potentials of SiO_2, Al_2O_3, and CaO across a granitic pluton-limestone contact may induce metasomatism. In addition, rare earth and transition metal elements may act as tracers, and their redistribution during metamorphism may record convective cooling processes. The results of this study may have an application toward the problem of radioactive waste disposal and the degree to which radioactive nuclides may be expected to migrate during geologically significant periods of time.

1455 (DOE/EV--0046(Vol.2), pp 259-272) TECHNICAL PROGRAM FOR ESTABLISHING THE SCIENTIFIC BASIS FOR GEOLOGIC DISPOSAL. Heineman, R.E.; Carbiener, W.A.; Basham, S.J. (Battelle Memorial Inst., Columbus, OH). Sep 1979.

From Environmental control symposium;

Washington, DC, USA (28 Nov 1978).

Work performed to date on characterization of geologic media, design of repositories and support facilities, and safety assessments of geologic isolation have provided an understanding of the important variables in the technology required. Reviews of this work by technical peer groups and by DOE, as well as an evaluation by an Interagency Review Group during 1978, have provided additional insights into the requirements for basic scientific data, engineering development, and systems modeling that should be developed or augmented to accomplish the goals of the NWTS program. The DOE and its major contractors in the program are responding to these identified needs by utilizing the resources of the US Geological Survey, universities, national laboratories, and industry in a coordinated program to characterize the properties of promising geologic and hydrologic regimes, to obtain basic scientific knowledge of the effects of heat-producing waste forms on the geochemistry and rock mechanics aspects of the media, to extend the programs of testing and model validation from salt to other candidate media such as granite and basalt, and to prepare a consolidated conceptual design to assess the safety and reliability of operation under normal and abnormal conditions. These programs will be guided by licensing plans which define how and when the data obtained will be utilized in reports on various topics important to the assessment of the short- and long-term safety of the repository. Design and licensing criteria are available, in part, and the remainder are being developed by DOE in parallel with a similar effort by the Environmental Protection Agency and the Nuclear Regulatory Commission. These on-going and planned NWTS programs will be described.

1456 (DOE/NE--0005) SPENT FUEL STORAGE. FACTS BOOKLET. (Department of Energy, Washington, DC (USA)). Apr 1980. 66p. NTIS, PC A04/MF A01.

In October 1977, the Department of Energy (DOE) announced a spent nuclear fuel policy where the Government would, under certain conditions, take title to and store spent nuclear fuel from commercial power reactors. The policy is intended to provide spent fuel storage until final disposition is available. DOE has programs for providing safe, long-term disposal of nuclear waste. The spent fuel storage program is one element of waste management and compliments the disposal program. The costs for spent fuel services are to be fully recovered by the Government from the utilities. This will allow the utilities to confidently consider the costs for disposition of spent fuel in their rate structure. The United States would also store limited amounts of foreign spent fuel to meet nonproliferation objectives. This booklet summarizes information on many aspects of spent fuel storage.

1457 (DOE/NE--0007) STATEMENT OF POSITION

1458 (DOE/RL/01830--14) REPORT ON GEOLOGIC EXPLORATION ACTIVITIES. Breslin, J.; Laughon, R.B.; Hall, R.J.; Voss, J.W. (comps.). (Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). Jan 1980. Contract EY-76-C-06-1830. 83p. Dep. NTIS, PC A05/MF A01.

This report provides an overview of the geological exploration activities being carried out as part of the National Waste Terminal Storage (NWTS) Program, which has been established by the US Department of Energy (DOE) to develop the technology and provide the facilities for the safe, environmentally acceptable isolation of civilian high-level and transuranic nuclear wastes, including spent fuel elements, for which the Federal government is responsible. The principal programmatic emphasis is on disposal in mined geologic repositories. Explorations are being conducted or planned in various parts of the country to identify potential sites for such repositories. The work is being undertaken by three separate but coordinated NWTS project elements. Under the Basalt Waste Isolation Project (BWIP), basalt formations underlying DOE's Hanford Reservation are being investigated. Granite, tuff, and shale formations at the DOE Nevada Test Site (NTS) are being similarly studied in the Nevada Nuclear Waste Storage Investigations (NNWSI). The Office of Nuclear Waste Isolation (ONWI) is investigating domed salt formations in several Gulf Coast states and bedded salt formations in Utah and Texas. The ONWI siting studies are being expanded to include areas overlying crystalline rocks, shales, and other geohydrologic systems. The current status of these NWTS efforts, including the projected budgets for FY 1981, is summarized, and the criteria and methodology being employed in the explorations are described. The consistency of the overall effort with the recommendations presented in the Report to the President by the Interagency Review Group on Nuclear Waste Management (IRG), as well as with documents representing the national technical consensus, is discussed.

1459 (DOE/RL/C--14) REPORT ON GEOLOGIC EXPLORATION ACTIVITIES. (Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). Jan 1980. Contract AC06-76RL01830. 83p. NTIS, PC A05/MF A01.

This report provides an overview of the geological exploration activities being carried out as part of the National Waste Terminal Storage (NWTS) Program, which has been established by the US Department of Energy (DOE) to develop the technology and provide the facilities for the safe, environmentally acceptable isolation of civilian high-level and transuranic nuclear wastes, including spent fuel elements, for which the Federal government is reponsible. The principal programmatic emphasis is on disposal in mined geologic repositories. Explorations are being conducted or planned in various parts of the country to

overlying crystalline rocks, shales, and other geohydrologic systems. The current status of these NWTS efforts, including the projected budgets for FY 1981, is summarized, and the criteria and methodology being employed in the explorations are described. The consistency of the overall effort with the recommendations presented in the Report to the President by the Interagency Review Group on Nuclear Waste Management (IRG), as well as with documents representing the national technical consensus, is discussed.

1460 (DOE/SR-SF--2004(Rev.1)) RERACKING TO INCREASE SPENT FUEL STORAGE CAPACITY. (Department of Energy, Aiken, SC (USA). Savannah River Operations Office). May 1980. 12p. NTIS, PC A02/MF A01.

Many utilities have already increased their spent fuel pool storage capacity by replacing aluminum racks having storage densities as low as 0.2 MTU/ft^2 with stainless steel racks which can more than double storage densities. Use of boron-stainless steel racks or thin stainless steel cans containing reassembled fuel rods allows even higher fuel storage densities (up to approximately 1.25 MTU/ft^2). This report evaluates the economics of smaller storage gains that occur if pools, already converted to high density storage, are further reracked.

1461 (DOE/SR-WM--79-2) HYDROLOGY OF BURIED CRYSTALLINE ROCK AT SAVANNAH RIVER PLANT NEAR AIKEN, SOUTH CAROLINA. Marine, I.W. (Department of Energy, Aiken, SC (USA). Savannah River Operations Office). Oct 1979. Contract AC09-76SR00001. 76p. NTIS, PC A05/MF A01.

The purpose of this report is to present the results of hydrologic investigations that were made on buried crystalline rock at the Savannah River Plant in connection with an investigation of the feasibility of storing high-level radioactive waste in artificially excavated chambers in the rock. The methods pursued in this investigation may be applicable to other investigations of low permeability metamorphic and igneous rocks. Fractures occurring in single boreholes were investigated by core inspection, geophysical logs, packer tests, and in-hole tracer tests. The correlation of fractures between holes was based on the rapidity of water level response to hydraulic activities in nearby wells and on an in-hole tracer test conducted in one boring while a nearby boring was being pumped. Values for hydraulic conductivity and other hydraulic parameters were determined from laboratory tests, packer tests, pumping tests, a two-well tracer test, and a numerical model that duplicated the results of a year-long pumping test. Dispersivity of the fractured crystalline rock was determined using a two-well tracer test. Water geochemistry and isotropic composition were evaluated. The age of the water was determined to be about 840,000 years. The average velocity of regional flow in crystalline rock is about 0.2 ft/y.

1462 (DOE/TIC--11260) SOCIAL IMPACT MITIGATION AND NUCLEAR WASTE REPOSITORY SITING. Peelle, E. (Oak Ridge National Lab., TN (USA)). 26 Aug 1980. Contract W-7405-ENG-26. 17p. NTIS, PC A02/MF A01.

Some aspects of the socioeconomic impacts of siting, constructing, and operating radioactive waste repositories in rural areas are discussed. These include public perceptions of high risk and uncertainty; limited benefits and no incentives; dissociations of costs and benefits; remoteness and inaccessibility of the decision making process for large energy facilities; no institutions to provide protection and accountability for those who may be affected by the siting; the fact that not all risks or impacts are fully mitigable; and constraints on DOE's present ability or authority to mitigate impacts. (DMC)

1463 (DP--1533) EARTHQUAKE RELATED DISPLACEMENT FIELDS NEAR UNDERGROUND FACILITIES. Pratt, H.R.; Zandt, G.; Bouchon, M. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Apr 1979. Contract AC09-76SR00001. 70p. NTIS, PC A04/MF A01.

Relative displacements of rock masses are evaluated in terms of geological evidence, seismological evidence, data from simulation experiments, and analytical predictive models. Numerical models have been developed to determine displacement fields as a function of depth, distance, and azimuth from an earthquake source. Computer calculations for several types of faults indicate that displacements decrease rapidly with distance from the fault, but that displacements can either increase or decrease as a function of depth depending on the type and geometry of the fault. For long shallow vertical strike-slip faults the displacement decreases markedly with depth. For square strike slip faults and for dip slip faults displacement does not decrease as markedly with depth. Geologic structure, material properties, and depth affect the seismic source spectrum. Amplification of the high frequencies of shear waves is larger by a factor of about 2 for layered geologic models than for an elastic half space.

1464 (DP-MS--78-92) EARTHQUAKE DAMAGE TO UNDERGROUND FACILITIES. Pratt, H.R.; Stephenson, D.E.; Zandt, G.; Bouchon, M.; Hustrulid, W.A. (Terra Tek, Inc., Salt Lake City, UT (USA); Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract EY-76-C-09-0001. 48p. (CONF-800603--1). Dep. NTIS, PC A03/MF A01.

From Rapid excavation and tunneling conference; Littleton, CO, USA (Jun 1980).

In order to assess the seismic risk for an underground facility, a data base was established and analyzed to evaluate the potential for seismic disturbance. Substantial damage to underground facilities is usually the result of displacements primarily along pre-existing faults and fractures, or at the surface entrance to these facilities. Evidence of this comes from both earthquakes and large explosions. Therefore, the displacement due to earthquakes as a function of depth is important in the evaluation of the hazard to underground facilities. To evaluate potential displacements due to seismic effects of block motions along pre-existing or induced fractures, the displacement fields surrounding two types of faults were investigated. Analytical models were used to determine relative displacements of shafts and near-surface displacement of large rock masses. Numerical methods were used to determine the displacement fields associated with pure strike-slip and vertical normal faults. Results are presented as displacements for various fault lengths as a function of depth and distance. This provides input to determine potential displacements in terms of depth and distance for underground facilities, important for assessing potential sites and design parameters.

1465 (DP-MS--79-20) MIGRATION OF TRANSURANIC NUCLIDES IN EARTHEN BURIAL TRENCHES

AT THE SAVANNAH RIVER PLANT. Johnson, D.R.; Wilhite, E.L. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1979. Contract EY-76-C-09-0001. 37p. Dep. NTIS, PC A03/MF A01.

The objectives, incentives and benefits derived from the data collected at the Savannah River Laboratory on waste migration were discussed, and encapsulated transmission waste burial data were presented. Factors influencing radionuclide migration were characterized. A map of the burial ground was included. The trench sampling strategy was summarized. A description of the coring samples was included. Actual soil recovery results were tabulated, and a specific problem which reduced recoveries even when using a Shelby tube core was discussed. Data on waste strike distribution and activity as a function of depth were tabulated. The composition of recovered waste was tabulated. Wood and paper were well preserved in spite of long burial. Radiation of core samples was measured. The distribution of plutonium among soil particle sizes was determined.

1466 (DP-MS--79-25) RADIOLYTIC GAS GENERATION IN CONCRETE MADE WITH INCINERATOR ASH CONTAINING TRANSURANIUM NUCLIDES. Bibler, N.E. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1979. Contract EY-76-C-09-0001. 9p. (CONF-791112--13). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

The effects of various factors on H_2 generation by alpha radiolysis of concrete containing TRU incinerator ash were studied. Methods for reducing H_2 generation were investigated. Samples of Portland and high-alumina cement containing up to 30% calcined ash (dry basis) were doped with $^{238}PuO_2$. Gas pressures were measured as a function of radiation dose; gas compositions were determined. Gas yields were calculated in terms of G values (molecules produced per 100 eV of alpha energy absorbed). These yields were used to estimate pressures in containers of radioactive concrete waste during storage. 4 figures.

1467 (DP-MS--79-30) CANISTER COMPATIBILITY WITH CARLSBAD SALT. Rankin, W.N. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1979. Contract EY-76-C-09-0001. 11p. (CONF-800305--1; CONF-791112--46). Dep. NTIS, PC A02/MF A01.

From Corrosion/80 NACE meeting; Chicago, IL, USA (6 Mar 1980).

No significant reaction was found when candidate canister alloys were heated with salt from Carlsbad, New Mexico, for up to 5000 hours in sealed capsules and for up to 10,000 hours in unsealed capsules at temperatures (80 to 225°C) that bracket the maximum temperature calculated for reference Savannah River Plant (SRP) waste containers at 20-foot spacings in salt. Additional tests were made at 600°C in sealed capsules to characterize reactions that may occur between candidate canister alloys and any component of the salt that is released when decrepitation occurs. Under these extreme conditions there was no significant attack of Type 304L stainless steel. But, there was up to 20-mils attack of the low-carbon steel.

1468 (DP-MS--79-31) MULTIBARRIER STORAGE OF SAVANNAH RIVER PLANT WASTE. Dukes, M.D.; Mosley, W.C.; Rankin, W.N.; Tennant, M.H.; Wiley, J.R. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1979. Contract EY-76-C-09-0001. 10p. (CONF-791112--8). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Borosilicate glass will perform well as part of a multibarrier system for SRP high level waste. Storage temperatures can be kept to less than or equal to 100°C with appropriate spacing of the reference canisters. Undry dry conditions the waste package should remain intact for very long periods of time. Even if the package is breached and water contacts the glass, the radionuclide release rate will be very low. 5 figures, 2 tables.

1469 (DP-MS--79-37) TEMPERATURES GENERATED BY UNDERGROUND STORAGE OF DEFENSE WASTE CANISTERS. Tennant, M.H. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). 1979. Contract EY-76-C-09-0001. 9p. (CONF-791112--11). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

For conditions conducive to leaching, i.e., moisture in contact with glass, the glass surface temperature would essentially be the canister cavity temperature because temperature rises across wet annuli are small. In turn, canister cavity temperatures are dominated by canister spacing for a given canister power and decay curve. Actual canister powers may be as much as 40% less than those used for these calculations. For dry salt in contact with the storage container, the temperature rises across the annuli may be large. The container temperature would tend to peak earlier for dry annuli than for wet annuli. When canister cavity temperatures peak, salt temperatures would be increased over normal approximately 500 feet in any direction extending from the repository. 5 figures.

1470 (DP-MS--79-49) EQUIPMENT FOR COLLECTING SLUDGE SAMPLES FROM SAVANNAH RIVER PLANT WASTE TANKS. Allen, B.M. Jr. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1979. Contract EY-76-C-09-0001. 16p. Dep. NTIS, PC A02/MF A01.

A sampler was developed to take 25-L samples of sludge from Savannah River Plant waste tanks. The cylindrical sample vessel has a retractable nose section. Sludge enters an annular space at the nose section as the sampler is forced through the sludge layer with rigid drive pipes. Two samples have been taken and transported in a special cask to a waste processing research facility at the Savannah River Laboratory. 7 figures.

1471 (DP-MS--80-4) SENSITIVITY CALCULATIONS FOR LOW HEAT GENERATING DEFENSE WASTE REPOSITORY TEMPERATURES. Tennant, M.H. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 21p. (CONF-800723--14). NTIS, PC A02/MF A01.

From 19. national heat transfer conference; Orlando, FL, USA (27 Jul 1980).

Repository temperatures were calculated for Savannah River wastes by using both two- and three-dimensional numerical schemes. The error introduced by using the simpler and more efficient two-dimensional models is less than the present uncertainties introduced by waste power generation and host rock properties. Waste canister temperatures were found to be relatively insensitive to geometric asymmetry and model detail.

1472 (DP-MS--80-7) COMPARISON OF LABORATORY, IN SITU, AND ROCK MASS MEASUREMENTS OF THE HYDRAULIC CONDUCTIVITY OF METAMORPHIC ROCK AT THE SAVANNAH RIVER PLANT NEAR AIKEN, SOUTH CAROLINA. Marine, I.W. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 18p. (CONF-800556--1). NTIS, PC A02/MF A01.

From Annual spring meeting of the American Geophysical Union; Toronto, Ontario, Canada (22 May 1980).

In situ testing of exploratory wells in metamorphic rock indicates that two types of fracturing occur in the rock mass. Rock containing small openings that permit only extremely slow movement of water is termed virtually impermeable rock. Rock containing openings of sufficient size to permit transmission of water at a significantly faster rate is termed hydraulically transmissive rock. Laboratory methods are unsuitable for measuring hydraulic conductivity in hydraulically transmissive rock; however, for the virtually impermeable rock, values comparable to the in situ tests are obtained. The hydraulic conductivity of the rock mass over a large region is calculated by using the hydraulic gradient, porosity, and regional velocity. This velocity is determined by dividing the inferred travel distance by the age of water which is determined by the helium content of the water. This rock mass hydraulic conductivity value is between the values measured for the two types of fractures, but is closer to the measured value for the virtually impermeable rock. This relationship is attributed to the control of the regional flow rate by the virtually impermeable rock where the discrete fractures do not form a continuous open connection through the entire rock mass. Thus, laboratory methods of measuring permeability in metamorphic rock are of value if they are properly applied.

1473 (DPE--3519) REPORT OF CONCEPTUAL DESIGN FOR TRU SOLID WASTE FACILITIES ADJACENT TO 200H AREA: SAVANNAH RIVER PLANT. (Du Pont de Nemours (E.I.) and Co., Wilmington, DE (USA). Engineering Dept.). Feb 1978. Contract AC09-76SR00001. 564p. NTIS, PC A24/MF A01.

Facilities for consolidating Savannah River Plant solid transuranic (TRU) waste and placing in long-term safe, retrievable storage have been designed conceptually. A venture guidance appraisal of cost for the facilities has been prepared. The proposed site of the new processing area is adjacent to existing H Area facilities. The scopes of work comprising the conceptual design describe facilities for: exhuming high-level TRU waste from buried and pad-stored locations in the plant burial ground; opening, emptying, and sorting waste containers and their contents within shielded, regulated enclosures; volume-reducing the noncombustibles by physical processes and decontaminating the metal waste; burning combustibles; fixing the consolidated waste forms in a concrete matrix within a double-walled steel container; placing product containers in a retrievable surface storage facility adjacent to the existing plant burial ground; and maintaining accountability of all special nuclear materials. Processing, administration, and auxiliary service buildings are to be located adjacent to existing H Area facilities where certain power and waste liquid services will be shared.

1474 (ECN--63) COMPARISON OF TEMPERATURE CALCULATIONS FOR AN ARBITRARY HIGH-LEVEL WASTE DISPOSAL CONFIGURATION IN SALT FORMATIONS. Kevenaar, J.W.A.M.; Janssen, L.G.J.; Ploumen, P.; Winske, P. (Stichting Energieonderzoek Centrum Nederland, Petten). May 1979. 33p. Dep. NTIS (US Sales Only), PC A03/MF A01.

The objective of this report is the comparison of the results of temperature analyses for an arbitrary high-level radioactive waste disposal configuration in salt formations. The analyses were carried out at the RWTH and ECN. The computer programs used are based on finite difference and finite element techniques. From the local temperature analyses that were intended to check the solution techniques, it could be concluded that both finite difference and finite elements are capable to analyse this type of problems. From the global temperature analyses it could be concluded that both analysis approaches: temperature dependent and iteratively determined temperature independent material properties, are suited to analyse the global temperature distribution in the salt formation.

1475 (ENICO--1031) FOURTH CALCINED SOLIDS STORAGE FACILITY. FINAL SAFETY ANALYSIS REPORT. Schindler, R.E. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Feb 1980. Contract AC07-79ID01675. 90p. NTIS, PC A05/MF A01.

This safety analysis report describes the Fourth Calcined Solids Storage Facility and presents the results of a safety evaluation of the facility including a design basis accident. The Idaho Chemical Processing Plant (ICPP) is a multi-purpose facility for recovering enriched U-235 from a wide variety of spent reactor fuels. Solvent extraction processes employed in recovery of fissile materials generate radioactive liquid wastes containing nuclear fission products. These liquid wastes are stored for several years in cooled, stainless steel tanks to allow decay of most short-lived radionuclides prior to calcination. In the Waste Calcining Facility (WCF), liquid waste are atomized in a hot-air-fluidized-bed of granular solids. A New Waste Calcining Facility (NWCF) is being designed to replace the WCF. The Fourth Calcined Solids Storage Facility will receive solids from the NWCF. There are currently three calcined solids storage facilities in service at ICPP; two are full and the third is being filled. The Fourth Calcined Solids Storage Facility provides an additional 17,000 ft^3 of storage. The new facility is similar to the existing facilities and will not alter appreciably the low risk level associated with existing storage of calcined solids. Double containment of the calcined solids is provided in three 12-ft diameter, 50-ft high, stainless steel bins enclosed in a reinforced concrete vault as shown. The facility is designed to withstand effects of local natural catastrophies, viz. flood, tornado and earthquake. Decay heat will be removed from the vault by conduction through the vault walls to the surrounding air and soil. During the first few years of facility use, supplementary cooling will be provided by the natural convection of cooling air through the vault. The new facility is similar to the existing calcined solids storage facilities; however, the number of bins is reduced from seven to three.

1476 (ENICO--1044) INVENTORY OF CALCINED WASTE STORED AT THE ICPP AS OF SEPTEMBER 1979. Kirkbride, R.A. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Sep 1980. Contract AC07-79ID01675. 46p. NTIS, PC A03/MF A01.

An option in the program for Long-Term Management of High-Level Idaho Chemical

Processing Plant (ICPP) Wastes calls for retrieving calcined waste stored at ICPP and converting it to a more stable, less dispersible form. Waste solidification options include vitrification, pelletization, or conversion to a ceramic form. A calcine inventory, from December 1963 to September 1979, has been prepared based on calciner run and solids storage facilities information which gives the range of chemical compositions of calcined waste stored at ICPP. Information researched includes calciner startup data, waste solution types and volumes calcined, calciner operating schedules, solids storage bin capacities, calcine storage bin distributor systems and solids storage bin thermocouple locations and temperature records. A recommendation for improving calcine inventory control is given.

1477 (ENICO--1060) STORAGE AND RETRIEVABILITY OF EXISTING AND FUTURE ICPP CALCINES. Cresap, D.A. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Oct 1980. Contract AC07-79ID01675. 38p. NTIS, PC A03/MF A01.

Calcine caking and retrievability tests were conducted to ensure that calcine stored at ICPP is retrievable by conventional vacuum methods. This report describes results of shearing strength (Jenike and Johanson) tests and retrieval tests on zirconia and zirconium-sodium blended calcines. Results of Jenike tests on calcine containing phosphate and calcine containing candidate anti-caking additives are also given. All calcines tested were retrievable with standard vacuum methods and nozzle vibration at storage temperatures anticipated at ICPP.

1478 (EPRI-NP--1197) STATUS REPORT ON RISK ASSESSMENT FOR NUCLEAR WASTE DISPOSAL. INTERIM REPORT. Koplik, C.M.; Oston, S.G.; Bartlett, J.W.; Kaplan, M.F. (Analytic Sciences Corp., Reading, MA (USA)). Oct 1979. 182p. Dep. NTIS, PC A09/MF A01.

This document reports the results of a comparative analysis and evaluation of reported studies on long-term safety for geologic disposal of nuclear wastes. The scope of work included consideration of uncertainty issues and their impact on results; assessment of the effects of design, siting and operational strategy alternatives on safety levels; and assessment of the adequacy of scope of the available results. Results obtained by the studies reviewed are reconciled and analyzed by normalizing the results to a common basis of repository contents at closure and environmental scenario conditions. The normalization greatly reduces the range of results and produces two classes of risk predictions: conservative (extreme) case studies for which individual doses are about 1% of background, and less conservative, more realistic studies for which doses are about a thousand times lower than those for the conservative studies. The scope of work also includes a comparative analysis of safety levels for disposal of spent fuel and vitrified high-level waste. The inherently higher risk levels associated with spent fuel disposal are demonstrated. The report concludes with a discussion of significant resolved and unresolved safety issues. It also discusses future work needed.

1479 (EUR--5947) EVALUATION OF LONG TERM LEACHING OF BOROSILICATE GLASSES. Lanza, F.; Parnisari, E. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1978. 27p. Dep. NTIS (US Sales Only), PC A03/MF A01.

For the evaluation of long term hazard of glass, data on long term glass leaching are needed. Moreover for long term leaching a model of homogeneous dissolution seems reasonable and ask for confirmation. Tests were performed at 30°, 80°, 100°, using an apparatus of the Soxhlet type, to 3.600 hours. Results were obtained as a weight loss and analysed following a relation with time composed by a parabolic and a linear part. Analysis of the surface layer using energy dispersion X ray spectrometry were performed. A critical analysis of the results and of the apparatus is presented.

1480 (EUR--6128) COMMUNITY'S R AND D PROGRAMME ON RADIOACTIVE WASTE MANAGEMENT AND STORAGE. 1977 2. ANNUAL PROGRESS REPORT. (Commission of the European Communities, Brussels (Belgium)). 1978. 228p. Dep. NTIS (US Sales Only), PC A11/MF A01.

The objective of the R and D actions is the demonstration of either the technical potential or, for further advanced projects, the feasibility and even the industrial availability of methods for treating and storing radwaste. The following aspects are investigated: processing of solid waste from reactors, reprocessing plants and the plutonium manufacture; intermediate and terminal storage of high activity and alpha waste; advanced waste management methods as the storage of gaseous waste. In addition to the scientific-technical R and D actions, a survey of the legal, administrative and financial problems encountered in radwaste management and storage is an essential part of the Communities' programme.

1481 (FBOU--289-01) ENGINEERING STUDY OF STORED WASTE RETRIEVAL AT IDAHO NATIONAL ENGINEERING LABORATORY. Baird, R.D.; Hill, F.J.; Hunter, P.H.; Rich, D.C.; Ricks, B.L.; Robertson, B.C.; Thomas, J.E. (Ford, Bacon and Davis Utah, Inc., Salt Lake City (USA)). Sep 1979. Contract EY-76-C-07-1570. 156p. Dep. NTIS, PC A08/MF A01.

A large quantity of transuranic waste is currently stored at the Transuranic Storage Area (TSA) at the Idaho National Engineering Laboratory. It is anticipated that a Slagging Pyrolysis Incinerator (SPI) will be constructed near the TSA to process this waste. The study described identifies design criter, provides a preliminary conceptual system design and performs engineering analyses of various strategies for retrieving waste from the TSA and delivering it to the SPI.

1482 (GJBX--122(80)) PLUTONIUM WASTE CRIB LOGGING USING THE PROMPT FISSION NEUTRON URANIUM LOGGING SYSTEM. Barnard, R.W.; Stephenson, W.A. (Sandia National Labs., Albuquerque, NM (USA)). May 1980. Contract AC04-76DP00789. 48p. (SAND--79-2131). NTIS, PC A03/MF A01.

Sandia Laboratories' Uranium Logging Project has demonstrated their prompt fission neutron (PFN) logging system at the Hanford, WA, site for Rockwell-Hanford Operations (RHO). The dates of the demonstration were July 31 through August 2, 1979. The purpose was to show RHO the capabilities of the system for measuring plutonium concentration. An underground effluent disposal crib associated with their processing facilities was used as the test site. The performance criterion was to be able to detect a 10 nCi/g concentration of plutonium. Six test wells penetrating the crib

were logged, as were three other wells. The PFN tool was able to maintain a good signal-to-noise ratio even under the most extreme conditions of high count rate and high background. The wells at the center of the crib indicated very high concentrations of plutonium, while those at the periphery indicated much less. Concentrations estimated to be lower than 10 nCi/g were detected. Comparisons with core data were not made. The technique used to obtain physical samples for analysis did not follow uranium-exploration coring practice so comparisons were not possible. The data interpretation model used was originally developed for uranium and was modified to calculate plutonium concentration. Results indicated that the operation of a PFN logging system by RHO personnel would provide a suitable technique for monitoring transuranic waste storage sites.

1483 (HEDL-SA--1892-FP) SURVEY TEST OF CANISTER, GEOLOGY, AND FUEL CLADDING MATERIAL INTERACTIONS. Krogness, J.C.; Almassy, M.Y.; Cantley, D.A.; Davis, R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1979. Contract EY-76-C-14-2170. 30p. (CONF-791033--7). Dep. NTIS, PC A03/MF A01.

From 1. annual ONWI information meeting; Columbus, OH, USA (30 Oct 1979).

Portions of document are illegible.

A series of Material Interaction Test (MIT) is being conducted. The first test is being conducted in the Dry Surface Storage Demonstration at the EMAD facility on NTS. This paper discusses details of this first test and gives a status report on the MIT series. 17 figures. (DLC)

1484 (HEDL-SA--2055) REMOTE CHARACTERIZATION OF SPENT LWR FUEL FOR GEOLOGIC DISPOSAL DEMONSTRATIONS. Davis, R.B.; Fish, R.L.; Pasupathi, V.; Stellrecht, D.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1980. Contract AC14-76FF02170. 20p. (CONF-800607--78). NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

State-of-the-art hot cell examination techniques are being used to evaluate spent fuel performance during exposure to simulated geologic repository environments. Forty-five pressurized light water reactor fuel rods were examined prior to emplacement in geologic disposal tests. Sufficient data were collected on both cladding and fuel to provide a basis, along with post-test examination data, for assessing the ability of the spent fuel to retain radionuclides.

1485 (HEDL-TC--1283(Rev.1)) DATA PACKAGE FOR THE TURKEY POINT MATERIAL INTERACTION TEST CAPSULES. Krogness, J.C.; Davis, R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1980. Contract EY-76-C-14-2170. 98p. Dep. NTIS, PC A05/MF A01.

Objective of the test is to obtain interaction information on candidate package storage materials and geologies under prototypic temperatures in gamma and low-level neutron fields. This document provides a fabrication record of the experiment. (DLC)

1486 (HEDL-TC--1331(Rev.1)) MATERIALS INTERACTION TEST SUMMARY DESCRIPTION. Krogness, J.C. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1980. Contract EY-76-C-14-2170. 17p. Dep. NTIS, PC A02/MF A01.

The Materials Interaction Test is designed to provide early scoping data on host rock performance and interaction between nuclear waste canister materials and host repository media under conditions representative of expected disposal environments. Capsules containing these materials were put in a spent fuel assembly and subsequently placed in a disposal test to study behavior in a low-level radiation environment at temperaures expected to range between 300 to 400°F. Thermal control capsules are being exposed in laboratory furnaces to allow a determination and separation of thermal and radiation effects. Post-test specimen examinations are planned to determine material property changes and interaction effects and provide data for understanding the effectiveness of host rock, canister, and cladding materials in long-term waste isolation.

1487 (HEDL-TC--1384(Rev.1)) SPENT FUEL CHARACTERIZATION FOR THE COMMERCIAL WASTE AND SPENT FUEL PACKAGING PROGRAM. Fish, R.L.; Davis, R.B.; Pasupathi, V.; Klingensmith, R.W. (Hanford Engineering Development Lab., Richland, WA (USA); Battelle Columbus Labs., OH (USA)). Mar 1980. Contract EY-76-C-14-2170. 55p. Dep. NTIS, PC A04/MF A01.

This document presents the rationale for spent fuel characterization and provides a detailed description of the characterization examinations. Pretest characterization examinations provide quantitative and qualitative descriptions of spent fuel assemblies and rods in their irradiated conditions prior to disposal testing. This information is essential in evaluating any subsequent changes that occur during disposal demonstration and laboratory tests. Interim examinations and post-test characterization will be used to identify fuel rod degradation mechanisms and quantify degradation kinetics. The nature and behavior of the spent fuel degradation will be defined in terms of mathematical rate equations from these and laboratory tests and incorporated into a spent fuel performance prediction model. Thus, spent fuel characterization is an essential activity in the development of a performance model to be used in evaluating the ability of spent fuel to meet specific waste acceptance criteria and in evaluating incentives for modification of the spent fuel assemblies for long-term disposal purposes.

1488 (HEDL-TME--78-70) PROPERTIES OF LIGHT WATER REACTOR SPENT FUEL CLADDING. INTERIM REPORT. Farwick, D.G.; Moen, R.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1979. Contract EY-76-C-14-2170. 97p. Dep. NTIS, PC A05/MF A01.

The Commercial Waste and Spent Fuel Packaging Program will provide containment packages for the safe storage or disposal of spent Light Water Reactor (LWR) fuel. Maintaining containment of radionuclides during transportation, handling, processing and storage is essential, so the best understanding of the properties of the materials to be stored is necessary. This report provides data collection, assessment and recommendations for spent LWR fuel cladding materials properties. Major emphasis is placed on mechanical properties of the zircaloys and austenitic stainless steels. Limited information on elastic constants, physical properties, and anticipated corrosion behavior is also provided. Work is in progress to revise these evaluations as the program proceeds.

1489 (IAEA--210) OCEANOGRAPHIC BASIS OF THE IAEA REVISED DEFINITION AND RECOMMENDATIONS CONCERNING HIGH-LEVEL RADIOACTIVE WASTE UNSUITABLE FOR DUMPING AT SEA. (International Atomic Energy Agency, Vienna (Austria)). 1978. 59p. (CONF-7706186--). Dep. NTIS (US Sales Only), PC A04/MF A01.

From Consultants meeting to review the radiological basis of the provisional definition and recommendations for the convention on the prevention of marine pollution by dumping of wastes and other matter; London, UK (13 Jun 1977).

The oceanographic basis of the provisional definition is reviewed. General recommendations on the controlled disposal of radioactive wastes are made.

1490 (IAEA--211) RADIOLOGICAL BASIS OF THE IAEA REVISED DEFINITION AND RECOMMENDATIONS CONCERNING HIGH-LEVEL RADIOACTIVE WASTE UNSUITABLE FOR DUMPING AT SEA. (International Atomic Energy Agency, Vienna (Austria)). 1978. 58p. (CONF-7703125--). Dep. NTIS (US Sales Only), PC A04/MF A01.

From Advisory group meeting to review the oceanographic basis of the provisional definition and recommendations for the convention on the prevention of marine pollution by dumping of wastes and the other matter; Vienna, Austria (21 Mar 1977).

The report of the Advisory Group considered the oceanographic basis and made suggestions concerning biological pathways that might be considered when estimating the potential transfer of radioactivity of man, and recommended that the assessment of radiation doses to man and of possible damage to the ecosystem should be carried out by a suitable constituted group of consultants.

1491 (IDO--10074(Rev.1)) CRITERIA FOR PACKAGING TRANSURANIC WASTE FOR RECEIPT AT THE IDAHO NATIONAL ENGINEERING LABORATORY RADIOACTIVE WASTE MANAGEMENT COMPLEX OFFSITE GENERATED WASTE. Anderson, B.C. (Idaho National Engineering Lab., Idaho Falls (USA)). Apr 1980. Contract AC07-76ID01570. 45p. NTIS, PC A03/MF A01.

This document delineates the packaging criteria requirements for storage of transuranic radioactive waste (> 10 nCi/g) at the Idaho National Engineering Laboratory. The Department of Energy, Idaho Operation Office (DOE-ID) will only accept transuranic waste from an offsite DOE location after an agreement has been reached between DOE-ID and the cognizant DOE field office. Several memoranda of agreements are currently in effect. The detailed criteria in these previously approved memoranda of agreements are superseded by the criteria in this document. Any deviations by the waste generator from the criteria stated herein must have prior approval of DOE-ID. In addition, DOE-ID will notify waste generators of any changes to the criteria prior to implementation.

1492 (IDO--10085) ENVIRONMENTAL AND OTHER EVALUATIONS OF ALTERNATIVES FOR LONG-TERM MANAGEMENT OF BURIED INEL TRANSURANIC WASTE. (Idaho National Engineering Lab., Idaho Falls (USA)). Dec 1979. Contract EY-76-C-07-1570. 527p. Dep. NTIS, PC A23/MF A01.

This study identifies, develops, and evaluates, in a preliminary manner, alternatives for long-term management of the TRU waste buried at the RWMC at the INEL. The technology required for managing the waste, the environmental effects, the risks to the public, the radiological and nonradiological hazards to workers, and the estimated costs are discussed. The RWMC was established in the southwestern corner of the INEL in 1952 as a controlled area for burial of solid radioactive waste generated by INEL operations. It encompasses about 144 acres. Since 1954, solid waste contaminated with transuranic radionuclides has been received from defense-related activities at the RFP and from other operations of the AEC and its successor agencies. Approximately 2,200,000 ft^3 of TRU waste was buried in pits and trenches at the RWMC between 1954 and 1970. Since 1970, about 1,100,000 ft^3 of TRU waste has been received and stored retrievably on aboveground asphalt pads at the RWMC. The containers (metal bins and drums and wooden boxes) for the stored waste are generally in good condition. However, the containers for the buried waste have deteriorated badly; some of the waste, such as large pieces of equipment, was buried without containers. Some of the soil immediately adjacent to the buried waste has become contaminated. Six alternatives for the long-term management of the buried TRU waste were studied. These alternatives are identified and concepts within these alternatives developed and evaluated.

1493 (IDO--22027-USGS) GEOLOGY, WATER SUPPLY, AND WASTE DISPOSAL AT SITES II AND IIA, BURIAL GROUND D, AND VICINITY, NATIONAL REACTOR TESTING STATION, IDAHO. Voegeli, P.T.; Deutson, M. (Geological Survey, Boise, ID (USA). Water Resources Div.). Jun 1953. Contract EW-78-X-07-0115. 97p. Dep. NTIS, PC A05/MF A01.

The problems of geology, water-supply, and waste disposal at the National Reactor Testing Station (NRTS), Idaho are studied. The geologic and hydrologic information about sites II and IIA are summarized. Information about the physical properties of geologic materials is summarized. Information obtained from deep test holes and wells near the mapped area and data from test pits and shallow test holes within the area are included. Chemical analysis of samples of ground water was performed. Ion exchange tests of sediments were also performed. These results are included. (DC)

1494 (INFCE/DEP/WG--7/10) INTERMEDIATE STORAGE FACILITY FOR VITRIFIED HIGH LEVEL WASTE FROM THE REPROCESSING OF SPENT NUCLEAR FUEL. (INFCE (Sweden)). Apr 1978. 13p. NTIS (US Sales Only), PC A02/MF A01.

An intermediate storage facility for vitrified high level waste is described. The design was made specifically for Swedish conditions but can due to modular design be applied also for other conditions. Most of the plant is located underground with a rock cover of about 30 m in order to provide protection against external forces such as acts of war and sabotage. The storage area consists of four caverns each with 150 pits. Each pit can take 10 waste cylinders of 0.4 m diameter and 1.5 m length containing 150 liters of glass. The capacity can be increased by adding additional caverns. Cooling is obtained by forced air convection. Reception areas, auxiliary systems and operation of the plant are also described.

1495 (INFCE/DEP/WG--7/13) GRANITE-REPOSITORY - GEOCHEMICAL ENVIRONMENT. (INFCE (Sweden)). Apr 1979. 23p. NTIS (US Sales Only), PC A02/MF A01.

Some geochemical data of importance for a radioactive waste repository in hard rock are reviewed. The ground water composition at depth

is assessed. The ground water chemistry in the vicinity of uranium ores is discussed. The redox system in Swedish bedrock is described. Influences of extreme climatic changes and of repository mining and construction are also evaluated.

1496 (INFCE/DEP/WG--7/16) RELEASE CONSEQUENCE ANALYSIS FOR A HYPOTHETICAL GEOLOGIC RADIOACTIVE WASTE REPOSITORY IN SALT. (INFCE (USA)). Aug 1979. 180p. NTIS (US Sales Only), PC A09/MF A01.

One subtask conducted under the INFCE program is to evaluate and compare the health and safety impacts of different fuel cycles in which all radioactive wastes (except those from mining and milling) are placed in a geologic repository in salt. To achieve this objective, INFCE Working Group 7 examined the radiologic dose to humans from geologic repositories containing waste arisings as defined for seven reference fuel cycles. This report examines the release consequences for a generic waste repository in bedded salt. The top of the salt formation and the top of the repository are assumed to be 250 and 600 m, respectively, below the surface. The hydrogeologic structure above the salt consists of two aquifers and two equitards. The aquifers connect to a river 6.2 km from the repository. The regional gradient to the river is 1 m/km in all aquifers. Hydrologic, transport, and dose models were used to model two release scenarios for each fuel cycle, one without a major disturbance and one in which a major geologic perturbation breached the repository immediately after it was sealed. The purpose of the modeling was to predict the rate of transport of radioactive contaminants from the repository through the geosphere to the biosphere, and to determine the potential dose to humans. Of the many radionuclides in the waste, only ^{129}I and ^{226}Ra arrived at the river in sufficient concentrations for a measurable dose calculation. Radionuclide concentrations in the ground water pose no threat to man because the ground water is a concentrated brine and it is diluted by a factor of 10^6 to 10^7 upon entering the river.

1497 (INFCE/DEP/WG--7/23) BRIEF ACCOUNT OF THE PROCEEDINGS OF WORKING GROUP 7, WASTE MANAGEMENT AND DISPOSAL, OF THE INTERNATIONAL NUCLEAR FUEL CYCLE EVALUATION. (INFCE Working Group 7. Secretariat). [nd]. 6p. NTIS (US Sales Only), PC A02/MF A01.

FUEL CYCLE;INTERNATIONAL COOPERATION; MEETINGS;RADIOACTIVE WASTE DISPOSAL;NUCLEAR INDUSTRY;RADIOACTIVE WASTE MANAGEMENT

1498 (INIS-mf--4782, pp 155-170) WASTE MANAGEMENT AS THE CENTRAL TASK OF NUCLEAR ENERGY POLICY. Boehm, H. 1977. (In German).

From Energy policies forum of the Landesregierung; Stuttgart, F.R. Germany (9 May 1977).

A survey article deals with the tasks of the different steps of waste disposal, the amounts of fuel elements and waste obtained and the role of reprocessing in waste management, the intermediate storage of fuel elements and the alternative reprocessing or direct ultimate storage of fuel elements. The present state of the art of large-scale waste management in West Germany, is briefly outlined including responsibilities.

1499 (INIS-mf--4782, pp 187-202) PROBLEMS OF THE FINAL STORAGE OF RADIOACTIVE WASTE IN SALT FORMATIONS. Hofrichter, E. 1977. (In German).

From Energy policies forum of the Landesregierung; Stuttgart, F.R. Germany (9 May 1977).

The geological conditions for the final storage of radioactive waste, the occurrence of salt formations, and the tectonics of salt domes are discussed. The safety of salt rocks, the impermeability of the rocks, and the thermal problems in the storage of high-activity waste are dealt with. Possibilities and preconditions of final storage in West Germany are discussed.

1500 (INIS-mf--4921) REGULATORY ASPECTS OF UNDERGROUND DISPOSAL OF RADIOACTIVE WASTE - DANISH NOTES. 1978. 6p. Dep. NTIS (US Sales Only), PC A02/MF A01.

In Denmark, provisions regulating nuclear installations (their licensing, and the disposal of radioactive waste amongst other matters) are contained in an Act of 12 May 1976. This act, however, will only come into force if Denmark decides to implement a nuclear power programme. Under the provisions of this Act, the Minister of the Environment is the licensing authority. He receives recommendations from various bodies, including the Inspectorate of Nuclear Installations, and may impose any conditions thought necessary. Three permits are required - site approval, construction permit, and operation permit - and applications must be accompanied by documentation relevant to environmental and nuclear safety and health aspects. Operation of a nuclear installation may be suspended in cases of urgency. As yet, no detailed safety regulations or guidelines on the disposal of nuclear waste have been issued, but a working party, established by the Environmental Protection Agency, is currently studying the problem.

1501 (INIS-mf--5101) POSSIBLE MICROBIAL CORROSION OF DECAY TANKS FOR LIQUID RADIOACTIVE WASTES IN NUCLEAR POWER PLANTS. Zizka, B.; Tittlova, E.; Karacon, J. (Vyskumny Ustav Jadrovych Elektrarni, Jaslovske Bohunice (Czechoslovakia)). (Vyskumny Ustav Jadrovych Elektrarni, Jaslovske Bohunice (Czechoslovakia)). [nd]. 3p. (In Czech). (CONF-7804146--8(Summ.)). Dep. NTIS (US Sales Only), PC A02/MF A01.

1502 (INIS-mf--5209) NUCLEAR POWER. THE NUCLEAR FUEL CYCLE. APPENDIX TO ''ENERGY POLITICAL REVIEW FROM THE MINISTRY OF TRADE, ER79''. (Handelsministeriet, Copenhagen (Denmark)). Mar 1979. 30p. (In Danish). Dep. NTIS (US Sales Only), PC A03/MF A01.

The Danish government has stated officially that the application of nuclear energy is a part of the government's energy politics; however, before the government can take a final position on the utilization of nuclear power the problem of radioactive waste disposal must be solved. The government anticipates that this will be cleared up before 1980. The present note reviews the government's contribution in providing national solutions to the storage problems and to establish bilateral or multilateral waste storage arrangements. As an appendix is reprinted an account from a Ministry of Trade committee on the nuclear fuel cycle.

1503 (INIS-mf--5211) FINAL DISPOSAL OF HIGH-LEVEL WASTE FROM NUCLEAR POWER PLANTS. (Akademiet for de Tekniske Videnskaber, Lyngby (Denmark)). May 1979. 67p. (In Danish). Dep. NTIS (US Sales Only), PC A04/MF A01.

A report on the possibilities of high-level radioactive waste disposal is presented by a working group appointed by the Danish Academy of Technical Sciences which consists of specialists in nuclear power, corrosion, health physics, chemistry, geology, physics, and zoology. If nuclear power is introduced in Denmark five nuclear power plants with a total installed power of about 5000 MW are expected to be established. Dependent on the handling procedures the volume of the high-level wastes will be between 10 and 50 cubic meters yearly. As the amount of wastes that would be produced in Danish nuclear power plants will be small compared to the amount from other countries, it is natural to try to solve a Danish waste problem through an arrangement on waste disposal with a foreign plant. Also, for economic and technical reasons this solution would be the best, and the entering into a satisfactory agreement should therefore be given high priority. However, it is not possible to know for sure that such an agreement could be reached, and it is therefore necessary to evaluate the possibilities for geologic waste disposal in Denmark. It is concluded that without doubt several geologic formations in the Danish deeper underground are suitable for waste disposal. A main problem is to find a formation which can prove to be isolated from the biosphere for many millennia. It is recommended that geological formations be studied in detail and that some locations suitable for waste disposal should be selected in order that they can be reserved for this purpose.

1504 (INIS-mf--5298) VITRIFIED RADWASTE FROM REPROCESSING. MATERIAL CONCERNING THE EXAMINATION BY THE SWEDISH NUCLEAR POWER INSPECTORATE OF THE SUPPLEMENTARY GEOLOGY REPORT FROM THE KBS-PROJECT. (Kaernbraenslesaekerhet, Stockholm (Sweden)). 1979. 210p. (In Swedish). Dep. NTIS (US Sales Only), PC A11/MF A01.

The Swedish Nuclear Power Inspectorate was designated by the Swedish Government to examine the supplementary geologic investigations performed by the utilities' KBS-project and to judge wheather the area investigated, Sternoe in southern Sweden, could be used for constructing a safe repository for radioactive wastes or not. This report contains material that was ordered by or sent to the Nuclear Power Inspectorate as well as the report by the Inspectorate to the Government.

1505 (INIS-mf--5299) VITRIFIED RADWASTE FROM REPROCESSING. SUPPLEMENTARY GEOLOGICAL INVESTIGATIONS OF THE KBS-PROJECT, SWEDEN. (Kaernbraenslesaekerhet, Stockholm (Sweden)). 1979. 34p. (In Swedish). Dep. NTIS (US Sales Only), PC A03/MF A01.

The Swedish nuclear power utilities' application to load two new reactors, according to the so called Stipulation Act was denied by the Swedish Government i Novermber 1978. According to the Government the utilities' KBS-project had not demonstrated the existence of a large, light rockformation suited for disposal of the radioactive wastes or the spent fuels. In this report an account is given of the futher investigations that were undertaken by the KBS-project to prove that such a rockformation exists at Sternoe in Southern Sweden.

1506 (INIS-mf--5549) ACT NO. 298 OF 16 MARCH 1979 ON PREVENTION OF MARINE POLLUTION. 1 Apr 1979. 3p. (In Finnish). NTIS (US Sales Only), PC A02/MF A01.

This Act enables implementation in Finland of the Convention on the Protection of Marine Environment of the Baltic Sea, 1974 (the so-called Helsinki Convention) and the Convention on the Prevention of Marine Pollution by Dumping of wastes and Other Matter, 1972 (the so-called London Convention). The Act prohibits the dumping of any high-level radioactive waste or matter. A prior permit is required for dumping lower level waste or matter.

1507 (INIS-mf--5570, pp 15-26) DESACTIVATION OF LIQUID RADIOACTIVE WASTES OF LOW AND MEDIUM ACTIVITY. Golinski, M.; Charomska, K. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

The results of research made according to the program of scientific and technical cooperation of the CMEA countries are discussed. The main direction of these research works is on future improvement of installations for purification of liquid radioactive wastes by chemical methods of coprecipitation and coagulation, ion exchange, sorption, distillation and electrolysis. It was shown that methods of coprecipitation and coagulation have low efficiency and the activity reduction factor seldom was more than 10. In sorption processes different sorbents, both organic and nonorganic were used. The modified bentonite used as a sorbent agent has shown high selectivity towards cesium ions. Waste concentration by means of distillation is an universal but rather expensive method and is applied mainly in the cases of high salts concentration and high specific activity of liquid wastes. Electrolysis, as a method of the liquid wastes purification is used in the USSR and has high efficiency with low energy consumption.

1508 (INIS-mf--5570, pp 100-103) PROLONGED STORAGE OF HIGHLY CONCENTRATED LIQUID RADIOACTIVE WASTES IN SPECIAL TANKS. Sobolev, I.A.; Khomchik, L.M.; Mingatina, R.G.; Nazsryuk, A.G.; Bazhenov, Yu.M.; Khozyainov, V.A. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Results of investigations for determination and estimation of processes occuring in liquid radioactive wastes when long period storage (1 - 5 years) are stated. These investigations were conducted at the Central station for radiation safety. Results are given for determination of physical state of solutions in tanks depending on the depth of sampling and also on chemical composition of wastes and composition of gas - air mixture ower the solution surface. Results of radiochemical analysis of samples are given. On the grounds of the results of investigations, conclusions are made and recomendations are given concerning prolonged storage of highly concentrated radioactive liquid wastes. Prolonged storage of this type of wastes is recognized potentially dangerous and hence unacceptable.

1509 (INIS-mf--5571, pp 129-133)

NONSTATIONARY TEMPERATURE FIELDS ON DISPOSAL OF SOLID RADIOACTIVE WASTES OF HIGH ACTIVITY INTO GROUND. Verigin, N.N.; Martynov, Yu.P.; Kryukov, I.I. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

The method is given for calculation of the temperature developed by vitrificated high-activity wastes as a result of selfheating in burial into ground. Nonstationary method is applied in calculation of the temperature fields. Two nonstationary problems are considered for deepened burial sites of idealized shape of sphere and horizantally placed cylinder. External temperature field is taken into account particularly. The external temperature field plaid the main role in the temperature regime establishment in burial into ground. As an example, temperature calculations are given for bituminized product with inclusion of spent ion exchange rasines from nuclear power plant. The results are given obtained in calculation of the temperature of solidificated radioactive wastes in deepened burial site of spheric shape. The salculations has been done by stationary and non-stationary methods of calculations.

1510 (INIS-mf--5571, pp 122-128) SURFACE DEPOSITORIES FOR VITRIFICATED HIGH-ACTIVITY WASTES. Azamaeva, L.G.; Kondrat'ev, A.N.; Kryukov, I.I.; Kulichendo, V.V.; Martynov, Yu.P.; Paramoshkin, V.I.; Terekhov, V.G. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Influence of specific heat emission and permissible storage temperature of vitrificated wastes and also influence of methods of the wastes cooling on the degree of necessary reduction of the size of tanks for wastes storage are stated. Influence of the degree of the liquid wastes concentration during the process of vitrification on economy of waste storage in the stores of different types are discussed. Calculations were made for vitrificated wastes from the reactor fuel reprocessing plant. Dependence is given for permissible diameter of the container on specific heat emission and thermal stability of vitrificated wastes. Design of the store for vitrificated wastes is described in particular cooling system for containers. Two variants of the store cooling system are considered; air cooling system and water cooling system. Technical and economic estimations of the storage methods for vitrificated wastes are given.

1511 (INIS-mf--5571, pp 134-140) DEVELOPMENT OF A STAND-DEPOSITORY FOR STORAGE AND INVESTIGATION OF HIGH-ACTIVITY SOLID WASTES BEHAVIOUR. Kirillovich, A.P.; Grushanin, A.A.; Grachev, E.A.; Skiba, O.V.; Lavrinovich, Yu.G.; Yur'ev, V.G.; Kazmenko, V.D. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Problems are considered connected with development of experimental stand-depository for controlled storage and investigation of behaviour of high-activity wastes. Behaviour of the high-activity wastes from the fast reactor BOR-60 fuel reprocessing is examined. Actuality of the problem is caused by the specifity of solid wastes from fuel regeneration process by the gaseous fluoride method. These solid wastes have specific activity of order of tenths and hundreds of thousands of curi per kilogram. Design of the depository built in two variants, with air and water cooling, is described. Characteristics of the wastes subject to storage and results of calculations of dependance of container radius from specific heat emittance of wastes are given. Some methods are stated of ensuring safety of especially higly active wastes. The results are given of calculation of maximum after-heat for the depositiry and for selection of basic parameters and dementions of the depository for high-active wastes.

1512 (INIS-mf--5571, pp 145-150) RESULTS OF INVESTIGATIONS OF BEHAVIOUR OF HIGH-ACTIVITY SOLID WASTES AND THEIR COMPATIBILITY WITH STRUCTURAL MATERIALS OF PROTECTIVE AMPULES DURING LONG PERIOD STORAGE. Kirillovich, A.P.; Dem'yanovich, M.A.; Lavrinovich, Yu.G.; Skiba, O.V.; Gazizov, R.K.; Vorobei, M.P.; Starozhukov, D.I.; Belokopytov, V.S. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Some results are presented of investigations of properties and behaviour of high-activity wastes, produced during regeneration of the BOR-60 reactor fuel by gaseous-fluorine method. The following characteristics were determined: energy emittance; radiation and thermal resistance; thermal conductivity; fission products volatility; corrosion effects of wastes on structural materials. As samples of the structural materials, austenite- and carbon-steels and nickel were examined. Changes of wastes and container walls temperature as well as preasure changes inside container during the period of experiment were determined. The results are given of investigations of corrosion resistance of the tested structural materials samples depending on the temperature and wastes type. It has shown that corrosion of the structural materials depends on elevation of the temperature and humidity of medium.

1513 (INIS-mf--5571, pp 103-109) THERMAL, CHEMICAL AND RADIATION STABILITY OF VITRIFICATED RADIOACTIVE WASTES. Kulichenko, V.V.; Krylova, N.V.; Musatov, N.D.; Vlasov, V.I. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Ionizing radiation and elevated temperature influence on the changes of leaching rate of high-activity vitrificated wastes during long time storage were examined. In addition, possibilities of radionuclides delocalization to different rocks in condition out of contact with water was investigated. It has shown that possibilities of environmental contamination due to radionuclides diffusion from glass, for instance diffusion of strontium-90, during storage of solid radioactive materials was excluded. Data are given for determination of delocalization rate for cesium-137 and strontium-90 during storage of vitrificated wastes at different temperatures. It has been found that the delocalization rate for radionuclides at the room temperature considerably rised as a result of storage at the open air. Leaching process for radionuclides is little dependent on the storage temperature when materials are in contact with water. Reduction of chemical stability is explained by the structural

changes of compound. The X-ray phase analysis has shown that compounds structure considerably depended on annealing time at 900 and 1100 centigrades. Increase of the annealing time leads to sharp increase of chemical stability. It has shown that prospective materials for vitrification of wastes from fast reactors fuel elements reprocessing could be basalt- and pyroxene- like materials obtained on the basis of blast-furnace slags.

1514 (INIS-mf--5571, pp 86-89) PROJECT FOR BURIAL OF NUCLEAR POWER PLANT WASTES IN CZECHOSLOVAKIA. Marek, J.; Petr, Ya. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Problems of ensuring safety of radioactive wastes burial for nuclear power plants wastes produced during their exploitation are discussed. The research programm is stated directed towards investigation and determination of the method for desactivation of liquid radioactive wastes from nuclear power plants. Estimation of the following variants of radioactive wastes desactivation are given: storage of liquid radioactive wastes in underground tanks at the nuclear power plant territory; processing of the wastes and storage of solidificated wastes at the territiry of the nuclear power plant; processing of the wastes at the territory of nuclear power plant and storage of the solidificated wastes in the centralized store; processing and storage of the wastes at the territiry of centralized store outside of the territory of nuclear power plant. Volumes and characteristics of the wastes processed and methods of wastes processing are given. Technology of solidification of liquid wastes from nuclear power plants by bituminization and technology of solid wastes processing are stated. Problems of the processed wastes transportation and storage are considered.

1515 (INIS-mf--5572) RESEARCH ON DESACTIVATION OF LIQUID, SOLID AND GASEOUS RADIOACTIVE WASTES AND DECONTAMINATION OF SURFACES. PART 3. (Sovet Ehkonomicheskoj Vzaimopomoshchi, Moscow (USSR). Postoyanniya Komissiya po Ispol'zovaniyu Atomnoj Ehnergii v Mirnykh Tselyakh). 1978. 56p. (In Russian). (CONF-761260--(Pt.3)). NTIS (US Sales Only), PC A04/MF A01.

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Problems are discussed concerning burial of liquid wastes both in deep and in surface geological formations. Some problems are elucidated concerning ionizing radiations effects on sorptive properties of soils and effects of radioactive load on them, methods of calculations of temperature fields of radioactive wastes containing mediums. Express-methods are discribed for control of radionuclides migration in stratum-collectors. The data presented have been obtained as a result of many years industrial-scale operation of burial sites.

1516 (INIS-mf--5572, pp 29-33) EFFECT OF IONIZING RADIATION ON THE SORPTIVE CAPACITY OF SOILS. Balukova, V.D.; Kosareva, I.M. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Sorptive capacity of soils and rocks with respect to radionuclides was investigated. Sorption of radionuclides from the wastes, buried in surface soil or underground geological formations was examined. Soils and rocks are considered as natural sorbents having, in general, cation exchange properties. Radiochemical composition of the wastes investigated and calculated values of absorbed dose in system soil- waste are given. Effect of ionizing radiation on sorptive parameters of soils and rocks were determined. It has been established that sorptive capacity of soils or rocks encreased by the grouth of the absorbed dose during irradiation of the rock-solution system. During irradiation only the solid phase, sorptive capacity is decreasing. It has been established that there was effect of the medium of solution in which irradiation occured and changes of sorption capacity of soils and rocks was connected with changes of surface structure of minerals and their dispersity during irradiation.

1517 (INIS-mf--5572, pp 48-53) RADIATION BURDEN IN UNDERGROUND STORES AND METHODS FOR CONTROL OF SPECIFIC RADIONUCLIDES CONTENT. Balukova, V.L.; Kabakchi, S.A.; Kosareva, I.M. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

It has been shown that radiation load in the stratum-depository during burial of liquid high-activity wastes was determined by mineralogical characteristics of rocks, by sorptive parameters of minerals, by chemical and radiochemical properties of wastes and by the radioactivity level of wastes and effective porosity of rocks. Radiochemical composition of the wastes examined is given. Distribution of every radionuclide in the stratum is characterized by the parameter of sorption rate and by the parameter of sorption equilibrium. Equation is given for calculation of sorption rate and the experimental data are given for the limit of possible accumulation of separate elements on rocks formed by sandstones, during filtration throungh the wastes, containing different amouts of surplus nitric acid. Data are stated for the results on investigations of wastes radiolysis during burial, for measurements of dose rate in time, for nitric acid decomposition and gase emittance and also for the results of investigations of nuclides desorption from rocks surfaces as a result of their treatment by weak solution of nitric acid.

1518 (INIS-mf--5572, pp 11-23) CALCULATION OF THE TEMPERATURE FIELD DURING BURIAL OF RADIOACTIVE WASTES. Bottcher, A. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

The problem of temperature field estimation for burial of solid radioactive wastes in salt deposits is considered. The temperature field is estimated caused by burial regions in the whole deposit during long period of time and taking into account geological situation. While solving the problem, maximum heating at the centre of burial region and the maximum temperature for definite scheme of burial are determined. The mathematical models are formulated as boundary problems for differential equations in quotient derivatives. Calculations of variants are interpreted

relative to the main task: ensuring maximum safety with minimum expenditure. Several ways for solution of the thermal conduction equation for different models are concidered. Comparisons are given for the results of measuring in natural conditions and the results of calculated values. For calculation, specially compiled computer codes are used.

1519 (INIS-mf--5572, pp 34-37) CALCULATION OF TEMPERATURE FIELD OF MEDIA, CONTAINING RADIOACTIVE WASTES. Burmistrova, N.M.; Okun'kov, G.A.; Yudin, F.P. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Method is considered for calculation of a temperature field in rock during burial of liquid wastes with addition of cement by the method of hydraulic rapture of watertight stratum and also during burial of wastes in deep pits in the form of cylindric solid blocks. To simplify the problem, heat physics properties of surraunding rocks and also properties of solidificated radioactive wastes have been taken equal and constant. Methodology of the temperature field calculation and results of the temperature change, depending to time, obtained by calculations for radiation sources of different shape are given. Computations have been performed on computer.

1520 (INIS-mf--5572, pp 38-47) RADIOACTIVE WASTES BURIAL IN SURFACE GEOLOGICAL FORMATIONS. Dlougly, Eh.; Shafarzh, O. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

The task of the research was to check safety conditions of solidificated radioactive wastes burial and to select geological formations excluding essential diffusion of radionuclides into environment. By means of geological models, migration of radionuclides in some soils and their disperse properties were investigated. The results attained were checked in real conditions at the sites for construction of nuclear power plants. By means of classificational study of soils and rocks frequently met with in the surface geological formations, search was done for litological types having low permeability with high sorptive capacity. Demands for the radioactive wastes burial site and criterions for the waste disposal station site selection are stated. Basic parameters of burial site and some design solutions are given. Results of comparison of several methods for solidificated wastes burial are given. Lay-out of the burial site exploitation is given. The results are stated of investigations on radionuclides migration in surface formations.

1521 (IS-M--273) ISSUES RELEVANT TO NUCLEAR WASTE CANISTER MATERIALS. Scott, T.E. (Ames Lab., IA (USA)). 1980. Contract W-7405-ENG-82. 38p. (CONF-800305--7). Dep. NTIS, PC A03/MF A01.

From Corrosion/80 NACE meeting; Chicago, IL, USA (6 Mar 1980).

This paper focuses on the canister as a component of multibarrier systems for the containment and isolation of high-level radioactive wastes and spent fuel from nuclear reactor burning. It provides perspective for the role of canisters in the overall nuclear fuel cycle with special emphasis on the multibarrier concept of waste isolation. Attention is given to the chemical composition of wastes, waste forms, interim storage environments, and geologic isolation repository environments; these will all have to be considered in canister materials selection. In addition, other factors such as mechanical loads, radiation effects, and radioactive decay-heat generation rates are cited. The paper culminates with a summary of the author's opinion of the technical issues which need to be resolved before canisters can be considered viable components of a multibarrier system for geologic waste isolation.

1522 (JAB--00099-128) CONSIDERATIONS FOR DEVELOPING SEISMIC DESIGN CRITERIA FOR NUCLEAR WASTE STORAGE REPOSITORIES. Owen, G.N.; Yanev, P.I.; Scholl, R.E. (URS/John A. Blume and Associates, Engineers, San Francisco, CA (USA)). Apr 1980. Contract AC08-76DP00099. 73p. Dep. NTIS, PC A04/MF A01.

The function of seismic design criteria is to reduce the potential for hazards that may arise during various stages of the repository life. During the operational phase, the major concern is with the possible effects of earthquakes on surface facilities, underground facilities, and equipment. During the decommissioned phase, the major concern is with the potential effects of earthquakes on the geologic formation, which may result in a reduction in isolation capacity. Existing standards and guides or criteria used for the static and seismic design of licensed nuclear facilities were reviewed and evaluated for their applicability to repository design. This report is directed mainly toward the development of seismic design criteria for the underground structures of repositories. An initial step in the development of seismic design criteria for the underground structures of repositories is the development of performance criteria, or minimum standards of acceptable behavior. A number of possible damage modes are identified for the operating phase of the repository; however, no damage modes are foreseen that would perturb the long-term function of the repository, except for the possibility of increased permeability within the rock mass. Subsequent steps in formulating acceptable seismic design criteria for the underground structures involve the quantification of the design process. The report discusses the necessity of specifying the form of ground motion that would be needed for seismic analysis and the procedures that may be used for making ground motion predictions. Further discussions outline what is needed for analysis, including rock properties, failure criteria, modeling techniques, seismic hardening criteria for the host rock mass, and probabilistic considerations.

1523 (JAERI-M--7780) INTEGRITY DEMONSTRATION TEST OF RADIOACTIVE WASTE PACKAGES DEEP-SEA DISPOSAL. HANGING DOWN-DRAWING UP SEA TESTS OF MULTISTAGE TYPE AND MONOLITHIC SOLID TYPE PACKAGES. Seki, S.; Ouchi, K.; Hisa, I.; Ito, A.; Morishita, S. (Japan Atomic Energy Research Inst., Tokyo). Jul 1978. 41p. (In Japanese). Dep. NTIS (US Sales Only), PC A04/MF A01.

Hanging down-drawing up tests in the sea were carried out down to 5000m depth of the model wastes, i.e. D-50 multi-stage type package and monolithic solid type package (packed in M class drum). 1) Hanging down-drawing up tests in the sea were successful. 2) In consecutive photographing a D-50 multi-stage package in deep sea, clear photographs were

obtained. 3) For the D-50 multi-stage type package, visual inspection of the drum outside and lining outside and cross-section and the consecutive photographs, and for the cement monolithic solid type package, the visual inspection of the drum outside and solid outside, showed no problems in safety.

1524 (JAERI-M--7936) LEACHING OF TRITIUM FROM A CEMENT COMPOSITE. Matsuzuru, Hideo; Ito, Akihiko. (Japan Atomic Energy Research Inst., Tokyo). Oct 1978. 17p. (In Japanese). Dep. NTIS (US Sales Only), PC A03/MF A01.

Leaching of tritium from cement composites into an aqueous phase has been studied to evaluate the safety of incorporation of the tritiated liquid waste into cement. Leaching tests were performed by the method recommended by the International Atomic Energy Agency. The Leaching fraction was measured as functions of waste-cement ratio (Wa/C), temperature of leachant and curing time. The tritium leachability of cement in the long term test follows the order: alumina cement portland cement slag cement. The fraction of tritium leached increases with increasing Wa/C and temperature and decreasing curing period. A deionized water as a leachant gives a slightly higher leachability than synthetic sea water. The amount leached of tritium from a 200 l drum size specimen was estimated on the basis of the above results.

1525 (JAERI-M--8044) RADIOLOGICAL SAFETY STUDIES ON THE GROUND DISPOSAL OF RADIOACTIVE WASTES. DISTRIBUTION AND MIGRATION OF RADIONUCLIDES IN AN AERATED ZONE. Takebe, S.; Wadachi, Y. (Japan Atomic Energy Research Inst., Tokyo). Jan 1979. 19p. (In Japanese). Dep. NTIS (US Sales Only), PC A03/MF A01.

A fundamental study on the safety evaluation of ground disposal of radioactive wastes is reported. In order to reveal the behavior of radionuclides in an aerated zone, the distribution coefficient, distribution ratio and migration rate of ^{60}Co, ^{137}Cs and ^{90}Sr-^{90}Y were measured with a sand layer model apparatus. Each radionuclide shows a large distribution coefficient (unsaturated) in the acidic and small value in both the neutral and the alkaline condition. In pouring a radioactive aqueous solution into the sand layer, most of the radionuclide is adsorbed on the surface of sand layer and the distribution ratio decreases exponentialy towards the deeper layer. The migration rates of ^{60}Co, ^{137}Cs and ^{90}Sr-^{90}Y were calculated by Inoue's equation regarding the radionuclide migration in an aerated zone. Each migration rate is small in the acidic and large in the alkaline condition. These migration rates, however, are considerably smaller as compared with that of water itself: ^{60}Co ca. 1/100, ^{137}Cs ca. 1/10,000 and ^{90}Sr-^{90}Y ca. 1/1,000.

1526 (Juel--1581) INVESTIGATIONS OF TRITIATED WATER FIXATION IN SILICAGEL, ZEOLITES AND DIFFERENT TYPES OF CEMENT. Todorovic, M. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Chemische Technologie). Mar 1979. 9p. NTIS (US Sales Only), PC A03/MF A01.

The exchange of tritiated water fixed in zeolites, silicagel and different kinds of cement has been studied as well as the leach behaviour of cements, using IAEA standard method. From the experiments a leach factor L has been evaluated according to Bell's mathematical model.

1527 (KBS-TR--47, pp 78-96) THREE DIMENSIONAL MODEL OF GROUNDWATER FLOW GOVERNED BY TOPOGRAPHY. Stokes, J.; Thunvik, R. (Tekniska Hoegskolan, Stockholm (Sweden)). May 1978.

Investigations of groundwater flow in rock around repositories for nuclear waste.

As a complement to the two-dimensional computations for the Forsmark Area, a three-dimensional flow model was developed. In this model, which is a finite-element model, the conductivity is defined separately for each element. In this way fracture zones have been included as well as a conductivity varying in space. The results are presented as equipotentials, travel times and maps describing conditions of in- and out flow.

1528 (KBS-TR--47, pp 62-77) LOCAL GROUNDWATER DEPRESSION AROUND A REPOSITORY. Thunvik, R. (Tekniska Hoegskolan, Stockholm (Sweden)). May 1978.

Investigations of groundwater flow in rock around repositories for nuclear waste.

A two-dimensional flow analysis was made to study the effect on the groundwater table due to drainage of the storage tunnels during the construction resp. operation period. The net accretion to the phreatic surface was assumed evenly distributed in space and time. Numerical examples with equipotentials and consecutive positions of the phreatic surface are presented.

1529 (KBS-TR--49) ROCK STRESS MEASUREMENTS IN STRIPA MINE. Carlsson, H. (Kaernbraenslesaekerhet, Stockholm (Sweden)). Aug 1977. 27p. (In Swedish). Dep. NTIS (US Sales Only), PC A03/MF A01.

Rock stress measurements at 340 m levels of the Stripa Mine have been carried out with the Leeman tri-axial equipment. The largest principal stress is found to be 20.0 MPa and directed parallel with the strike of the granite. The intermediate principal stress is 11.5 MPa and directed almost horizontal and perpendicular to the contact. The minor principal stress has a magnitude of 5.4 MPa. The deduced vertical stress is approximately of the same value as can be theoretically calculated.

1530 (KBS-TR--109) LEACHABLE GAP ACTIVITIES. Devell, L.; Hesboel, R. (Kaernbraenslesaekerhet, Stockholm (Sweden)). Oct 1978. 26p. (In Swedish). Dep. NTIS (US Sales Only), PC A03/MF A01.

In the event of ground water penetration into fuel pins after ultimate disposal in crystalline rock a certain fraction of the volatile fission products iodine-129 and cesium-135 may be leached from the fuel within a shorter time period than the rest of the fuel. This fraction based on gap activities and leach experiments has been estimated to be: For BWR-fuel 0.1-1 per cent; and for PWR-fuel 1-10 per cent, for both isotopes.

1531 (KBS-TR--110) IN SITU EXPERIMENTS ON NUCLIDE MIGRATION IN FRACTURED CRYSTALLINE ROCKS. Landstroem, O.; Klockars, C.E.; Holmberg, K.E.; Westerberg, S.; Klockars, C.E. (Kaernbraenslesaekerhet, Stockholm (Sweden)). Jul 1978. 29p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Nuclide migration in fractured rocks was studied in field experiments in a granite-gneissic outcrop within the Studsvik research

centre area. Radionuclides representing long-lived fission products of the elements selenium, technetium, tin, cesium, iodine, neodymiun and strontium were injected into a fracture zone intersecting one of the testholes at a depth of 72 metres below the ground surface. Concentration time curves of activities arriving at the pumping borehole were measured. The distance between the boreholes was 51 metres and the pumping rate 0.1 litre/s. The mean transit time and the dispersion coefficient for water were calculated to be 57 h and 8.8 m^2/h, respectively. The radioactivity measurement techniques included gammaspectrometric borehole logging, continuous activity measurements of pumped water and water sampling followed by laboratory analysis. Technetium and iodine travelled as anions with the same velocity as that of water. Strontium was retarded by a factor of about 6. Neither cesium nor neodymium could be detected. In a second series of experiments it was shown that the fracture system surrounding the injection borehole could be effectively grouted with bentonite. Subsequent tracer tests with strontium-85 showed that after more than twelve months all the injected activity still remained in the borehole. It was found that bentonite injection is a very effective way of reducing the radionuclide migration through strongly fractured rock.

1532 (KBS-TR--113, pp 1-48) REPORT ON STABILITY OF MINERALS AT HYDROTHERMAL CONDITIONS. Bergstroem, L. (Goeteborg Univ. (Sweden)). Sep 1978. (In Swedish).
Studies of ceramic materials for incapsulation of high-active waste.
In the first part of this report summarizing discussions and recommendations are given while a literature survey together with references are presented in the second part.

1533 (KBS-TR--113, pp 1-7) PROPOSAL OF MATERIALS FOR THE STORAGE OF RADIOACTIVE WASTES. Carlsson, R. (Svenska Silikatforskningsinstitutet, Goeteborg (Sweden)). Sep 1978. (In Swedish).
Studies of ceramic materials for incapsulation of high-active waste.
On the basis of a literature study concerning the chemical stability of ceramics as well as of different experiencies of persons working with ceramics in Sweden a proposal of candidate materials for the storage of radioactive wastes is presented. Advantages and disadvantages in connection with the use of different ceramics have been tabulated.

1534 (KBS-TR--113, pp 1-16) AL_2O_3 SAMPLES EXPOSED TO SIMULATED UNDERGROUND WATER HAVE BEEN INVESTIGATED BY ELECTRON SPECTROSCOPY FOR CHEMICAL ANALYSIS (ESCA). Olefjord, I.; Rilby, U. (Chalmers Tekniska Hoegskola, Goeteborg (Sweden)). Sep 1978. (In Swedish).
Studies of ceramic materials for incapsulation of high-active waste.
Al_2O_3 samples, which have been exposed to simulated underground water during 30, 100 and 268 days at a temperature of 90 deg C and with pH=8.5, have been studied by ESCA (Electron Spectroscopy for Chemical Analysis). This technique was chosen due to its surface sensitivity and the possibilities to obtain information on the chemical condition of the surface layer and its thickness. Synthetic oxides and hydroxides as well as their correspondences normally formed on metals have also been studied.

1535 (KBS-TR--113, pp 1-8) STUDY WITH AUGER ELECTRON SPECTROSCOPY OF A NUMBER OF CERAMIC SPECIMENS AFTER LEACHING. Leygraf, C.; Hultquist, G. (Tekniska Hoegskolan, Stockholm (Sweden)). Sep 1978. (In Swedish).
Studies of ceramic materials for incapsulation of high-active waste.
A number of ceramic specimens have been investigated with Auger electron spectroscopy in order to make chemical analyses of the remaining ceramic surfaces after leaching or of the leaching product outside the surfaces.

1536 (KBS-TR--114) GAMMA-RADIOLYSIS OF ORGANIC COMPOUNDS AND ALPHA-RADIOLYSIS OF WATER. Christensen, H. (Kaernbraenslesaekerhet, Stockholm (Sweden)). Sep 1978. 32p. (In Swedish, English). Dep. NTIS (US Sales Only), PC A03/MF A01.
This KBS-report is a collection of five technical reports. Various radiolytic problems in connection with the disposal of high-active waste are dealt with. The English titles of the five reports are: 1) Radiolysis of fulvic acids; 2) Radiolysis of organic compounds in bentonite; 3) α-radiolysis of water during the disposal of fuel without reprocessing; 4) Radiolysis of water during the disposal of unreprocessed spent fuel. Oxidation by hydrogen peroxide; 5) Formation and decomposition of hydrogen peroxide by α-radiolysis. These reports (in Swedish) are attached as Appendices A-E.

1537 (KBS-TR--119) FINAL STORAGE IN CONCRETE OF ACTIVATED METAL PARTS. Romben, L.; Tuutti, K. (Kaernbraenslesaekerhet, Stockholm (Sweden)). Jul 1978. 42p. (In Swedish). Dep. NTIS (US Sales Only), PC A04X/MF A01.
A part of the medium-level nuclear waste problem is the disposal of metal parts which have been activated during use in nuclear reactors. Some alloys contain Ni-59 with a half-life or 75000 years. A proposed method for final disposal consists in storing the waste in rock tunnels at a depth of 300-500 m inside containers which are surrounded by a buffer consisting of compacted quartz-bentonite mixture. This paper deals with the possibilities to use containers made of concrete and designed as cubic boxes enclosing the waste material cast and incorporated into cement mortar matrix. Special regard is given to the containment problem in relation to the mechanical and chemical processes that are operating. A calculation of the rate of release of Ni-59 through the walls of a container has given a figure of about 10^{-5} kg Ni per year for undeteriorated container walls. In 6 appendices the sizes of different quantities describing the mechanical and chemical processes which are operating in this containment problem are given.

1538 (KBS-TR--120) SOME NOTES IN CONNECTION WITH THE KBS STUDIES OF FINAL DISPOSAL OF SPENT FUEL. (Kaernbraenslesaekerhet, Stockholm (Sweden)). Sep 1978. 39p. Dep. NTIS (US Sales Only), PC A03/MF A01.
Individual papers were abstracted separately.

1539 (KBS-TR--120, pp 16-19) NOTE ON THE CONSEQUENCE OF HYDROGEN PRODUCTION IN THE REPOSITORY. Neretnieks, I. (Kungliga Tekniska Hoegskolan, Stockholm (Sweden)). Sep 1978.
Some notes in connection with the KBS studies of final disposal of spent fuel.
Hydrogen may be produced in the copper

capsule by zircalloy-corrosion and by radiolysis. Hydrogen diffuses slowly in compacted bentonite. If the production of hydrogen is fast it will not have time to escape by diffusion at the same rate at which it is produced. A gas bubble may form. In the present work it is concluded that no grave consequences are expected if escaping hydrogen opens a channel in the clay and in the rock.

1540 (KFK--2552) CHEMICAL COMPATIBILITY OF HLW BOROSILICATE GLASSES WITH ACTINIDES. SOLUBILITIES AND SEGREGATION PROCESSES. Walker, C.T.; Scheffler, K.; Riege, U. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Entsorgungstechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Nov 1978. 23p. (EUR--5750e; PWA--90/78). Dep. NTIS (US Sales Only), PC A03/MF A01.

During liquid storage of HLLW the formation of actinide enriched sludges is being expected. Also during melting of HLW glasses an increase of top-to-bottom actinide concentrations can take place. Both effects have been studied. Besides, the vitrification of plutonium enriched wastes from Pu fuel element fabrication plants has been investigated with respect to an isolated vitrification process or a combined one with the HLLW. It is shown that the solidification of actinides from HLLW and actinide waste concentrates will cause no principal problems. The leaching of actinides has been measured in salt brine at 23°C and 115°C.

1541 (KFK--2750, pp 4600-1-4600-4) PROCESS-DEVELOPMENT AND IMPROVEMENT OF OFF GAS FILTERS FOR REPROCESSING PLANTS. Furrer, J.; Barth, H.; Herrmann, R.; Hunsinger, H.; Linek, A.; Oberst, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Lab. fuer Aerosolphysik und Filtertechnik 2). Oct 1979. (In German).

Semiannual report 1978/2.

The PASSAT facility was commissioned without major technical problems. The equipment for droplet generation and measurement could be calibrated. First investigations of the removal by prototype fiber package units, using droplets of about 1-10 μm diameter, yielded high retention factors for water droplets. At nitrogen monoxide concentrations up to 1 vol.% in pure nitrogen as the carrier gas and with 24 h of expourse at test bed temperatures of 130°C and 150°C noticeable effects have not been found on the loading capacity and iodine removal of the AC 6120-12% Ag iodine sorption material.

1542 (KFK--2750, pp 4600-26-4600-33) INVESTIGATIONS FOR THE KR-85 STORAGE. Penzhorn, R.D.; Noppel, H.E. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Radiochemie); Borgstedt, H.U. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung 1). Oct 1979. (In German).

Semiannual report 1978/2.

First results on the corrosion by Rb and Rb_2O on the inner wall of stainless steal pressure cylinders (material Nr. 1.4306 and 1.4301) and welds (material Nr. 1.4316) under 100 bar Ar pressure after 3000 h at 150°C were obtained. The fixation of noble gases in zeolites was investigated as an alternative to the storage of Kr-85 in pressure cylinders.

1543 (KFK--2798) NEUTRON WELL COUNTER FOR PLUTONIUM ASSAY IN 200 L WASTE DRUMS. Eyrich, W.; Kuechle, M.; Shafiee, M. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Spaltstoffflusskontrolle). May 1979. 20p. Dep. NTIS (US Sales Only), PC A03/MF A01.

A neutron well counter is briefly described which will be used for monitoring the plutonium content of 200 l barrels in the waste treatment plant of the Kernforschungszentrum Karlsruhe. Measurements on simulated waste were made to study the influence of matrix material and non-homogeneous plutonium distribution. The variation in detection efficiency could be reduced from 28% to 10% when the signals from inner and outer neutron detectors in the polyethylene annulus are counted separately and a correction is applied, using this information. This method is superior to the source addition technique. Coincidence counting shows a larger variation which could not be reduced to below 18%.

1544 (KFK--2857) CALCULATIONS ON HEAT GENERATION AND TEMPERATURE RISE DURING STORAGE AND SOLIDIFICATION OF MLW/LLW IN LARGE CAPACITY CAVERNS. REFERENCE SYSTEMS A AND B OF THE IN-SITU-PROJECT. Hauser, W.; Smailos, E.; Koester, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Entsorgungstechnik). Sep 1979. 31p. (In German). NTIS (US Sales Only), PC A03/MF A01.

Investigations were made on the conditions under which the containerless final disposal of liquid radioactive MLW/LLW (in-situ project) from the back-end fuel cycle center in caverns of 82 500 m^3 (and 134 000 m^3, respectively) capacity (reference systems A and B) about 1 000 m below ground level will be feasible without involving problems of heating. The waste product to be introduced by layers via a vertical pipeline in reference system A consists of a cemented granulated material (diameter about 10 mm) containing the MLW/LLW concentrate, and a cementitious grout mixed with tritium effluents, which serves as the filler material. In reference system B the cemented MLW/LLW concentrate is packed into 200-400 l units. The maximum permissible temperature for the waste product is fixed at 90°C for reasons of product quality. Calculations have been performed on the temperature rise in the product due to the decay heat and the heat of setting of cements in the caverns. The calculations were related to the degree of solidification of the preconditioned granulated material and to cements of different hydratation heats (Portland cement 350 F, blast-furnace cement), to different sand admixtures in the grout and to different rates of storing. It could be shown that under the aspect of heat generation both reference systems are suited in principle for storing the MLW/LLW considered here, provided that following assumption are made: 1) complete setting of the granulated material prior to filling; 2) high sand content in the grout; 3) storage by thin layers of the waste product amount produced every year.

1545 (LA--7931-PR) STUDIES OF TRANSURANIC WASTE STORAGE UNDER CONDITIONS EXPECTED IN THE WASTE ISOLATION PILOT PLANT (WIPP). INTERIM SUMMARY REPORT, OCTOBER 1, 1977-JUNE 15, 1979. Kosiewicz, S.T.; Barraclough, B.L.; Zerwekh, A. (Los Alamos Scientific Lab., NM (USA)). Jan 1980. Contract W-7405-ENG-36. 33p. Dep. NTIS, PC A03/MF A01.

The major focus of the program has been on

the gas generation potential of organic wastes produced by radiolytic and thermal degradation under simulated WIPP storage conditions. The effects of TRU contamination level, temperature, waste type, pressure, and exposure time on radiolysis are presented. In addition, results from preliminary experiments on processed sludge dewatering are discussed. A summary is presented here of the results of a detailed study of all retrievably stored TRU wastes present at LASL before January 1, 1978. The data indicate a gross volume for the LASL inventory of 1610 m^3 with a total weight of nearly 1.24×10^6 kg (1240 metric tonnes). The dominant radionuclide contents of the waste are plutonium (primarily ^{239}Pu) and americium.

1546 (LA--7974-PR) RESEARCH AND DEVELOPMENT RELATED TO NEVADA NUCLEAR WASTE STORAGE INVESTIGATIONS. PROGRESS REPORT, APRIL 1-JUNE 30, 1979. Wolfsberg, K. (comp.). (Los Alamos Scientific Lab., NM (USA)). Aug 1979. Contract W-7405-ENG-36. 14p. Dep. NTIS, PC A02/MF A01.

Geochemical laboratory support for Subtask 3.2.2, Tuff Media Investigations; geologic support for Subtask 2.5, Tectonics, Seismicity, and Volcanism; and administrative support for Subtask 5.2, Quality Control are presented. Mineralogic-petrologic examination of material from Yucca Mountain hole UE25Anumber1 is nearing completion. Sorption measurements on tuff from holes J-13 and UE25Anumber1 are continuing with both natural and synthetic ground waters and under aerobic and anoxic conditions. Column work is continuing. A standardized batch procedure for Am and Pu has been adopted. A preliminary probability analysis has been performed for volcanic hazards of the Crater Flats basalts.

1547 (LA--8049-MS) PRELIMINARY CONCEPTS: MATERIALS MANAGEMENT IN AN INTERNATIONALLY SAFEGUARDED NUCLEAR-WASTE GEOLOGIC REPOSITORY. Ostenak, C.A.; Whitty, W.J.; Dietz, R.J. (Los Alamos Scientific Lab., NM (USA)). Nov 1979. Contract W-7405-ENG-36. 66p. Dep. NTIS, PC A04/MF A01.

Preliminary concepts of materials accountability are presented for an internationally safeguarded nuclear-waste geologic repository. A hypothetical reference repository that receives nuclear waste for emplacement in a geologic medium serves to illustrate specific safeguards concepts. Nuclear wastes received at the reference repository derive from prior fuel-cycle operations. Alternative safeguards techniques ranging from item accounting to nondestructive assay and waste characteristics that affect the necessary level of safeguards are examined. Downgrading of safeguards prior to shipment to the repository is recommended whenever possible. The point in the waste cycle where international safeguards may be terminate depends on the fissile content, feasibility of separation, and practicable recoverability of the waste: termination may not be possible if spent fuels are declared as waste.

1548 (LA--8088-PR) LABORATORY STUDIES OF RADIONUCLIDE DISTRIBUTIONS BETWEEN SELECTED GROUNDWATERS AND GEOLOGIC MEDIA. ANNUAL REPORT, OCTOBER 1, 1978-SEPTEMBER 30, 1979. Erdal, B.R. (comp.). (Los Alamos Scientific Lab., NM (USA)). Feb 1980. Contract W-7505-ENG-36. 91p. Dep. NTIS, PC A05/MF A01.

Extensive studies of the behavior of plutonium and americium in pH approx. = 8 groundwaters were made, particularly with respect to container sorption, filtering, and centrifugation. Significant improvements in the method used for measuring sorption ratios for these elements were developed, and their sorption-desorption ratios on argillite and tuff were measured. Effects of particle size, temperature, sampling location, mineralogy, and time were investigated for these elements. The chemical composition of the water was found to be a major factor that governs sorption behavior. Studies of the sorption of strontion, cesium, barium, cerium, europium, uranium, and americium on Hainesville salt dome materials were made under aerobic and anoxic (<0.2 ppM oxygen) conditions using two synthetic groundwaters: one represented the Wilcox aquifer in the Hainesville region and the second was a dilute brine. Studies of the sorption of strontium, cesium, barium, cerium, europium, and uranium(VI) on granite and argillite were made under anoxic (<0.2 ppM oxygen) conditions and the results were compared to earlier measurements made under aerobic conditions. The sorption of uranium(VI) on argillite under atmospheric conditions was investigated. Measurements of migration rates in crushed granite, argillite, and tuff were made and compared with batch results. Infiltration experiments involving the forced injection of activity into intact and fractured cores were also performed. Microautoradiographic techniques were used to detect specific sorption sites. This latter technique was also used to characterize the sorption of plutonium and neptunium on polished thin-sections of alluvium, granite, tuff, and argillite and to assess the amount of aggregation that occurred. Additional physical and chemical characterizations of the materials used in these studies were made, and new analytical techniques were developed.

1549 (LA--8110-MS) SORPTION-DESORPTION STUDIES ON TUFF. II. CONTINUATION OF STUDIES WITH SAMPLES FROM JACKASS FLATS, NEVADA AND INITIAL STUDIES WITH SAMPLES FROM YUCCA MOUNTAIN, NEVADA. Vine, E.N.; Aguilar, R.D.; Bayhurst, B.P. (Los Alamos Scientific Lab., NM (USA)). Jan 1980. Contract W-7405-ENG-36. 75p. Dep. NTIS, PC A04/MF A01.

Distruibution coefficients were determined by a static (batch) technique for sorption-desorption of radionuclides between tuffs from drill holes UE25a No. 1 and J-13 at the Nevada Test Site and water from well J-13. Measurements were performed under atmospheric and controlled atmosphere conditions. Under atmospheric conditions tuffs high in zeolite minerals had sorption ratios of approx. 10^3 to 10^4 ml/g with Sr, Cs, Ba, Ce, Eu, Am, and Pu. For tuffs similar mineralogically to a microgranite the sorption ratios were approx. 10^2 to 10^3 ml/g. Values for U and Tc were obtained under controlled atmosphere (< 0.2 ppM O_2) conditions. Studies were also begun to measure distribution ratios by a dynamic (column) technique. The ratios obtained for the elements studied, Sr, Cs, and Ba, were similar to, although lower than, those obtained by batch methods.

1550 (LA--8152-PR) RESEARCH AND DEVELOPMENT RELATED TO THE NEVADA NUCLEAR WASTE STORAGE INVESTIGATIONS. PROGRESS REPORT, JULY 1-SEPTEMBER 30, 1979. Crowe, B.M. (comp.). (Los Alamos Scientific Lab., NM (USA)). Nov 1979. Contract W-7405-ENG-36. 14p. Dep. NTIS, PC A02/MF A01.

Sorption under anoxic conditions is reported for core samples of tuff from exploratory drill hole UE25a-1. Sorption for Sr, Cs, Ba, Ce, and Eu is somewhat lower in pure nitrogen than in ambient atmosphere, but generally by less than

a factor of two. U and Tc sorb poorly in nitrogen; however, an increase over atmospheric conditions is noted for Tc. Final results for sorption of Pu and Am on core samples from drill hole J-13 are presented, and problems with Am are discussed. Ground water composition is found to be a major factor in sorption. Autoradiography indicates that Pu sorbs indiscriminately on rock thin sections and that Np deposits in aggregate form. Zeolite minerals are present within two distinct horizons of tuff in the stratigraphic section penetrated by exploratory drill hole UE25a-1. The horizons occur in low density tuff (partially to nonwelded and bedded tuff) within the lower part of and stratigraphically below Paintbrush Tuff. Zeolite minerals include clinoptilotite and minor amounts of low silica, high alkali mordenite. The zeolite is characteristic of low temperature (<100°C) ground water alteration of glass in an open hydrologic system. Prototype containment vessels for the hydrothermal soak tests have been assembled and tested. Regional studies of the occurrence and tectonic setting of Plio-Pleistocene age basaltic volcanic centers of the southern Great Basin are in progress. Revised volcanic disruption probability calculations for a 60-km radius circle around Yucca Mountain fall into the range of 10^{-9}/year. Petrographic and geochemical data for the basalts of Crater Flat show a strong control of basalt type with structural setting. Models of crystal-liquid fractionation of the basalts of Crater Flat using observed phenocryst phases cannot account for chemical variations of basalt types.

1551 (LA--8177) ENVIRONMENTAL SAMPLING PROGRAM FOR A SOLAR EVAPORATION POND FOR LIQUID RADIOACTIVE WASTES. Romero, R.; Gunderson, T.C.; Talley, A.D. (Los Alamos Scientific Lab., NM (USA)). Apr 1980. Contract W-7405-ENG-36. 10p. NTIS, PC A02/MF A01.

Los Alamos Scientific Laboratory (LASL) is evaluating solar evaporation as a method for disposal of liquid radioactive wastes. This report describes a sampling program designed to monitor possible escape of radioactivity to the environment from a solar evaporation pond prototype constructed at LASL. Background radioactivity levels at the pond site were determined from soil and vegetation analyses before construction. When the pond is operative, the sampling program will qualitatively and quantitatively detect the transport of radioactivity to the soil, air, and vegetation in the vicinity. Possible correlation of meteorological data with sampling results is being investigated and measures to control export of radioactivity by biological vectors are being assessed.

1552 (LA--8210-PR) LABORATORY STUDIES OF RADIONUCLIDE DISTRIBUTIONS BETWEEN SELECTED GROUNDWATERS AND GEOLOGIC MEDIA. PROGRESS REPORT, OCTOBER 1-DECEMBER 31, 1979. Erdal, B.R. (comp.). (Los Alamos Scientific Lab., NM (USA)). Mar 1980. Contract W-7405-ENG-36. 49p. Dep. NTIS, PC A03/MF A01.

This report presents the Los Alamos Scientific Laboratory contribution to the Waste/Rock Interactions Technology program. The majority of the effort involved extensive studies under reduced oxygen and carbon dioxide conditions, measurements of isotherms, microautoradiographic studies, and migration rate studies. Efforts to estimate uranium, plutonium, and neptunium solubilities were initiated.

1553 (LA--8224-PR) STUDIES OF TRANSURANIC WASTE STORAGE UNDER CONDITIONS EXPECTED IN THE WASTE ISOLATION PILOT PLANT (WIPP). PROGRESS REPORT, OCTOBER 1-DECEMBER 31, 1979. Kosiewicz, S.T.; Zerwekh, A. (Los Alamos Scientific Lab., NM (USA)). Mar 1980. Contract W-7405-ENG-36. 8p. Dep. NTIS, PC A02/MF A01.

This is the ninth quarterly report describing progress in an experimental program to determine the effects of radiolytic, thermal, and catalyzed thermal degradation of various forms of existing or developmental transuranic wastes proposed for Waste Isolation Pilot Plant emplacement. We conclude that there is no dose rate dependency for the radiolysis of cellulosics. Data from desiccation experiments indicate that 8% of the contained water in process sludge is mildly bound.

1554 (LA--8230-MS) HEAT PIPE COOLING SYSTEM FOR UNDERGROUND, RADIOACTIVE WASTE STORAGE TANKS. Cooper, K.C.; Prenger, F.C. (Los Alamos Scientific Lab., NM (USA)). Feb 1980. Contract W-7405-ENG-36. 21p. Dep. NTIS, PC A02/MF A01.

An array of 37 heat pipes inserted through the central hole at the top of a radioactive waste storage tank will remove 100,000 Btu/h with a heat sink of 70°F atmospheric air. Heat transfer inside the tank to the heat pipe is by natural convection. Heat rejection to outside air utilizes a blower to force air past the heat pipe condenser. The heat pipe evaporator section is axially finned, and is constructed of stainless steel. The working fluid is ammonia. The finned pipes are individually shrouded and extend 35 ft down into the tank air space. The hot tank air enters the shroud at the top of the tank and flows downward as it is cooled, with the resulting increased density furnishing the pressure difference for circulation. The cooled air discharges at the center of the tank above the sludge surface, flows radially outward, and picks up heat from the radioactive sludge. At the tank wall the heated air rises and then flows inward to comple the cycle.

1555 (LA--8297-PR) POTENTIAL MICROBIAL IMPACT ON TRANSURANIC WASTES UNDER CONDITIONS EXPECTED IN THE WASTE ISOLATION PILOT PLANT (WIPP). ANNUAL REPORT, OCTOBER 1, 1978-SEPTEMBER 30, 1979. Barnhart, B.J.; Campbell, E.W.; Martinez, E.; Caldwell, D.E.; Hallett, R. (Los Alamos Scientific Lab., NM (USA)). Jul 1980. Contract W-7405-ENG-36. 27p. NTIS, PC A03/MF A01.

Previous results were confirmed showing elevated frequencies of radiation-resistant bacteria in microorganisms isolated from shallow transuranic (TRU) burial soil that exhibits nanocurie levels of beta and gamma radioactivity. Research to determine whether plutonium could be methylated by the microbially produced methyl donor, methylcobalamine, was terminated when literature and consulting radiochemists confirmed that other alkylated transuranic elements are extremely short-lived in the presence of oxygen. Emphasis was placed on investigation of the dissolution of plutonium dioxide by complex formation between plutonium and a polyhydroxamate chelate similar to that produced by microorganisms. New chromatographic and spectrophotometric evidence supports previous results showing enhanced dissolution of alpha radioactivity when ^{239}Pu dioxide was mixed with the chelate Desferol. Microbial degradation studies of citrate, ethylenediamine tetraacetate (EDTA), and nitrilo triacetate (NTA) chelates of europium are in progress. Current results are summarized. All of the

chelates were found to degrade. The average half-life for citrate, NTA, and EDTA was 3.2, 8.0, and 28 years, respectively. Microbial CO_2 generation is also in progress in 72 tests on several waste matrices under potential WIPP isolation conditions. The mean rate of gas generation was 5.97 μg CO_2/g waste/day. Increasing temperature increased rates of microbial gas generation across treatments of brine, varying water content, nutrient additions, and anaerobic conditions. No microbial growth was detected in experiments to enumerate and identify the microorganisms in rocksalt cores from the proposed WIPP site. This report contains the year's research results and recommendations derived for the design of safe storage of TRU wastes under geologic repository conditions.

1556 (LA--8339-PR) LABORATORY STUDIES OF RADIONUCLIDE DISTRIBUTIONS BETWEEN SELECTED GROUNDWATERS AND GEOLOGIC MEDIA. PROGRESS REPORT, JANUARY 1-MARCH 31, 1980. Erdal, B.R. (comp.). (Los Alamos Scientific Lab., NM (USA)). May 1980. Contract W-7405-ENG-36. 55p. NTIS, PC A04/MF A01.

This report covers the technical activities on Waste-Rock Interactions and Technology (WRIT) contracts B-A2377-A-K and 78996-A-K to the Los Alamos Scientific Laboratory. Much of the activity during the second quarter of FY-80 involved those sorption studies needed to extend the current data base for tuff, to continue studies of sorption isotherms, to continue chemical analysis and characterization techniques, to continue studies using the microautoradiographic technique, and to continue measurements of migration rates in crushed and fractured materials. Finally, preparation of status reports has involved appreciable effort.

1557 (LA--8345-PR) STUDIES OF TRANSURANIC WASTE STORAGE UNDER CONDITIONS EXPECTED IN THE WASTE ISOLATION PILOT PLANT (WIPP). PROGRESS REPORT, JANUARY 1-MARCH 25, 1980. Kosiewicz, S.T.; Zerwekh, A. (Los Alamos Scientific Lab., NM (USA)). Jul 1980. Contract W-7405-ENG-36. 13p. NTIS, PC A02/MF A01.

This is the tenth and final progress report in an experimental program to determine the effects of radiolytic, thermal, and catalyzed thermal degradation of various forms of existing or developmental transuranic (TRU) wastes proposed for Waste Isolation Pilot Plant (WIPP) emplacement. This report contains short conclusions on all phases of research conducted during this program. Several journal publications are in various stages of the publication process. All contract requirements were met or exceeded.

1558 (LA--8422-MS) RADIOCHEMICAL ANALYSES OF SAMPLES FROM BENEATH A SOLID RADIOACTIVE WASTE DISPOSAL PIT AT LOS ALAMOS, NEW MEXICO. Purtymun, W.D.; Rogers, M.A.; Wheeler, M.L. (Los Alamos Scientific Lab., NM (USA)). Jun 1980. Contract W-7405-ENG-36. 18p. NTIS, PC A02/MF A01.

Solid radioactive wastes are disposed of by burial in pits excavated in rhyolite tuff at the Los Alamos Scientific Laboratory (LASL). Contaminants in the waste include fission products, uranium, and transuranic elements. In 1976, horizontal core holes were drilled beneath a waste disposal pit that was used from 1963 to 1966. Samples of the core were analyzed for gross alpha, gross beta, total uranium, ^{90}Sr, ^{137}Cs, ^{238}Pu, $^{239,240}Pu$, and ^{241}Am. The measured gross alpha, gross beta, and uranium concentrations were above minimum detection limits; concentrations of the remaining radionuclides, all of which are man-made isotopes, were below the minimum detection limits. Statistical comparisons were made of the gross alpha, gross beta, and uranium data to identify any significant variations from natural concentrations in the tuff. The comparisons demonstrated that none of the radioactivity detected in the samples can be attributed to migration from the disposal pit.

1559 (LA--8472-PR) LABORATORY STUDIES OF RADIONUCLIDE DISTRIBUTIONS BETWEEN SELECTED GROUNDWATERS AND GEOLOGIC MEDIA. QUARTERLY TECHNICAL PROGRESS REPORT, APRIL 1-JUNE 30, 1980. Erdal, B.R. (comp.). (Los Alamos Scientific Lab., NM (USA)). Sep 1980. Contract W-7405-ENG-36. 30p. NTIS, PC A03/MF A01.

This quarterly report presents the Los Alamos Scientific Laboratory contribution to the Waste-Rock Interactions Technology program, Tasks 3 and 4, for the third quarter of FY-1980.

1560 (LA-UR--79-2992) PARAMENTERS AFFECTING RADIONUCLIDE MIGRATION IN GEOLOGIC MEDIA. Erdal, B.R.; Bayhurst, B.P.; Daniels, W.R. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 11p. (CONF-791112--23). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Adsorption of several nuclides (Sr, Tc, Cs, Ba, Ce, Eu) on tuff, monzonite, and argillite was studied experimentally. 3 tables. (DLC)

1561 (LA-UR--80-437) LABORATORY STUDIES OF RADIONUCLIDE DISTRIBUTIONS BETWEEN SELECTED GROUNDWATERS AND GEOLOGIC MEDIA. Erdal, B.R. (ed.). (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 91p. Dep. NTIS, PC A05/MF A01.

Extensive studies of the behavior of plutonium and americium in pH 8 groundwaters were made, particularly with respect to container sorption, filtering, and centrifugation. Significant improvements in the method used for measuring sorption ratios for these elements were developed, and their sorption-desorption ratios on argillite and tuff were measured. Effects of particle size, temperature, sampling location, mineralogy, and time were investigated for these elements. The chemical composition of the water was found to be a major factor that governs sorption behavior for some elements. Studies of the sorption of strontium, cesium, barium, cerium, europium, uranium, and americium on Hainesville salt dome materials were made under aerobic and anoxic (< 0.2 ppm oxygen) conditions using two synthetic groundwaters: one represented the Wilcox aquifer in the Hainesville region and the second was a dilute brine. Studies of the sorption of strontium, cesium, barium, cerium, europium, and uranium(VI) on granite and argillite were made under anoxic (< 0.2 ppm oxygen) conditions and the results were compared to earlier measurements made under aerobic conditions. The sorption of uranium(VI) on argillite under atmospheric conditions was investigated. Measurements of migration rates in crushed granite, argillite, and tuff were made and compared with batch results. Infiltration experiments involving the forced injection of activity into intact and fractured cores were also performed. Microautoradiographic techniques were used to detect specific sorption sites. This latter technique was also used to characterize the sorption of plutonium and neptunium on polished

thin-sections of alluvium, granite, tuff, and argillite and to assess the amount of aggregation that occurred. Additional physical and chemical characterizations of the materials used in these studies were made, and new analytical techniques were developed.

1562 (LBL--7061) CALCULATED THERMALLY INDUCED DISPLACEMENTS AND STRESSES FOR HEATER EXPERIMENTS AT STRIPA, SWEDEN. LINEAR THERMOELASTIC MODELS USING CONSTANT MATERIAL PROPERTIES. Chan, T.; Cook, N.G.W. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.; California Univ., Berkeley (USA). Dept. of Materials Science and Mineral Engineering). Dec 1979. Contract W-7405-ENG-48. 133p. (SAC--22). NTIS, PC A07/MF A01.

Thermally induced displacements and stresses have been calculated by finite element analysis to guide the design, operation, and data interpretation of the in situ heating experiments in a granite formation at Stripa, Sweden. There are two full-scale tests with electrical heater canisters comparable in size and power to those envisaged for reprocessed high level waste canisters and a time-scaled test. To provide a simple theoretical basis for data analysis, linear thermoelasticity was assumed. Constant (temperature-independent) thermal and mechanical rock properties were used in the calculations. These properties were determined by conventional laboratory testing on small intact core specimens recovered from the Stripa test site. Two-dimensional axisymmetric models were used for the full-scale experiments, and three-dimensional models for the time-scaled experiment. Highest compressive axial and tangential stresses are expected at the wall of the heater borehole. For the 3.6 kW full-scale heated experiment, maximum compressive tangential stress was predicted to be below the unconfined compressive strength of Stripa granite, while for the 5 kW experiment, the maximum was approximately equal to the compressive strength before the concentric ring of eight 1 kW peripheral heaters was activated, but would exceed that soon afterwards. Three zones of tensile thermomechanical stresses will occur in each full-scale experiment. Maximum vertical displacements range from a fraction of a millimeter over most of the instrumented area of the time-scaled experiment to a few millimeters in the higher-power full-scale experiment. Radial displacements are typically half or less than vertical displacements. The predicted thermomechanical displacements and stresses have been stored in an on-site computer to facilitate instant graphic comparison with field data as the latter are collected.

1563 (LBL--7083) CHARACTERIZATION OF DISCONTINUITIES IN THE STRIPA GRANITE. TIME-SCALE HEATER EXPERIMENT. Thorpe, R. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Jul 1979. Contract W-7405-ENG-48. 110p. Dep. NTIS, PC A06/MF A01.

The report describes the methodology and results of a detailed study of geologic discontinuities associated with the time-scale heater test at the Stripa mine in Sweden. Mapping of the floor of the experiment tunnel coupled with observation of core samples from beneath the drift indicate that four N-striking shear fractures dip steeply through the 6 x 10 x 25-m rock mass. Oblique-thrust faulting has produced displacements of up to 2 m on one of the surfaces, and its inferred 3-D configuration is consistent with observed slickensiding. Resolution of locally measured principal stresses on the shear plane yields a theoretical shear direction that also coincides with the slickensiding. Four distinct joint sets exist locally, one of which coincides with the shear fractures. Another lies nearly horizontal, and two others are steeply inclined. Fracture length and spacing distributions for the four joint sets are shown to be lognormal. Two of the sets lie perpendicular to principal stress directions. The fact that one of these two joint sets apparently post-dates other fracturing and is normal to the minimum principal stress suggests that it is due to isostatic rebound.

1564 (LBL--7089) VERY DEEP HOLE CONCEPT: EVALUATION OF AN ALTERNATIVE FOR NUCLEAR WASTE DISPOSAL. O'Brien, M.T.; Cohen, L.H.; Narasimhan, T.N.; Simkin, T.L.; Wollenberg, H.A.; Brace, W.F.; Green, S.; Pratt, H.P. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.; Terra Tek, Inc., Salt Lake City, UT (USA)). Jul 1979. Contract W-7405-ENG-48. 56p. Dep. NTIS, PC A04/MF A01.

One proposal for disposing of radioactive waste is to put it in drill holes or mined cavities so deep that the waste would be effectively isolated from the surface. Even if radioisotopes escaped from the disposal canister, they would be removed from the circulating groundwater system by sorption and/or chemical reaction in their transit on very long paths to the surface. This report summarizes the feasibilities and costs of making deep holes and deep mine shafts; estimates probable technological advances by the year 2000; presents thermal history and thermally induced stress calculations based on several assumptions regarding age of waste and density of emplacement; and summarizes lack of knowledge that bear upon the isolation of waste at great depth. In strong rock, present technology would probably enable us to drill a hole 20 cm in diameter to a depth of 11 km and sink a shaft 10 m in diameter to about 4.4 km. By the year 2000, with advancement of technology, holes of 15 km depth and 20 cm diameter could be drilled, and shafts of 6.4 km or deeper could be sunk. The heat output of 5.5-year-old spent fuel and 6.5-year-old reprocessed waste is used to calculate temperature increases and stress buildings in the surrounding rocks. Some waste configurations may cause unacceptably high temperature increases; indeed, limitations on temperatures reached will in some cases limit the packing density of waste canisters and/or require longer cooling of the waste before emplacement. Sealing boreholes and shafts for significant times, i.e. 1,000 to 100,000 years presents additional problems. The casing or ling of the borehole or shaft would have to be removed in the region where seals are constructed, or the lining material would have to be designed to function as an integral part of the long-term seal. Sealing fractures in the rock around the borehole or shaft will be quite important.

1565 (LBL--8271(Rev.)) STUDY OF REGIONAL TEMPERATURE AND THERMOHYDROLOGICAL EFFECTS OF AN UNDERGROUND REPOSITORY FOR NUCLEAR WASTES IN HARD ROCK. Wang, J.S.Y.; Tsang, C.F.; Cook, N.G.W.; Witherspoon, P.A. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Oct 1979. Contract W-7405-ENG-48. 68p. Dep. NTIS, PC A04/MF A01.

Heat released by the radioactive decay of nuclear wastes in an underground repository causes a long-term thermal disturbance in the surrounding rock mass. The nature of this disturbance for a planar repository 3000 m in diameter at a depth of 500 m below surface is

investigated for various waste forms. The effects of changes in the density and viscosity of groundwater caused by the temperature changes on the flow through a simple model of a vertical fracture connected to a horizontal fracture in a rock mass are evaluated. It is concluded that different waste forms and time periods before burial have significant effects on the thermal disturbance and that buoyant groundwater flow is a function of both the vertical and horizontal fracture transmissivities, as well as the changes in temperature. Loaded initially with a power density of 10 W/m^2 of spent fuel assemblies 10 years after discharge from a reactor, the maximum increase in temperature of the repository in granite is about 50°C and the epicentral thermal gradient about 70°C/km. 30 figures, 4 tables.

1566 (LBL--8313) INSTRUMENT EVALUATION, CALIBRATION, AND INSTALLATION FOR THE HEATER EXPERIMENTS AT STRIPA. Schrauf, T.; Pratt, H.; Simonson, E.; Hustrulid, W.; Nelson, P.; DuBois, A.; Binnall, E.; Haught, R. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.; Terra Tek, Inc., Salt Lake City, UT (USA)). Dec 1979. Contract W-7405-ENG-48. 187p. (SAC--25). NTIS, PC A09/MF A01.

Borehole instrumentation for the measurement of temperature, displacement, and stress was evaluated, modified, calibrated, and installed in an underground site at Stripa, Sweden where experiments are currently underway to investigate the suitability of granite as a storage medium for nuclear waste. Three arrays of borehole instrumentation measure the thermomechanical effects caused by electrical heaters which simulate the thermal output of canisters of radioactive waste. Because most rock mechanics investigations are carried out at modest temperatures, a sustained operating temperature as high as 200°C was an unusual and most important criterion governing the instrumentation program. Extensive laboratory experiments were conducted to determine the effect of high temperature on instrument behavior and also to develop calibration and data-reduction procedures. The rod extensometers were tested for anchor creep, the selection of a suitable high-temperature pressurizing fluid, and the thermal stability of the grout. Four temperature corrections are incorporated into the data reduction of the USBM borehole deformation measurement: the bridge voltage offset correction, the change in calibration factor induced by temperature, and the thermal expansion of the gage and of the rock. The vibrating wire gages were calibrated in the laboratory by loading gages installed in a granite block at pressures up to 13 MPa and at temperatures ranging from 20° to 200°C. Both the slope and offset of the response equation are corrected for temperature effects. Most thermocouples were calibrated in an oven at the field site. Thermocouples were emplaced with individual gages and into holes backfilled with sand or grout.

1567 (LBL--8423) DETERMINATION OF IN-SITU THERMAL PROPERTIES OF STRIPA GRANITE FROM TEMPERATURE MEASUREMENTS IN THE FULL-SCALE HEATER EXPERIMENTS: METHOD AND PRELIMINARY RESULTS. TECHNICAL INFORMATION REPORT NO. 24. Jeffry, J.A.; Chan, T.; Cook, N.G.W.; Witherspoon, P.A. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). May 1979. Contract W-7405-ENG-48. 34p. (SAC--24; CONF-781246--2). Dep. NTIS, PC A03/MF A01.

From American Geophysical Union annual fall meeting; San Francisco, CA, USA (4 Dec 1978).

The in-situ thermal conductivity and thermal diffusivity of a granite rock mass at the Stripa mine, Sweden, have been extracted from the first 70 days of temperature data for the 5 kW full-scale heater experiment by means of least-squares fit to a finite-line source solution. Thermal conductivity and thermal diffusivity have been determined to be 3.69 W/(m-°C) and 1.84 x 10^{-6} m^2/s, respectively, at an average rock temperature of 23°C (the average value of the actual temperature data used). These values are only slightly higher than the corresponding laboratory values, i.e., there is no significant size effect in the thermal properties of this rock mass. Since the size and shape of the heater canister used are similar to those considered for nuclear waste canisters and a substantial volume of rock is heated, the thermal properties obtained in this study are representative of in-situ rock mass properties under actual nuclear repository operating conditions.

1574 (LBL--8907) GEOLOGY AND FRACTURE SYSTEM AT STRIPA. TECHNICAL INFORMATION REPORT NO. 21. Olkiewicz, A.; Gale, J.E.; Thorpe, R.; Paulsson, B. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.; Waterloo Univ., Ontario (Canada)). Feb 1979. Contract W-7405-ENG-48. 171p. (SAC--21). Dep. NTIS, PC A08/MF A01.
The Stripa test site has been excavated in granitic rock between 338 m and 360 m below the ground surface, and is located under the north limb of an ENE-plunging synclinal structure. The granitic rocks, in the areas mapped, are of Archean age and are dominated by a reddish, medium-grained, massive monzogranite that shows varying degrees of deformation. The granitic rocks have been intruded by diabase (dolerite) and pegmatite dikes. Surface and subsurface mapping shows that the Stripa granite is highly fractured and that there are at least four joint sets in the area of the test excavations. In addition to the joints, the rock mass contains fissures, fracture zones, and small-scale shear zones, representing the complete spectrum of the fracture family. Most of the fractures are lined with chlorite, occasionally with calcite. Many of the small-scale shear fractures are filled or coated with epidote. Offsets of pegmatite dikes formed by these fractures are usually limited to one to two meters. Water seepage is observed only as drops from fractures or moist fracture surfaces. It was found that reconstruction of the local three-dimensional fracture system is the heater-experiment sites was difficult, and in some cases subjective. Such reconstruction is a prerequisite to accurate interpretation of thermal and mechanical data from such sites.

Separate abstracts were prepared for Parts I and II.

1576 (LBL--9392, pp 1-23) I. SOME RESULTS FROM A FIELD INVESTIGATION OF THERMO-MECHANICAL LOADING OF A ROCK MASS WHEN HEATERS ARE EMPLACED IN THE ROCK. Hood, M. (Univ. of California, Berkeley). Jul 1979.
I. Some results from a field investigation of thermo-mechanical loading of a rock mass when heaters are emplaced in the rock. II. The application of field data from heater experiments conducted at Stripa, Sweden to parameters for repository design. SAC-26.
Results are presented of a field experiment to monitor the response of a rock mass to thermomechanical loading from electrically heated canisters emplaced in the rock at a depth of 340 m. Measurements made to date of temperature, displacement, and stress fields indicate that heat is transferred through the rock mainly by conduction; discontinuities within the rock mass have a minimal effect on the heat flow. Displacements within the rock from thermal expansion are shown to be much less than those predicted by linear thermoelastic theory. A plausible, though not complete, reason for these reduced displacements is the absorption of the initial rock expansions into discontinuities within the rock mass. Difficulties have been experienced in obtaining reliable stress measurement data using borehole deformation gauges to monitor changes in rock stress. Some data have been obtained and are being analyzed. Rock decrepitation in the heater boreholes is discussed.

1577 (LBL--9392, pp 24-39) II. APPLICATION OF FIELD DATA FROM HEATER EXPERIMENTS CONDUCTED AT STRIPA, SWEDEN, TO PARAMETERS FOR REPOSITORY DESIGN. Hood, M.; Carlsson, H.; Nelson, P.H. (Univ. of California, Berkeley). Jul 1979.
I. Some results from a field investigation of thermo-mechanical loading of a rock mass when heaters are emplaced in the rock. II. The application of field data from heater experiments conducted at Stripa, Sweden to parameters for repository design. SAC-26.
Current experiments are designed to yield information about both the near-field and the far-field effects of thermomechanical loading of an in-situ, granitic rock mass. Electrically heated canisters, constructed to represent high-level radioactive waste canisters, are emplaced in boreholes from excavations some 340 m below the surface. Thermally induced spalling along the heater borehole wall, a near-field effect, has been monitored and two types of spalling, one serious and one not serious, have been identified. A suggested failure criterion for the serious type of spalling is sigma/sub max/ greater than or equal to C_o (where sigma/sub max/ is the maximum induced compressive stress at the borehole wall and C_o is the uniaxial compressive strength of the rock). In one of these experiments this criterion was exceeded, and gross failure at the wall occurred when the equivalent power to the heater was increased beyond 5 kW. The far-field effects of the applied loading are investigated by measuring the temperature, displacement, and stress fields and then comparing the results with predictions which were made based on linear thermoelastic theory. The results show that the dominant mode of heat transfer through the rock is by conduction and, therefore, that predictions of the temperature field are made readily using simple calculations. However, displacements and stresses within the rock mass are measured to be only one-half or less of the values predicted. Two reasons for this major discrepancy are suggested. Work to verify this result is in progress.

1578 (LBL--9424) WASTE DISPOSAL IN GRANITE: PRELIMINARY RESULTS FROM STRIPA, SWEDEN. Cook, N.G.W.; Gale, J.E.; Witherspoon, P.A. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.; Waterloo Univ., Ontario (Canada)). Mar 1979. Contract W-7405-ENG-48. 11p. (CONF-790304--8). Dep. NTIS, PC

A02/MF A01.
From 19. annual ASME symposium, geological disposal of nuclear waste; Albuquerque, NM, USA (15 Mar 1979).
The results of this experiment to date indicate that the temperature fields in a rock mass contaning geologic discontinuities can be predicted with accuracy using the simple linear theory of heat conduction. Geologic discontinuities appear to introduce significant non-linear thermomechanical behavior into the rock mass as a result of which the thermally induced displacements are much less than those predicted by the simple theory of thermoelasticity, using laboratory values for Poisson's ratio and the coefficient of thermal expansion. The additional compliance introduced into the rock mass by geologic discontinuities affects the thermally induced stresses but to a lesser degree than the displacements. Further analytical, laboratory and field studies are expected to resolve many of the current uncertainties, especially field data gathered during a planned cooling down period following the switching off of the heaters scheduled in the near future.

1579 (LBL--9426) EXPERIMENTAL RESULTS FROM STRIPA. Hood, M. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Jun 1979. Contract W-7405-ENG-48. 18p. (CONF-790683--3). Dep. NTIS, PC A02/MF A01.
From ONWI-LLL workshop on thermomechanical modeling for a hard rock repository; Berkeley, CA, USA (25 Jun 1979).
The results indicate that the temperature fields in a rock mass containing geologic discontinuities can be predicted accurately using the simple theory of heat conduction. Geologic discontinuities appear to introduce significant nonlinear thermomechanical deformation into the rock mass, as a result of which the thermally induced displacements are much less than those predicted by the simple theory of thermo-elasticity. In addition, the assumption that the rock properties are temperature independent appears to increase the values predicted for these displacements significantly. Therefore, it is important that the temperature dependence of these properties is known and that these values be used in the calculations. The onset of significant thermal spalling along the walls of the heater boreholes appears to be related to conditions where the maximum induced compressive stress exceeds the uniaxial compressive strength of the rock. 7 figures.

1580 (LBL--9582) LABORATORY INVESTIGATIONS ON THE HYDRAULIC AND THERMOMECHANICAL PROPERTIES OF FRACTURED CRYSTALLINE ROCKS. Witherspoon, P.A.; Watkins, D.J.; Cook, N.G.W.; Hood, M.; Gale, J.E. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Aug 1979. Contract W-7405-ENG-48. 19p. (CONF-791033--3). Dep. NTIS, PC A02/MF A01.
From 1. annual ONWI information meeting; Columbus, OH, USA (30 Oct 1979).
The laws of fluid flow in fractures, the dependence of fracture conductivity on the size of the sample tested, and the thermomechanical properties of both intact and discontinuous samples in crystalline rocks were discussed. (DC)

1581 (LBL--9677) STUDY OF ROCK-WATER-NUCLEAR WASTE INTERACTIONS IN THE PASCO BASIN, WASHINGTON. PART I. DISTRIBUTION AND COMPOSITION OF SECONDARY AND PRIMARY MINERAL PHASES IN BASALTS OF THE PASCO BASIN, WASHINGTON. Benson, L.V.; Teague, L.S. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Sep 1979. Contract W-7405-ENG-48. 157p. NTIS, PC A08/MF A01.
In Part I of this report the results of Task III are presented and discussed. The subject of Task III is the study and identification of secondary and primary mineral assemblages in basalts of the Pasco Basin of southeastern Washington. In particular, we have determined the relative amounts, crystallization sequence, and compositions of secondary minerals found lining vesicle and fracture surfaces. This information, together with data on the chemical composition of primary minerals and the extent to which they have undergone dissolution, has been used in theoretical simulations of mass transfer which is the subject of Part II (Task IV) of this report.

1582 (LBL--9903) ROLE OF LARGE-SCALE PERMEABILITY MEASUREMENTS IN FRACTURED ROCK AND THEIR APPLICATION AT STRIPA. Witherspoon, P.A.; Wilson, C.R.; Long, J.C.S.; DuBois, A.D.; Gale, J.E.; McPherson, M. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.; Waterloo Univ., Ontario (Canada); Nottingham Univ. (UK)). Oct 1979. Contract W-7405-ENG-48. 11p. (CONF-791112--26). Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
Completion of the macropermeability experiment will provide: (i) a direct, in situ measurement of the permeability of 10^5 to 10^6 m^3 of rock; (ii) a potential method for confirming the analysis of a series of small scale permeability tests performed in surface and underground boreholes; (iii) a better understanding of the effect to open borehole zone length on pressure measurement; (iv) increased volume in fractured rock; (v) a basis for evaluating the ventilation technique for flow measurement in large scale testing of low permeability rocks.

1583 (LBL--9945) WASTE ISOLATION SAFETY ASSESSMENT PROGRAM. TASK 4. COLLECTION AND GENERATION OF TRANSPORT DATA THEORETICAL AND EXPERIMENTAL EVALUATION OF WASTE TRANSPORT IN SELECTED ROCKS. ANNUAL PROGRESS REPORT, OCTOBER 1, 1978-SEPTEMBER 30, 1979. Silva, R.J.; Benson, L.V.; Yee, A.W.; Parks, G.A. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). 30 Sep 1979. Contract W-7405-ENG-48. 108p. Dep. NTIS, PC A06/MF A01.
The objective of the program is to establish a basis for the prediction of radionuclide sorption in geologic environments. In FY 79, experimental and theoretical efforts were concentrated on a study of the sorption of cesium on the solid substrates Min-u-sil (quartz) and Belle Fourche clay (montmorillonite). Cesium sorption isotherms were obtained for the two substrates at 26°C as a function of initial Cs concentration in solution (10^{-3}M to 10^{-9}M), pH (5 to 10) and supporting electrolyte concentration (0.002M, 0.01M, 0.1M, and 1M) NaCl and a simulated basalt groundwater in batch-type experiments using crushed material. Characterization of the solid phases included measurements of chemical compositions, particle sizes, surface areas, and cation-exchange capacities. In addition, potentiometric acid/base titrations of the solid phases were conducted in order to determine the acid dissociation and electrolyte exchange constants of the surfaces. Preliminary analysis of the sorption data indicate that while the clay data could be explained by simple mass-action expressions, the quartz data could not. Theoretical efforts were aimed at

developing and testing an electrolyte binding electrical double-layer model to predict sorption isotherms. A computerized version of the model, MINEQL, which simultaneously considers surface and solution chemical equilibria, was brought to operational status. Input parameters required by MINEQL were determined and sorption isotherms for Cs on the Belle Fourche clay were calculated over the same range of parameters as the experimental measurements. Comparisons showed that the model was able to simulate the isotherms quite well except at the lowest pH values for the 0.002M and 0.01M NaCl solutions.

1584 (LBL--9952) ROCK INSTRUMENTATION PROBLEMS EXPERIENCED DURING IN-SITU HEATER TESTS. Binnall, E.; DuBois, A.; Lingle, R. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.; Terra Tek, Inc., Salt Lake City, UT (USA)). Oct 1979. Contract W-7405-ENG-48. 11p. (CONF-791112--51). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

A large amount of valid data has been obtained from the Stripa experiments by the use of modified and calibrated off-the-shelf rock instrumentation. The elevated temperatures and the need for long time integrity in a wet environment revealed unsolved problems. The identification and solution of these problems would greatly benefit future experiments. More effort should be applied to the development of instruments to meet the environmental, reliability and accuracy requirements for test site observations.

1585 (LBL--10193(Rev.)) THERMOMECHANICAL MODELING AND DATA ANALYSIS FOR HEATING EXPERIMENTS AT STRIPA, SWEDEN. Chan, T.; Littlestone, N.; Wan, O. (California Univ., Berkeley (USA). Lawrence berkeley Lab.). Nov 1979. Contract W-7405-ENG-48. 11p. (CONF-800507--7(Rev.)). NTIS, PC A02/MF A01.

From Rock mechanics symposium; Rolla, MO, USA (27 May 1980).

Comparisons were made between predicted and measured thermomechanical displacements and stresses for in situ heating experiments at a depth of 340 m in a granite body at Stripa, Sweden. We found that taking into account the temperature dependence of the thermal expansion coefficient and the mechanical properties of the rock substantially improves the agreement between theory and experiment. In general, the displacements calculated using laboratory values of rock properties agree better with field data than in the case of stresses. This may be due to the difference between in situ and laboratory rock modulus. The significance of temperature-dependent rock properties and strength to thermomechanical failure is also discussed.

1586 (LBL--10358) PREDICTED AND MEASURED TEMPERATURES, DISPLACEMENTS AND STRESSES FROM THE STRIPA HEATER EXPERIMENTS. Chan, T.; Hood, M.; Witherspoon, P.A. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Jan 1980. Contract W-7405-ENG-48. 10p. (CONF-800645--2). NTIS, PC A02/MF A01.

From Special session on nuclear waste disposal; Stockholm, Sweden (23 Jun 1980).

A summary of the results of heater experiments conducted at the Stripa Mine in Sweden is given. These results for the induced temperature, displacement and stress fields, are compared with the original predictions for these parameters which were made using both analytical and finite-element calculations assuming that the material properties of the rock remained temperature independent. Discrepancies between the measured and the predicted results are discussed. Additional calculations, based on a limited amount of laboratory data for the temperature dependence of these material properties, are described. These new predictions are found to agree better with the measured field data.

1587 (LBL--10387) SECONDARY MINERALS FOUND IN THE CORES DC2 A1 AND DC2 A2 TAKEN FROM THE GRANDE RONDE BASALT FORMATION, PASCO BASIN, WASHINGTON. Teague, L.S. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Jan 1980. Contract W-7405-ENG-48. 36p. NTIS, PC A03/MF A01.

The results obtained for Task I are presented and discussed in this report. The subject of Task I is the study and identification of secondary mineral assemblages in two slant cores drilled off core DC2. The data were obtained from scanning electron microscopic (SEM/EDAX), x-ray diffraction (XRD), and thin section petrographic studies. In addition, an attempt was made to determine the lateral continuity of the secondary mineralization and the extent to which the fissures in this potential repository horizon were interconnected. Differences between the slant cores and DC2 may be due to variations in the vertical distribution of the samples and the fewer slant core samples studied. As a result, firm conclusions cannot be drawn regarding the depth dependence and relationship of mordenite precipitation to clinoptilolite dissolution. The limited data obtained in this and previous reports supports the preliminary conclusion that secondary mineralization is laterally continuous. Secondary mineral assemblages and morphologies in all cores are similar and no significant horizontal changes are observed.

1588 (LBL--10483) BETWEEN-HOLE ACOUSTIC SURVEYING AND MONITORING OF A GRANITIC ROCK MASS. Paulsson, B.N.P.; King, M.S. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Feb 1980. Contract W-7405-ENG-48. 19p. Dep. NTIS, PC A02/MF A01.

The purpose of this technical note is to present preliminary results of an acoustic monitoring study performed as part of a comprehensive rock mechanic and geophysics research program (Ref.20) associated with large-scale heater tests in an abandoned iron-ore mine in central Sweden. The investigation was performed in a fractured granitic rock mass at a sub-surface depth of 340 m, in a drift adjacent to the original iron-ore mine workings. Acoustic monitoring took place between four empty, dry, vertical boreholes of 10 m depth spaced in the vicinity of a vertical heater borehole in the floor of a drift.

1589 (LBL--10517) ROCK PROPERTIES AND THEIR EFFECT ON THERMALLY-INDUCED DISPLACEMENTS AND STRESSES. Chan, T.; Hood, M.; Board, M. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.; California Univ., Berkeley (USA). Dept. of Materials Science and Mineral Engineering; Terra Tek, Inc., Salt Lake City, UT (USA)). Feb 1980. Contract W-7405-ENG-48. 22p. (CONF-800204--10). NTIS, PC A02/MF A01.

From Energy-sources technology conference; New Orleans, LA, USA (3 Feb 1980).

A discussion is given of the importance of material properties in the finite-element calculations for thermally induced displacements and stresses resulting from a

heating experiment in an in-situ granitic rock, at Stripa, Sweden. Comparisons are made between field measurements and finite element method calculations using (1) temperature independent, (2) temperature dependent thermal and thermomechanical properties and (3) in-situ and laboratory measurements for Young's modulus. The calculations of rock displacements are influenced predominantly by the temperature dependence of the thermal expansion coefficient, whereas the dominant factor affecting predictions for rock stresses is the in-situ modulus.

1590 (LBL--10541) TABULATION AND EVALUATION OF ION EXCHANGE DATA ON SMECTITES, CERTAIN ZEOLITES AND BASALT. Benson, L.V. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). May 1980. Contract W-7405-ENG-48. 51p. NTIS, PC A04/MF A01.

An extensive search of the literature has been made for ion exchange data on smectites, certain zeolites and basalt. The data are in the form of thermodynamic equilibrium constants, corrected selectivity coefficients, and distribution coefficients. Room temperature alkali and alkaline earth metal cation ion exchange data for smectites are extensive. Correlation between the exchange free energies of alkali metal cations on Camp Berteau montmorillonite values with their Debeye-Hueckel parameter was found. Significant differences in values of exchange constants for the same reaction on different smectites were noted. While this in part may be attributable to differences in experimental procedures, much of the variance is probably due to differences in charge densities and the effective field strengths of the smectites. Differences in field strength are related to the type and amount of substitution on intercrystalline octahedral and tetrahedral sites. Data on smectites suggest that cation exchange selectivities are very strong functions of temperature. Experiments on the exchange properties of clinoptilolite and mordenite have been generally confined to alkali and alkaline earth cations although data for certain transition metal ions are also available for synthetic mordenite. The temperature dependences of zeolite exchange selectivities remain largely unknown. Distribution coefficients for groundwater-basalt systems have been measured for a variety of elements at temperatures up to 150°C. Steady state concentrations are often never achieved either from the sorption or the desorption side. Classical models of ion exchange have been applied successfully to zeolite and smectite exchange reactions. The sorption behavior of a basalt is better treated with models of the interface which take surface ionization and complexation into account.

1591 (LBL--10559) PROGRESS WITH FIELD INVESTIGATIONS AT STRIPA. Witherspoon, P.A.; Cook, N.G.W.; Gale, J.E. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Feb 1980. Contract W-7405-ENG-48. 62p. (SAC--27). NTIS, PC A04/MF A01.

It is generally agreed that the most practicable method of isolating nuclear wastes from the biosphere is by deep burial in suitable geologic formations. Such burial achieves a high degree of physical isolation but raises questions concerning the rate at which some of these wastes may return to the biosphere through transport by groundwater. Any suitable repository site will be disturbed first by the excavation of the repository and second by the thermal pulse caused by the radioactive decay of the wastes. To assess the effectiveness of geologic isolation it is necessary to develop the capability of predicting the response of a rock mass to such a thermal pulse. Ultimately, this requires field measurements at depths below surface and in media representative of those likely to be encountered at an actual repository. Access to a granitic rock mass adjacent to a defunct iron ore mine at Stripa in Sweden at a depth of about 350 m below surface has provided a unique opportunity to conduct a comprehensive suite of hydrological and thermo-mechanical experiments under such conditions virtually without delay. The results of these field tests have shown the importance of geologic structure and the functional dependence of the thermo-mechanical properties on temperature in developing a valid predictive model. The results have also demonstrated the vital importance of being able to carry out large scale investigations in a field test facility.

1592 (LBL--10849) CROSS-HOLE INVESTIGATION OF A ROCK MASS SUBJECTED TO HEATING. Paulsson, B.N.P.; King, M.S. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Apr 1980. Contract W-7405-ENG-48. 9p. (CONF-800645--1). NTIS, PC A02/MF A01.

From Special session on nuclear waste disposal; Stockholm, Sweden (23 Jun 1980).

A cross-hole high-frequency acoustic investigation of a granitic rock mass subjected to sustained heating is reported. Compressional and shear-wave velocity measurements along four different paths between four vertical boreholes made prior to turning on the heater, during 398 days of heating and after the heater was turned off correlated well with the presence of fracture zones, in which the fractures were closed by thermal expansion of the rock upon heating. When the rock mass cooled, the velocity measurements indicated a greater intensity of fracturing than had existed prior to heating. Laboratory compressional and shear-wave velocity measurements have been made on intact rock specimens obtained from the site and subjected to axial stress. When used to interpret the increases in velocities measured in the field upon heating the rock mass, increases in horizontal normal stresses to between 30 and 40 MPa were inferred. Increases of these magnitudes agree with stress measurements made by the other techniques. The ratio of measured compressional to shear-wave velocity appears to provide a sensitive measure of the fraction of crack porosity containing water or gas.

1593 (LBL--10876) HEAT TRANSFER IN UNDERGROUND HEATING EXPERIMENTS IN GRANITE, STIPA, SWEDEN. Chan, T.; Javandel, I.; Witherspoon, P.A. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Apr 1980. Contract W-7405-ENG-48. 29p. (CONF-801102--17). NTIS, PC A03/MF A01.

From ASME winter annual meeting; Chicago, IL, USA (16 Nov 1980).

Electrical heater experiments have been conducted underground in granite at Stripa, Sweden, to investigate the effects of heating associated with nuclear waste storage. Temperature data from these experiments are compared with closed-form and finite-element solutions. Good agreement is found between measured temperatures and both types of models, but especially for a nonlinear finite-element heat conduction model incorporating convective boundary conditions, measured nonuniform initial rock temperature distribution, and temperature-dependent thermal conductivity. In situ thermal properties, determined by least-squares regression, are very close to

laboratory values. A limited amount of sensitivity analysis is undertaken.

1594 (MAFF-FL--17) OBSERVATIONS ON THE USE OF COST-BENEFIT ANALYSIS IN THE CONTROL OF RADIOACTIVE WASTE DISPOSAL. Shepherd, J.G.; Hetherington, J.A. (Ministry of Agriculture, Fisheries and Food, Lowestoft (UK). Fisheries Radiobiological Lab.). Oct 1975. 5p. NTIS (US Sales Only), PC A02/MF A01.

The disposal of radioactive waste to the environment can lead to the irradiation of large numbers of people, and although the individual doses may be very small compared with the ICRP dose limits the total population dose may not be insignificant. In these circumstances the control procedure is likely to be determined by the requirement that doses be kept 'as low as is readily achievable'(see ICRP-9, para. 52). This recommendation has been interpreted in ICRP-22, where the use of cost-benefit analysis is suggested as a means of application in practice. This paper discusses some of the implications of these recommendations in relation to the control of radioactive waste disposal, under the following headings: the use of collective dose; the costing of collective dose; the assessment and use of detrimental costs; and the payment of detrimental costs.

1595 (MTR--7718) ALTERNATIVE DISPOSAL CONCEPTS FOR HIGH-LEVEL AND TRANSURANIC RADIOACTIVE WASTE DISPOSAL. Altomare, P.; Bernardi, R.; Gabriel, D.; Nainan, D.; Parker, W.; Pfundstein, R. (Mitre Corp., McLean, VA (USA). METREK Div.). May 1979. 278p. Mitre Corp., McLean, VA.

Various alternatives have been proposed for the disposal of high-level and transuranic radioactive waste generated from the nuclear electric power industry and the US Defense program. The most advanced disposal option, and the one under active development, is the US owned and operated deep-mined geologic repository. This report reviews the primary alternative concepts to the geologic repository, their present state-of-development and, to the extent possible, their environmental implications. The concepts included are: transmutation, extraterrestrial disposal, seabed disposal, ice sheet disposal, and other continental geologic disposal (matrix of drilled holes, etc.). Projections of radioactive waste quantities and the technologies for partitioning and fractionation of the waste are also discussed. This study reviewed information which was available through approximately January of 1978.

1596 (N--79-25869) THERMAL CONTROL OF HIGH ENERGY NUCLEAR WASTE, SPACE OPTION. Peoples, J.A. (National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center). May 1979. 45p. NTIS, PC A03/MF A01.

Problems related to the temperature and packaging of nuclear waste material for disposal in space are explored. An approach is suggested for solving both problems with emphasis on high energy density waste material. A passive cooling concept is presented which utilized conduction rods that penetrate the inner core. Data are presented to illustrate the effectiveness of the rods and the limit of their capability. A computerized thermal model is discussed and developed for the cooling concept.

1597 (N--79-27193) SPACE AUGMENTATION OF MILITARY HIGH-LEVEL WASTE DISPOSAL. English, T.; Lees, L.; Divita, E. (Jet Propulsion Lab., Pasadena, CA (USA)). 1 May 1979. Contract NAS7-100. 54p. NTIS, PC A04/MF A01.

Space disposal of selected components of military high-level waste (HLW) is considered. This disposal option offers the promise of eliminating the long-lived radionuclides in military HLW from the earth. A space mission which meets the dual requirements of long-term orbital stability and a maximum of one space shuttle launch per week over a period of 20-40 years, is a heliocentric orbit about halfway between the orbits of earth and Venus. Space disposal of high-level radioactive waste is characterized by long-term predicability and short-term uncertainties which must be reduced to acceptably low levels. For example, failure of either the Orbit Transfer Vehicle after leaving low earth orbit, or the storable propellant stage failure at perihelion would leave the nuclear waste package in an unplanned and potentially unstable orbit. Since potential earth reencounter and subsequent burn-up in the earth's atmosphere is unacceptable, a deep space rendezvous, docking, and retrieval capability must be developed.

1598 (NEDG--24749) ALTERNATIVE CONCEPTS FOR SPENT FUEL STORAGE BASIN EXPANSION AT MORRIS OPERATION. Graf, W.A. Jr.; King, C.E.; Miller, G.P.; Shadel, F.H.; Sloat, R.J. (General Electric Co., San Jose, CA (USA). Nuclear Fuel and Services Div.). Aug 1980. Contract AC09-76SR00001. 263p. NTIS, PC A12/MF A01.

Alternative concepts for increasing basin capabilities for storage of spent fuel at the Morris Operation have been defined in a series of simplified flow diagrams and equipment schematics. Preliminary concepts have been outlined for (1) construction alternatives for an add-on basin, (2) high-density baskets for storage of fuel bundles or possible consolidated fuel rods in the existing or add-on basins, (3) modifications to the existing facility for increasing cask handling and fuel receiving capabilities and (4) accumulation, treatment and disposal of radwastes from storage operations. Preliminary capital and operating costs have been prepared and resource and schedule requirements for implementing the concepts have been estimated. The basin expansion alternatives would readily complement potential dry storage projects at the site in an integrated multi-stage program that could provide a total storage capacity of up to 7000 tonnes of spent fuel.

1599 (NIRS-R--7, pp 90-94) CONCEPTION DESIGN FOR EXPERIMENTAL FACILITY OF THE RESEARCH ON INTERNAL EMITTERS. Matsuoka, D.; Koizumi, A.; Fukuda, S.; Ogiso, Y. (National Inst. of Radiological Sciences, Chiba (Japan)). Apr 1978. (In Japanese).

Interim progress report of the project research 'assessment of human risks after exposure to low level radiation'. (April 1973 - March 1978).

The conception design of the experimental facility for research on internal emitters was conducted in 1976 and 1977. This facility is effective for research on the evaluation of injury due to internal emitters, i.e. toxic isotopes such as Pu. Facilities for breeding and keeping many kinds of experimental animals for a long time and for the safe handling of toxic isotopes must be provided for the experimental facility. This facility must have a special facility for waste disposal including the treatment of radioactive cadovers and

radioactive raw sewage of animals. These treatments must be carried out completely within the facility as the nuclides are nuclear fuel substances, and the wastes of animals are apt to putrefy. The first step considers the design of air conditioning and ventilation systems to satisfy the requirements of animal breeding and the treatment of radioisotopes, the liquid waste treatment system, including the purifying plant for activated raw sewage, and the treatment system for animal codovers. The second stage of this conceptual design evaluates, the special function structure and specification of the laboratories the architecture planning, and the planning of disaster prevention from the viewpoint of treating transuranic elements. Research an the treatment of radioactive wastes, including the treatment of animal cadovers was begun, and the multistep treatment process was planned. This method envolves freezing fracturing, Tihydrating, thermally decomposing, ash encapsulating, and storing the animal cadovers. This method is effective for preventing the dispersion of Pu. The new dehydrating process, utilizing microwave heating, for cadavers was tested. The new liquid waste treatment system for radioisotopes is introduced.

1600 (NUREG--0527(Summ.)) REGULATION OF FEDERAL RADIOACTIVE WASTE ACTIVITIES. SUMMARY OF REPORT TO CONGRESS ON EXTENDING THE NUCLEAR REGULATORY COMMISSION'S LICENSING OR REGULATORY AUTHORITY TO FEDERAL RADIOACTIVE WASTE STORAGE AND DISPOSAL ACTIVITIES. Smith, R.D. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Material Safety and Safeguards). Sep 1979. 14p. NTIS.

The NRC Authorization Bill for FY 1979 directed NRC to conduct a study of extending the Commission's licensing or regulatory authority to include categories of existing and future Federal radioactive waste storage and disposal activities not presently subject to such authority. The report includes a complete listing and inventory of all radioactive waste storage and disposal activities now being conducted or planned by Federal agencies. The NRC study has attempted to present a general comparison of the relative hazards associated with defense-generated and commercial wastes. Options for extending Commission authority were developed and analyzed. The implications of NEPA were analyzed in the context of these options. The national security implications of extending NRC's regulatory authority over DOE programs are examined and evaluated. Costs and benefits are identified and assessed. The Commission's recommendations, based on the study, are to extend licensing authority over new DOE disposal activities involving transuranic wastes and non-defense low-level waste and to initiate a pilot program to test the feasibility of NRC playing a consultative role in the evaluation of existing DOE activities.

1601 (NUREG/CP--0008, pp 200-228) LOW LEVEL WASTE BURIAL GROUND. Murphy, E.S. Dec 1979.

From State workshop of review of the Nuclear Regulatory Commission's decommissioning policy; Seattle, WA, USA (25 Sep 1979).

The study to decommission shallow land burial sites for the disposal of low level radioactive waste is discussed. The study was to provide information on the available technology, the probable costs, and the safety considerations of decommissioning low level waste burial grounds.

1602 (NUREG/CR--0612) INVESTIGATIONS OF THE PERFORMANCE OF SOLIDIFIED HIGH-LEVEL NUCLEAR WASTE FORMS. Cheung, H. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Jan 1979. Contract W-7405-ENG-48. 198p. (UCRL--52700). Dep. NTIS, PC A09/MF A01.

The Lawrence Livermore Laboratory has been providing technical support to the Nuclear Regulatory Commission in the development of regulations, regulatory guides, and branch technical positions for the management of nuclear wastes. Studies of solidified high-level waste during the period from 1976 to 1978, when work was terminated because of shifting of national emphasis onto spent fuel disposal, are presented in this report. The problem of management, i.e., handling, generation, and disposal of solidified high-level waste derived from operation of commercial light-water reactors, requires a thorough systematic solution to protect health and ensure safety. A definition of the problem by describing the components of the waste management system is given: the waste form, the containers, storage and transportation appurtenances, handling equipment, the repository surface and underground facilities, the repository site, and the operations. A systems analysis methodology to assess the hazards of waste management is developed. Data on accident probabilities, waste form characteristics, and geological and hydrological properties of potential repository sites are compiled. A wide range of management scenarios are generated. Limited sensitivity and uncertainty analyses are performed. On the basis of available information, preliminary investigations showed that transportation and interim storage are of most concern. Also identified are areas needing further study: transportation data base, thermal and seismic aspects of interim storage, human factors, geochemical transport of radionuclides, and ground water composition, among others. In addition to the technical solution of the problems, brief consideration to historical and socioeconomic aspects is also given.

1603 (NUREG/CR--0619) PROPERTIES OF RADIOACTIVE WASTES AND WASTE CONTAINERS. FIRST TOPICAL REPORT. Becker, W.; Colombo, P.; Francis, A.J. (Brookhaven National Lab., Upton, NY (USA)). Aug 1979. Contract EY-76-C-02-0016. 164p. (BNL-NUREG--50957). Dep. NTIS, PC A08/MF A01.

This topical report summarizes the results of the NRC sponsored program, Properties of Radioactive Wastes and Waste Containers, from its inception through September 1978. The properties of waste forms and packages resulting from the solidification of liquid concentrate and solid wastes generated as by-products of the liquid radioactive waste treatment systems in commercial BWRs and PWRs have been determined. The solidification agents currently employed at power reactors in the United States and (to a lesser extent) agents actively marketed for solidification of these wastes were considered. The waste form and package properties that have been studied in the experimental program include leachability, thermal stability, combustibility, thermal conductivity, mechanical strength, dispersibility, radiation stability, corrosion, and biodegradability. In addition, work has been conducted to determine the effects of various processing parameters on basic waste form criteria. This information is required to assess the safety and environmental impacts of radioactive waste disposal and to support quality control and assurance standards for radioactive waste treatment systems in operating facilities.

1604 (NUREG/CR--0794) GENERAL INVESTIGATION OF RADIONUCLIDE RETENTION IN MIGRATION PATHWAYS AT THE WEST VALLEY, NEW YORK LOW-LEVEL BURIAL SITE. ANNUAL REPORT, SEPTEMBER 1, 1977-SEPTEMBER 30, 1978. Dana, R.H. Jr.; Molello, S.A.; Fickies, R.H.; Fakundiny, R.H. (New York State Geological Survey, Albany (USA)). Nov 1979. 106p. (NYSGS--79-2403). NTIS.

The scope of this research program includes several basic parts: a surface water program, a geomorphic and erosion study, a trench water study, and a soil analysis study. The study involved the collection of surface water data, a geomorphic study and mapping of a 4.1 km reach of Buttermilk Creek and adjacent areas within the drainage basin, the analysis of water samples collected from waste burial trenches, and the analysis of soil samples collected from a research trench near the burial site. Buttermilk Creek Valley is being actively subjected to erosion by a combination of fluvial transport, lateral channel scour processes, transport on alluvial fans, and landsliding. Local ponding may contribute to landsliding and slumping by bringing moisture contents close to the liquid limit of the soil. Tests indicate that the soil in which the waste is buried has been subjected to a load greater than the present day overburden loadng. The theoretical depth limit to which cracks can penetrate in the soil is approximately 50 feet.

1605 (NUREG/CR--0795) GEOMORPHIC AND EROSION STUDIES AT THE WESTERN NEW YORK NUCLEAR SERVICE CENTER, WEST VALLEY, NEW YORK. Boothroyd, J.C.; Timson, B.S.; Dana, R.H. Jr. (New York State Geological Survey, Albany (USA); Mahoosuc Corp., Augusta, ME (USA)). Dec 1979. 74p. (NYSGS--79-2406). NTIS.

This report is one in a series of related reports presenting the results of a study to evaluate the containment capability of a low-level, solid radioactive waste-burial ground at West valley, NY. This project is the first portion of a detailed geomorphic and erosion study of the reach of Buttermilk Creek adjacent to the waste-burial site. Buttermilk Creek valley is being actively modified by fluvial transport, lateral channel scour, and landsliding. High surface runoff rates create highly variable but enhanced stream flows that result in coarse-gravel sediment transport within the active channel. The active channel morphology indicates that braided stream processes are common in Buttermilk, leading to active channel down-cutting and lateral migration. Where lateral migration of the active channel has undercut valley wall slopes, large-scale landsliding enhances valley wall retreat. A major site of historical and recent slide activity lies adjacent to the low-level burial trenches. Initial, post-glacial Buttermilk Creek incision began before 9920 +-240 B.P., the age of the oldest dated fluvial terrace. Future evolution of the system is expected to proceed by Buttermilk valley lowering, tributary and landslide widening, and stream capture.

1606 (NUREG/CR--0857) PROPERTIES OF RADIOACTIVE WASTES AND WASTE CONTAINERS. PROGRESS REPORT NO. 10, JULY-SEPTEMBER 1978. Colombo, P.; Neilson, R.M. Jr. (Brookhaven National Lab., Upton, NY (USA)). May 1979. Contract EY-76-C-02-0016. 39p. (BNL-NUREG--51026). Dep. NTIS, PC A03/MF A01.

Modified IAEA and equilibrium leaching studies were performed using portland cement, urea-formaldehyde and vinyl ester-styrene waste forms containing BWR chemical regenerative waste. This set of experiments, with its range of leachant replacement intervals, should cover the range of expected leach rates for most conditions. The equilibrium leach method generally resulted in lower release rates than the modified IAEA method. In the case of strontium-85 release from portland cement, this decrease was dramatic. The use of finite and semi-infinite diffusional mass transport models for leaching data analysis to predict long-term releases from full scale waste forms is discussed. While the finite model can give a more accurate description of activity release since it considers specimen depletion effects, the double series function solution converges slowly for small effective diffusivities and small total numbers of summation terms. This can result in computer truncation error dominating in the solutions for small releases. In this report period, the first topical report for the program Properties of Radioactive Wastes and Waste Containers was also written. This document appears under a separate cover.

1607 (NUREG/CR--0911) PROPERTIES OF RADIOACTIVE WASTES AND WASTE CONTAINERS. PROGRESS REPORT NO. 11, OCTOBER-DECEMBER 1978. Colombo, P.; Neilson, R.M. Jr. (Brookhaven National Lab., Upton, NY (USA)). Jun 1979. Contract EY-76-C-02-0016. 33p. (BNL-NUREG--51042). Dep. NTIS, PC A03/MF A01.

Portland cement waste forms were tested to determine the extent of particulate formation and the particle size distribution resulting from an impact loading environment. Test specimens which were cylindrical with a diameter of 2.5 cm and a height of 3.8 cm were formulated using various simulated wastes. Impact energies of 0.8 kg-m (7.85 joule) to 3.2 kg-m (31.4 joule) were employed. The cumulative weight percentage particulate was measured versus particle size as a function of impact energy, waste/binder ratio, and waste type. Because of the porosity initially present in portland cement waste forms, this data cannot be interpreted directly relative to the formation of increased surface area. The effect of cobalt-60 radiation exposure on the leachability of portland cement and urea-formaldehyde waste forms was investigated. Total doses of 10^5-10^8 rad were employed. The release of cesium-137 and strontium-85 from cement waste forms was unaffected by radiation dose in the range considered. The leachability of urea-formaldehyde waste forms did increase with dose for 10^7 to 10^8 rad. At lower total dose, no effect on leachability was noted. A photomicroscopic technique was employed to examine the particle size of waste solids in bitumen waste forms. The twin screw extruder used to produce these waste forms provided significant comminution of waste solids.

1608 (NUREG/CR--0912(Vol.1)) GEOSCIENCE DATA BASE HANDBOOK FOR MODELING A NUCLEAR WASTE REPOSITORY. VOLUME 1. Isherwood, D. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Dec 1979. Contract W-7405-ENG-48. 327p. (UCRL--52719(Vol.1)). Dep. NTIS, PC A15/MF A01.

This handbook contains reference information on parameters that should be considered in analyzing or modeling a proposed nuclear waste repository site. Only those parameters and values that best represent the natural environment are included. Rare extremes are avoided. Where laboratory and field data are inadequate, theoretical treatments and informed engineering judgements are presented. Volume 1 contains a data base on salt as a repository medium. Chapters on the geology of bedded and dome salt, the geomechanics of salt, hydrology, geochemistry, natural and man-made features,

and seismology provide compiled data and related information useful for studying a proposed repository in salt. These and other data will be needed to derive generic deep geologic modeling parameters and will also serve as background for the verification of source data that may be presented in licensing applications for nuclear waste repositories. Volume 2 is the result of a scoping study for a data base on the geology, geomechanics, and hydrology of shale, granite, and basalt as alternative repository media. Except for the geomechanics of shale, most of the sections contain relatively complete compilations of the available data, as well as discussions of the properties that are unique to each rock type.

1609 (NUREG/CR--0912(Vol.2)) GEOSCIENCE DATA BASE HANDBOOK FOR MODELING A NUCLEAR WASTE REPOSITORY. Isherwood, D. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Feb 1980. Contract W-7405-ENG-48. 331p. (UCRL--52719(Vol.2)). NTIS.

The three chapters of Volume 2 are the results of a scoping study on the geology, geomechanics, and hydrology of basalt and granite, and on the geology and hydrology of shale. The chapters include relatively complete compilations of the data currently available, as well as discussions of the properties that are unique to each rock type. Most of the data are, however, undigested; many of the figures and tables were taken from the original sources without extensive review. The use of symbols, especially in the sections on geomechanics, has been made generally consistent with the chapters of Volume 1; nonetheless, owing to the inconsistencies that pervade the literature, some differences remain. The discussion of shales in the present volume presents brief geologic descriptions of shale formations in the US and compiles extensive hydrologic data. The most thorough data are from the Great Basin, the Rocky Mountains, and the Colorado Plateau. The data on basalts are less copious. Nonetheless, geomechanical data are presented from a variety of places, notably Amchitka Island, the Great Lakes region (the Dresser Basalt), and the Columbia Plateau. The most useful hydrologic data have been collected at the Idaho National Engineering Laboratory and the Hanford Reservation on the Columbia Plateau. The geological descriptions of basalt flows focus on the Pacific Northwest. Data on granites come from widely scattered sources, including dam sites, tunnel sites, and quarries around the world.The most systematic geomechanical data, including the results of thermal modeling experiments, have been collected at the Stripa mine project currently underway in Sweden. The chapter on granites also includes descriptions of the major granite batholiths of the US and a discussion of fracture flow that is equally applicable to other rock types.

1610 (NUREG/CR--1005(Vol.1)) RADIOACTIVE WASTE DISPOSAL CLASSIFICATION SYSTEM. Rogers, V.C. (Ford, Bacon and Davis Utah, Inc., Salt Lake City (USA)). Sep 1979. 62p. NTIS.

The Nuclear Regulatory Commission, as part of its development of regulations for the disposal of radioactive waste, has contracted for the development of a radioactive waste classification system. The need for removing the waste from man's environment increases as the potential for endangering the health and safety of the public increases. The classification system being proposed is based on the requirements for safe disposal. The steps which were followed are: define safe, determine the pathways through the environment, formulate categories for the classification system and recommend disposal concentration guides for each category. The proposed categories are based on the length of administrative controls, the accessability of the waste and the hydrologic conditions. 13 figures, 6 tables.

1611 (NUREG/CR--1005(Vol.2)) RADIOACTIVE WASTE DISPOSAL CLASSIFICATION SYSTEM. VOLUME 2. THE COMPUTER PROGRAM AND GROUNDWATER MIGRATION MODELS. Rogers, V.C.; Baird, R.D.; Robertson, B.C.; Macbeth, P.J. (Ford, Bacon and Davis Utah, Inc., Salt Lake City (USA)). Sep 1979. 57p. NTIS.

The Nuclear Regulatory Commission, as part of its development of regulations for the disposal of radioactive waste, has contracted for the development of a radioactive classification system. A five category system, based on requirements for safe disposal, has been proposed. A computer program which calculates the Disposal Concentration Guides for individual isotopes for each category was prepared. The program allows parameters for the isotopes and condition of the disposal to be varied. A description of the equations representing the potential exposure mechanisms is also provided.

1612 (NUREG/CR--1037) EVALUATION OF ISOTOPE MIGRATION, LAND BURIAL. WATER CHEMISTRY AT COMMERCIALLY OPERATED LOW-LEVEL RADIOACTIVE WASTE DISPOSAL SITES. PROGRESS REPORT NO. 10, JULY-SEPTEMBER 1978. Colombo, P.; Weiss, A.J. (Brookhaven National Lab., Upton, NY (USA)). Sep 1979. Contract EY-76-C-02-0016. 44p. (BNL-NUREG--51083). Dep. NTIS, PC A03/MF A01.

Water samples were collected by anoxic procedures from trenches 2, 3, 4, 5, 8, and 9 at the West Valley, New York low-level radioactive waste disposal site. In-situ measurements of pH, Eh, specific conductance, and temperature were made. The results of inorganic, organic, and radiochemical analyses are reported. Acid-base titration curves exhibit the complex nature of these waters compared to local ground water. The methylene chloride extraction technique used to isolate acidic, neutral, and basic organic compounds from trench waters is described. Gas chromatograms and concentrations of individual compounds identified by GC/MS methods are shown. Cobalt-60, strontium-90, cesium-137, and plutonium-238, 239, 240 were found dissolved in all trench waters. Dissolved sodium-22 and cesium-134 were found in most trenches, whereas americium-241 was found dissolved only in trench 8.

1613 (NUREG/CR--1325) EVALUATION OF ISOTOPE MIGRATION: LAND BURIAL. WATER CHEMISTRY AT COMMERCIALLY OPERATED LOW-LEVEL RADIOACTIVE WASTE DISPOSAL SITES. QUARTERLY PROGRESS REPORT, OCTOBER-DECEMBER 1979. Weiss, A.J.; Colombo, P. (Brookhaven National Lab., Upton, NY (USA)). Feb 1980. Contract EY-76-C-02-0016. 27p. (BNL-NUREG--51147). Dep. NTIS, PC A03/MF A01.

Decreasing radionuclide sorption, K/sub d/, was observed for ^{241}Am, ^{85}Sr, and ^{60}Co when organic substances were added to well water and shale from the Maxey Flats, Kentucky, disposal site. Ethylenediaminetetraacetic acid (EDTA) caused the greatest decrease in K/sub d/. Several reference clays were also used for comparison. Only montmorillonite maintained its sorption capability in the presence of EDTA. Experiments were performed to establish the existence of organoradionuclide complexes in trench waters from the low level radioactive

waste disposal sites. Fractionations of trench waters were accomplished by gel filtration chromatography. Preliminary results indicated that cesium isotopes in the trench water from West Valley, New York, may be associated with organic molecules as species with molecular weight less than 700, and that it is unlikely an EDTA complex.

1614 (NVO--196-11) NEVADA NUCLEAR WASTE STORAGE INVESTIGATIONS. QUARTERLY REPORT, APRIL-JUNE 1979. (Department of Energy, Las Vegas, NV (USA). Nevada Operations Office). Sep 1979. 62p. Dep. NTIS, PC A04/MF A01.
Seven subtasks are reported on: seismic, geology/hydrology, media (argillite, tuff, granite), NTS support, quality assurance, technical overview, and spent fuel test. Yucca Mountain is recommended by USGS. (DLC)

1615 (NVO--196-12) NEVADA NUCLEAR WASTE STORAGE INVESTIGATIONS. QUARTERLY REPORT, JULY-SEPTEMBER 1979. (Department of Energy, Las Vegas, NV (USA). Nevada Operations Office). Dec 1979. 62p. Dep. NTIS, PC A04/MF A01.
Geohydrologic cross sections through the Kern Mountains, Lone Mountain-Weepah Hills, and Clipper Gap granitic areas indicate that the groundwater flow paths from the Kern Mountains are the longest and those from Clipper Gap the shortest. Probability of both the recurrence of volcanism and the disruption of a repository site at Yucca Mountain fall in the range of 10^{-9} per year. Global thermomechanical calculations of the response of argillite to thermal expansion have been completed. A study of Spent Fuel Test-Climax showed that radiation exposure would not induce sufficient hydrogen production to create an explosive mixture during the five-year experiment - even without any ventilation.

1616 (NVO--196-13) NEVADA NUCLEAR WASTE STORAGE INVESTIGATIONS: FY 1980 PROJECT PLAN AND FY 1981 FORECAST. (Department of Energy, Las Vegas, NV (USA). Nevada Operations Office). Feb 1980. 112p. Dep. NTIS, PC A06/MF A01.
The DOE is responsible for developing or improving the technology for safely and permanently isolating radioactive wastes from the biosphere. The National Waste Terminal Storage Program, which is a part of the US Nuclear Waste Management Program, is concerned with disposing of the high-level wastes associated with DOE and commercial nuclear reactor fuel cycles. The DOE/NV has been delegated the responsibility to evaluate the geohydrologic setting and underground rock masses of the Nevada Test Site (NTS) area to determine whether a suitable site exists for constructing a repository for isolating highly radioactive solid wastes. Accordingly, the Nevada Nuclear Waste Storage Investigations (NNWSI) were established by NV to conduct these evaluations. The NNWSI are managed by the DOE/NV, but the field and laboratory investigations are being performed by scientific investigators from several organizations. The four primary organizations involved are: Los Alamos Scientific Laboratory (LASL), Lawrence Livermore Laboratory (LLL), Sandia Laboratories (SL), and the US Geological Survey (USGS). DOE/NV is responsible for coordinating these investigations. This document presents the Project Plan for the NNWSI for FY 1980 and forecasts activities for FY 1981. Each task is divided into subtasks and described. This Plan is subject ot periodic review and revision by the DOE/NV. Changes will be addressed as they occur in NNWSI Quarterly Reports. This document also presents information on the Project's technical approach as well as its history, organization, and management.

1617 (NVO--196-14) NEVADA NUCLEAR WASTE STORAGE INVESTIGATIONS. QUARTERLY REPORT, OCTOBER-DECEMBER 1979. (Department of Energy, Las Vegas, NV (USA). Nevada Operations Office). Mar 1980. 61p. Dep. NTIS, PC A04/MF A01.
Eight tasks are reported: Weapons Test Seismic Investigations, Geologic and Hydrologic Investigations, Media Investigations, Engineering and Technical Support, Quality Assurance, Technical Overview, Spent Fuel Test (Climax), and National Waste Terminal Storage Program Support.

1618 (NVO--196-16) NEVADA NUCLEAR WASTE STORAGE INVESTIGATIONS. FY 1979 PEER REVIEW SUMMARIES AND RELATED DOCUMENTATION. (Department of Energy, Las Vegas, NV (USA). Nevada Operations Office). Jun 1980. 192p. NTIS, PC A09/MF A01.
The NNWSI FY 1979 Project Plan (NVO-196-9) describes the accomplishment plan and objectives of the FY 1979 investigations. Three critical tasks and one critical subtask were selected by Project management for in-depth external peer review at meetings held at the DOE/NV in Las Vegas. The four technical peer review meetings held during FY 1979 were conducted to obtain an external assessment of the sufficiency and quality of the four selected critical investigative segments of the NNWSI. Peer reviewers representing appropriate fields of expertise were invited to attend each meeting. Within about two weeks of each meeting, the invited reviewers summarized their impressions of the technical activities presented to them and transmitted their summaries and recommendations to DOE/NV by letter. This document is a compilation, according to the individual meetings, of all correspondence between reviewers and Project personnel that is relevant to the technical activities of the NNWSI. The section for each meeting briefly summarizes the major activities of the NNWSI being reviewed and the effects of the reviewers comments and recommendations on Project planning. Each section also includes a list of the invited peer reviewers, a meeting agenda, and a copy of all technical correspondence relating to the review meeting. General impressions of the overall peer review process and improvements to be incorporated into future peer review activities are discussed in the next section as an introduction to the four subsequent sections which are devoted to the individual FY 1979 peer reviews.

1619 (NVO--196-17) NEVADA NUCLEAR WASTE STORAGE INVESTIGATIONS: QUALITY ASSURANCE PLAN. (Department of Energy, Las Vegas, NV (USA). Nevada Operations Office). Aug 1980. 30p. NTIS, PC A03/MF A01.
The Nevada Nuclear Waste Storage Investigations (NNWSI) were established by DOE/NV to evaluate the geohydrologic setting and underground rock masses of the Nevada Test Site (NTS) and contiguous areas to determine whether a suitable site exists for constructing a repository for isolating highly radioactive solid wastes. Since the results of these evaluations will impact possible risks to public health and safety, a quality assurance program which conforms to the criteria given in the Code of Federal Regulations is needed to control the quality aspects of the work. This Quality Assurance Plan (QAP) describes the general quality assurance program for the overall NNWSI project under which the quality

assurance programs of the individual participating organizations and support contractors are to operate. The details of how each of these groups will meet the criteria will differ among participating organizations and support contractors, and those details are given in the QAPP's listed in Appendix A. It is the purpose of this plan to show the commonality of quality assurance programs in effect within the project and to define how each element fits into the entire picture to give total quality assurance coverage for the NNWSI Project.

1620 (NVO--196-19) NEVADA NUCLEAR WASTE STORAGE INVESTIGATIONS. QUARTERLY REPORT, APRIL - JUNE 1980. (Department of Energy, Las Vegas, NV (USA). Nevada Operations Office). Aug 1980. 61p. NTIS, PC A04/MF A01.

Geologic reconnaissance of the Crater Flat tuff and correlations with existing drill hole data revealed at least three ash-flow tuff members. A topographic base map of the southwest quadrant of the NTS was compiled. A major effort was devoted to integrating all electrical traverse data obtained near Yucca Mountain with the mapped geology to produce a map of inferred faulting in the area of interest. The collection, inversion, and analysis of all vertical electrical sounding (VES) data obtained from the Amargosa Desert were completed in support of the NTS regional hydrologic investigations. Precipitation data were analyzed to assess relationships and correlations between the amounts of groundwater recharge from area to area for use in the sensitivity studies. A simplified computer program and mathematical model were completed in a study of erosion rates in the Great Basin. The data obtained on NTS seismicity show diffuse seismicity occurring in an east-west band on the north of the NTS and a U-shaped band of near-quiescence that encompasses the NTS on the south. The Nevada Bureau of Mines completed its literature research and appraisal of the mineral-resource poential of the following granitic sites: Clipper Gap, the Manhatten District, and the Kern Mountains. The In Situ Tuff Water Migration/Heater Experiment was completed and cooldown behavior was monitored; the water generation rates during the experiment were consistent with the values determined previously. Preparations for and loading of the spent fuel canisters into the SFT-C test array were successfully completed without incident; activation of the electrical simulators and guard heaters was accomplished and data collection is in progress. Two new investigative tasks were incorporated into the NNWSI this quarter, Rock Mechanics and Radionuclide Migration; detailed program plans are currently being developed and will be the subject of peer reviews.

1621 (ONWI--9(2)) TECHNICAL PROGRESS REPORT FOR THE QUARTER JANUARY 1-MARCH 31, 1979. (Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). 1979. Contract EY-76-C-06-1830. 352p. Dep. NTIS, PC A16/MF A01.

The ONWI program is designed to provide all of the technology and engineering design bases for a waste repository to isolate nuclear waste safely, with protection to the environment. The technical programs required to meet the challenge of the NRC licensing process are site characterization, technology development, and facilities engineering. This document is divided into sections dealing with: science and technology, process/equipment development, systems analysis, geologic exploration, facilities engineering, and site qualification and licensing. (DLC)

1622 (ONWI--9(3)) TECHNICAL PROGRESS REPORT, APRIL 1-JUNE 30, 1979. (Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). 1979. Contract EY-76-C-06-1830. 275p. Dep. NTIS, PC A12/MF A01.

Objective is to provide the technology and engineering design bases for a waste repository to isolate nuclear waste safely, with protection to the environment. This document reports progress on technology development, systems analysis, site characterization, licensing, and facility engineering. (DLC)

1623 (ONWI--9(4)) TECHNICAL PROGRESS REPORT FOR THE QUARTER JULY 1-SEPTEMBER 30, 1979. (Battelle Columbus Labs., OH (USA)). 1979. Contract AC06-76RL01830. 394p. NTIS, PC A17/MF A01.

This report describes the technical accomplishments on the commercial nuclear waste management programs under the direction of the Office of Nuclear Waste Isolation (ONWI). The ONWI program is designed to provide all of the technology and engineering design bases for a waste repository to isolate nuclear waste safely, with protection to the environment.

1624 (ONWI--19(Rev.1)) NATIONAL WASTE TERMINAL STORAGE PROGRAM. OFFICE OF NUCLEAR WASTE ISOLATION TECHNICAL PROGRAM PLAN. (Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). Dec 1979. Contract EY-76-C-06-1830. 131p. Dep. NTIS, PC A07/MF A01.

The National Waste Terminal Storage Program (NWTS) was established in 1976 with the objective of developing a system for the permanent isolation of nuclear wastes. DOE is charged with developing programs for the long term management of highly radioactive nuclear wastes by federal law. This legislation specifies that DOE must provide facilities for the successful isolation of these wastes from the biosphere in federally licensed and owned repositories for as long as they represent a significant hazard. The scope of NWTS activities includes providing the technology and facilities for the terminal isolation of commercial wastes by disposal in stable geologic repositories deep underground. Steps leading to the accomplishment of this purpose include: site exploration, characterization, and recommendation; design, licensing, construction, and operation of a geologic repository (or repositories); provision of spent fuel packaging and transportation facilities; technology to support these steps; and coordination of studies of altenate disposal concepts (i.e., deep hole, seabed, space, etc.). Emphasis is being placed on a system of multiple barriers - natural and man-made - to isolate nuclear waste from the environment. Because the nature of the host rock is basic to determination of other barriers, work in the geologic aspects of the multiple barrier system is well under way in several candidate media. Throughout the process, the NWTS Program has the responsibility to provide public information on all aspects of the program and to encourage public interaction.

1625 (ONWI--23) PRELIMINARY EVALUATION OF THE ENVIRONMENTAL ASPECTS OF POTENTIAL RADIOACTIVE WASTE REPOSITORY STUDY AREAS IN THE OHIO AND NEW YORK PORTIONS OF THE SALINA BASIN. (Battelle Memorial Inst., Columbus, OH (USA)).

Sep 1979. Contract AC06-76RL01830. 95p. NTIS, MF A01.

Portions of document are illegible.

Various geographical regions and geological media are being evaluated to determine their potential suitability as an underground repository for commercial radioactive wastes. All three areas and the subarea of Ohio and New York have good highway and rail-transport access. More information is needed on the agricultural viability of all areas. Surface and ground-water usage are much greater in the urbanized Ohio area; because of its rural nature, New York Study Area 1 and the Beaver Dams Subarea have the lowest demand for either water source. Of the New York areas, Study Area 1 appears to provide greater possibilities, considering the objective of minimizing environmental impact. The Ohio study area includes a large part that is within the urbanized area surrounding Cleveland. In addition, the entire study area is marked by a high density of other screening factors such as historic and archaeological sites, natural areas and scenic highways. While more detailed study in the Ohio area might reveal subareas relatively lightly developed and sufficient in size for a repository, significant land use conflicts are likely for most of the area of geologic interst. The Ohio area, from a nongeologic standpoint, appears to be the least promising of the areas identified.

1626 (ONWI--24) ASSUMPTIONS AND GROUND RULES USED IN NUCLEAR WASTE PROJECTIONS AND SOURCE TERM DATA. Storch, S.N.; Prince, B.E. (Union Carbide Corp., Oak Ridge, TN (USA). Nuclear Div.). Sep 1979. Contract W-7405-ENG-26;AC06-76RL01830. 137p. NTIS, PC A07/MF A01.

Assumptions and ground rules of long term domestic commercial nuclear waste projections published in studies by Union Carbide's Office of Waste Isolation, Arthur D. Little, Inc., and DOE are compared to those of the Commercial Waste Management Impact Statement, prepared by Battelle Pacific Northwest Laboratory. Target capacity growths associated with these projections range from 183 to 570 GW(e) for the year 2000. Each study regards the once-through (no recycle) fuel cycle as a reference case; however, fuel cycles employing reprocessing and various recycle strategies were also considered. The studies are compared with respect to characteristics and packaging/shipment features of spent fuel and wastes generated from reprocessing and other fuel cycle activities. Issues associated with the interim storage of spent fuel are discussed along with the characteristics and issues relating to ore mill tailings and non-fuel cycle wastes. Finally, assumptions and limitations associated with certain computer codes (viz., ORIGEN, KWIKPLAN, WASPR, and DISFUL) employed in the four waste projection studies are outlined. Overall, the report is intended to serve as a guidebook in relating information contained in the published waste projection studies.

1627 (ONWI--29) REGIONAL SUMMARY AND RECOMMENDED STUDY AREA FOR OHIO AND NEW YORK PORTIONS OF THE SALINA BASIN. (Battelle Memorial Inst., Columbus, OH (USA)). Sep 1979. Contract AC06-76RL01830. 43p. NTIS, MF A01.

Portions of document are illegible.

Various geographical regions and geological media are being evaluated to determine their potential suitability as an underground repository for commercial radioactive wastes. The geologic information shows that the salt thickness, depth, and lateral extent within these areas is sufficient to warrant further detailed examination. The geologic structure is relatively complex in New York when compared with Ohio, but meets minimum screening requirements. Deep and interaquifer ground-water flow patterns are not known. The Salina basin is considered to be tectonically stable. Areas with industrial activities such as oil and gas fields, salt mining, and brining operations have been excluded in the geologic screening process, which has led to certain areas being recommended for further evaluation. The preliminary environmental examination revealed no reasons for excluding the search areas of geologic interest in New York from further study. Of the New York areas, Study Area I appears to provide greater possibilities, considering the objective of minimizing environmental impact. The Ohio study area includes a large part that is within the urbanized area surrounding Cleveland. In addition, the entire study area is marked by a high density of other screening factors such as historic and archaeological sites, natural areas and scenic highways. While more detailed study in this area might reveal subareas relatively lightly developed and sufficient in size for a repository, significant land-use conflicts are likely for most of the area of geologic interest. From a nongeologic standpoint, the Ohio area appears to be the least promising of the areas identified.

1628 (ONWI--39(Vol.2)) ASSESSMENT OF LWR SPENT FUEL DISPOSAL OPTIONS. VOLUME 2. SYSTEM DEFINITION AND ASSESSMENTS. TECHNICAL REPORT. (Bechtel National, Inc., San Francisco, CA (USA)). Jul 1979. Contract EY-76-C-06-1830. 211p. Dep. NTIS, PC A10/MF A01.

Volume 2, in addition to introducing and defining the requirements for the study, contains the detailed evaluation of the study cases in each of six assessment areas, and describes and evaluates a number of study variations.

1629 (ONWI--39(Vol.3)) ASSESSMENT OF LWR SPENT FUEL DISPOSAL OPTIONS. VOLUME 3. STUDY BASES AND SYSTEM DESIGN CONSIDERATIONS (APPENDICES). TECHNICAL REPORT. (Bechtel National, Inc., San Francisco, CA (USA)). Jul 1979. Contract EY-76-C-06-1830. 462p. Dep. NTIS, PC A20/MF A01.

Volume 3 (Appendices) provides a tabulation of the bases and assumptions used in the study as well as preconceptual design description and cost estimates of the facilities and transportation systems necessary to implement the various study cases.

1630 (ONWI--59) DISPOSAL OF SPENT NUCLEAR FUEL. (Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). Dec 1979. Contract EY-76-C-06-1830. 72p. Dep. NTIS, PC A04/MF A01.

This report addresses the topic of the mined geologic disposal of spent nuclear fuel from Pressurized Water Reactors (PWR) and Boiling Water Reactors (BWR). Although some fuel processing options are identified, most of the information in this report relates to the isolation of spent fuel in the form it is removed from the reactor. The characteristics of the waste management system and research which relate to spent fuel isolation are discussed. The differences between spent fuel and processed HLW which impact the waste isolation system are defined and evaluated for the nature and extent of that impact, What is

known and what needs to be determined about spent fuel as a waste form to design a viable waste isolation system is presented. Other waste forms and programs such as geologic exploration, site characterization and licensing which are generic to all waste forms are also discussed. R and D is being carried out to establish the technical information to develop the methods used for disposal of spent fuel. All evidence to date indicates that there is no reason, based on safety considerations, that spent fuel should not be disposed of as a waste.

1631 (ONWI--60) WASTE ISOLATION PERFORMANCE ASSESSMENT: A STATUS REPORT. Burkholder, H.C. (Battelle Memorial Inst., Columbus, OH (USA)). Nov 1979. Contract EY-76-C-06-1830. 31p. Dep. NTIS, PC A03/MF A01.

The assessment of system performance following emplacement of the waste is a key activity in the development of nuclear waste isolation systems. The assessment results provide a technical basis for decisions concerning site selection, repository design selection, engineered barrier selection, and system acceptability, and they bear directly on the central issue of nuclear waste isolation, Do the proposed isolation systems sufficiently protect humans from the waste. The objective of this paper is to describe the performance assessment problem, outline general approaches to its solution, and describe the status of the development, validation, and application of performance assessment technology.

1632 (ONWI--65) ALTERNATIVE WASTE DISPOSAL CONCEPTS. AN INTERIM TECHNICAL ASSESSMENT, TECHNICAL REPORT. Crandall, D.B. (Bechtel National, Inc., San Francisco, CA (USA)). Nov 1979. Contract AC06-76RL01830. 262p. NTIS, PC A12/MF A01.

ONWI's objectives under the NWTS program are (1) to identify and develop geologic sites for use as nuclear waste repositories and (2) to manage the development and application of specific supporting data and base technologies. The investigation and evaluation of alternative waste disposal technologies is required to satisfy the second objective and to comply with the NEPA process. The study (1) provides a preliminary identification and description of alternative waste disposal concepts, (2) combines them selectively with particular forms of spent fuel and waste into specific cases, and (3) provides a preliminary comparative assessment of the cases with respect to radiological impact, environmental impact, degree of development, resource consumption, safeguards, and economics. This report provides a tentative ranking of the cases studied, based on the assessments made, and contains recommendations for additional work required to provide a more thorough definition of disposal concepts and a means for developing final evaluations of the alternatives.

1633 (ONWI--74) SUITABILITY OF PALESTINE SALT DOME, ANDERSON CO., TEXAS FOR DISPOSAL OF HIGH-LEVEL RADIOACTIVE WASTE. Patchick, P.F. (Battelle Memorial Inst., Columbus, OH (USA)). Jan 1980. Contract AC06-76RL01830. 39p. NTIS, PC A03/MF A01.

The suitability of Palestine salt dome, in Anderson County, Texas, is in serious doubt for a repository to isolate high-level nuclear waste because of abandoned salt brining operations. The random geographic and spatial occurrence of 15 collapse sinks over the dome may prevent safe construction of the necessary surface installations for a repository. The dissolution of salt between the caprock and dome, from at least 15 brine wells up to 500 feet deep, may permit increased rates of salt dissolution long into future geologic time. The subsurface dissolution is occurring at a rate difficult, if not impossible, to assess or to calculate. It cannot be shown that this dissolution rate is insignificant to the integrity of a future repository or to ancillary features. The most recent significant collapse was 36 feet in diameter and took place in 1972. The other collapses ranged from 27 to 105 feet in diameter and from 1.5 to more than 15 feet in depth. ONWI recommends that this dome be removed from consideration as a candidate site.

1634 (ONWI--77) INVESTIGATION OF SALT TRANSPORT IN VERTICAL BOREHOLES IN BRINE INVASION INTO FRESHWATER AQUIFERS. TECHNICAL REPORT. Knapp, R.M.; Podio, A.L. (Texas Univ., Austin (USA)). May 1979. Contract AC06-76RL01830. 87p. NTIS, PC A05/MF A01.

This report contains numerical and experimental studies convective-diffusive flow in wellbores and a numerical simulation of brine invasion of a freshwater aquifer. In the numerical study, comparisons of observed concentrations with values calculated from a one dimensional salt transport model demonstrated the model's adequacy in representing the salt transport. The experimental study generated data regarding salt concentration buildup in vertical tubes as a function of time. In the numerical simulation through comparison of several methods, the feasibility of using a high order finite difference method in multidimensional problems was demonstrated.

1635 (ONWI--79/E511-00300-4) LOCATING FIELD CONFIRMATION STUDY AREAS FOR ISOLATION OF NUCLEAR WASTE IN THE TEXAS PANHANDLE. ANNUAL REPORT, OCTOBER 1, 1978-SEPTEMBER 30, 1979. Gustavson, T.C.; Handford, C.R.; Presley, M.W.; Baumgardner, R.W. Jr.; Dutton, S.P.; Finley, R.J.; McGillis, K.A.; Simpkins, W.W. (Texas Univ., Austin (USA). Bureau of Economic Geology). 1 Dec 1979. Contract AC97-79ET44614. 115p. Dep. NTIS, PC A06/MF A01.

Since early 1977, the Bureau of Economic Geology has been evaluating several salt-bearing basins within the State of Texas as part of the national nuclear repository program. The Bureau, a research unit of the University of Texas at Austin and the State of Texas, is carrying out a long-term program to gather and interpret all geologic and hydrologic information necessary for description, delineation, and evaluation of salt-bearing strata in the Palo Duro and Dalhart Basins of the Texas Panhandle. The program in FY 79 has been subdivided into four broad research tasks, which are addressed by a basin analysis group, a surface studies group, a geohydrology group, and a host-rock analysis group. The basin analysis group has delineated the structural and stratigraphic framework of the basins, initiated natural resource assessment, and integrated data from 8000 ft (2400 m) of core material into salt-stratigraphy models. Salt depth and thickness have been delineated for seven salt-bearing stratigraphic units. Concurrently, the surface studies group has collected ground and remotely sensed data to describe surficial processes, including salt solution, slope retreat/erosion mechanisms, geomorphic evolution, and fracture system development. The basin geohydrology group has begun evaluating both shallow and deep fluid circulation within the basins. The newly formed host-rock analysis group has

initiated study of cores from two drilling sites for analysis of salt and the various lithologies overlying and interbedded with salt units. This paper, a summary report of progress in FY 79, presents principal conclusions and reviews methods used and types of data and maps generated. Topical reports, discussing various geological aspects of the Palo Duro and Dalhart Basins in detail, will be forthcoming as phases of the study are completed.

1636 (ONWI--84) STATUS REPORT ON THE IMPORTANCE OF NATURAL ORGANIC COMPOUNDS IN GROUNDWATER AS RADIONUCLIDE-MOBILIZING AGENTS. Means, J.L.; Hastings, D.W. (Battelle Columbus Labs., OH (USA)). Dec 1979. Contract EY-76-C-06-1830. 33p. Dep. NTIS, PC A03/MF A01.

This status report describes the results of our preliminary chemical analyses of the uranium solution mine leachate and the deep groundwater from Hanford. Some particularly interesting results have been obtained on the speciation of uranium in the leachate. Also included in this report are detailed literature reviews on three subjects of great importance to this program: (1) The origin and geochemistry of humic substances; (2) the aqueous transport of actinides by humic substances; and (3) the enrichment of actinides by organic substrates. The last section of this report describes plans for FY 1979-80.

1637 (ONWI--85) THERMAL GRADIENT BRINE INCLUSION MIGRATION IN SALT STUDY: GAS-LIQUID INCLUSIONS, PRELIMINARY MODEL. Olander, D.R.; Machiels, A.J. (California Univ., Berkeley (USA)). Oct 1979. Contract EY-76-C-06-1830. 53p. Dep. NTIS, PC A04/MF A01.

Natural salt deposits contain small cubical inclusions of brine distributed through the salt. Temperature gradients, resulting from storing heat-generating wastes in the salt, can cause the inclusions to move through the salt. Prediction of the rate and amount of brine-inclusion migration is necessary for the evaluation of bedded or domed salts as possible media for waste repositories. Inclusions filled exclusively with liquid migrate up the temperature gradient towards the heat source. The solubility of salt in the brine inclusion increases with temperature. Consequently, salt dissolves into the inclusion across the hot surface and crystallizes out at the cold surface. Diffusion of salt within the liquid phase from the hot to the cold faces causes the inclusions to move in the opposite direction. In so doing, they change shape and eventually become rectangular parallelipipeds with a width (dimension perpendicular to the thermal gradient) much larger than the thickness (dimension in the direction of the thermal gradient). The inclusions may also contain a gas phase predominantly consisting of water vapor. These entities are termed two-phase or gas-liquid inclusions. The two-phase inclusions usually migrate down the temperature gradient away from the heat source remaining more-or-less cubical. A two-phase inclusion also forms when an all-liquid inclusion reaches the waste package; upon opening up at the salt-package interface, the brine partially evaporates and the inclusion reseals with some insoluble gas trapped inside. These gas-liquid inclusions proceed to move down the temperature gradient, in the opposite sense of the all-liquid inclusions. The gas-liquid inclusions phenomenon provides a pathway by which radionuclides leached from the wasteform by the brine can be transported away from the waste package and thus might have greater access to the biosphere.

1638 (ONWI--88) WASTE ISOLATION PERFORMANCE ASSESSMENT AND IN-SITU TESTING. Maass, K.E.; Pomplun, E.; Weis, M. (eds.). (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Clausthal-Zellerfeld (Germany, F.R.). Inst. fuer Tieflagerung; Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.)). 1979. Contract EY-76-C-06-1830. 435p. (CONF-791087--). NTIS, PC A19/MF A01.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

Thirty-three papers and summaries are included, under the categories of plenary lectures, performance assessment, and Asse experiments. Separate abstracts were prepared for 27 of the papers; one was previously abstracted. (DLC)

1639 (ONWI--88, pp 7-14) OVERVIEW OF SOME CURRENT US DESIGN CONCEPTS FOR NUCLEAR WASTE/SPENT FUEL REPOSITORIES IN SALT. Claiborne, H.C. (Oak Ridge National Lab., TN). 1979.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

Conceptual designs for geologic disposal of high-level waste or spent fuel elements in salt deposits are compared with each other and with the reference repository design which is under development. 2 figures, 2 tables. (DLC)

1640 (ONWI--88, pp 15-36) FRG CONCEPTUAL DESIGN AND DESIGN BASIS. Roethemeyer, H. (Physikalisch-Technische Bundesanstalt, Braunschweig, Germany). 1979.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

For the site-independent conceptual design the following requirements have been laid down: (1) for safety reasons retrievability is not considered; (2) standard mining techniques and experience gained at Asse should be used; (3) two shafts should be sufficient; (4) different waste forms and containers shall be disposed of in different storage areas; (5) ventilated sections must allow the shutting off of each storage area from the rest of the mine; (6) the mining method of retreat working should be applied; (7) the mine works shall have a lateral safety distance to the caprock of 200 m and a vertical safety zone beneath salt level of 300 m; (8) all disposal areas shall be on one level; (9) salt and waste shall be transported in different drifts, mainly in a one way system.

1641 (ONWI--88, pp 37-61) PROJECT SAFETY-STUDIES ENTSORGUNG IN THE FEDERAL REPUBLIC OF GERMANY. Levi, H.W. (Hahn-Meitner-Institut fuer Kernforschung Berlin, Germany). 1979.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

The project SAFETY-STUDIES ENTSORGUNG (PSE) has been initiated by the Federal Ministry of Research and Technology. Entsorgung stands for back-end of the fuel cycle. Purpose of PSE is to analyze important safety aspects of the German nuclear Entsorgungs-Center (NEC) in considerable depth, to collect reliability and performance data, to adapt or to develop models and computer programs concerning radionuclide release mechanisms and release consequences and eventually to test them out with suitable subsystems of the NEC. Much of the efforts spent in PSE is devoted to the geologic subsystem, the waste repository. Two points are

considered important pecularities of waste repository safety analyses: employment of a deterministic rather than of a probabilistic approach, and definition of a significant period of the waste repository hazard to serve as a guideline for a time limitation of the analysis.

1642 (ONWI--88, pp 62-74) US PERFORMANCE ASSESSMENT. Burkholder, H.C. (Battelle Memorial Inst., Columbus, OH). 1979.
From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).
Viewographs are given illustrating the procedures used in assessing the performance of nuclear wasste isolation. The procedures include the ONWI, WIPP, BWIP, NRC-LLL, EPRI, EPA, and NRC-Sandia programs. (DLC)

1643 (ONWI--88, pp 75-82) US IN-SITU STUDIES IN SALT. Robinson, R.A. (Battelle Memorial Inst., Columbus, OH). 1979.
From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).
The in-situ field tests are necessary to provide data for performance assessment model verification and for comparison to a much broader data base obtained in laboratory and engineering-scale facilities. The justification for conducting relatively large and costly in-situ experiments is to encompass important geologic variables (e.g., lithostatic stress fields, heterogeneous geologic properties, and local hydrologic factors) that cannot be adequately simulated in a laboratory environment. Also, there is a need to examine possible synergistic effects such as coupling and feedback of temperature, radiation, stress relaxation, etc., that cannot be completely evaluated in a laboratory environment.

1644 (ONWI--88, pp 83-97) GERMAN IN-SITU STUDIES IN SALT. Kuehn, K. (Gesellschaft fuer Strahlen- und Umweltforschung, Clausthal-Zellerfeld, Germany). 1979.
From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).
The overall objective for the German program of radioactive waste disposal is construction and operation of a repository for all waste categories in a salt dome. The related in situ, studies in a salt test facility can therefore be divided into six categories: development and test of disposal methods, studies related to the stability of underground openings at ambient temperatures; studies related to all consequences of putting high-level heat generating waste into a salt repository, studies related to the backfilling and sealing of boreholes and of the repository, studies related to failure scenarios, and special studies necessary for operating the test facility. The main test facility in the Federal Republic of Germany is the Asse Salt Mine.

1645 (ONWI--88, pp 98-118) GEOLOGICAL AND HYDROLOGICAL EXPLORATION OF GULF COAST SALT DOMES. Laughon, R.B. (Battelle Memorial Inst., Columbus, OH). 1979.
From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).
The geologic exploration program in the Gulf Coast Salt Dome Region is based on a screening process that includes a series of increasingly detailed studies. The screening procedure takes the following steps: (1) determination of regions for further study (in this case, the salt domes of the interior Gulf Coast); (2) regional surveys and the determination of areas within those regions which are thought to be most suitable and which are recommended for further evaluation (in this case, eight specific salt domes); (3) area characterizations and the determination of locations within the areas which are thought to have a high probability of suitability (in this case, two or three of the eight salt domes); (4) location studies and the determination of a potential repository site, which is thought to be suitable and licensable and which is recommended for completion of site characterization studies (in this case, a single salt dome).

1646 (ONWI--88, pp 119-132) UNITED STATES GEOLOGICAL EXPLORATION AND HYDROLOGY, SOUTHEASTERN NEW MEXICO. Brannen, J.P. (Sandia Labs., Albuquerque, NM). 1979.
From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).
This discussion focuses on those features viewed as having a major impact on performance. Those features are potential contributors to a repository breach or are important in the movement of materials to the biosphere. The proposed WIPP site is in southeastern New Mexico in the Delaware Basin, a structural subelement of the Permian Basin. Major siting criteria and factors considered in the Los Medanos studies are outlined.

1647 (ONWI--88, pp 133-155) GERMAN GEOLOGICAL EXPLORATION AND HYDROLOGY OF ASSE II. Batsche, H.; Klarr, K.; von Stempel, C. (Gesellschaft fuer Srahlen- end Umweltforschung, Clausthal-Zellerfeld, Germany). 1979.
From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).
For the following reasons the Asse II salt mine was acquired by the Gesellschaft fuer Strahlen- und Umweltforschung in 1965 for the disposal of radioactive wastes: the large safety margin observed in shaft 2 towards Asse 1 and the overlying rocks, the nonexistence of Hauptanhydrit anhydrite which was often the cause of groundwater intrusion in salt mines, the fact that the caprock found here is dry. The disposal of radioactive wastes on an experimental basis involved an extensive geological and hydrological exploration of both the salt anticline itself and the overlying rocks. These consist in a multiple succession of jointed and fissured permeable and clayey marly impermeable layers with diagonal and transverse faults.

1648 (ONWI--88, pp 169-185) WASTE ISOLATION SAFETY ASSESSMENT PROGRAM WISAP RELEASE SCENARIO ANALYSIS. Benson, G.L. (Battelle Pacific Northwest Labs., Richland, WA). 1979.
From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).
This paper consists of viewographs which outline the release scenario analysis and disruptive event analysis methodologies for a simulated waste repository over a 10^6 year time frame. (DLC)

1649 (ONWI--88, pp 226-247) THERMAL/MECHANICAL MODELLING FOR REPOSITORY DESIGN AND IN-SITU TESTING. Gnirk, P.F. (RE/SPEC Inc., Rapid City, SD). 1979.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

A thermomechanical model of a radioactive waste repository in a geologic medium is used to evaluate the time and spatial response of the rock mass to repository excavation and emplacement of heat-generating wastes. Modeling results are presented for repository temperature, vertical surface displacements, room closure, canister/rock interface temperatures, etc. (DLC)

1650 (ONWI--88, pp 248-319) THERMAL MECHANICAL MODELLING. Langer, M. Delisle, G.; Wallner, M. (Bundesanstalt fuer Geowissenschaften und Rohstoffe, Hannover, Germany). 1979.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

This discussion of thermal and thermo-mechanical effects of a nuclear waste repository onthe host formation (salt concerns itself with the research results gained in Germany since the last US/FRG Workshop in Richland/Wash. Thermal aspects are considered first, followed by a discussion of recent results of investigations dealing with thermo-mechanical effects.

1651 (ONWI--88, pp 325-339) SUMMARY OF CONVERGENCE AND STRESS MEASUREMENTS IN THE TEMPERATURE-TEST-FIELD 4. Duerr, K. (Institut fuer Tieflagerung, Zellerfeld, Germany). 1979.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

Aim of ongoing convergence measurements in the gallery sides, roof, and floor of Temperature-test-field 4 (TVF 4) will determine the alterations of the rock's physical parameters by the temperature increase. For this purpose wire and rod extensometers have been used. In the boreholes, which will be heated later on, convergence sounds are installed. To know the initial rock-mechanical conditions in the test field extensometer measurements will be necessary before heating.

1652 (ONWI--88, pp 340-345) WASTE ISOLATION PILOT PLANT (WIPP) EXPERIMENTAL PROGRAM. Hunter, T.O. (Sandia Labs., Albuquerque, NM). 1979.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

The Waste Isolation Pilot Plant (WIPP) proposed for implementation in southeastern New Mexico provides a facility for the retrievable storage of defense transuranic wastes. WIPP will also include a location for generic experimentation on the interaction of defense wastes and bedded salt. These experiments will include waste forms which have heat and radiation production commensurate with defense high-level wastes (DHLW). Experiments will also be performed with enhanced temperature and radiation conditions which accelerate the interactions of interest. All experiments on DHLW are planned for removal after the experimentation is complete.

1653 (ONWI--88, pp 346-351) SUMMARY OF SHAPED CAVERN CONVERGENCE MEASUREMENTS. Staupendahl, G. (Institut fuer Tieflagerung, Zellerfeld, Germany). 1979.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

Preliminary conclusions can be drawn from observation at present: (1) the time dependent wall closure of the cavity and displacements within the surrounding salt stratum in a global sence are running with almost decreasing rates; (2) the long-term deformation and strains accumulated up to now are smaller than anticipated before; (3) the structural safety of this cavity is ensured at present; (4) it could be demonstrated, that the monitoring system installed can be operated successfully as well over a long-term period as under most severe conditions; (5) these observations and in situ experiments are nessessary and suggestive; (6) results and conclusions from these measurements are not only important with regard to this cavity, moreover for other projects at Asse and other sites in comparable salt formations.

1654 (ONWI--88, pp 377-384) BRINE EXPERIMENTS BY THE BGR IN THE ASSE II. Kopietz, J. (Bundesanstalt fuer Geowissenschaften und Rohstoffe, Hannover, Germany). 1979.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

Objectives of these simple thermomechanical heating experiments in the Asse is to investigate the influence of radioactive heat production on repository integrity. The increase in temperature was accompanied by an increase in the brine level in the boreholes due to borehole convergence caused by the heating. The brine levels in the outer observation boreholes are still rising about one year after turning the heater off. 6 figures. (DLC)

1655 (ONWI--88, pp 385-391) ASSE II IN-SITU BRINE MIGRATION TESTS. Rothfuchs, T. (Institut fuer Tieflagerung, Zellerfeld, Germany). 1979.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

For measuring the heat-induced brine inflow into a heater borehole an experimental area in the Older Halite formation on the 750m level of the ASSE II salt mine was selected. In March and April 1978 the mining of the room in preparation for this experiment was completed. Five 2KW - heaters will be placed in the borehole No. 2. These heaters simulate High Active Waste (HAW) and will give data in regard to the thermal, thermal-mechanical and physical-chemical response of the Older Halite Formation by electrical heating.

1656 (ONWI--88, pp 405-416) EXPERIMENTS ON THE CORROSION OF MATERIALS FOR BOREHOLE CASINGS AND FOR WASTE PACKAGING CANISTER IN SALT. Gies, H. (Institut fuer Tieflagerung, Zellerfeld, Germany). 1979.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

For the test storage initially planned of HLW-canisters at the Asse salt mine a possibility of safe recovery must be provided. For this purpose the borehole must be cased. To ensure safe operation, suitable corrosion resistant materials must be used for the canister and for the borehole casings. This requires studies providing information about the corrosion resistance of the materials throughout the test storage. The catalogue of requirements to be met by the materials for the canisters and for the boreholes drafted

initially has been rediscussed with responsible technical institutions, and in the light of this discussion the corrosion resistance of the materials has been reformulated and the test programme has been expanded.

1657 (ONWI--91) POTENTIAL US/CANADIAN COOPERATIVE ACTIVITIES IN GEOLOGICAL DISPOSAL OF RADIOACTIVE WASTE. Duguid, J.O. (Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). Mar 1980. Contract AC06-76RL01830. 43p. (TR--104). NTIS, PC A03/MF A01.

A joint review meeting between the US and Canada was held on June 19 and 20, 1979 to discuss waste isolation activities in crystalline rocks. The review meeting served the purposes of an initial information transfer and as a mechanism to stimulate thinking for a workshop on US/Canadian cooperative programs which was held on June 21, 1979. The workshop participants divided into working groups to discuss areas of potential cooperation: the Administrative Working Group established protocol for information exchange and cooperative activities; the Geotechnical Working Group selected activities in exploration, field testing, instrumentation and measurement technique development, monitoring, and quality assurance where cooperation would be of benefit to both countries; and the Assessment/Modeling Working Group discussed areas in model development and verification, engineered barriers, radiation effects, hydrologic properties of fractured rocks, waste form leaching, and sorption where cooperation would enhance both the US and Canadian programs.

1658 (ONWI--98) PROCEEDINGS OF A WORKSHOP ON THERMOMECHANICAL MODELING FOR A HARDROCK WASTE REPOSITORY. Holzer, F.; Ramspott, L. (eds.). (California Univ., Livermore (USA). Lawrence Livermore Lab.). 1979. Contract W-7405-ENG-48. 138p. (UCAR--10043; CONF-790683--(Summ.)). NTIS, PC A07/MF A01.

From ONWI-LLL workshop on thermomechanical modeling for a hard rock repository; Berkeley, CA, USA (25 Jun 1979).

These proceedings summarize the discussions, conclusions, and recommendations reached in a workshop on Thermomechanical Modeling for a Radioactive Waste Respository in hard crystalline rock from June 25-27, 1979, in Berkeley, California. The workshop was arranged and chaired by the Lawrence Livermore Laboratory under the sponsorship of the Office of Nuclear Waste Isolation and the DOE. About 100 participants from national laboratories, universities, private companies, and government organizations spent 2-1/2 days exchanging information and developing a set of conclusions and recommendations. The objectives of the workshop were as follows: (1) identify the key issues connected with modeling and validating the response of a hard rock respository to the emplaced waste source; and (2) identify status and develop a list of recommended activities, in order of priority, which would serve as programmatic input to ONWI and DOE for future consideration and implementation. Discussions covered modeling and calculations, laboratory and field measurements of properties and effects, instruments and techniques, and field experimentation for validation and model testing. Emphasis was placed on the thermomechanical response of the rock to the radioactive waste source emplaced within it. Hydrologic and radionuclide transport properties were specifically excluded, because they were to be the subject of a subsequent workshop.

1659 (ORNL--5485, pp 106-108) ENVIRONMENTAL CHEMISTRY. Feb 1979.

Chemistry Division annual progress report for period ending August 31, 1978.

A brief description is given of the kinetic model for predicting the composition of chlorinated estuary or sea water discharged from power plants. Flow of brines through salt beds under thermal gradients was studied. 2 figures. (DLC)

1660 (ORNL--5578) EFFECTS OF GASEOUS RADIOACTIVE NUCLIDES ON THE DESIGN AND OPERATION OF REPOSITORIES FOR SPENT LWR FUEL IN ROCK SALT. Jenks, G.H. (Oak Ridge National Lab., TN (USA)). Dec 1979. Contract W-7405-ENG-26. 114p. Dep. NTIS, PC A06/MF A01.

Information relating to the identities and amounts of gaseous radionuclides present in spent LWR fuel and to their release from canistered spent fuel under plausible storage and disposal conditions was assembled, reviewed, and analyzed. Information was also reviewed and analyzed on several other subjects that relate to the integrity of the carbon steel canister in which the spent fuel is to be encapsulated and to the expected rates of transfer of gaseous radionuclides through crushed salt backfill within a disposal room in a reference repository in rock salt. The advantages and disadvantages were considered for several different canister-backfill materials, and recommendations were made regarding preferred materials. Other recommendations relate to encapsulation procedures and specifications and to needs for additional experimental studies. The objective of this work was to provide reference information, conclusions, and recommendations that could be used to establish design and operating conditions and procedures for a bedded salt repository for spent LWR fuel and that could also be used to help evaluate the safety of the repository. The results of this work will also generally apply to spent fuel repositories in domal salt. However, because the domal salt may have little or no brine inclusions within it, there may be little or no possibility that brine will migrate into open spaces around an emplaced canister. Addordingly, some of the concerns that result from the possible occurrence of brine migration in bedded salt may be of no importance in domal salt.

1661 (ORNL--5607) REVIEW OF INFORMATION ON THE RADIATION CHEMISTRY OF MATERIALS AROUND WASTE CANISTERS IN SALT AND ASSESSMENT OF THE NEED FOR ADDITIONAL EXPERIMENTAL INFORMATION. Jenks, G.H.; Baes, C.F. Jr. (Oak Ridge National Lab., TN (USA)). Mar 1980. Contract W-7405-ENG-26. 80p. Dep. NTIS, PC A05/MF A01.

The brines, vapors, and salts precipitated from the brines will be exposed to gamma rays and to elevated temperatures in the regions close to a waste package in the salt. Accordingly, they will be subject to changes in composition brought about by reactions induced by the radiations and heat. This report reviews the status of information on the radiation chemistry of brines, gases, and solids which might be present around a waste package in salt and to assess the need for additional laboratory investigations on the radiation chemistry of these materials. The basic aspects of the radiation chemistry of water and aqueous solutions, including concentrated salt solutions, were reviewed briefly and found to be substantially unchanged from those presented

in Jenks's 1972 review of radiolysis and hydrolysis in salt-mine brines. Some additional information pertaining to the radiolytic yields and reactions in brine solutions has become available since the previous review, and this information will be useful in the eventual, complete elucidation of the radiation chemistry of the salt-mine brines. 53 references.

1662 (ORNL--5617) AUTORADIOGRAPHIC STUDY OF ACTINIDE SORPTION ON CLIMAX STOCK GRANITE. Beall, G.W.; O'Kelley, G.D.; Allard, B. (Oak Ridge National Lab., TN (USA)). Jun 1980. Contract W-7405-ENG-26. 30p. NTIS, PC A03/MF A01.

An autoradiographic technique that employed an arrangement for placing in firm contact Polaroid sheet film, a scintillator screen, and the radioactive face of a specimen was applied to a study of the sorption of americium, neptunium, plutonium, and uranium on Climax Stock granite under varying conditions of pH and Eh. Qualitative agreement was found between the sorption of americium on crushed, pure minerals and on the minerals comprising the specimen of Climax Stock granite. The observations also supported a mechanism for reduction of Np(V) to Np(IV) and Pu(VI) to Pu(IV) by Fe(II)-containing minerals. There was no evidence for reduction of U(VI) by the Fe(II)-containing minerals, although the uranium, assumed to be present as UO_2^{2+}, appeared to be the only actinide species to exhibit sorption by a simple, cation-exchange mechanism at particular mineral sites. Some implications of these results for nuclear waste isolation are discussed briefly.

1663 (ORNL--5620, pp 113-120) BURIAL GROUND TECHNOLOGY. Cutshall, N.H. Mar 1980.

Environmental Sciences Division. Annual progress report for period ending September 30, 1979.

The shallow land burial of low-level radioactive waste is a common disposal method which has been practiced for many years. This technique has the advantage of being inexpensive and technologically simple when compared to other treatment or disposal alternatives. Usual methods practiced to date were simply to place containers of contaminated material, untreated, in excavations and cover them with the native geologic material. Such methods have not provided complete containment of radionuclides because circulating ground water migrates through the buried waste and transports contaminants to the surface. If such a condition develops at a disposal site, the exhumation of buried waste, repackaging, transport to an alternative disposal site, and site cleanup is an expensive process and presents numerous problems related to logistics and personnel radiation exposure. Therefore, it is imperative from both a safety and economic viewpoint that radioactive waste be buried such that the risk of release if minimal and any resultant dose to man is as low as reasonably achievable.

1664 (ORNL/CSD/TM--84) DIFFUSION FROM SOLID CYLINDERS. Nestor, C.W. Jr. (Oak Ridge National Lab., TN (USA)). Jan 1980. Contract W-7405-ENG-26. 31p. Dep. NTIS, PC A03/MF A01.

The problem considered is the diffusion of material from a solid cylinder initially containng a uniform concentration and immersed in a well-stirred bath which maintains the external concentration at zero. The Fourier-Bessel series form of the fraction of the original material removed from the cylinder as a function of time converges very slowly for small time. An alternate form was obtained, which converges reasonably rapidly for small time. The convergence acceleration method of P. Wynn was also used to provide an efficient method for computation. Numerical examples and program listings are included.

1665 (ORNL/EIS--156/V1) SELECTED, ANNOTATED BIBLIOGRAPHY OF STUDIES RELEVANT TO THE ISOLATION OF NUCLEAR WASTES. Hyder, L.K.; Fore, C.S.; Vaughan, N.D.; Faust, R.A. (Oak Ridge National Lab., TN (USA)). Sep 1980. Contract W-7405-ENG-26. 459p. NTIS, PC A20/MF A01.

This annotated bibliography of 705 references represents the first in a series to be published by the Ecological Sciences Information Center containing scientific, technical, economic, and regulatory information relevant to nuclear waste isolation. Most references discuss deep geologic disposal, with fewer studies of deep seabed disposal; space disposal is also included. The publication covers both domestic and foreign literature for the period 1954 to 1980. Major chapters selected are Chemical and Physical Aspects; Container Design and Performance; Disposal Site; Envirnmental Transport; General Studies and Reviews; Geology, Hydrology and Site Resources; Regulatory and Economic Aspects; Repository Design and Engineering; Transportation Technology; Waste Production; and Waste Treatment. Specialized data fields have been incorporated to improve the ease and accuracy of locating pertinent references. Specific radionuclides for which data are presented are listed in the Measured Radionuclides field, and specific parameters which affect the migration of these radionuclides are presented in the Measured Parameters field. The references within each chapter are arranged alphabetically by leading author, corporate affiliation, or title of the document. When the author is not given, the corporate affiliation appears first. If these two levels of authorship are not given, the title of the document is used as the identifying level. Indexes are provided for author(s), keywords, subject category, title, geographic location, measured parameters, measured radionuclides, and publication description.

1666 (ORNL/ENG/INF--80/1) MANAGEMENT OF SOLID WASTE. Thompson, W.T.; Stinton, L.H. (Union Carbide Corp., Oak Ridge, TN (USA). Nuclear Div.). 16 Apr 1980. Contract W-7405-ENG-26. 21p. (CONF-800416--2). Dep. NTIS, PC A02/MF A01.

From UCC-ND and GAT waste management seminar program; Portsmouth, OH, USA (22 Apr 1980).

Compliance with the latest regulatory requirements addressing disposal of radioactive, hazardous, and sanitary solid waste requires the application of numerous qualitative and quantitative criteria in the selection, design, and operation of solid waste management facilities. Due to the state of flux of these regulatory requirements from EPA and NRC, several waste management options were identified as being applicable to the management of the various types of solid waste. This paper highlights the current regulatory constraints and the design and operational requirements for construction of both storage and disposal facilities for use in management of DOE-ORO solid waste. Capital and operational costs are included for both disposal and storage options.

1667 (ORNL/SUB--75/87989) PRELIMINARY

REGIONAL STUDY OF THE PRESENT AND POSSIBLE FUTURE OIL AND GAS DEVELOPMENT IN THE AREAS OF THICK ROCK SALT AND SHALE DEPOSITS OF MICHIGAN, OHIO, PENNSYLVANIA, AND WESTERN NEW YORK AS OF DECEMBER 1975. (Netherland, Sewell and Associates, Inc., Dallas, TX (USA)). Dec 1975. Contract W-7405-ENG-26. 43p. NTIS, PC A03/MF A01.

The objective of this study was to make a preliminary investigation of those areas of the Michigan basin and the Ohio-Pennsylvania-western New York portion of the Appalachian basin which are underlain by thick beds of rock salt and certain shale deposits for the overall purpose of locating general areas where present and/or possible future oil and gas development would not interfere with the possible storage of radioactive waste material in the thick beds of salt or shale deposits underlying these areas. Some of the more pertinent factors included in our investigation were: (1) the location of the present oil and gas fields in the areas of interest; (2) the general geology, including structure, stratigraphy, and general thickness of the sediments above and below the thick salt beds and shale deposits; (3) the trends indicated by past and present oil and gas development as well as the indicated trends of possible future oil and gas development throughout the areas of interest; (4) the density and depth of holes drilled, either successful or unsuccessful, in the search for oil and gas and the effect which these holes might have on the use of the thick beds of salt and shale deposits as possible storage sites for radioactive waste material; and (5) the general areas where the past, present and/or possible future oil and gas development would not interfere with the possible storage of radioactive waste in such salt beds and shale deposits underlying the major portion of the Michigan basin and that portion of the Appalachian basin found in Ohio, Pennsylvania and western New York.

1668 (ORNL/Sub--79/13617/2) LOW LEVEL WASTE MANAGEMENT: A COMPILATION OF MODELS AND MONITORING TECHNIQUES. VOLUME 1. Mosier, J.E.; Fowler, J.R.; Barton, C.J. (comps.). (Science Applications, Inc., Oak Ridge, TN (USA)). Apr 1980. Contract W-7405-ENG-26. 633p. (SAI/OR--565-2). NTIS, PC A99/MF A01.

In support of the National Low-Level Waste (LLW) Management Research and Development Program being carried out at Oak Ridge National Laboratory, Science Applications, Inc., conducted a survey of models and monitoring techniques associated with the transport of radionuclides and other chemical species from LLW burial sites. As a result of this survey, approximately 350 models were identified. For each model the purpose and a brief description are presented. To the extent possible, a point of contact and reference material are identified. The models are organized into six technical categories: atmospheric transport, dosimetry, food chain, groundwater transport, soil transport, and surface water transport. About 4% of the models identified covered other aspects of LLW management and are placed in a miscellaneous category. A preliminary assessment of all these models was performed to determine their ability to analyze the transport of other chemical species. The models that appeared to be applicable are identified. A brief survey of the state-of-the-art techniques employed to monitor LLW burial sites is also presented, along with a very brief discussion of up-to-date burial techniques.

1669 (ORNL/SUB--79/13837/1) STATE OF THE ART REVIEW OF ALTERNATIVES TO SHALLOW LAND BURIAL OF LOW LEVEL RADIOACTIVE WASTE. (Gilbert/Commonwealth, Jackson, MI (USA); Gilbert/Commonwealth, Reading, PA (USA)). Apr 1980. Contract W-7405-ENG-26. 101p. Dep. NTIS, PC A06/MF A01.

A review of alternatives to shallow land burial for disposal of low level radioactive waste was conducted to assist ORNL in developing a program for the evaluation, selection, and demonstration of the most acceptable alternatives. The alternatives were categorized as follows: (1) near term isolation concepts, (2) far term isolation concepts, (3) dispersion concepts, and (4) conversion concepts. Detailed descriptions of near term isolation concepts are provided. The descriptions include: (1) method of isolation, (2) waste forms that can be accommodated, (3) advantages and disadvantages, (4) facility and equipment requirements, (5) unusual operational or maintenance requirements, (6) information/technology development requirements, and (7) related investigations of the concept.

1670 (ORNL/SUB--79/13837/2) STATE OF THE ART REVIEW OF RADIOACTIVE WASTE VOLUME REDUCTION TECHNIQUES FOR COMMERCIAL NUCLEAR POWER PLANTS. (Gilbert/Commonwealth, Reading, PA (USA); Gilbert/Commonwealth, Jackson, MI (USA)). Apr 1980. Contract W-7405-ENG-26. 251p. Dep. NTIS, PC A12/MF A01.

A review is made of the state of the art of volume reduction techniques for low level liquid and solid radioactive wastes produced as a result of: (1) operation of commercial nuclear power plants, (2) storage of spent fuel in away-from-reactor facilities, and (3) decontamination/decommissioning of commercial nuclear power plants. The types of wastes and their chemical, physical, and radiological characteristics are identified. Methods used by industry for processing radioactive wastes are reviewed and compared to the new techniques for processing and reducing the volume of radioactive wastes. A detailed system description and report on operating experiences follow for each of the new volume reduction techniques. In addition, descriptions of volume reduction methods presently under development are provided. The Appendix records data collected during site surveys of vendor facilities and operating power plants. A Bibliography is provided for each of the various volume reduction techniques discussed in the report.

1671 (ORNL/SUB--80/13619/1) IDENTIFICATION OF TECHNICAL PROBLEMS ENCOUNTERED IN THE SHALLOW LAND BURIAL OF LOW-LEVEL RADIOACTIVE WASTES. Jacobs, D.G.; Epler, J.S.; Rose, R.R. (Oak Ridge National Lab., TN (USA)). Mar 1980. Contract W-7405-ENG-26. 187p. Dep. NTIS, PC A09/MF A01.

A review of problems encountered in the shallow land burial of low-level radioactive wastes has been made in support of the technical aspects of the National Low-Level Waste (LLW) Management Research and Development Program being administered by the Low-Level Waste Management Program Office, Oak Ridge National Laboratory. The operating histories of burial sites at six major DOE and five commercial facilities in the US have been examined and several major problems identified. The problems experienced st the sites have been grouped into general categories dealing with site development, waste characterization, operation, and performance evaluation. Based on this grouping of the problem, a number of major technical issues have been identified which should be incorporated into program plans for further research and development. For each

technical issue a discussion is presented relating the issue to a particular problem, identifying some recent or current related research, and suggesting further work necessary for resolving the issue. Major technical issues which have been identified include the need for improved water management, further understanding of the effect of chemical and physical parameters on radionuclide migration, more comprehensive waste records, improved programs for performance monitoring and evaluation, development of better predictive capabilities, evaluation of space utilization, and improved management control.

1672 (ORNL/TM--6473) INFILTRATION CONTROL FOR LOW-LEVEL RADIOACTIVE SOLID WASTE DISPOSAL AREAS: AN ASSESSMENT. Arora, H.S. (Oak Ridge National Lab., TN (USA)). Nov 1980. Contract W-7405-ENG-26. 63p. NTIS, PC A04/MF A01.

The primary mode of radionuclide transport from shallow land-disposal sites for low-level wastes can be traced to infiltration of precipitation. This report examines the factors that affect surface water entry and movement in the ground and assesses available infiltration-control technology for solid-waste-disposal sites in the humid eastern portion of the United States. A survey of the literature suggests that a variety of flexible and rigid liner systems are available as barriers for the stored waste and would be effective in preventing water infiltration. Installation of near-surface seals of bentonite clay admixed with dispersive chemicals seem to offer the required durability and low permeability at a reasonable cost. The infiltration rate in a bentonite-sealed area may be further retarded by the application of dispersive chemicals that can be easily admixed with the surface soil. Because the effectiveness of a dispersive chemical for infiltration reduction is influenced by the physico-chemical properties of the soil, appropriate laboratory tests should be conducted prior to field application.

1673 (ORNL/TM--6882) FLOWABILITY OF BULK SOLIDS USED IN SHALE FRACTURING GROUTS AS DETERMINED BY THE JENIKE AND JOHANSON METHOD. McDaniel, E.W.; Weeren, H.O. (Oak Ridge National Lab., TN (USA)). Sep 1979. Contract W-7405-ENG-26. 22p. Dep. NTIS, PC A02/MF A01.

Smooth operation of the shale fracturing facility at Oak Ridge National Laboratory requires that an even, uninterrupted flow of dry solids be delivered to a mixer at a rate of approximately 1200 lb/min. Some operational difficulties have been experienced with the dry solids system at the existing facility. Occasionally the solids flow from a bin was difficult to initiate or was irregular, particularly when the storage bin was nearly empty. A new shale fracturing facility is now being designed with a solids handling system that will eliminate the current problems. This report describes the tests made to obtain the necessary information about bulk-flow properties of the dry solids that are required for the facility modifications. Flow properties of fly ash, attapulgite, pottery clay, and a blended solids mix were determined in a Jenike and Johanson Flowfactor Tester. Tests with this unit involve the consolidation of a solid at a given pressure and the measurement of the force required to create a shear plane. The procedure is repeated several times at different consolidating pressures to determine a locus of points that can be displayed graphically. Results indicate that a bottom-hopper opening of about 4 ft will be required on the new, bulk storage bins if mass flow is to be achieved. It was also found that the existing bins are quite unsuitable for either their present function or their proposed function. Since these bins have served moderately well for 14 years, the effect of aeration is obviously major; these tests indicate only an upper limit to the size of the hopper opening that will be required. Pottery clay and attapulgite were found to have flow characteristics considerably inferior to blended solids. It is known, however, that attapulgite clay will flow from the existing bins, and modification of the bin bottoms to enlarge the openings does not appear to be justified.

1674 (ORNL/TM--6987) ACTINIDE PARTITIONING-TRANSMUTATION PROGRAM FINAL REPORT. VII. LONG-TERM RISK ANALYSIS OF THE GEOLOGIC REPOSITORY. Logan, S.E.; Conarty, R.L.; Ng, H.S.; Rahal, L.J.; Shirley, C.G. (Los Alamos Technical Associates, Inc., NM (USA)). Sep 1980. Contract W-7405-ENG-26. 130p. NTIS, PC A07/MF A01.

This report supports the overall assessment by Oak Ridge National Laboratory of actinide partitioning and transmutation by providing an analysis of the long-term risks associated with the terminal storage of wastes from a fuel cycle which incorporates partitioning and transmutation (P-T) and wastes from a cycle which does not. The system model and associated computer code, called AMRAW (Assessment Method for Radioactive Waste), are used for the analysis and are applied to the Los Medanos area in southeastern New Mexico. Because a conservative approach is used throughout, calculated results are believed to be consistently higher than reasonable expectations from actual disruptive incidents at the site and therefore are not directly suited for comparison with other analyses of the particular geologic location. The assessment is made with (1) the probabilistic, or risk, mode that uses combinations of reasonable possible release incidents with their probability of occurrence distributed and applied throughout the assessment period, and (2) the consequence mode that forces discrete release events to occur at specific times. An assessment period of 1 million years is used. The principal results are: (1) In all but the expulsive modes, ^{99}Tc and ^{129}I completely dominate cumulative effects based on their transport to man through leaching and movement with groundwater, effecting about 33,000 health effects (deaths) over the 1 million years; (2) P-T has only limited effectiveness in reducing long-term risk from a radionuclide waste repository under the conditions studied, and such effectiveness is essentially confined to the extremely unlikely (probability of occurrence 10^{-12}/year) expulsive events; (3) Removal or immobilization of ^{99}Tc and ^{129}I might provide benefits sufficiently tangible to warrant special consideration.

1675 (ORNL/TM--7092) CEMENT TECHNOLOGY FOR BOREHOLE PLUGGING: AN INTERIM REPORT ON PERMEABILITY MEASUREMENTS OF CEMENTITIOUS SOLIDS. McDaniel, E.W. (Oak Ridge National Lab., TN (USA)). Jan 1980. Contract W-7405-ENG-26. 25p. Dep. NTIS, PC A02/MF A01.

The permeability of borehole plug solids and plug-wall rock junctions is a property of major interest in the Borehole Plugging Program. This report describes the equipment and techniques used to determine the permeabilities of possible borehole plugging materials and presents results from tests on various cementitious solids and plug-rock combinations. The cementitious solids were made from mixtures

of cement, sand, salt, fly ash, and water. Three different types of cement and four different fly ashes were used. Permeabilities ranged from a high value of 3×10^{-4} darcy for a neat cement paste to a low of 5×10^{-8} darcy for a saltcrete containing 30 wt % sodium chloride. Miniature boreholes were made in the following four different types of rock: Westerly granite, Dresser basalt, Sioux quartzite, and St. Cloud granodiorite. These small holes were plugged with a mix consisting of 23 wt % Type I Portland cement, 20 wt % bituminous fy ash, 43.2 wt % sand, and 13.8 wt % water. After curing for 91 days at ambient temperature, the permeability of the plug-wall rock junctions ranged from 3×10^{-5} to $< 1 \times 10^{-8}$ darcy. Three of the four miniature plugged boreholes exhibited permeabilities of < 10 microdarcys.

1676 (ORNL/TM--7106) CEMENT TECHNOLOGY FOR BOREHOLE PLUGGING: INTERIM REPORT ON THE EFFECTS OF FLY ASH AND SALT ON THE PHYSICAL PROPERTIES OF CEMENTITIOUS SOLIDS. Moore, J.G.; Morgan, M.T.; McDaniel, E.W.; Greene, H.B.; West, W.A. (Oak Ridge National Lab., TN (USA)). Mar 1980. Contract W-7405-ENG-26. 31p. Dep. NTIS, PC A03/MF A01.

Results of initial studies of a systematic investigation to determine the effects of fly ash and salt on the physical properties of pozzolanic concretes and saltcretes are reported. Addition of fly ash to mortars decreased the set time and bleed characteristics and increased the compressive strength and permeability, but it had very little effect on the density or the thermal conductivity of the solid. The magnitude of these effects was only slightly related to the lime content of the fly ash. In the case of saltcretes, low-lime fly ash slightly decreased the set time and the bleed characteristics of the wet mix. However, a high-lime fly ash doubled the set time and decreased the bleed characteristics to essentially zero. The compressive strength of saltcretes was increased by the addition of fly ash and was independent of the lime content. Such additions had little effect on the thermal conductivity or density. The thermal conductivities of cement pastes containing fly ash showed a near-linear relationship with the density of the resulting solids. In the case of mortars, the thermal conductivity decreased with increasing temperature and showed some hysteresis in the initial heating cycle. After the first cycle, the thermal conductivity decreased from about 1.32 W/m.K at 350°K to 1.27 W/m.K at 475°K.

1677 (ORNL/TM--7112) COMPARISON OF THE RESULTS OF SEVERAL HEAT TRANSFER COMPUTER CODES WHEN APPLIED TO A HYPOTHETICAL NUCLEAR WASTE REPOSITORY. Claiborne, H.C.; Wagner, R.S.; Just, R.A. (Oak Ridge National Lab., TN (USA)). Dec 1979. Contract W-7405-ENG-26. 69p. Dep. NTIS, PC A04/MF A01.

A direct comparison of transient thermal calculations was made with the heat transfer codes HEATING5, THAC-SIP-3D, ADINAT, SINDA, TRUMP, and TRANCO for a hypothetical nuclear waste repository. With the exception of TRUMP and SINDA (actually closer to the earlier CINDA3G version), the other codes agreed to within +-5% for the temperature rises as a function of time. The TRUMP results agreed within +-5% up to about 50 years, where the maximum temperature occurs, and then began an oscillary behavior with up to 25% deviations at longer times. This could have resulted from time steps that were too large or from some unknown system problems. The available version of the SINDA code was not compatible with the IBM compiler without using an alternative method for handling a variable thermal conductivity. The results were about 40% low, but a reasonable agreement was obtained by assuming a uniform thermal conductivity; however, a programming error was later discovered in the alternative method. Some work is required on the IBM version to make it compatible with the system and still use the recommended method of handling variable thermal conductivity. TRANCO can only be run as a 2-D model, and TRUMP and CINDA apparently required longer running times and did not agree in the 2-D case; therefore, only HEATING5, THAC-SIP-3D, and ADINAT were used for the 3-D model calculations. The codes agreed within +-5%; at distances of about 1 ft from the waste canister edge, temperature rises were also close to that predicted by the 3-D model.

1678 (ORNL/TM--7125) WASTE SLUDGE RESUSPENSION AND TRANSFER: DEVELOPMENT PROGRAM. Weeren, H.O.; Mackey, T.S. (Oak Ridge National Lab., TN (USA)). Feb 1980. Contract W-7405-EN-26. 95p. Dep. NTIS, PC A05/MF A01.

The six Gunite waste tanks at Oak Ridge National Laboratory (ORNL) contain about 400,000 gal of sludge that has precipitated from solution and settled during the 35 years these tanks have been in service. Eventual decommissioning of the tanks has been proposed. The first part of this program is to resuspend the accumulated sludge, to transfer it to new storage tanks in Melton Valley, and to dispose of it by the shale-fracturing process. On the basis of preliminary information, a tentative operational concept was adopted. The sludge in each tank would be resuspended by hydraulic sluicing and pumped from the tank. This resuspended sludge would be treated as necessary to keep the particles in suspension and would be pumped to the new waste-storage tanks. Subsequently the sludge would be pumped from the tanks, combined with a cement-base mix, and disposed of by the shale-fracturing facility. Verification of the feasibility of this concept required development effort on characterization of the sludge and development of techniques for resuspending the sludge and for keeping it in suspension. These development efforts are described in this report. Sections of the report describe both the known properties of the sludge and the tests of grinding methods investigated, discuss tests of various suspenders, describe tests with cement-base mixes, summarize hot-cell tests on actual sludge samples, and describe tests that were made at a mockup of a Gunite tank installation. On the basis of the tests made, it was concluded that reslurrying and resuspension of the sludge is quite feasible and that the suspensions can be made compatible with cement mixes.

1679 (ORNL/TM--7201) EXPECTED ENVIRONMENTS IN HIGH-LEVEL NUCLEAR WASTE AND SPENT FUEL REPOSITORIES IN SALT. Claiborne, H.C.; Rickertsen, L.D., Graham, R.F. (Oak Ridge National Lab., TN (USA)). Aug 1980. Contract W-7405-ENG-26. 206p. NTIS, PC A10/MF A01.

The purpose of this report is to describe the expected environments associated with high-level waste (HLW) and spent fuel (SF) repositories in salt formations. These environments include the thermal, fluid, pressure, brine chemistry, and radiation fields predicted for the repository conceptual designs. In this study, it is assumed that the repository will be a room and pillar mine in a rock-salt formation, with the disposal horizon

located approx. 2000 ft (610 m) below the surface of the earth. Canistered waste packages containing HLW in a solid matrix or SF elements are emplaced in vertical holes in the floor of the rooms. The emplacement holes are backfilled with crushed salt or other material and sealed at some later time. Sensitivity studies are presented to show the effect of changing the areal heat load, the canister heat load, the barrier material and thickness, ventilation of the storage room, and adding a second row to the emplacement configuration. The calculated thermal environment is used as input for brine migration calculations. The vapor and gas pressure will gradually attain the lithostatic pressure in a sealed repository. In the unlikely event that an emplacement hole will become sealed in relatively early years, the vapor space pressure was calculated for three scenarios (i.e., no hole closure - no backfill, no hole closure - backfill, and hole closure - no backfill). It was assumed that the gas in the system consisted of air and water vapor in equilibrium with brine. A computer code (REPRESS) was developed assuming that these changes occur slowly (equilibrium conditions). The brine chemical environment is outlined in terms of brine chemistry, corrosion, and compositions. The nuclear radiation environment emphasized in this report is the stored energy that can be released as a result of radiation damage or crystal dislocations within crystal lattices.

1680 (ORNL/TM--7310) STATISTICAL SENSITIVITY ANALYSIS OF A SIMPLE NUCLEAR WASTE REPOSITORY MODEL. Ronen, Y.; Lucius, J.L.; Oblow, E.M. (Oak Ridge National Lab., TN (USA)). Jun 1980. Contract W-7405-ENG-26. 75p. NTIS, PC A05/MF A01.

This report represents a preliminary step in what should be a comprehensive sensitivity analysis of the modeling of a nuclear waste repository. The purpose of the complete analysis will be to determine which modeling parameters and physical data are most important in determining key design performance criteria and then to obtain the uncertainty in the design for safety considerations. The theory for a statistical screening design methodology is developed for later use in the overall program. The theory was applied to the test case of determining the relative importance of the sensitivity of near field temperature distribution in a single-level salt repository to modeling parameters. The exact values of the sensitivities to these physical and modeling parameters were then obtained using direct methods of recalculation. The sensitivity coefficients found to be important for the sample problem were thermal loading, distance between the spent fuel canisters and their radius. Other important parameters were those related to salt properties at a point of interest in the repository. In particular, the screening methodology singled out four parameters related to the salt as having high sensitivities: salt conductivity, heat capacity, and density, and initial temperature of salt at the point of interest. These predictions of the screening theory were confirmed by direct recalculations which also reveal the time behavior of these sensitivities. It was found that the sensitivities of thermal loading, distance between the fuel canisters, their radius and salt density and heat capacity increase (in absolute value) during the 50-year period studied. The sensitivity of the initial temperature decreases (in absolute value) whereas the sensitivity of the salt conductivity is important at the time the temperature of the salt is equal to the response temperature. It was found that nonlinearity effects of the input parameters on the responses are negligible.

1681 (ORNL/TM--7421) SHALE FRACTURING INJECTIONS AT OAK RIDGE NATIONAL LABORATORY: 1977-1979 SERIES. Weeren, H.O. (Oak Ridge National Lab., TN (USA)). Sep 1980. Contract W-7405-ENG-26. 117p. NTIS, PC A06/MF A01.

Intermediate-level waste solution generated at ORNL is periodically mixed with a cement-base blend of dry solids and injected into an impermeable shale formation at an approximate depth of 240 m (800 ft). The grout mix sets shortly after the injection, permanently fixing the radionuclides in the shale formation. A series of four injections of intermediate-level waste solution was made between 1977 and 1979. A total of 1.2 million l (314,000 gal) of waste solution containing 81,780 Ci of radionuclides was injected. This report is an account of this injection series - preparations, injections, results, and conclusions. The volumes and activities that were injected are summarized. In Injection ILW-15 a small leak of grout to the waste pit eroded the drain valves and forced a shutdown of the injection while repairs were made. The injection was completed 2 days later. Injection ILW-16 was terminated about two-thirds through the injection when the diesel drive of the injection pump blew a connecting rod through the block. The facility and well were washed down with the standby pump. Prior to Injection ILW-17, air pads were installed on all bulk solids storage bins. All subsequent injections have been marked by a much more even flow of solids and a resulting improvement in the mix ratio control. Injections ILW-17 and ILW-18 were made without notable incidents. Logs of the observation wells indicated that all grout sheets were within the disposal zone.

1682 (ORNL/TM--7497) RHEOLOGY OF SLUDGE-SLURRY GROUTS. McDaniel, E.W. (Oak Ridge National Lab., TN (USA)). Oct 1980. Contract W-7405-ENG-26. 28p. NTIS, PC A03/MF A01.

A series of rheograms was developed that relates the critical velocity (velocity where flow changes from laminar to turbulent) of a cementitious grout that incorporates a suspended sludge-slurry to the critical velocity of a reference grout made with a simulated waste solution. The sludge that is now in the Gunite waste tanks at the Oak Ridge National Laboratory (ORNL) will be suspended and pumped to the new waste storage tanks in Melton Valley. The sludge will then be blended with a cement mix base to form a grout which will be injected underground by the shale fracturing process. This report describes the materials, equipment, and techniques used in the laboratory studies to suspend sludges and mix sludge-slurry grouts that have flow properties similar to those of current shale fracturing grouts. Bentonite clay is an effective suspender in dilute $NaNO_3$ solutions; 15 wt % solids can be suspended with 2.0 wt % bentonite in a 0.1 M $NaNO_3$ solution. Other suspending materials were evaluated, but bentonite gave the best results. If a slurry grout becomes too viscous to pump, methods must be available to thin the mixture. A number of thinners, friction reducers, and plasticizers were examined. Q-Broxin, a thinner supplied by Baroid, reduced the velocity of a grout required for turbulent flow in a 5.0-cm (2-in.)-diam tube from 1.76 to 1.20 m/s (5.79 to 3.95 ft/s); FX-32C, a plasticizer supplied by Fox Industries, Inc., reduced the velocity from

1.76 to 0.75 m/s (5.6 to 2.45 ft/s).

1683 (ORO--4447-102) ANION EFFECTS ON THE RETENTION OF SELECTED ACTINIDES ON GEOLOGIC MEDIA. Krajewski, T.M. (Tennessee Univ., Knoxville (USA)). Mar 1980. Contract EY-76-S-05-4447. 75p. Dep. NTIS, PC A04/MF A01.

The distribution coefficients of ^{241}Am and ^{235}Np were measured on several minerals in synthetic groundwater and NaCl solutions. The minerals studied contain complexing anions within their crystalline lattices, and they were characterized for purity, ion exchange capacity, and surface area. A batch equilibration technique was used to determine the uptake of ^{241}Am and ^{235}Np by the minerals over a pH range of 4.0 to 9.0. It was found that apatite [$Ca_5(PO_4)_3(F,OH,Cl)$], dolomite [$CaMg(CO_3)_2$], marble ($CaCO_3$), fluorite (CaF_2), and (to a lesser extent) anhydrite ($CaSO_4$) sorbed ^{241}Am more strongly than did the other minerals. The distribution coefficients obtained on these minerals were higher in value and less pH dependent than the distribution coefficients obtained on the majority of minerals. Apatite was found to be the only mineral to sorb ^{235}Np very strongly. Precipitation and ion exchange reactions were found not to be important sorption mechanisms. Anionic complexation, especially with OH^- and CO_3^{2-}, and/or chemisorption were reasoned to be playing an important role in the sorption of ^{241}Am and ^{235}Np on apatite, dolomite, marble, fluorite, and anhydrite. The significance of these results lies in isolation of nuclear wastes. 17 figures, 12 tables.

1684 (ORO--5366-T1(Vol.1)) NATIONAL WASTE TERMINAL STORAGE REPOSITORY IN A BEDDED SALT FORMATION FOR SPENT UNREPROCESSED FUEL. VOLUME I. CONCEPTUAL DESIGN REPORT. (Kaiser Engineers, Oakland, CA (USA)). Dec 1978. Contract EY-77-C-05-5366. 357p. NTIS, PC A10/MF A01.

In February 1976, the Energy Research and Development Administration (ERDA), now the Department of Energy (DOE), established a National Waste Terminal Storage (NWTS) program. As a part of this program, two parallel conceptual design efforts were initiated in January 1977. One was for deep geologic storage, in domed salt, of high level waste resulting from the reprocessing of spent fuel. The other was for deep geologic storage of unreprocessed spent fuel in bedded salt. These two concepts are identified as NWTS Repository 1 and Repository 2, respectively. Repository 2 (NWTSR2) is the concept which is covered by this Conceptual Design Report. Volume I of the conceptual design report contains the following information: physical description of the report; project purpose and justification; principal safety, fire, and health hazards; environmental impact considerations; quality assurance considerations; assessment of operational interfaces; assessment of research and development interfaces; project schedule; proposed method of accomplishment; summary cost estimate; and outline specifications. The conceptual design for Repository 2 was developed in sufficient detail to permit determination of scope, engineering feasibility, schedule, and cost estimates, all of which are necessary for planning and budgeting the project.

1685 (ORO--5366-T1(Vol.2)) NATIONAL WASTE TERMINAL STORAGE REPOSITORY IN A BEDDED SALT FORMATION FOR SPENT UNREPROCESSED FUEL. VOLUME II. CONCEPTUAL DESIGN REPORT. (Kaiser Engineers, Oakland, CA (USA)). Dec 1978. Contract EY-77-C-05-5366. 99p. NTIS, MF A01.

Portions of document are illegible.

This volume documents the conceptual design of a National Waste Terminal Storage Repository in bedded salt for spent unreprocessed nuclear fuel. Drawings and specifications are included.

1686 (ORO--5366-T2) NATIONAL WASTE TERMINAL STORAGE REPOSITORY IN A BEDDED SALT FORMATION FOR SPENT UNREPROCESSED FUEL. OCCUPATIONAL EXPOSURE AND HEALTH PHYSICS STUDIES. KE REPORT NO. 78-21-R. (Kaiser Engineers, Oakland, CA (USA)). Sep 1978. Contract EY-77-C-05-5366. 174p. NTIS, PC A08/MF A01.

This report includes the Occupational Exposure and Health Physics studies of the National Waste Terminal Storage Repository Number 2 (NWTSR2). Section 1 deals with occupational radiation exposures. The results of dose equivalent and dose commitment calculations are summarized. The man-rem total is a summation of all doses to all personnel throughout a year. It would have to be divided by the number of total personnel involved, to obtain an average annual dose per person. Section 2 presents the occupational exposures due to nonradiological pollutants. The activities of workers and the equipment used during the construction, storage/retrieval and decommissioning of the facility are outlined. Tabulations are presented of the substances (dusts, fumes, gases and vapors) and physical agents (heat, vibration, and nonionizing radiation) to which personnel will be exposed in various surface and underground work areas during construction and decommissioning, and during storage and retrieval operations. Some significant nonradiological occupational exposures are summarized. Section 3 outlines the health physics program for the NWTSR2 facility. It is important to initiate the health physics program one or two years before the facility is placed in operation to establish the radiation background levels at the site and its surrounding area, and to collect environmental samples, both on-site and off-site, prior to waste storage and retrieval operations. The health physics organization consists of 15 persons, including five health physicists.

1687 (ORO--5366-T3) NATIONAL WASTE TERMINAL STORAGE REPOSITORY IN A BEDDED SALT FORMATION FOR SPENT UNREPROCESSED FUEL. SPECIAL STUDY NO. 1. TWENTY-FIVE-YEAR RETRIEVABILITY CAPITAL EQUIPMENT COST ESTIMATE. (Kaiser Engineers, Oakland, CA (USA)). Nov 1978. Contract EY-77-C-05-5366. 203p. NTIS, MF A01.

Portions of document are illegible.

This estimate covers capital equipment costs of facilities for the receipt, handling, and storage in bedded salt, of canistered spent fuel assemblies from both BWR and PWR commercial power plants. The estimate includes all capital equipment and replacement costs for a repository constructed in accordance with the design shown in the Conceptual Design Report (CDR), and Special Study No. 1, KE Report No. 78-60-RE for 25-year retrievability.

1688 (ORO--5366-T4) NATIONAL WASTE TERMINAL STORAGE REPOSITORY IN A BEDDED SALT FORMATION FOR SPENT UNREPROCESSED FUEL. SPECIAL STUDY NO. 1. 25-YEAR RETRIEVABILITY. (Kaiser Engineers, Oakland, CA (USA)). Dec 1978. Contract EY-77-C-05-5366. 132p. NTIS, PC A07/MF A01.

National Waste Terminal Storage Repository 2 (NWTSR2), in bedded salt, for spent unreprocessed fuel is the subject of a

conceptual design project which began in January 1977. In the base conceptual design the spent fuel is to be stored in a retrievable mode for 5 years. This report presents the results of a separate study on 25-year retrievability with open storage rooms. Drawings prepared for 25-year retrievability are only those which differ from the companion 5-year retrievability drawings which comprise Volume II of the Conceptual Design Report (CDR). NWTSR2 capital facilities originally were to be constructed in phases. Phase I was to include those facilities required for the first 5 years of operation, which were hypothesized to be from 1985 through 1990; Phase II was to include facilities required from 1991 until the capacity of the 2000-acre mine was reached. These dates are used as the basis for conceptual design and for Special Study No. 1 but do not represent actual schedule dates for the repository. The terms Phase I and Phase II are used throughout the drawings and test, so they need to be understood. However, it is not now intended to phase the capital construction because of the relatively small effort represented by Phase II surface construction. An optional future expansion of the mine, Phase III, would add 1000 acres on the end of the mine opposite the shaft pillar. The optional Phase III expansion would commence operation upon completion of Phase II operations. The drawings and design comparisons for Phase III mine operations appear only in this report.

1689 (ORO--5366-T5) NATIONAL WASTE TERMINAL STORAGE REPOSITORY IN A BEDDED SALT FORMATION FOR SPENT UNREPROCESSED FUEL. QUALITY ASSURANCE PROGRAM FOR LICENSING. (Kaiser Engineers, Oakland, CA (USA)). Dec 1978. Contract EY-77-C-05-5366. 83p. NTIS, PC A05/MF A01.

A National Waste Terminal Storage Repository, in bedded salt, for spent unreprocessed fuel is the subject of a conceptual design project which began in January 1977. This volume presents a preliminary quality assurance program to guide the license applicant in developing a detailed program that will be compatible with anticipated National Waste Terminal Storage (NWTSR2) contracting arrangements and provide the documentation required by regulatory bodies. This QA program is designed to provide confidence that the quality-related activities pertaining to safety-related structures, systems, and components will be identified and controlled. Specific responsibilities for quality-related activities are documented and assigned to personnel and organizations for the major phases of facility design and construction. These responsibilities encompass a broad range of activities and are addressed in this preliminary program. The quality assurance program elements are organized and discussed herein as follows: (1) quality assurance during design and construction; (2) the applicant (DOE); (3) siting contractor; (4) architect/engineer; (5) project field management; and (6) operations contractor.

1690 (ORO--5366-T6) NATIONAL WASTE TERMINAL STORAGE REPOSITORY IN A BEDDED SALT FORMATION FOR SPENT UNREPROCESSED FUEL. SPECIAL STUDY NO. 3. WASTE RETRIEVAL FROM BACKFILLED REGIONS. (Kaiser Engineers, Oakland, CA (USA)). Sep 1978. Contract EY-77-C-05-5366. vp. NTIS, MF A01.

Portions of document are illegible.

Methods and costs were studied for delayed canister retrieval from rooms that had been backfilled immediately after canister storage. The effects of this method of storage on mine geometry, thermal and rock mechanics environments, mine development and operations, mine ventilation, time schedule, retrieval machinery and safety were investigated. Salt and air temperatures were determined. Pillar width, number of rooms, extraction ratio, tonnages of mined salt, and salt handling and hoisting requirements were calculated. The required changes in mining equipment were established. Salt handling and elapsed time schedules were developed. Ventilation requirements - size and number of shafts, size the arrangement of airways, number of stacks, and size and number of fans were then calculated. The development sequence of these facilities was established. Canister retrieval problems were analyzed for canisters stuck in the hole as well as free. Retrieval methods and machinery were studied and are described. Safety with respect to both radiation and room collapse was studied and compared with CDR safety conditions. The effects of a reduced themal loading of 30 KW/acre on temperatures, room closure, mine layout, ventilation and ground control were studied and reported. A cost estimate was prepared, giving cost differentials between the base CDR costs and Special Study No. 3. Two appendices are included. The first contains nine Heat Transfer memoranda that state the thermal basis of this study. The second appendix provides a detailed operating time analysis of the retrieval machinery.

1691 (ORO--5366-T7) NATIONAL WASTE TERMINAL STORAGE REPOSITORY IN A BEDDED SALT FORMATION FOR SPENT UNREPROCESSED FUEL. SPECIAL STUDY NO. 1. TWENTY-FIVE-YEAR RETRIEVABILITY, DECOMMISSIONING COST ESTIMATE. (Kaiser Engineers, Oakland, CA (USA)). Nov 1978. Contract EY-77-C-05-5366. 25p. NTIS, PC A02/MF A01.

This estimate covers decommissioning costs of facilities for the receipt, handling, and storage in bedded salt of canistered spent fuel assemblies from both BWR and PWR commercial power plants. The estimate includes all decommissioning costs for a repository, based on 25-year retrievability, constructed in accordance with the design shown in Conceptual Design Report (CDR), as modified by Special Study No. 1 (KE Report No. 78-60-RE) and decommissioned in accordance with the program outlined in the Conceptual Design Description Report, KE Report No. 78-58-R. Costs for Operating Contractor personnel on the site at this time are included in this report and not in the Operating Cost Estimate (KE Report 78-63-RE). The operating cost estimates end with the completion of storage room backfilling. The three major elements of decommissioning are: demolition of surface facilities, backfilling of main entries and airways, and shaft liner removal and shaft plugging. EDIT, ECON, and DELOX computer programs and a chart of accounts were furnished by UCC-ND under direction of the Government and the line item-capital-cost estimate was prepared according to the prescribed format. The decommissioning cost estimate referenced herein is in the same format as its companion line item-capital-cost estimate KE Report 78-62-RE.

1692 (ORO--5366-T8) NATIONAL WASTE TERMINAL STORAGE REPOSITORY IN A BEDDED SALT FORMATION FOR SPENT UNREPROCESSED FUEL: CONSTRUCTION ACCOUNTING MANUAL. (Kaiser Engineers, Oakland, CA (USA)). Dec 1978. Contract EY-77-C-05-5366. 167p. NTIS, PC A08/MF A01.

The preparation of a cost estimate for a program to construct a new or add-on waste

storage facility is one of the major objectives of the conceptual design effort. It is essential that a construction accounting manual be developed for use in estimating (conceptual, Title 1 and working estimates), cost accounting and cost control purposes on a consistent basis throughout life of the project. In order to meet this objective, itemized cost estimates and cost accounting data must be in sufficient detail to assure the reliability of such cost estimates and cost data. A cost accounting manual for contractors involved in the project is set forth in this document. For the conceptual design cost estimate, the estimate will be prepared in accordance with this construction accounting manual and all future estimates will be prepared on this basis. When work starts under the project, cost data will be accumulated and reported in accordance with this manual to provide consistency between estimates and actual cost data for cost control programs.

1693 (PB--80-138993) SUMMARY REPORT ON THE LOW-LEVEL RADIOACTIVE WASTE BURIAL SITE, WEST VALLEY, NEW YORK (1963-1975). Giardina, P.A.; DeBonis, M.F.; Eng, J.; Meyer, G.L. (Environmental Protection Agency, New York (USA). Region II). Oct 1977. 136p. NTIS, PC A07/MF A01.

The purpose of this report is to take the information gathered in the lithological boring study along with information from other pertinent studies performed on the West Valley low-level radioactive waste burial site through March 1975 and examine the several pathways, actual and potential, for radioactivity to move from the site. Using the same information an examination of the status of this site will be compared with recommendations made for low-level nuclear waste disposal sites and hazardous material disposal sites. Possible improvements in the areas of the site selection, development, and operation to reduce environmental impacts of this and similar sites will be recommended. Finally, follow up studies that are either needed or being performed will be described.

1694 (PB--80-147754) ASSESSMENT OF WASTE MANAGEMENT OF VOLATILE RADIONUCLIDES. TECHNICAL NOTE. Altomare, P.M.; Barbier, M.; Lord, N.; Nainan, D. (Mitre Corp., McLean, VA (USA). METREK Div.). May 1979. Contract EPA-68-01-3997. 125p. NTIS, PC A06/MF A01.

This document presents a review of the technologies for waste management of the volatile radionuclides of iodine-129, krypton-85, tritium, and carbon-14. The report presents an estimate of the quantities of these volatile radionuclides as are produced in the nuclear power industry. The various technologies as may be used, or which are under investigation, to immobilize these nuclides and to contain them during storage, and in disposal are discussed. Also, the alternative disposal options as may be applied to isolate these radioactive waste from the human environment are presented.

1695 (PB--80-801772) RADIOACTIVE WASTE DISPOSAL IN SALT DEPOSITS (A BIBLIOGRAPHY WITH ABSTRACTS). REPORT FOR 1964-NOVEMBER 1979. Cavagnaro, D.M. (National Technical Information Service, Springfield, VA (USA)). Dec 1979. 257p. NTIS PC N01/MF N01.

This bibliography contains reports on underground disposal of radioactive wastes in salt deposits. The citations cover radiation protection, efficiency of the disposal method, sites that are selected, stability of the sites, mathematical models of the disposal method, hydrology, and design. (This updated bibliography contains 248 abstracts, 80 of which are new entries to the previous edition.)

1696 (PB--292735) SOCIAL DECISION-MAKING FOR HIGH CONSEQUENCE, LOW PROBABILITY OCCURRENCES. FINAL REPORT 1975-77. (National Planning Association, Washington, DC (USA); Haldi Associates, Inc., New York (USA)). Oct 1978. Contract EPA-68-01-3228. 220p. NTIS PC A10/MF A01.

Part I reviews the two main classes of criteria proposed for social decisions: (1) market mechanisms and cost-benefit analysis and (2) the approaches of Rawls and Buchanan to arrive at a social consensus. The authors propose an eight element criteria for evaluating a social decision process capable of application in judicial, legislative, academic, and managerial situations. Parts II and III are case studies of different decision procedures. The former inspects the administrative law procedure using the U.S. EPA chlordane/heptachlor suspension hearings for example. The legal procedure is concluded to be a forward-looking decision process in an effort to increase social acceptability of the outcome. The latter examines the disjointed decision procedure concerning the disposal of nuclear waste. In both cases the eight criteria proposed in Part I nevertheless provide a useful tool for evaluating the process.

1697 (PB--293401) INFORMATION BASE FOR WASTE REPOSITORY DESIGN. VOLUME 1. BOREHOLE AND SHAFT SEALING. TECHNICAL REPORT. Koplik, C.M.; Pentz, D.L.; Talbot, R. (Analytic Sciences Corp., Reading, MA (USA)). Mar 1979. Contract NRC-02-77-129. 124p. NTIS, PC AA06/MF A01.

This report is Volume 1 of a seven volume document on nuclear waste repository design issues. This report discusses the design requirements and the current technology for sealing shafts and boreholes in an underground disposal facility for nuclear waste. The discussion is focused upon repositories for high-level waste disposal in bedded salt. The type of data necessary to evaluate a particular proposal for shaft or borehole sealing is presented.

1698 (PB--293402) INFORMATION BASE FOR WASTE REPOSITORY DESIGN. VOLUME 2. EQUIPMENT PERFORMANCE REQUIREMENTS. TECHNICAL REPORT. Koplik, C.M.; Pentz, D.L.; Talbot, R. (Analytic Sciences Corp., Reading, MA (USA)). Mar 1979. Contract NRC-02-77-129. 132p. NTIS, PC AA07/MF A01.

This report is Volume 2 of a seven volume document on nuclear waste repository design issues. This report describes equipment requirements for the operation of a nuclear waste repository. Only equipment which can significantly affect nuclear safety was considered. A conceptual repository layout is presented and mining and ventilation methods are reviewed. Major emphasis is placed on nuclear waste handling operations, since these are peculiar to the situation at hand. A discussion of existing applicable regulations is also included.

1699 (PB--293403) INFORMATION BASE FOR WASTE REPOSITORY DESIGN. VOLUME 3. WASTE/ROCK INTERACTIONS. TECHNICAL REPORT. Koplik, C.M.; Oston, S.G.; Pentz, D.L.; Talbot, R. (Analytic Sciences Corp., Reading, MA (USA)). Mar 1979. Contract NRC-02-77-129. 137p. NTIS, PC AA07/MF A01.

This report is Volume 3 of a seven volume document on nuclear waste repository design issues. This report describes the important effects resulting from interaction between radioactive waste and the rock in a nuclear waste repository. The state-of-the-art in predicting waste/rock interactions is summarized. Where possible, independent numerical calculations have been performed. Recommendations are made pointing out areas which require additional research.

1700 (PB--293404) INFORMATION BASE FOR WASTE REPOSITORY DESIGN. VOLUME 4. MINE STRUCTURAL FEATURES. TECHNICAL REPORT. Byrne, R.J.; Koplik, C.M.; Oston, S.G.; Giuffre, M.S.; Myer, L.R. (Analytic Sciences Corp., Reading, MA (USA)). Mar 1979. Contract NRC-02-77-129. 373p. NTIS, PC AA16/ MF A01.

This report is Volume 4 of a seven volume document on nuclear waste repository design issues. This report discusses the mine structural features of an underground nuclear waste disposal facility which are important to repository operation, waste retrieval, and long-term waste containment. Emphasis is on repositories for high-level waste disposal in bedded salt, although much of the material is relevant to other geologic disposal mediums. The results of a numerical structural analysis of a depository in bedded salt are presented.

1701 (PB--293405) INFORMATION BASE FOR WASTE REPOSITORY DESIGN. VOLUME 5. DECOMMISSIONING OF UNDERGROUND FACILITIES. TECHNICAL REPORT. Giuffre, M.S.; Plum, R.L.; Koplik, C.M.; Talbot, R. (Analytic Sciences Corp., Reading, MA (USA)). Mar 1979. Contract NRC-02-77-129. 96p. NTIS, PC AA05/ MF A01.

This report is Volume 5 of a seven volume document on nuclear waste repository design issues. This report discusses the requirements for decommissioning a deep underground facility for the disposal of radioactive waste. The techniques for sealing the mined excavations are presented and an information base on potential backfill materials is provided. Possible requirements for monitoring the site are discussed. The performance requirements for backfill materials are outlined. The advantages and disadvantages of each sealing method are stated.

1702 (PB--293406) INFORMATION BASE FOR WASTE REPOSITORY DESIGN. VOLUME 6. EXCAVATION TECHNOLOGY. TECHNICAL REPORT. Koplik, C.M.; Pentz, D.L.; Talbot, R. (Analytic Sciences Corp., Reading, MA (USA)). Mar 1979. Contract NRC-02-77-129. 85p. NTIS, PC AA05/ MF A01.

This report is Volume 6 of a seven volume document on nuclear waste repository design issues. This report discusses the excavation technology to be used for a nuclear waste facility in a deep geologic formation. Particular emphasis is placed on the requirement to minimize the disturbance to the depository rock. This can reduce the probability of radionuclide migration through the rock surrounding the excavation. An information base is provided to assist in the evaluation of mining methods. A methodology is presented which can be used to determine performance requirements for excavation techniques.

1703 (PB--293407) INFORMATION BASE FOR WASTE REPOSITORY DESIGN. VOLUME 7. EXECUTIVE SUMMARY. TECHNICAL REPORT. Bartlett, J.W.; Pentz, D.L.; Talbot, R. (Analytic Sciences Corp., Reading, MA (USA)). Mar 1979. Contract NRC-02-77-129. 27p. NTIS, PC AA03/ MF A01.

This report is Volume 7 of a seven volume document on nuclear waste repository design issues. This report is an executive summary of studies in support of design performance criteria for radioactive waste repositories. Details of the study are provided in six companion volumes. The work developed information bases concerning shaft and borehole sealing, equipment performance requirements, waste/rock interactions, mine structural features, decommissioning performance, and excavation technology requirements. Results are summarized here under four headings: factors that are currently adequate, technology needing further development, critical information needs, and prudent repository operating procedures. Design option studies that are needed and the interactions between repository design and overall waste management strategy are also discussed.

1704 (PB--295038) A SURVEY OF PACKAGING FOR SOLIDIFIED LOW-LEVEL RADIOACTIVE WASTE. TECHNICAL NOTE. Miller, N.E. (Battelle Columbus Labs., OH (USA)). Sep 1978. Contract EPA-68-01-3924. 46p. NTIS PC A03/ MF A01.

There are presently no federal regulations controlling the packaging of low-level radioactive wastes for disposal by shallow land burial. The packaging of low-level radioactive wastes for ocean disposal by the European community has been controlled by guidelines of the Nuclear Energy Agency of the OECD. For both methods of disposal, the 55-gallon steel drum has been the most commonly used container. The use of nonmetal packaging has been more common for contaminated trash and other low-level wastes at DOE shallow land burial sites. The life of the disposal container is affected by the structural stresses imposed by the handling and disposal operations, and by deterioration from corrosion in the disposal environment.

1705 (PB--296947, pp 219-230) HISTORICAL REVIEW OF FEDERAL/STATE ROLES IN REGULATING COMMERCIAL LOW LEVEL RADIOACTIVE WASTE BURIAL GROUND. Kerr, G.W. (Nuclear Regulatory Commission, Washington, DC). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

The subject of disposal of low level radioactive waste has generated considerable interest among state and federal agencies, state and federal legislatures, the public and the industry in the past three to four years. The background and regulatory processes which have been followed since 1961 in regulating the low level waste burial grounds provide a useful point of reference for consideration of the currently evolving changes in this sector of the nuclear industry. The background is discussed in this paper as well as the type of activities conducted at the burial sites and the processes followed in licensing and regulating the existing commercial burial sites. The paper also discusses the possible future roles of federal and state governments in regulating such sites.

1706 (PB--296947, pp 1-9) LOW-LEVEL RADIOACTIVE WASTE MANAGEMENT: RETROSPECT AND PROSPECT. Lieberman, J.A. (Nuclear Safety Associates, Bethesda, MD). May 1979.

From 12. Health Physics Society midyear

topical symposium; Williamsburg, VA, USA (12 Feb 1979).

The history of the disposal of low-level radioactive wastes is recounted. Incineration, shallow burial, and sea disposal are discussed. Political and social impacts on safeguard regulations relating to radioactive waste disposal were also discussed. The technical, institutional and administrative issues involved in future prospects of waste disposal are presented. A classification system for radioactive wastes, alternative disposal systems, federal-state relationships, commercial waste burial grounds, and on-site management at reactor sites are also discussed in this lecture. (DC)

1707 (PB--296947, pp 16-26) PERSPECTIVE ON THE RELATIVE HAZARD OF LOW-LEVEL RADIOACTIVE WASTE DISPOSAL. Dornsife, W.P. (Pennsylvania Dept. of Environmental Resources, Harrisburg). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

Low-level radioactive waste disposal is presently one of the major problems facing most of the industries and institutions which use and produce radioactive materials. A more widespread but less publicized waste disposal problem may, however, be facing almost all major industries. This problem is the disposal of other hazardous wastes. This paper will examine the problem of radioactive waste management and the management of other hazardous wastes by comparing their relative toxicities. The relative risks of othe total problem will then be assessed by comparing the generation rates of each. In addition, the radioactive wastes produced by the nuclear fuel cycle will be compared with the potentially hazardous waste produced by alternate energy sources, namely, the coal fuel cycle and the manufacturing of equipment for the collection of solar energy. These comparisons suggest that the consequences of the disposal of other hazardous waste could result in risk to current and future generations which are comparable with or which may exceed that due to radioactive waste disposal. Other aspects of the problems inherent in the safe management of hazardous waste compared to radioactive waste will also be explored.

1708 (PB--296947, pp 27-37) PROFILE OF INSTITUTIONAL RADIOACTIVE WASTES GENERATED IN 1977. Beck, T.J.; McCampbell, M.R.; Cooley, L.R. (Univ. of Maryland, Baltimore). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

A national survey of radwaste volumes and characteristics generated by large medical and academic institutions in 1977 was performed. This is a followup to a survey which obtained 1975 data. The estimated total waste volume generated by the survey population in 1977 was 7771 m^3 (274,400 ft^3). These data and those from the previous survey show that the volume is increasingly linearly and consistently accounts for approximately 11% of the total volume of low level radwaste buried commercially. Most of the waste shipped by respondents (78%) was shipped to the shallow land burial site at Barnwell, South Carolina. Included in this profile of institutional radwastes are: a report of the principal radionuclides present as waste contaminants, and a breakdown of waste by form; an estimate of the effects of mechanical compaction of dry waste and a review of the extent to which alternative disposal methods are used by the study population for the various waste forms.

1709 (PB--296947, pp 49-60) LOW-LEVEL RADIOACTIVE WASTE FROM RARE METALS PROCESSING FACILITIES. Eng, J. (Bureau of Radiation Protection, Trenton, NJ); Hendricks, D.W.; Feldman, J.; Giardina, P.A. May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

In the past year, problems of disposal of byproducts, tailings, and wastes from rare metals and thorium producing facilities have received the attention of radiological agencies. Many of the raw ores used by these processing facilities were rich in natural radioactivity and the residues of production were often not disposed of properly. Mill tailings from the uranium mining industry have only recently come under federal regulation. It can be expected that similar attention will be focused on the environmental impacts of the rare metals processing industry as illustrated by interest in the problems of Parkersburg, WV, and Albany, OR. One other site in Akron, NY, does not appear to be an immediate problem, but its situation is typical of the many yet unsurveyed inactive rare metal facilities in the country. The radiological problems presented by and tydecontamination activities which may be required of these rare metal facilities are examined.

1710 (PB--296947, pp 62-66) DOE'S LOW-LEVEL WASTE MANAGEMENT PROGRAM. Meyers, S. (Dept. of Energy, Washington, DC). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

Government policies on the management of low-level radioactive wastes are discussed. The DOE program of radioactive waste disposal at DOE sites is described. Ten major program elements are highlighted: program management; systems analysis; criteria and standards development; public and regulatory interface; technology development; waste generation reduction; current systems operations; future systems development and acquisition, commercial wastes, and alternatives to shallow land burial. (DC)

1711 (PB--296947, pp 67-73) NUCLEAR POWER PLANT APPROACH TO TEMPORARY ON-SITE STORAGE OF RADIOACTIVE WASTE. Buring, M.R. (Metropolitan Edison Co., Reading, PA); Gutwein, E.E. May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

Designed storage space for solidified radioactive waste and spent filters at nuclear power plants has long been an area of concern. Increased personnel exposures arise when waste cannot be shipped for offsite disposal on a timely basis. In addition, significant cost savings can be realized in both transportation and burial costs if the short-lived isotopes in the solidified waste are permitted to decay. In order to increase flexibility in plant operations a large storage area for radioactive waste was designed. The design utilized existing structures as much as possible. A large concrete roof over a heat exchanger vault was connected by a dock to the radwaste processing area. The maximum anticipated radiation levels from the solidified waste were utilized in designing the shield wall around the storage area. Salient features of the storage area include four spent filter storage wells, a dual track overhead crane for moving

50 ft³ liners and an enclosed truck pad to facilitate loading. The 6000 ft² storage area can conveniently handle 99 50 ft³ liners on 5 ft x 5 ft pallets or 396 55 gal drums on similar 5 ft x 5 ft pallets. This is approximately one half of one unit's (PWR) average annual output of solidified evaporator bottoms. The spent filter storage wells will permit approximately two years decay with an estimated annual savings in transportation and burial charges of $12,000. Provisions for maintaining radiation exposures ALARA were included in the design of the facility. It was felt that conservatively estimated savings in radiation exposures and shipping and burial costs justified the project.

1712 (PB--296947, pp 101-106) COLLECTION AND DISPOSAL OF LOW LEVEL WASTE AT AN EDUCATIONAL INSTITUTION. Andrews, D.L.; Gilchrist, J.R.; Berk, H.W. (Univ. of Virginia, Charlottesville). May 1979.
From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).
Low level radioactive wastes are generated by a number of different laboratories and departments at the University of Virginia. Radioactive materials are utilized in a variety of research applications including medical and basic sciences, as well as for diagnostic and therapeutic uses at the University Hospital. Radioisotopes are purchased from commercial sources and are produced locally for use in research and medical diagnosis and treatment by the University of Virginia Reactor. In 1974, the University Radiation Safety Committee adopted rules for discharging radioisotopes to the environment which are more restrictive than the Nuclear Regulatory Commission regulations. The committee's philosophy is that no radioactive substances should be discharged to the environment which can be reasonably avoided, including those used in medical diagnosis and therapy. This policy has caused a significant increase in the accumulation of low-level radioactive wastes. The volume of low-level wastes at the University has increased from about 1.5 M³ in 1969 to over 68 M³ in 1977. Disposal costs have increased proportionately. Currently the University employs a full-time technician to collect and package radioactive wastes under the supervision of the health physics staff of the Radiation Safety Office. In 1976, the Radioactive Waste Management Facility (RWMF) was completed. This facility houses the Radiation Safety Office staff and has modern facilities for collecting and packaging all types of radioactive wastes. The facility is being used to limit the total cost of radioactive waste disposal, while fulfilling the objectives of the Radiation Safety Committee. Methods used to limit waste disposal volumes and costs are compaction, storage and decay of short half-life isotopes, solidification of liquid wastes, and education and training of radioactive material users throughout the University in reducing waste volume.

1713 (PB--296947, pp 107-115) COLLECTION AND HANDLING OF RADIOACTIVE WASTES FROM A LARGE UNIVERSITY. Shotts, J.G.; Spate, D.L.; Lee, P.K. (Univ. of Missouri, Columbia). May 1979.
From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).
Various types, levels, and amounts of radioactive wastes are generated by the Universtiy of Missouri, Columbia research, teaching, and clinical programs. Health Physics Services is responsible for collecting these wastes from the more than 200 laboratories spread over the sprawling campus and disposing of the wastes in an economical and safe manner. Most of the radioactive wastes are laboratory paper trash and liquids containing low levels of activity but some high level wastes and contaminated large animal carcasses also require disposal. The wastes are stored at one of four interim storage locations until ultimately disposed of by incineration, sewer release, local burial, shipment for commercial waste disposal or decay. The economics, safety, and handling aspects of the various disposal methods must be considered.

1714 (PB--296947, pp 126-132) REGULATORY CONSIDERATIONS FOR RADIOACTIVE WASTE DIPOSAL. Fuhrman, D.R.; Black, S.A.; Pasinosky, J.P. (Teledyne Isotopes, Westwood, NJ). May 1979.
From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).
Packaging, transportation, and burial of radioactive wastes involves a complex, sometimes nebulous set of regulatory conditions, restrictions, and exceptions for proper handling. These regulations affect the shipper of radioactive wastes directly as in the case of the Department of Transportation (DOT), Nuclear Regulatory Commission (NRC), state highway permits or bridge and tunnel authorities, or indirectly by imposing restrictions on the burial site of which the shipper must be aware. Due to the complexity of the regulations involving the various levels and types of radioactive wastes, this paper concentrates on low level (i.e., Type A and LSA quantities) wastes. When considering the shipment of Type A or LSA waste, the shipper must first consider the packaging, marking, labeling, etc. requirements as specified by the DOT and compatible with the respective burial site restrictions. The appropriate shipping papers must be completed certifying the packaging, marking, and labeling in accordance with DOT regulations. In transporting radioactive wastes, the DOT imposes requirements and restrictions on the carrier. Driver's logs and examination certificates must be in the driver's possession. In addition, requirements for the safe operation of vehicles carrying hazardous materials are imposed by the DOT. In addition to the DOT regulations, certain states, localities, highway authorities or bridge and tunnel authorities impose restrictions or require permit authorization prior to transporting radioactive wastes through their jurisdiction. In many states, the respective environmental agencies have recently imposed permit requirements for transport of any hazardous materials. The regulatory process governing radioactive waste disposal has become a maze of requirements, conditions, restrictions, and exemptions which are often redundant and ambiguous, which raises the costs to commercial waste disposal companies, carriers, and ultimately the generator.

1715 (PB--296947, pp 133-140) OPERATIONAL EXPERIENCE AT CHEM-NUCLEAR'S BARNWELL FACILITY. Ebenhack, D.G. (Chem-Nuclear Systems, Inc., Barnwell, SC). May 1979.
From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).
Chem-Nuclear's low level burial ground located in Barnwell, SC with primary licensing by the state of South Carolina has seen a substantial increase in volume of waste and presently serves the majority of fuel and non-

fuel cycle radwaste generators in the country. The waste, upon receipt, is monitored and disposed of in one of our engineered trenches. The packaging requirements, trench design and surface management minimize the possibility of release through the water pathway. The Health Physics practices and the environmental programs evaluate and monitor the personnel and population exposure pathways.

1716 (PB--296947, pp 141-150) MANAGEMENT AND SURVEILLANCE OF A UNIVERSITY RADIOACTIVE WASTE BURIAL SITE. Lee, P.K.; Shotts, J.G.; Spate, D.L. (Univ. of Missouri, Columbia). May 1979.
From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).
A radioactive waste burial site is operated at the University of Missouri under the conditions of 10 CFR 20.304. Over 90% of the radioactive wastes generated by the laboratories and clinics, exclusive of the Research Reactor Facility, are economically disposed at this site. During the seven year operation about 200 cubic meters of low-level wastes containing about 1.5×10^{11} becquerels have been buried in 3.6 meter deep and 0.6 meter wide trenches. A radiation surveillance program confirms that radiation levels in the vicinity of the burial site are well within acceptable limits.

1717 (PB--296947, pp 159-167) STATUS OF LOW-LEVEL RADIOACTIVE WASTE DISPOSAL: HOW TO PLAN A DISASTER. McArthur, W.C. (Hittman Nuclear and Development Corp., Columbia, MD). May 1979.
From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).
The nuclear industry is faced with serious problems in the transportation and burial of low-level radioactive wastes. Soaring burial costs, state regulations regarding transportation routes, and lack of direction from regulatory agencies are problems that must quickly be resolved. In order to gain control of this situation four major steps must be taken. First, states must accept their fair share of responsibility in the waste problem. Regulatory agencies must recognize the seriousness of the problem and develop a schedule for action. The nuclear industry must assert itself in a positive manner regarding the safety of nuclear power, and the low-level waste burial ground situation must improve.

1718 (PB--296947, pp 168-173) SHALLOW LAND BURIAL: WHY OR WHY NOT. Thompson, W.T.; Ledbetter, J.O.; Rohlich, G.A. (Univ. of Texas, Austin). May 1979.
From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).
This paper summarizes a master's thesis on the state-of-the-art for shallow land burial of solid low-level radioactive wastes. The coverage of the thesis, which is condensed for this paper, ranges from site selection to problem case histories. Inherent in such coverage is the assessment of risk, the discussion of operational and management problems and the real significance of off-site migration - this topic will be discussed in light of the stands taken that the migration is a serious problem and that it is not. Emphasis is on the engineering parameters of importance in site selection, and what pretreatment, if any, is needed.

1719 (PB--296947, pp 203-212) COMPARISON OF ALTERNATIVES FOR LOW-LEVEL RADIOACTIVE WASTE DISPOSAL. Macbeth, P.J. (Ford, Bacon and Davis Inc. Salt Lake City, UT). May 1979.
From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).
A comparative analysis of alternatives for disposal of low-level radioactive wastes has been performed for the US NRC. A systematic evaluation of all possible disposal mechanisms identifying options most viable for further analysis is presented. Generic reference disposal facility concepts for each viable alternative are evaluated to provide a consistent, meaningful comparison based on technological, economic, and sociopolitical factors. The results of the comparative analysis are presented in a convenient matrix format to facilitate intercomparisons and to promote understanding of the complexities of the tradeoffs involved in selecting waste disposal options. The concepts judged to be the most viable alternatives to the current practice in this country of disposal of low-level wastes by shallow land burial include improvements to shallow land burial, ocean disposal, intermediate depth burial (10- to 15 m deep), disposal in natural or mined cavities, and disposal in exposed or covered structures. Representative waste disposal facility concepts for each of these alternatives were analyzed as the basis of the evaluation, using reference waste volumes and facility lifetimes.

1720 (PB--296947, pp 214-218) DISPOSAL CLASSIFICATION OF LOW-LEVEL RADIOACTIVE WASTE. Adam, J.A. (Nuclear Regulatory Commission, Washington, DC). May 1979.
From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).
A system for classifying radioactive wastes is presented. This system is based on the minimum requirements for safe disposal. Study guidelines for this project are discussed. Two types of pathways are investigated: onsite reclaimer events and offsite migration. The classification system postulates 5 classes of terrestrial disposal. These are discussed. (DC)

1721 (PB--296947, pp 234-237) BURIAL OF SMALL QUANTITIES OF RADIONUCLIDES WITHOUT PRIOR NRC APPROVAL. Hickey, J.W.N. (Nuclear Regulatory Commission, Washington, DC). May 1979.
From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).
The US Nuclear Regulatory Commission has proposed to delete a regulation (10 CFR 20.304) which allows licensees to bury specified small quantities of radionuclides anywhere without notification or approval of NRC, subject to certain conditions. In developing this proposed deletion, the NRC staff contacted licensees, state officials, inspectors, and others to obtain information on disposal practices. The Commission and its staff tentatively concluded that burials pursuant to 10 CFR Section 20.304 should stop, and that the impact of the proposed deletion would be small. If review of public comments does not change this evaluation, 10 CFR Section 20.304 will be deleted, and burials will have to be specifically approved in advance by NRC.

1722 (PB--296947, pp 252-260) DECOMMISSIONING STANDARDS: THE RADIOACTIVE WASTE IMPACT. Russell, J.L.; Crofford, W.N.

(Environmental Protection Agency, Washington, DC). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

Several considerations are important in establishing standards for decommissioning nuclear facilities, sites and materials. The review includes discussions of some of these considerations and attempts to evaluate their relative importance. Items covered include the form of the standards, timing for decommissioning, occupational radiation protection, costs and financial provisions, and low-level radioactive waste. Decommissioning appears more closely related to radiation protection than to waste management, although it is often carried under waste management programs or activities. Basically, decommissioning is the removal of radioactive contamination from facilities, sites and materials so that they can be returned to unrestricted use or other actions designed to minimize radiation exposure of the public. It is the removed material that is the waste and, as such, it must be managed and disposed of in an environmentally safe manner. It is important to make this distinction even though, for programmatic purposes, decommissioning may be carried under waste management activities. It was concluded that the waste disposal problem from decommissioning activities is significant in that it may produce volumes comparable to volumes produced during the total operating life of a reactor. However, this volume does not appear to place an inordinate demand on shallow land burial capacity. It appears that the greater problems will be associated with occupational exposures and costs, both of which are sensitive to the timing of decommissioning actions.

1723 (PB--296947, pp 261-269) MODELING AND ENVIRONMENTAL ASSESSMENT OF LAND DISPOSAL METHODS FOR LOW-LEVEL RADIOACTIVE WASTES. Meyer, G.L.; Bard, S.T.; Hung, C.Y.; Neiheisel, J. (Environmental Protection Agency, Washington, DC). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

The Environmental Protection Agency (EPA) is evaluating the potential environmental impact and risk to man from disposing of low-level radioactive waste (LLW) in the ground. A generic model is being developed to simulate the interaction of a variety of LLW waste types and land disposal methods and operations with the natural characteristics of the site and their potential impact on the environment. Shallow land burial will be used as a base case. This model will be an important tool in EPA's work to develop environmental standards for LLW. This paper presents the general objectives, information requirements, components, and pathways considered in the environmental assessment model and some considerations in developing the model.

1724 (PB--296947, pp 366-372) RECOMMENDATIONS FOR REMEDIAL ACTION AND DECOMMISSIONING OF A RADIOACTIVE WASTE BURIAL SITE. Giardina, P.A. (Environmental Protection Agency, New York, NY); Eng, J.; Feldman, J. May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

For the past year, the Nuclear Fuel Services, Inc. (NFS) site located in West Valley, NY has been the subject of state and federal efforts to determine decontamination and decommissioning options. In 1978, the US Environmental Protection Agency (EPA) issued Criteria for Radioactive Wastes for storage and disposal of all forms of radioactive wastes. Under an Atomic Energy Commission (AEC) license, NFS operated the only commercial fuel reprocessing facility in the United States. As a result of the reprocessing activities, the site contains liquid high-level radioactive waste, buried cladding hulls and defective fuel elements, a spent fuel storage pool, and a low-level burial ground. Low-level radioactive material contained therein also comes from sources other than NFS's operations. The site received a license from the state of New York to perform low-level burial operations and radioactive material was buried until 1975. Studies of the low-level burial area show radioactive gases have leaked through the trench caps and the caps are more permeable than the surrounding soil allowing water infiltration into the trenches. Active site maintenance is used to prevent trench water overflow through the trench caps. Other remedial actions have been described for the site and are undergoing implementaion. The West Valley site will be examined to determine the extent of remedial action and decommissioning activities which may be necessary based on the proposed EPA environmental criteria for radioactive waste.

1725 (PB--296947, pp 38-48) HEALTH PHYSICS CONSIDERATIONS IN ACCELERATOR DECOMMISSIONING AND DISPOSAL. Mundis, R.L.; Kikta, M.J.; Marmer, G.J.; Opelka, J.H.; Peterson, J.M.; Siskind, B. (Argonne National Lab., IL). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

There are perhaps as many as 1200 particle accelerators in the United States, ranging in size from the very small Cockroft-Walton and electron linear accelerators to the multi-GeV research synchrotrons. When an accelerator has reached the end of its useful life the radioactivity induced in the components then presents several disposal problems. At least fifty accelerators produce significant induced activation, and several hundred more are capable of producing fluxes of neutrons which could result in activation of various components of the accelerator facility. This is generally of low level except for the very high energy/high intensity machines. In most cases, the induced radioactivity is confined to relatively few parts of the machine and the disposition of these is through the normal radioactive waste channels without complication. However, some machines leave a legacy of low level induced radioactivity in massive components. Examples of massive items are large magnets, shield blocks and beam stops of concrete, earth or iron, and even the walls and floors of the building itself. These need to be dealt with in a manner so as to pose no potential health hazards to persons in the vicinity of the public at large. The disposition of radioactive waste from major past decommissionings, including the Cambridge Electron Accelerator (CEA) and the Brookhaven Cosmotron, will be discussed. The extent of the induced radioactivity problmes in decommissioning of smaller accelerators will also be discussed.

1726 (PNCT--841-78-69) STUDIES ON THE DISPERSION OF LOW-LEVEL LIQUID EFFLUENT RELEASED FROM THE FUEL REPROCESSING PLANT INTO THE SEA. Iwasaki, K.; Fukuda, S.; Hirayama, A.; Kitahara, Y.; Kishimoto, Y. (Power

Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Dec 1978. 127p. (In Japanese). NTIS (US Sales Only), PC A07/MF A01.

The low level liquid waste effluent has been released batchwise into the Pacific Ocean from the fuel reprocessing plant of PNC sited in Tokai-mura since September 1977. The liquid effluent is discharged from the nozzle located about sixteen meters below the sea surface and dispersed by ambient cross stream. Gross beta activity, tritium and ^{137}Cs concentrations in seawater were measured from November 1972 to June 1973 in accordance with a special monitoring program to examine the dilution and dispersion of effluent in seawater. The results of tritium measurement showed that the effluent was diluted by two or three orders of magnitude by jet mixing immediately after the discharge from the nozzle, and was further diluted by one or two orders of magnitude by traveling several hundred meters along the current. It was observed that the areal concentration of tritium in surface water raised temporarily after the discharge of more than several tens curies, but returned to the background level within a day or so. No significant increase in concentration of gross beta activity and ^{137}Cs activities in seawater was observed in this period.

1727 (PNL--2557) CHARACTERIZATION OF THE HANFORD 300 AREA BURIAL GROUNDS. FINAL REPORT: DECONTAMINATION AND DECOMMISSIONING. Phillips, S.J.; Ames, L.L.; Fitzner, R.E.; Gee, G.W.; Sandness, G.A.; Simmons, C.S. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jan 1980. Contract EY-76-C-06-1830. 255p. Dep. NTIS, PC A12/MF A01.

Pacific Northwest Laboratory conducted a series of investigations at the Hanford Site to develop technologies for characterizing and monitoring radioactive waste burial facilities that could be used in determining appropriate decommissioning alternatives. Specific objectives were to develop unique functional geophysics, geochemical, soil physics, numerical modeling, and biological methodologies needed to better characterize and monitor buried radioactive waste disposal sites. To meet these objectives the project was divided into four tasks: Task I, Geophysical Evaluation - Geophysical surveys were taken to locate and define the gross composition of waste materials. Task II, Geochemical Analysis - The interaction of disposed radionuclides with geologic media was analyzed through an integrated radiochemical procedure. Task III, Fluid Transport and Modeling - Computer modeling of water migration in partially saturated groundwater systems was verified with actual data collected at a field test facility used to monitor micrometeorological and geohydrological energy and mass transfer factors. Task IV, Biological Transport - Several biological organisms were evaluated for potential radionuclide uptake and transport. Along with the four tasks, the project included a review of pertinent literature and regulatory issues that might affect the alternatives selected. Surveys were taken of the surrounding area and specific sites and operations. The overall results indicated that the 300 Area Burial Grounds have been adequate in containing radioactive waste. Based on the results of the project, the alternatives identified for decommissioning these sites are exhumation and translocation, entombment, perpetual care, and abandonment. Perpetual care (currently used) appears to be the best decommissioning alternative for these burial grounds at this time. However, another alternative may be selected depending on future waste management policies, plans, or activities.

1728 (PNL--2563) ORGANIC COMPONENTS OF NUCLEAR WASTES AND THEIR POTENTIAL FOR ALTERING RADIONUCLIDE DISTRIBUTION WHEN RELEASED TO SOIL. McFadden, K.M. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Aug 1980. Contract AC06-76RL01830. 34p. NTIS, PC A03/MF A01.

Normal waste processing at the Hanford operations requires the use of many organic materials, chiefly in the form of complexing agents and diluents. These organic materials and their chemical and radiolytic degradation products, have potential for complexing fission products and transuranium elements, both in the waste streams and upon infiltration into soil, perhaps influencing future sorption or migration of the nuclides. Particular complexation characteristics of various nuclides which constitute the major fission products, long-lived isotopes, and the most mobile in radioactive wastes are discussed briefly with regards to their anticipated sorption or mobility in soils. Included in the discussion are Am, Sb, Ce, Cs, Co, Cm, Eu, I, Np, Pm, Pu, Ra, Ru, Sr, Tc, U, and Zr. 107 references.

1729 (PNL--2776) NATURALLY OCCURRING GLASSES: ANALOGUES FOR RADIOACTIVE WASTE FORMS. Ewing, R.C.; Haaker, R.F. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Apr 1979. Contract EY-76-C-06-1830. 82p. Dep. NTIS, PC A05/MF A01.

Volcanic glasses are very often altered by weathering and leaching and recrystallize to their fine-grained equivalents (rhyolites, felsites). The oldest volcanic glasses are dated at 40 million years before the present, but the majority are much younger. Devitrification textures was produced experimentally; and hydration rates for volcanic glasses were determined as a function of composition, temperature, and climate. Presence of water and temperature are the most important rate controlling variables. Even material that may still be described as glassy often exhibits evidence of alteration and recrystallization. Of the volcanic glasses that are preserved in the geologic record, it would be rare to describe such a glass as pristine. Despite the common alteration and recrystallization effects observed in volcanic glasses, glasses formed as a result of impact, tektites and lunar glasses, may occur in substantially unaltered form. In the case of tektites, their resistance to alteration is a result of their high SiO_2 content and low alkali content. Lunar glasses have been preserved for hundreds of millions of years because they exist in an environment with a low oxygen fugacity and an extremely low water vapor partial presssure. Thus one might expect glasses of particular compositions or in specific types of environment to be stable for long periods of time. These conclusions are applied to radioactive waste disposal over several time periods (0-30h, 30h-20y, 20-200y).

1730 (PNL--2782) ASSESSMENT OF EFFECTIVENESS OF GEOLOGIC ISOLATION SYSTEMS. TEST CASE RELEASE CONSEQUENCE ANALYSIS FOR A SPENT FUEL REPOSITORY IN BEDDED SALT. Raymond, J.R.; Bond, F.W.; Cole, C.R.; Nelson, R.W.; Reisenauer, A.E.; Washburn, J.F.; Norman, N.A.; Mote, P.A.; Segol, G. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jan 1980. Contract EY-76-C-06-1830. 82p. Dep. NTIS, PC A05/MF A01.

Geologic and geohydrologic data for the

Paradox Basin have been used to simulate movement of ground water and radioacrtive contaminants from a hypothetical nuclear reactor spent fuel repository after an assumed accidental release. The pathlines, travel times and velocity of the ground water from the repository to the discharge locale (river) were determined after the disruptive event by use of a two-dimensional finite difference hydrologic model. The concentration of radioactive contaminants in the ground water was calculated along a series of flow tubes by use of a one-dimensional mass transport model which takes into account convection, dispersion, contaminant/media interactions and radioactive decay. For the hypothetical site location and specific parameters used in this demonstration, it is found that Iodine-129 (I-129) is tthe only isotope reaching the Colorado River in significant concentration. This concentration occurs about 8.0×10^5 years after the repository has been breached. This I-129 groundwater concentration is about 0.3 of the drinking water standard for uncontrolled use. The groundwater concentration would then be diluted by the Colorado River. None of the actinide elements reach more than half the distance from the repository to the Colorado River in the two-million year model run time. This exercise demonstrates that the WISAP model system is applicable for analysis of contaminant transport. The results presented in this report, however, are valid only for one particular set of parameters. A complete sensitivity analysis must be performed to evaluate the range of effects from the release of contaminants from a breached repository.

1731 (PNL--2851) SUMMARY OF FY-1978 CONSULTANT INPUT FOR SCENARIO METHODOLOGY DEVELOPMENT. Scott, B.L.; Benson, G.L.; Craig, R.A. (eds.); Harwell, M.A. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Nov 1979. Contract EY-76-C-06-1830. 180p. Dep. NTIS, PC A04/MF A01.

Associated with commercial nuclear power production in the United States is the generation of potentially hazardous radioactive waste products. The Department of Energy (DOE), through the National Waste Terminal Storage (NWTS) Program, is seeking to develop nuclear waste isolation systems in geologic formations. These underground waste isolation systems will preclude contact with the biosphere of waste radionuclides in concentrations which are sufficient to cause deleterious impact on humans or their environments. Comprehensive analyses of specific isolation systems are needed to assess the postclosure expectations of the systems. Assessment of Effectiveness of Geologic Isolation Systems (AEGIS) program has been established for developing the capability of making those analyses. The assessment of repository post-closure safety has two basic components: identification and analyses of breach scenarios and the pattern of events and processes causing each breach, and identification and analyses of the environmental consequences of radionuclide transport and interactions subsequent to a repository breach. Specific processes and events which might affect potential repository sites and, the rates and probabilities for those phenomena are presented. The description of the system interactions and synergisms and of the repository system as an evolving and continuing process are included. Much of the preliminary information derived from the FY-1978 research effort is summarized in this document. This summary report contains information pertaining to the following areas of study: climatology, geomorphology, glaciology, hydrology, meteorites, sea level fluctuations, structural geology and volcanology.

1732 (PNL--2851) SUMMARY OF FY-1978 CONSULTATION INPUT FOR SCENARIO METHODOLOGY DEVELOPMENT. Scott, B.L.; Benson, G.L.; Craig, R.A.; Harwell, M.A. (eds.). (Battelle Pacific Northwest Labs., Richland, WA (USA)). Nov 1979. Contract EY-76-C-06-1830. 180p. Dep. NTIS, PC A09/MF A01.

The Scenario Methodology Development task is concerned with evaluating the geologic system surrounding an underground repository and describing the phenomena (volcanic, seismic, meteorite, hydrologic, tectonic, climate, etc.) which could perturb the system and possibly cause loss of repository integrity. This document includes 14 individual papers. Separate abstracts were prepared for all 14 papers. (DLC)

1733 (PNL--2851, pp I.1-I.9) DISRUPTIVE EVENT ANALYSIS: VOLCANISM AND IGNEOUS INTRUSION. Crowe, B.M. (Los Alamos Scientific Lab., NM). Nov 1979.

Summary of FY-1978 consultation input for Scenario Methodology Development.

Three basic topics are addressed for the disruptive event analysis: first, the range of disruptive consequences of a radioactive waste repository by volcanic activity; second, the possible reduction of the risk of disruption by volcanic activity through selective siting of a repository; and third, the quantification of the probability of repository disruption by volcanic activity.

1734 (PNL--2854) ASSESSMENT OF EFFECTIVENESS OF GEOLOGIC ISOLATION SYSTEMS. GEOLOGIC FACTORS IN THE ISOLATION OF NUCLEAR WASTE: EVALUATION OF LONG-TERM GEOMORPHIC PROCESSES AND CATASTROPHIC EVENTS. Mara, S.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Mar 1980. Contract EY-76-C-06-1830. 54p. Dep. NTIS, PC A04/MF A01.

SRI International has projected the rate, duration, and magnitude of geomorphic processes and events in the Southwest and Gulf Coast over the next million years. This information will be used by the Department of Energy's Pacific Northwest Laboratory (PNL) as input to a computer model, which will be used to simulate possible release scenarios and the consequences of the release of nuclear waste from geologic containment. The estimates in this report, although based on best scientific judgment, are subject to considerable uncertainty. An evaluation of the Quaternary history of the two study areas revealed that each had undergone geomorphic change in the last one million years. Catastrophic events were evaluated in order to determine their significance to the simulation model. Given available data, catastrophic floods are not expected to occur in the two study areas. Catastrophic landslides may occur in the Southwest, but because the duration of the event is brief and the amount of material moved is small in comparison to regional denudation, such events need not be included in the simulation model. Ashfalls, however, could result in removal of vegetation from the landscape, thereby causing significant increases in erosion rates. Because the estimates developed during this study may not be applicable to specific sites, general equations were presented as a first step in refining the analysis. These equations identify the general relationships among the important variables and suggest those areas of concern for which further data are required. If the current model indicates that geomorphic

processes (taken together with other geologic changes) may ultimately affect the geologic containment of nuclear waste, further research may be necessary to refine this analysis for application to specific sites.

1735 (PNL--2858) HYDROGEOLOGIC EFFECTS OF NATURAL DISRUPTIVE EVENTS ON NUCLEAR WASTE REPOSITORIES. Davis, S.N. (Arizona Univ., Tucson (USA)). Jun 1980. Contract AC06-76RL01830. 41p. NTIS, PC A03/MF A01.

Some possible hydrogeologic effects of disruptive events that may affect repositories for nuclear wastte are described. A very large number of combinations of natural events can be imagined, but only those events which are judged to be most probable are covered. Waste-induced effects are not considered. The disruptive events discussed above are placed into four geologic settings. Although the geology is not specific to given repository sites that have been considered by other agencies, the geology has been generalized from actual field data and is, therefore, considered to be physically reasonable. The geologic settings considered are: (1) interior salt domes of the Gulf Coast, (2) bedded salt of southeastern New Mexico, (3) argillaceous rocks of southern Nevanda, and (4) granitic stocks of the Basin and Range Province. Log-normal distributions of permeabilities of rock units are given for each region. Chapters are devoted to: poresity and permeability of natural materials, regional flow patterns, disruptive events (faulting, dissolution of rock forming minerals, fracturing from various causes, rapid changes of hydraulic regimen); possible hydrologic effects of disruptive events; and hydraulic fracturing.

1736 (PNL--2859) PRELIMINARY SUBSURFACE HYDROLOGIC CONSIDERATIONS: COLUMBIA RIVER PLATEAU PHYSIOGRAPHIC PROVINCE. ASSESSMENT OF EFFECTIVENESS OF GEOLOGIC ISOLATION SYSTEMS. Veatch, M.D. (Battelle Pacific Northwest Labs., Richland, WA (USA); Shannon and Wilson, Inc., Seattle, WA (USA)). Apr 1980. Contract EY-76-C-06-1830. 43p. NTIS, PC A03/MF A01.

This report contains a discussion of the hydrologic conditions of the Columbia River Plateau physiographic province. The Columbia River Plateau is underlain by a thick basalt sequence. The Columbia River basalt sequence contains both basalt flows and sedimentary interbeds. These sedimentary interbeds, which are layers of sedimentary rock between lava flows, are the main aquifer zones in the basalt sequence. Permeable interflow zones, involving the permeable top and/or rubble bottom of a flow, are also water-transmitting zones. A number of stratigraphic units are present in the Pasco Basin, which is in the central part of the Columbia River Plateau. At a conceptual level, the stratigraphic sequence from the surface downward can be separated into four hydrostratigraphic systems. These are: (1) the unsaturated zone, (2) the unconfined aquifer, (3) the uppermost confined aquifers, and (4) the lower Yakima basalt hydrologic sequence. A conceptual layered earth model (LEM) has been developed. The LEM represents the major types of porous media (LEM units) that may be encountered at a number of places on the Columbia Plateau, and specifically in the Pasco Basin. The conceptual LEM is not representative of the actual three-dimensional hydrostratigraphic sequence and hydrologic conditions existing at any specific site within the Columbia Plateau physiographic province. However, the LEM may be useful for gaining a better understanding of how the hydrologic regime may change as a result of disruptive events that may interact with a waste repository in geologic media.

1737 (PNL--2862) ASSESSMENT OF EFFECTIVENESS OF GEOLOGIC ISOLATION SYSTEMS: THE FEASIBILITY OF COMPUTER INTERROGATION OF EXPERTS FOR WISAP. Wight, L.H. (Battelle Pacific Northwest Labs., Richland, WA (USA); TERA Corp., Berkeley, CA (USA)). May 1980. Contract EY-76-C-06-1830. 101p. NTIS, PC A06/MF A01.

Simulation of the response of a waste repository to events that could initiate a fault tree to breach and failure is currently a keystone to the Battelle Waste Isolation Safety Assessment Program (WISAP). The repository simulation, which is part of the Disruptive Event Analysis Task, models the repository for its entire design life, one million years. This is clearly a challenging calculation, requiring input unlike any other response analysis by virtue of the long design life of the facility. What technology will provide design criteria for a million year design life. Answers to questions like this can, to some extent, be based on data, but always require some subjective judgments. The subjectivity, which is sometimes driven by inadequate or incomplete data or by a lack of understanding of the physical process, is therefore a crucial ingredient in an analysis of initiating events. Because of the variety of possible initiating events (glaciation, man-caused disruption, volcanism, etc.), many expert opinions will be solicited as input. The complexity of the simulation, the variety of experts involved, and the volume of applicable data all suggest that there may be a more direct, economical method to solicit the expert opinion. This report addresses the feasibility of such a system. Background information is presented that demonstrates the advantages of a computer interrogation system over conventional interrogation and assessment techniques. In the subsequent three sections the three elements - structure and decomposition, scaling, and synthesis - that are basic to any interrogation and assessment technique are reviewed. The interrelationship are schematically illustrated between these three fundamental elements and, therefore, serves as a useful guide to these three sections. Each of these three sections begins with a recommended approach to the particular element and ends with an illustration of representative dialogue.

1738 (PNL--2863) GLACIOLOGICAL PARAMETERS OF DISRUPTIVE EVENT ANALYSIS. Bull, C. (Battelle Pacific Northwest Labs., Richland, WA (USA); Ohio State Univ., Columbus (USA)). Apr 1980. Contract EY-76-C-06-1830. 55p. Dep. NTIS, PC A04/MF A01.

The possibility of complete glaciation of the earth is small and probably need not be considered in the consequence analysis by the Assessment of Effectiveness of Geologic Isolation Systems (AEGIS) Program. However, within a few thousand years an ice sheet may well cover proposed waste disposal sites in Michigan. Those in the Gulf Coast region and New Mexico are unlikely to be ice covered. The probability of ice cover at Hanford in the next million years is finite, perhaps about 0.5. Sea level will fluctuate as a result of climatic changes. As ice sheets grow, sea level will fall. Melting of ice sheets will be accompanied by a rise in sea level. Within the present interglacial period there is a definite chance that the West Antarctic ice sheet will melt. Ice sheets are agents of erosion, and some estimates of the amount of material they erode

have been made. As an average over the area glaciated by late Quaternary ice sheets, only a few tens of meters of erosion is indicated. There were perhaps 3 meters of erosion per glaciation cycle. Under glacial conditions the surface boundary conditions for ground water recharge will be appreciably changed. In future glaciations melt-water rivers generally will follow pre-existing river courses. Some salt dome sites in the Gulf Coast region could be susceptible to changes in the course of the Mississippi River. The New Mexico site, which is on a high plateau, seems to be immune from this type of problem. The Hanford Site is only a few miles from the Columbia River, and in the future, lateral erosion by the Columbia River could cause changes in its course. A prudent assumption in the AEGIS study is that the present interglacial will continue for only a limited period and that subsequently an ice sheet will form over North America. Other factors being equal, it seems unwise to site a nuclear waste repository (even at great depth) in an area likely to be glaciated.

1739 (PNL--2874) WASTE ISOLATION SAFETY ASSESSMENT PROGRAM. TECHNICAL PROGRESS REPORT FOR FY-1978. Brandstetter, A.; Harwell, M.A.; Howes, B.W.; Benson, G.L.; Bradley, D.J.; Raymond, J.R.; Serne, R.J.; Schilling, A.H. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jul 1979. Contract EY-76-C-06-1830. 338p. NTIS, PC A15/MF A01.

Associated with commercial nuclear power production in the United States is the generation of potentially hazardous radioactive wastes. The Department of Energy (DOE) is seeking to develop nuclear waste isolation systems in geologic formations that will preclude contact with the biosphere of waste radionuclides in concentrations which are sufficient to cause deleterious impact on humans or their environments. Comprehensive analyses of specific isolation systems are needed to assess the expectations of meeting that objective. The Waste Isolation Safety Assessment Program (WISAP) has been established at the Pacific Northwest Laboratory (operated by Battelle Memorial Institute) for developing the capability of making those analyses. Progress on the following tasks is reported: release scenario analysis, waste form release rate analysis, release consequence analysis, sorption-desorption analysis, and societal acceptance analysis. (DC)

1740 (PNL--2928) ASSESSMENT OF EFFECTIVENESS OF GEOLOGIC ISOLATION SYSTEMS. PERSPECTIVES ON THE GEOLOGICAL AND HYDROLOGICAL ASPECTS OF LONG-TERM RELEASE SCENARIO ANALYSES. Stottlemyre, J.A.; Wallace, R.W.; Benson, G.L.; Zellmer, J.T. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jun 1980. Contract AC06-76RL01830. 123p. NTIS, PC A06/MF A01.

Information that may be relevant to individuals involved with analyzing long-term release scenarios of specific repositories for nuclear waste is presented. The bulk of the information is derived from recent studies in West Germany and the United States. Emphasis is on the specific geological and hydrological phenomena that, alone or in concert, could potentially perturb the area around specific repository sites. Research is continuing on most of the topics discussed within this report. Because research is ongoing, statements and conclusions described in this document are subject to change. The main topics of this report are: (1) fracturing, (2) geohydrology, (3) magmatic activity, and (4) geomorphology. Therefore, the site-specific nature of the problem cannot be overemphasized. As an example of how one might combine the many synergistic and time-dependent parameters into a concise format the reader is referred to A Conceptual Simulation Model for Release Scenario Analysis of a Hypothetical Site in Columbia Plateau Basalts, PNL-2892. For additional details on the topics in this report, the reader is referred to the Pacific Northwest Laboratory (PNL) consultant report listed in the bibliography.

1741 (PNL--2939) FINITE-ELEMENT THREE-DIMENSIONAL GROUND-WATER (FE3DGW) FLOW MODEL - FORMULATION, PROGRAM LISTINGS AND USERS' MANUAL. Gupta, S.K.; Cole, C.R.; Bond, F.W. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Dec 1979. Contract EY-76-C-06-1830. 283p. Dep. NTIS, PC A13/MF A01.

The Assessment of Effectiveness of Geologic Isolation Systems (AEGIS) Program is developing and applying the methodology for assessing the far-field, long-term post-closure safety of deep geologic nuclear waste repositories. AEGIS is being performed by Pacific Northwest Laboratory (PNL) under contract with the Office of Nuclear Waste Isolation (OWNI) for the Department of Energy (DOE). One task within AEGIS is the development of methodology for analysis of the consequences (water pathway) from loss of repository containment as defined by various release scenarios. Analysis of the long-term, far-field consequences of release scenarios requires the application of numerical codes which simulate the hydrologic systems, model the transport of released radionuclides through the hydrologic systems to the biosphere, and, where applicable, assess the radiological dose to humans. Hydrologic and transport models are available at several levels of complexity or sophistication. Model selection and use are determined by the quantity and quality of input data. Model development under AEGIS and related programs provides three levels of hydrologic models, two levels of transport models, and one level of dose models (with several separate models). This document consists of the description of the FE3DGW (Finite Element, Three-Dimensional Groundwater) Hydrologic model third level (high complexity) three-dimensional, finite element approach (Galerkin formulation) for saturated groundwater flow.

1742 (PNL--2954) TESTS FOR DETERMINING IMPACT RESISTANCE AND STRENGTH OF GLASS USED FOR NUCLEAR WASTE DISPOSAL. Bunnell, L.R. (Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1979. Contract EY-76-C-06-1830. 41p. Dep. NTIS, PC A03/MF A01.

Tests are described for determining the impact resistance (Section A) and static tensile strength (Section B) of glasses containing simulated or actual nuclear wastes. This report describes the development and use of these tests to rank different glasses, to assess effects of devitrification, and to examine the effect of impact energy on resulting surface area. For clarity this report is divided into two sections, Impact Resistance and Tensile Strength.

1743 (PNL--3070) COMPARISON OF INTERA AND WISAP CONSEQUENCE MODEL APPLICATION. ASSESSMENT OF EFFECTIVENESS OF GEOLOGIC ISOLATION SYSTEMS. Cole, C.R.; Bond, F.W. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jan 1980. Contract EY-76-C-06-1830. 66p. Dep. NTIS, PC A04/MF A01.

The Waste Isolation Safety Assessment Program (WISAP) is being conducted to develop,

for the Office of Nuclear Waste Isolation (ONWI), the methodology necessary to perform long-term safety assessments of deep geologic repositories. The Waste Isolation Pilot Plant (WIPP) program is developing a nuclear waste storage facility and is performing assessments of that site. WISAP and WIPP have similar, though independent, methodologies for assessing the consequences of a repository breach subsequent to closure. Intera Environmental Consultants are under contract to Sandia Laboratories to conduct the hydrologic and transport modeling for the WIPP Site Release Consequence Analysis (WIPP EIS/ER 1978). To provide a mutual benchmark check of the radionuclide and ground-water transport models of these two programs, ONWI has requested WISAP to perform a release consequence analysis based on the WIPP site, utilizing the same data and conceptual model which the WIPP program used for its environmental assessments. Therefore, only a portion of the WISAP methodology was used; specifically, only WISAP geotransport models were exercised. The other important parts of WISAP assessment methodology were not used, so that WISAP did not develop the scenario nor did WISAP interpret the field data to develop the conceptual model of the geohydrology of the WIPP site. The results of the comparative assessment are presented. Although the different models required slightly different input parameters, the results of the hydrologic simulations show a very close correspondence between the WISAP and WIPP predictions. This was as expected, since the various hydrologic codes available essentially utilize and solve the same basic flow equations. In addition, this report presents the results of the WISAP radionuclide transport model simulations. These results will provide the basis for comparison with WIPP results when these become available.

1744 (PNL--3139) STATUS OF SORPTION INFORMATION RETRIEVAL SYSTEM. Hostetler, D.D.; Serne, R.J.; Brandstetter, A. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Sep 1979. Contract EY-76-C-06-1830. 64p. Dep. NTIS, PC A04/MF A01.

A Sorption Information Retrieval System (SIRS) is being designed to provide an efficient, computerized, data base for information on radionuclide sorption in geologic media. The data bank will include Kd values for a large number of radionuclides occurring in radioactive wastes originating from the commercial nuclear power industry. Kd values determined to date span several groundwater compositions and a wide variety of rock types and minerals. The data system will not only include Kd values, but also background information on the experiments themselves. This will allow the potential user to retrieve not only the Kd values of interest but also sufficient information to evaluate the accuracy and usefulness of the data. During FY-1979, the logic structure of the system was designed, the software programmed, the data categories selected, and the data format specified. About 40% of the approximately 5000 Kd experiments performed by the Waste Isolation Safety Assessment Program (WISAP) and its subcontractors during FY-1977 and FY-1978 have been evaluated, coded and keypunched. Additional software improvements and system testing are needed before the system will be fully operational. A workshop requested by the NEA was held to discuss potential internatioal participation in the data system.

1745 (PNL--3160-3) VARIABLE THICKNESS TRANSIENT GROUND-WATER FLOW MODEL. VOLUME 3. PROGRAM LISTINGS. Reisenauer, A.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Dec 1979. Contract EY-76-C-06-1830. 236p. Dep. NTIS, PC A11/MF A01.

The Assessment of Effectiveness of Geologic Isolation Systems (AEGIS) Program is developing and applying the methodology for assessing the far-field, long-term post-closure safety of deep geologic nuclear waste repositories. AEGIS is being performed by Pacific Northwest Laboratory (PNL) under contract with the Office of Nuclear Waste Isolation (ONWI) for the Department of Energy (DOE). One task within AEGIS is the development of methodology for analysis of the consequences (water pathway) from loss of repository containment as defined by various release scenarios. Analysis of the long-term, far-field consequences of release scenarios requires the application of numerical codes which simulate the hydrologic systems, model the transport of released radionuclides through the hydrologic systems to the biosphere, and, where applicable, assess the radiological dose to humans. Hydrologic and transport models are available at several levels of complexity or sophistication. Model selection and use are determined by the quantity and quality of input data. Model development under AEGIS and related programs provides three levels of hydrologic models, two levels of transport models, and one level of dose models (with several separate models). This is the third of 3 volumes of the description of the VTT (Variable Thickness Transient) Groundwater Hydrologic Model - second level (intermediate complexity) two-dimensional saturated groundwater flow.

1746 (PNL--3161-1) ASSESSMENT OF EFFECTIVENESS OF GEOLOGIC ISOLATION SYSTEMS. CIRMIS DATA SYSTEM. VOLUME 1. INITIALIZATION, OPERATION, AND DOCUMENTATION. Friedrichs, D.R. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jan 1980. Contract EY-76-C-06-1830. 164p. Dep. NTIS, PC A08/MF A01.

The Assessment of Effectiveness of Geologic Isolation Systems (AEGIS) Program is developing and applying the methodology for assessing the far-field, long-term post-closure safety of deep geologic nuclear waste repositories. AEGIS is being performed by Pacific Northwest Laboratory (PNL) under contract with the Office of Nuclear Waste Isolation (ONWI) for the Department of Energy (DOE). One task within AEGIS is the development of methodology for analysis of the consequences (water pathway) from loss of repository containment as defined by various release scenarios. The various input parameters required in the analysis are compiled in data systems. The data are organized and prepared by various input subroutines for use by the hydrologic and transport codes. The hydrologic models simulate the groundwater flow systems and provide water flow directions, rates, and velocities as inputs to the transport models. Outputs from the transport models are basically graphs of radionuclide concentration in the groundwater plotted against time. After dilution in the receiving surface-water body (e.g., lake, river, bay), these data are the input source terms for the dose models, if dose assessments are required. The dose models calculate radiation dose to individuals and populations. CIRMIS (Comprehensive Information Retrieval and Model Input Sequence) Data System, a storage and retrieval system for model input and output data, including graphical interpretation and display is described. This is the first of four volumes of the description of the CIRMIS Data System.

1747 (PNL--3161-2) CIRMIS DATA SYSTEM. VOLUME 2. PROGRAM LISTINGS. Friedrichs, D.R. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jan 1980. Contract EY-76-C-06-1830. 291p. Dep. NTIS, PC A13/MF A01.

The Assessment of Effectiveness of Geologic Isolation Systems (AEGIS) Program is developing and applying the methodology for assessing the far-field, long-term post-closure safety of deep geologic nuclear waste repositories. AEGIS is being performed by Pacific Northwest Laboratory (PNL) under contract with the Office of Nuclear Waste Isolation (OWNI) for the Department of Energy (DOE). 1750 (PNL--3162) PATHS GROUNDWATER HYDROLOGIC MODEL. Nelson, R.W.; Schur, J.A. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Apr 1980. Contract AC06-76RL01830. 156p. NTIS, PC $10.50/MF $3.50.

A preliminary evaluation capability for two-dimensional groundwater pollution problems was developed as part of the Transport Modeling Task for the Waste Isolation Safety Assessment Program (WISAP). Our approach was to use the data limitations as a guide in setting the level of modeling detail. PATHS Groundwater Hydrologic Model is the first level (simplest) idealized hybrid analytical/numerical model for two-dimensional, saturated groundwater flow and single component transport; homogeneous geology. This document consists of the description of the PATHS groundwater hydrologic model. The preliminary evaluation capability

prepared for WISAP, including the enhancements that were made because of the authors' experience using the earlier capability is described. Appendixes A through D supplement the report as follows: complete derivations of the background equations are provided in Appendix A. Appendix B is a comprehensive set of instructions for users of PATHS. It is written for users who have little or no experience with computers. Appendix C is for the programmer. It contains information on how input parameters are passed between programs in the system. It also contains program listings and test case listing. Appendix D is a definition of terms.

1751 (PNL--3173) STATUS REPORT ON LWR SPENT FUEL IAEA LEACH TESTS. Katayama, Y.B.; Bradley, D.J.; Harvey, C.O. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Mar 1980. Contract EY-76-C-06-1830. 59p. NTIS, PC A04/MF A01.

Spent light-water-reactor (LWR) fuel with an average burnup of 28,000 MWd/MTU was leach-tested at 25°C using a modified version of the International Atomic Energy Agency procedure. Leach rates were determined from tests conducted in five different solutions: deionized water, sodium chloride (NaCl), sodium bicarbonate ($NaHCO_3$), calcium chloride ($CaCl_2$) and Waste Isolation Pilot Plant B brine solutions. Elemental leach rates are reported based on the release of ^{90}Sr + ^{90}Y, ^{106}Ru, ^{137}Cs, ^{144}Ce, ^{154}Eu, /sup 239 + 240/Pu, ^{244}Cm and total uranium. After 467 days of cumulative leaching, the elemental leach rates are highest in deionized water. The elemental leach rates uin the different solutions generally decreased from deionized water to the 0.03M NaCl solution to the WIPP B brine solution to the 0.03M $NaHCO_3$ solution and was a factor of 20 lower in 0.015M $CaCl_2$ solution than in deionized water. The leach rates of spent fuel and borosilicate waste-glass were also compared. In sodium bicarbonate solution, the leach rates of the two waste forms were nearly equal, but the glass was increasingly more resistant than spent fuel in calcium chloride solution, followed by sodium chloride solution, WIPP B brine solution and deionized water. In deionized water the glass, based on the elemental release of plutonium and curium, was 50 to 400 times more leach resistant than spent fuel.

1752 (PNL--3179) MULTICOMPONENT MASS TRANSPORT MODEL: A MODEL FOR SIMULATING MIGRATION OF RADIONUCLIDES IN GROUND WATER. Washburn, J.F.; Kaszeta, F.E.; Simmons, C.S.; Cole, C.R. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jul 1980. Contract AC06-76RL01830. 120p. NTIS, PC A06/MF A01.

This report presents the results of the development of a one-dimensional radionuclide transport code, MMT2D (Multicomponent Mass Transport), for the AEGIS Program. Multicomponent Mass Transport is a numerical solution technique that uses the discrete-parcel-random-wald (DPRW) method to directly simulate the migration of radionuclides. MMT1D accounts for: convection;dispersion; sorption-desorption; first-order radioactive decay; and n-membered radioactive decay chains. Comparisons between MMT1D and an analytical solution for a similar problem show that: MMT1D agrees very closely with the analytical solution; MMT1D has no cumulative numerical dispersion like that associated with solution techniques such as finite differences and finite elements; for current AEGIS applications, relatively few parcels are required to produce adequate results; and the power of MMT1D is the flexibility of the code in being able to handle complex problems for which analytical solution cannot be obtained. Multicomponent Mass Transport (MMT1D) codes were developed at Pacific Northwest Laboratory to predict the movement of radiocontaminants in the saturated and unsaturated sediments of the Hanford Site. All MMT models require ground-water flow patterns that have been previously generated by a hydrologic model. This report documents the computer code and operating procedures of a third generation of the MMT series: the MMT differs from previous versions by simulating the mass transport processes in systems with radionuclide decay chains. Although MMT is a one-dimensional code, the user is referred to the documentation of the theoretical and numerical procedures of the three-dimensional MMT-DPRW code for discussion of expediency, verification, and error-sensitivity analysis.

1753 (PNL--3226) FIELD TEST FACILITY FOR MONITORING WATER/RADIONUCLIDE TRANSPORT THROUGH PARTIALLY SATURATED GEOLOGIC MEDIA: DESIGN, CONSTRUCTION, AND PRELIMINARY DESCRIPTION. Phillips, S.J.; Campbell, A.C.; Campbell, M.D.; Gee, G.W.; Hoober, H.H.; Schwarzmiller, K.O. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Nov 1979. Contract EY-76-C-06-1830. 52p. Dep. NTIS, PC A04/MF A01.

Shallow land burial has been a common practice for disposing radioactive waste materials since the beginning of plutonium production operations. Accurate monitoring of radionuclide transport and factors causing transport within the burial sites is essential to minimizing risks associated with disposal. However, monitoring has not always been adequate. Consequently, the Department of Energy (DOE) has begun a program aimed at better assuring and evaluating containment of radioactive wastes at shallow land burial sites. This program includes a technological base for monitoring transport. As part of the DOE program, Pacific Northwest Laboratory (PNL) is developing geohydrologic monitoring systems to evaluate burial sites located in arid regions. For this project, a field test facility was designed and constructed to assess monitoring systems for near-surface disposal of radioactive waste and to provide information for evaluating site containment performance. The facility is an integrated network of monitoring devices and data collection instruments. This facility is used to measure water and radionuclide migration under field conditions typical of arid regions. Monitoring systems were developed to allow for measurement of both mass and energy balance. Work on the facility is ongoing. Continuing work includes emplacement of prototype monitoring instruments, data collection, and data synthesis. At least 2 years of field data are needed to fully evaluate monitoring information.

1754 (PNL--3226(App.1)) FIELD TEST FACILITY FOR MONITORING WATER/RADIONUCLIDE TRANSPORT THROUGH PARTIALLY SATURATED GEOLOGIC MEDIA: DESIGN, CONSTRUCTION, AND PRELIMINARY DESCRIPTION. APPENDIX I. ENGINEERING DRAWINGS. Phillips, S.J.; Campbell, A.C.; Campbell, M.D.; Gee, G.W.; Hoober, H.H.; Schwarzmiller, K.O. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Nov 1979. Contract EY-76-C-06-1830. 20p. Dep. NTIS, PC A02/MF A01.

The engineering plans for a test facility to monitor radionuclide transport in water through partially saturated geological media are included. Drawings for the experimental set-up

excavation plan and details, lysimeter, pad, access caisson, and caisson details are presented. (DC)

1755 (PNL--3227) GEOPHYSICAL SURVEYS FOR BURIED WASTE DETECTION AT THE IDAHO NATIONAL ENGINEERING LABORATORY. Sandness, G.A.; Rising, J.L.; Kimbrough, J.R. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Dec 1979. Contract EY-76-C-06-1830. 77p. Dep. NTIS, PC A05/MF A01.

This report describes a series of geophysical surveys performed at the Idaho National Engineering Laboratory (INEL). The main purpose of the surveys was to evaluate techniques, principally ground-penetrating radar, for detecting and mapping radioactive wastes buried in shallow trenches and pits. A second purpose was to determine the feasibility of using ground-penetrating radar to measure the depth of basalt bedrock. A prototype geophyscal survey system developed by the US Department of Energy's Pacific Northwest Laboratory was used for this study. Radar, magnetometer, and metal detector measurements were made at three sites in the Radioactive Waste Management Complex (RWMC) at INEL. Radar measurements were made at fourth site adjacent to the RWMC. The combination of three geophysical methods was shown to provide considerable information about the distribution of buried waste materials. The tests confirmed the potential effectiveness of the radar method, but they also pointed out the need for continued research and development in ground-penetrating radar technology. The radar system tested in this study appears to be capable of measuring the depth to basalt in the vicinity of the RWMC.

1756 (PNL--3318) MATERIALS CHARACTERIZATION CENTER WORKSHOP ON LEACHING OF RADIOACTIVE WASTE FORMS. SUMMARY REPORT. Ross, W.A.; Strachan, D.M.; Turcotte, R.P.; Westsik, J.H. Jr. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Apr 1980. Contract EY-76-C-06-1830. 104p. Dep. NTIS, PC A06/MF A01.

At the first Materials Characterization Center (MCC) workshop, on the leaching of radioactive waste forms, there was general agreement that, after certain revisions, the proposed leach test plan set forth by the MCC can be expected to meet most of the nuclear waste community's waste form durability data requirements. The revisions give a clearer definition of the purposes of each test and the end uses of the data. As a result of the workshop, the format of the test program has been recast to clarify the purposes, limitations, and interrelationships of the individual tests. There was also a recognition that the leach test program must be based on an understanding of the mechanistic principles of leaching, and that further study is needed to ensure that the approved data from the MCC leach tests will be compatible with mechanistic research needs. It was agreed that another meeting of the participants in Working Groups 3 and 4, and perhaps some other experts, should be held as soon as possible to focus just on the definition of leach test requirements for mechanistic research. The MCC plans to hold this meeting in April 1980. Many of the tests that will lead to increased understanding of mechanisms will of necessity be long-term tests, sometimes lasting for several years. But the MCC also faces pressing needs to produce approved data that can be used for the comparison of waste forms in the relative near-term, i.e., in the next 1 to 3 yr. Therefore, it was decided to initiate a round-robin test of the MCC short-term static leach procedure as soon as practicable. The MCC has tentative plans for organization of the round robin in May 1980.

1757 (PNL--3326) LEACH TEST METHODOLOGY FOR THE WASTE/ROCK INTERACTIONS TECHNOLOGY PROGRAM. Bradley, D.J.; McVay, G.L.; Coles, D.G. (Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1980. Contract AC06-76RL01830. 49p. NTIS, PC A03/MF A01.

Experimental leach studies in the WRIT Program have two primary functions. The first is to determine radionuclide release from waste forms in laboratory environments which attempt to simulate repository conditions. The second is to elucidate leach mechanisms which can ultimately be incorporated into nearfield transport models. The tests have been utilized to generate rates of removal of elements from various waste forms and to provide specimens for surface analysis. Correlation between constituents released to the solution and corresponding solid state profiles is invaluable in the development of a leach mechanism. Several tests methods are employed in our studies which simulate various proposed leach incident scenarios. Static tests include low temperature (below 100°C) and high temperature (above 100°C) hydrothermal tests. These tests reproduce nonflow or low-flow repository conditions and can be used to compare materials and leach solution effects. The dynamic tests include single-pass, continuous-flow(SPCF) and solution-change (IAA)-type tests in which the leach solutions are changed at specific time intervals. These tests simulate repository conditions of higher flow rates and can also be used to compare materials and leach solution effects under dynamic conditions. The modified IAEA test is somewhat simpler to use than the one-pass flow and gives adequate results for comparative purposes. The static leach test models the condition of near-zero flow in a repository and provides information on element readsorption and solubility limits. The SPCF test is used to study the effects of flowing solutions at velocities that may be anticipated for geologic groundwaters within breached repositories. These two testing methods, coupled with the use of autoclaves, constitute the current thrust of WRIT leach testing.

1758 (PNL--3333) SUMMARY OF NON-US NATIONAL AND INTERNATIONAL RADIOACTIVE WASTE MANAGEMENT PROGRAMS 1980. Harmon, K.M.; Kelman, J.A.; Stout, L.A.; Hsieh, K.A. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Mar 1980. Contract EY-76-C-06-1830. 110p. Dep. NTIS, PC A06/MF A01.

Many nations and international agencies are working to develop improved technology and industrial capability for nuclear fuel cycle and waste management operations. The effort in some countries is limited to research in university laboratories on treating low-level waste from reactor plant operations. In other countries, national nuclear research institutes are engaged in major programs in all phases of the fuel cycle and waste management, and there is a national effort to commercialize fuel cycle operations. Since late 1976, staff members of Pacific Northwest Laboratory have been working under US Department of Energy sponsorship to assemble and consolidate openly available information on foreign and international nuclear waste management programs and technology. This report summarizes the information collected on the status of fuel cycle and waste management programs in selected countries making major efforts in these fields

as of the end of January 1980.

1759 (PNL--3349) METHODS FOR DETERMINING RADIONUCLIDE RETARDATION FACTORS: STATUS REPORT. Relyea, J.F.; Serne, R.J.; Rai, D. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Apr 1980. Contract AC06-76RL01830. 65p. NTIS, PC A04/MF A01.

This report identifies a number of mechanisms that retard radionuclide migration, and describes the static and dynamic methods that are used to study such retardation phenomena. Both static and dynamic methods are needed for reliable safety assessments of underground nuclear-waste repositories. This report also evaluates the extent to which the two methods may be used to diagnose radionuclide migration through various types of geologic media, among them unconsolidated, crushed, intact, and fractured rocks. Adsorption is one mechanism that can control radionuclide concentrations in solution and therefore impede radionuclide migration. Other mechanisms that control a solution's radionuclide concentration and radionuclide migration are precipitation of hydroxides and oxides, oxidation-reduction reactions, and the formation of minerals that might include the radionuclide as a structural element. The retardation mechanisms mentioned above are controlled by such factors as surface area, cation exchange capacity, solution pH, chemical composition of the rock and of the solution, oxidation-reduction potential, and radionuclide concentration. Rocks and ground waters used in determining retardation factors should represent the expected equilibrium conditions in the geologic system under investigation. Static test methods can be used to rapidly screen the effects of the factors mentioned above. Dynamic (or column) testing, is needed to assess the effects of hydrodynamics and the interaction of hydrodynamics with the other important parameters. This paper proposes both a standard method for conducting batch Kd determinations, and a standard format for organizing and reporting data. Dynamic testing methods are not presently developed to the point that a standard methodology can be proposed. Normal procedures are outlined for column experimentation and the data that are needed to analyze a column experiment are identified.

1760 (PNL--3398) ASSESSMENT OF EFFECTIVENESS OF GEOLOGIC ISOLATION SYSTEMS: A SHORT DESCRIPTION OF THE AEGIS APPROACH. Silviera, D.J.; Harwell, M.A.; Napier, B.A.; Zellmer, J.T.; Benson, G.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Sep 1980. Contract AC06-76RL01830. 59p. NTIS, PC A04/MF A01.

To meet licensing criteria and protection standards for HLW disposal, research programs are in progress to determine acceptable waste forms, canisters, backfill materials for the repository, and geological formations. Methods must be developed to evaluate the effectiveness of the total system. To meet this need, methods are being developed to assess the long-term effectiveness of isolating nuclear wastes in geologic formations. This work was started in 1976 in the Waste Isolation Safety Assessment Program (WISAP) and continues in the Assessment of Effectiveness of Geologic Isolation Systems (AEGIS) Program. The evaluation of this long-term effectiveness involves a number of distinct steps. AEGIS currently has the methods for performing these evaluation steps. These methods are continuously being improved to meet the increasing level of sophistication which will be required. AEGIS develops a conceptual description of the geologic systems and uses computer models to simulate the existing groundwater pathways. AEGIS also uses a team of consulting experts, with the assistance of a computer model of the geologic processes, to develop and evaluate plausible release scenarios. Then other AEGIS computer models are used to simulate the transport of radionuclides to the surface and the resultant radiation doses to individuals and populations. (DLC)

1761 (PNL--3484) INVESTIGATION OF METALLIC, CERAMIC, AND POLYMERIC MATERIALS FOR ENGINEERED BARRIER APPLICATIONS IN NUCLEAR-WASTE PACKAGES. Westerman, R.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Oct 1980. Contract AC06-76RL01830. 119p. NTIS, PC A06/MF A01.

An effort to develop licensable engineered barrier systems for the long-term (about 1000 yr) containment of nuclear wastes under conditions of deep continental geologic disposal has been underway at Pacific Northwest Laboratory since January 1979, under the auspices of the High-Level Waste Immobilization Program. In the present work, the barrier system comprises the hard or structural elements of the package: the canister, the overpack(s), and the hole sleeve. A number of candidate metallic, ceramic, and polymeric materials were put through mechanical, corrosion, and leaching screening tests to determine their potential usefulness in barrier-system applications. Materials demonstrating adequate properties in the screening tests will be subjected to more detailed property tests, and, eventually, cost/benefit analyses, to determine their ultimate applicability to barrier-system design concepts. The following materials were investigated: two titanium alloys of Grade 2 and Grade 12; 300 and 400 series stainless steels, Inconels, Hastelloy C-276, titanium, Zircoloy, copper-nickel alloys and cast irons; total of 14 ceramic materials, including two grades of alumina, plus graphite and basalt; and polymers such as polyamide-imide, polyarylene, polyimide, polyolefin, polyphenylene sulfide, polysulfone, fluoropolymer, epoxy, furan, silicone, and ethylene-propylene terpolymer (EPDM) rubber. The most promising candidates for further study and potential use in engineered barrier systems were found to be rubber, filled polyphenylene sulfide, fluoropolymer, and furan derivatives.

1762 (PNL-SA--6698) KRYPTON ENTRAPMENT IN PULSE BIASED SPUTTER-DEPOSITED METALS. Bayne, M.A.; Moss, R.W.; McClanahan, E.D. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1978. Contract EY-76-C-06-1830. 27p. (CONF-780430--7). Dep. NTIS, PC A03/MF A01.

From Conference on metallurgical coatings; San Francisco, CA, USA (3 Apr 1978).

A supported gas discharge sputtering system was constructed to investigate krypton entrapment in high-rate sputter-deposited thick films. Krypton entrapment was studied as a function of substrate and target voltage for nickel, aluminum, titanium and iron deposits. Control of substrate and target voltages was achieved with pulse circuits capable of adjusting the pulse duration and repetition rate. A water-cooled cylindrical copper substrate 15 cm in diameter was used to collect the sputtered metal from a 9-cm diameter cylindrical target. To observe the immediate effect of changes in sputtering parameters on gas trapping, as well as measure the total gas trapped, a sensitive mass flow indicator was installed in the krypton supply of the dynamically pumped system. Data relating krypton content to substrate bias conditions

and deposition rate are discussed in light of the theory of Carter, Colligon and Leck on ion absorption in the presence of sputtering. Krypton contents > 2 at.% were found in the metals studied, all of which were deposited at rates exceeding 1 nm/sec. Computed krypton concentrations agreed with concentrations in samples that were analyzed chemically.

1763 (PNL-SA--7184) METHODOLOGY FOR ASSESSING THE LONG-TERM SAFETY OF RADIOACTIVE WASTE STORAGE IN GEOLOGIC FORMATIONS. Brandstetter, A. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Sep 1978. Contract EY-76-C-06-1830. 4p. (CONF-7809198--1). Dep. NTIS, PC A02/MF A01.

From Meeting on migration of radionuclides in crystalline rocks; Studsvik, Sweden (11 Sep 1978).

The development of the safety assessment methodology currently consists of four major tasks: release scenario analysis, waste release studies, release consequence analysis, and radionuclide sorption studies. Each of these tasks and plans for each are discussed. International cooperation on these tasks is urged. (DLC)

1764 (PNL-SA--7197) WORKSHOP ON POTENTIALLY DISRUPTIVE PHENOMENA FOR NUCLEAR WASTE REPOSITORIES, JULY 27-28, 1977. Jacobson, J.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1977. Contract EY-76-C-06-1830. 37p. Dep. NTIS, PC A03/MF A01.

The workshop on Potentially Disruptive Phenomena for Nuclear Waste Repositories brought together experts in the geosciences to identify and evaluate potentially disruptive events and processes and to contribute ideas on how to extrapolate data from the past into the next one million years. The analysis is to be used to model a repository in geologic media for long-term safety assessments of nuclear waste storage. The workshop included invited presentations on the following items: an overview of the Waste Isolation Safety Assessment Program (WISAP), simulation techniques, subjective probabilities and methodology of obtaining data, similar modeling efforts at Lawrence Livermore and Sandia Laboratories, and geologic processes or events.

1765 (PNL-SA--7243) WASTE ISOLATION SAFETY ASSESSMENT PROGRAM. Brandstetter, A.; Harwell, M.A. . (Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1979. Contract EY-76-C-06-1830. 15p. (IAEA-SM--243/35; CONF-790711--4). Dep. NTIS, PC A02/MF A01.

From International symposium on underground disposal of radioactive wastes; Otaniemi, Finland (2 Jul 1979).

Associated with commercial nuclear power production in the United States is the generation of potentially hazardous radioactive wastes. The Department of Energy (DOE), through the National Waste Terminal Storage (NWTS) Program, is seeking to develop nuclear waste isolation systems in geologic formations that will preclude contact with the biosphere of waste radionuclides in concentrations which are sufficient to cause deleterious impact on humans or their environments. Comprehensive analyses of specific isolation systems are needed to assess the expectations of meeting that objective. The Waste Isolation Safety Assessment Program (WISAP) has been established at the Pacific Northwest Laboratory (operated by Battelle Memorial Institute) for developing the capability of making those analyses. Among the analyses required for isolation system evaluation is the detailed assessment of the post-closure performance of nuclear waste repositories in geologic formations. This assessment is essential, since it is concerned with aspects of the nuclear power program which previously have not been addressed. Specifically, the nature of the isolation systems (e.g., involving breach scenarios and transport through the geosphere), and the time-scales necessary for isolation, dictate the development, demonstration and application of novel assessment capabilities. The assessment methodology needs to be thorough, flexible, objective, and scientifically defensible. Further, the data utilized must be accurate, documented, reproducible, and based on sound scientific principles.

1766 (PNL-SA--7352(Vol.1), pp 231-329) SYSTEMATIC STUDY OF METAL ION SORPTION ON SELECTED GEOLOGIC MEDIA. SESQUIANNUAL REPORT, APRIL 1977-SEPTEMBER 1978. Meyer, R.E. (comp.). (Oak Ridge National Lab., TN). 1978.

From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).

Results of the first year and a half of a research program on equilibria of inorganic ions between selected minerals and aqueous solutions covering a wide range of composition are summarized. The work is motivated by needs of information for enhanced oil recovery and isolation of nuclear waste, as well as by interest in the fundamental chemistry. A method using an axial filter configuration was adapted to these adsorbents. A technique of supporting clay on filteraid (diatomaceous earth) of low adsorptive properties was developed to allow measurements with columns of dispersible adsorbents, such as montmorillonite. These approaches, which are advantageous under some conditions, were shown to give distribution coefficients (D; adsorbate per weight of clay/adsorbate concentration in equilibrium solution) concordant with values obtained by batch equilibrations. Equilibria of non-hydrolyzed, non-complexed cations and clays were found to be in accord with ion-exchange predictions to a good approximation over a wide range of conditions. As expected on this basis, distribution coefficients of ions present in low concentration declined rapidly as salinity increased. Values of D for many ions at trace levels were the same as at moderate fractional loadings of the ion-exchange capacity. Exceptions were alkali metal ions on the calcium form of montmorillonite, for which decreases of D with loading were found to occur at unexpectedly low loadings, and the dependence of D's of rare earth and actinide (III) ions on salinity, for which a minimum or levelling was found at moderate ionic strength. Adsorption of Cs(I) and Sr(II) on rock samples were much lower from solutions of high salinity than from solutions of low salinity; D-values of Pu, present in unknown species, were erratic.

1767 (PNL-SA--7352(Vol.1)) PROCEEDINGS OF THE TASK 4 WASTE ISOLATION SAFETY ASSESSMENT PROGRAM SECOND CONTRACTOR INFORMATION MEETING. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1978. Contract EY-76-C-06-1830. 522p. (CONF-7810227--(Vol.1)). Dep. NTIS, PC A22/MF A01.

From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).

Volume 1 contains the following papers: Solution Species of ^{239}Pu in Oxidizing Environments; Solution Species of ^{239}Pu in the Environment; Theoretical and Experimental Evaluation of Waste Transport in Selected Rocks;

Studies of Radionuclide Availability and Migration at the Nevada Test Site Relevant to Radioactive Waste Disposal; Systematic Study of Metal Ion Sorption on Selected Geologic Media; Chromatographic K/sub d/ values of Radionuclides; Effects of Redox Potentials on Sorption of Radionuclides by Geologic Media; and Transport Properties of Nuclear Waste in Geologic Media. Individual papers were processed.

1768 (PNL-SA--7352(Vol.1), pp 97-185)
THEORETICAL AND EXPERIMENTAL EVALUATION OF WASTE TRANSPORT IN SELECTED ROCKS. Silva, R.J.; Benson, L.V.; Apps, J.A. (Univ. of California, Berkeley). 1978.
From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).
The experimental results obtained in FY 1978 in the study of rock interaction with U, Np, Pu, Am, and Cm are discussed, as well as the progress in the development and application of mass transfer codes to simulate groundwater conditions in low permeability rocks. Basalt, granite, and shale were used in the study.

1769 (PNL-SA--7352(Vol.1), pp 187-230)
STUDIES OF RADIONUCLIDE AVAILABILITY AND MIGRATION AT THE NEVADA TEST SITE RELEVANT TO RADIOACTIVE WASTE DISPOSAL. Tewhey, J.D.; Weed, H.C.; Coles, D.G.; Ramspott, L.D.; MacLean, S.C. (Univ. of California Livermore). 1978.
From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).
The sorption distribution coefficient, K/sub d/, of a nuclide is defined as the concentration of a nuclide on a solid phase divided by its concentration in the liquid phase subsequent to equilibrium being attained. In the case of batch K/sub d/ measurements done in the laboratory, it is difficult to ascertain the extent of equilibration, and experiments may not reflect true K/sub d/ values. Kurt Wolfsberg of Los Alamos Scientific Laboratory has referred to laboratory K/sub d/ measurements as distribution ratios or R/sub d/'s. An R/sub d/ is obtained in the same manner as a K/sub d/ but does not imply equilibrium. The term R/sub d/ is used in this study. The results from the batch R/sub d/ studies are listed in tabular form. The standard deviation of the counting data for each R/sub d/ is given. The R/sub d/ values can be arranged according to the following inequalities: Pu > Cs, except for biotite; Cs > Sr, except for limestone; and Sr > Tc. The exceptions are considered significant for Pu vs Cs on biotite, but not for Cs vs Sr on limestone. The low R/sub d/ values for Tc indicate that within the limits of measurement it is not sorbed under the experimental conditions in this study. One possible cause for the negative values is preferential sorption of the sample on the walls of the sample container, so that the sample container sorbs less Tc than the blank container does.

1770 (PNL-SA--7352(Vol.1), pp 405-508)
TRANSPORT PROPERTIES OF NUCLEAR WASTES IN GEOLOGIC MEDIA. ANNUAL REPORT, OCTOBER 1, 1977-SEPTEMBER 30, 1978. Seitz, M.G.; Rickert, P.G.; Fried, S.M.; Friedman, A.M.; Steindler, M.J. (Argonne National Lab., IL). 1978.
From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).
Laboratory experiments were performed with nuclides of strontium, tin, cesium, plutonium, and americium to determine their migration characteristics in rocks from formations that may be suitable for geologic repositories for nuclear waste. Infiltration experiments have been performed at high pressures and at different solution flows, using columns of massive porous rock, porous beds of granulated minerals, or impermeable rock having fissures. Experimental results obtained this year confirm results obtained in the previous year - that nuclides migrating by fluid flow in rock often exhibit complex behavior (bleeding, dispersion of nuclide velocities, etc.) not predicted by simple chromatographic-type models. Experimental results this year, obtained using two radically different geologic media (mineral sand and rock fissures), were in agreement with a migration model which considers the kinetics of nuclides reacting with the solution and geologic media.

1771 (PNL-SA--7352(Vol.1), pp 59-68)
SOLUTION SPECIES OF ^{239}PU IN OXIDIZING ENVIRONMENTS: I. POLYMERIC PU(IV). Rai, D.; Serne, R.J. (Battelle Pacific Northwest Labs., Richland, WA). 1978.
From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).
The uncertainties regarding the presence of Pu(IV) polymer in environmental studies is a source of error in evaluation of adsorption and in estimation of Pu migration rates. Our data suggest that Pu(IV) polymer is similar to $Pu(OH)_4$ in its solubility and that the presence of the polymer may be predicted from pH and total Pu in solution.

1772 (PNL-SA--7352(Vol.1), pp 69-95)
SOLUTION SPECIES OF ^{239}PU [V] IN THE ENVIRONMENT. Rai, D.; Serne, R.J.; Swanson, J.L. (Battelle Pacific Northwest Labs., Richland, WA). 1978.
From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).
Information regarding the oxidation states of Pu in environmental samples is needed for estimating its migration through the geologic media. Thermodynamic data were used to develop stability fields for different Pu species. The data indicate that in the Eh-pH range of natural aqueous environments, the dominant species of Pu is likely to be Pu[V] in relatively oxidizing environments and Pu[III] in reducing environments. Because of the lack of methods of determining Pu[V] in environmental samples containing trace concentrations of Pu, Pu[V] has not been previously identified in these samples. Plutonium [VI] is generally assumed to be the dominant species in relatively oxidizing environments. However, a combination of solvent extraction and spectrophotometric techniques used in this study show that solutions (> 10^{-5} M Pu) in equilibrium with ^{239}Pu[IV] hydroxide contain Pu[V], which is in agreement with the thermodynamic predictions. Although this method could not be used conclusively with the remaining solutions (< 10^{-5} M Pu) contacting ^{239}Pu[IV] hydroxide and $^{239}PuO_2$, the solvent extraction and Eh-pH results are similar for all the samples suggesting the strong possibility that all samples contain Pu[V]. Thus the possibility, ignored in the past, that Pu[V] may be the dominant species in relatively oxidizing environments should be considered.

1773 (PNL-SA--7352(Vol.2)) PROCEEDINGS OF THE TASK 4 WASTE ISOLATION SAFETY ASSESSMENT PROGRAM SECOND CONTRACTOR INFORMATION MEETING. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1978. Contract EY-76-C-06-1830. 494p. (CONF-7810227--(Vol.2)). Dep. NTIS, PC A21/MF A01.

From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).
Volume II contains the following papers: Laboratory Studies of Radionuclide Distributions between Selected Groundwaters and Geologic Media; Applicability of Microautoradiography to Sorption Studies; The Kinetics and Reversibility of Radionuclide Sorption Reactions with Rocks; Mobility and Sorption Processes of Radioactive Waste Materials in Subsurface Migration; Batch K/sub d/ Experiments with Common Minerals and Representative Groundwaters; Cesium and Strontium Migration in Unconsolidated Geologic Material; Statistical Investigation of the Mechanics Controlling Radionuclide Sorption; The ARDISC Model - A Computer Program to Calculate the Distribution of Trace Element Migration in Partially-Equilibrating Media; and Some Geochemical Aspects of the Canadian Nuclear Waste Disposal System. Individual papers were processed.

1774 (PNL-SA--7352(Vol.2), pp 161-218)
KINETICS AND REVERSIBILITY OF RADIONUCLIDE SORPTION REACTIONS WITH ROCKS. PROGRESS REPORT FOR FISCAL YEAR 1978. Barney, G.S.; Anderson, P.D. (Rockwell International, Richland, WA). 1978.
From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).
Sorption reactions of environmentally significant radionuclides with rocks from proposed waste repository sites were examined. The kinetics and reversibility of sorption were studied by measuring the distribution of radioactive tracers between synthetic groundwaters and crushed basalt, granite, and argillite in batch experiments. The initial rapid sorption reaction is followed by a slow reaction which results from changes in the composition of the rock surface and bulk solution. Equilibrium concentrations of radionuclides were not reached even after 91 days. Dissolution of some rock components is also incomplete after this time. A relatively large amount of silica is dissolved in groundwaters contacted with basalt due to dissolution of the glassy phase of the basalt sample. This silica appears to increase the solubility of plutonium and americium. Artificially weathering basalt greatly increases the sorption capacity for each of the radionuclides studied. Weathering of granite had no observable effect on sorption. However, weathered argillite sorbs cesium, plutonium, and americium more strongly than unweathered argillite. Several irreversible sorption reactions were identified. Cesium is irreversibly sorbed on granite and ruthenium is irreversibly sorbed on basalt, granite, and argillite. Strontium and neptunium sorption are reversible for each rock type.

1775 (PNL-SA--7352(Vol.2), pp 219-258)
MOBILITY AND SORPTION PROCESSES OF RADIOACTIVE WASTE MATERIALS IN SUBSURFACE MIGRATION. Eichholz, G.G.; Wahlig, B.G. (Georgia Inst. of Tech., Atlanta). 1978.
From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).
The present work has been directed to the study of two related phenomena: the movement of submicron particles of a type expected near disposal sites through aquifers of appropriate characteristics, and the sorption processes associated with the uptake of waste ions in trace concentrations on submicron particles and the measurement of subsequent partition coefficients leading to competitive transfer from the particles to surrounding media. Because of the late date of finalization of the research contract and, hence, the limited manpower devoted to this project until recently, the results obtained so far are largely preliminary in nature. Work done has included some of the following: setting up of two types of columns with detector systems; determination of sensitivity and spatial resolution of the collimated GM and scintillation detectors; preparation of suspensions of kaolin particles; measurement of particulate movements through the bed with neutron-activated particles; determination of the Pu-237 γ-ray spectrum; and planning of the next phases of the work, using several columns and a larger research group. The results obtained so far illustrate the kind of differential movement between soluble tracers and active particulates that takes place in a permeable rock medium. It is hoped to obtain more definite results on the parameters concerned in the near future.

1776 (PNL-SA--7352(Vol.2), pp 259-332)
BATCH KD DETERMINATIONS WITH COMMON MINERALS AND REPRESENTATIVE GROUNDWATERS. Relyea, J.F.; Ames, L.L.; Serne, R.J.; Fulton, R.W.; Washburne, C.D. (Battelle Pacific Northwest Labs., Richland, WA). 1978.
From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).
Adsorption and desorption Kd's have been determined for seven elements (Pu, Am, I, Tc, Cs, Np, Sr) in tracer concentrations using four simulated groundwaters and twelve minerals (illite, kaolinite, montmorillonite, vermiculite, biotite, quartz, albite, anorthite, microcline, hornblende, enstatite, augite) in all their 336 combinations. System parameters have been measured in an attempt to characterize each system in as complete a manner as possible. The mineralogy and chemical composition of each mineral used have been determined (both before and after crushing bulk samples). Eh and pH have been measured for each system. The mineral-solution effluent is presently being analyzed using effluent from experiments without tracers. The data generated will be analyzed by Adaptronics to produce empirical equations for Kd's which will be used in models to predict nuclide migration in geologic media. Multiple oxidation state elements have been found to behave differently than single oxidation state elements in certain situations. Research beyond the scope of this study is required to determine the cause of this anomalous behavior (specifically: Tc, Np and Pu). To obtain an understanding of adsorption phenomenon under reducing conditions in geologic media, the batch Kd determinations just described will be carried out under anoxic and reducing conditions with the same nuclides, minerals and solutions.

1777 (PNL-SA--7352(Vol.2), pp 333-425)
STATISTICAL INVESTIGATION OF THE MECHANICS CONTROLLING RADIONUCLIDE SORPTION. PART II. FINAL TECHNICAL REPORT. Mucciardi, A.N.; Booker, I.J.; Orr, E.C.; Cleveland, D. (Adaptronics, Inc., McLean, VA). 1978.
From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).
The results in this report demonstrate the feasibility of modeling empirically the transport of radionuclides (sorption coefficient, K/sub d/) in several geologic media/groundwater solution environments. Nonlinear Adaptive Learning Network models were synthesized to predict adsorption and desorption K/sub d/'s for seven radionuclides as a function of 16 minerals and four groundwaters. The major results reported here are comparisons between the actual K/sub d/'s

and those predicted by the models, and a rank-ordering of the importance of the geologic medium/solution variables per nuclide K/sub d/ model.

1778 (PNL-SA--7352(Vol.2), pp 429-435) ARDISC MODEL: A COMPUTER PROGRAM TO CALCULATE DISTRIBUTION OF TRACE ELEMENT MIGRATION IN PARTIALLY-EQUILIBRATING MEDIA. Strickert, R. (Battelle Pacific Northwest Labs., Richland, WA). 1978.

From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).

The computer model used is similar to the standard mixing model, in which a one-dimensional box is divided into zones. Each zone can sorb a solute such that, at equilibrium, the distribution of the species between the surface of the zone and the volume of the solution is α/β, where α = the relative amount of species on the surface, and $\beta = 1 - \alpha$. Following this distribution, the solution from one zone is transferred to the next zone and another equilibrium distribution cycle can occur, and so on for additional cycles and zones. To incorporate a kinetic effect into this migrational model, the α/β distribution was modified.

1779 (PNL-SA--7352(Vol.2), pp 437-445) SOME GEOCHEMICAL ASPECTS OF THE CANADIAN NUCLEAR WASTE DISPOSAL PROGRAM. Vandergraaf, T. (Atomic Energy of Canada, Pinawa, Manitoba). 1978.

From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).

The Canadian disposal program concept calls for the disposal of radioactive wastes in a deep underground repository in an igneous intrusion (pluton) in the Canadian Precambrian Shield. The experiment program involves exploratory drilling and radionuclides adsorption studies. The main interest is in measuring surface adsorption coefficients for 20 radioactive elements on force rock types as a function of time, temperature, groundwater composition, and aging of the rock.

1780 (PNL-SA--7897) MATHEMATICAL SIMULATION FOR SAFETY ASSESSMENT OF NUCLEAR WASTE REPOSITORIES. Brandstetter, A.; Raymond, J.R.; Benson, G.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1979. Contract EY-76-C-06-1830. 24p. (CONF-790994--1). Dep. NTIS, PC A02/MF A01.

From 26. Pacific Northwest regional meeting of the American Geophysical Union; Bend, OR, USA (17 Sep 1979).

Mathematical models are being developed as part of the Waste Isolation Safety Assessment Program (WISAP) for assessing the post-closure safety of nuclear waste storage in geologic formations. The objective of this program is to develop the methods and data necessary to determine potential events that might disrupt the integrity of a waste repository and provide pathways for radionuclides to reach the bioshpere, primarily through groundwater transport. Four categories of mathematical models are being developed to assist in the analysis of potential release scenarios and consequences: (1) release scenario analysis models; (2) groundwater flow models; (3) contaminant transport models; and (4) radiation dose models. The development of the release scenario models is in a preliminary stage; the last three categories of models are fully operational. The release scenario models determine the bounds of potential future hydrogeologic changes, including potentially disruptive events. The groundwater flow and contaminant transport models compute the flowpaths, travel times, and concentrations of radionuclides that might migrate from a repository in the event of a breach and potentially reach the biosphere. The dose models compute the radiation doses to future populations. Reference site analyses are in progress to test the models for application to different geologies, including salt domes, bedded salt, and basalt.

1781 (PNL-SA--7953) NATURE OF GLASS LEACHING. McVay, G.L.; Buckwalter, C.Q. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jul 1979. Contract EY-76-C-06-1830. 40p. (CONF-7909102--2). Dep. NTIS, PC A03/MF A01.

From Argonne specialists' workshop on basic research needs for nuclear waste management; Argonne, IL, USA (5 Sep 1979).

Several models have been proposed in the literature to describe glass leaching behavior in aqueous solutions, but they are primarily applicable to relatively simple glasses. Their shortcoming is that they do not incorporate enough of the phenomena occurring during leaching. Leaching characteristics of a complex waste containment glass are discussed. Gamma irradiation increases the leach rates. Since bulk diffusion does not play a major role in leaching, the existing models are totally indequate for complex glasses. 4 figures, 3 tables. (DLC)

1782 (PNL-SA--7992) PROCEEDINGS OF THE TASK 2 WORKSHOP WASTE ISOLATION SAFETY ASSESSMENT PROGRAM. Bradley, D.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1979. Contract EY-76-C-06-1830. 234p. Dep. NTIS, PC A11/MF A01.

The reports from the workshop on waste form release rate analysis are presented. The workshop started with overview presentations on the Office of Nuclear Waste Isolation (ONWI), the Waste Isolation Safety Assessment Program (WISAP), WISAP Task 2 (Waste Form Release Rate Analysis), and WISAP Task 4 (Sorption/Desorption Analysis). Technical presentations followed in these areas: leaching studies on spent fuels, leaching studies on high-level waste glass, waste form surface science experiments, radiation effects, and leach modeling. Separate abstracts were prepared for each.

1783 (PNL-SA--7992, pp 1-10) OVERVIEW OF THE OFFICE OF NUCLEAR WASTE ISOLATION. Kircher, J.F. (Office of Nuclear Waste Isolation, Columbus, OH). 1979.

Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.

The role of the Office of Nuclear Waste Isolation (ONWI) is discussed. The 2 main goals are to identify and characterize geological sites for use as nuclear waste depositories and to manage the development and application of specific supporting data and base technologies. The specific means of carrying out these goals and an organizational chart are included.

1784 (PNL-SA--7992, pp 11-19) WASTE ISOLATION SAFETY ASSESSMENT PROGRAM. Brandstetter, A. (Battelle Pacific Northwest Lab., Richland, WA). 1979.

Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.

Associated with commercial nuclear power production in the United States is the generation of potentially hazardous radioactive wastes. The Department of Energy (DOE), through

the National Waste Terminal Storage (NWTS) Program, is seeking to develop nuclear waste isolation systems in geologic formations that will preclude contact with the biosphere of waste radionuclides in concentrations which are sufficient to cause deleterious impact on humans or their environments. Comprehensive analyses of specific isolation systems are needed to assess the expectations of meeting that objective. The Waste Isolation Safety Assessment Program (WISAP) has been established at the Pacific Northwest Laboratory (operated by Battelle Memorial Institute) for developing the capability of making those analyses. The objectives of the Waste Isolation Safety Assessment Program (WISAP) are to: (1) develop the capabilities needed to assess the post-closure safety of geologic repositories, (2) obtain scientifically defensible generic and site-specific data necessary for safety assessments, (3) provide, as needed, studies to further support these data and analyses, (4) demonstrate the assessment capabilities by performing analyses of reference sites, (5) apply the assessment methodology to assist the National Waste Terminal Storage Program in site selection, and (6) perform repository site analyses responsive to the time schedule and to the level of sophistication required to meet the licensing needs of the National Waste Terminal Storage Program. Release scenario analysis, Task 1, is discussed.

1785 (PNL-SA--7992, pp 21-31) WASTE ISOLATION SAFETY ASSESSMENT PROGRAM. TASK 2: WASTE FORM RELEASE RATE ANALYSIS. Bradley, D.J. (Battelle Pacific Northwest Lab., Richland, WA). 1979.
Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.
The purpose of this task is to measure and understand radionuclide release rates for waste forms anticipated for geologic isolation. At the present time, these waste forms include spent fuel, High-Level Waste (HLW) glass, and for TRU, concrete, bitumen, urea-formaldehyde, and polymers. Radionuclide release processes are of major importance to breach consequence analyses because slower leach rates delay the transport of radionuclides from a breached repository to the biosphere. These processes are also responsible for determining the source term for migration away from the repository.

1786 (PNL-SA--7992, pp 33-43) WISAP TASK 4 (SORPTION-DESORPTION ANALYSIS). Serne, R.J. (Battelle Pacific Northwest Lab., Richland, WA). 1979.
Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.
The overall objective of Task 4 is to provide the WISAP Task 3, release consequence analysis modelers the necessary information on long-term migration potential of leached nuclear wastes. The data being generated on nuclide sorption-desorption and precipitation-dissolution is obtained by both theoretical and experimental studies. At present only rock-nuclide interactions in the far-field (away from the waste induced heat and radiation fields) are under the preview of WISAP Task 4. The transport rate of nuclides is quantified by measurement of a parameter called Kd, the distribution coefficient. Kd is defind as the ratio of the amount of nuclide adsorbed on the solid media (rock) divided by the amount of nuclide remaining in the contacting solution (groundwater). This distribution, for each nuclide, can be dependent on the rock type, groundwater composition, nuclide concentration, nuclide valence state, and rock-nuclide contact time and surface area contacted. Presently the thrust of the Task 4 program is generic in nature. Until more direction and actual samples are available, work is being performed to gather data on nuclide-rock interactions for a wide range of rocks and groundwater types.

1787 (PNL-SA--7992, pp 45-66) NON-FLOW RELEASE STUDIES. Bradley, D. (Battelle Pacific Northwest Lab., Richland, WA). 1979.
Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.
Associated with commercial nuclear power production in the United States is the generation of potentially hazardous radioactive wastes. The Department of Energy (DOE), through the National Waste Terminal Storage (NWTS) Program, is seeking to develop nuclear waste isolation systems in geologic formations that will preclude contact with the biosphere of waste radionuclides in concentrations which are sufficient to cause deleterious impact on humans or their environments. Comprehensive analyses of specific isolation systems are needed to assess the expectations of meeting that objective. The Waste Isolation Safety Assessment Program (WISAP) has been established at the Pacific Northwest Laboratory (operated by Battelle Memorial Institute) for developing the capability of making those analyses. The subtask with this title encompasses all the tests that are not run above 100°C, which falls into the Autoclave release subtask. Currently we are conducting IAEA and static leach tests in parallel on both spent fuel and cold and actinide doped waste glasses.

1788 (PNL-SA--7992, pp 67-71) AUTOCLAVE RELEASE STUDIES. Westsik, J.H. Jr. (Battelle Pacific Northwest Lab., Richland, WA). 1979.
Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.
Associated with commercial nuclear power production in the United States is the generation of potentially hazardous radioactive wastes. The Department of Energy (DOE), through the National Waste Terminal Storage (NWTS) Program, is seeking to develop nuclear waste isolation systems in geologic formations that will preclude contact with the biosphere of waste radionuclides in concentrations which are sufficient to cause deleterious impact on humans or their environments. Comprehensive analyses of specific isolation systems are needed to assess the expectations of meeting that objective. The Waste Isolation Safety Assessment Program (WISAP) has been established at the Pacific Northwest Laboratory (operated by Battelle Memorial Institute) for developing the capability of making those analyses. Among the analyses required for isolation system evaluation is the detailed assessment of the post-closure performance of nuclear waste repositories in geologic formations. The objective of this subtask is to examine the behavior of a high-level waste glass and spent fuel in aqueous solutions at high temperatures and pressures. By studying the waste water interactions we will (1) generate leach rate data, (2) gain some understanding of the kinetics and mechanisms of the interactions, (3) simulate long time, low temperature leaching, and (4) provide input to the leach model subtask.

1789 (PNL-SA--7992, pp 73-81) RELEASE MODEL DEVELOPMENT. Turcotte, R.P. (Battelle Pacific Northwest Lab., Richland, WA). 1979.
Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.
Associated with commercial nuclear power

production in the United States is the generation of potentially hazardous radioactive wastes. The Department of Energy (DOE), through the National Waste Terminal Storage (NWTS) Program, is seeking to develop nuclear waste isolation systems in geologic formations that will preclude contact with the biosphere of waste radionuclides in concentrations which are sufficient to cause deleterious impact on humans or their environments. Comprehensive analyses of specific isolation systems are needed to assess the expectations of meeting that objective. The Waste Isolation Safety Assessment Program (WISAP) has been established at the Pacific Northwest Laboratory (operated by Battelle Memorial Institute) for developing the capability of making those analyses. Among the analyses required for isolation system evaluation is the detailed assessment of the post-closure performance of nuclear waste repositories in geologic formations. The objective of this subtask is to develop a release model. Although leaching studies of nuclear waste glasses and other solid forms have been part of every development effort, we are not yet at a point where a defensible leach model can be presented. A major result of our work during the last year has been a clearer recognition that leaching models proposed previously, based on studies of simple glasses, are simply not applicable to typical nuclear waste glasses.

1790 (PNL-SA--7992, pp 93-111) LEACHING CHARACTERISTICS OF ACTINIDES FROM SIMULATED REACTOR WASTE GLASS. Weed, H.C. (Lawrence Livermore Lab., CA); Coles, D.G.; Bradley, D.J.; Mensing, R.W.; Schweiger, J.S.; Rego, J.H. 1979.

Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.

This investigation is conducted for the Office of Nuclear Waste Isolation through Task 2 of the PNL Waste Isolation Safety Assessment Program (WISAP). One of the important goals of this program is to be able to calculate the rate of radionuclide release from candidate waste forms for geologic repository disposal. The present study has the following objectives in support of that goal: (1) to provide radionuclide source term information for use in release consequence analysis and migration rate calculations - this includes the effect of leaching, solution composition, flow rate, temperature, and time on the leach rate of simulated high level reactor waste glass; (2) to compare results obtained from the dynamic one-pass leaching method at LLL with those from the IAEA method at PNL. This progress report includes results to 120 days. Additional reports will be issued as the results are analyzed statistically, and a final report will be issued with PNL after the end of the experiments.

1791 (PNL-SA--7992, pp 113-146) LEACHING PROPERTIES OF SOLIDIFIED TRU WASTE FORMS (WBS ELEMENT 0206). Colombo, P.; Neilson, R.M. Jr. (Brookhaven National Lab., Upton, NY). 1979.

Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.

Approximately 12 x 10^6 ft^3 of defense TRU wastes are in storage or burial at various DOE installations, principally at the Idaho National Engineering Laboratory (INEL), Hanford, and the Savannah River Plant. (Continued waste generation rates of 2 x 10^5 ft^3/yr are estimated.) These wastes will ultimately be moved and placed into a geologic repository for disposal. While there is some question as to whether existing TRU wastes will be disposed in their current form or first undergo some additiona volume reduction process, it is evident that volume reduction will be required for future TRU wastes. There are a number of volume reduction options available for combustible TRU wastes, the most viable option currently being some form of incineration. While incineration does result in a large volume reduction for combustible solid wastes, the ash that results is highly dispersible. As such, the immobilization of incinerator ash by solidification producing a solid monolithic waste form is desirable. Safety analysis of solidified TRU contaminated incinerator ash waste forms requires an estimate of the ability of these waste forms to retain activity in the disposal environment. The primary mechanism for the potential release of this activity is assumed to be by leaching. The experimental program conducted at Brookhaven National Laboratory will determine the leaching properties of TRU contaminated incinerator ash waste forms using hydraulic cement, urea-formaldehyde, bitumen, and vinyl ester-styrene as solidification agents. The data obtained will indicate the relative activity retention abilities of these waste forms and provide the basis for long-term release projections from full-scale waste forms.

1792 (PNL-SA--7992, pp 159-166) LEACHING U-NP-PU-LOADED SIMULATED WASTE-GLASS. Diamond, H.; Friedman, A. (Argonne National Lab., IL). 1979.

Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.

Static leaching measurements were made in an oxygen-free environment. Three solutions, water, 0.3 M $NaHCO_3$ and brine were used; three intervals 2d, 8d, and 32d, and 23°C and 75°C temperatures were examined. The preliminary results show a varied response to temperature and some evidence that the leached material is not bound in siliceous fragments.

1793 (PNL-SA--7992, pp 167-179) SPENT FUEL LEACH TESTS. Katayama, B. (Battelle Pacific Northwest Lab., Richland, WA). 1979.

Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.

This presentation is divided into two parts, pre-WISAP and WISAP. The pre-WISAP leach tests were started before WISAP sponsorship and do not give data directly applicable to the spent fuel release modeling studies being done in WISAP Task 2. However, the general leaching trends have suggested the general approach to some mechanistic studies. The WISAP portion of this presentation was started under WISAP sponsorship and is designed to fulfill the requirement of obtaining radionuclide release rates from spent fuel and understanding the radionuclide release process under simulated geologic storage conditions.

1794 (PNL-SA--7992, pp 181-204) FUEL AND WASTE IMMOBILIZATION IN CANADA RELATED TO WISAP TASK 2. Strathdee, G.G. (Battelle Seattle Research Center, WA); Cameron, D.J.; Sargent, F.P.; Vandergraaf, T.T.; Johnson, L.H.; Shoesmith, D.W.; Taylor, P.; McIntyre, N.S.; Tait, J.C. 1979.

Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.

Durable glass samples which are leached for prolonged periods in standard tests behave in unexpected ways, particularly with respect to deposition of multi-valent cations at the glass alteration layer-solution interface. The standard leach tests normally used to provide comparisons of glass product durabilities may

yield leach rate values which are conservative and high with respect to those within an actual repository environment. Depth profile studies indicate that addition of certain cations to waste glasses (i.e., those found to concentrate at the aqueous-glass interface and which promote mineralization of the alteration layer) may lead to in-situ generation of an additional barrier to radionuclide loss.

1795 (PNL-SA--7992, pp 205-229) WIPP WASTE CHARACTERIZATION AND EXPERIMENTAL PROGRAMS. Molecke, M.A. (Sandia Labs., Albuquerque, NM). 1979.
Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.
The Waste Isolation Pilot Plant (WIPP) is intended to serve as a nuclear waste repository for those defense transuranic wastes, both contact-handled and remote-handled, which the Department of Energy (DOE) may designate as requiring deep geologic disposal. The WIPP will also provide a separate underground facility in which in-situ experiments with various waste forms, including high-level waste (HLW) and spent fuel, may be conducted. The DOE has also recommended (but not determined) that the WIPP be used to demonstrate the disposal of a limited number (no more than 1000) of spent fuel assemblies from commercial nuclear reactors. All the wastes, both TRU and spent fuel, placed into the WIPP for intended disposal would be retrievable for the periods required to demonstrate the validity of the disposal concept. These periods are not expected to exceed 10 years for TRU waste and 25 years for spent fuel. Wastes used in the experimental program will be removed at the conclusion of the experiments.

1796 (PNL-SA--7992, pp 147-157) X-RAY PHOTOEMISSION SPECTROSCOPY (XPS) AND EXTENDED X-RAY ABSORPTION FINE STRUCTURE (EXAFS) STUDIES OF SILICATE BASED GLASSES. Karim, D.; Lam, D.J. (Argonne National Lab., IL). 1979.
Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.
The application of the x-ray photoemission spectroscopy (XPS) technique to study the electronic structure and bonding of heavy metal oxides in alkali- and alkali-earth-silicate glasses had been demonstrated. The bonding characteristics of the iron oxide and uranium oxide in sodium silicate glasses were deduced from the changes in the oxygen 1s levels and the heavy metal core levels. It is reasonable to expect that the effect of leaching on the heavy metal ions can be monitored using the appropriate core levels of these ions. To study the effect of leaching on the glass forming network, the valence band structure of the bridging and nonbridging oxygens in sodium silicate glasses were investigated. The measurement of extended x-ray absorption fine-structure (EXAFS) is a relatively new analytical technique for obtaining short range (<5 A) structural information around atoms of a selected species in both solid and fluid systems. Experiments have recently begun to establish the feasibility of using EXAFS to study the bonding of actinides in silicate glasses. Because of the ability of EXAFS to yield specific structural data even in complex multicomponent systems, it could prove to be an invaluable tool in understanding glass structure.

1797 (PNL-SA--7992, pp 83-91) GAMMA-IRRADIATION EFFECTS ON LEACHING CHARACTERISTICS OF WASTE CONTAINMENT MATERIALS. McVay, G.L. (Battelle Pacific Northwest Lab., Richland, WA). 1979.
Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program.
Materials which contain typical radioactive waste are subjected to gamma-irradiation from the waste itself. Therefore, it is important to understand the effect of this irradiation on the leaching characteristics of waste containing materials in the event of an exposure to water during the time span when significant gamma-irradiation is occurring. With this goal in mind, an experiment has been initiated to characterize the leaching behavior of 7668 glass, supercalcine ceramic, and UO_2 during exposure to gamma-irradiation.

1798 (PNL-SA--8011) RADIOLOGICAL ASPECTS OF SEA BED DUMPING IN THE DEEP OCEANS. Templeton, W.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1979. Contract EY-76-C-06-1830. 19p. (CONF-791050--2). Dep. NTIS, PC A02/MF A01.
From 3. Nuclear Energy Agency seminar on marine radioecology; Tokyo, Japan (1 Oct 1979).
In order to control coastal discharges or ocean dumping of any kind of material, it is necessary to determine a release rate. This can only come from a knowledge of the composition and chemical form of the source materials, the distribution and bioavailability of these materials in the ocean ecosystem, the degree and rates of bioaccumulation and the actual or potential use of the ocean resources. With this information release rates within acceptable limits for man and the ecosystem can then be determined. Today, probably the only situations which apply this approach are the controlled disposal of radioactive wastes. In this paper a recent radiological assessment of the dumping of packaged radioactive wastes on the seabed is discussed and some environmental aspects of the United States Department of Energy program are described examining the feasibility of the emplacement of contained radioactive wastes within the deep ocean sediments.

1799 (PNL-SA--8571(Vol.1)) WASTE ISOLATION SAFETY ASSESSMENT PROGRAM. TASK 4. THIRD CONTRACTOR INFORMATION MEETING. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jun 1980. Contract AC06-76RL01830. 558p. (CONF-7910160--(Vol.1)). NTIS, PC A24/MF A01.
From 3. contractor information meeting on waste isolation safety assessment program task 4; Seattle, WA, USA (14 Oct 1979).
The Contractor Information Meeting (October 14 to 17, 1979) was part of the FY-1979 effort of Task 4 of the Waste Isolation Safety Assessment Program (WISAP): Sorption/Desorption Analysis. The objectives of this task are to: evaluate sorption/desorption measurement methods and develop a standardized measurement procedure; produce a generic data bank of nuclide-geologic interactions using a wide variety of geologic media and groundwaters; perform statistical analysis and synthesis of these data; perform validation studies to compare short-term laboratory studies to long-term in situ behavior; develop a fundamental understanding of sorption/desorption processes; produce x-ray and gamma-emitting isotopes suitable for the study of actinides at tracer concentrations; disseminate resulting information to the international technical community; and provide input data support for repository safety assessment. Conference participants included those subcontracted to WISAP Task 4, representatives and independent subcontractors to the Office of Nuclear Waste Isolation, representatives from other waste disposal programs, and experts in the area of

waste/geologic media interaction. Since the meeting, WISAP has been divided into two programs: Assessment of Effectiveness of Geologic Isolation Systems (AEGIS) (modeling efforts) and Waste/Rock Interactions Technology (WRIT) (experimental work). The WRIT program encompasses the work conducted under Task 4. This report contains the information presented at the Task 4, Third Contractor Information Meeting. Technical Reports from the subcontractors, as well as Pacific Northwest Laboratory (PNL), are provided along with transcripts of the question-and-answer sessions. The agenda and abstracts of the presentations are also included. Appendix A is a list of the participants. Appendix B gives an overview of the WRIT program and details the WRIT work breakdown structure for 1980.

1800 (PTB-SE--1) SEMINAR ON R + D WORK AND STUDIES ON THE DISPOSAL AND FINAL STORAGE OF RADIOACTIVE WASTE. REPORT SE-1. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.). Abt. Sicherstellung und Endlagerung Radioaktiver Abfaelle). Oct 1979. 60p. (In German). NTIS (US Sales Only), PC A04/MF A01.

The Seminar had following goals: The research- and development works for safeguarding and final storage of waste are discussed and gone through with regard to their complete processing in due time. A survey on possible co-operation in R+D work is to be set up. The PTB (Physical-technical federal organisation) can normally not order any R+D work nor can it financially support them; it will, however support necessary R+D works with all possibilities it has, for example by sending letters of recommendation and agreement to ministries and other competent institutions. For special investigations relevant for the permission, there are also own means in restricted volume available.

1801 (PTB-SE--2) PROTOCOL OF THE RESULTS OF THE 18TH PTB SEMINAR 'SITE-INDEPENDENT PLANNING OF THE FINAL STORAGE FACILITY AT THE SITE OF THE GORLEBEN INTEGRATED NUCLEAR WASTE MANAGEMENT CENTRE. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.). Abt. Sicherstellung und Endlagerung Radioaktiver Abfaelle). Nov 1979. 15p. (In German). NTIS (US Sales Only), PC A02/MF A01.

On 24 April 1979 the Seminar on site-independent planning of the final storage mine at the site of the integrated waste management centre Gorleben under the leadership of H. Roethemeyer took place in PTB, Braunschweig. The Seminar was attended by PTB-staff and by 45 invited attendees from several federal ministries and their consulting committees and from industry, authorities, universities, and research institutes. In several presentations, PTB and the industry reported on the situation of the planning works. The new task to set up the systems of the Federal Government for safeguarding and final storage of radioactive waste and to operate them was given PTB with the 4th supplementary atomic law of 31st October 1976. Furthermore PTB has to take care of the R-D works necessary to realise these systems to be finished in due time. This point was also reported in several presentations on the present situation of the works concerned. Numerous contributions made in the discussions following to the prescutations brought valuous ideas for the progress of the plannings and the R-D programmes.

1802 (RFP--3110) US DEPARTMENT OF ENERGY ACCEPTANCE OF COMMERCIAL TRANSURANIC WASTE. Taboas, A.L.; Bennett, W.S.; Brown, C.M. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). Feb 1980. Contract AC04-76DP03533. 27p. NTIS, PC A03/MF A01.

Contaminated transuranic wastes generated as a result of non-defense activities have been disposed of by shallow land burial at a commercially operated (NECO) facility located on the Hanford federal reservation, which is licensed by the State of Washington and by the NRC. About 15,000 ft^3 of commercial TRU waste have been generated each year, but generation for the next three years could triple due to decontamination and decommissioning scheduled to start in 1980. Disposal at other commercial burial sites has been precluded due to sites closing or prohibitions on acceptance of transuranic wastes. The State of Washington recently modified the NECO-Hanford operating license, effective February 29, 1980, to provide that radioactive wastes contaminated with transuranics in excess of 10 nCi/g will not be accepted for disposal. Consistent with the state policy, the NRC amended the NECO special nuclear material license so that Pu in excess of 10n Ci/g cannot be accepted after February 29, 1980. As a result, NRC requested DOE to examine the feasibility of accepting these wastes at a DOE operated site. TRU wastes accepted by the DOE would be placed in retrievable storage in accordance with DOE policy which requires retrievable storage of transuranic wastes pending final disposition in a geologic repository. DOE transuranic wastes are stored at six major DOE sites: INEL, Hanford, LASL, NTS, ORNL, and SRP. A specific site for receiving commercial TRU waste has not yet been selected. Shipments to DOE-Hanford would cause the least disruption to past practices. Commercial TRU wastes would be subject to waste form and packaging criteria established by the DOE. The waste generators would be expected to incur all applicable costs for DOE to take ownership of the waste, and provide storage, processing, and repository disposal. The 1980 charge to generators for DOE acceptance of commercial TRU waste is $147 per cubic foot.

1803 (RHO-BWI--79-100) BASALT WASTE ISOLATION PROJECT. ANNUAL REPORT, FISCAL YEAR 1979. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Nov 1979. Contract EY-77-C-06-1030. 265p. Dep. NTIS, PC A12/MF A01.

This project is aimed at examining the feasibility and providing the technology to design and construct a radwaste repository in basalt formations beneath and within the Hanford Site. The project is divided into seven areas: systems integration, geosciences, hydrologic studies, engineered barriers, near-surface test facility, engineering testing, and repository engineering. This annual report summarizes key investigations in these seven areas. (DLC)

1804 (RHO-BWI--79-100-3Q) BASALT WASTE ISOLATION PROGRAM. QUARTERLY REPORT, APRIL 1, 1979-JUNE 30, 1979. Deju, R.A. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Jul 1979. Contract EY-77-C-06-1030. 51p. Dep. NTIS, PC A04/MF A01.

During the quarter, progress was made in all areas of the Basalt Waste Isolation Program. In the Geosciences, Hydrology, and Engineered Barriers areas, work continued on schedule aimed at being able to make a site selection decision in 1981, as scheduled. Emphasis

continued to be placed on geologic mapping studies, on hydrologic data gathering, and on definition of waste/basalt interactions and needed engineered barriers. Progress at the end of the quarter on the Near-Surface Test Facility was approximately on schedule and the rate of work was accelerating to better than scheduled due to some equipment improvements and tunnel design modifications. In the Engineering Testing area, design work, test planning, and fabrication of heaters and auxiliary equipment continued on schedule. In the Repository area, an Architect/Engineer Evaluation Board was formally designed by the US Department of Energy-Headquarters during October 1978. The evaluation board will select an architect/engineer for repository conceptual design with an option for follow-on Title I, Title II, and Title III engineering services. Selection will be completed by October 1979. Questionnaire information was received from a number of interested architect/engineer firms by the US Department of Energy-Richland Operations Office and has been evaluated. Onsite visits with the qualified firms were completed during April 1979. In addition, repository preconceptual design studies continued on schedule with emphasis on compilation of repository functional design criteria by July 1979, and the repository preconceptual design report in September 1979.

1805 (RHO-BWI--79-100-4Q) BASALT WASTE ISOLATION PROJECT. QUARTERLY REPORT, JULY 1, 1979-SEPTEMBER 30, 1979. Deju, R.A. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Oct 1979. Contract EY-77-C-06-1030. 58p. Dep. NTIS, PC A04/MF A01.

Progress in various areas of the Basalt Waste Isolation Project during the last quarter is reported. Systems integration, licensing, geologic activities, hydrology, borehole studies, geophysical logging, engineered barriers, test facilities, testing of canisters, and selection process for architect-engineer services for repository conceptual design are discussed. (DC)

1806 (RHO-BWI--80-100-2Q) BASALT WASTE ISOLATION PROJECT. QUARTERLY REPORT, JANUARY 1-MARCH 31, 1980. Deju, R.A. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Apr 1980. Contract AC06-77RL01030. 94p. NTIS, PC A05/MF A01.

This report addresses the technical progress for the Basalt Waste Isolation Project for the second quarter of fiscal year 1980. Seismic design values were developed for preliminary repository design purposes; 0.25 g horizontal and 0.125 g vertical maximum accelerations for surface, zero-period conditions. Preliminary seismic data indicate broad, smooth areas exist in the bedrock surface in the western portion of the Cold Creek syncline and a gently undulating bedrock surface in the eastern portion. Test results indicate hydraulic property values fall within the range previously reported for sedimentary and interflow zones in basalt formations at the Hanford Site. Preliminary results of available hydrochemical data obtained from several borehole sites indicate that little, if any, vertical mixing of groundwaters is taking place across this stratigraphic boundary. Multiple barrier studies indicate that the primary candidate canister/overpack alloys are TiCode-12, Inconel 625, Incoloy 825, and Zircaloy 2. Low-carbon steel and cast iron are among the list of secondary candidate canister alloys. Laboratory tests of borehole plug designs have shown that it is feasible to design a composite plug system that will satisfactorily seal a nuclear waste repository in Columbia River basalt. The National Lead Industries, Inc., NLI-1/2 Universal Spent Fuel Shipping Cask was selected for use in Phase II operations. Creep test results of samples of Umtanum basalt from borehole DC-6 were plotted and show the day-to-day variation in deformation versus time. The concept selection phase of repository conceptual design was completed in March 1980. A test plan for the Exploratory Shaft Test Facility was developed and is scheduled for submittal to the US Department of Energy in May 1980.

1807 (RHO-BWI--80-100-3Q) BASALT WASTE ISOLATION PROJECT. QUARTERLY REPORT, APRIL 1, 1980-JUNE 30, 1980. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). Jul 1980. Contract AC06-77RL01030. 74p. NTIS, PC A04/MF A01.

Progress is reported in the following work areas: systems integration, geosciences, hydrology, engineered barriers, near-surface test facility, engineering testing, and repository studies. (DLC)

1808 (RHO-BWI--80-100-19) BASALT WASTE ISOLATION PROJECT. QUARTERLY REPORT, OCTOBER 1, 1979-DECEMBER 31, 1979. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). Jan 1980. Contract EY-77-C-06-1030. 84p. Dep. NTIS, PC A05/MF A01.

Progress in geology and hydrology is reported. Engineered barrier experiments with spent fuel indicate that basalt favorably affects the repository performance: experiments leaching simulated spent fuel alone remove 90 to 100% of the cesium, rubidium, and molybdenum present, while leaching in the presence of basalt produced residual solutions containing less than 10% of these cations. The following alloys appear to be best for use as a waste canister and/or overpack in a basalt environment: Ticode 12, Hastelloy C-276, Inconel 625, Incoloy 825, and 90-10 Cupronickel. The Title II design of the Bottom Loading Transporter was completed this quarter. The design of the heaters for Block Tests No. 1 and No. 2 was completed.

1809 (RHO-BWI-C-13) DRILLING HISTORY CORE HOLE DC-6 HANFORD, WASHINGTON. (Fenix and Scisson, Inc., Richland, WA (USA)). Jun 1978. Contract EY-77-C-06-1030. 55p. Dep. NTIS, PC A04/MF A01.

Core hole DC-6 was completed in May 1978 by Boyles Brothers Drilling Company, Spokane, Washington, under subcontract to Fenix and Scisson, Inc. The hole was cored for the US Department of Energy and the Rockwell Hanford Operations' Basalt Waste Isolation Program. Fenix and Scisson, Inc. furnished the engineering, daily supervision of the core drilling activities, and geologic core logging for hole DC-6. Core hole DC-6 is located within the boundary of the Hanford Site at the old Hanford town site. The Hanford Site coordinates for DC-6 are North 54,127.17 feet and West 17,721.00 feet. The surface elevation is approximately 402 feet above sea level. The purpose of core hole DC-6 was to core drill vertically through the basalt and interbed units for stratigraphic depth determination and core collection and to provide a borehole for hydrologic testing. The total depth of core hole DC-6 was 4336 feet. Core recovery was 98.4% of the total footage cored.

1810 (RHO-BWI-C--29) DRILLING HISTORY CORE HOLE DC-8. (Fenix and Scisson, Inc., Richland, WA (USA)). Oct 1978. Contract EY-77-C-06-1030. 51p. Dep. NTIS, PC A04/MF A01.

Core hole DC-8 was completed in August, 1978 by Boyles Brothers Drilling Company, Spokane, Washington, under subcontract to Fenix and Scission, Inc. The hole was cored for the US Department of Energy and the Rockwell Hanford Operations' Basalt Waste Isolation Program. Fenix and Scisson, Inc. furnished the engineering, daily supervision of the core drilling activities, and geologic core logging for hole DC-8. Core hole DC-8 is located on the Hanford Site near the Wye Barricade and 50 feet northwest of rotary hole DC-7. The Hanford Site vation coordinates for DC-8 are North 14,955.94 feet and West 14,861.92 coordinates for DC-8 are North 14,955.94 feet and West 14,861.92 mean sea level. The purpose of core hole DC-8 was to core drill vertically through the basalt and interbed units for stratigraphic depth determination and core collection, and to provide a borehole for hydrologic testing and cross-hole seismic shear and pressure wave velocity studies with rotary hole DC-7. The total depth of core hole DC-8 was 4100.5 feet. Core recovery exceeded 97 percent of the total footage cored.

1811 (RHO-BWI-C--40) DRILLING HISTORY CORE HOLE DC-4. (Fenix and Scisson, Inc., Richland, WA (USA)). Dec 1978. Contract EY-77-C-06-1030. 48p. Dep. NTIS, PC A03/MF A01.

Core hole DC-4 was completed at a depth of 3998 feet in December, 1978 by Boyles Brothers Drilling Company, Spokane, Washington, under subcontract to Fenix and Scission, Inc. The hole was cored for the US Department of Energy and the Rockwell Hanford Operations' Basalt Waste Isolation Program. Fenix and Sicsson, Inc. furnished the engineering, daily supervision of the cable tool and core drilling activities, and geological core logging for DC-4. Core hole DC-4 is located on the Hanford Site about 3 miles east of the Yakima Barricade and approximately 103 feet southwest of rotary hole DC-5, which was completed to 3990 feet in February, 1978. Hanford Site coordinates reported for hole DC-4 are north 49,385.62 feet and west 85,207.63 feet, and Washington State coordinates are north 454,468.73 feet and east 2,209,990.87 feet. No elevation survey is available for hole DC-4, but it is approximately 745 feet above mean sea level based upon the survey of hole DC-5, which has a reported elevation of 745.16 feet on the top of the 3-inch flange. The purpose of core hole DC-4 was to core drill vertically through the basalt and interbed units for stratigraphic depth determination and core collection, and to provide a borehole for hydrologic testing, cross-hole seismic shear, and pressure wave velocity studies with rotary hole DC-5. Hole DC-4 was drilled through the overburden into basalt bedrock by cable tool methods (0-623 feet) and continuously cored through the final interval (623 to 3998 feet).Core recovery was 95.8 percent of the total footage cored.

1812 (RHO-BWI-C--45) HYDROLOGIC BIBLIOGRAPHY OF THE COLUMBIA RIVER BASALTS IN WASHINGTON WITH SELECTED ANNOTATIONS. Tanaka, H.; Wildrick, L.; Pearson, B. (Washington State Dept. of Ecology, Olympia (USA)). Aug 1979. Contract AC06-77RL01030. 118p. NTIS, PC A06/MF A01.

The objective of this compilation is to present a comprehensive listing of the published, unpublished, and open file references pertaining to the surface and subsurface hydrology of the Columbia River basalts within the State of Washington and is presented in support of Rockwell's hydrologic data compilation effort for the Basalt Waste Isolation Program. A comprehensive, annotated bibliography of the Pasco Basin (including the Hanford Site) hydrology has been prepared for Rockwell as part of the Pasco Basin hydrology studies. In order to avoid unnecessary duplication, no effort was made to include a complete list of bibliographic references on Hanford in this volume.

1813 (RHO-BWI-C--47) SPRING INVENTORY OF THE RATTLESNAKE HILLS. Schwab, G.E.; Colpitts, R.M. Jr.; Schwab, D.A. (Summers (W.K.) and Associates, Inc., Socorro, NM (USA)). May 1979. Contract EY-77-C-06-1030. 207p. Dep. NTIS, PC A10/MF A01.

Springs and reported spring locations within about 182 square miles of the Rattlesnake Hills in Benton and Yakima Counties, Washington, were studied for this report. One hundred twenty-five discrete locations were visited. Water was tested at 74 locations. Of the remainder, 35 were dry, 7 were iced over, and 7 were damp (too little water to sample). Two cisterns were not sampled. Eighty-three water samples from 73 springs and 1 cistern were analyzed in the field. Temperature, specific conductance, and pH were measured at each sample site. Water from each of these sources was titrated to determine carbonate, bicarbonate, and carbon dioxide contents. Seventy-one sketch maps show sample sites plus 9 other locations. Profile sections accompany the sketches where such views are informative. Altitudes of visited locations range from 700 feet to 3360 feet. Altitudes of sampled springs range from 1150 feet to 3275 feet. Discharge rates within the study area range from seeps estimated at less than one-quarter gallon per minute to a multiple-spring stream measured at about 70 gallons per minute.

1814 (RHO-BWI-C--49) BOREHOLE PLUGGING OF MAN-MADE ACCESSES TO A BASALT REPOSITORY: A PRELIMINARY STUDY. Taylor, C.L.; Anttonen, G.J.; O'Rourke, J.E.; Niccum, M.R. (Woodward-Clyde Consultants, San Francisco, CA (USA)). Sep 1979. Contract AC06-RL7701030. 318p. NTIS, PC A14/MF A01.

This report describes the status of work currently in progress for the Basalt Borehole Plugging Program (BBPP). The primary objectives of the BBPP outlined in this report have been met during this first phase of work. These objectives included: (1) the preparation of a preliminary list of candidate plug materials; (2) a description of available machinery capable of placing candidate plug materials; and (3) the development of physical and geochemical testing programs to help evaluate the chemical stability and physical properties of candidate plug materials. The most significant finding from work to date is that given reasonable regulatory criteria, nothing has been identified which would prevent design of a plug system to seal manmade openings leading to a nuclear waste repository in Columbia River basalt for significantly long periods of time (on the order of thousands of years). Work accomplished to date indicates that this plug system can be designed using both natural and manufactured materials and can be emplaced with existing placement machinery and modifications of that machinery. The objectives of Task II are to conduct laboratory tests to evaluate the suitability of preferred candidate materials for plugging boreholes in

the proposed repository, select plug system(s), initiate preconceptual machinery design for the placement of materials in plug system(s), and prepare a preliminary Task II report. As with Task I project organization, Task II is divided into subtasks that are identified by written subtask work summaries.

1815 (RHO-BWI-C--59) BIBLIOGRAPHY OF THE GEOLOGY OF THE COLUMBIA BASIN AND SURROUNDING AREAS OF WASHINGTON. Tucker, G.B.; Rigby, J.G. (Washington State Dept. of Natural Resources, Olympia (USA)). Jul 1979. Contract AC06-77RL01030. 543p. NTIS, PC A23/MF A01.

In the fall of 1977, the Washington State Department of Natural Resources, Division of Geology and Earth Resources (WDGER), entered into a contract with the US Department of Energy, administered by Rockwell Hanford Operations (Rockwell) in Richland, Washington, as a principal contributor to a geologic study of feasibility of storing radioactive waste within Columbia River basalt. WDGER's responsibility was the production of this bibliography and a reconnaissance geologic map of the sediments overlying the Columbia River Basalt Group in the State of Washington. This bibliography is a compilation of all known published, unpublished, and open-file references dealing with geology and geophysics of the Columbia Basin of eastern Washington. The citations were obtained primarily from the WDGER and Washington State libraries; the Geo-Ref bibliographic system was also utilized. Because the WDGER portion of the study included preparation of a reconnaissance geologic map of surficial deposits in the Columbia Basin, available references dealing with this subject have been annotated. Many abstracts in the annotated section are quotations and have been copied directly from their respective publications.

1816 (RHO-BWI-C--60) REGIONAL BASALT HYDROLOGY OF THE COLUMBIA PLATEAU IN WASHINGTON. Tanaka, H.; Barrett, G.; Wildrick, L. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Oct 1979. Contract AC06-77RL01030. 855p. NTIS, PC A99/MF A01.

This study is part of the Basalt Waste Isolation Project, operated for the US Department of Energy by Rockwell Hanford Operations. The overall purpose of the study is to assess locations within the Columbia River Basalt Group beneath the Hanford Site in south-central Washington suitable for a geologic repository for radioactive waste. This hydrologic study was made to describe the hydrologic characteristics of the basalt units of the Columbia Plateau. This was done by comprehensive data compilation, data interpretation and analysis. Data are presented in the form of maps and tables suitable as input information about the regional hydrology for possible future analysis by computer models. The report includes: an introduction; basic data; interpretation which covers stratigraphic trend surface, water levels, transmissivity and storage of aquifers, recharge, discharge, flow, subbasins, cross sections, references and appendix of record of wells.

1817 (RHO-BWI-C--62(Vol.1)) SITE LOCALITY IDENTIFICATION STUDY: HANFORD SITE. VOLUME I. METHODOLOGY, GUIDELINES, AND SCREENING. (Woodward-Clyde Consultants, San Francisco, CA (USA)). Jul 1980. Contract AC06-77RL01030. 194p. NTIS, PC A09/MF A01.

Presented in this report are the results of the site locality identification study for the Hanford Site using a screening process. To enable evaluation of the entire Hanford Site, the screening process was applied to a somewhat larger area; i.e., the Pasco Basin. The study consisted of a series of screening steps that progressively focused on smaller areas which are within the Hanford Site and which had a higher potential for containing suitable repository sites for nuclear waste than the areas not included for further study. Five site localities, designated H-1, H-2, H-3, H-4, H-5 (Figure A), varying in size from approximately 10 to 50 square miles, were identified on the Hanford Site. It is anticipated that each site locality may contain one or more candidate sites suitable for a nuclear waste repository. The site locality identification study began with definition of objectives and the development of guidelines for screening. Three objectives were defined: (1) maximize public health and safety; (2) minimize adverse environmental and socioeconomic impacts; and (3) minimize system costs. The screening guidelines have numerical values that provided the basis for the successive reduction of the area under study and to focus on smaller areas that had a higher likelihood of containing suitable sites.

1818 (RHO-BWI-C--62(Vol.2)) SITE LOCALITY IDENTIFICATION STUDY: HANFORD SITE. VOLUME II. DATA CATALOGING. (Woodward-Clyde Consultants, San Francisco, CA (USA)). Jul 1980. Contract AC06-77RL01030. 199p. NTIS, PC A09/MF A01.

Data compilation and cataloging for the candidate site locality identification study were conducted in order to provide a retrievable data cataloging system for the present siting study and future site evaluation and licensng processes. This task occurred concurrently with and also independently of other tasks of the candidate site locality identification study. Work in this task provided the data utilized primarily in the development and application of screening and ranking processes to identify candidate site localities on the Hanford Site. The overall approach included two steps: (1) data acquisition and screening; and (2) data compilation and cataloging. Data acquisition and screening formed the basis for preliminary review of data sources with respect to their probable utilization in the candidate site locality identification study and review with respect to the level of completeness and detail of the data. The important working assumption was that the data to be used in the study be based on existing and available published and unpublished literature. The data compilation and cataloging provided the basic product of the Task; a retrievable data cataloging system in the form of an annotated reference list and key word index and an index of compiled data. The annotated reference list and key word index are cross referenced and can be used to trace and retrieve the data sources utilized in the candidate site locality identification study.

1819 (RHO-BWI-C--66) PRELIMINARY GEOCHEMICAL AND PHYSICAL TESTING OF MATERIALS FOR PLUGGING OF MAN-MADE ACCESSES TO A REPOSITORY IN BASALT. Taylor, C.L.; Anttonen, G.J.; O'Rourke, J.E.; Allirot, D. (Woodward-Clyde Consultants, San Francisco, CA (USA)). Apr 1980. Contract AC06-77RL01030. 398p. NTIS, PC A17/MF A01.

The available data on environmental conditions (both natural and man-made) at the Hanford Site are sufficient for preconceptual

plug system design. Results of the geochemical testing program indicate that preferred candidate plug materials are chemically nonreactive during laboratory tests that simulated some of the expected environmental conditions. Agitated, crushed-basalt samples and mixtures containing basalt were found to be self-cementing under the hydrothermal conditions. Materials considered most suitable for consideration in future test programs and preconceptual plug design are mixtures of natural materials (basalt, clay, glaciofluvial sand, gravel, and zeolite) and processed natural materials (portland cement Type V and grouts plus additives).

1820 (RHO-BWI-C--68) ADDITIONS AND CORRECTIONS TO THE BIBLIOGRAPHY OF GEOLOGIC STUDIES, COLUMBIA PLATEAU (COLUMBIA RIVER BESALT) AND ADJACENT AREAS, IN IDAHO, 1980. Strowd, W. (Idaho Bureau of Mines and Geology, Moscow (USA). Dept. of Lands). 1980. Contract AC02-77RL01030. 124p. NTIS, PC A06/MF A01.

This bibliography is an update to Idaho Bureau of Mines and Geology Open-File Report 78-6, Bibliography of Geological Studies, Columbia Plateau (Columbia River Basalt Group) and adjacent areas in Idaho (also known as Rockwell Hanford Operations' contractor report RHO-BWI-C-44). To keep the original document current, this additions and corrections report was prepared for the Basalt Waste Isolation Project of Rockwell Hanford Operations. This update is supplementary; therefore, references cited in the original document have not been included here. What is included are materials that have become available since the original publication and pertinent literature that had originally been overlooked. Accompany this updated bubliography are index maps that show locations of geologic studies and geochemical petrographic, remanent paleomagnetic, and radiometric age-dated sites within the Columbia River Basalt Group field within Idaho; also identified are archeological sites, test wells, mines, quarries, and other types of excavations. References on the index maps are keyed to the bibliography and cover the Spokane, Pullman, Hamilton, Grangeville, Elk City, Baker, Boise, and Jordan Valley Army Map Service two-degree quadrangles.

1821 (RHO-BWI-C--70) HYDROTHERMAL INTERACTIONS OF CESIUM AND STRONTIUM PHASES FROM SPENT UNREPROCESSED FUEL WITH BASALT PHASES AND BASALTS. Komarneni, S.; Scheetz, B.E.; McCarthy, G.J.; Coons, W.E. (Pennsylvania State Univ., University Park (USA); Atomics International Div., Richland, WA (USA). Rockwell Hanford Operations). Mar 1980. Contract AC06-77RL01030. 39p. NTIS, PC A03/MF A01.

This investigation is a segment of an extensive research program aimed at investigating the feasibility of long-term, subsurface storage of commercial nuclear waste. Specifically, it is anticipated that the waste will be housed in a repository mined from the basalt formations which lie beneath the Hanford Site. The elements monitored during the present experiments were Cs and Sr. These two elements represent significant biohazards if released from a repository and are the major heat producing radionuclides present in commercial radioactive waste. Several Cs phases and/or solutions were reacted with either isolated basalt phases or bulk-rock basalt, and the resulting solids and solutions were analyzed. The hydrothermal reactivity of $SrZrO_3$, which is believed to be a probable host for Sr in SFE was investigated. While so far no evidence exists which indicates that Sr is present in a water soluble phase in spent fuel elements (SFE), detailed investigation of a potential hazard is warranted. This investigation has determined that some Cs compounds likely to be stable components of spent fuel (i.e., CsOH, Cs_2MoO_4, $Cs_2U_2O_7$) have significant hydrothermal solubilities. These solubilities are greatly decreased in the presence of basalt and/or basalt minerals. The decrease in the amount of Cs in solution results from reactions which form pollucite and/or $CsAlSiO_4$, with the production of pollucite exceeding that of $CsAlSiO_4$. Dissolution of β-$Cs_2U_2O_7$ implies solubilizing a uranium species to an undetermined extent. The production of schoepite ($UO_3.3H_2O$) during some experiments containing basalt phases, indicates a tendency to oxidize U^{4+} to U^{6+}. When diopside (nominally $CaMgSi_2O_6$) and β-$Cs_2U_2O_7$ were hydrothermally reacted, at 300°C both UO_2 and $UO_3.3H_2O$ were produced. Results of experiments on $SrZrO_3$ show it to be an unreactive phase.

1822 (RHO-BWI-C--76) THERMAL PROPERTY MEASUREMENTS OF POMONA MEMBER BASALT FROM CORE HOLES DB-5 AND DB-15, HANFORD SITE, SOUTHEASTERN WASHINGTON. Erikson, R.L.; Krupka, K.M. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 1980. Contract AC06-77RL01030. 42p. NTIS, PC A03/MF A01.

Thermal diffusivities of dense samples of Pomona basalt from core holes DB-5 and DB-15 were calculated between 25°C and 300°C from measured values of thermal conductivity, thermal expansion, and specific heat. The bulk densities and apparent porosities of the samples studied ranged from 2.86 to 2.88 g/cm³, and 0.50 to 0.60%, respectively. Experimental values of thermal conductivity, linear thermal expansion, and specific heat were determined with a steady-state, cut-bar apparatus, a dilatometer, and a drop calorimeter, respectively. The thermal conductivity of Pomona basalt from core holes DB-5 and DB-15 increases with increasing temperature. The experimental conductivity data for these samples of Pomona basalt are adequately represented by the equations: (1) $k = (2.4 \times 10^{-3})T + 3.52$; and (2) $k = (2.5 \times 10^{-3})T + 3.79$, respectively. Thermal expansion data suggest that the tested samples of Pomona basalt expand linearly between 100°C and 300°C; the expansion coefficients for these samples are in the range 2.0 to 3.0 x 10^{-6}/°C. There are no significant differences in the values of relative enthalpies measured by drop calorimetry for Pomona basalt from core holes DB-5 and DB-15. Consequently, the specific heats as a function of temperature of both basalts are identical. A Maier-Kelley equation which represents the specific heat of Pomona basalt between 25°C and 350°C was derived from the relative enthalpy measurements: $Cp = 0.306216 - (2.58056 \times 10^{-5})T - (1.15331 \times 10^{4})T^{-2}$. The calculations of thermal diffusivity for the samples of Pomona basalt from core holes DB-5 and DB-15 imply a small decrease in diffusivity as a function of temperature between 25°C and 300°C. The approximate range of diffusivity values for these samples of basalt calculated between 25°C and 300°C is 8.0 to 5.8.

1823 (RHO-BWI-CD--2(Rev.1)) NUCLEAR WASTE REPOSITORY IN BASALT: PRECONCEPTUAL DESIGN GUIDELINES. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Jun 1979. Contract EY-77-C-06-1030. 192p. Dep. NTIS, PC A09/MF A01.

The development of the basalt waste

isolation program parallels the growing need for permanent, environmentally safe, and secure means to store nuclear wastes. The repository will be located within the Columbia Plateau basalt formations where these ends can be met and radiological waste can be stored. These wastes will be stored such that the wastes may be retrieved from storage for a period after placement. After the retrieval period, the storage locations will be prepared for terminal storage. The terminal storage requirements will include decommissioning provisions. The facility boundaries will encompass no more than several square miles of land which will be above a subsurface area where the geologic makeup is primarily deep basaltic rock. The repository will receive, from an encapsulation site(s), nuclear waste in the form of canisters (not more than 18.5 feet x 16 inches in diameter) and containers (55-gallon drums). Canisters will contain spent fuel (after an interim 5-year storage period), solidified high-level wastes (HLW), or intermediate-level wastes (ILW). The containers (drums) will package the low-level transuranic wastes (LL-TRU). The storage capacity of the repository will be expanded in a time-phased program which will require that subsurface development (repository expansion) be conducted concurrently with waste storage operations. The repository will be designed to store the nuclear waste generated within the predictable future and to allow for reasonable expansion. The development and assurance of safe waste isolation is of paramount importance. All activities will be dedicated to the protection of public health and the environment. The repository will be licensed by the US Nuclear Regulatory Commission (NRC). Extensive efforts will be made to assure selection of a suitable site which will provide adequate isolation.

1824 (RHO-BWI-CD--22(Rev.1)) PRECONCEPTUAL DESIGN MANAGEMENT PLAN BASALT WASTE ISOLATION PROGRAM BASALT REPOSITORY. Marron, J.F. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 10 Nov 1978. Contract EY-77-C-06-1030. 25p. Dep. NTIS, PC A02/MF A01.

The repository in Columbia Plateau basalt will receive nuclear waste in canisters (spent fuel, HLW, and ILW) and drums (low-level waste). This document establishes the management plan for the preconceptual design of the basalt repository. (DLC)

1825 (RHO-BWI-CD--35) NUCLEAR WASTE REPOSITORY IN BASALT PROJECT B-301 PRECONCEPTUAL DESIGN REPORT. (Rockwell International Corp., Richland, WA (USA). Energy Systems Group). Feb 1980. Contract AC06-77RL01030. 730p. NTIS, PC A99/MF A01.

The functions and design requirements are consistent with the DOE initially approved functional design criteria. The reference preconceptual design meets the initially approved criteria with two significant exceptions. Codes, standards, and regulations governing the design are summarized. Many design criteria are yet to be determined. Documentation regarding the nuclear waste forecast used (namely 380 GWe in the year 2000) is presented. This forecast provides a conservative basis for repository sizing, budgeting, risk assessment, and license planning during the early design stages and was used in preference to more recent forecasts. Each part of the report is presented in terms of the preconceptual waste breakdown structure (WBS) elements so that the schedules and cost estimates correlate with the design descriptions. The preconceptual WBS used is presented. The WBS will be modified and expanded during the conceptual design, consistent with the heirarchy of physical elements, project phases, organizational responsibilities, and funding categories. The WBS and its further expansions will govern the development of the system design description, project schedule, and cost estimate. Designs are available for nuclear waste repositories in several geologic mediums in the United States and elsewhere. To assure maximum technology transfer, designs and criteria for these other repositories have been reviewed. Key design parameters for a repository in basalt are compared with those for repositories in other geologic media. Repositories in different geologic media differ primarily in their subsurface features. Consequently, design emphasis was placed on the shafts, subsurface facilities, and subsurface systems. Rock mechanics and trade studies are included, documenting significant subsurface design features, alternatives considered.

1826 (RHO-BWI-CD--42) RESEARCH BOREHOLE DRILLING ACTIVITY FOR BOREHOLES DH-18, DH-19, DC-12, DC-13, DC-14, DC-15, AND DEEPENING OF EXISTING BOREHOLE DC-7. (Atomics International Div., Richland, WA (USA). Rockwell Hanford Operations). Sep 1979. Contract AC06-77RL01030. 27p. NTIS, PC A03/MF A01.

This report is an environmental evaluation of the impacts of proposed borehole drilling activities at the Hanford Site, northwest of Richland, Washington. The proposed action is to drill six research boreholes ranging in depth from 137 to 1372 meters (m) [250 to 4500 +- feet (ft)]. In addition, an existing borehole (DC-7) will be extended from 1249 to 1524 m (4099 to 5000 +- ft). The purpose of the US Department of Energy's (DOE) borehole drilling activities is to collect data on in situ rock formations that are considered potentialy suitable for nuclear waste repositories. The technical program efforts necessary to identify and qualify specific underground waste facility sites in candidate rock formations include geologic and hydrologic studies (seismicity and tectonics, rock structure and stratigraphy, lithology, etc.). Borehole drilling is an integral part of the geological studies and is essential to a thorough understanding of potentially suitable geologic formations. The purpose of the proposed drilling activities is to obtain data for evaluating Columbia River basalts that are being evaluated by the National Waste Terminal Storage (NWTS) Program to determine their suitability potential for nuclear waste repositories. Unavoidable impact to the environment is limited primarily to the clearing of land needed for access and drilling operations. Considerations exercised during site preparation, drilling, and subsequent site restoration will limit modification of the natural environment to the minimum required for accomplishment of test objectives.

1827 (RHO-BWI-LD--19) TECHNICAL REQUIREMENTS FOR QUALIFICATION OF A POTENTIAL NUCLEAR WASTE REPOSITORY SITE IN BASALT. Johnson, R.E.; Deju, R.A. (Rockwell International Corp., Palo Alto, CA (USA). Energy Systems Group). Sep 1979. Contract AC06-77RL01030. 27p. NTIS, PC A03/MF A01.

A site identification study has been conducted to identify and categorize a number of candidate sites that appear to be suitable for the location of a repository for radioactive waste on the Hanford Site. Three objectives were defined as a basis for the selection of guidelines for screening. These

were: (1) maximize public health and safety; (2) minimize adverse environmental and socioeconomic impact; and (3) minimize system costs. For each objective, appropriate considerations were identified; a guideline for which would be the delineation of progressively smaller siting areas and sites that may be suitable for locating a repository. This document is designed to be used as the reference framework for guiding the qualification of identified sites in lieu of formal NRC-issued criteria. As such, it will serve as a framework for guiding our research and development effort. A site will be considered qualified when, having been characterized in detail, it is demonstrated to meet these requirements and thus can be offered for formal licensing by the NRC.

1828 (RHO-BWI-LD--22) SITE IDENTIFICATION PRESENTATION: BASALT WASTE ISOLATION PROJECT. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Nov 1979. Contract EY-77-C-06-1030. 77p. Dep. NTIS, PC A05/MF A01.

The final step in the site identification process for the Basalt Waste Isolation Project is described. The candidate sites are identified. The site identification methodology is presented. The general objectives which must be met in selecting the final site are listed. Considerations used in the screening process are also listed. Summary tables of the guidelines used are included. (DMC)

1829 (RHO-BWI-LD--23) FUNCTIONS OF AN ENGINEERED BARRIER SYSTEM FOR A NUCLEAR WASTE REPOSITORY IN BASALT. Coons, W.E.; Moore, E.L.; Smith, M.J.; Kaser, J.D. (Atomics International Div., Richland, WA (USA). Rockwell Hanford Operations). Jan 1980. Contract AC06-77RL01030. 35p. NTIS, PC A03/MF A01.

Defined in this document are the functions of components selected for an engineered barrier system for a nuclear waste repository in basalt. The definitions provide a focal point for barrier material research and development by delineating the purpose and operative lifetime of each component of the engineered system. A five-component system (comprised of waste form, canister, buffer, overpack, and tailored backfill) is discussed in terms of effective operation throughout the course of repository history, recognizing that the emplacement environment changes with time. While components of the system are mutually supporting, redundancy is provided by subsystems of physical and chemical barriers which act in concert with the geology to provide a formidable barrier to transport of hazardous materials to the biosphere. The operating philosophy of the conceptual engineered barrier system is clarified by examples pertinent to storage in basalt, and a technical approach to barrier design and material selection is proposed. A method for system validation and qualification is also included which considers performance criteria proposed by external agencies in conjunction with site-specific models and risk assessment to define acceptable levels of system performance.

1830 (RHO-BWI-SA--19) STATUS REPORT ON STUDIES TO ASSESS THE FEASIBILITY OF STORING NUCLEAR WASTE IN COLUMBIA PLATEAU BASALTS. Deju, R.A. (Atomics International Div., Richland, WA (USA). Rockwell Hanford Operations). Jul 1979. Contract EY-77-C-06-1030. 18p. (IAEA-SM--243/36; CONF-790711--5). Dep. NTIS, PC A02/MF A01.

From International symposium on underground disposal of radioactive wastes; Otaniemi, Finland (2 Jul 1979).

Basalts, such as the Columbia Plateau basalts, which underlie a large portion of the Pacific Northwest and the Hanford Site, were selected for initial geologic reconnaissance. Geologic exploration of Columbia Plateau basalts was needed to determine the feasibility of utilizing those formations as a site for terminal storage of commercial nuclear waste. The Basalt Waste Isolation Program within Rockwell Hanford Operations has been chartered with the responsibility of conducting these investigations. This program is divided into systems integration, geology, hydrology, engineered barriers studies, engineering testing, and the construction of a near-surface test facility.

1831 (RHO-BWI-SA--20) NUMERICAL MODELING OF THE GEOMECHANICAL RESPONSE OF A ROCK MASS TO A RADIOACTIVE WASTE REPOSITORY. Hardy, M.P.; St. John, C.M.; Hocking, G. (Minnesota Univ., Minneapolis (USA). Mineral Resources Research Center; Dames and Moore, Boston, MA (USA)). Jun 1979. Contract EY-76-C-06-2130. 16p. (CONF-790944--1). Dep. NTIS, PC A02/MF A01.

From 4. international congress on rock mechanics; Montreux, Switzerland (2 Sep 1979).

Geotechnical numerical models capable of predicting the thermomechanical response and groundwater movements around an underground radioactive waste repository are vital to the success of the nuclear waste disposal program. In the absence of directly related engineering experience, the design, risk assessment, and licensing procedures of a repository will be reliant on predictions made using such models. This paper reviews models being used to assist in repository design and summarizes the results of a recent parametric study of underground disposal in basaltic rocks. On the basis of preliminary site data, it is concluded that the allowable areal density of heat-generating waste will be controlled by the stability of placement rooms and the boreholes in which waste canisters are placed. Regional effects including thermally induced upward groundwater flow, appear to present less severe problems.

1832 (RHO-BWI-SA--21) BASALT NEAR-SURFACE TEST FACILITY TEST PLANS. Krug, A.D. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Jun 1979. Contract EY-77-C-06-1030. 15p. (CONF-790683--2). Dep. NTIS, PC A02/MF A01.

From ONWI-LLL workshop on thermomechanical modeling for a hard rock repository; Berkeley, CA, USA (25 Jun 1979).

The NSTF is under construction at Gable Mountain for in-situ testing, which will be conducted in two phases: Phase I, using electric heaters to simulate nuclear waste canisters in order to study the thermomechanical response of basalt; and Phase II, using spent fuel canisters. The tests planned for Phases I and II are described. (DLC)

1833 (RHO-BWI-SA--25) STATUS REPORT ON STUDIES TO ASSESS THE FEASIBILITY OF STORING NUCLEAR WASTE IN COLUMBIA PLATEAU BASALTS. Deju, R.A.; Evans, G.C. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Nov 1979. Contract EY-77-C-06-1030. 13p. (CONF-791033--2; CONF-791112--44). Dep. NTIS, PC A02/MF A01.

From 1. annual ONWI information meeting; Columbus, OH, USA (30 Oct 1979).

The Basalt Waste Isolation Project, is part of the National Waste Terminal Storage Program. The program, as presently structured, is aimed at assessing the feasibility and providing the technology needed to design and construct a repository for storage of commercial radioactive waste in the extensive basalts beneath the Hanford Site of the United States Department of Energy. The program is presently in the research and development phase to assess feasibility. Geologic site selection studies are to be completed in September 1981, to allow a feasibility decision at that time, whereupon if feasibility is proven and the United States Department of Energy goes forward with the project, we would move into the licensing phase of the project. Ultimately, it would be up to the United States Nuclear Regulatory Commission to grant a construction license and, later on, an operating license. During the research and development phase, the program includes seven areas of study; namely, geosciences, hydrology multiple engineered barriers, test facility design and construction, engineering testing, systems integration, and preliminary repository engineering design. The progress made to date in each of these areas is detailed.

1834 (RHO-BWI-SA--29) RATE OF DEFORMATION IN THE PASCO BASIN DURING THE MIOCENE AS DETERMINED BY DISTRIBUTION OF COLUMBIA RIVER BASALT FLOWS. Reidel, S.P.; Ledgerwood, R.K.; Myers, C.W.; Jones, M.G.; Landon, R.D. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Mar 1980. Contract EY-77-C-06-1030. 43p. (CONF-800342--1). Dep. NTIS, PC A03/MF A01.

From 76. annual meeting Cordilleran Section Geological Society of America; Corvallis, OR, USA (19 Mar 1980).

Detailed mapping of over 8000 square kilometers and logs from 20 core holes were used to determine the distribution and thickness of basalt flows and interbeds in the Pasco Basin. The data indicate the high-MgO Grande Ronde Basalt and Wanapum Basalt thicken from the northeast to the southwest. Deformation began in late Frenchman Springs time in the Saddle Mountains along a northwest-southeast trend and in Roza time along an east-west trend. By late Wanapum time, basalt flows were more restricted on the east side. Saddle Mountains Basalt flows spread out in the basin from narrow channels to the east. The Umatilla Member entered from the southeast and is confined to the south-central basin, while the Wilbur Creek, Asotin, Esquatzel, Pomona, and Elephant Mountain Members entered from the east and northeast. The distribution of these members is controlled by flow volume, boundaries of other flows, and developing ridges. The Wilbur Creek, Asotin, and Esquatzel flows exited from the basin in a channel along the northern margin of the Umatilla flow, while the Pomona and Elephant Mountain flows exited between Umtanum Ridge and Wallula Gap. The thickness of sedimentary interbeds and basalt flows indicated subsidence and/or uplift began in post-Grande Ronde time (14.5 million years before present) and continued through Saddle Mountains time (10.5 million years before present). Maximum subsidence occurred 40 kilometers (24 miles) north of Richland, Washington with an approximate rate of 25 meters (81 feet) per million years during the eruption of the basalt. Maximum uplift along the developing ridges was 70 meters (230 feet) per million years.

1835 (RHO-BWI-SA--30) STRAIN DISTRIBUTION AND MODEL FOR FORMATION OF EASTERN UMTANUM RIDGE ANTICLINE, SOUTH-CENTRAL WASHINGTON. Price, E.H. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Oct 1979. Contract EY-77-C-06-1030. 27p. (CONF-800342--3). Dep. NTIS, PC A03/MF A01.

From 76. annual meeting Cordilleran Section Geological Society of America; Corvallis, OR, USA (19 Mar 1980).

Umtanum Ridge in south-central Washington is the topographic expression of a complex anticline within the Yakima Fold system in the Miocene Columbia River Basalt Group. The Yakima Fold system, which is partly contained within the Hanford Site, is an example of a layered basalt sequence folded near the surface of the earth. The Pasco Basin stratigraphic nomenclature is used in this repot. Rockwelll Hanford Operations, under contract to the US Department of Energy, is investigating the feasibility of therminal high-level nuclear waste storage in mined repositories in basalt beneath the Hanford Site. Because thereis essentially no basalt within the Site that has not been involved in some folding, any potential location for a repository will be either on the limbs or near the hinge zone of a Yakima Fold structure. Umtanum Ridge is the best exposed Yakima Fold structure in the vicinity of the Site for studying the nature and three-dimensional style of deformation of a multilayered basalt sequence. The structural geometry, distribution of strain within the Umtanum structure and deformational mechanisms of the Umtanum Ridge are discussed.

1836 (RHO-BWI-SA--32) CHEMICAL STRATIGRAPHY OF GRANDE RONDE BASALT, PASCO BASIN, SOUTH-CENTRAL WASHINGTON. Long, P.E.; Ledgerwood, R.K.; Myers, C.W.; Reidel, S.P.; Landon, R.D.; Hooper, P.R. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Feb 1980. Contract EY-77-C-06-1030. 33p. (CONF-800342--2). Dep. NTIS, PC A03/MF A01.

From 76. annual meeting Cordilleran Section Geological Society of America; Corvallis, OR, USA (19 Mar 1980).

Grande Ronde Basalt in the Pasco Basin, south-central Washington, can be subdivided into three chemical types and two chemical subtypes based on x-ray fluorescence major element analysis of samples from seven deep core holes and three surface sections. These chemical types are: (1) high-Mg Grande Ronde chemical type; (2) low-Mg Grande Ronde chemical type; (3) low-K (very high-Mg.) Grande Ronde chemical type; and (4) Umtanum Grande Ronde chemical subtype. A possible fifth subdivision is the McCoy Canyon Grande Ronde chemical subtype. The Umtanum and the McCoy Canyon subtypes are both single flows which belong to the low Mg and high-Mg chemical types, respectively. These subdivisions are all distinguished on a plot of MgO versus TiO_2 and/or MgO versus P_2O_5, but other major and minor elements, as well as trace elements, also reflect consistent chemical differences between the chemical types. Identification of these chemical types in the Pasco Basin subsurface shows that the high-Mg and low-Mg chemical types are ubiquitous, but the low-K chemical type is limited to the central, southern, and eastern parts of the basin. The Umtanum chemical subtype is present throughout the Pasco Basin subsurface, although it thins in the northeastern part of the basin and is apparently absent from surface exposures 40 kilometers (25 miles) north of the basin. The McCoy Canyon chemical subtype is also present throughout the basin.

1837 (RHO-BWI-SA--43) LANDSAT DATA AS A BASIS FOR REGIONAL ENVIRONMENTAL ASSESSMENT WITHIN THE COLUMBIA PLATEAU. Leonhart, L.S.; Stephan, J.G. (Atomics International Div., Richland, WA (USA). Rockwell Hanford Operations; Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1980. Contract AC06-77RL01030. 19p. (CONF-800577--1). NTIS, PC A02/MF A01.

From 6. Canadian symposium on remote sensing; Halifax, Canada (21 May 1980).

LANDSAT data are being used to assist in classifying land cover for the purpose of providing regional environmental assessments of a 105,000 km² area within the Columbia Plateau region of the northwestern United States. The environmental assessment is being performed in conjunction with siting a radioactive waste terminal-storage facility within the federally operated Hanford Site in south-central Washington. Initial assessments involved classification of four contiguous LANDSAT scenes recorded over the region during the summer of 1975 and about 300 1978 high-altitude (U-2) photographs. The resulting mosaic was segregated into ten land-cover classes. The classified land-cover data were then machine-integrated with digital irrigation well-location data taken from the US Geological Survey's Ground-Water Site Inventory. The resulting groundwater multi-source data product was required by hydrologists to segregate potential artificial recharge areas from artificial groundwater discharge areas. Related studies have employed LANDSAT data and aerial imagery to identify linear structures and other geologic features which may have a significant bearing on the tectonic and/or hydrologic setting of the Columbia Plateau. Future plans call for attempts to correlate land-cover patterns with other physical and environmental parameters such as digital terrain and hydrometeorological data.

1838 (RHO-BWI-SA--49) BASALT WASTE ISOLATION PROJECT BOREHOLE PLUGGING STUDIES: AN OVERVIEW. Smith, M.J.; McCarel, S.C. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 1980. Contract AC06-77RL01030. 14p. (CONF-800527--7). NTIS, PC A02/MF A01.

From International BHP symposium; Columbus, OH, USA (7 May 1980).

The objective of the Basalt Waste Isolation Project (BWIP) is to establish the feasibility of constructing a geologic repository for commercial high-level nuclear waste in the basalt flows within the Columbia Plateau and to provide the technology needed for design and construction of such a facility. The success of a repository located in basalt is dependent upon the ability to seal the facility at the end of the operational period. Therefore, a borehole plugging study is being conducted by the engineered barriers group of the BWIP in order to develop,test, and demonstrate materials, equipment, and techniques for plugging the various man-made openings (boreholes, shafts, and tunnels) in and around the repository. These plugs are intended to severely restrict groundwater transport of toxic materials by both chemical and physical retardation. Verification of engineered plug system designs is accomplished through a proposed series of field tests and demonstrations.

1839 (RHO-BWI-SA--50) SEALING A NUCLEAR WASTE REPOSITORY IN COLUMBIA RIVER BASALT: PRELIMINARY RESULTS. Hodges, F.N.; O'Rourke, J.E.; Anttonen, G.J. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations; Woodward-Clyde Consultants, San Francisco, CA (USA)). 1980. Contract AC06-77RL01030. 21p. (CONF-800527--6). NTIS, PC A02/MF A01.

From International BHP symposium; Columbus, OH, USA (7 May 1980).

The long containment time required of repositories for nuclear waste (10^4 to 10^6 years) requires that materials used for repository seals be stable in the geologic environment of the repository and of proven longevity. A list of candidate materials for sealing a repository in Columbia River basalts has been prepared and refined through laboratory testing. The most feasible techniques for emplacing preferred plug materials have been identified and the resultant plugs have been evaluated on the basis of design functions. Preconceptual designs for tunnel, shaft, and borehole seals consist of multiple zone plugs with each zone fulfilling one or more design functions. Zones of disturbed rock around tunnels and shafts, resulting from excavation and subsequent stress release, are zones of higher permeability and of possible fluid migration. In preliminary designs the disturbed zones are blocked by cut-off collars filled with low permeability materials.

1840 (RHO-BWI-SA--51) TECHNICAL APPROACH TO RESOLVING ISSUES ON ROCK MECHANICS AS APPLIED TO DEVELOPMENT OF A NUCLEAR WASTE REPOSITORY IN A CRYSTALLINE ROCK FORMATION. Case, J.B. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Mar 1980. Contract AC06-77RL01030. 25p. (CONF-800377--1). NTIS, PC A02/MF A01.

From Meeting on radioactive waste storage in mined caverns; Stockhol, Sweden (4 Mar 1980).

This paper summarizes the technical efforts for resolving issues on rock mechanics as applied to development of a nuclear waste repository in a crystalline rock formation. This section provides background information and definitions pertinent to rock mechanics. Section 2.0 presents the rock mechanics issues related to licensing, design, and construction of a waste repository. Section 3.0 presents the technical approach to the resolution of issues and concludes that a multi-faceted approach involving principally site characterization, laboratory testing, numerical modeling and analysis, and in situ testing and monitoring is required. While this technical approach is directed to further scientific understanding and quantification of the phenomena involved accompanying the thermal heating of rock from nuclear waste, it is emphasized that formulation of a design basis for an engineered rock structure will precede the development of a large waste repository. Section 4.0 summarizes the status of resolution activities in the areas of thermomechanical effects, coupled thermal, mechanical, and hydrological phenomena, mine-induced fracturing, mine stability, and seismicity. Section 5.0 gives a concluding statement. Under the present project plans, technical activities are proceeding on multiple fronts involving field, laboratory, and numerical modeling and analysis studies of the important phenomena related to the disposal of radioactive waste in crystalline rock. The advancement of the state of the art in rock mechanics from these activities will culminate in the risk analysis and the formulation of a design basis for repositories.

1841 (RHO-BWI-SA--66) EVALUATION OF PRECONCEPTUAL PLUG DESIGNS USING EXPERTS' JUDGEMENT. Sioshansi, F.P.; O'Rourke, J.E. (Woodward-Clyde Consultants, San Francisco, CA

(USA)). Mar 1980. Contract AC06-77RL01030. 35p. (CONF-801106--1). NTIS, PC A03/MF A01.
From American Institute for Decision Sciences conference; Las Vegas, NV, USA (5 Nov 1980).
A number of preconceptual plug designs for an underground nuclear waste repository were to be evaluated based on the available information on plug materials and placement techniques. Because of complex environment and loading conditions, long time frame under consideration, rigid performance characteristics and considerable uncertainties present in preconceptual design and material properties, a qualitative and judgmental evaluation procedure was needed to supplement technical studies. A structured procedure was developed to qualitatively capture evaluator's views and reservations on the proposed preconceptual schemes. Since a thorough evaluation of each proposed plug scheme required in-depth experience and familiarity with many components of the plug, three knowledgeable experts with specialties in the most relevant aspects of the problem were independently interviewed. Each plug scheme was broken down into three subcomponents and each subcomponent was evaluated separately. The proposed schemes were then rated taking their subcomponents into consideration. Because the experts had different specialties, their subcomponent and overall ratings were not in full agreement. Each plug scheme's lowest overall rating was used as the most significant determinant of the judgmental preference categories reported in this study. The approach used discriminated between the proposed schemes for those with highest probability of being successful. The most preferred schemes were then reviewed with respect to the data produced in the technical analysis performed during the project. The results of the judgmental analysis were then synthesized and modified with results of the technical analysis to produce the preconceptual plug designs.

1842 (RHO-BWI-ST--7) ENGINEERED BARRIER DEVELOPMENT FOR A NUCLEAR WASTE REPOSITORY IN BASALT: AN INTEGRATION OF CURRENT KNOWLEDGE. Smith, M.J. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). May 1980. Contract AC06-77RL01030. 647p. NTIS, PC A99/MF A01.
This document represents a compilation of data and interpretive studies conducted as part of the engineered barriers program of the Basalt Waste Isolation Project. The overall objective of these studies is to provide information on barrier system designs, emplacement and isolation techniques, and chemical reactions expected in a nuclear waste repository located in the basalts underlying the Hanford Site within the state of Washington. Backfills, waste-basalt interactions, sorption, borehole plugging, etc., are among the topics discussed.

1843 (RHO-BWI-ST--8) NEAR-SURFACE TEST FACILITY. PHASE I. GEOLOGIC SITE CHARACTERIZATION REPORT. Moak, D.J.; Wintczak, T.M. (Rockwell International Corp., Richland, WA (USA). Energy Systems Group). Aug 1980. Contract AC06-77RL01030. 234p. NTIS, PC A11/MF A01.
The report is a description of the geology and characterization of the rock mass of the area in which the Phase I qualification tests at the Near-Surface Test Facility (NSTF) are being performed. The NSTF is located on Gable Mountain within the Hanford Site near Richland, Washington. It is located in the entablature of the Pomona Member, an upper flow in the Columbia River Basalt Group, and is approximately 150 feet (47.5 meters) below the surface. Core logging from the instrument boreholes coupled with joint mapping, statistics, and other test data provided the basis for a detailed characterization of the 16-foot x 20-foot x 28-foot (5-meter x 6-meter x 9-meter) rock masses surrounding Full-Scale Heater Tests No. 1 and No. 2. The Pomona entablature contains three joint sets delineated by their degree of dip, each with apertures averaging 0.25 millimeter and having no preferred strike orientation. Although joint frequencies in the study area exceed 4 joints per foot (13 per meter), the rock-mass classification rating is good.

1844 (RHO-BWI-ST--9) IDENTIFICATION OF KEY RADIONUCLIDES IN A NUCLEAR WASTE REPOSITORY IN BASALT. Barney, G.S.; Wood, B.J. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). May 1980. Contract AC06-77RL01030. 33p. NTIS, PC A03/MF A01.
Radionuclides were identified which appear to pose the greatest potential hazard to man during long-term storage of nuclear waste in a repository mined in the Columbia Plateau basalt formation. The criteria used to select key radionuclides were as follows: quantity of radionuclide in stored waste; biological toxicity; leach rate of the wastes into groundwater; and transport rate via groundwater flow. The waste forms were assumed to be either unreprocessed spent fuel or borosilicate glass containing reprocessed high-level waste. The nuclear waste composition was assumed to be that from a light water reactor. Radionuclides were ranked according to quantity, toxicity, and release rate from the repository. These rankings were combined to obtain a single list of key radionuclides. The ten most important radionuclides in order of decreasing hazard are: ^{99}Tc, ^{129}I, ^{237}Np, ^{226}Ra, ^{107}Pd, ^{230}Th, ^{210}Pb, ^{126}Sn, ^{79}Se, and ^{242}Pu. Safety assessment studies and the design of engineered barriers should concentrate on containment of radionuclides in this list.

1845 (RHO-C--22) STRENGTH AND ELASTIC PROPERTIES OF CONCRETES FROM WASTE TANK FARMS. Gillen, M. (Portland Cement Association, Skokie, IL (USA). Construction Technology Labs.). Dec 1978. Contract EY-77-C-06-1030. 59p. Dep. NTIS, PC A04/MF A01.
Tests were conducted on concretes from Hanford Waste Tank Farms, and on concrete cast by the Portland Cement Association using Hanford mix designs and materials. Elastic modulus (static method), Poisson's ratio, and compressive and splitting tensile strengths were determined at room temperature, and for specimens maintained at 250F for varying lengths of time. Variables examined were temperature, length of exposure to elevated temperature, and geometry of test specimens. Compressive strength generally decreased after specimens were exposed to heat. Maximum losses were 20 to 33 percent of room temperature strength. Initially stronger concretes lost a proportionately larger percentage of their strength after exposure than did weaker concrete. In some series, concrete appeared to gain strength after exposure. In other series, concrete initially lost strength, then recovered strength after prolonged heating. Splitting tensile strength of heated specimens followed trends similar to those obtained for compressive strength. Highest strength losses were about 40 percent. However, in most cases, considerably less strength deterioration resulted from exposure to heat. Modulus of

elasticity and Poisson's ratio also decreasd after exposure to heat. Greatest losses were about 40 percent of room temperature values, but amounts differed widely among test series.

1846 (RHO-C--28) ELASTIC AND STRENGTH PROPERTIES OF HANFORD CONCRETE MIXES AT ROOM AND ELEVATED TEMPERATURES. Abrams, M.S.; Gillen, M.; Campbell, D.H. (Portland Cement Association, Skokie, IL (USA). Construction Technology Labs.). Mar 1979. Contract EY-77-C-06-1030. 111p. Dep. NTIS, PC A06/MF A01.

The effects of long-term exposure to elevated temperatures on the physical properties of concrete mixes used in Hanford radioactive waste storage tanks were determined. Temperature had a significant effect on the elastic modulus of concretes. Poisson's ratio determined by the sonic method remained relatively constant. The splitting tensile strength increased rapidly up to 190 days of age. Then strength decreased to about 350 days and either leveled off or increased from that point on. Compressive strength data were erratic. (FS)

1847 (RHO-C--39) COMPARISON OF THE MICROSTRUCTURE OF HANFORD TYPE II CONCRETE STRUCTURES AND TEST SPECIMENS. Daniel, J.L.; Buck, A.D. (Battelle Pacific Northwest Labs., Richland, WA (USA); Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations; Corps of Engineers, Vicksburg, MS (USA). Waterways Exeriment Station). Apr 1980. Contract AC06-77RL01030. 96p. NTIS, PC A05/MF A01.
