High-level radioactive waste from the current waste management operation at Hanford is stored in underground reinforced concrete tanks with a steel liner on the sides and bottom. The removal of pumpable liquid results in a moist salt-cake of sodium salts that is relatively immobile compared to its original liquid state. Additional immobilization and isolation techniques are being studied to further improve waste isolation and containment. Retrieval of the waste and permanent disposal will be deferred until a permanent disposal mode and location is selected. The integrity of the storage tanks is of critical importance during this interim period. Technical studies and laboratory tests have been performed to determine the effect of the stored waste's temperatures and chemistry on the reinforced concrete's strength and elastic properties. However, relatively little attention has been given to studying or predicting very long-term behavior based on short-term specimen examination. This report describes the results of the first phase of a laboratory program for which the ultimate goal is the ability to predict the probable condition of Hanford Type II concrete structures after 100 years of more of lifetime. The purpose of this phase was the evaluation of the microstructure of several existing test and field samples of Hanford concrete, and to correlate microstructural data with the physical test measurements on hand from other programs and tasks.

1848 (RHO-CD--34-4Q) RADIOACTIVE LIQUID WASTE DISCHARGED TO GROUND IN THE 200 AREAS DURING 1977. Anderson, J.D.; Poremba, B.E. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 20 Mar 1978. Contract AC06-77RL01030. 233p. NTIS, PC A11/MF A01.

An overall summary is presented giving the radioactive liquid wastes discharged to ground during 1977 and since start-up (for both total and decayed depositions) within the Rockwell Hanford Operations control zone (200 Area plateau). Overall summaries are also presented for 200 East Area and for 200 West Area. The data contain an estimate of the radioactivity discharged to individual ponds, cribs and specific retention sites during 1977 and from startup through December 31, 1977; an estimate of the decayed activities from startup through 1977; the location and reference drawings of each disposal site; and the usage dates of each disposal site. The estimates for the radioactivity discharged to the ponds also includes major nonradioactive streams. The waste discharged during 1977 to each active disposal site are detailed on a month-to-month basis, along with the monthly maximum concentration and average concentration data.

1849 (RHO-CD--78-34-4Q) RADIOACTIVE LIQUID WASTES DISCHARGED TO GROUND IN THE 200 AREAS DURING 1978. Anderson, J.D.; Poremba, B.E. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 26 Mar 1979. Contract EY-77-C-06-1030. 235p. Dep. NTIS, PC A11/MF A01.

Portions of document are illegible.

This document is issued quarterly for the purpose of summarizing the radioactive liquid wastes that have been discharged to the ground in the 200 Areas. In addition to data for 1978, cumulative data since plant startup are presented. Also, in this document is a listing of decayed activity to the various plant sites.

1850 (RHO-CD--78-35-4Q) RADIOACTIVITY IN GASEOUS WASTE DISCHARGED FROM THE SEPARATIONS FACILITIES DURING 1978. Anderson, J.D.; Poremba, B.E. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 30 Mar 1979. Contract EY-77-C-06-1030. 25p. Dep. NTIS, PC A02/MF A01.

This document is issued quarterly for the purpose of summarizing the radioactive gaseous wastes that are discharged from the facilities of the Rockwell Hanford Operations. Data on alpha and beta emissions during 1978 are presented where relevant to the gaseous effluent. Emission data are not included on gaseous wastes produced within the 200 Areas by other Hanford contractors.

1851 (RHO-CD--79-34-4Q) RADIOACTIVE LIQUID WASTES DISCHARGED TO GROUND IN THE 200 AREAS DURING 1979. Sliger, G.J. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 6 Mar 1980. Contract AC06-77RL01030. 227p. NTIS, PC A11/MF A01.

An overall summary is presented giving the radioactive liquid waste discharged to the ground during the current year of 1979 and since startup (for both total and decayed depositions) with the Rockwell Hanford Operations (Rockwell) control zone (200 Area plateau). Overall summaries are also presented for 200 East and for 200 West Area. The data contains an estimate of the radioactivity discharged to individual ponds, cribs and specific retention sites during the following periods: (1) All four quarters of 1979; and (2) from startup through December 31, 1979. The location and reference drawings of each disposal site, and the usage dates of each disposal site are given. The estimates for the radioactivity discharged to the ponds also include major nonradioactive streams. The waste discharged during 1979 to each active disposal site is detailed on a month-to-month basis, along with the monthly maximum concentration and average concentration data.

1852 (RHO-CD--132(Rev.4)) TECHNICAL PROGRAM PLAN, BASALT WASTE ISOLATION PROJECT. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 19 Oct 1979. Contract EY-77-C-06-1030. 60p. Dep. NTIS, PC A04/MF A01.

The Basalt Waste Isolation Program covers all activities necessary to assess the feasibility and provide the technology needed to design and construct a nuclear waste repository in basalt. The program is divided into the following areas: program management; systems integration; scientific technology; near-surface test facility; and repository studies. The program is discussed in detail.

1853 (RHO-CD--132(Rev.5)) TECHNICAL PROGRAM PLAN, BASALT WASTE ISOLATION PROJECT. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Dec 1979. Contract AC06-77RL01030. 128p. NTIS, PC A07/MF A01.

The Basalt Waste Isolation Project (BWIP) program as administered by the DOE's Richland Operations Office and Rockwell Hanford Operations is described. The objectives, scope and scientific technologies are discussed. The work breakdown structure of the project includes: project management and support, systems integration, geosciences, hydrology, engineered barriers, test facility design and construction, engineering testing, repository studies, and schedules. The budget of the program including operating and capital cost control is also included. (DC)

1854 (RHO-CD--773) INTERIM REPORT ON STATUS OF CONTAINMENT INTEGRITY STUDIES FOR CONTINUED IN-TANK STORAGE OF HANFORD HIGH-LEVEL DEFENSE WASTE. Mercier, P.F. (Atomics International Div., Richland, WA (USA). Rockwell Hanford Operations). Sep 1979. Contract EY-77-C-06-1030. 25p. Dep. NTIS, PC A02/MF A01.

This interim report supplements technical information reported in RHO-LD-52, Status of Containment Integrity Studies for Continued In-Tank Storage of Hanford Defense High-Level Waste, September 1978. Only new data from the continuing laboratory programs and those studies initiated in the past year are included. Analyses of waste tank concrete integrity continued through the year. Laboratory tests to determine the effect of long-term elevated temperatures on the strength and elastic properties of concrete showed that the modulus of elasticity, compressive strength, and splitting tensile strength continued to decrease as a function of temperature; Poisson's ratio was relatively unchanged. The durability tests of reinforced concrete specimens exposed to simulated waste chemicals showed no evidence of deterioration after 6 months exposure. Temperature cycling effects after 17 cycles showed little change in the compressive strength but a large reduction in the modulus of elasticity. A structural failure mode analysis was initiated to estimate the effect of constant dead load, elevated temperature, and aggressive chemicals on tank structural integrity after 100 years of waste storage. No results are presently available. A report is scheduled for completion in early 1980. An electron microscopy analysis was initiated to determine if microstructural changes in concrete can be detected which would provide a key for correlating relatively short-term laboratory data to predicting long-term structural behavior. Documented results are scheduled for late 1980.

1855 (RHO-CD--810) PRELIMINARY CRITERIA FOR SHALLOW-LAND STORAGE/DISPOSAL OF LOW-LEVEL RADIOACTIVE SOLID WASTE IN AN ARID ENVIRONMENT. Shord, A.L. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Sep 1979. Contract EY-77-C-06-1030. 81p. Dep. NTIS, PC A05/MF A01.

Preliminary criteria for shallow land storage/disposal of low level radioactive solid waste in an arid environment were developed. Criteria which address the establishment and operation of a storage/disposal facility for low-level radioactive solid wastes are discussed. These were developed from the following sources: (1) a literature review of solid waste burial; (2) a review of the regulations, standards, and codes pertinent to the burial of radioactive wastes; (3) on site experience; and (4) evaluation of existing burial grounds and practices. (DMC)

1856 (RHO-CD--882) INSPECTION AND EVALUATION OF NUCLEAR FUEL SERVICES HIGH-LEVEL WASTE STORAGE SYSTEM. PROGRAM PLAN. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Jan 1980. Contract AC06-77RL01030. 64p. NTIS, PC A04/MF A01.

The Nuclear Regulatory Commission has expressed the need for additional information concerning the condition of the high-level waste tanks at the Western New York State Nuclear Service center near West Valley, New York. This information is intended to be used in evaluating the safety of continued storage and in the development of alternatives for final disposition of the high-level waste.

1857 (RHO-CD--896) REVIEW OF CLASSIFICATION OF NINE HANFORD SINGLE-SHELL QUESTIONABLE INTEGRITY TANKS. Schulz, W.W. (comp.). (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Jan 1980. Contract EY-77-C-06-1030. 112p. Dep. NTIS, PC A06/MF A01.

Based upon this latest thorough review of the historical and current data base for Tanks 107-B, 110-B, 201-B, 101-C, 110-SX, 108-T, 111-T, 101-TY, and 112-U, Rockwell finds that Tanks 107-B, 201-B, 101-C, and 112-U should be reclassified as Confirmed Leakers. The volumes of liquid waste estimated to have leaked from these four tanks are: (1) Tank 107-B, 8,000 gallons (May 1968 to August 1969); (2) Tank 201-B, 1,200 gallons (April 1968 to June 1971); (3) Tank 101-C, 17,000 to 24,000 gallons (January 1968 to December 1969); and (4) Tank 112-U, 7,000 to 10,000 gallons (February 1969 to March 1970). Tanks 110-B, 110-SX, 108-T, 111-T, and 101-TY should continue to be classified as of Questionable Integrity.

1858 (RHO-CD--980) WASTE TANK CORE DRILLING DEMONSTRATION RESULTS. DeFigh-Price, C. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). May 1980. Contract AC06-77RL01030. 38p. NTIS, PC A03/MF A01.

In order to develop a strong data base and methodology for evaluating the structural integrity of the existing waste storage tanks, it is desirable to obtain concrete core samples from load bearing areas (the haunch, wall and footing) of actual waste tanks. The cores can be tested and compared with laboratory test data. Before cores are removed from the load bearing areas of an actual waste tank, it must be demonstrated that the drilling operation, including water control, can be safely performed. Two drilling tests were successfully

completed in the 100-F Area during February and March 1980 demonstrating the feasibility of core drilling the wall of a 1 million gallon underground waste tank. This report summarizes the results of the demonstrations.

1859 (RHO-LD--45) GRANULOMETRIC DATA 216-B CRIB FACILITIES MONITORING WELL SEDIMENTS. Fecht, K.R.; Last, G.V.; Marratt, M.C. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Mar 1978. Contract EY-77-C-06-1030. 276p. Dep. NTIS, PC A13/MF A01.

Approximately 3400 sediment samples collected during the drilling of wells in the 216-B Crib Facilities have been analyzed for grain size and calcium carbonate content. The grain size data were used to categorize the sediment samples into sediment classes. The granulometric data, the calcium carbonate data, and the sediment class of each of the 3400 sediment samples are documented in this report.

1860 (RHO-LD--71) STRATIGRAPHY OF THE LATE CENOZOIC SEDIMENTS BENEATH THE 216-A CRIB FACILITIES. Fecht, K.R.; Last, G.V.; Marratt, M.C. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Feb 1979. Contract EY-77-C-06-1030. 168p. Dep. NTIS, PC A08/MF A01.

The stratigraphy of the late Cenozoic sediments beneath the 216-A Crib Facilities is presented as lithofacies cross sections and is based on textural variations of the sedimentary sequence lying above the basalt bedrock. The primary source of data in this study is geologic information obtained from well drilling operations and geophysical logging. Stratigraphic interpretations are based primarily on textural analysis and visual examination of sediment samples and supplemented by drillers logs and geophysical logs.

1861 (RHO-LD--72) STRATIGRAPHY OF THE LATE CENOZOIC SEDIMENTS BENEATH THE 216-B AND C CRIB FACILITIES. Fecht, K.R.; Last, G.V.; Marratt, M.C. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). Feb 1979. Contract EY-77-C-06-1030. 206p. Dep. NTIS, PC A10/MF A01.

The stratigraphy of the late Cenozoic sediments beneath the 216-B and C Crib Facilities is presented as lithofacies cross sections and is based on textural variations of the sedimentary sequence lying above the basalt bedrock. The primary source of data in this study is geologic information obtained from well drilling operations and geophysical logging. Stratigraphic interpretations are based primarily on textural analysis and visual examination of sediment samples and supplemented by drillers logs and geophysical logs.

1862 (RHO-LD--82) SOIL (SEDIMENT) PROPERTIES OF TWELVE HANFORD WELLS WITH GEOLOGIC INTERPRETATION. Routson, R.C.; Fecht, K.R. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Nov 1979. Contract EY-77-C-06-1030. 58p. Dep. NTIS, PC A04/MF A01.

Laboratory soil (sediment) properties were determined for twelve study wells from an area south of the Hanford 200 West Area. Properties measured included: (1) mechanical analysis; (2) porosity; (3) $CaCO_3$ content; (4) moisture content at 0.33, 1.5, and 15 bars water potential; (5) field moisture content; (6) cation exchange capacity; and (7) bulk density. Geologic, stratigraphic cross sections were prepared using the above data and previously published data for the study area.

1863 (RHO-LD--97) PROJECT PLAN FOR INSPECTION AND EVALUATION OF NUCLEAR FUEL SERVICES HIGH-LEVEL WASTE STORAGE SYSTEM. Reep, I.E. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Aug 1979. Contract EY-77-C-06-1030. 77p. Dep. NTIS, PC A05/MF A01.

Information is needed about the condition of the high-level waste tanks and their contents in the NFS West Valley, New York reprocessing facility. This project plan will inspect the two carbon steel waste tanks 8D-1 and 8D-2 and characterize and analyze the waste. Soil transport studies will also be conducted around the tanks to determine the consequences of hypothetical tank leakage. Soil thermal properties and the total heat generation rate of the high-level waste will be measured. (DLC)

1864 (RHO-LD--98) LEACHING TECHNIQUE FOR STUDYING ACTINIDE-CONTAMINATED HANFORD SEDIMENTS. Gallagher, S.A. (Atomics International Div., Richland, WA (USA). Rockwell Hanford Operations). Oct 1979. Contract AC06-77RL01030. 23p. NTIS, PC A02/MF A01.

For more than 30 years, liquid wastes containing low concentrations of actinides from chemical processing plants have been disposed directly to the ground of the Hanford Site via trenches. These liquid wastes contained trace amounts of the actinides plutonium and americium. Because these elements are biologically harmful to man, they must remain isolated from the biosphere. Therefore, the ability of the sediments to provide this protection must be studied. Assessment of the stability of the actinides in the trench sediments is necessary to evaluate the need for long-term radionuclide stabilization measures. Three possible mechanisms exist for the transport of plutonium and americium in the sediments. These are leaching, diffusion, and particulate transport. Compared to particulate transport, diffusion is generally a slow method of transport, and leaching can occur at the same time as solutions percolate through the sediments. For this reason, three leaching techniques were reviewed, and small column leaching was chosen as the best method for assessing the stability of the actinides in contaminated sediments. This method most closely approximates natural conditions and employs a realistic solution/soil ratio. Procedures are given for implementing this technique. Both the stability and the chemical form of plutonium will be studied. Data will be input to the modeling of transport of radionuclides in sediments and also input to the ongoing assessment of waste sites.

1865 (RHO-LD--100) HEAT TRANSFER ANALYSIS FOR A LOSS OF INSTITUTIONAL CONTROL EVENT AT THE WASTE ENCAPSULATION AND STORAGE FACILITY. Allen, G.K. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Sep 1979. Contract EY-77-C-06-1030. 21p. Dep. NTIS, PC A02/MF A01.

A heat transfer analysis was made for a hypothetical loss of institutional control accident at the WESF 100 years after implementation of the Continued Present Action alternative. Three separate storage configurations were studied. The storage configuration with the maximum number of capsules per storage rack produced maximum capsule temperatures of 2475°F and maximum

concrete temperatures of 2435°F. The storage configuration with the minimum number of capsules per storage rack produced maximum capsule temperatures of 1030°F and maximum concrete temperatures of 1011°F. These maximum temperatures will be reached in less than 2.5 years after loss of cooling water. The time required to boil a storage pool dry for the maximum number of capsules per storage rack was calculated to be 48 days; for the minimum number of capsules per storage rack, 190 days.

1866 (RHO-LD--136) SUMMARY REPORT OF WASTE TANK IMPROVEMENT STUDIES. Mercier, P.F. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). Aug 1980. Contract AC06-77RL01030. 18p. NTIS, PC A02/MF A01.

Conceptual studies to improve the safety of storing high-level defense waste in the single-shell tanks were directed toward methods that would not prevent retrieval of the waste. Two concepts could be beneficial: (1) provide an impervious barrier between the storage tanks and the biosphere, and (2) strengthen the tank structure. Cement grout, chemical additives, subsurface slurry walls, and steel sheet piling were investigated to provide the impervious barrier. No method was found acceptable for providing assured, long-term, leak-free containment. A demonstration test of a chemical grout was not successful. A consultant report on subsurface slurry wall construction concluded that the wall would be only 95% leak free at installation and repairs to assure 100% would not be economically feasible. Cement grouts displace soil and could develop considerable pressure against the side of a tank. Sheet steel piling would require development of a method to seal the long, vertical joint of adjoining sections. Conceptual studies for strengthening the tank structure were directed toward providing support for the tank dome because of its flexibility and the magnitude of the soil cover load supported. The studies considered external dome supports, internal dome supports, and filling of the tank void volume. External support methods, while technically feasible, would require access for examination and maintenance. Internal supports are feasible. Filling of the tank void with crushed basalt or Hanford soil is feasible and would allow retrieval with currently planned equipment.

1867 (RHO-SA--108) STRUCTURAL EVALUATIONS OF EXISTING UNDERGROUND REINFORCED CONCRETE TANKS FOR RADIOACTIVE WASTE STORAGE. Vollert, F.R. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Oct 1979. Contract AC06-77RL01030. 40p. (CONF-791196--1). NTIS, PC A03/MF A01.

From Symposium on evaluation of existing concrete structures; Washington, DC, USA (1 Nov 1979).

Structural integrity evaluations are being conducted for underground, steel-lined reinforced concrete tanks for storing radioactive wastes. The tanks sustain large soil overburden loads and elevated temperatures from the waste for long time periods. The evaluations include laboratory experiments to determine the long-term effects of elevated temperatures on the elastic properties of concrete, and to estimate the effect of the waste chemicals on concrete durability. Available concrete samples from the tanks were also tested to determine the quality of the concrete in the tanks and for comparison with the laboratory data. Finite element, nonlinear, time-dependent analyses are performed to show the thermal creep, cracking, and stresses occurring in the concrete tanks due to the service conditions. Ultimate load analyses are made to assess the safety margin in the tanks. Finally, seismic analyses of a tank in the stressed condition due to the soil and thermal loadings were conducted to determine that the structure has sufficient reserve capacity to withstand 0.25 g earthquake accelerations.

1868 (RHO-SA--117) PARAMETRIC STUDY OF GLASS FORMULATIONS. Hill, L.R.; Jensen, L.; Rubinstein, S. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Aug 1979. Contract EY-77-C-06-1030. 7p. (CONF-790825--6). Dep. NTIS, PC A02/MF A01.

From Annual meeting of the American Statistical Association; Washington, DC, USA (12 Aug 1979).

Experiments were run on a limited system of glass formulations to test their resistance to leaching by water. Nuclear waste may be incorporated into glasses to provide a method of long-term waste storage. The effects of varying the amounts of six of seven components were estimated using fractions of 2^6 factorial designs. The seventh component was assumed to be neutral and allowed to float to complete the composition. This was used as an alternative to a mixture design. Using main-effects and first order interactions, a model for predicting weight percent of the composition dissolved by water was constructed having an R^2 value of 0.973. The residuals were well behaved. These results indicate that the problems encountered with mixture designs can be avoided by using fractions of factorials if a neutral component is available.

1869 (RHO-SA--131) TRANSURANIC DISTRIBUTION BENEATH A RETIRED UNDERGROUND DISPOSAL FACILITY, HANFORD SITE. Kasper, R.B.; Price, S.M.; Addition, M.K.; Smith, R.M.; Last, G.V.; Wagenaar, G.L. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Nov 1979. Contract EY-77-C-06-1030. 24p. (CONF-791103--62). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

Past liquid waste disposal practices at the Hanford Site included the discharge of solutions containing low-level concentrations of transuranics directly to the ground via structures collectively termed cribs. A study was conducted to determine the present spatial distribution of plutonium and americium beneath the retired 216-Z-1A Crib, which contains one of the highest cumulative plutonium inventories, 57 kilograms. Sixteen shallow wells were drilled in the unsaturated sediments underlying the facility using specialized, totally contained drilling techniques. Samples from each well were analyzed to obtain profiles of both sediment type and plutonium and americium concentrations as a function of depth beneath the facility. The results of the study show that the highest concentration of plutonium (>10^4 nCi/g of sediment) occurs within the first 3 meters of sediment beneath the central distribution pipe. The high activity at this position is tentatively attributed to the removal of solid particles from the waste stream by sediment filtration. The distributions of plutonium and americium in the sediments are similar. Peak transuranic activity in the sediment profile is generally associated with silt lenses or with major sedimentary unit interfaces (ie, sand to gravel). The maximum vertical extent of transuranic activity found is approximately 30 meters below the bottom of the crib or

approximately 25 meters above the regional water table. No contamination greater than the instrumental limit of detection of 10^{-5} nCi/g of sediment was found from a depth of 30 to 40 meters, the maximum depth of sampling.

1870 (RHO-SA--142) RISK PERSPECTIVES IN WASTE MANAGEMENT. Rowe, W.D.; Bartfeld, C.I.; Boykin, R.F.; Wood, D.E. (American Univ., Washington, DC; Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). May 1980. Contract AC06-77RL01030. 11p. (CONF-800565--1). NTIS, PC A02/MF A01.
From TIMS/ORSA national meeting; Washington, DC, USA (4 May 1980).
The consequences of an array of events in nuclear waste management and their relative likelihoods have been addressed in many instances. The question of what these risks mean to the scientific community, to the public, and to the decision makers is as important as the risk estimates themselves. Perspectives for attaching meaning to these estimates are investigated and reported in this study.

1871 (RHO-SA--143) REAL-TIME MONITORING OF HANFORD NUCLEAR WASTE. McNeece, S.G.; Glasscock, J.A.; Rosnick, C.K. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Oct 1979. Contract EY-77-C-06-1030. 19p. Dep. NTIS, PC A02/MF A01.
Two minicomputers are used to perform real time monitoring of radioactive waste storage tanks on the Hanford Nuclear Reservation. The Computer Automated Surveillance System, CASS, consists of a network of six field microprocessors, a central microprocessor and two central Eclipse minicomputers. The field microprocessors are each responsible for monitoring alarm sensors, liquid levels and temperatures. The field microprocessors report alarm conditions immediately to the central microprocessor. The central minicomputer reports all alarm conditions to the user terminals, requests data from the field on a scheduled and requested basis, and generates reports. It handles all requests for information from the user and stores all incoming data for historical purposes. The CASS software consists of five major segments: (1) process creation, (2) report generation, (3) file updating, (4) terminal communication, and (5) microprocessor communication. Since CASS must operate 24 hours a day, 7 days a week, the system cannot be allowed to abnormally terminate. For this reason all processes are started by the creation process. Having a single process responsible for creating all other processes provides the ability to detect a failure of a subordinate process and to automatically restart the failed process. The report generation process schedules reports, requests the data to be gathered to produce the reports, forms the reports, and distributes the reports to the user terminals. The file updating process handles all data file modifications. There is a terminal communication process for each user terminal which is responsible for printing scheduled reports and for allowing the user to request information from the CASS system. The microprocessor communication process handles all communication with the central microprocessor.

1872 (RHO-SA--155) SORPTION STUDIES AT HANFORD FOR THE CONTROL OF RADIOACTIVE WASTES. Routson, R.C.; Barney, G.S.; Smith, R.M. (Rockwell International Corp., Richland, WA (USA). Energy Systems Group). Jan 1980. Contract EY-77-C-06-1030. 15p. (CONF-800607--31). Dep. NTIS, PC A02/MF A01.
From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).
Since 1944, the Hanford Site has been a location for the storage and disposal of radioactive wastes, nuclear reactor operations, and the chemical separations of nuclear materials. These activities resulted in the storage and disposal of fission products and low-level transuranic (TRU) radioactive wastes in the near future sediments above the water table. With the scale-down of Hanford reactor operations and fuel separation activities after 1967, increased emphasis was placed on waste management activities. Assessment of future impact of past Hanford operations required the development and verification of transport sorption models to make such assessments. Present Hanford sorption models and current studies for the sorption of strontium, cesium, and cobalt on the sediments of the Hanford Separation Areas based on a waste property/areal site-specific measurement concept are discussed.

1873 (RHO-SA--160) HEAT TRANSFER ANALYSIS OF THE GEOLOGIC DISPOSAL OF SPENT FUEL AND HIGH-LEVEL WASTE STORAGE CANISTERS. Allen, G.K. (Atomics International Div., Richland, WA (USA). Rockwell Hanford Operations). Aug 1980. Contract AC06-77RL01030. 47p. (CONF-801102--28). NTIS, PC A03/MF A01.
From ASME winter annual meeting; Chicago, IL, USA (16 Nov 1980).
Near-field temperatures resulting from the storage of high-level waste canisters and spent unreprocessed fuel assembly canisters in geologic formations were determined. Preliminary design of the repository was modeled for a heat transfer computer code, HEATING5, which used the Crank-Nicolson finite difference method to evaluate transient heat transfer. The heat transfer system was evaluated with several two- and three-dimensional models which transfer heat by a combination of conduction, natural convention, and radiation. Physical properties of the materials in the model were based upon experimental values for the various geologic formations. The effects of canister spacing, fuel age, and use of an overpack were studied for the analysis of the spent fuel canisters; salt, granite, and basalt were considered as the storage media for spent fuel canisters. The effects of canister diameter and use of an overpack were studied for the analysis of the high-level waste canisters; salt was considered as the only storage media for high-level waste canisters. Results of the studies on spent fuel assembly canisters showed that the canisters could be stored in salt formations with a maximum heat loading of 134 kw/acre without exceeding the temperature limits set for salt stability. The use of an overpack had little effect on the peak canister temperatures. When the total heat load per acre decreased, the peak temperatures reached in the geologic formations decreased; however, the time to reach the peak temperatures increased. Results of the studies on high-level waste canisters showed that an increased canister diameter will increase the canister interior temperatures considerably; at a constant areal heat loading, a 381 mm diameter canister reached almost a 50°C higher temperature than a 305 mm diameter canister. An overpacked canister caused almost a 30°C temperature rise in either case.

1874 (RHO-SA--170) BATTLE FOR NUCLEAR

POWER. Nees, W.L. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 4 Apr 1980. Contract AC06-77RL01030. 10p. (CONF-800535--2). NTIS, PC A02/MF A01.
From ASME Idaho section symposium; Idaho Falls, ID, USA (29 May 1980).
With the emotional level running so high over nuclear power these days, it is more important than ever that you communicate your ideas and information in a way that it will be heard and understood by your audience. Keep your presentation simple and to the point. As the issues surrounding nuclear change frequently, keep informed on these issues. The central area of discussion these days is high level radioactivity waste storage. Make an effort to become informed about the technical information that is available on high level waste storage.

1875 (RHO-ST--23) GEOLOGY OF THE SEPARATION AREAS, HANFORD SITE, SOUTH-CENTRAL WASHINGTON. Tallman, A.M.; Fecht, K.R.; Marratt, M.C.; Last, G.V. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Jun 1979. Contract EY-77-C-06-1030. 204p. Dep. NTIS, PC A10/MF A01.
The major geologic units beneath the Separation Areas are: basement rocks of undetermined origin, the Columbia River Basalt Group with intercalated sediments of the Ellensburg Formation, the Ringold Formation, and the glaciofluvial sediments (Hanford Formation). A loess deposit (early Palouse soil) occurs between the Ringold and Hanford formations in parts of 200 West Area. The surface of the Separation Areas is veneered with loess and sand dunes of varying thickness. The sediments of the Hanford Formation are the most significant geologic unit in the transport and sorption of radionuclides from surface and near surface waste storage facilities. The Hanford sediments in the Separation Areas effectively isolate and sorb most radiocontaminants (half life greater than one year) discharged to or stored in the ground due to a thick sequence of unsaturated sediments with an adequate sorption capacity. The general horizontal bedding of the Hanford sediments promotes lateral spreading of moisture and retards downward transport of radionuclides.

1876 (SAND--77-0274(Add.A)) WIPP CONCEPTUAL DESIGN REPORT. ADDENDUM A. DESIGN CALCULATIONS FOR WASTE ISOLATION PILOT PLANT (WIPP). (Sandia Labs., Albuquerque, NM (USA)). Apr 1977. Contract EY-76-C-04-0789. 368p. Dep. NTIS, MF A01.
Portions of document are illegible.
The design calculations for the Waste Isolation Pilot Plant (WIPP) are presented. The following categories are discussed: general nuclear calculations; radwaste calculations; structural calculations; mechanical calculations; civil calculations; electrical calculations; TRU waste surface facility time and motion analysis; shaft sinking procedures; hoist time and motion studies; mining system analysis; mine ventilation calculations; mine structural analysis; and miscellaneous underground calculations.

1877 (SAND--77-0274(Add.B)) WIPP CONCEPTUAL DESIGN REPORT. ADDENDUM B. TAILINGS DISPOSAL PROPOSAL. Poli, D.L. (Sandia Labs., Albuquerque, NM (USA)). Apr 1977. Contract EY-76-C-04-0789. 7p. Dep. NTIS, PC A02/MF A01.
The disposal of tailings (mostly salt) created as a result of mining for underground emplacement of nuclear wastes at the Waste Isolation Pilot Plant (WIPP) is discussed. The alternatives are presented and recommendations are included. (DC)

1878 (SAND--77-0274(Add.C)) WIPP CONCEPTUAL DESIGN REPORT. ADDENDUM C. COST WORKSHEETS FOR WASTE ISOLATION PILOT PLANT (WIPP). (Holmes and Narver, Inc., Anaheim, CA (USA); Fenix and Scisson, Inc., Tulsa, OK (USA); Sandia Labs., Albuquerque, NM (USA)). Apr 1977. Contract EY-76-C-04-0789. 364p. Dep. NTIS, MF A01.
Portions of document are illegible.
The cost worksheets for the Waste Isolation Pilot Plant (WIPP) are presented. A summary cost estimate, cost estimate for surface facilities, and cost estimate for shafts and underground facilities are included. (DC)

1879 (SAND--77-0274(Add.D)) WIPP CONCEPTUAL DESIGN REPORT. ADDENDUM D. A REPORT TO HOLMES and NARVER, INC., ANAHEIM, CALIFORNIA ON ALTERNATIVE ENERGY SOURCES FOR WASTE ISOLATION PILOT PLANT, CARLSBAD, NEW MEXICO. (Envirodyne Energy Services, Anaheim, CA (USA)). Mar 1977. Contract EY-76-C-04-0789. 65p. Dep. NTIS, PC A04/MF A01.
This report presents the results of a technical and economic analysis of alternative methods of meeting the energy needs of a proposed Waste Isolation Pilot Plant (WIPP) to be located in southeastern New Mexico. The WIPP is a facility for underground storage of radioactive wastes in a deep salt bed. The report analyzes a total of sixteen possible methods for meeting WIPP energy requirements, consisting of purchased electricity and on-site generation in various combinations from full purchased to full on-site.

1880 (SAND--77-0274(Add.E)) WIPP CONCEPTUAL DESIGN REPORT. ADDENDUM E. ELECTRICAL LOAD SUMMARY FOR WASTE ISOLATION PILOT PLANT. (Holmes and Narver, Inc., Anaheim, CA (USA)). Apr 1977. Contract EY-76-C-04-0789. 21p. Dep. NTIS, PC A02/MF A01.
The electrical load summary for the Waste Isolation Pilot Plant (WIPP) is presented. (DC)

1881 (SAND--77-0274(Add.F)) WIPP CONCEPTUAL DESIGN REPORT. ADDENDUM F. HVAC SYSTEMS ENERGY ANALYSIS FOR WASTE ISOLATION PILOT PLANT. (Holmes and Narver, Inc., Anaheim, CA (USA)). Apr 1977. Contract EY-76-C-04-0789. 39p. Dep. NTIS, PC A03/MF A01.
This report presents the results of a technical and economic analysis of alternative methods of meeting the heating, ventilating, and air conditioning requirements of the Waste Isolation Pilot Plant (WIPP) facilities proposed to be constructed in southeastern New Mexico. This report analyzes a total of ten WIPP structures to determine the most energy and economic efficient means of providing heating, ventilating, and air conditioning services. Additional analyses were performed to determine the merits of centralized versus dispersed refrigeration and heating facilities, and of performing supplemental domestic hot water heating with solar panels.

1882 (SAND--77-0274(Add.G)) WIPP CONCEPTUAL DESIGN REPORT. ADDENDUM G. ACCIDENT ANALYSIS FOR WASTE ISOLATION PILOT PLANT. Shefelbine, H.C.; Metcalf, J.H. (Sandia Labs., Albuquerque, NM (USA)). Jun 1977. Contract EY-76-C-04-0789. 19p. Dep. NTIS, PC A02/MF A01.

The types of accidents or risks pertinent to the Waste Isolation Pilot Plant (WIPP) are presented. Design features addressing these risks are discussed. Also discussed are design features that protect the public. (DC)

1883 (SAND--77-0274(Add.H)) WIPP CONCEPTUAL DESIGN REPORT. ADDENDUM H. SPECIAL EQUIPMENT DEVELOPMENT PROGRAM FOR WASTE ISOLATION PILOT PLANT (WIPP). Stinebaugh, R. (Sandia Labs., Albuquerque, NM (USA)). Jun 1977. Contract EY-76-C-04-0789. 13p. Dep. NTIS, PC A02/MF A01.

This addendum outlines the planned development program for equipment, identified and conceptually shown in the Waste Isolation Pilot Plant (WIPP) Conceptual Design Report (CDR), that is required for storage emplacement and retrieval of all wastes accepted at the WIPP.

1884 (SAND--77-0274(Add.I)) WIPP CONCEPTUAL DESIGN REPORT. ADDENTUM I. SOILS AND FOUNDATION INVESTIGATION FOR PROPOSED WASTE ISOLATION PILOT PLANT, EDDY COUNTY, NEW MEXICO. (Pettigrew (Richard R.) and Associates, Clovis, NM (USA)). Apr 1977. Contract EY-76-C-04-0789. 67p. Dep. NTIS, PC A04/MF A01.

This report presents the results of a soils and foundation investigation for the proposed Waste Isolation Pilot Plant (WIPP) located in Section 21, Township 22 South, Range 31 East, N.M.P.M., Eddy County, New Mexico. The purpose of this investigation was to determine the physical characteristics of the subsoils in order to provide foundation design recommendations. The investigation was performed and the report prepared in accordance with the requirements received from John West Engineering Company and Mr. Bill Wowak, Sandia Laboratories. These were: (1) statement of work for WIPP soils investigation program, and (2) WIPP soil investigation revised drill hole location.

1885 (SAND--77-0274(Add.J)) WIPP CONCEPTUAL DESIGN REPORT. ADDENDUM J. SUPPORT EQUIPMENT IN THE HIGH LEVEL WASTE FACILITY OF THE WASTE ISOLATION PILOT PLANT. Rieb, M.J.; Foley, R.S. (Aerojet Mfg. Co., Fullerton, CA (USA)). Apr 1977. Contract EY-76-C-04-0789. 115p. Dep. NTIS, PC A06/MF A01.

The Aerojet Manufacturing Company (AMCO) received a contract in November 1976 to provide consulting services in assisting Holmes and Narver, Incorporated with the conceptual designs, cost estimates, and schedules of equipment used to handle waste casks, to decontaminate waste canisters and to overpack damaged or highly contaminated waste canisters for the Waste Isolation Pilot Plant (WIPP). Also, the layout of the hot cell in which canister handling, overpack and decontamination takes place was to be reviewed along with the time and motion study of the cell operations. This report has been prepared to present the results of the efforts and contains all technical and planning data developed during the program. The contents of this report are presented in three sections: (1) comments on the existing design criteria, equipment conceptual designs, hot cell design and time and motion studies of projected hot cell activities; (2) design descriptions of the equipment concepts and justification for varying from the existing concept (if a variation occurred). Drawings of each concept are provided in Appendix A. These design descriptions and drawings were used as the basis for the cost estimates; and (3) schedule projections and cost estimates for the equipment described in Section 2. Detail cost estimate backup data is provided in Appendix B.

1886 (SAND--77-0274(Add.L)) WIPP CONCEPTUAL DESIGN REPORT. ADDENDUM L. MINE SAFETY CODE REVIEW FOR WASTE ISOLATION PILOT PLANT (WIPP). (Fenix and Scisson, Inc., Tulsa, OK (USA)). Jun 1977. Contract EY-76-C-04-0789. 16p. Dep. NTIS, PC A02/MF A01.

An initial review of New Mexico and Federal mining standards and regulations has been made to determine their applicability to the WIPP conceptual design. These standards and regulations are reviewed point by point and the enclosed listing includes comments and recommendations for those which will affect the design and/or eventual operations of WIPP. The majority of the standards, both federal and state, are standard safe mining practices. Those standards are listed which are thought should be emphasized for development of the design; also those that would increase the hazard risk by strict compliance. Because the WIPP facility is different in many respects from mines for which the regulations were intended, strict compliance in some respects would provide an increased hazard, while in other instances the regulations are less strict than is desirable. These are noted in the attached review.

1887 (SAND--77-0274(Add.M)) WIPP CONCEPTUAL DESIGN REPORT. ADDENDUM M. COMPUTER SYSTEM AND DATA PROCESSING REQUIREMENTS FOR WASTE ISOLATION PILOT PLANT (WIPP). Young, R. (Sandia Labs., Albuquerque, NM (USA)). Jun 1977. Contract EY-76-C-04-0789. 10p. Dep. NTIS, PC A02/MF A01.

Data-processing requirements for the Waste Isolation Pilot Plant (WIPP) dictate a computing system that can provide a wide spectrum of data-processing needs on a 24-hour-day basis over an indeterminate time. A computer system is defined as a computer or computers complete with all peripheral equipment and extensive software and communications capabilities, including an operating system, compilers, assemblers, loaders, etc., all applicable to real-world problems. The computing system must be extremely reliable and easily expandable in both hardware and software to provide for future capabilities with a minimum impact on the existing applications software and operating system. The computer manufacturer or WIPP operating contractor must provide continuous on-site computer maintenance (maintain an adequate inventory of spare components and parts to guarantee a minimum mean-time-to-repair of any portion of the computer system). The computer operating system or monitor must process a wide mix of application programs and languages, yet be readily changeable to obtain maximum computer usage. The WIPP computing system must handle three general types of data processing requirements: batch, interactive, and real-time. These are discussed. Data bases, data collection systems, scientific and business systems, building and facilities, remote terminals and locations, and cables are also discussed. (DC)

1888 (SAND--78-1147) PRELIMINARY THERMAL EXPANSION SCREENING DATA FOR TUFFS. Lappin, A.R. (Sandia Labs., Albuquerque, NM (USA)). Mar 1980. Contract AC04-76DP00789. 40p. Dep. NTIS, PC A03/MF A01.

A major variable in evaluating the potential of silicic tuffs for use in geologic disposal of heat-producing nuclear wastes is thermal

expansion. Results of ambient-pressure linear expansion measurements on a group of tuffs that vary treatly in porosity and mineralogy are presente here. Thermal expansion of devitrified welded tuffs is generally linear with increasing temperature and independent of both porosity and heating rate. Mineralogic factors affecting behavior of these tuffs are limited to the presence or absence of cristobalite and altered biotite. The presence of cristobalite results in markedly nonlinear expansion above 200°C. If biotite in biotite-hearing rocks alters even slightly to expandable clays, the behavior of these tuffs near the boiling point of water can be dominated by contraction of the expandable phase. Expansion of both high- and low-porosity tuffs containing hydrated silicic glass and/or expandable clays is complex. The behavior of these rocks appears to be completely dominated by dehydration of hydrous phases and, hence, should be critically dependent on fluid pressure. Valid extrapolation of the ambient-pressure results presented here to depths of interest for construction of a nuclear-waste repository will depend on a good understanding of the interaction of dehydration rates and fluid pressures, and of the effects of both micro- and macrofractures on the response of tuff masss.

1889 (SAND--79-0172) DEFENSE HIGH-LEVEL WASTE AND SPENT FUEL CHARACTERIZATION FOR GEOLOGIC WASTE REPOSITORIES. Sutherland, S.H.; Bennett, D.E. (Sandia Labs., Albuquerque, NM (USA)). Sep 1979. Contract EY-76-C-04-0789. 32p. Dep. NTIS, PC E04/MF E04.

Results of SANDIA-ORIGEN calculations are given for the total thermal output and radionuclide content, up to 100,000 years decay time, for defense high-level waste expected from the Savannah River Plant, the Hanford Reservation and the Idaho National Engineering Laboratory, and for one pressurized water reactor and five boiling water reactor spent fuel types. These results are expected to be of value in evaluating the potential for storing defense high-level waste and/or spent fuel in geologic waste repositories.

1890 (SAND--79-0273) BASIC DATA REPORT FOR DRILLHOLE WIPP 13 (WASTE ISOLATION PILOT PLANT - WIPP). (Geological Survey, Albuquerque, NM (USA); Sandia Labs., Albuquerque, NM (USA)). Oct 1979. Contract EY-76-C-04-0789. 75p. Dep. NTIS, PC A04/MF A01.

The borehole WIPP-13 was drilled in the SW 1/4 section 17, T22S, R31E of eastern Eddy County during July and August, 1978, to investigate the nature of a resistivity anomaly. The stratigraphic section was normal, consisting of 13 feet of Quaternary deposits (including artificial fill for drill pad), 53 feet of the Triassic Santa Rosa Sandstone, 451 feet of Dewey Lake Red Beds, 269 feet of the Rustler Formation and 179 feet of the upper member of the Salado Formation. Consecutive cores were taken from 570 to 595, 656 to 729, and 827 to 878 feet. Cuttings were collected at 10-foot intervals throughout the rest of the hole. Geophysical logs were run to aid in interpretation of the stratigraphy. The WIPP is to demonstrate (through limited operations) disposal technology for transuranic (TRU) defense wastes. Eventual conversion of the facility to a repository for TRU defense wastes is anticipated. The WIPP will also provide research facilities for interactions between high-level waste and salt.

1891 (SAND--79-0275) BASIC DATA REPORT FOR DRILLHOLE WIPP 18 (WASTE ISOLATION PILOT PLANT - WIPP). (Sandia Labs., Albuquerque, NM (USA)). Mar 1980. Contract AC04-76-DP00789. 73p. NTIS, PC A04/MF A01.

WIPP 18 is an exploratory borehole whose objective is to determine the nature of the near-surface formations after seismic information indicated a possible fault. The borehole is located in section 20, T.22S., R.31E., in eastern Eddy County, New Mexico, and was drilled between March 14 and 30, 1978. The hole was drilled to a depth of 1060 feet and encountered, from top to bottom, surficial Holocene deposits (5', including artificial fill for drill pad), the Mescalero caliche (4'), the Santa Rosa Sandstone (129'), the Dewey Lake Red Beds (475'), the Rustler Formation (315'), and the upper portion of the Salado Formation (132'). Cuttings were collected at 10-foot intervals. A suite of geophysical logs was run to measure acoustic velocities, density, and radioactivity. On the basis of comparison with other geologic sections drilled in the area, the WIPP 18 section is a normal stratigraphic sequence and it does not show structural disruption. The WIPP is to demonstrate (through limited operations) disposal technology for transuranic defense wastes. The WIPP will also provide facilities to research interactions between high-level waste and salt.

1892 (SAND--79-0277) BASIC DATA REPORT FOR DRILLHOLE WIPP 21 (WASTE ISOLATION PILOT PLANT - WIPP). (Sandia Labs., Albuquerque, NM (USA)). Mar 1980. Contract AC04-76DP00789. 62p. NTIS, PC A04/MF A01.

WIPP 21 is an exploratory borehole whose objective is to determine the nature of the near-surface formations after seismic information indicated a possible fault. The borehole is located in section 20, T.22S., R.31E., in eastern Eddy County, New Mexico, and was drilled between May 24 and 26, 1978. The hole was drilled to a depth of 1046 feet and encountered, from top to bottom, surficial Holocene deposits (6', including artificial fill for drill pad), the Mescalero caliche (6'), the Santa Rosa Sandstone (34'), the Dewey Lake Red Beds (487'), the Rustler Formation (308'), and the upper portion of the Salado Formation (178'). Cuttings were collected at 10-foot intervals. A suite of goephysical logs was run to measure acoustic velocities, density, and radioactivity. On the basis of comparison with other geologic sections drilled in the area, the WIPP 21 section is a normal stratigraphic sequence and it does not show structural disruption. The WIPP is to demonstrate (through limited operations) disposal technology for transuranic defense wastes. The WIPP will also provide facilities to research interactions between high-level waste and salt.

1893 (SAND--79-0278) BASIC DATA REPORT FOR DRILLHOLE WIPP 22 (WASTE ISOLATION PILOT PLANT, WIPP). (Sandia Labs., Albuquerque, NM (USA); Geological Survey, Albuquerque, NM (USA)). Mar 1980. Contract AC04-76DP00789. 72p. NTIS, PC A04/MF A01.

WIPP 22 is an exploratory borehole whose objective is to determine the nature of the near-surface formations after seismic information indicated a possible fault. The borehole is located in section 20, T.22S., R.31E., in eastern Eddy County, New Mexico, and was drilled between March 14 and 30, 1978. The hole was drilled to a depth of 1448 feet and encountered, from top to bottom, surficial Holocene deposits (6', including artificial fill for drill pad), the Mescalero caliche

(7'), the Santa Rosa Sandstone (68'), the Dewey Lake Red Beds (492'), the Rustler Formation (311'), and the upper portion of the Salado Formation (565'). Cuttings were collected at 10-foot intervals. A suite of geophysical logs was run to measure acoustic velocities, density, and radioactivity. On the basis of comparison with other geologic sections drilled in the area, the WIPP 22 section is a normal stratigraphic sequence and it does not show structural disruption. The WIPP is to demonstrate (through limited operations) disposal technology for transuranic defense wastes. The WIPP will also provide facilities to research interactions between high-level waste and salt.

1894 (SAND--79-0279) BASIC DATA REPORT FOR DRILLHOLE WIPP 25 (WASTE ISOLATION PILOT PLANT - WIPP). (Sandia Labs., Albuquerque, NM (USA)). Sep 1979. Contract EY-76-C-04-0789. 62p. Dep. NTIS, PC A04/MF A01.

WIPP 25 was drilled on the eastern edge of Nash Draw (SW 1/4, Sec. 15, T22S, R30E) in Eddy County, New Mexico, to determine subsurface stratigraphy and examine dissolution features above undisturbed salt in the Salado Formation. Determination of dissolution rates will refine previous estimates and provide short-term (geologically) rates for WIPP risk assessments. The borehole encountered, from top to bottom, Pleistocene sediments (17 ft with fill material for pad), Dewey Lake Red Beds (215 ft, Rustler Formation (333 ft, and 90 ft of the upper Salado Formation. A dissolution residue, 37 ft thick, is at the top of the Salado Formation overlying halite-rich beds. In addition to obtaining nearly continuous core from the surface to total depth (655 ft, geophysical logs were taken to measure acoustic velocities, density, radioactivity, and formation resistivity. An interpretive report on dissolution in Nash Draw will be based on combined borehole basin data, surface mapping, and laboratory analyses of Nash Draw rocks and fluids. The WIPP is to demonstrate (through limited operations) disposal technology for transuranic defense wastes and to then be converted to a repository. The WIPP will also provide research facilities for interactions between high-level waste and salt.

1895 (SAND--79-0280) BASIC DATA REPORT FOR DRILLHOLE WIPP 26 (WASTE ISOLATION PILOT PLANT - WIPP). (Sandia Labs., Albuquerque, NM (USA); Geological Survey, Albuquerque, NM (USA)). Aug 1979. Contract EY-76-C-04-0789. 92p. Dep. NTIS, PC A05/MF A01.

WIPP 26 was drilled in Nash Draw (SE 1/4 NE 1/4, sec. 29, T22S, R30E) in Eddy County, New Mexico, to determine subsurface stratigraphy and examine dissolution features above undisturbed salt in the Salado Formation. Determination of dissolution rates will refine previous estimates and provide short-term (geologically) rates for WIPP risk assessments. The borehole encountered, from top to bottom, surficial deposits (10 ft with full materials for pad), Rustler Formation (299 ft), and the upper 194 ft of the Salado Formation. A dissolution residue, 11 ft thick, is at the top of the Salado Formation overlying halite-rich beds. In addition to obtaining nearly continuous core from the surface to total depth (503 ft), geophysical logs were taken to measure acoustic velocities, density, radioactivity, and formation resistivity. An interpretive report on dissolution in Nash Draw will be based on combined borehole basin data, surface mapping, and laboratory analyses of Nash Draw rocks and fluids. The WIPP is to demonstrate (through limited operations) disposal technology for transuranic defense wastes and to then be converted to a repository. The WIPP will also provide research facilities for interactions between high-level waste and salt.

1896 (SAND--79-0281) BASIC DATA REPORT FOR DRILLHOLE WIPP 27 (WASTE ISOLATION PILOT PLANT). (Sandia Labs., Albuquerque, NM (USA); Geological Survey, Denver, CO (USA)). Oct 1979. Contract EY-76-C-04-0789. 84p. Dep. NTIS, PC A05/MF A01.

WIPP 27 was drilled in Eddy County, New Mexico (NW 1/4 sec. 21, T21S, R30E) to investigate evaporite dissolution features and to determine the stratigraphy of surface and near-surface formations. The borehole encountered, from top to bottom, 79 feet of Quaternary deposits, 73 feet of the Rustler Formation, and 171 feet of the upper portion of the Salado Formation. Consecutive cores were obtained for the entire depth of WIPP 27. Geophysical logs measure acoustic velocities, density, radioactivity, and formation resistivity. An interpretive report on dissolution in Nash Draw will be based on combined borehole data, surface mapping and laboratory analyses of Nash Draw rocks and fluids.

1897 (SAND--79-0283) BASIC DATA REPORT FOR DRILLHOLE WIPP 29 (WASTE ISOLATION PILOT PLANT-WIPP). (Sandia Labs., Albuquerque, NM (USA); Geological Survey, Denver, CO (USA)). Sep 1979. Contract EY-76-C-04-0789. 78p. Dep. NTIS, PC A05/MF A01.

WIPP 29 was drilled in Nash Draw (SE 1/4, Sec. 34, T22S, R29E) in Eddy County, New Mexico, to determine subsurface stratigraphy and examine dissolution features above undisturbed salt in the Salado Formation. Determination of dissolution rates will refine previous estimates and provide short-term (geologically) rates for WIPP risk assessments. The borehole encountered, from top to bottom, unnamed Pleistocene deposits (12' with fill material for pad), Dewey Lake Red Beds (203'), Rustler Formation (131'), and the upper 234' of the Salado Formation. A dissolution residue, 105' thick, is at the top of the Salado Formation overlying halite-rich beds. In addition to obtaining nearly continuous core from the surface to total depth (358'), geophysical logs were taken to measure acoustic velocities, density, radioactivity, and formation resistivity. An interpretive report on dissolution in Nash Draw will be based on combined borehole basin data, surface mapping, and laboratory analyses of Nash Draw rocks and fluids. The WIPP is to demonstrate (through limited operations) disposal technology for transuranic defense wastes and to then be converted to a repository. The WIPP will also provide research facilities for interactions between high-level waste and salt.

1898 (SAND--79-0284) BASIC DATA REPORT FOR DRILLHOLE WIPP 30 (WASTE ISOLATION PILOT PLANT - WIPP). (Sandia National Labs., Albuquerque, NM (USA)). Apr 1980. Contract AC04-76DP00789. 84p. NTIS, PC A05/MF A01.

WIPP 30 was drilled in east-central Eddy County, New Mexico, in NW 1/4, Sec. 33, T21S, R31E, to obtain drill core for the study of dissolution of near-surface rocks. The borehole encountered from top to bottom, the Dewey Lake Red Beds (449' including artificial fill for drill pad), Rustler Formation (299'), and the upper 160' of the Salado Formation. Continuous core was cut from the surface to total depth. Geophysical logs were taken the full length of

the borehole to measure acoustic velocities, density, and distribution of potassium and other radioactive elements. Information from this borehole will be included in an interpretive report on dissolution in Nash Draw based on combined borehole data, surface mapping and laboratory analyses of rocks and fluids. The WIPP is to demonstrate (through limited operations) disposal technology for transuranic defense wastes and to then be converted to a repository. The WIPP will also provide research facilities for interactions between high-level waste and salt. Administration policy as of February 1980 is to hold the WIPP site in reserve until the first disposal site can be chosen from several potential sites, including the WIPP.

1899 (SAND--79-0344) SMALL SCALE HEATER TESTS IN ARGILLITE OF THE ELEANA FORMATION AT THE NEVADA TEST SITE. McVey, D.F.; Thomas, R.K.; Lappin, A.R. (Sandia Labs., Albuquerque, NM (USA)). Nov 1979. Contract EY-76-C-04-0789. 62p. Dep. NTIS, PC A04/MF A01.

Near-surface heater tests were run in the Eleana Formation at the Nevada Test Site, in an effort to evaluate argillaceous rock for nuclear waste storage. The main test, which employed a full-scale heater with a thermal output approximating commercial borosilicate waste, was designed to operate for several months. Two smaller, scaled tests were run prior to the full-scale test. This report develops the thermal scaling laws, describes the pretest thermal and thermomechanical analysis conducted for these two tests, and discusses the material properties data used in the analyses. In the first test, scaled to a large heater of 3.5 kW power, computed heater temperatures were within 7% of measured values for the entire 96-hour test run. The second test, scaled to a large heater having 5.0 kW power, experienced periodic water in-flow onto the heater, which tended to damp the temperature. For the second test, the computed temperatures were within 7% of measured for the first 20 hours. After this time, the water effect became significant and the measured temperatures were 15 to 20% below those predicted. On the second test, rock surface spallation was noted in the bore hole above the heater, as predicted. The scaled tests indicated that in-situ argillite would not undergo major thermostructural failure during the follow-on, 3.5 kW, full-scale test. 24 figures, 6 tables.

1900 (SAND--79-0377) BOREHOLE-INCLUSION STRESSMETER MEASUREMENTS IN BEDDED SALT. Cook, C.W.; Ames, E.S. (Sandia National Labs., Albuquerque, NM (USA)). Jul 1980. Contract AC04-76DP00789. 28p. NTIS, PC A03/MF A01.

Sandia purchased borehole-inclusion stressmeters from a commercial supplier to measure in situ stress changes in bedded salt. However, the supplied stressmeters were difficult to set in place and gave erratic results in bedded salt. These problems were overcome with a new extended platen design. Also a straingaged transducer was designed which can be read with a conventional data logger. Due to the nonlinear behavior of bedded salt under uniaxial loading, a new empirical calibration scheme was devised. In essence, the stressmeters are calibrated as force transducers and this calibration curve is then used to determine the relationship between uniaxial stress changes in bedded salt and the gage's output. The stressmeter and calibration procedures have been applied under mine conditions and produced viable results. Future work will involve finite element analysis to calculate the observed behavior of the stressmeters. The response of the stressmeters in bedded salt is neither that of a true stressmeter or of a true strainmeter. However, repeatable calibrations make the gages very useful.

1901 (SAND--79-0625) PRE-WIPP IN-SITU EXPERIMENTS IN SALT. PART I. EXECUTIVE SUMMARY. PART II. PROGRAM DESCRIPTION. Sattler, A.R.; Hunter, T.O. (Sandia Labs., Albuquerque, NM (USA)). Aug 1979. Contract EY-76-C-04-0789. 96p. Dep. NTIS, PC A05/MF A01.

This document presents plans for in-situ experiments in a specific location in southeastern New Mexico. Schedule and facility design were based on features of a representative local potash mine and on contract negotiations with mine owners. Subsequent WIPP program uncertainties have required a delay in the implementation of the activities discussed here; however, the relative schedule for various activities are appropriate for future planning. The document represents a matrix of in-situ activities to address relevant technical issues prior to the availability of a bedded salt repository.

1902 (SAND--79-0895C) PROBABILISTIC ASPECTS OF FAULTING IN ANISOTROPIC MEDIA. Cranwell, R.M.; Donath, F.A. (Sandia Labs., Albuquerque, NM (USA); Illinois Univ., Urbana (USA)). 1979. Contract EY-76-C-04-0789. 8p. (CONF-791112--6). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

The potential is estimated for new faults occurring and intersecting a radwaste repository. In-situ stress measurements and seismic activity records are needed. (DLC)

1903 (SAND--79-0905C) IN SITU EXPERIMENTS TO SUPPORT DEVELOPMENT OF THE WASTE ISOLATION PILOT PLANT (WIPP). Sattler, A.R.; Walker, H.C.; Hunter, T.O. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 16p. (CONF-791112--33). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Most of the WIPP in-situ experiments are associated with the WIPP early shaft complex. They include: HLW interactions, thermal/structural experiments, stable nuclide migration, permeability, brine migration, borehole plugging, operation/design, and instrumentation development. (DLC)

1904 (SAND--79-0907C) GEOLOGIC WASTE DISPOSAL AND A MODEL FOR THE SURFACE MOVEMENT OF RADIONUCLIDES. Helton, J.; Iman, R.; Brown, J.; Schreurs, S. (Sandia Labs., Albuquerque, NM (USA); Atomenergikommissionen, Copenhagen (Denmark); Nuclear Regulatory Commission, Washington, DC (USA)). 1979. Contract EY-76-C-04-0789. 8p. (CONF-791112--18). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

A model for the surface movement of radionuclides is presented. This model, which is referred to as the Pathways Model, was constructed in a NRC project to develop a methodology to assess the risk associated with the geologic disposal of high-level radioactive waste. The methodology development involves

work in two major areas: (a) models for physical processes, and (b) statistical techniques for the use and assessment of these models. The presentation of the Pathways Model involves topics from both areas.

1905 (SAND--79-0911C) GAS GENERATION FROM TRANSURANIC WASTE DEGRADATON. Molecke, M.A. (Sandia Labs., Albuquerque, NM (USA)). Oct 1979. Contract EY-76-C-04-0789. 9p. (CONF-791112--21). Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
Based on experimental data the relative quantities of gas generated by individual mechanism for existing forms of TRU-contaminated wastes under expected WIPP environmental conditions are ranked in order as: (1) BACTERIAL (greatest potential, but large variability); (2) THERMAL (at 40°C; probably insignificant at 25°C); (3) RADIOLYSIS (most predictable; potential short-term risks); (4) CORROSION (under the dry conditions expected in WIPP); and (5) ALPHA DECAY (insignificant). Results indicate that waste processing to minimize such gas generation is not technically required.

1906 (SAND--79-0954C) MECHANISM FOR ELEVATED TEMPERATURE LEACHING. Kenna, B.T.; Murphy, K.D. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 8p. (CONF-791112--31). Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
Long-term, elevated temperature leaching and subsequent electron microprobe analysis of simulated waste glass and ceramic materials have been completed. A cyclic leaching pattern was found in all systems over a 20-month period. It appears that the leaching of mobile ions by simple diffusional processes is modified by more complex chemical interactions. The release of immobile ions is primarily a function of their chemical interactions in the matrix which suggests that these ions may be complex species when released into solution. A mechanism is proposed which incorporates these ideas and the cyclic phenomenon observed.

1907 (SAND--79-0981C) TRACER TESTS PERFORMED IN THE FIELD FOR WIPP IN SOUTHEASTERN NEW MEXICO. Gonzalez, D.D.; Hill, L.R. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 3p. (CONF-791112--19). Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
A two-well recirculating tracer test began in October, 1979, to define as accurately as possible the hydraulic character of a fractured carbonate aquifer, the Culebra dolomite member of the Rustler Formation at the WIPP site in Eddy and Lee Counties, New Mexico. The Culebra dolomite overlies a zone planned for isolation of transuranic contaminated waste generated by the United States defense programs. The storage zone of the proposed facility is in nearly pure halite and about 1400 feet (427 meters) below the Culebra dolomite, the most likely pathway for the migration of radionuclides to the biosphere in the event the repository is breached by groundwater. Included in the definition of the hydraulic character of the Culebra aquifer are natural groundwater velocities, aquifer porosity and components of dispersivity. The proposed tracer test using sodium benzoate, a homologous series of chlorofluoromethanes and pentafluorobenzoic acid as tracers is described. Results of the test will be reported at a later date.

1908 (SAND--79-0988C) RADIONUCLIDE SORPTION STUDIES ON ABYSSAL RED CLAYS. Erickson, K.L. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 7p. (CONF-791112--48). Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
The radionuclide sorption properties of a widely distributed abyssal red clay are being experimentally investigated using batch equilibration techniques. This paper summarizes sorption equilibrium data obtained when 0.68 N NaCl solutions containing either Tc, U, Pu, Am or Cm were contacted with samples of the red clay and also summarizes some initial results from experiments designed to determine the relative selectivity of the clay for various nuclides. Under mildly oxidizing conditions, the sorption equilibrium distribution coefficients for technetium were essentially zero. At solution-phase nuclide concentrations on the order of 10^{-6} M and less and at solution pH values of about 6.9, the distribution coefficients for plutonium were about 3×10^3 ml/gm and for uranium, americium, and curium were about 10^5 ml/gm or greater. However, at solution pH values of about 2.7, the distribution coefficients for each of the nuclides were greatly diminished. Initial experiments conducted in order to determine the relative selectivity of the clay for cesium, barium, and cerium, indicated that the silicate phases in the clay were selective for cesium over barium and cerium. These experiments also indicated that the hydrous oxide phases were selective for cerium over barium and for barium over cesium.

1909 (SAND--79-0989C) PRELIMINARY RATE EXPRESSIONS FOR ANALYSIS OF RADIONUCLIDE MIGRATION RESULTING FROM FLUID FLOW THROUGH JOINTED MEDIA. Erickson, K.L. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 10p. (CONF-791112--47). Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
A theoretical and experimental basis is being developed for analysis of radionuclide transport in jointed geologic media. Batch equilibration and rate experiments involving samples of Eleana argillite and tertiary silicic tuffs in contact with solutions containing Cs, Sr, or Pm indicated that most radionuclide sorption was associated with the surfaces of very small intergranular regions and that the rate of sorption was controlled by diffusion of the nuclides into such regions. Based on these experimental results, the continuity equations for radionuclides in the mobile and immobile phases were reduced to a model analogous to Rosen's equations for packed beds and were solved similarly. Using the model and experimental data, limited radionuclide transport analyses were made which indicated that important parameters controlling transport include the intergranular porosity and nuclide penetration depth, fracture plate spacing and length, fluid velocity and sorption distribution coefficient. Many of these parameters represent physical quantities or processes which can be quantified in the laboratory. However, fluid velocities and fracture plate spacings and lengths must be obtained from the field, and methods must be developed to establish reliable bounds for such field-determined parameters.

1910 (SAND--79-0990C) BACKFILL AS AN

ENGINEERED BARRIER FOR NUCLEAR WASTE MANAGEMENT. Nowak, E.J. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 8p. (CONF-791112--42). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Portions of document are illegible.

The swelling, plastic flow, and relative impermeability of bentonite and hectorite were observed and measured after wetting with concentrated brines. Measurements of stable values of pH > 6.5 for the interstitial brines in wetted bentonite and hectorite confirmed conditions favorable for precipitation and sorption of transuranics. Values of K/sub d/ > 2000 ml/g were measured for Pu and Am. Calculated estimates of the effectiveness of a one-foot-thick backfill barrier are presented. They show that the breakthrough of Pu and other transuranics (K/sub d/ = 2000 ml/g) can be delayed for 10^4 to 10^5 years. The breakthrough of most fission products (K/sub d/ = 200 ml/g) can be delayed for 10^3 to 10^4 years, sufficient time for them to decay to very low concentrations. A backfill barrier can contribute significantly to a radioactive waste isolation system.

1911 (SAND--79-1000C) THERMAL ASPECTS OF WASTE EMPLACEMENT IN LAYERED TUFFS. Bulmer, B.M.; Lappin, A.R. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 4p. (CONF-791112--2). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

The thermal response of layered tuffs in Yucca Mountain at NTS to radwaste emplacement at 711 m depth (Bullfrog tuff) was analyzed. Three in-situ boiling criteria were examined. No boiling is predicted for any burial depth with power densities up to 150 kW/acre. Allowable powerdensities are plotted vs depth below 711 m for both HLW and spent fuels. (DLC)

1912 (SAND--79-1013C) FAR FIELD THERMAL CALCULATIONS FOR THE WIPP SITE IN SENM. Pahwa, S.B.; Wayland, J.R. (INTERA Environmental Consultants, Inc., Houston, TX (USA); Sandia Labs., Albuquerque, NM (USA)). Oct 1979. Contract EY-76-C-04-0789. 20p. (CONF-791112--14). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

This idealized study indicates that there is little impact upon the far thermal field from water expansion or for stoppage of aquifer flow. The variability of salt thermal conductivity in the Salado Formation can be as important to the magnitude of the temperature fields as the extremes proposed for thermal loading densities. 5 figures, 3 tables.

1913 (SAND--79-1019C) INTERACTION OF RADIONUCLIDES WITH GEOMEDIA FROM THE NEVADA TEST SITE. Lynch, A.W.; Dosch, R.G. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 7p. (CONF-791112--34). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Aqueous/solid distribution coefficients have been measured for ^{137}Cs, ^{85}Sr, ^{99}Tc, ^{152}Eu, ^{144}Ce, ^{238}Pu, ^{243}Am and ^{244}Cm on powdered argillite and hornfels obtained from the Nevada Test Site. The fluid phases included a groundwater simulant and deionized water preequilibrated with powdered argillite. Distribution coefficients for lanthanides and actinides are generally high and Eleana shale was found to effectively sorb technetium.

1914 (SAND--79-1036C) THERMAL ASPECTS OF THE ELEANA NEAR-SURFACE HEATER EXPERIMENT. McVey, D.F.; Lappin, A.R. (Sandia Labs., Albuquerque, NM (USA)). [nd]. Contract W-7405-ENG-36. 3p. (CONF-791112--4). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

An electrically powered heater simulating a full size High Level Waste canister has been operated for 250 days at a depth of 23 meters in Eleana argillite on the DOE Nevada Test Site. A constant 3.8 kW was input to the 0.3 m diameter x 3 m long (heated section) heater. This presentation discusses results of the thermal modeling for this test, compares model results with measured temperatures, and discusses present limitations in code and modeling capability.

1915 (SAND--79-1047C) MECHANICAL MODELING OF NUCLEAR WASTE DISPOSAL IN ARGILLITE AT THE NEVADA TEST SITE. Thomas, R.K.; Lappin, A.R. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 4p. (CONF-791112--3). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Numerical calculations for a near surface heater experiment in argillite conducted at the Nevada Test Site were performed using the finite element code ADINA assuming a two-dimensional axisymmetric geometry. The existence and extent of the region of tensional opening of joints surrounding the heater, predicted by the mechanical model, were confirmed by posttest borehole inspection, permeability measurements, and drillback. Exrapolation of near surface heater model to repository depths reveals the necessity for prior knowledge of the mechanical properties and state of stress in-situ. The extent of the joint opening zone, for example, is not altered by changes in the elastic modulus at the near surface, but is significantly decreased beyond certain depths depending upon the in-situ elastic modulus. Results of these calculations are presented. To further define the behavior at depth, and place bounds on the joint opening zone, far-field calculations were performed for a generic repository in argillite. Both spent fuel and high level waste heat sources were considered at different burial densities and depths. Results of a parametric study are presented in which the mechanical properties, in-situ stresses, and waste heat sources were varied.

1916 (SAND--79-1076C) PERSPECTIVE OF WASTE ISOLATION RESEARCH ISSUES AND ASSESSMENT OF CONSEQUENCES FOR RADIONUCLIDE RELEASE. Hunter, T.O. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 9p. (CONF-791112--29). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

The finiteness of research resources to address technical issues for nuclear waste management requires a realistic assessment of their importance. The most appropriate method for making this assessment is the combination of system studies, which include consideration of the role of all protective barrier, and consequence assessment models that can estimate the potential hazard imposed upon man for assumed violations of these barriers. Sensitivity analyses on certain issues can then be performed to determine the impact of various

descriptive parameters. Work commensurate with this strategy has been initiated at Sandia. Some conclusions drawn from these studies specifically applicable to WIPP for the scenarios considered are that: Waste form and protective canisters are not essential as barriers. Assumed radionuclide dissolutioning is far in excess of that possible with developmental waste forms. Brine migration plays no significant role in long-term isolation; complications to retrievability can be avoided with numerous technical alternaives. Radionuclide sorption in geomedia near repositories plays an important role in reducing consequences, but sites with favorable geologic and hydrologic settings such as WIPP can tolerate essentially no reliance on sorption and still achieve inconsequential predicted doses. Plutonium sorption with K/sub d/ greater than 10 are sufficient to eliminate direct doses from plutonium. Borehole plugs are not required for primary protection. Continued scientific resolution of both real and perceived issues can, however, provide additional assurance and public confidence that consequences can be reduced beyond those predicted in bounding scenarios. In addition, such investigation will assure that appropriate limits are instituted for defining parameters and that all assumptions in predictive models are technically sound.

1917 (SAND--79-1109) BACKFILL BARRIER AS A COMPONENT IN A MULTIPLE BARRIER NUCLEAR WASTE ISOLATION SYSTEM. Nowak, E.J. (Sandia National Labs., Albuquerque, NM (USA)). May 1980. Contract AC04-76DP00789. 32p. NTIS, PC A03/MF A01.

Quantitative estimates of the potential effectiveness of backfill barriers based on a linear sorption model are presented. Using getters such as clays (known sorbents), a backfill approximately 1-foot-thick can delay by 10^4 to 10^5 years the breakthrough of transuranics. A delay of 10^3 years is possible for major cationic fission products. These delays can be achieved provided that (1) the distribution coefficient (K/sub d/, a measure of affinity for sorbed species) for the barrier material is equal to or greater than 2000 ml/g for transuranics and 200 ml/g for fission products; (2) the interstitial groundwater velocity through the barrier is limited to 1 ft/year or less; (3) the effective porosity of the barrier is equal to or less than 0.1; and (4) the physical integrity of the barrier is maintained (no channels or cracks). Mixtures containing expanding clays such as smectites and other getters are expected to satisfy these criteria.

1918 (SAND--79-1110) RADIONUCLIDE SORPTION AND MIGRATION STUDIES OF GETTERS FOR BACKFILL BARRIERS. Nowak, E.J. (Sandia National Labs., Albuquerque, NM (USA)). Jul 1980. Contract AC04-76DP00789. 57p. NTIS, PC A04/MF A01.

Bentonite and hectorite clay minerals were chosen for study and development as potential backfill materials for testing in the proposed Waste Isolation Pilot Plant (WIPP), a radioactive waste repository and test facility in bedded salt. This choice of materials was based on initial screening results which are presented and on the predicted physical properties of these materials. These properties were verified experimentally in concentrated brines specific to the WIPP site. Distribution coefficients, K/sub d/, were calculated from batch sorption measurements on bentonite and hectorite in the nearly saturated brines A and B. The resulting K/sub d/ values were in the range of (1 to 5) x 10^3 ml/g for europium; (2 to 40) x 10^3 ml/g for plutonium(IV); and (4 to 16) x 10^3 ml/g for americium(III). A silica- and calcite-containing sand mixed with bentonite and hectorite acted as a sorber of americium(III) but was merely an inert diluent for plutonium(IV). Pertechnetate anions (TcO_4^-) sorbed on activated charcoal with K/sub d/ values in the range of (0.2 to 0.4) x 10^3 ml/g. Pertechnetate, cesium, and strontium ions in brine were not sorbed appreciably by bentonite or hectorite. Although experimental evidence is given for a possible role of solubility in the sorption of europium on getters, other data presented here and evidence from the literature are inconsistent with a simple single reaction sorption mechanism. It is concluded that a backfill containing bentonite on hectorite and activated charcoal is potentially an effective barrier to the migration of Eu(III), Pu(IV), and Am(III) cations and, with further development, to the migration of TcO_4^- anions as well.

1919 (SAND--79-1156) PROCEEDINGS OF THE FOURTH ANNUAL SEABED WORKING GROUP MEETING, ALBUQUERQUE, NEW MEXICO USA, MARCH 5-7, 1979. Anderson, D.R. (ed.). (Sandia Labs., Albuquerque, NM (USA)). Aug 1979. Contract EY-76-C-04-0789. 223p. Dep. NTIS, PC A10/MF A01.

Objectives of the meeting were: (1) to review the technical status and policies of national programs regarding assessment of deep ocean bed disposal of high-level radioactive wastes; (2) to provide a forum for discussions, information exchange, and planning of future efforts; (3) to identify and coordinate research vessel cruises and experiments, and establish cooperative programs, and (4) to identify one-of-a-kind test facilities and consider multinational use of such facilities. Seven countries (Canada, France, Japan, Federal Republic of Germany, the Netherlands, the United Kingdom, and the United States) participated. A representative of the Commission of European Communities, Ispra Establishment, was also present. Papers submitted at the meeting, together with the reports of the Seabed Working Group Executive Committee and the individual task groups, are compiled in this document.

1920 (SAND--79-1197C) SENSITIVITY STUDY ON THE PARAMETERS OF THE REGIONAL HYDROLOGY MODEL FOR THE NEVADA NUCLEAR WASTE STORAGE INVESTIGATIONS. Iman, R.L.; Davenport, J.M.; Waddell, R.K.; Stephens, H.P.; Leap, D.I. (Sandia Labs., Albuquerque, NM (USA); Texas Tech Univ., Lubbock (USA); Geological Survey, Denver, CO (USA)). 1979. Contract EY-76-C-04-0789. 31p. (CONF-791016--3). Dep. NTIS, PC A03/MF A01.

From 1979 DOE statistical symposium; Gatlinburg, TN, USA (24 Oct 1979).

Statistical methodology has been applied to the investigation of the regional hydrologic systems of a large area encompassing the Nevada Test Site (NTS) as a part of the overall evaluation of the NTS for deep geologic disposal of nuclear waste. Statistical techniques including Latin hypercube sampling were used to perform a sensitivity analysis on a two-dimensional finite-element code of 16 geohydrologic zones used to model the regional ground-water flow system. The Latin hypercube sample has been modified to include correlations between corresponding variables from zone to zone. From the results of sensitivity analysis it was found that: (1) the ranking of the relative importance of input variables between locations within the same

geohydrologic zone were similar, but not identical; and (2) inclusion of a correlation structure for input variables had a significant effect on the ranking of their relative importance. The significance of these results is discussed with respect to the hydrology of the region.

1921 (SAND--79-1199) HEATED MINE ROOM AND PILLAR SECONDARY CREEP RESPONSE. Tillerson, J.R.; Dawson, P.R. (Sandia Labs., Albuquerque, NM (USA)). Apr 1980. Contract AC04-76DP 00789. 47p. NTIS, PC A03/MF A01.

Heated salt mine room and pillar simulations have been performed to provide information regarding parameters affecting room closure rates to designers of radioactive waste isolation facilities. A coupled secondary creep and heat transfer formulation with large strain capabilities was used to assess the effects of variations in creep law parameters, thermal properties, imposed boundary conditions, temporal integration, and meshing resolution on room closure rates. Results indicate that the greatest effect results from variations in parameters appearing in the creep constitutive equation.

1922 (SAND--79-1259C) THERMOPHYSICAL PROPERTIES OF ROCKS: A PERSPECTIVE ON DATA NEEDS, SOURCES AND ACCURACY. Stephens, H.P.; Sinnock, S. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 27p. (CONF-791205--10). Dep. NTIS, PC A03/MF A01.

From ASME winter annual meeting; New York, NY, USA (2 Dec 1979).

Recent emphasis on research in geologic isolation of nuclear wastes and geoenergy resource development has created a renewed demand for engineering thermophysical property data for rocks and other geologic materials at elevated pressures and temperatures. In contrast to fabricated engineering materials, with properties which can be specified, rocks used in engineering design are complex, naturally occurring materials having properties which must be characterized, rather than specified, for engineering studies. Much difficulty in measuring, reporting, and using thermophysical properties of rocks results from (1) rock inhomogeneity and anisotropy on both microscopic and macroscopic scales; (2) inclusion of pore fluids, such as water; and (3) measurement of laboratory properties under conditions quite different from those of in situ material. Because measurements on in situ materials are scarce, many analyses must depend on extrapolated values of uncertain accuracy. A survey of thermophysical property data available for geologic thermal transport studies indicates that caution must be taken to effectively match data abstracted from the literature with project objectives.

1923 (SAND--79-1265) PRELIMINARY ONE-DIMENSIONAL THERMAL ANALYSIS OF WASTE EMPLACEMENT IN TUFFS. Bulmer, B.M.; Lappin, A.R. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1980. Contract AC04-76DP00789. 31p. NTIS, PC A03/MF A01.

One-dimensional calculations of near-field temperatures resulting from waste emplacement in a multiple-layered tuff stratigraphy are presented. Results indicate a marked sensitivity of peak temperatures to assignment of in-situ fluid pressure, geothermal-heat flux, waste type, and location of waste relative to a specific stratigraphic discontinuity. Under the criterion that allowable initial-power densities are limited by the occurrence of boiling at a distance of 10 m from emplaced waste, allowable power densities are calculated to range up to 150 kW/acre or more, depending upon geothermal heat flux and waste type.

1924 (SAND--79-1276) IN-SITU TUFF WATER MIGRATION/HEATER EXPERIMENT: EXPERIMENTAL PLAN. Johnstone, J.K. (Sandia National Labs., Albuquerque, NM (USA)). Aug 1980. Contract AC04-76DP00789. 166p. NTIS, PC A08/MF A01.

Tuffs on the Nevada Test Site (NTS) are currently under investigation as a potential isolation medium for heat-producing nuclear wastes. The National Academy of Sciences has concurred in our identification of the potentially large water content (less than or equal to 40 vol %) of tuffs as one of the important issues affecting their suitability for a repository. This Experimental Plan describes an in-situ experiment intended as an initial assessment of water generation/migration in response to a thermal input. The experiment will be conducted in the Grouse Canyon Welded Tuff in Tunnel U12g (G-Tunnel) located in the north-central region of the NTS. While the Grouse Canyon Welded Tuff is not a potential repository medium, it has physical, thermal, and mechanical properties very similar to those tuffs currently under consideration and is accessible at depth (400 m below the surface) in an existing facility. Other goals of the experiment are to support computer-code and instrumentation development, and to measure in-situ thermal properties. The experimental array consists of a central electrical heater, 1.2 m long x 10.2 cm diameter, surrounded by three holes for measuring water-migration behavior, two holes for measuring temperature profiles, one hole for measuring thermally induced stress in the rock, and one hole perpendicular to the heater to measure displacement with a laser. This Experimental Plan describes the experimental objectives, the technical issues, the site, the experimental array, thermal and thermomechanical modeling results, the instrumentation, the data-acquisition system, posttest characterization, and the organizational details.

1925 (SAND--79-1278) PRETEST THERMAL ANALYSIS OF THE TUFF WATER MIGRATION/IN-SITU HEATER EXPERIMENT. Bulmer, B.M. (Sandia Labs., Albuquerque, NM (USA)). Feb 1980. Contract AC04-76DP00789. 43p. NTIS, PC A03/MF A01.

This report describes the pretest thermal analysis for the Tuff Water Migration/In-Situ Heater Experiment to be conducted in welded tuff in G-tunnel, Nevada Test Site. The parametric thermal modeling considers variable boiling temperature, tuff thermal conductivity, tuff emissivity, and heater operating power. For nominal tuff properties, some near field boiling is predicted for realistic operating power. However, the extent of boiling will be strongly determined by the ambient (100% water saturated) rock thermal conductivity. In addition, the thermal response of the heater and of the tuff within the dry-out zone (i.e., bounded by boiling isotherm) is dependent on the temperature variation of rock conductivity as well as the extent of induced boiling.

1926 (SAND--79-1305) SUMMARY OF RESEARCH AND DEVELOPMENT ACTIVITIES IN SUPPORT OF WASTE ACCEPTANCE CRITERIA FOR WIPP. Hunter, T.O. (comp.). (Sandia Labs., Albuquerque, NM (USA)). Nov 1979. Contract EY-76-C-04-0789. 244p. Dep. NTIS, PC A11/MF A01.

The development of waste acceptance criteria for the Waste Isolation Pilot Plant (WIPP) is summarized. Specifications for acceptable waste forms are included. Nine program areas are discussed. They are: TRU characterization, HLW interactions, thermal/structural interactions, nuclide migration, permeability, brine migration, borehole plugging, operation/design support, and instrumentation development. Recommendations are included. (DC)

1927 (SAND--79-1306) TEST PLAN: POTASH CORE TEST. WIPP EXPERIMENTAL PROGRAM BOREHOLE PLUGGING. Christensen, C.L. (Sandia Labs., Albuquerque, NM (USA)). Sep 1979. Contract EY-76-C-04-0789. 40p. Dep. NTIS, PC A03/MF A01.

The Potash Core Test will utilize a WIPP emplaced plug to obtain samples of an in-situ cured plug of known mix constituents for bench scale testing. An earlier effort involved recovery at the salt horizon of Plug 217, a 17 year old plug in a potash exploration hole for bond testing, but the lack of particulars in the emplacement precluded significant determination of plug performance.

1928 (SAND--79-1429C) CORROSION RESISTANT METALLIC CANISTERS: AN IMPORTANT ELEMENT OF A MULTIBARRIER DISPOSAL PROGRAM. Magnani, N.J.; Braithwaite, J.W. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 8p. (CONF-791112--30). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

A program with the goal of qualifying a material for a 300 year lifetime as a nuclear waste canister is underway at Sandia Laboratories. The corrosion and stress corrosion cracking behavior of the leading candidate, TiCode-12 (Ti-0.8% Ni-0.3% Mo), is contrasted to that of a commonly used engineering alloy, 304 stainless steel. Experimental evidence is presented which shows the inadequacy of 304 stainless steel in simulated repository environments and shows that TiCode-12 may survive the desired 300 years. Further work required to qualify TiCode-12 is outlined.

1929 (SAND--79-1474C) CONASAUGA NEAR SURFACE HEATER EXPERIMENT. IMPLICATIONS FOR A REPOSITORY SITED IN A WATER-SATURATED ARGILLACEOUS FORMATION. Krumhansl, J.L.; Sundberg, W.D. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 10p. (CONF-790938--3). Dep. NTIS, PC A02/MF A01.

From Workshop on the use of argillaceous materials for the isolation of radioactive wastes; Paris, France (10 Sep 1979).

Results of the Conasauga Near Surface Heater Experiment suggest that the effects of ground water on a repository located in shale would be most pronounced in their influence on chemical processes. Despite the water-saturated condition of the Conasauga shale, conduction, not convection, was the principal mode of heat transport. Metal corrosion, however, was found to be significantly enhanced by the refluxing steam. The several centimeters of scale left behind by the boiling water, in a repository, could interfere with retrieval operations or form a coating of low thermal conductivity material on a canister. Finally, alternate wetting and drying due to sporadic steam generation caused up to 20 microns of alteration on a sample of borosilicate waste glass simulant (PNL 75-25) included in the test.

1930 (SAND--79-1475C) THERMAL AND CHEMICAL PROPERTIES OF SATURATED MARINE CLAYS IN A NEAR FIELD ENVIRONMENT. Krumhansl, J.L.; Hadley, G.R. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 13p. (CONF-790938--1). Dep. NTIS, PC A02/MF A01.

From Workshop on the use of argillaceous materials for the isolation of radioactive wastes; Paris, France (10 Sep 1979).

Thermal and geochemical investigations were made on water saturated marine clays for the purpose of determining whether such sediments would have properties favorable for the disposal of high level waste. Thermal conductivity and diffusivity were found to remain relatively constant between 25 and 300°C. The chemistry of seawater-sediment mixtures, however, undergoes marked changes with heating. A distinctly acidic condition may be generated above 200°C and many trace elements are solubilized. Mineralogic changes are dominated by the formation of a magnesium-rich smectite clay. These changes are, however, of sufficiently localized extent that a considerable barrier to radionuclide migration would remain between an emplaced waste canister and the ocean floor.

1931 (SAND--79-1484) STATUS OF SHAFT 78 WITH RESPECT TO MODELING RADIOACTIVE WASTE BURIAL IN ELEANA ARGILLITE, INCLUDING CALCULATIONS TO DATE. Eaton, R.R.; Sundberg, W.D.; Larson, D.E.; Sherman, M.P. (Sandia National Labs., Albuquerque, NM (USA)). May 1980. Contract AC04-76DP00789. 28p. NTIS, PC A03/MF A01.

The SHAFT 78 Code (multidimensional, two fluid phases, porous medium) has been used to begin assessment of the consequences of nuclear waste burial in a 1000-acre repository emplaced in argillite. The methodology used can well be applied to other argillaceous rocks as well as to hard rocks in general so long as their in-situ rock permeability can reasonably be assumed to be temperature- and stress-independent. The repository is assumed to contain spent fuel (SF) UO_2 at an initial power loading of 150 kW/acre and located at a depth of 600 m. It was found that with perfect backfill (permeabilty = 1×10^{7} darcy), a maximum fluid pressure of 770 bars existed in the repository at a time of 55 y after burial. Holding all other input variables constant, the maximum fluid pressure in the repository never exceeded the local lithostatic pressure when the permeability of the backfill material was increased to 1×10^{-1} darcy. The calculated temperature histories are essentially independent of backfill permeability and porosity, indicating that heat transfer is conduction-dominated.

1932 (SAND--79-1514) BOREHOLE PLUGGING MATERIALS DEVELOPMENT PROGRAM, REPORT 2. Gulick, C.W. Jr.; Boa, J.A. Jr.; Walley, D.M.; Buck, A.D. (Sandia Labs., Albuquerque, NM (USA); Army Engineer Waterways Experiment Station, Vicksburg, MS (USA)). Feb 1980. Contract EY-76-C-04-0789. 89p. Dep. NTIS, PC A05/MF A01.

The data for 2 yr of grout mixtures durability studies developed for the borehole plugging program of the Nuclear Waste Isolation Pilot Plant (WIPP) are reported. In addition, data for 1 yr of durability studies of grout mixture field samples used to plug the ERDA No. 10 exploratory drill hole near the WIPP site are included. The grout samples and the data do not show any evidence of deterioration during the durability studies that include exposure to

brine at both ambient and elevated temperatures. The data include strength, compressional wave velocity, dynamic modulus, expansion, weight change, porosity, permeability, bond strength, chemical analysis of cements, and petrographic examinations. The work was performed at the Concrete Division of the Structures Laboratory of the US Army Engineer Waterways Experiments Station (WES), Vicksburg, Mississippi. The work is continuing at WES.

1933 (SAND--79-1618/1) SUBSEABED DISPOSAL PROGRAM. ANNUAL REPORT, JANUARY-DECEMBER 1978. Talbert, D.M. (ed.). (Sandia Labs., Albuquerque, NM (USA)). Feb 1980. Contract EY-76-C-04-0789. 50p. Dep. NTIS, PC $8.50/MF $3.80.

This is the fifth annual report describing the progress and evaluating the status of the Subseabed Disposal Program (SDP), which was begun in June 1973. The program was initiated by Sandia Laboratories to explore the utility of stable, uniform, and relatively unproductive areas of the world as possible repositories for high-level nuclear wastes. The program, now international in scope, is currently focused on the stable submarine geologic formations under the deep oceans.

1934 (SAND--79-1618(Vol.2)) SUBSEABED DISPOSAL PROGRAM ANNUAL REPORT, JANUARY-DECEMBER 1978. VOLUME II. PRINCIPAL INVESTIGATOR PROGRESS REPORTS. (Sandia Labs., Albuquerque, NM (USA)). Oct 1979. Contract EY-76-C-04-0789. 1014p. Dep. NTIS, PC A99/MF A01.

The topics covered in this report include: geologic siting considerations for the disposal of radioactive wastes into submarine geologic formations; geologic assessment of the MPG-1 regions Central North Pacific; site mapping; geotechnical aspects of subsurface seabed disposal; heat transfer, thermal and fluid physics in the deep ocean sediments; mechanical response predictive capability; sediment-seawater interaction at 300°C, 500 bars; stability of actinides in chloride media; cannister corrosion studies; nuclide sorption and migration; development of apparatus and measurement of thermal conductivity of seabed illite and smectite at temperatures to 500°C at simulated depths to 15,000 ft (9000 psi); in-situ heat transfer experiments; preliminary seabed disposal transport modeling studies; radionuclide migration studies; radionuclide distributions in deep ocean cores; benthic biological studies; deep sea microbial studies; activity rates of abyssal communities; Deep-towed RUM III (Sandia Seabed working platform): a third-generation remote underwater manipulator; long coring facility program; transportation; legal, political, and institutional implications of the Seabed Program for radioactive waste disposal.

1935 (SAND--79-1634C) FIELD TEST PROGRAMS OF BOREHOLE PLUGS IN SOUTHEASTERN NEW MEXICO. Christensen, C.L. (Sandia Labs., Albuquerque, NM (USA)). Oct 1979. Contract EY-76-C-04-0789. 10p. (CONF-791033--1; ONWI/Sub--79-E-511-03700). Dep. NTIS, PC A02/MF A01.

From 1. annual ONWI information meeting; Columbus, OH, USA (30 Oct 1979).

This paper presents the status of the Borehole Plugging Program underway for the plugging of drill holes on and near the proposed Waste Isolation Pilot Plant (WIPP) in southeastern New Mexico. This program will provide the technology for plugging wellbores when required at repository decommissioning.

1936 (SAND--79-1665) THERMAL CONDUCTIVITY OF ROCKSALT AND OTHER GEOLOGIC MATERIALS FROM THE SITE OF THE PROPOSED WASTE ISOLATION PILOT PLANT. Sweet, J.N.; McCreight, J.E. (Sandia Labs., Albuquerque, NM (USA)). 19 Mar 1980. Contract EY-76-C-04-0789. 33p. Dep. NTIS, PC A03/MF A01.

The measurements first reported by Acton on the thermal conductivity of samples taken from a borehole at the site of the proposed nuclear waste isolation pilot plant (WIPP) near Carlsbad, NM, have been extended to include additional samples and higher temperature measurements. Samples for measurements were taken from several depths of three wells, including the well AEC 8 from which Acton obtained his samples. These samples ranged from relatively pure rocksalt (NaCl) with small amounts of interstitial anhydrite to essentially nonsalt samples composed of gypsum or clay. The measurements in this latest series were conducted at Sandia, the Los Alamos Scientific Laboratory (LASL), and at Dynatech Corp. In general, the data from the three laboratories agreed reasonably well for similar coarse grained translucent rock salt samples, with the LASL and Sandia results typically being about 20% higher than those of Dynatceh. On the basis of these experiments, it is concluded that the thermal conductivity of materials found at the site can be predicted to an accuracy +-30% from knowledge of the composition and grain size of these materials.

1937 (SAND--79-1679) SEABED DISPOSAL PROJECT TWO-DIMENSIONAL AXISYMMETRIC PENETROMETER SIMULATIONS. Chavez, P.F.; Dawson, P.R.; Schuler, K.W. (Sandia Labs., Albuquerque, NM (USA)). Mar 1980. Contract EY-76-C-04-0789. 54p. Dep. NTIS, PC A04/MF A01.

Preliminary two-dimensional, one-constituent hole closure analyses of an experimental apparatus and the flow of in situ ocean sediments following a penetrometer explacement have been performed. Boundary conditions associated with the experimental apparatus were found to greatly affect cavity response. Difficulties were encountered in modelling penetrometer-sediment interfaces and in obtaining smooth stress histories. The use of a different computer code in later analyses led to more realistic penetrometer-sediment interface models and to improved success in obtaining stress histories. These results along with some recommendations for future work are presented.

1938 (SAND--79-1746C) TEST RESULTS AND SUPPORTING ANALYSIS OF A NEAR SURFACE HEATER EXPERIMENT IN THE ELEANA ARGILLITE. McVey, D.F.; Lappin, A.R.; Thomas, R.K. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 21p. (CONF-790938--4). Dep. NTIS, PC A02/MF A01.

From Workshop on the use of argillaceous materials for the isolation of radioactive wastes; Paris, France (10 Sep 1979).

A preliminary evaluation of the in-situ thermomechanical response of argillite to heating was obtained from a near-surface heater test in the Eleana Formation, at the Nevada Test Site. The experiment consisted of a 3.8 kW, 3-m long x 0.3-m diameter electrical heater in a central hole surrounded by peripheral holes containing instrumentation to measure temperature, gas pressures, and vertical displacement. A thermal model of the experiment agreed well with experimental results; a comparison of measured and predicted

temperatures indicates that some nonmodeled vertical transport of water and water vapor occurred near the heater, especially at early times. A mechanical model indicated that contraction of expandable clays in the argillite produced a region 1.5 to 2.0 m in radius, in which opening of preexisting joints occurred as a result of volumetric contraction. Results of thermal and mechanical modeling, laboratory property measurements, experimental temperature measurements, and post-test observations are all self-consistent and provide preliminary information on the in situ response of argillaceous rocks to the emplacement of heat-producing nuclear waste. 9 figures, 2 tables.

1939 (SAND--79-1855) CONASAUGA NEAR-SURFACE HEATER EXPERIMENT. FINAL REPORT. Krumhansl, J.L. (Sandia Labs., Albuquerque, NM (USA)). Nov 1979. Contract EY-76-C-04-0789. 98p. Dep. NTIS, PC A05/MF A01.

The Conasauga Experiment was undertaken to begin assessment of the thermomechanical and chemical response of a specific shale to the heat resulting from emplacement of high-level nuclear wastes. Canister-size heaters were implanted in Conasauga shale in Tennessee. Instrumentation arrays wee placed at various depths in drill holes around each heater. The heaters operated for 8 months and, after the first 4 days, were maintained at 385°C. Emphasis was on characterizing the thermal and mechanical response of the formation. Conduction was the major mode of heat transport; convection was perceptible only at temperatures above the boiling point of water. Despite dehydration of the shale at higher temperatures, in situ thermal conductivity was essentially constant and not a function of temperature. The mechanical response of the formation was a slight overall expansion, apparently resulting in a general decrease in permeability. Metallurgical observations were made, the stability of a borosilicate glass wasteform simulant was assessed, and changes in formation mineralogy and groundwater composition were documented. In each of these areas, transient nonequilibrium processes occur that affect material stability and may be important in determining the integrity of a repository. In general, data from the test reflect favorably on the use of shale as a disposal medium for nuclear waste.

1940 (SAND--79-1889) STRATEGY FOR INVESTIGATION OF FLUID MIGRATION IN EVAPORITES (WASTE ISOLATION PILOT PLANT - WIPP). Lambert, S.J.; Shefelbine, H.C. (Sandia Labs., Albuquerque, NM (USA)). Mar 1980. Contract EY-76-C-04-0789. 27p. Dep. NTIS, PC A03/MF A01.

The proposed strategy for WIPP project investigations of fluid migration in evaporites focuses upon a quantitative evaluation of each of several processes. Potential short- and long-term problems arising from fluid migration are complication of waste retrieval and mobilization of waste nuclides. The strategy will attempt to determine the degree to which these potentials are realized with respect to five hypothetical types of waste-rock interactions: movement of waste containers, migration of nuclides, formation of radioactive brine pocket, radiolytic generation of gas, and degradation of waste container. Of eight identified processes whose combinations could lead to the five types of interactions, only five are to be quantitatively investigated by the studies of fluid migration per se: presence of fluids, fluid mobilization toward heat-producing and contact-handled waste, encounter of fluids with influence of waste form, reversal of direction of fluid mobilization, and entrainment of nuclides in fluids. Methods of investigation entail an iterative combination of laboratory experimentation and mathematical modeling.

1941 (SAND--79-1902) INSTRUMENTATION DEVELOPMENT FOR THE WASTE ISOLATION PILOT PLANT (WIPP) BOREHOLE PLUGGING PROGRAM (BHP). Cook, C.W. (Sandia Labs., Albuquerque, NM (USA)). Nov 1979. Contract EY-76-C-04-0789. 17p. Dep. NTIS, PC A02/MF A01.

This report discusses the instrumentation development needs of the borehole testing program as it now exists. Although requirements may change as the program progresses, the items indicated are basic to any borehole plugging program. Instrumentation is discussed both for the plug environment and for the plug itself. For the plug environment, a probe for measuring the disturbed region and a coordinate logging tool are required. For the plug itself, instrumentation includes measurements above, within, and below the plug. Instrumentation for most measurements above the plug is currently available; for measurements within and below the plug, however, further development is required. Specifically, resistivity, induction, and acoustic probes; an in situ stressmeter; and a hardwire, feedthrough system need to be developed.

1942 (SAND--79-1950C) SUMMARY OF RESULTS AND PLANS OF THE EXPERIMENTAL PROGRAM FOR THE WASTE ISOLATION PILOT PLANT. Hunter, T.O. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 20p. Dep. NTIS, PC A02/MF A01.

Four programs are reported: WIPP experimental program, brine migration experiments, canister material studies, and mine environment studies. (DLC)

1943 (SAND--79-1959C) WASTE ISOLATION PILOT PLANT (WIPP) RELEASE SCENARIOS. Brannen, J.P. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 11p. (CONF-791087--1). Dep. NTIS, PC A02/MF A01.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

The selection of release scenarios utilized in the assessment of the Waste Isolation Pilot Plant (WIPP) performance studies is discussed. The first scenario selected was an uncased 9'' borehole penetrating the Rustler Formation, the Repository, and the Bell Canyon Aquifer. The second scenario selected was described as a U tube scenario. It postulated events which lead to a flow from the Rustler Formation through the Repository then back to the Rustler Formation. The third scenario selected covered the formation of a nonflowing communication between the Repository and the Rustler Formations. Here the movement of radionuclides is up the salinity gradient by molecular diffusion. The last scenario assumed that at some future date, a drill crew cored through a cannister and brought the material to the surface.

1944 (SAND--79-2015) PRELIMINARY INVENTORY OF PRE-CENOZOIC CLAY SHALES AND ARGILLITES OF THE CONTERMINOUS UNITED STATES. Connolly, J.R.; Woodward, L.A. (Sandia Labs., Albuquerque, NM (USA)). Mar 1980. Contract EY-76-C-04-0789. 51p. Dep. NTIS, PC A04/MF A01.

Cretaceous shales of the Western Interior of

the United States occur in vast quantities and in thickness greater than 150 m (500 ft). Some older Mesozoic, Paleozoic, and Precambrian shale and argillites also appear to approach these thicknesses in deposits of considerable lateral extent. These older rocks commonly have a lower proportion of expandable clays and lower water contents.

1945 (SAND--79-2019C) CALCULATED HYDROGEOLOGIC PRESSURES AND TEMPERATURES RESULTING FROM RADIOACTIVE WASTE IN THE ELEANA ARGILLITE. Eaton, R.R.; Sundberg, W.D.; Larson, D.E.; Sherman, M.P. (Sandia Labs., Albuquerque, NM (USA); Rochester Inst. of Technology, NY (USA)). 1979. Contract EY-76-C-04-0789. 9p. (CONF-791112--32). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

The SHAFT 78 code (multi-dimensional, two fluid phases, porous medium) has been used to begin assessment of the consequences of nuclear waste burial in a 1000-acre repository emplaced in argillite. The repository is assumed to contain spent fuel [SF (UO_2)] at a loading of 150 kW/acre and to be located at a depth of 600 m. It was found that with perfect backfill, permeability = 1.0×10^{-7} Darcys, a maximum fluid pressure in the repository of 770 bars existed at a time of 55 years after burial. Holding all other input variables constant, the maximum fluid pressure in the underground workings never exceeded the local lithostatic pressure when the permeability of the backfill material was increased to 1.0×10^{-1} Darcys. The calculated temperature profiles are essentially independent of backfill permeability and porosity indicating that the heat flow is conduction dominated.

1946 (SAND--79-2023C) TITANIUM ALLOY CORROSION IN NUCLEAR WASTE ENVIRONMENTS. Braithwaite, J.W.; Magnani, N.J.; Munford, J.W. (Sandia Labs., Albuquerque, NM (USA)). 1980. Contract EY-76-C-04-0789. 35p. (CONF-800305--5). Dep. NTIS, PC A03/MF A01.

From Corrosion/80 NACE meeting; Chicago, IL, USA (6 Mar 1980).

A corrosion study has been conducted on the titanium alloys Ti-50A, TiCode 12, and Ti-Pd to evaluate their suitability as a long lifetime (300 to 600 year) canister material for the isolation of nuclear wastes. TiCode 12, selected as the primary candidate material, is shown to be very resistant to environmental attack. Results of electrochemical, general corrosion, and stress corrosion cracking experiments are presented. These data, including those from severe overtests, have shown that TiCode 12 is a viable candidate material for long-term waste isolation. 17 figures.

1947 (SAND--79-2073) BIOLOGICAL STUDIES OF THE US SUBSEABED DISPOSAL PROGRAM. Gomez, L.S.; Hessler, R.R.; Jackson, D.W.; Marietta, M.G.; Smith, K.L. Jr.; Talbert, D.M.; Yayanos, A.A. (Sandia National Labs., Albuquerque, NM (USA); Scripps Institution of Oceanography, La Jolla, CA (USA); Falcon Research and Development, Albuquerque, NM (USA)). Feb 1980. Contract AC04-76DP00789. 18p. NTIS, PC A02/MF A01.

The Subseabed Disposal Program (SDP) of the US is assessing the feasibility of emplacing high level radioactive wastes (HLW) within deep-sea sediments and is developing the means for assessing the feasibility of the disposal practices of other nations. This paper discusses the role and status of biological research in the SDP. Studies of the disposal methods and of the conceived barriers (canister, waste form and sediment) suggest that biological knowledge will be principally needed to address the impact of accidental releases of radionuclides. Current experimental work is focusing on the deep-sea ecosystem to determine: (1) the structure of benthic communities, including their microbial component; (2) the faunal composition of deep midwater nekton; (3) the biology of deep-sea amphipods; (4) benthic community metabolism; (5) the rates of bacterial processes; (6) the metabolism of deep-sea animals; and (7) the radiation sensitivity of deep-sea organisms. A multicompartment model is being developed to assess quantitatively the impact (on the environment and on man) of releases of radionuclides into the sea.

1948 (SAND--79-2117) BIOLOGICAL RAMIFICATIONS OF THE SUBSEABED DISPOSAL OF HIGH-LEVEL NUCLEAR WASTE. Gomez, L.S.; Hessler, R.R.; Jackson, D.W.; Marietta, M.G.; Smith, K.L. Jr.; Talbert, D.M.; Yayanos, A.A. (Sandia National Labs., Albuquerque, NM (USA)). May 1980. Contract AC04-76DP00789. 31p. NTIS, PC A03/MF A01.

The primary goal of the US Subseabed Disposal Program (SDP) is to assess the technical and environmental feasibility of disposing of high-level nuclear waste in deep-sea sediments. The subseabed biology program is charged with assessing possible ecosystem effects of radionuclides as well as possible health effects to man from radionuclides which may be released in the deep sea and transported to the ocean surface. Current biological investigations are attempting to determine benthic community structure; benthic community metabolism; the biology of deep-sea mobile scavengers; the faunal composition of midwater nekton; rates of microbial processes; and the radiation sensitivity of deep-sea organisms. Existing models of the dispersal of radionuclides in the deep sea have not considered many of the possible biological mechanisms which may influence the movement of radionuclides. Therefore, a multi-compartment foodweb model is being developed which considers both biological and physical influences on radionuclide transport. This model will allow parametric studies to be made of the impact on the ocean environment and on man of potential releases of radionuclides.

1949 (SAND--79-2117C) BIOLOGICAL RAMIFICATIONS OF THE SUBSEABED DISPOSAL OF HIGH-LEVEL NUCLEAR WASTE. Gomez, L.S.; Hessler, R.R.; Jackson, D.W.; Marietta, M.G.; Smith, K.L. Jr.; Talbert, D.M.; Yayanos, A.A. (Sandia Labs., Albuquerque, NM (USA); Scripps Institution of Oceanography, La Jolla, CA (USA); Falcon Research and Development, Albuquerque, NM (USA)). 1980. Contract EY-76-C-04-0789. 30p. (CONF-800420--1). Dep. NTIS, PC A03/MF A01.

From 2. international ocean disposal symposium; Woods Hole, MA, USA (15 Apr 1980).

Portions of document are illegible.

The primary goal of the US Subseabed Disposal Program (SDP) is to assess the technical and environmental feasibility of disposing of high-level nuclear waste in deep-sea sediments. The subseabed biology program is charged with assessing possible ecosystem effects of radionuclides as well as possible health effects to man from radionuclides which may be released in the deep sea and transported to the ocean surface. Current biological investigations are attempting to determine benthic community structure; benthic community

metabolism; the biology of deep-sea mobile scavengers; the faunal composition of midwater nekton; rates of microbial processes, and the radiation sensitivity of deep-sea organisms. Existing models of the dispersal of radionuclides in the deep sea have not considered many of the possible biological mechanisms which may influence the movement of radionuclides. Therefore, a multi-compartment foodweb model is being developed which considers both biological and physical influences on radionuclide transport. This model will allow parametric studies to be made of the impact on the ocean environment and on man of potential releases of radionuclides.

1950 (SAND--79-2141) BOREHOLE PLUGGING PROGRAM. STATUS REPORT, OCTOBER 1, 1978-SEPTEMBER 30, 1979. Christensen, C.L.; Cook, C.W.; Gulick, C.W. (Sandia Labs., Albuquerque, NM (USA)). Jan 1980. Contract EY-76-C-04-0789. 24p. Dep. NTIS, PC A02/MF A01.

This program is in support of the Waste Isolation Pilot Plant (WIPP) proposed for southeastern New Mexico. Current-year activities cover management, materials, instrumentation, and field tests. Proposed FY 80 activities are also outlined. (DLC)

1951 (SAND--79-2212) CREEP CONSOLIDATION OF NUCLEAR DEPOSITORY BACKFILL MATERIALS. Butcher, B.M. (Sandia National Labs., Albuquerque, NM (USA)). Oct 1980. Contract AC04-76DP00789. 28p. NTIS, PC A03/MF A01.

Evaluation of the effects of backfilling nuclear waste repository rooms is an important aspect of waste repository design. Consolidation of the porous backfill takes place as the room closes with time, causing the supporting stress exerted by the backfill against the intact rock to increase. Estimation of the rate of backfill consolidation is required for closure rate predictions and should be possible if the creep law for the solid constituent is known. A simple theory describing consolidation with a spherical void model is derived to illustrate this relationship. Although the present form of the theory assumes a homogeneous isotropic incompressible material atypical of most rocks, it may be applicable to rock salt, which exhibits considerable plasticity under confined pressure. Application of the theory is illustrated assuming a simple steady-state creep law, to show that the consolidation rate depends on the externally applied stress, temperature, and porosity.

1952 (SAND--79-2216A) DEGRADATION OF TRANSURANIC-CONTAMINATED WASTES UNDER GEOLOGIC ISOLATION CONDITIONS. Molecke, M.A. (Sandia Labs., Albuquerque, NM (USA)). Nov 1979. Contract EY-76-C-04-0789. 3p. (CONF-800611--2). Dep. NTIS, PC A02/MF A01.

From International symposium on the management of alpha-contaminated wastes; Vienna, Austria (2 Jun 1980).

An extensive experimental study of the degradation of existing forms of defense-related, transuranic-contaminated (TRU) wastes is being conducted by and for Sandia Laboratories. Studies have been performed under environmental conditions expected for deep geologic isolation in the Waste Isolation Pilot Plant (WIPP), a bedded-salt TRU waste repository planned for southeastern New Mexico. A primary purpose of this program has been to support the US Department of Energy in establishing waste acceptance criteria for TRU wastes for isolation in the WIPP. TRU waste forms investigated include cellulosics (paper, rags, wood), plastics, rubbers, mixed organic composite, bitumen, a developmental concrete-TRU ash matrix, mild steel, and inorganic process sludges. This review includes laboratory and field results for waste degradation under a range of conditions, resultant gas generation rates, gas compositions, corrosion rates, and microbial formation and degradation of chelating agents.

1953 (SAND--79-2226) SALT BLOCK II: DESCRIPTION AND RESULTS. Hohlfelder, J.J. (Sandia National Labs., Albuquerque, NM (USA)). Jun 1980. Contract AC04-76DP00789. 69p. NTIS, PC A04/MF A01.

A description of and results from the Salt Block II experiment, which involved the heating of and measurement of water transport within a large sample of rock salt, are presented. These results include the measurement of water released into a heated borehole in the sample as well as measured temperatures within the salt. Measured temperatures are compared with the results of a mathematical model of the experiment.

1954 (SAND--79-2244C) THERMAL, CHEMICAL, AND MASS-TRANSPORT PROCESSES INDUCED IN ABYSSAL SEDIMENTS BY THE EMPLACEMENT OF NUCLEAR WASTE: EXPERIMENTAL AND MODELING RESULTS. McVey, D.F.; Erickson, K.L.; Seyfried, W. (Sandia Labs., Albuquerque, NM (USA); Minnesota Univ., Minneapolis (USA). Dept. of Geology). 1980. Contract EY-76-C-04-0789. 52p. (CONF-800420--3). Dep. NTIS, PC A04/MF A01.

From 2. international ocean disposal symposium; Woods Hole, MA, USA (15 Apr 1980).

This paper discusses heat and mass transport studies of marine red clay sediments being considered as a nuclear waste isolation medium. Numerical models indicate that for a maximum allowable sediment/canister interface temperature of 200 to 250°C, the sediment can absorb about 1.5 kW initial power from waste in a 3 m long by 0.3 m dia canister buried 30 m in the sediment. Fluid displacement due to convection is found to be less than 1 m. Laboratory studies of the geochemical effects induced by heating sediment/seawater mixtures indicate that the canister and waste form must be designed to resist a hot, acid (pH 3 to 4) oxidizing environment. Since the thermally altered sediment volume of about 5.5 m^3 is small relative to the sediment volume overlying the canister, the acid and oxidizing conditions are not anticipated to effect the properties of the far field. Using sorption coefficient correlations, the migration of four nuclides ^{239}Pu, ^{137}Cs, ^{129}I, and ^{99}Tc were computer for a canister buried 30 m deep in a 60 m thick red clay sediment layer. It was found that the ^{239}Pu and ^{137}Cs are essentially completely contained in the sediments, while ^{129}I and ^{99}Tc broke through the 30 m of sediment in about 5000 years. The resultant peak injection rates of 4.6×10^{-5} μCi/year-m^2 for ^{129}I and 1.6×10^{-2} μCi/year-m^2 for ^{99}Tc were less than the natural radioactive flux of ^{226}Ra (3.5 to 8.8 x 10^{-4} μCi/year-m^2) and ^{222}Rn (0.26 to 0.88 μCi/year-m^2).

1955 (SAND--79-2245) STRATEGY FOR ASSESSING THE TECHNICAL, ENVIRONMENTAL, AND ENGINEERING FEASIBILITY OF SUBSEABED DISPOSAL. Anderson, D.R.; Talbert, D.M.; Reese, D.; Boyer, D.G.; Herrmann, H.; Kelly, J. (Sandia National Labs., Albuquerque, NM (USA); Harvard Univ., Cambridge, MA (USA); Department of Energy, Washington, DC (USA); New Hampshire Univ., Durham (USA)). Jul 1980. Contract AC04-

76DP00789. 26p. NTIS, PC A03/MF A01.
This report presents the strategy and management techniques used in the development of the US Subseabed Disposal Program (SDP) for possible disposal of both high-level waste and spent fuel. These have been developed through joint efforts of the Department of Energy (DOE), Division of Waste Isolation, the Sandia Technical Program Manager, the Technical Program Coordinators, the Advisory Group, and the Principal Investigators. Three subsections of this paper address the various components which make up the SDP strategy and management techniques. The first section summarizes the US DOE high-level waste and spent-fuel disposal program and the position that the SDP occupies within that program. The second section, the Subseabed Program Plan, addresses the technical and administrative tools which are employed to facilitate the day-to-day operation of the SDP. The third section addresses the current studies and future plans for addressing the legal, political, and international uncertainties that must be resolved before the SDP reaches the final engineering phases.

1956 (SAND--79-2245C) STRATEGY FOR ASSESSING THE TECHNICAL, ENVIRONMENTAL, AND ENGINEERING FEASIBILITY OF SUBSEABED DISPOSAL. Anderson, D.R.; Boyer, D.G.; Herrmann, H.; Kelly, J.; Talbert, D.M. (Sandia Labs., Albuquerque, NM (USA)). 1980. Contract EY-76-C-04-0789. 32p. (CONF-800420--2). Dep. NTIS, PC A03/MF A01.
From 2. international ocean disposal symposium; Woods Hole, MA, USA (15 Apr 1980).
This paper presents the strategy and management techniques used in the development of the US Subseabed Disposal Program (SDP) for possible disposal of both high-level waste and spent fuel. These have been developed through joint efforts of the Department of Energy (DOE), Division of Waste Isolation, the Sandia Technical Program Manager, the Technical Program Coordinators, the Advisory Group, and the Principal Investigators. Three subsections of this paper address the various components which make up the SDP strategy and management techniques. The first section will summarize the US DOE high-level waste and spent fuel disposal program and the position that the SDP occupies within that program. The second section, the Subseabed Program Plan, addresses the technical and administrative tools which are employed to facilitate the day-to-day operation of the SDP. The third section addresses the current studies and future plans for addressing the legal, political, and international uncertainties that must be resolved prior to the time the SDP reaches the final engineering phases.

1957 (SAND--79-2250) COMPUTER THERMAL MODELING FOR THE SALT ROCK II EXPERIMENT. George, O.L. Jr. (Sandia National Labs., Albuquerque, NM (USA)). Oct 1980. Contract AC04-76DP00789. 28p. NTIS, PC A03/MF A01.
The Salt Block II experiment consisted of a cylindrical block of bedded salt which was heated from within by a cylindrical electric heater. It was an extensively instrumented laboratory experiment that served, among other things, as a touchstone against which to measure the validity of a computer thermal model. The thermal model consisted of 282 nodes joined by 572 conductors, and was constructed for use with the CINDA heat transfer code. Both transient and steady-state temperature distributions within the salt were computed for heater power levels of 200, 400, 600, 1000 and 1500 watts. Temperature versus time plots are presented for 23 locations throughout the Block over a 58-day period. Comparisons of the model results and experimental results are shown for both transient and steady-state conditions. The computed steady-state results were used to develop equations describing both the temperature and the temperature derivative as functions of radial location.

1958 (SAND--79-2254) MEASUREMENTS OF VERY LARGE DEFORMATIONS IN POTASH SALT IN CONJUNCTION WITH AN ONGOING MINING OPERATION. Sattler, A.R.; Christensen, C.L. (Sandia National Labs., Albuquerque, NM (USA)). Jun 1980. Contract AC04-76DP00789. 29p. NTIS, PC A03/MF A01.
Room and pillar deformation were measured in conjunction with a relatively new type of mining operation in a southeastern New Mexico potash mine. The extraction ratio was approximately 90 percent in a first mining operation. Due to severe deformations encountered, instrumentation had to be developed/modified for these measurements. This paper concentrates on experiment design, design of special instrumentation, field installation of equipment, and presentation of the data. Measurements made include extensometers in the pillar, in the floor and ceiling in the room between pillars, absolute level measurements, floor ceiling closure, and stress (strain) measurements. Associated laboratory rock mechanics measurements of samples from the mine are being done separately. Two separate room pillar complexes were instrumented. In the first complex, floor-ceiling deformations of approximately 1 inch/day and pillar deformations around 1/2 inch/day were measured. In the second complex, instrumentation was installed while the pillar was a part of a long wall and the subsequent sequential mining (long wall-pillar with only one adjoining room on one side - pillar in the middle of room pillar complex) was observed. Data return from this operation was good.

1959 (SAND--79-2254C) MEASUREMENTS OF VERY LARGE DEFORMATIONS IN POTASH SALT IN CONJUNCTION WITH AN ONGOING MINING OPERATION. Sattler, A.R.; Christensen, C.L. (Sandia Labs., Albuquerque, NM (USA)). 1980. Contract EY-76-C-04-0789. 10p. (CONF-800507--4). Dep. NTIS, PC A02/MF A01.
From Rock mechanics symposium; Rolla, MO, USA (27 May 1980).
Room and pillar deformation were measured in conjunction with a relatively new type of mining operation in a southeastern New Mexico potash mine. The extraction ration was approximately 90 percent in a first mining operation. Due to severe deformations encountered, instrumentation had to be developed/modified for these measurements. This paper concentrates on experiment design, design of special instrumentation, field installation of equipment, and presentation of the data. In the first complex, floor-ceiling deformations of approximately 1 inch/day and pillar deformations around 1/2 inch/day were measured. In the second complex, instrumentation was installed while the pillar was a part of a long wall and the subsequent sequential mining (long wall-pillar with only one adjoining room on one side - pillar in the middle of room pillar complex) was observed. Data return from this

operation was good.

1960 (SAND--79-2328C) CREEP OF OCEAN SEDIMENTS RESULTING FROM THE ISOLATION OF RADIOACTIVE WASTES. Dawson, P.R.; Chavez, P.F.; Lipkin, J.; Silva, A.J. (Cornell Univ., Ithaca, NY (USA). Sibley School of Mechanical and Aerospace Engineering; Rhode Island Univ., Kingston (USA). Dept. of Ocean Engineering). 1980. Contract AC04-76DP00789. 39p. (CONF-800420--4). NTIS, PC A03/MF A01.
From 2. international ocean disposal symposium; Woods Hole, MA, USA (15 Apr 1980).
Predictive models for the creep of deep ocean sediments resulting from the disposal of radioactive wastes are presented and preliminary observations of a program for evaluation of creep constitutive equation parameters are discussed. The models are used to provide calculated response of sediments under waste disposal conditions.

1961 (SAND--79-2423) MINERALOGICAL ASPECTS OF FLUID MIGRATION IN THE SALT BLOCK II EXPERIMENT. Lambert, S.J. (Sandia National Labs., Albuquerque, NM (USA)). May 1980. Contract AC04-76DP00789. 33p. NTIS, PC A03/MF A01.
A block of evaporite rock containing the mineral assemblage halite (88%) - polyhalite (8%) - sylvite (4%) was machined into a cylinder one meter in diameter and one meter high, and was fitted with an axial heater, thermocouples and an off-gas collection system. After about 100 days of heating, identification of mineral efflorescences at the heater hole (carnallite and bischofite) showed that a significant portion of the 111 grams of water recovered (out of around 8500 grams available in the rock) migrated as a liquid, not as a vapor. A microscopic examination of rock slices from within 15 cm of the heater hole (where the temperature was 100 to 200°C, and the gradient was 3 to 15°C/cm) revealed that: (1) fluid inclusions had migrated, but rarely across grain boundaries; (2) fluid inclusions had not been mobilized at distances greater than about 15 cm from the heater hole; and (3) intergranular liquid had been conspicuously mobilized within 15 cm of the heater hole.

1962 (SAND--79-2468) ASSESSMENT OF POTENTIAL RADIONUCLIDE TRANSPORT IN SITE-SPECIFIC GEOLOGIC FORMATIONS. Dosch, R.G. (Sandia National Labs., Albuquerque, NM (USA)). Aug 1980. Contract AC04-76DP000789. 42p. NTIS, PC A03/MF A01.
Associated with the development of deep, geologic repositories for nuclear waste isolation is a need for safety assessments of the potential for nuclide migration. Frequently used in estimating migration rates is a parameter generally known as a distribution coefficient, K/sub d/, which describes the distribution of a radionuclide between a solid (rock) and a liquid (groundwater) phase. This report is intended to emphasize that the use of K/sub d/ must be coupled with a knowledge of the geology and release scenarios applicable to a repository. Selected K/sub d/ values involving rock samples from groundwater/brine simulants typical of two potential repository sites, WIPP and NTS, are used to illustrate this concern. Experimental parameters used in K/sub d/ measurements including nuclide concentration, site sampling/rock composition, and liquid-to-solid ratios are discussed. The solubility of U(VI) in WIPP brine/groundwater was addressed in order to assess the potential contribution of this phenomena to K/sub d/ values. Understanding mehanisms of sorption of radionuclides on rocks would lead to a better predictive capability. Sorption is attributed to the presence of trace constituents (often unidentified) in rocks. An attempt was made to determine if this applied to WIPP dolomite rocks by comparing sorption behavior of the natural material with that of a synthetic dolomite prepared in the laboratory with reagent grade chemicals. The results were inconclusive. The results of a study of Tc sorption by an argillite sample from the Calico Hills formation at NTS under ambient laboratory conditions were more conclusive. The Tc sorption was found to be associated with elemental carbon. Available evidence points to a reduction mechanism leading to the apparent sorption of Tc on the solid phase.

1963 (SAND--79-7042) METEOROLOGICAL AND AIR QUALITY DATA QUARTERLY REPORT WIPP SITE: EDDY COUNTY, NEW MEXICO. WINTER QUARTER, DECEMBER 1976-FEBRUARY 1977. Pocalujka, L.P.; Babij, E.; Church, H.W. (TRC, Inc., Wethersfield, CT (USA); Sandia Labs., Albuquerque, NM (USA)). Aug 1979. Contract EY-76-C-04-0789. 216p. Dep. NTIS, PC A10/MF A01.
The Wipp meteorological, air quality, and radiological measurements program was implemented to support the environmental effort for the evaluations of the site selection suitability. This data report is the third of a series of seasonal quarterly data summaries to be issued for the southeastern New Mexico site.

1964 (SAND--79-7050) SALT BLOCK I TEST: EXPERIMENTAL DETAILS AND COMPARISON WITH THEORY. FINAL REPORT. Duffey, T.A. (Los Alamos Technical Associates, Inc., NM (USA)). Feb 1980. Contract EY-76-C-04-0789. 85p. Dep. NTIS, PC A05/MF A01.
A series of laboratory experiments has been completed at Sandia Laboratories to provide an understanding of the steady state and transient thermal response of a large salt block containing an internal heat source. In this report, details of the experimental program are presented along with results of related efforts, such as thermal conductivity experiments, done in support of the heater experiments (Salt Block I). Finite element temperature field predictions, both transient and steady state, are performed utilizing the COYOTE nonlinear heat conduction program. Comparisons of experimental and theoretical results are generally quite good.

1965 (SAND--79-7102) BIBLIOGRAPHY OF MARINE RADIATION ECOLOGY PREPARED FOR THE SEABED PROGRAM. Schultz, V.S. (Lockheed Missiles and Space Co., Palo Alto, CA (USA)). Feb 1980. Contract EY-76-C-04-0789. 318p. Dep. NTIS, PC A14/MF A01.
References on the effects of ionizing radiation on aquatic organisms have been obtained from a number of sources. Many were obtained from reviews and other publications. Although the primary purpose of preparing this bibliography was to obtain information related to the nuclear wastes Seabed Disposal Biology Program of Sandia Laboratories, freshwater organisms are included as a matter of convenience and also with the belief that such a bibliography would be of interest to a wider audience than that restricted to the Seabed Program. While compilation of a list in an area broad in scope is often somewhat arbitrary, an attempt was made to reference publications that were related to field or laboratory studies of wild species of plants and animals with respect to radiation effects. Complete information concerning each reference are provided without

excessive library search. Since one often finds references listed in the literature that are incompletely cited, it was not always possible to locate the reference for verification or completion of the citation. Such references are included where they appeared to be of possible value. When known, a reference is followed with its Nuclear Science Abstract designation, or rarely other abstract sources. Those desiring additional information should check Nuclear Science Abstracts utilizing the abstract number presented or other abstracting sources. In addition, the language of the article, other than English, is given when it is known to me.

1966 (SAND--79-7111) THERMOMECHANICAL RESPONSE OF WIPP REPOSITORIES. Maxwell, D.E.; Wahi, K.K.; Dial, B. (Science Applications, Inc., San Leandro, CA (USA); Civil Systems, Inc., Albuquerque, NM (USA)). May 1980. Contract AC04-76DP00789. 77p. NTIS, PC A05/MF A01.

Coarsely zoned STEALTH 2D calculations were used to investigate two candidate WIPP repositories. The grid was designed for one hundred thousand years of response with modest computing costs. As a result, the early time mechanical response was compromised by non-real oscillations that could not be damped completely before a few thousand years. In spite of these oscillations, it was possible to see that the dominant effects of stress and strain peaked between one and two thousand years, at the time of maximum heat in the site. This time corresponded to the condition that the surface heat loss rate balanced the heat generation rate. Though the creep strains were quite small, a large volume of salt was involved and the effects were significant. The peak surface uplift of 75HLW was increased by about 25% due to creep. However, the deviatoric stress relaxation due to creep produced large changes in the stress fields. The Rustler layer survived reasonable failure criterion for the 75HLW case with creep, and failed both in tension and shear, according to these same criterion, when the calculation was repeated without creep. The deviatoric stress fields, with and without salt creep, concentrated near the repository as expected and also in the Rustler layer due to its relatively high Young's modulus compared to the neighboring layers. Since the time of interest is so much smaller than the 100,000 years this calculation was designed to examine, it is possible to model the WIPP stratigraphy in much more detail and still be able to calculate the response for the time of interest. A finer zoned calculation of the response of the WIPP stratigraphy to a repository similar to the 75 K watt/acre repository is modeled in this report. In this calculation the Rustler formation is modeled as a five layered formation using material properties derived from data taken at the Nome site.

1967 (SAND--80-0007/1) SUBSEABED DISPOSAL PROGRAM PLAN. VOLUME I. OVERVIEW. (Sandia Labs., Albuquerque, NM (USA)). Jan 1980. Contract EY-76-C-04-0789. 67p. Dep. NTIS, PC A04/MF A01.

Some of the most stable geologic formations are underneath the deep oceans. Purpose of this program is to assess the technical, environmental, and engineering feasibility of disposing of packaged high-level waste and/or repackaged spent reactor fuel in these formations. (DLC)

1968 (SAND--80-0007/2) SUBSEABED DISPOSAL PROGRAM PLAN. VOLUME II. FY80 BUDGET AND SUBTASK WORK PLANS. (Sandia Labs., Albuquerque, NM (USA)). Jan 1980. Contract EY-76-C-04-0789. 63p. Dep. NTIS, PC A04/MF A01.

This volume of the Subseabed Disposal Program Plan presents a breakdown of the master program structure by major activity. Each activity is described and accompanied by a specific cost plan schedule and a milestone plan. The costs have been compiled in the Cost Plan Schedules attached to each Subtask Work Plan. The FY 1980 budget for the Subseabed Disposal Program is summarized at the second level of the Work Breakdown Structure. The milestone plans for FY 80 are presented. The milestones can be changed only with the concurrence of the Sandia Subseabed Program Manager.

1969 (SAND--80-0039) ANALYTIC SOLUTIONS FOR THERMAL CONDUCTION FROM HEAT PRODUCING CYLINDERS AND SPHERES. Gartling, D.K. (Sandia National Labs., Albuquerque, NM (USA)). May 1980. Contract AC04-76DP00789. 39p. PC A03/MF A01.

Solution methods are developed to determine the temperature fields surrounding time dependent, cylindrical or spherical heat sources located in an infinite or semi-infinite medium. The method of superposition is employed to extend the single source solutions to the case of multiple heat sources. Numerical procedures are developed to efficiently evaluate the integral heat source solutions. Two computer programs based on the solution procedure are described. Complete user instructions and example problems for these programs are presented.

1970 (SAND--80-0087) CREEP CURVES AND FITTING PARAMETERS FOR SOUTHEASTERN NEW MEXICO BEDDED SALT. Herrmann, W.; Wawersik, W.R.; Lauson, H.S. (Sandia National Labs., Albuquerque, NM (USA)). Mar 1980. Contract AC04-76DP00789. 171p. NTIS, PC A08/MF A01.

Existing experimental data for 68 separate creep tests on rock salt from the Salado formation of SE New Mexico have been analyzed. The experimental conditions covered an intermediate temperature range from 22°C to 200°C, and shear stresses from 1000 psi (7 MPa) to 6000 psi (31 MPa). Most tests exhibited both transient and steady-state creep. Data for individual tests have been fitted both to an exponential transient creep law expected to hold at high temperaures (> 200°C) and a logarithmic transient creep law expected to hold at low temperature (< 50°C). A few tests also exhibited accelerating creep, and these were fitted with an exponential creep law which included an accelerating term. The exponential and logarithmic fits yielded steady-state creep rates which were in good agreement with each other. Low temperature and low stress tests were fitted much better by the logarithmic creep law. At higher tempertures both logarithmic and exponential creep laws were found to fit equally well. Tabulations of fitting parameters and plots of the experimental data and fitted creep curves are presented for each experiment, for use in further analysis.

1971 (SAND--80-0149) COMPARISON OF THERMOMECHANICAL CALCULATIONS FOR HIGHLY NON-LINEAR QUASISTATIC DRIFT DEFORMATIONS. Wayland, J.R.; Bertholf, L.D. (Sandia National Labs., Albuquerque, NM (USA)). Jul 1980. Contract AC04-76DP00789. 64p. NTIS, PC A04/MF A01.

Results of code calculations for the

November 14, 1979, Waste Isolation Pilot Plant (WIPP) Code Benchmark Workshop are compared. The results from five different codes (COUPLEFLO, JAC, SANCHO, SPECTROM, and STEALTH) are given for a problem involving the creep closure of an underground drift. The basic features of the codes are summarized and the codes are evaluated in terms of their applicability to WIPP problems. The codes predicted essentially the same response for this problem, and they appear to be nearly equally applicable to problems of this type. Also, a new benchmark problem is suggested along with a more realistic creep model for bedded salt.

1972 (SAND--80-0201) EVAPORATIVE WATER LOSS FROM WELDED TUFF. Hadley, G.R.; Turner, J.R. Jr. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1980. Contract AC04-76DP00789. 21p. NTIS, PC A02/MF A01.

Welded tuff is one of the many candidate rocks presently being considered as a host medium for the disposal of radioactive waste. In the case where the disposal site lies above the water table, the host rock will in general be only partially saturated. This condition leads to a number of mass transfer processes of interest, including evaporative drying, two-phase water flow due to pressure gradients, capillary movement, plus others. Although these processes have all been known about for decades, it is not clear at this time what the relative importance of each is with regard to geologic media in a waste disposal environment. In particular, there seems to be no data available for tuff that would allow an investigator to sort out mechanisms. This work is intended to be a start in that direction. This paper reports the measurement of water loss rate for welded tuff at various temperatures due to the action of evaporative drying. The initial saturation was unknown, but the average initial water content was found to be 7% by weight. The resulting data show that the water loss rate declines monotonically with time at a given temperature and increases with increasing temperature as expected. Somewhat surprising, however, is the fact that over 90% of the water from a sample was lost by evaporation at room temperature within 72 hours. All the water loss data, including that taken at temperatures as high as 150°C, are explained to within a factor of two by a simple evaporation front model. The latter assumes the water is lost by the molecular diffusion of water vapor from a receding evaporation front. The motion of the evaporation front seems to depend on mass balance rather than energy balance. Capillary forces and the resulting liquid diffusion are evidently not strong enough to wash out the evaporation front, since the front model seems to fit the data well.

1973 (SAND--80-0304C) SUBSEABED RADIOACTIVE WASTE DISPOSAL FEASIBILITY PROGRAM: OCEAN ENGINEERING CHALLENGES FOR THE 80'S. Talbert, D.M. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 16p. (CONF-800921--1). NTIS, PC A02/MF A01.

From IEEE/Oceans '80 conference; Seattle, WA, USA (8 Sep 1980).

The objective of the Subseabed Disposal Program is to assess the feasibility of disposing of high-level radioactive wastes or spent fuel in suitable geologic formations beneath the deep ocean floor. The program is entering a phase which will address engineering feasibility. While the current phase of the program to determine the scientific and environmental feasibility of the concept is not yet complete, activities to assess the engineering aspects are being initiated in parallel to facilitate the development of the concept on a time scale commensurate with other related programs both in the United States and abroad. It is anticipated that engineering aspects will become the central focus of the program during the early 80's and will continue so through the establishment of a pilot-plant level activity which could occur by the mid-90's.

1974 (SAND--80-0307C) SEDIMENT MECHANICAL RESPONSE DUE TO EMPLACEMENT OF A WASTE CANISTER. Karnes, C.H.; Dawson, P.R.; Silva, A.J.; Brown, W.T. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 11p. (CONF-800921--3). NTIS, PC A02/MF A01.

From IEEE/Oceans '80 conference; Seattle, WA, USA (8 Sep 1980).

Preliminary studies have been conducted to determine the interaction between a waste canister and seabed sediment during and after emplacement. Empirical and approximate methods for determining the depth reached by a freefall penetrator indicate that a boosted penetrator emplacement method may be necessary. Hole closure is necessary, but has not been verified because calculations and laboratory experiments show sensitivity to boundary conditions which control the degree of dynamic hole closure. Laboratory studies show that closure will take place by creep deformation but closure times in seabed environments are uncertain. For assumed thermomechanical properties of sediments, it is shown that a heat generating waste canister will probably not move a significant distancce during the heat generation period.

1975 (SAND--80-0310C) FINITE ELEMENT ANALYSIS OF THERMAL CONVECTION IN DEEP OCEAN SEDIMENTS. Gartling, D.K. (Sandia Labs., Albuquerque, NM (USA)). 1980. Contract EY-76-C-04-0789. 15p. (CONF-800515--1). Dep. NTIS, PC A02/MF A01.

From 3. international conference on finite elements in water resources; Oxford, MS, USA (19 May 1980).

Of obvious importance to the study and engineering of a seabed disposal is the determination of the temperature and fluid flow fields existing in the sediment layer and the perturbation of these fields due to the implantation of localized heat sources. The fluid mechanical and heat transfer process occurring in oceanic sediments may be characterized as free (or natural) convection in a porous material. In the case of an undisturbed sediment layer, the driving force for the natural circulation of pore water comes from the geothermal heat flux. Current theories for heat flow from the sea floor suggest the possibility of large scale hydrothermal circulation in the oceanic crust (see e.g., Ribando, et al. 1976) which is in turn coupled with a convection process in the overlying sediment layer (Anderson 1980, Anderson, et al. 1979). The introduction of a local heat source, such as a waste canister, into a saturated sediment layer would by itself initiate a convection process due to buoyancy forces. Since the mathematical description of natural convection in a porous medium is of sufficient complexity to preclude the use of most analytic methods of analysis, approximate numerical procedures are often employed. In the following sections, a particular type of numerical method is described that has proved useful in the solution of a variety of porous flow problems. However, rather than concentrate on the details of the numerical algorithm the main emphasis of the presentation will be on the types of

problems and results that are encountered in the areas of oceanic heat flow and seabed waste disposal.

1976 (SAND--80-0312C) ANALYSIS OF HEAT AND MASS TRANSFER IN SUB-SEABED DISPOSAL OF NUCLEAR WASTE. Hickox, C.E.; Gartling, D.K.; McVey, D.F.; Russo, A.J.; Nuttall, H.E. (Sandia National Labs., Albuquerque, NM (USA); New Mexico Univ., Albuquerque (USA)). 1980. Contract AC04-76DP00789. 22p. (CONF-801020--2). NTIS, PC A02/MF A01.
From Marine technology conference; Washington, DC, USA (6 Oct 1980).
Portions of document are illegible.
A mathematical basis is developed for the prediction of thermal and radionuclide transport in marine sediments. The theory is applied to the study of radioactive waste disposal by emplacement, in specially designed containers, well below the sediment/water interface. Numerical results are obtained for a specified model problem through use of two computer programs designed primarily for the analysis of waste disposal problems. One program (MARIAH) provides descriptions of the temperature and velocity fields induced by the presence of a container of thermally active nuclear waste. A second program (IONMIG), which utilizes the results of the thermal analysis, is used to provide predictions for the migration of four representative radionuclides: ^{239}Pu, ^{137}Cs, ^{129}I, and ^{99}Tc.

1977 (SAND--80-0323C) TECHNICAL ISSUES IN THE GEOLOGIC DISPOSAL OF RADIOACTIVE WASTES. Weart, W.D. (Sandia Labs., Albuquerque, NM (USA)). 1980. Contract EY-76-C-04-0789. 10p. (CONF-800517--2). Dep. NTIS, PC A02/MF A01.
From 26. annual technical meeting of the Institute for Environmental Sciences; Philadelphia, PA, USA (11 May 1980).
The status of technical understanding regarding radioactive waste repositories in geologic media is improving at a rapid rate. Within a few years the knowledge regarding non-salt repositories will be on a par with that which now exists for salt. To date there is no technical reason to doubt that geologic repositories in several different geologic media can be safely implemented to provide long-term isolation of radioactive wastes. Indeed, for bedded salt, there is now sufficient knowledge to allow all the identified phenomena to be bounded with satisfactory resultant consequences. It is possible to now proceed with technical confidence in an orderly development of a bedded-salt repository at a satisfactory site. This development would call for in-situ experiments, at the earliest possible stage, to confirm or validate the predictions made for the site. These in-situ experiments will be necessary for each repository in a different rock type. If, for non-technical reasons, repository development is delayed, field test facilities should be located as soon as possible in geologic settings typical of proposed repositories. Extensive testing to resolve generic issues will allow subsequent development of repositories to proceed more rapidly with only minimal in-situ testing required to resolve site-specific concerns.

1978 (SAND--80-0358C) BELL CANYON TEST (BCT): CEMENT DEVELOPMENT REPORT. Gulick, C.W.; Boa, J.A. Jr.; Buck, A.D. (Sandia National Labs., Albuquerque, NM (USA); Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Structures Lab.). May 1980. Contract AC04-76DP00789. 32p. (CONF-800527--5). NTIS, PC A03/MF A01.
From International BHP symposium; Columbus, OH, USA (7 May 1980).
The Borehole Plugging (BHP) materials development program which has been underway at WES under Sandia sponsorship for about five years is reviewed. Development testing data for candidate grout mixtures for the BCT plug are presented. Field batching, mixing, and placement operations are discussed. Data from field samples molded during the two plug placements include strength, expansion, compressional wave velocity, dynamic modulus, density, and porosity. Microstructure and composition are compared for grout samples at ages of a few weeks and one year.

1979 (SAND--80-0359C) STRATEGY FOR EVALUATING THE LONG-TERM STABILITY OF HOLE-PLUGGING MATERIALS IN THEIR GEOLOGICAL ENVIRONMENTS. Lambert, S.J. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract EY-76-C-04-0789. 11p. (CONF-800527--2). Dep. NTIS, PC A02/MF A01.
From International BHP symposium; Columbus, OH, USA (7 May 1980).
Material used to plug boreholes will not in general be in chemical equilibrium with its host rock. Adverse long-term performance of a plug can involve changes in phase assemblage in the plug/rock system which are difficult to observe at low temperatures in real time. The thermodynamics of multiphase equilibria provides a technique of predicting what phase changes might occur. The thermodynamic treatment of plug/rock systems utilizes (1) a formulation of possible chemical reactions among phases in the system and (2) determinations of changes in values of Gibbs' free energies for the hypothetical reactions, to identify the theoretically-permitted reactions which could degrade plug performance. Time-dependent prediction of phase changes requires a knowledge of rate laws and constants for specific reactions whose mechanisms are well known.

1980 (SAND--80-0390C) SANDIA BOREHOLE PLUGGING PROGRAM FOR THE WASTE ISOLATION PILOT PLANT (WIPP). Christensen, C.L. (Sandia Labs., Albuquerque, NM (USA)). 1980. Contract EY-76-C-04-0789. 30p. (CONF-800527--1). Dep. NTIS, PC A03/MF A01.
From International BHP symposium; Columbus, OH, USA (7 May 1980).
This paper presents the current Borehole Plugging Program (BHP) at Sandia National Laboratories and addresses the four major functional tasks considered necessary for a successful program: (1) project management, including methods to identify, design, and control needed experimentation; (2) identification of candidate materials, emphasizing cement-based products as the most advanced alternatives due to the extensive existing technology base, but recognizing the potential application of alternate materials; (3) development of test instrumentation based on utilization of existing techniques, evaluation of their adequacy, and identifying modifications necessary to improve effectiveness; (4) field test program, which includes testing and verification of plug performance. The scope of the current program on wellbores, cementitious grouts, and available technology is compared to planned extension to shafts and drifts, alternate materials, and improved instrumentation. The relationship of this program with assessments of long-term suitability performed in the geochemical program is presented. A brief

presentation of current and planned field tests is given along with projections for future activities and results.

1981 (SAND--80-0416) STORED ENERGY OF GAMMA-IRRADIATED WIPP SALT. Moss, M. (Sandia Labs., Albuquerque, NM (USA)). Mar 1980. Contract EY-76-C-04-0789. 21p. Dep. NTIS, PC A02/MF A01.

Samples of WIPP salt exposed at 363°K to gamma radiation from a ^{60}Co source were annealed at constant rates of heating in a differential scanning calorimeter in order to release the energy stored. Radiation doses were 2.2, 5.4, 8.2, 11 and 13 x 10^7 rad, and temperature scans were conducted from room temperature to 800°K. The specific stored energy-dose relationship deduced from 80 K/min scans could be only approximately established due to the extreme variability of the specific energy in samples of a given dose. This variability probably results from unequal amounts of impurities in the 10 to 25 mg samples required for the calorimeter. The energy-dose relationship is best described empirically by $\ln Q_0(cal/g) = (-40.6 +- 2.6) + (1.84 +- 0.12) \ln D(rad)$. Temperature scans of 10, 20, 40, and 80 K/min were performed to determine the activation energy E of the annealing process. For the four more highly dosed samples, E = 31.1 +- 5.6 kcal/mole. Based upon criteria established elsewhere, there appears to be no danger of the stored energy being released quickly in a nuclear waste repository of bedded salt, nor could serious consequences result from such a release by some unforeseen mechanism.

1982 (SAND--80-0426C) THERMAL CONVECTION AT LOW RAYLEIGH NUMBER FROM CONCENTRATED SOURCES IN POROUS MEDIA. Hickox, C.E. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 29p. (CONF-801102--9). NTIS, PC A03/MF A01.

From ASME winter annual meeting; Chicago, IL, USA (16 Nov 1980).

A simple mathematical theory is proposed for the analysis of natural convective motion, at low Rayleigh number, from a concentrated source of heat in a fluid-saturated porous medium. The theory consists of retaining only the leading terms of series expansions of the dependent variables in terms of the Rayleigh number, is thus linear, and is valid only in the limit of small Rayleigh number. Based on fundamental results for a variety of isolated sources, superposition is used to provide solutions for situations of practical interest. Special emphasis is given to the analysis of sub-seabed disposal of nuclear waste. 8 figures.

1983 (SAND--80-0440) SYSTEMS ENGINEERING PROGRAMS FOR GEOLOGIC NUCLEAR WASTE DISPOSAL. Klett, R.D.; Hertel, E.S. Jr.; Ellis, M.A. (Sandia National Labs., Albuquerque, NM (USA); Dikewood Corp., Albuquerque, NM (USA)). Jun 1980. Contract AC04-76DP00789. 136p. NTIS, PC A07/MF A01.

The design sequence and system programs presented begin with general approximate solutions that permit inexpensive analysis of a multitude of possible wastes, disposal media, and disposal process properties and configurations. It then continues through progressively more precise solutions as parts of the design become fixed, and ends with repository and waste form optimization studies. The programs cover both solid and gaseous waste forms. The analytical development, a program listing, a users guide, and examples are presented for each program. Sensitivity studies showing the effects of disposal media and waste form thermophysical properties and repository layouts are presented as examples.

1984 (SAND--80-0459) DOWNHOLE TELEVISION (DHTV) APPLICATIONS IN BOREHOLE PLUGGING. Christensen, C.L.; Statler, R.D.; Peterson, E.W. (Systems, Science and Software, La Jolla, CA (USA)). May 1980. Contract AC04-76DP00789. 32p. NTIS, PC A03/MF A01.

The Borehole Plugging (BHP) Program is a part of the Sandia experimental program to support the Waste Isolation Pilot Plant (WIPP). The Sandia BHP program is an Office of Nuclear Waste Isolation (ONWI)-funded program designed to provide inputs to the generic plugging program while simultaneously acquiring WIPP-specific data. For this reason a close liaison is maintained between the Sandia WIPP project and the ONWI generic program. Useful technology developed within the Sandia BHP to support WIPP is made available and considered for further development and application to the generic Borehole Plugging and Repository Sealing Program at ONWI. The purpose of this report is to illustrate the usefulness of downhole television (DHTV) observations of a borehole to plan plugging operations. An indication of the wellbore conditions observed is provided. The equipment and setup procedure used in the evaluation of AEC-7 for the Bell Canyon test series are illustrated. A sequence of pictures at various depths as the DHTV rig is lowered through the wellbore is presented. Sample photographs taken with both dry and underwater lamps for illumination are included. The caliper logs for the same depth are included for comparison. General comments are provided on the illustrations.

1985 (SAND--80-0467) NUMERICAL SIMULATION OF CREEP CLOSURE OF DEEP POTASH MINES (WITH APPLICATION TO WASTE ISOLATION). Munson, D.E.; Dawson, P.R. (Sandia Labs., Albuquerque, NM (USA); Cornell Univ., Ithaca, NY (USA). Dept. of Mechanical and Aerospace Engineering). Jul 1980. Contract AC04-76DP00789. 28p. NTIS, PC A03/MF A01.

In this work, numerical simulation of the mechanical response of a deep mine opening in potash is shown to match measured room closures to within a factor of two. In this case, the calculated closure rates after eight years are within 25 to 75 percent of those measured. In making the calculations, a constitutive model for creep, as determined from laboratory triaxial tests of salt and short cylinder compressive tests of potash, was incorporated into a coupled thermal-mechanical fluid flow code, COUPLEFLO. The model is a multimechanism formulation of thermally activated processes acting in parallel. Because the field tests were well-documented, two-dimensional configurations and because the constitutive model was uniquely determined by laboratory data, the agreement between calculations and field data for these significant time durations is a first step in verification of the simulation technique. Application of the model and numerical methods presented here can be used to understand deformation in deep potash mines and, very importantly, to aid also in design of the waste isolation and petroleum storage facilities.

1986 (SAND--80-0502C) ROLE OF BOREHOLE PLUGGING IN THE EVALUATION OF THE WASTE ISOLATION PILOT PLANT. Hunter, T.O. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract EY-76-C-04-0789. 20p. (CONF-800527--3). Dep. NTIS, PC A02/MF A01.

From International BHP symposium; Columbus, OH, USA (7 May 1980).

Research on borehole plugging (BHP) is part of an integrated strategy to develop technology that can assure successful nuclear waste isolation. The application of this strategy to the Waste Isolation Pilot Plant (WIPP) in southeastern New Mexico has included an assessment of the role BHP plays in the development of a repository at that site. This paper presents a description of the WIPP site, repository design, and the current research and development program. The status of drill holes - those drilled for petroleum and potash exploration and those drilled for site characterization - within the proposed site boundaries is presented. Sixty-six holes are present on the 7700 hectare (19,000 acre) site, yet only 8 penetrate as deep as the proposed repository location. The assumptions made about shaft and borehole sealing in consequence assessment studies are presented. The results of these studies indicate that borehole seals with effective permeabilities greater than tens of darcies would result in doses to maximally exposed individuals of less than 0.01% of natural background.

1987 (SAND--80-0531C) APPLICATION OF QA GEOSCIENCE INVESTIGATIONS. Henderson, J.T. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 10p. (CONF-8005105--1). NTIS, PC A02/MF A01.

From 35. annual technical conference; San Francisco, CA, USA (11 May 1980).

This paper discusses the evolution of a classical hardware QA program (as currently embodied in DOE/ALO Manual Chapter 08XA; NRC 10CFR Part 50, Appendix B; and other similar documents) into the present geoscience quality assurance programs that address eventual NRC licensing, if required. In the context of this paper, QA will be restricted to the tasks associated with nuclear repositories, i.e. site identification, selection, characterization, verification, and utilization.

1988 (SAND--80-0558) ANALYSIS OF STEADY STATE CREEP OF SOUTHEASTERN NEW MEXICO BEDDED SALT. Herrmann, W.; Wawersik, W.R.; Lauson, H.S. (Sandia National Labs., Albuquerque, NM (USA)). Mar 1980. Contract AC04-76DP00789. 41p. NTIS, PC A03/MF A01.

Steady state creep rates have been obtained from a large suite of existing experimental creep data relating to bedded rock salt from the Salado formation of S.E. New Mexico. Experimental conditions covered an intermediate temperature range from 22°C to 200°C, and shear stresses from 1000 psi (7 MPa) to 6000 psi (31 MPa). An expression, based on a single diffusion controlled dislocation climb mechanism, has been found to fit the observed dependence of steady state creep rate on shear stress and temperature, yielding an activation energy of 12 kcal/mole (50 kJ/mole) and a stress exponent of 4.9. Multiple regression analysis revealed a dependence on stratigraphy, but no statistically significant dependence on pressure of specimen size. No consistent dilatancy or compaction associated with steady state creep was found, although some individual specimens dilated or compacted during creep. The steady state creep data were found to agree very well with creep data for both bedded and dome salt from a variety of other locations.

1989 (SAND--80-0632) IMPULSE RADAR SCANNING OF INTACT SALT AT THE AVERY ISLAND MINE. Cook, C.W. (Sandia Labs., Albuquerque, NM (USA)). May 1980. Contract AC04-76DP00789. 36p. NTIS, PC A03/MF A01.

A series of experiments was run in the Avery Island Mine to evaluate the capability of an impulse radar to locate anomalies and simulated waste targets in intact dome salt. Voids in salt were difficult to detect. On the positive side, metal targets and simulated waste (glass) were easily located in intact salt. Radar scanning at ranges of greater than 25 meters and short-range resolution of target positions to within a few centimeters were achieved.

1990 (SAND--80-0705C) PRESSURE MEASUREMENTS IN LOW PERMEABILITY FORMATIONS. Veneruso, A.F.; McConnell, T.D. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 19p. (CONF-800344--2). NTIS, PC A02/MF A01.

From 3. invitational well testing symposium; Oakland, CA, USA (26 Mar 1980).

This paper examines the performance requirements and identifies candidate hardware implementations for pressure instrumentation that is needed to provide well test data in low permeability formations. Low permeability values are typically defined to be less than 1 microdarcy and are usually encountered in hard rock formations, such as granite, that are of interest in hot dry rock geothermal, deep exploration drilling, and fluid waste disposal. Groundwater flow in these tight formations has been shown to be dominated by flow-through fractures rather than through the formation's intrinsic permeability. In these cases, we cannot use Darcy's law or the usual dimensionless coefficients to estimate the expected scale factors and dynamic responses necessary to properly select and setup the wellbore pressure instrument. This paper shows that the expected instrument responses can be estimated using some recent work by Wang, Narasimhan, and Witherspoon. This paper further describes the minimum electronic capability that the downhole pressure instrument must have in order to provide the required measurement resolution, dynamic range, and transient response. Three specific hardware implementations are presented based on the following transducers: a quartz resonator, a capacitance gauge, and a resistance strain gauge.

1991 (SAND--80-0781C) SYSTEMS ANALYSIS APPROACH TO THE DISPOSAL OF HIGH-LEVEL WASTE IN DEEP OCEAN SEDIMENTS. de Marsily, G.; Hill, M.D.; Murray, C.N.; Talbert, D.M.; Van Dorp, F.; Webb, G.A.M. (Sandia National Labs., Albuquerque, NM (USA); Centre d'Informatique Geologique Ecoles des Mines de Paris, Fontainebleu (France); National Radiological Protection Board, Harwell (UK); Commission of the European Communities, Ispra (Italy). Joint Research Centre; Instituut voor Toepassing van Atoomenergie in de Landbouw, Wageningen (Netherlands)). 1980. Contract AC04-76DP00789. 17p. (CONF-801063--2; IAEA-SM--248/115). NTIS, PC A02/MF A01.

From International symposium on the impacts of radionuclide releases into the marine environment; Vienna, Austria (6 Oct 1980).

Among the different options being studied for disposal of high-level solidified waste, increasing attention is being paid to that of emplacement of glasses incorporating the radioactivity in deep oceanic sediments. This option has the advantage that the areas of the oceans under investigation appear to be relatively unproductive biologically, are relatively free from cataclysmic events, and are areas in which the natural processes are slow. Thus the environment is stable and predictable so that a number of barriers to the

release and dispersion of radioactivity can be defined. Task Groups set up in the framework of the International Seabed Working Group have been studying many aspects of this option since 1976. In order that the various parts of the problem can be assessed within an integrated framework, the methods of systems analysis have been applied. In this paper the Systems Analysis Task Group members report the development of an overall system model. This will be used in an iterative process in which a preliminary analysis, together with a sensitivity analysis, identifies the parameters and data of most importance. The work of the other task groups will then be focussed on these parameters and data requirements so that improved results can be fed back into an improved overall systems model. The major requirements for the development of a preliminary overall systems model are that the problem should be separated into identified elements and that the interfaces between the elements should be clearly defined. The model evolved is deterministic and defines the problem elements needed to estimate doses to man.

1992 (SAND--80-0799) THERMAL PROPERTIES MEASUREMENTS ON ROCKSALT SAMPLES FROM THE SITE OF THE PROPOSED WASTE ISOLATION PILOT PLANT. Sweet, J.N.; McCreight, J.E. (Sandia Labs., Albuquerque, NM (USA)). 13 May 1980. Contract AC04-76DP00789. 76p. NTIS, PC A05/ MF A01.

Thermal conductivity, thermal expansion, and specific heat measurements have been made on a number of specimens. The specific heat measurements were made by differential scanning calorimetry and the results showed that the specific heats of both clean rocksalt samples and of dirty samples with less than or equal to 7% insoluble impurities were essentially identical to the published specific heat for pure NaCl. In the thermal expansion measurements, two distinct groups of samples were identified. The first group had average expansion coefficients in the temperature range 300 to 700°K close to that reported for pure NaCl. All the samples in this group were composed predominantly of halite, with only small amounts of other minerals or materials present. A second group of samples had expansion coefficients only approx. 0.3 to 0.5 that of NaCl. The samples in this group were composed largely of polyhalite, anhydrite, or siltstone. The measurements first reported by Acton on the thermal conductivity of samples taken from a borehole at the site of the proposed nuclear waste isolation pilot plant (WIPP) near Carlsbad, NM, have been extended to include additional samples and higher temperature measurements. This is not believed to be the result of the onset of radiative thermal transport because the deviations are negative as well as positive. Infrared transmission measurements on rocksalt samples from the proposed WIPP site show no transmission in the 3 to 10 μm wavelength range for samples > 5 cm thick. Use of the estimated infrared absorption coefficient leads to the conclusion that there is little radiative heat transport for T < 800°K. All samples were dense with little or no porosity evident. On the basis of these experiments, it is concluded that the thermal conductivity of materials found at the site can be predicted to an accuracy +- 30% from knowledge of the composition and grain size of these materials.

1993 (SAND--80-0812) RECOMMENDED ANALYSIS PLAN FOR THE BOREHOLE PLUGGING PROGRAM POTASH CORE TEST. Lambert, S.J. (Sandia National Labs., Albuquerque, NM (USA)). May 1980. Contract AC04-76DP00789. 22p. NTIS, PC A02/ MF A01.

A four-year old plugged potash core hole near the Waste Isolation Pilot Plant (WIPP) site in southeastern New Mexico has been proposed for overcoring, in order to examine the behavior of known grout mix constituents in contact with a variety of rock types during an extended grout-curing interval. This report recommends that various geochemical analyses be applied to the core samples containing both grout and rock and the interface between the two. The methods to be used include optical petrography, electron microscopy, electron probe microanalysis, x-ray diffraction, thermal analysis (TGA, DSC, DTA) with gas chromatography/mass spectrometry, and bulk chemical analysis. These analyses would allow identification of phases which have developed during grout curing, and provide evidence of reactions which may have taken place among constituents in the system grout-rock-groundwater. These reactions, and their sequence of occurrence will be compared with reactions predicted by thermodynamic modeling as the system seeks its lowest Gibbs' free energy. Identification of reactions which have the potential for compromising the integrity of a grout plug will receive special attention. Since not all such detrimental reactions can be observed directly in a human lifetime, due to kinetic inhibitions, and since a capability of time-dependent prediction of their degree of occurrence cannot be developed, thermodynamic modeling is the only known way of evaluating the long-term stability of a grout plug. The analysis of the plug-rock system will give an indication of in situ curing history of grout plug, and will allow an early occurrence of potentially detrimental reactions to be detected. Thus, this activity will be a case-study of suitability of certain grout mixtures for use in evaporites, as an example of evaluation of grouts for long-term compatability with a variety of rock types.

1994 (SAND--80-1020/1) PREDICTION OF GROUND MOTION FROM UNDERGROUND NUCLEAR WEAPONS TESTS AS IT RELATES TO SITING OF A NUCLEAR WASTE STORAGE FACILITY AT NTS AND COMPATIBILITY WITH THE WEAPONS TEST PROGRAM. Vortman, L.J. IV. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1980. Contract EY-76-C-04-0789. 44p. NTIS, PC A03/MF A01.

This report assumes reasonable criteria for NRC licensing of a nuclear waste storage facility at the Nevada Test Site where it would be exposed to ground motion from underground nuclear weapons tests. Prediction equations and their standard deviations have been determined from measurements on a number of nuclear weapons tests. The effect of various independent parameters on standard deviation is discussed. That the data sample is sufficiently large is shown by the fact that additional data have little effect on the standard deviation. It is also shown that coupling effects can be separated out of the other contributions to the standard deviation. An example, based on certain licensing assumptions, shows that it should be possible to have a nuclear waste storage facility in the vicinity of Timber Mountain which would be compatible with a 700 kt weapons test in the Buckboard Area if the facility were designed to withstand a peak vector acceleration of 0.75 g. The prediction equation is a log-log linear equation which predicts acceleration as a function of yield of an explosion and the distance from it.

1995 (SAND--80-1020/1) PREDICTION OF GROUND

MOTION FROM UNDERGROUND NUCLEAR WEAPONS TESTS AS IT RELATES TO SITING OF A NUCLEAR WASTE STORAGE FACILITY AT NTS AND COMPATIBILITY WITH THE WEAPONS TEST PROGRAM. Vortman, L.J. III. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1980. Contract EY-76-C-04-0789. 44p. NTIS, PC A03/MF A01.

This report assumes reasonable criteria for NRC licensing of a nuclear waste storage facility at the Nevada Test Site where it would be exposed to ground motion from underground nuclear weapons tests. Prediction equations and their standard deviations have been determined from measurements on a number of nuclear weapons tests. The effect of various independent parameters on standard deviation is discussed. That the data sample is sufficiently large is shown by the fact that additional data have little effect on the standard deviation. It is also shown that coupling effects can be separated out of the other contributions to the standard deviation. An example, based on certain licensing assumptions, shows that it should be possible to have a nuclear waste storage facility in the vicinity of Timber Mountain which would be compatible with a 700 kt weapons test in the Buckboard Area if the facility were designed to withstand a peak vector acceleration of 0.75 g. The prediction equation is a log-log linear equation which predicts acceleration as a function of yield of an explosion and the distance from it.

1996 (SAND--80-1319C) SANDIA'S ACTIVITIES IN URANIUM MILL TAILINGS REMEDIAL ACTION. Neuhauser, S. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 9p. (CONF-800584--1). NTIS, PC A02/MF A01.

From Fish and wildlife service workshop; Ft Collins, CO, USA (28 May 1980).

The Uranium Mill Tailings Radiation Control Act of 1978 requires that remedial action be taken at over 20 inactive uranium mill tailings sites in the United States. Standards promulgated by the EPA under this act are to be the operative standards for this activity. Proposed standards must still undergo internal review, public comment, and receive Nuclear Regulatory Commission concurrence before being finalized. Briefly reviewed, the standards deal separately with new disposal sites (Part A) and cleanup of soil and contaminated structures at existing locations (Part B). In several cases, the present sites are felt to be too close to human habitations or to be otherwise unacceptably located. These tailings will probably be relocated. New disposal sites for relocated tailings must satisfy certain standards. The salient features of these standards are summarized.

1997 (SAND--80-1407C) GEOCHEMICAL STUDIES SUPPORTING THE US SUBSEABED DISPOSAL PROGRAM. Erickson, K.L.; Seyfried, W.E.; Heath, G.R.; Krumhansl, J.L.; Bowen, V.T. (Sandia National Labs., Albuquerque, NM (USA); Minnesota Univ., Minneapolis (USA); Oregon State Univ., Corvallis (USA); Woods Hole Oceanographic Institution, MA (USA)). 1980. Contract AC04-76DP00789. 18p. NTIS, PC A02/MF A01.

The important chemical phenomena associated with emplacing high-level radioactive waste in subseabed geologic formations are being identified and experimentally investigated. Studies of processes occuring in the hydrothermal environment near the canister have focused on sediment-seawater interactions at elevated temperatures and pressures and the resulting potential effects on canister, wasteform, and radionuclide source term. Significant changes in oxidation potential and pH have been related to variations in temperature and mineralogy. Investigation of phenomena occurring in the sediment outside of the hydrothermal environment have focused on actinide solution chemistry, sorption phenomena, and radionuclide diffusion rates. Data for several radionuclides and sediment types are being used to compare predicted and experimental results from diffusion experiments. Studies of processes occurring near the sediment-seawater interface have emphasized establishing a data base for evaluating the geochemical, physical, biological, and fluid-mechanical mechanisms determining radionuclide fluxes across the interface.

1998 (SAND--80-1464) EVALUATION OF TUFF AS A MEDIUM FOR A NUCOLEAR WASTE REPOSITORY: INTERIM STATUS REPORT ON THE PROPERTIES OF TUFF. Johnstone, J.K.; Wolfsberg, K. (eds.). (Sandia National Labs., Albuquerque, NM (USA); Los Alamos Scientific Lab., NM (USA)). Jul 1980. Contract AC04-76DP00789. 139p. NTIS, PC A07/MF A01.

This report is the second in a series of summary briefings to the National Academy of Science's (NAS) Committee on Radioactive Waste Management dealing with feasibility of disposal of heat-producing radioactive waste in silicic tuff. The interim status of studies of tuff properties determined on samples obtained from Yucca Mountain and Rainier Mesa (G-tunnel) located on the Nevada Test Site (NTS) are discussed. In particular, progress is described on resolving issues identified during the first briefing to the NAS which include behavior of water in tuff when heated, the effect of the presence or absence of water and joints on the thermal/physical properties of tuff and the detailed/complex sorptive properties of highly altered and unaltered tuff. Initial correlations of thermal/physical and sorptive properties with the highly variable porosity and mineralogy are described. Three in-situ, at-depth field experiments, one nearly completed and two just getting underway are described. In particular, the current status of mineralogy and petrology, geochemistry, thermal and mechanical, radiation effects and water behavior studies are described. The goals and initial results of a Mine Design Working Group are discussed. Regional factors such as seismicity, volcanism and hydrology are not discussed.

1999 (SAND--80-1533C) THERMOPHYSICAL PROPERTIES OF DEEP OCEAN SEDIMENTS. Hadley, G.R.; McVey, D.F.; Morin, R. (Sandia National Labs., Albuquerque, NM (USA); Rhode Island Univ., Kingston (USA). Dept. of Ocean Engineering). 1980. Contract AC04-76DP00789. 12p. (CONF-801020--1). NTIS, PC A02/MF A01.

From Marine technology conference; Washington, DC, USA (6 Oct 1980).

Here we report measurements of the thermal conductivity and diffusivity of reconsolidated illite and smectite ocean sediments at a pore pressure of 600 bars and temperatures ranging from 25 to 420°C. The conductivity and diffusivity were found to be in the range of 0.8 to 1.0 W/m-K and 2.2 to 2.8 x 10^{-7} m^2/s, respectively. These data are consistent with a mixture model which predicts sediment thermal properties as a function of constituent properties and porosity. Comparison of pre- and post-test physical properties indicated a decrease in pore water content and an order of magnitude increase in shear strength and permeability.

2000 (SAND--80-1566C) RADIATION HARDENING OF ROCKSALT. Arnold, G.W. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 6p. (CONF-801124--7). NTIS, PC A02/MF A01.

From 3. annual meeting of the Materials Research Society; Boston, MA, USA (17 Nov 1980).

This report gives indentation hardness results for irradiated (^{60}Co γ-irradiated and ion implanted) natural and synthetic NaCl for irradiation temperatures less than 95°C. Both rocksalt and synthetic NaCl increase in indentation hardness (by a factor of about 1.7) when exposed to γ-ray doses in excess of 10^{10} rads at temperatures less than 95°C. The large optical densities produced make it very difficult to assess the importance, if any, of colloidal Na upon the change in hardness. This difficulty has been circumvented by using ion implantation to get high concentrations of defects in a thin surface layer. Annealing of such implanted layers produces colloidal Na. Increases in hardness by a factor of about 2.1 have been found by this technique when only the colloidal Na band is present in the optical absorption. It is important to note that the colloidal band disappears in a matter of hours at 170°C and thus the changes in hardness we have noted will depend critically upon the interface temperature in the repository, the accumulated dose, and the time of exposure at a given temperature.

2001 (SAND--80-1592C) GEOMECHANICS ACTIVITIES CONDUCTED AT SANDIA NATIONAL LABORATORIES IN SUPPORT OF THE WASTE ISOLATION PILOT PLANT. Krieg, R.D.; Hunter, T.O. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 16p. (CONF-800751--1). NTIS, PC A02/MF A01.

From Workshop on thermomechanical-hydrochemical modeling for hardrock waste repository; Bereley, CA, USA (29 Jul 1980).

The geotechnical characterization associated with the development of the WIPP includes: (a) studies of the hydrologic flow system in surrounding aquifer systems, and (b) studies of thermal-structural interaction between the repository and the rock formation. The former is summarized in a companion paper. The latter, to be discussed here, includes the development and verification of methods to evaluate the response of the host rock to both ambient conditions upon excavation and the enhanced deformations anticipated with heat-producing wastes. This program includes development and application of analytical models, laboratory materials testing, and in situ testing. The thermostructural analysis capability for the WIPP repository in halite is advancing rapidly. The creep characteristics of halite, while not completely established for short-time or primary creep behavior, seems well established for long-time behavior. There are several operational computer programs which have demonstrated a capability to work these problems. They are presently being compared with the second in a series of benchmark problems. A single, but important concern with the codes is the long running times and therefore high cost of running meaningful problems. Three-dimensional calculations have not been considered at this time for that reason. An understanding of the role of various stratigraphic details is being developed as more calculations are made. This experience base will be valuable in narrowing alternatives in design work. A detailed correlation of the codes with field data is just beginning. This correlation and the characterization of primary creep in halite are the two areas receiving the most research emphasis at this time.

2002 (SAND--80-1599C) TECHNICAL DEVELOPMENTS IN THE WIPP PROGRAM. Weart, W.D. (Sandia Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 37p. (CONF-801077--1). NTIS, PC A03/MF A01.

From Association of Engineering Geologists annual meeting; Dallas, TX, USA (20 Oct 1980).

More than five years of site specific studies have led to the conclusion that radioactive wastes can be safely isolated in the bedded salt of the Delaware Basin in southeast New Mexico. Aspects of particular concern for site integrity, such as regional or local dissolution processes and salt deformation have been thoroughly evaluated and are not believed to present hazards to the repository. Hydrology of the site area has been shown to possess many desirable features with respect to transport of radioisotopes to the bioshpere in the event of a repository breach. Natural resources, potash and hydrocarbons, are present in the area of the site but can be exploited with appropriate precautions. Safety analyses have considered the consequences of their possible attraction to future man. Repository behavior and interactions between waste and the host rock have been studied in the laboratory, in field tests and by calculational methods. In particular, such issues as brine migration and canister corrosion may be shown to have little detrimental impact if modest and practical engineering measures are adopted. Calculations indicate salt deformation and room closure rates may be great enough that a salt repository must be carefully designed in order to assure ready retrieval of emplaced waste over long periods of time. Safety assessment calculations have been performed to determine the consequences of assumed repository failure scenarios. Even the most dire credible (but improbable) natural failure scenarios prove to be benign in their consequences to man. Direct penetration by unknowing, future man could result in significant exposures to the specific individuals involved but would not cause significant population effects.

2003 (SAND--80-1606C) OVERVIEW OF THE SUBSEABED DISPOSAL PROGRAM. Anderson, D.R.; Boyer, D.G.; Hessler, R.R.; Hollister, C.D.; Talbert, D.M.; Yayanos, A.A. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 7p. (CONF-801020--3). NTIS, PC A02/MF A01.

From Marine technology conference; Washington, DC, USA (6 Oct 1980).

This presentation addresses the rationale, history, strategy, and management techniques used in the development of the US Subseabed Disposal Program (SDP) for both high level waste and spent fuel. The three subsections will summarize first, the US Department of Energy (DOE) high level waste and spent fuel waste disposal strategy and the position that the SDP occupies within that strategy; second, the technical and administrative tools developed to support the long range research and engineering plans defined by the DOE, program management, and program participants and employed to facilitate the day-to-day operation of the SDP; and third, the current studies and plans for addressing the legal, political, and international uncertainties that must be addressed before the SDP reaches the final engineering phases.

2004 (SAND--80-1616C) STORED ENERGY OF

GAMMA-IRRADIATED 97% PURE ROCKSALT. Moss, M. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 7p. (CONF-801102--21). NTIS, PC A02/MF A01.

From ASME winter annual meeting; Chicago, IL, USA (16 Nov 1980).

Samples of 97% pure NaCl from the Waste Isolation Pilot Plant (WIPP) site near Carlsbad, New Mexico, were exposed at 363°K to gamma radiation from a ^{60}Co source, and annealed at constant rates of heating in a differential scanning calorimeter in order to release the stored energy. Radiation doses were 2.2, 5.4, 8.2, 11, and 13 x 10^9 rad, and temperature scans were conducted from room temperature to 800°K. The stored energy-dose relationship is best described empirically by $\ln Q_0(kJ/kg) = (-39.2 \pm 2.6) + (1.84 \pm 0.12) \ln D(rad)$. Temperature scans of 0.17, 0.33, 0.67, and 1.33 K/s were performed to determine the activation energy E of the annealing process. For the four most highly irradiated samples, E = 113 +- 31 kJ/mol. The values of stored energy and activation energy for the annealing process are similar to those reported by previous investigators. These data, then, support their conclusion that there appears to be no danger of a rapid release of the stored energy in a nuclear waste respository of bedded salt, nor could serious consequences result from such a release by some unforeseen mechanism.

2005 (SAND--80-2035C) GEOTECHNICAL PROPERTIES OF SEDIMENTS FROM NORTH PACIFIC AND NORTHERN BERMUDA RISE. Silva, A.J.; Laine, E.P.; Lipkin, J.; Heath, G.R.; Akers, S.A. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 9p. (CONF-801020--5). NTIS, PC A02/MF A01.

From Marine technology conference; Washington, DC, USA (6 Oct 1980).

Studies of geotechnical properties for the Sub-seabed Disposal Program have been oriented toward sediment characterization related to effectiveness as a containment media and determination of detailed engineering behavior. Consolidation tests of the deeper samples in the North Pacific clays indicate that the sediment column is normally consolidated. The in-situ coefficient of permeability (k) within the cored depth of 25 meters is relatively constant at 10^{-7} cm/sec. Consolidated undrained (CIU) triaxial tests indicate stress-strain properties characteristic of saturated clays with effective angles of friction of 35° for smectite and 31° for illite. These results are being used in computer modeling efforts. Some general geotechnical property data from the Bermuda Rise are also discussed.

2006 (SAND--80-2096C) ENVIRONMENTAL STUDIES DATA BASE: DEVELOPMENT AND DATA SYNTHESIS ACTIVITIES OF THE US SUBSEABED DISPOSAL PROGRAM. Gomez, L.S.; Hessler, R.R.; Jackson, D.W.; Marietta, M.G.; Smith, K.L. Jr.; Yayanos, A.A. (Sandia Labs., Albuquerque, NM (USA); Scripps Institution of Oceanography, La Jolla, CA (USA); Concepts Development, Inc., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 25p. (CONF-801063--3; IAEA-SM--248/142). NTIS, PC A02/MF A01.

From International symposium on the impacts of radionuclide releases into the marine environment; Vienna, Austria (6 Oct 1980).

The US Subseabed Disposal Program is assessing the scientific feasibility of subseabed emplacement of high-level nuclear wastes. Studies of disposal methods and of the barriers to radionuclide migration (canister, waste form and sediment) suggest that environmental information will be needed to address the impact of accidental release of radionuclides in the deep sea. Biological, physical, and geochemical data are being collected from field and laboratory studies as well as from literature searches. These data are being analyzed using a multicompartmental radionuclide transport model and appropriate physical oceanographic models. The data integrated into this framework will help answer two questions: what are the environmental effects of radionuclides which may be released in the deep sea, and what are the effects of such a release upon man.

2007 (SAND--80-2414C) BELL CANYON TEST AND RESULTS. Christensen, C.L.; Hunter, T.O. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 9p. (CONF-801124--3). NTIS, PC A02/MF A01.

From 3. annual meeting of the Materials Research Society; Boston, MA, USA (17 Nov 1980).

The purposes of the Borehold Plugging Program are: to identify issues associated with sealing boreholes and shafts; to establish a data base from which to assess the importance of these issues; and to develop sealing criteria, materials, and demonstrative test for the Waste Isolation Pilot Plant (WIPP). The Bell Canyon Test described in this report is one part of that program. Its purpose was to evaluate, in situ, the state of the art in borehole plugs and to identify and resolve problems encountered in evaluating a typical plug installation in anhydrite. The test results are summarized from the work of Peterson and Christensen and divided into two portions: system integrity and wellbore characterization tests prior to plug installation, and a series of tests to evaluate isolation characteristics of the 1.8-m-long plug. Conclusions of the Bell Canyon Test are: brine and fresh-water grouts, with acceptable physical properties in the fluid and hardened states, have been developed; the field data, taken together with laboratory data, suggest that the predominant flow into the test region occurs through the cement plug/borehold interface region, with lesser contributions occurring through the wellbore damage zone, the plug core, and the surrounding undisturbed anhydrite bed; and the 1.8-m-long by 20-cm-diameter grout plug, installed in anhydrite at a depth of 1370 m in the AEC-7 borehole, limits flow from the high pressure Bell Canyon aquifer to 0.6 liters/day.

2008 (SAND--80-2462C) BOREHOLE PLUGGING TEST ACTIVITIES IN SOUTHEASTERN NEW MEXICO. Hunter, T.O. (Sandia National Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 8p. (CONF-801209--4). NTIS, PC A02/MF A01.

From 2. annual National Waste Terminal Storage (NWTS) information meeting; Columbus, OH, USA (9 Dec 1980).

Conclusions from these studies indicated that borehole seals with effective permeabilities on the order of tens of darcies would result in doses to maximally exposed individuals of less than 0.01% of natural background. In addition to overall assessments, techniques have been developed to evaluate the effectiveness of a plug/formation system to block fluid flow along the axis of the borehole. These techniques allow the characterization of the flow region within or surrounding a plug. They have been applied to results from tests in which flow was measured around an in situ plug. Current emphasis has been on evaluation of cementitious grouts. Grout mixes with expansive cement have been

developed using various additives and both brines and fresh water. These mixes have been tailored to specific rocks for use in field tests. The characteristics (e.g., permeability bond strength) of these mixes and associated rocks have been determined in the laboratory and then compared with in situ performance. Studies of grout feasibility have been coupled with strategies for assessing long-term stability.

2009 (SGAE--3035) PROPERTIES OF SPENT FUEL ELEMENTS. Kamelander, G.; Stimpfl, G. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Vienna). Mar 1979. 35p. (In German). (RS--149/79). Dep. NTIS (US Sales Only), PC A03/MF A01.

The report gives a presentation of the physical behaviour of spent fuel elements. Radioactivity, heat production and nuclide concentration of typical LWR-fuel-elements have been calculated for the period after removal from the reactor. The calculations have been performed by means of the NEA-Code ORIGEN.

2010 (SKBF-KBS-TR--79-01) CLAY PARTICLE REDISTRIBUTION AND PIPING PHENOMENA IN BENTONITE/QUARTZ BUFFER MATERIAL DUE TO HIGH HYDRAULIC GRADIENTS. Pusch, R. (Svensk Kaernbraenslefoersoerjning AB, Stockholm; Kaernbraenslesaekerhet, Stockholm (Sweden)). Jan 1979. 18p. Dep. NTIS (US Sales Only), PC A03/MF A01.

The deposition of canisters with highly radioactive wastes in tunnels at 500 m depth involves application of in siter compacted bentonite/quartz buffer material in tunnels and shafts. Such material is sometimes also specified for the deposition holes as well. One possible drawback of this procedure could be that the water which enters the buffer mass from the surrounding rock may cause erosion either by washing out tiny clay paritcles from the mass or by creating ''piping'' in it. Two test series were made in the laboratory to investigate the clay transporting power of percolating water. The tests show that piping and temporarily rapid water flow may take place. It requires, however, that rather extreme and improbably high gradients are produced in the tunnel fill. The tests also show that a steady homogeneous water flow does not transport clay particles through the grain matrix even under high gradients. The fact that a tunnel filled with 20 % Na bentonite does not obey Darcy's law, means that it will be practically impervious when only regional gradients are finally in operation.

2011 (SKBF/KBS-TR--79-03) TEMPERATURE LOADING AND ROCKS MECHANICS AT FINAL STORAGE OF RADIOACTIVE WASTE. Leijon, B.; Stephansson, O. (Kaernbraenslesaekerhet, Stockholm (Sweden); Svensk Kaernbraenslefoersoerjning AB, Stockholm). Jan 1979. 32p. (In Swedish). Dep. NTIS (US Sales Only), PC A03/MF A01.

This report describes the rock mechanical effects - in the far field - from the thermal loading at a final storage of radioactive waste in crystalline rocks. The stress distribution of a two-storey storage is described in more details. The temperature rise in a final storage of radiactive waste will create thermal stresses which may cause a failure of the rock mass, and thereby an increase of its permeability. However, the state of stress in the Earth's crust is able to neutralize the thermal stresses. By this analysis we have been able to demonstrate that the thermal stresses due to heat conduction from the final storage are compensated by the state of stress in the upper part of the crust. The absolute stress, which is the superposition of thermal stress and virgin rock stress, is in all cases found to be below the limit of failure due to frictional resistance between surfaces of constituent blocks in the rock mass. Failure by sliding friction is the most conservative failure criterion for a rock mass.

2012 (SKBF/KBS-TR--79-04) TEMPERATURE AND STRESS CALCULATION FOR FINAL DISPOSAL. Tarandi, T. (Kaernbraenslesaekerhet, Stockholm (Sweden); Svensk Kaernbraenslefoersoerjning AB, Stockholm). Feb 1979. 47p. (In Swedish). Dep. NTIS (US Sales Only), PC A04/MF A01.

Temperature and stress distribution in and around the final storage facility has been calculated for three different arrangements of the tunnels: - 2 planes with 60 m vertical distance between them - 2 planes with 100 m distance and - 1 plane. The highest temperatures and stresses occur for the 2 plane alternative with distance 60 m between planes. The maximum compressive stress is in this case 24.0 MPa 140 years after the time of deposition, compared with 12.6 MPa in the 1 plane case. The maximum tensile stress exists at the surface and is in the 2 plane case 6.0 MPa 800 - 1,500 years after deposition, compared with 4.2 MPa for the 1 plane variant. An estimation of maximum tensile stresses between the tunnel planes yields a value of 1.5 MPa. The above-mentioned stresses are due to temperature distribution induced by the radioactive waste. To obtain the total stresses, initial stresses in the undisturbed rock, which vary according to location, are to be added to these stresses.

2013 (SKBF/KBS-TR--79-09) EVALUATION OF THE HYDROGEOLOGIC AND BED ROCK GEOLOGIC CONDITIONS AT STERNOE, SWEDEN. Ahlbom, K.; Carlsson, L.; Gidlund, G.; Klockars, C.E.; Scherman, S.; Thoregren, U. (Kaernbraenslesaekerhet, Stockholm (Sweden)). Feb 1979. 27p. (In Swedish). Dep. NTIS (US Sales Only), PC A03/MF A01.

The bedrock at Sternoe is known from surface mapping and from five deep boreholes with core recovery. The results from these investigations can be summarized as follows: 1. The bedrock consists of three different rock types a) Coastal gneiss b) Gneissic granite c) Karlshamn granite 2. The investigated area is limited by northwest and northeast striking fracture zones in the northern part of Sternoe and by a west-east striking fracture zone in the southern part. A dike of diabase appears in the eastern part of Sternoe. A fracture zone parallell to the diabase is dividing the investigated area into two blocks. 3. The fracture frequency in the main part of the cores are low, 0 - 4 fractures/3 meter core length. Fractured zones are found mainly in boreholes Ka 3 (1.6 m), Ka 2 (1.25 m) and to a higher degree in Ka 4. 4. There is no specific difference in fracturing between different rock types. 5. The evaluation of the hydraulic conductivity at Sternoe from measurings in four of the boreholes shows two volumes of bedrock, separated by a north-north-east striking fracture zone, which has a very low hydraulic conductivity ($< 10^{-11}$ m/s) below 300 meter. 6. The hydraulic conductivity in the fracture zones varies between 1×10^{-9} m/s to 1.5×10^{-8} m/s.

2014 (SKBF/KBS-TR--79-12) GEOPHYSICAL BOREHOLE MEASUREMENTS. Magnusson, K.A.; Duran, O. (Kaernbraenslesaekerhet, Stockholm (Sweden)). Feb 1979. 32p. (In Swedish).

Dep. NTIS (US Sales Only), PC A03/MF A01.
Measurements have been performed in two boreholes at Sternoe, Sweden, with the exception of the granite in one borehole (Ka4), the bedrock is of very high quality. The bedrock has few sparsely dispersed fissure zones with large parts of unfractured rock. The borehole wall is smooth which indicates that most of the fissures are closed or partly closed. The granite in Ka4 has several zones which are strongly fractured with open fractures and high water content.

2015 (SKBF/KBS-TR--79-14) CORROSION TESTING OF UNALLOYED TITANIUM IN SIMULATED DISPOSAL ENVIRONMENTS FOR REPROCESSED NUCLEAR WASTE. Henrikson, S.; de Pourbaix, M. (Kaernbraenslesaekerhet, Stockholm (Sweden)). May 1979. 34p. (In Swedish). (STUDSVIK/E1--79/83). NTIS (US Sales Only), PC A03/MF A01.
On the commission of the Nuclear Safety Project (KBS) corrosion tests have been carried out on unalloyed titanium, which is planned to be used as an outer corrosion resistant canister for reprocessed nuclear waste. Tests were conducted for 300 days in a corrosive medium of modified Baltic water at 100 and 130 degC with high (8 ppm) or a low (< 10 ppb) oxygen content. The tests at low oxygen content and 100 degC were continued for 600 days. Very low oxidation rates (0.01 - 0.1 μm/year) were obtained, corresponding to a life time of ten to hundred thousands of years for a 6 mm thick titanium canister. In spite of the considerably more severe corrosive contitions (higher temperature, higher chloride and fluoride contents as well as lower pH) compared with those estimated for the final disposal, no signs of localized corrosion were found, nor could any hydrogen pick-up be detected.

2016 (STUDSVIK/E2--79/38) PRELIMINARY MINI EXPERIMENTS ON LEACHING OF GLASS. A REPORT OF THE SITUATION 1979-03-15. Blomqvist, G. (Studsvik Energiteknik AB, Nykoeping (Sweden)). Apr 1979. 13p. (In Swedish). Dep. NTIS (US Sales Only), PC A02/MF A01.
The work performed within a project concerning preliminary mini experiments on the leaching of glass up to 1979-03-15 is summarized. It is shown that steady states are not obtained during one month for the investigated elements (Na, Cs, Sr, Ba) while the concentration of Ca in the leachate decreases to almost zero. The solubility of glass seems to be dependent on the volume.

2017 (STUDSVIK-K2--78/20) ALMA. CALCULATIONS OF DIFFUSION AND RADIATION DOSES IN CONNECTION WITH FINAL STORAGE OF RADIOACTIVE WASTES. Gelin, R.; Kjellbert, N.; Stenquist, C. (Aktiebolaget Atomenergi, Studsvik (Sweden)). Sep 1978. 30p. (In Swedish). Dep. NTIS (US Sales Only), PC A03/MF A01.
Calculations of diffusion and radiation doses in connection with final storage of low-level and intermediate-level radioactive wastes. The results show that the doses obtained with realistic values of parameters used in the calculations are very low. However, substantially simplified assumption have been applied in the calculations. Thus more detailed models for the description of the diffusion process have to be developed.

2018 (STUDSVIK-K2--78/70) CALCULATIONS OF THE DIFFUSION OF NUCLIDES THROUGH CRACKS IN CONTAINERS MADE OF CONCRETE. Haeggblom, H. (Studsvik Energiteknik AB, Nykoeping (Sweden)). Dec 1978. 29p. (In Swedish). Dep. NTIS (US Sales Only), PC A03/MF A01.
Active nuclear waste from Oskarshamn and Ringhals, Sweden, is encapsulated in containers made of concrete. The containers have plane surfaces. The diffusion of nuclides through the concrete as well as through an assumed crack with thicknesses of 0.1 and 1.0 mm, respectively, has been calculated with the computer code TEMPER 3. The density of nuclids outside the containers was assumed to be zero. The calculations were performed with two different values of the diffusion constant in concrete and with two different values of the retardation factor for nuclides in the crack. The results of the calculations show that the migration time through the crack varied between 18 days and 300 years depending on the different assumptions. The times before maximum migration velocities were obtained were a factor of 6 longer.

2019 (STUDSVIK-SA--78/34) STUDIES CONCERNING THE CONDITIONS FOR UNDERGROUND STORAGE OF SHORT-LIVED RADIOACTIVE WASTES. Carlsson, T.; Jacobsson, A.; Linder, P.; Holmberg, K.E. (Aktiebolaget Atomenergi, Studsvik (Sweden)). Aug 1978. 18p. (In Swedish). Dep. NTIS (US Sales Only), PC A05/MF A01.
Studies concerning the conditions for underground storage of short-lived radioactive wastes at different places are reported. Thus a literature study of the different factors affecting the radionuclide migration in the ground is reported as well as experiments, in which the distribution constant for radionuclide migration have been determined. Furthermore measuring methods for the determination of different migration parameters are described.

2020 (UCID--17893) DISRUPTIVE EVENT UNCERTAINTIES IN A PERTURBATION APPROACH TO NUCLEAR WASTE REPOSITORY RISK ANALYSIS. Harvey, T.F. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Sep 1980. Contract W-7405-ENG-48. 59p. NTIS, PC A04/MF A01.
A methodology is developed for incorporating a full range of the principal forecasting uncertainties into a risk analysis of a nuclear waste repository. The result of this methodology is a set of risk curves similar to those used by Rasmussen in WASH-1400. The set of curves is partially derived from a perturbation approach to analyze potential disruptive event sequences. Such a scheme could be useful in truncating the number of disruptive event scenarios and providing guidance to those establishing data-base development priorities.

2021 (UCID--18009) TECHNICAL CONCEPT FOR ROCK MECHANICS TESTS, CLIMAX GRANITE, NTS. Hearst, J.R. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Feb 1979. Contract W-7405-ENG-48. 74p. Dep. NTIS, PC A04/MF A01.
If we are to believe our predictions of the thermomechanical behavior of the material surrounding a nuclear waste repository in granite, we must test the computational methods used in making the predictions. If thermal loadings appropriate to a real repository are used, thermally induced displacements and strains are quite small, and available geotechnical instrumentation is only marginally able to measure these effects to the accuracy desired to make thorough tests of the predictions. We outline a three-step program to address these issues. (1) Conduct experiments

in which the thermal loading is large compared to that induced by a real repository. This will permit us to make accurate measurements with available instrumentation. (2) Simultaneously, develop improved instrumentation that will enable us to make accurate measurements of motions induced by thermal loadings appropriate to a real repository. (3) Finally, conduct a second set of experiments, with the improved instrumentation and thermal loading similar to that of a real repository in granite. If we can predict the effects of this thermal loading to a few percent over distances of tens of meters for time periods of a few years, and demonstrate that these predictions are correct, we can have reasonable confidence that, using the same methods, we can predict the behavior over thousands of meters for hundreds of years to an order of magnitude. That accuracy should be satisfactory for those distances and times.

2022 (UCID--18125) SEISMIC SAFETY IN NUCLEAR-WASTE DISPOSAL. Carpenter, D.W.; Towse, D. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 26 Apr 1979. Contract W-7405-ENG-48. 62p. Dep. NTIS, PC A04/MF A01.

Seismic safety is one of the factors that must be considered in the disposal of nuclear waste in deep geologic media. This report reviews the data on damage to underground equipment and structures from earthquakes, the record of associated motions, and the conventional methods of seismic safety-analysis and engineering. Safety considerations may be divided into two classes: those during the operational life of a disposal facility, and those pertinent to the post-decommissioning life of the facility. Operational hazards may be mitigated by conventional construction practices and site selection criteria. Events that would materially affect the long-term integrity of a decommissioned facility appear to be highly unlikely and can be substantially avoided by conservative site selection and facility design. These events include substantial fault movement within the disposal facility and severe ground shaking in an earthquake epicentral region. Techniques need to be developed to address the question of long-term earthquake probability in relatively aseismic regions, and for discriminating between active and extinct faults in regions where earthquake activity does not result in surface ruptures.

2023 (UCID--18133(Rev.1)) ABSTRACTS: NRC WASTE MANAGEMENT PROGRAM REPORTS. Heckman, R.A.; Minichino, C. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Nov 1979. Contract W-7405-ENG-48. 150p. Dep. NTIS, PC A07/MF A01.

This document consists of abstracts of all reports published by the Nuclear Regulatory Commission (NRC) Waste Management Program at Lawrence Livermore Laboratory (LLL). It will be updated at regular intervals. Reports are arranged in numerical order, within each category. Unless otherwise specified, authors are LLL scientists and engineers.

2024 (UCID--18502) CLIMAX GRANITE TEST RESULTS. Ramspott, L.D. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 15 Jan 1980. Contract W-7405-ENG-48. 24p. Dep. NTIS, PC A02/MF A01.

The Lawrence Livermore Laboratory (LLL), as part of the Nevada Nuclear Waste Storage Investigations (NNWSI) program, is carrying out in situ rock mechanics testing in the Climax granitic stock at the Nevada Test Site (NTS). This summary addresses only those field data taken to date that address thermomechanical modeling for a hard-rock repository. The results to be discussed include thermal measurements in a heater test that was conducted from October 1977 through July 1978, and stress and displacement measurements made during and after excavation of the canister storage drift for the Spent Fuel Test (SFT) in the Climax granite. Associated laboratory and field measurements are summarized. The rock temperature for a given applied heat load at a point in time and space can be adequately modeled with simple analytic calculations involving superposition and integration of numerous point source solutions. The input, for locations beyond about a meter from the source, can be a constant thermal conductivity and diffusivity. The value of thermal conductivity required to match the field data is as much as 25% different from laboratory-measured values. Therefore, unless we come to understand the mechanisms for this difference, a simple in situ test will be required to obtain a value for final repository design. Some sensitivity calculations have shown that the temperature field is about ten times more sensitive to conductivity than to diffusivity under the test conditions.The orthogonal array was designed to detect anisotropy. After considering all error sources, anisotropic efforts in the thermal field were less than 5 to 10%.

2025 (UCID--18575) PARAMETER IDENTIFICATION IN GROUNDWATER FLOW: A FEASIBILITY STUDY. Azevedo, S.G.; Doerr, T.A.; Candy, J.V.; Pimentel, K.D. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 11 Mar 1980. Contract W-7405-ENG-48. 57p. Dep. NTIS, PC A04/MF A01.

A set of first-order differential state equations is developed from taking finite differences of the partial differential equation that describes groundwater flow during a pump-drawdown test. The number of states in the model is a direct function of the number of discrete spatial segments used in the approximate model. This number of states is studied to determine a reasonably low-order model that preserves the accuracy of resulting simulations when compared with an available analytical solution. The resulting reduced-order model is then used in an extended Kalman filter for combined state and parameter estimation. This report summarizes work done in a recent pilot study to demonstrate the feasibility of these techniques in groundwater research and points the way toward other approaches to this problem area now under study.

2026 (UCID--18650) DEVELOPMENT AND UTILIZATION OF A TWO-DIMENSIONAL MODEL OF TRANSIENT FLUID FLOW IN A GENERIC REPOSITORY (OGRE). Korver, J.A. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 10 Oct 1979. Contract W-7405-ENG-48. 61p. Dep. NTIS, PC A04/MF A01.

An existing time-dependent numerical model (OGRE) has been modified to examine the time frames associated with repressuring the formation rocks surrounding a generic nuclear waste repository following the operational period when wastes are being stored. The model is two-dimensional in the vertical plane, and assumes that the entire regime is saturated, but the repository is at one atmosphere during the operational period. For the physical and geometric parameters assumed, the results of a simulation of the time necessary to repressurize the formation after the operational period was 421.5 years. These

results were in close agreement with a steady-state calculation performed by Golder Associates, Inc., in 1977. The fact that the time-dependent model results were close to the steady-state calculation resulted from the use (in the model) of a very small compressibility value, which caused the simulation to reach a steady-state condition in a relatively short time. Based on these studies, the magnitude of the system (water plus matrix) compressibility is of great importance in determining whether the time for repressurization can be determined from analytical methods or requires the use of a time-dependent numerical model.

2027 (UCID--18651) APPLICATION OF FRAMIS TO K/SUB D/ DATA. Storch, N. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 20 Mar 1980. Contract W-7405-ENG-48. 25p. NTIS, PC A02/MF A01.

This report documents an application of the FRAMIS relational data base management system. A geochemical data base of ion exchange distribution coefficients (K/sub D/) is created and maintained by using very simple commands. Reports are automatically generated. Familiarity with the LLL Octopus Time-Sharing System and FRAMIS is assumed.

2028 (UCID--18662) ANNULAR AIR SPACE EFFECTS ON NUCLEAR WASTE CANISTER TEMPERATURES IN A DEEP GEOLOGIC WASTE REPOSITORY. Lowry, W.E.; Cheung, H.; Davis, B.W. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 13 May 1980. Contract W-7405-ENG-48. 37p. NTIS, PC A03/MF A01.

Air spaces in a deep geologic repository for nuclear high level waste will have an important effect on the long-term performance of the waste package. The important temperature effects of an annular air gap surrounding a high level waste canister are determined through 3-D numerical modeling. Air gap properties and parameters specifically analyzed and presented are the air gap size, surfaces emissivity, presence of a sleeve, and initial thermal power generation rate; particular emphasis was placed on determining the effect of these variables have on the canister surface temperature. Finally a discussion based on modeling results is presented which specifically relates the results to NRC regulatory considerations.

2029 (UCID--18664) REVIEW OF GEOCHEMICAL MEASUREMENT TECHNIQUES FOR A NUCLEAR WASTE REPOSITORY IN BEDDED SALT. Knauss, K.G.; Steinborn, T.L. (California Univ.; Livermore (USA). Lawrence Livermore Lab.). 22 May 1980. Contract W-7405-ENG-48. 72p. NTIS, PC A04/MF A01.

A broad, general review is presented of geochemical measurement techniques that can provide data necessary for site selection and repository effectiveness assessment for a radioactive waste repository in bedded salt. The available measurement techniques are organized according to the parameter measured. The list of geochemical parameters include all those measurable geochemical properties of a sample whole values determine the geochemical characteristics or behavior of the system. For each technique, remarks are made pertaining to the operating principles of the measurement instrument and the purpose for which the technique is used. Attention is drawn to areas where further research and development are needed.

2030 (UCID--18665) REMARKS ON THE ASSESSMENT, REPRESENTATION, AGGREGATION AND UTILIZATION OF EXPERT OPINION. Fine, T.L. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Apr 1980. Contract W-7405-ENG-48. 42p. NTIS, PC A03/MF A01.

This report considers the relevance of recent ideas in the foundations of probability to the rational use of expert opinion in the design of a nuclear waste repository, and the assessment of its performance. The main probability concepts introduce are those of modal (probably A), comparative (A is at least as probable as B) and interval-valued (the lower probability of A is P(A) and the upper probability of A is P(anti A)) probabilities. We then outline an approach first using comparative probability to model the resuls of binary elicitation of an expert's opinions concerning repository uncertainties and then employing interval-valued probability to represent comparative probability in a computationally convenient form. We further consider the issue of aggregating or amalgamating the responses of several experts, and we emphasize the need to preserve some measure of the disagreements among the experts. The resulting aggregated interval-valued representation of the responses concerning the uncertainties surrounding the performance of a nuclear waste repository design can then be used to numerically assess this performance in a manner parallel to that of utility theory. Utility theory is the basis for statistical decision theory. Our recommendations can only be tentative, and research is recommended to gain some working experience with the results of the proposed decision-making process in the repostory design context.

2031 (UCID--18666) BRINE: A COMPUTER PROGRAM TO COMPUTE BRINE MIGRATION ADJACENT TO A NUCLEAR WASTE CANISTER IN A SALT REPOSITORY. Duckworth, G.D.; Fuller, M.E. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 10 Jun 1980. Contract W-7405-ENG-48. 29p. NTIS, PC A03/MF A01.

This report presents a mathematical model used to predict brine migration toward a nuclear waste canister in a bedded salt repository. The mathematical model is implemented in a computer program called BRINE. The program is written in FORTRAN and executes in the batch mode on a CDC 7600. A description of the program input requirements and output available is included. Samples of input and output are given.

2032 (UCID--18678) WASTE FORM DISSOLUTION IN BEDDED SALT. Kaufman, A.M. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 16 Sep 1980. Contract W-7405-ENG-48. 24p. NTIS, PC A02/MF A01.

A model was devised for waste dissolution in bedded salt, a hydrologically tight medium. For a typical Spent UnReprocessed Fuel (SURF) emplacement, the dissolution rate will be diffusion limited and will rise to a steady state value after t/sub eq/ approx. = 250 (1+(1-epsilon$_o$) K/sub D//epsilon$_o$) (years) epsilon$_o$ is the overpack porosity and K/sub d/ is the overpack sorption coefficient. The steady state dissolution rate itself is dominated by the solubility of UO_2. Steady state rates between 5 x 10^{-5} and .5 (g/year) are achievable by SURF emplacements in bedded salt without overpack, and rates between 5 x 10^{-7} and 5 x 10^{-3} (g/year) with an overpack having porosity of 10^{-2}.

2033 (UCID--18681) EFFECTS OF DIMENSIONALITY AND BOUNDARY CONDITIONS ON THERMAL CALCULATIONS. Thorson, L.D.; Montan,

D.N. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 29 Sep 1980. Contract W-7405-ENG-48. 19p. NTIS, PC A02/MF A01.

We consider several aspects of the thermal modeling of an underground nuclear waste repository. These are the long term temperature response due to different ground surface boundary conditions, the effects of treating the three-dimensional problem in 2-D, and the consequences of using a constant power load rather than decaying power typical of radioactive waste. Our approach is superposition in time and space of the appropriate analytic solutions.

2034 (UCID--18700) NUMERICAL CALCULATION OF THERMAL CONVECTION IN POROUS MEDIA IN TWO DIMENSIONS WITH APPLICATIONS TO NUCLEAR REPOSITORY DESIGN. Maiden, D.E. (California Univ., Livermore (USA). Lawrence Livermore Lab.). May 1980. Contract W-7405-ENG-48. 15p. NTIS, PC A02/MF A01.

Thermal convection induced by nuclear waste heating could be an important mechanism in the transport of radioactive nuclides to the biosphere. A computer code HP2D was developed to calculate this effect. The code calculates transient and steady state heat and fluid flow in porous media. It allows for anisotropy of hydraulic conductivities, temperature dependent fluid density and viscosity. A heat source and a variety of temperature and flow boundary conditions can be easily employed. The code solves two coupled governing equations. The time dependent heat transport is solved by an alternating direction implicit technique; and the steady state flow of water is solved by a Gauss-Seidel Poisson solver. A sample calculation of thermal convection about a repository is given.

2035 (UCID--18796-80-1) WASTE ISOLATION PROGRAM EVALUATION ASSISTANCE. QUARTERLY TECHNICAL PROGRESS REPORT. Maninger, R.C.; Harvey, T.F. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 25 Sep 1980. Contract W-7405-ENG-48. 20p. NTIS, PC A02/MF A01.

This report covers the effort for the first quarter on the Waste Isolation Program Evaluation Assistance Project at LLNL. The basic principles of a method of portraying the National Waste Terminal Storage Program are outlined and an example of their applcations is given.

2036 (UCRL--15095) PROCESSES AND PARAMETERS INVOLVED IN MODELING RADIONUCLIDE TRANSPORT FROM BEDDED SALT REPOSITORIES. FINAL REPORT. TECHNICAL MEMORANDUM. Evenson, D.E.; Prickett, T.A.; Showalter, P.A. (Camp Dresser and McKee, Boston, MA (USA)). Jul 1979. Contract W-7405-ENG-48. 76p. Dep. NTIS, PC A05/MF A01.

The parameters necessary to model radionuclide transport in salt beds are identified and described. A proposed plan for disposal of the radioactive wastes generated by nuclear power plants is to store waste canisters in repository sites contained in stable salt formations approximately 600 meters below the ground surface. Among the principal radioactive wastes contained in these canisters will be radioactive isotopes of neptunium, americium, uranium, and plutonium along with many highly radioactive fission products. A concern with this form of waste disposal is the possibility of ground-water flow occurring in the salt beds and endangering water supplies and the public health. Specifically, the research investigated the processes involved in the movement of radioactive wastes from the repository site by groundwater flow. Since the radioactive waste canisters also generate heat, temperature is an important factor. Among the processes affecting movement of radioactive wastes from a repository site in a salt bed are thermal conduction, groundwater movement, ion exchange, radioactive decay, dissolution and precipitation of salt, dispersion and diffusion, adsorption, and thermomigration. In addition, structural changes in the salt beds as a result of temperature changes are important. Based upon the half-lives of the radioactive wastes, he period of concern is on the order of a million years. As a result, major geologic phenomena that could affect both the salt bed and groundwater flow in the salt beds was considered. These phenomena include items such as volcanism, faulting, erosion, glaciation, and the impact of meteorites. CDM reviewed all of the critical processes involved in regional groundwater movement of radioactive wastes and identified and described the parameters that must be included to mathematically model their behavior. In addition, CDM briefly reviewed available echniques to measure these parameters.

2037 (UCRL--15111) RETRIEVAL SYSTEM FOR EMPLACED SPENT UNREPROCESSED FUEL (SURF) IN SALT BED DEPOSITORY: ACCIDENT EVENT ANALYSIS AND MECHANICAL FAILURE PROBABILITIES. FINAL REPORT. Bhaskaran, G.; McCleery, J.E. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Oct 1979. Contract W-7405-ENG-48. 250p. Dep. NTIS, PC A11/MF A01.

This report provides support in developing an accident prediction event tree diagram, with an analysis of the baseline design concept for the retrieval of emplaced spent unreprocessed fuel (SURF) contained in a degraded Canister. The report contains an evaluation check list, accident logic diagrams, accident event tables, fault trees/event trees and discussions of failure probabilities for the following subsystems as potential contributors to a failure: (a) Canister extraction, including the core and ram units; (b) Canister transfer at the hoist area; and (c) Canister hoisting. This report is the second volume of a series. It continues and expands upon the report Retrieval System for Emplaced Spent Unreprocessed Fuel (SURF) in Salt Bed Depository: Baseline Concept Criteria Specifications and Mechanical Failure Probabilities. This report draws upon the baseline conceptual specifications contained in the first report.

2038 (UCRL--15141) REVIEW OF GEOTECHNICAL MEASUREMENT TECHNIQUES FOR A NUCLEAR WASTE REPOSITORY IN BEDDED SALT. (International Engineering Co., Inc., San Francisco, CA (USA)). Dec 1979. Contract W-7405-ENG-48. 282p. Dep. NTIS, PC A13/MF A01.

This report presents a description of geotechnical measurement techniques that can provide the data necessary for safe development - i.e., location, design, construction, operation, decommissioning and abandonment - of a radioactive waste repository in bedded salt. Geotechnical data obtained by a diversity of measurement techniques are required during all phases of respository evolution. The techniques discussed in this report are grouped in the following categories: geologic, geophysical and geodetic; rock mechanics; hydrologic, hydrogeologic and water quality; and thermal. The major contribution of the report is the presentation of extensive tables that provide a review of available measurement techniques for each of these categories. The techniques are

also discussed in the text to the extent necessary to describe the measurements and associated instruments, and to evaluate the applicability or limitations of the method. More detailed discussions of thermal phenomena, creep laws and geophysical methods are contained in the appendices; references to detailed explanations of measurement techniques and instrumentation are included throughout the report.

2039 (UCRL--15152) GEOSCIENCE PARAMETER DATA BASE HANDBOOK: GRANITES AND BASALTS. (Owens (Willard) Associates, Inc., Wheat Ridge, CO (USA)). Dec 1979. Contract W-7405-ENG-48. 407p. Dep. NTIS, PC A18/MF A01.

The Department of Energy has the responsibility for selecting and constructing Federal repositories for radioactive waste. The Nuclear Regulatory Commission must license such repositories prior to construction. The basic requirement in the geologic disposal of radioactive waste is stated as: placement in a geologic host whereby the radioactive waste is not in mechanical, thermal or chemical equilibrium with the object of preventing physical or chemical migration of radionuclides into the biosphere or hydrosphere in hazardous concentration (USGS, 1977). The object of this report is to document the known geologic parameters of large granite and basalt occurrences in the coterminous United States, for future evaluation in the selection and licensing of radioactive waste repositories. The description of the characteristics of certain potential igneous hosts has been limited to existing data pertaining to the general geologic character, geomechanics, and hydrology of identified occurrences. A description of the geochemistry is the subject of a separate report.

2040 (UCRL--15163) SURVEY OF NEAR-FIELD FLOW CALCULATIONS FOR NUCLEAR WASTE REPOSITORIES NMA L21. Wilson, R.N.; Holland, D.H. (New Millennium Associates, Santa Barbara, CA (USA)). Nov 1979. Contract W-7405-ENG-48. 39p. Dep. NTIS, PC A03/MF A01.

A survey of methods and codes which describe the flow of groundwater and the migration of radioactive waste in and about nuclear repositories was performed. A number of laboratories engaged in studies of waste migration and groundwater flow were visited in order to discuss the general problem and obtain reports of work being performed. The results of this survey are discussed. (DMC)

2041 (UCRL--15166(Vol.1)) DERIVATION OF PARAMETERS NECESSARY FOR THE EVALUATION OF PERFORMANCE OF SITES FOR DEEP GEOLOGICAL REPOSITORIES WITH PARTICULAR REFERENCE TO BEDDED SALT, LIVERMORE, CALIFORNIA. VOLUME I. MAIN TEXT. Ashby, J.P.; Rawlings, G.E.; Soto, C.A.; Wood, D.F.; Chorley, D.W. (Golder Associates, Inc., Kirkland, WA (USA)). Dec 1979. Contract W-7405-ENG-48. 289p. Dep. NTIS, PC A13/MF A01.

A survey of parameters to be considered in the evaluation of sites for deep geologic nuclear waste repositories is presented. As yet, no comprehensive site selection procedure or performance evaluation approach has been adopted. A basis is provided for the development of parameters by discussing both site selection and performance evaluation. Three major groups of parameters are considered in this report: geologic, mining/rock mechanics, and hydrogeologic. For each type, the role of the parameter in the evaluation of repository sites is discussed. The derivation of the parameter by measurement, correlation, inference, or other method is discussed. Geologic parameters define the framework of the repository site and can be used in development of conceptual models and the prediction of long-term performance. Methods for deriving geological parameters include mapping, surveying, drilling, geophysical investigation, and historical and regional analysis. Rock mechanics/mining parameters are essential for the prediction of short-term performance and the development of initial conditions for modeling of long-term performance. Rock mechanics/mapping parameters can be derived by field or laboratory investigation, correlation, and theoretically or empirically based inference. Hydrogeologic parameters are the most important for assessment of long-term radionuclide confinement, since transport throughout the regional hydrogeologic system is the most likely mode of radionuclide escape from geologic repositories. Hydrogeologic parameters can be derived by hydrogeologic mapping and interpretation, hydrogeologic system modeling, field measurements, and lab tests. Procedures used in determination and statistical evaluation of geologic and rock mechanics parameters are discussed.

2042 (UCRL--15166(Vol.2)) DERIVATION OF PARAMETERS NECESSARY FOR THE EVALUATION OF PERFORMANCE OF SITES FOR DEEP GEOLOGICAL REPOSITORIES WITH PARTICULAR REFERENCE TO BEDDED SALT, LIVERMORE, CALIFORNIA. VOLUME II. APPENDICES. Ashby, J.P.; Rawlings, G.E.; Soto, C.A.; Wood, D.F.; Chorley, D.W. (Golder Associates, Inc., Kirkland, WA (USA)). Dec 1979. Contract W-7405-ENG-48. 173p. Dep. NTIS, PC A08/MF A01.

The method of selection of parameters to be considered in the selection of a site for underground disposal of radioactive wastes is reported in volume 1. This volume contains the appendix to that report. The topics include: specific rock mechanics tests; drilling investigation techniques and equipment; geophysical surveying; theoretical study of a well text in a nonhomogeneous aquifer; and basic statistical and probability theory that may be used in the derivation of input parameters.

2043 (UCRL--15167(Vol.1)) ASPECTS OF NUCLEAR WASTE MANAGEMENT. VOLUME 1. PRE-EMPLACEMENT RISKS. Ensminger, D.A.; Oston, S.G. (Analytic Sciences Corp., Reading, MA (USA)). 10 Aug 1979. Contract W-7405-ENG-48. 58p. Dep. NTIS, PC A04/MF A01.

Results of the previous one-dimensional thermal analysis of interim storage accidents are confirmed by more detailed two-dimensional calculations. Waste temperatures calculated for interim storage accidents are moderately sensitive to assumptions concerning canister spacing and are much less sensitive to boundary conditions at the canister top. For an individual 100 m from a transportation accident involving solidified high-level waste, the expected dose from gamma radiation is on the order of or smaller than the other possible exposures in the same accident. For the calculation of expected doses to the worst-situated individual in accidents: Expected population dose should remain the primary measure of pre-emplacement risk in order to maintain comparability of consequences of different types of accidents.

2044 (UCRL--15173) PRECIPITATION AND LAKE-LEVEL CHANGES IN THE WEST AND MIDWEST OVER THE PAST 10,000 TO 24,000 YEARS. FINAL REPORT.

Webb, T. III; Street, F.A.; Howe, S. (Brown Univ., Providence, RI (USA). Dept. of Geological Sciences; Oxford Univ. (UK). Geography School; Carnegie-Mellon Univ., Pittsburgh, PA (USA). Dept. of Statistics). 4 Feb 1980. Contract W-7405-ENG-48. 129p. Dep. NTIS, PC A07/MF A01.

The goal of the research described in this report is to document the climatic variability over the past 10,000 to 20,000 years in areas in which sites may be designated for the burial of nuclear wastes. Three separate data sets were studied, and the results are presented in three chapters. The first data set consisted of radiocarbon dates documenting past changes in lake levels in lakes and playas in the western United States. The sites were mapped where water levels were higher than the levels today and were presented in a table telling what evidence is available at each site. The lake-level fluctuations for the past 24,000 years at sites in the West were also mapped and time series for these fluctuations at four sites were presented. The second data set was a selection of the published radiocarbon-dated pollen diagrams from the western United States. These data are a valuable source of climatic information and complement the geological evidence of lake-level fluctuations in the West. A table is presented that gives the location, elevation, and number of radiocarbon dates for each site. The third data set was a set of fossil pollen data from 20 sites in the upper Midwest. These data were calibrated in terms of precipitation changes over the past 10,000 years, and maps are presented of the estimated precipitation changes between 10,000 and 7000 years ago and between 7000 years ago and today.

2045 (UCRL--15176) NUMERICAL MODELING CAPABILITIES TO PREDICT REPOSITORY PERFORMANCE. (Golder Associates, Inc., Golden, CO (USA)). Sep 1979. Contract W-7405-ENG-48. 118p. Dep. NTIS, PC A06/MF A01.

This report presents a summary of current numerical modeling capabilities that are applicable to the design and performance evaluation of underground repositories for the storage of nuclear waste. The report includes codes that are available in-house, within Golder Associates and Lawrence Livermore Laboratories; as well as those that are generally available within the industry and universities. The first listing of programs are in-house codes in the subject areas of hydrology, solute transport, thermal and mechanical stress analysis, and structural geology. The second listing of programs are divided by subject into the following categories: site selection, structural geology, mine structural design, mine ventilation, hydrology, and mine design/construction/operation. These programs are not specifically designed for use in the design and evaluation of an underground repository for nuclear waste; but several or most of them may be so used.

2046 (UCRL--15177) REVIEW OF Y/OWI/TM-36: REPOSITORY DESIGN PERFORMANCE IN SALT, GRANITE, SHALE OR BASALT. Talbot, R.; Nair, O.B. (Golder Associates, Inc., Golden, CO (USA)). Sep 1979. Contract W-7495-ENG-48. 76p. Dep. NTIS, PC A05/MF A01.

As part of the ongoing work by the Lawrence Livermore Laboratory to evaluate repository design performance, this memorandum presents a review of the preconceptual repository design described in Y/OWI/TM-36, Technical Support for GEIS: Radioactive Waste Isolation in Geologic Formations, April 1978. The purpose of this review is: to assess the adequacy of the design procedures and assumptions; to identify inappropriate or unsubstantiated design issues; to identify areas where additional numerical analyses may be required; and to develop data for inclusion in a reference repository design. The preconceptual repository design is presented in the form of 23 volumes of data base, analyses, and design layouts for four rock types: bedded salt, shale, granite and basalt. This memorandum reviews all four repository designs.

2047 (UCRL--15178) GENERAL BASIN MODELING FOR SITE SUITABILITY. DRAFT REPORT 1. BASELINE DATA. (Golder Associates, Inc., Golden, CO (USA)). Apr 1979. Contract W-7405-ENG-48. 80p. Dep. NTIS, PC A05/MF A01.

This report summarizes work completed by Golder Associates under Task 2 - Site Suitability specifically for modeling of fluid flow and mass transport in sedimentary basins containing thick shale or salt. It also describes ongoing and future work on the above topic. The purpose of the study is to develop a general model for a nuclear waste repository situated in a deep sedimentary basin environment. The model will be used in conjunction with Golder's fluid flow and mass transport codes to study specific aspects of nuclide transport by groundwater flow.

2048 (UCRL--15179) NUMERICAL MODELING OF SOLUTE TRANSPORT IN GROUNDWATER. Miller, I. (Golder Associates, Inc., Grand Junction, CO (USA)). Dec 1979. Contract W-7405-ENG-48. 41p. Dep. NTIS, PC A03/MF A01.

Although the Galerkin finite element method has been used for problems of solute transport by flowing groundwater for nearly a decade, there are a number of problems which make its use as a routine modeling technique somewhat difficult. This report discussed three problem areas: boundary conditions, interfaces between materials of different permeabilities or radically different velocity vectors, and numerical instability. Methods are proposed for improving these problem areas and are demonstrated using a sample problem.

2049 (UCRL--15180) DEVELOPMENT OF AN INTER-LAYER SOLUTE TRANSPORT ALGORITHM FOR SOLTR COMPUTER PROGRAM. PART 1. THE ALGORITHM. Miller, I.; Roman, K. (Golder Associates, Inc., Kirkland, WA (USA)). Dec 1979. Contract W-7405-ENG-48. 37p. NTIS, PC A03/MF A01.

In order to perform studies of the influence of regional groundwater flow systems on the long-term performance of potential high-level nuclear waste repositories, it was determined that an adequate computer model would have to consider the full three-dimensional flow system. Golder Associates' SOLTR code, while three-dimensional, has an overly simple algorithm for simulating the passage of radionuclides from one aquifer to another above or below it. Part 1 of this report describes the algorithm developed to provide SOLTR with an improved capability for simulating interaquifer transport.

2050 (UCRL--15181) REGIONAL FLOW AND SOLUTE TRANSPORT MODELING FOR SITE SUITABILITY. PART I. Rowe, J.; Miller, I. (Golder Associates, Inc., Golden, CO (USA)). Dec 1979. Contract W-7405-ENG-48. 172p. Dep. NTIS, PC A08/MF A01.

The nature of regional flow systems in large sedimentary basins will largely determine the effectiveness of regional flow as a barrier to

radionuclide escape from deep geologic repositories. The purpose of the work reported herein and the proposed future work is to develop a methodology for evaluating regional flow barriers by using numerical models. The Williston Basin was chosen as an archetype case for the regional modeling study. However, due to the simplified nature of the study, the results are not meant to represent the behavior of a repository actually placed within the Williston Basin. The major components of this Phase I study are: (1) assembly and reduction of available data; (2) formulation of a simplified geohydrologic model; (3) computer simulation of fluid flow; and (4) computer simulation of solute transport. As of this report, the first two items are essentially completed. Computer simulation of fluid flow will require some revision and further study, which will be done in the second phase of this study. Computer simulation of solute transport has been considered only on a very preliminary basis. Important conclusions of this Phase I study are as follows. Assembly and reduction of data require an extensive work effort. Generally, the parameters describing fluid flow are poorly known on a regional basis and those describing solute transport are unknown.

2051 (UCRL--15184) PRELIMINARY ANALYTICAL REPOSITORY FLOW MODEL. Oston, S.G. (Analytic Sciences Corp., Reading, MA (USA)). 1 Aug 1979. Contract W-7405-ENG-48. 16p. Dep. NTIS, PC A02/MF A01.

This memo describes a preliminary model that predicts the flow of dissolved nuclear waste in an underground repository. The model is based on the flow of water that enters regions of the repository in which the waste is actually contained; it is expected to be an improvement over the current approach that assumes the waste flow is proportional to total flow of water along various pathways. The repository flow model is intended for implementation in the TASC WASTE computer code. The model treats the repository as a homogeneous two-dimensional slab contained in a geologic formation and penetrated by a shaft leading to an aquifer. Flow of water both perpendicular and along the central corridor is determined in order to compute the heads of the repository as a function of position. The heads are then used to estimate the fraction of waste that leaks to the formation and the fraction that travels up the shaft. The waste-splitting fractions are presented as closed form analytical expressions to facilitate rapid calculations. Numerical results for a typical geometry are also given.

2052 (UCRL--15203) GEOLOGIC, STRATIGRAPHIC, THERMAL, AND MECHANICAL FACTORS WHICH INFLUENCE REPOSITORY DESIGN IN THE BEDDED SALT ENVIRONMENT. Ashby, J.P.; Nair, O.; Ortman, D.; Rowe, J. (Golder Associates, Inc., Kirkland, WA (USA)). Dec 1979. Contract W-7405-ENG-48. 89p. Dep. NTIS, PC A05/MF A01.

This report describes the geologic, stratigraphic, thermal, and mechanical considerations applicable to repository design. The topics discussed in the report include: tectonic activity; geologic structure; stratigraphy; rock mechanical properties; and hydrologic properties.

2053 (UCRL--15204) ROCK SALT CONSTITUTIVE MODELING. Nickell, R.E. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 18 Mar 1980. Contract W-7405-ENG-48. 11p. Dep. NTIS, PC A02/MF A01.

The Serata model is the best operational model available today because it incorporates: (1) a yield function to demarcate between viscoelastic and viscoplastic behavior of rock salt; (2) a pressure and temperature dependence for yield stresses; and (3) a standard linear solid, which can be readily extended into the non-linear regime, to represent creep behavior. Its only deficiencies appear to be the lack of secondary creep behavior (a free dashpot) and some unsettling arbitrariness about the Poisson's ratio ($\nu \rightarrow 0.5$) argument for viscoplasticity. The Sandia/WIPP model will have good primary and secondary creep capability, but lacks the viscoplastic behavior. In some cases, estimated inelastic strains may be underpredicted. If a creep acceleration mechanism associated with brine inclusions is observed, this model may require extensive revision. Most of the other models available (SAI, RE-SPEC, etc.) are only useful for short-term calculations, because they employ temporal power law (t/sup n/) primary creep representations. These models are unsatisfactory because they cannot represent dual mechanisms with differing characteristic times. An approach based upon combined creep and plasticity is recommended in order to remove the remaining deficiency in the Serata model. DOE/Sandia/WIPP should be encouraged to move aggressively in this regard.

2054 (UCRL--15205) EFFECTS OF RESOURCE ACTIVITIES UPON REPOSITORY SITING AND WASTE CONTAINMENT WITH REFERENCE TO BEDDED SALT. Ashby, J.; Rowe, J. (Golder Associates, Inc., Kirkland, WA (USA)). Feb 1980. Contract W-7405-ENG-48. 66p. Dep. NTIS, PC A04/MF A01.

The primary consideration for the suitability of a nuclear waste repository site is the overall ability of the repository to safely contain radioactive waste. This report is a discussion of the past, present, and future effects of resource activities on waste containment. Past and present resource activities which provide release pathways (i.e., leaky boreholes, adjacent mines) will receive initial evaluation during the early stages of any repository site study. However, other resource activities which may have subtle effects on containment (e.g., long-term pumping causing increased groundwater gradients, invasion of saline water causing lower retardation) and all potential future resource activities must also be considered during the site evaluation process. Resource activities will affect both the siting and the designing of repositories. Ideally, sites should be located in areas of low resource activity and low potential for future activity, and repository design should seek to eliminate or minimize the adverse effects of any resource activity. Buffer zones should be created to provide areas in which resource activities that might adversely affect containment can be restricted or curtailed. This could mean removing large areas of land from resource development. The impact of these frozen assets should be assessed in terms of their economic value and of their effect upon resource reserves. This step could require a major effort in data acquisition and analysis followed by extensive numerical modeling of regional fluid flow and mass transport. Numerical models should be used to assess the effects of resource activity upon containment and should include the cumulative effects of different resource activities. Analysis by other methods is probably not possible except for relatively simple cases.

2055 (UCRL--15208) SOURCES OF DATA FOR BIODOSE SIMULATIONS USED IN BEDDED SALT REPOSITORY ANALYSIS. Duffy, J.J.

(California Univ., Livermore (USA). Lawrence Livermore Lab.). 4 Jan 1980. Contract W-7405-ENG-48. 65p. Dep. NTIS, PC A04/MF A01.

Sources of parameter data for BIODOSE simulations are documented. These simulations were used in bedded salt repository analysis. Water system parameters are presented for a southwestern river system (patterned after the lower Colorado River). Nuclide-specific parameters are given also.

2056 (UCRL--15217) EXAMPLE OF MONTE CARLO ANALYSIS APPLIED TO REPOSITORY SITING. Giuffre, M.S.; Kaplan, M.F. (Analytic Sciences Corp., Reading, MA (USA)). 31 Aug 1979. Contract W-7405-ENG-48. 54p. Dep. NTIS, PC A04/MF A01.

This report contains a detailed description of a Monte Carlo analysis of a hypothetical nuclear waste repository performed for the Lawrence Livermore Laboratory as part of their mock siting exercise. Field measurements had been used to construct a hydrology model of the geologic medium surrounding a nuclear waste repository, complete with specified uncertainties. The Monte Carlo analysis has been used to ascertain the uncertainty in the radioactive release from the repository given the uncertainty in the geohydrologic parameters, and correlation analysis has identified some input parameters that have a potentially large influence on the output (radioactivity release) uncertainty.

2057 (UCRL--15228) CONCEPTUAL DESIGN OF RETRIEVAL SYSTEMS FOR EMPLACED TRANSURANIC WASTE CONTAINERS IN A SALT BED DEPOSITORY. FINAL REPORT. Fogleman, S.F. (International Engineering Co., Inc., San Francisco, CA (USA)). Apr 1980. Contract W-7405-ENG-48. 110p. Dep. NTIS, PC A06/MF A01.

The US Department of Energy and the Nuclear Regulatory Commission have jurisdiction over the nuclear waste management program. Design studies were previously made of proposed repository site configurations for the receiving, processing, and storage of nuclear wastes. However, these studies did not provide operational designs that were suitable for highly reliable TRU retrieval in the deep geologic salt environment for the required 60-year period. The purpose of this report is to develop a conceptual design of a baseline retrieval system for emplaced transuranic waste containers in a salt bed depository. The conceptual design is to serve as a working model for the analysis of the performance available from the current state-of-the-art equipment and systems. Suggested regulations would be based upon the results of the performance analyses.

2058 (UCRL--15229) TRANSURANIC CONTAMINATED WASTE FUNCTIONAL DEFINITION AND IMPLEMENTATION. Kniazewycz, B.G. (TERA Corp., Berkeley, CA (USA)). Mar 1980. Contract W-7405-ENG-48. 157p. Dep. NTIS, PC A08/MF A01.

The purpose of this report is to examine the problem(s) of TRU waste classification and to document the development of an easy-to-apply standard(s) to determine whether or not this waste package should be emplaced in a geologic repository for final disposition. Transuranic wastes are especially significant because they have long half-lives and some are rather radiotoxic. Transuranic radionuclides are primarily produced by single or multiple neutron capture by U-238 in fuel elements during the operation of a nuclear reactor. Reprocessing of spent fuel elements attempts to remove plutonium, but since the separation is not complete, the resulting high-activity liquids still contain some plutonium as well as other transuranics. Likewise, transuranic contamination of low-activity wastes also occurs when the transuranic materials are handled or processed, which is primarily at federal facilities involved in R and D and nuclear weapons production. Transuranics are persistent in the environment and, as a general rule, are strongly retained by soils. They are not easily transported through most food chains, although some reconcentration does take place in the aquatic food chain. They pose no special biological hazard to humans upon ingestion because they are weakly absorbed from the gastrointestional tract. A greater hazard results from inhalation since they behave like normal dust and fractionate accordingly.

2059 (UCRL--15232) MONITORING SYSTEM SPECIFICATIONS: RETRIEVAL OF SURF FROM A SALT REPOSITORY. (EA and T Co., Inc., Marina del Rey, CA (USA)). Jan 1980. Contract W-7405-ENG-48. 87p. Dep. NTIS, PC A05/MF A01.

The task of developing specifications for a reference monitoring system determined by repository environmental conditions, retrieval operations, and federal regulatory criteria is discussed. The monitoring system specified in this report is capable of measuring (1) package position and orientation, (2) vault deformation, (3) brine accumulation, (4) spent fuel dissolution, (5) temperature, (6) nuclear radiation, and (7) package condition with sufficient accuracy to provide data input to a general risk assessment model. In order to define a monitoring system which can provide probabilistic data on radiological risk to operating personnel and the general public for a salt mine repository, the following information is required: (1) a complete design of the salt SURF repository including inventory, density and waste package design details; (2) probalistic failure rate data on containment integrity of the SURF waste package; (3) probabilistic failure rate data on the monitoring system components (i.e., monitoring procedure, instrumentation, data acquisition, data processing and data interpretation).

2060 (UCRL--15235) SPATIAL PATTERNS OF RADIOLOGICAL DOSE FROM WELLS DRILLED NEAR NUCLEAR WASTE REPOSITORIES. (Analytic Sciences Corp., Reading, MA (USA)). 31 Mar 1980. Contract W-7405-ENG-48. 63p. NTIS, PC A04/MF A01.

This report describes methodology for assessing the spatial patterns of radiological dose to man from wells drilled near nuclear waste repositories. Descriptions of the various categories of water wells and a model of a typical aquifer are presented. The equation governing the one-dimensional flow of waste in groundwater through porous media to a well is discussed. This is followed by development of a method for constructing lines of constant dose from a well located randomly in the plane of the aquifer. An area of hazard, in which the dose to man from a well exceeds a given statuatory or recommended limit, is then defined within this dose pattern. This technique is then used to compute dose and hazard profiles for wells adjacent to a repository located in either impermeable or permeable bedded salt. The repository and geologic parameters employed in this example are taken from a Lawrence Livermore Laboratory report for which this report serves as a supporting document. Scenarios with impermeable salt involve waste entering the repository through the shaft/tunnel fracture zone and exiting through a single additional flaw

(borehole). Permeable-salt scenarios involve waste escaping from the repsitory through a borehole and via interstitial flow. Calculations are performed assuming both a single-layer (sandstone) aquifer and a double-layer (sandstone/shale) aquifer in the strate overlying the repository. Results indicate a time-varying area of hazard from well drilling, whose size depends on the permeability of the salt, the regional hydrology, and the surface ecosystem assumed in the potential hazard calculations.

2061 (UCRL--15236) BEDDED-SALT REPOSITORY ANALYSIS. FINAL REPORT. Guiffre, M.S.; Kaplan, M.F.; Ensminger, D.A.; Oston, S.G.; Nalbandian, J.Y. (Analytic Sciences Corp., Reading, MA (USA)). 31 Mar 1980. Contract W-7405-ENG-48. 214p. NTIS, PC A10/MF A01.

This report contains a description of an analysis of generic nuclear waste repository in bedded salt. This analysis was performed by TASC for inclusion in a major Lawrence Livermore Laboratory report to NRC; this report therefore should be viewed as providing more complete and detailed information about this analysis than was possible to include in the LLL report. The analysis is performed with the NUTRAN computer codes which are described in the report. The model to be analyzed is defined, and the results of a series of possible waste migration scenarios are presented. Several of these scenarios are used as the basis for a sensitivity analysis, and an uncertainty analysis utilizing Monte Carlo techniques is also performed. A new method for defining the consequences to users of a well drilled near the repository is also described, and results are presented based on two of the waste migration scenarios.

2062 (UCRL--15238) DEEP GEOLOGICAL ISOLATION OF NUCLEAR WASTE: NUMERICAL MODELING OF REPOSITORY SCALE HYDROLOGY. Dettinger, M.D. (Camp Dresser and McKee, Boston, MA (USA)). Apr 1980. Contract W-7405-ENG-48. 79p. NTIS, PC A05/MF A01.

The Scope of Work undertaken covers three main tasks, described as follows: (Task 1) CDM provided consulting services to the University on modeling aspects of the study having to do with transport processes involving the local groundwater system near the repository and the flow of fluids and vapors through the various porous media making up the repository system. (Task 2) CDM reviewed literature related to repository design, concentrating on effects of the repository geometry, location and other design factors on the flow of fluids within the repository boundaries, drainage from the repository structure, and the eventual transport of radionucldies away from the repository site. (Task 3) CDM, in a joint effort with LLL personnel, identified generic boundary and initial conditions, identified processes to be modeled, and recommended a modeling approach with suggestions for appropriate simplifications and approximations to the problem and identifiying important parameters necessary to model the processes. This report consists of two chapters and an appendix. The first chapter (Chapter III of the LLL report) presents a detailed description and discussion of the modeling approach developed in this project, its merits and weaknesses, and a brief review of the difficulties anticipated in implementing the approach. The second chapter (Chapter IV of the LLL report) presents a summary of a survey of researchers in the field of repository performance analysis and a discussion of that survey in light of the proposed modeling approach. The appendix is a review of the important physical processes involved in the potential hydrologic transport of radionuclides through, around and away from deep geologic nuclear waste repositories.

2063 (UCRL--15249) SPECIFICATIONS FOR THE DEVELOPMENT OF A FULLY THREE-DIMENSIONAL NUMERICAL GROUNDWATER MODEL FOR REGIONAL MASS TRANSPORT OF RADIONUCLIDES FROM A DEEP WASTE REPOSITORY. Prickett, T.A. (Camp Dresser and McKee, Inc., Champaign, IL (USA). Water Resources Div.). Apr 1980. Contract W-7405-ENG-48. 326p. NTIS, PC A15/MF A01.

Specifications are given which are necessary to develop a three-dimensional numerical model capable of simulating regional mass transport of radionuclides from a deep waste repository. The model to be developed will include all of the significant mass transport processes including flow, chemical, and thermal advection, mechanical dispersion, molecular diffusion, ion exchange reactions, and radioactive decay. The model specifications also include that density and viscosity fluid properties be functions of pressure, temperature, and concentration and take into account fluid and geologic heterogenieties by allowing possible assignment of individual values to every block of the model. The model specifications furthermore include the repository shape, input/output information, boundary conditions, and the need for documentation and a user's manual. Model code validation can be accomplished with the included known analytical or laboratory solutions. It is recommended that an existing finite-difference model (developed by INTERCOMP and INTERA, Inc.) be used as a starting point either as an acceptable basic code for modification or as a pattern for the development of a completely different numerical scheme. A ten-step plan is given to outline the general procedure for development of the code.

2064 (UCRL--15250) CONCEPTUAL MODEL FOR REGIONAL RADIONUCLIDE TRANSPORT FROM A SALT DOME REPOSITORY: A TECHNICAL MEMORANDUM. Kier, R.S.; Showalter, P.A.; Dettinger, M.D. (Camp Dresser and McKee, Inc., Champaign, IL (USA). Water Resources Div.). 30 May 1980. Contract W-7405-ENG-48. 146p. NTIS, PC A07/MF A01.

Disposal of high-level radioactive wastes is a major environmental problem influencing further development of nuclear energy in this country. Salt domes in the Gulf Coast Basin are being investigated as repository sites. A major concern is geologic and hydrologic stability of candidate domes and potential transport of radionuclides by groundwater to the biosphere prior to their degradation to harmless levels of activity. This report conceptualizes a regional geohydrologic model for transport of radionuclides from a salt dome repository. The model considers transport pathways and the physical and chemical changes that would occur through time prior to the radionuclides reaching the biosphere. Necessary, but unknown inputs to the regional model involve entry and movement of fluids through the repository dome and across the dome-country rock interface and the effect on the dome and surrounding strata of heat generated by the radioactive wastes.

2065 (UCRL--15251) DISPERSIVE PROCESSES IN MODELS OF REGIONAL RADIONUCLIDE MIGRATION. TECHNICAL MEMORANDUM. Evenson, D.E.; Dettinger, M.D. (Camp Dresser and McKee, Inc., Walnut Creek, CA (USA)). May 1980. Contract W-7405-ENG-48. 141p. NTIS, PC A07/MF A01.

Three broad areas of concern in the development of aquifer scale transport models will be local scale diffusion and dispersion processes, regional scale dispersion processes, and numerical problems associated with the advection-dispersion equation. Local scale dispersion processes are fairly well understood and accessible to observation. These processes will generally be dominated in large scale systems by regional processes, or macro-dispersion. Macro-dispersion is primarily the result of large scale heterogeneities in aquifer properties. In addition, the effects of many modeling approximations are often included in the process. Because difficulties arise in parameterization of this large scale phenomenon, parameterization should be based on field measurements made at the same scale as the transport process of interest or else partially circumvented through the application of a probabilistic advection model. Other problems associated with numerical transport models include difficulties with conservation of mass, stability, numerical dissipation, overshoot, flexibility, and efficiency. We recommend the random-walk model formulation for Lawrence Livermore Laboratory's purposes as the most flexible, accurate and relatively efficient modeling approach that overcomes these difficulties.

2066 (UCRL--15252) CONCEPTUAL MODEL FOR REGIONAL RADIONUCLIDE TRANSPORT FROM A BASALT REPOSITORY SITE. FINAL DRAFT, TECHNICAL MEMORANDUM. Walton, W.C.; Voorhees, M.L.; Prickett, T.A. (Camp Dresser and McKee, Inc., Champaign, IL (USA). Water Resources Div.). 23 May 1980. Contract W-7405-ENG-48. 77p. NTIS, PC A05/MF A01.

This technical memorandum was prepared to: (1) describe a typical basalt radionuclide repository site, (2) describe geologic and hydrologic processes associated with regional radionuclide transport in basalts, (3) define the parameters required to model regional radionuclide transport from a basalt repository site, and (4) develop a "conceptual model" of radionuclide transport from a basalt repository site. In a general hydrological sense, basalts may be described as layered sequences of aquifers and aquitards. The Columbia River Basalt, centered near the semi-arid Pasco Basin, is considered by many to be typical basalt repository host rock. Detailed description of the flow system including flow velocities with high-low hydraulic conductivity sequences are not possible with existing data. However, according to theory, waste-transport routes are ultimately towards the Columbia River and the lengths of flow paths from the repository to the biosphere may be relatively short. There are many physical, chemical, thermal, and nuclear processes with associated parameters that together determine the possible pattern of radionuclide migration in basalts and surrounding formations. Brief process descriptions and associated parameter lists are provided. Emphasis has been placed on the use of the distribution coefficient in simulating ion exchange. The use of the distribution coefficient approach is limited because it takes into account only relatively fast mass transfer processes. In general, knowledge of hydrogeochemical processes is primitive.

2067 (UCRL--15268) STATE-OF-THE-ART FOR EVALUATING THE POTENTIAL EFFECTS OF EROSION AND DEPOSITION ON A RADIOACTIVE WASTE REPOSITORY. FINAL REPORT. (Geotechnical Engineers, Inc., Winchester, MA (USA)). 16 Jul 1980. Contract W-7405-ENG-48. 64p. NTIS, PC A04/MF A01.

The potential impact of future geologic processes on the integrity of a deep, high-level radioactive-waste repository is evaluated. The following study identifies the potential consequences of surface erosion and deposition on sub-surface repository containment characteristics and assesses the ability to measure and predict quantitatively the rates and corresponding extent of these processes in the long term. Numerous studies of the magnitudes and rates of surficial erosion and deposition that have been used to determine the minimum allowable depth for a geologic repository (300 m - NRC Code of Federal Regulations, Part 60.122, Draft 10) are cited in this report. Measurement and interpretation of potential rates and extent of surficial processes in these studies involved considerable uncertainty, and the implications of this uncertainty on presently proposed repository siting criteria are addressed herein. Important concepts that should be considered when developing siting criteria to protect against deleterious effects arising from future erosion or deposition are highlighted. Erosion agents that could affect deep repositories are distinguished in this report so that their individual and combined impacts may be examined. This approach is recommended when evaluating potential repository sites in diverse environments that are susceptible to different agents of erosion. In contrast, agents of sedimentation are not differentiated in this report because of their relatively minor impact on a deep repository.

2068 (UCRL--52736) MACRO1: A CODE TO TEST A METHODOLOGY FOR ANALYZING NUCLEAR-WASTE MANAGEMENT SYSTEMS. Edwards, L.L. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 14 Dec 1979. Contract W-7405-ENG-48. 56p. Dep. NTIS, PC A04/MF A01.

The code is primarily a manager of probabilistic data and deterministic mathematical models. The user determines the desired aggregation of the available models into a composite model of a physical system. MACRO1 then propagates the finite probability distributions of the inputs to the model to finite probability distributions over the outputs. MACRO1 has been applied to a sample analysis of a nuclear-waste repository, and its results compared satisfactorily with previously obtained Monte Carlo statistics.

2069 (UCRL--52747) NEW DEVELOPMENTS IN MEASUREMENT TECHNOLOGY RELEVANT TO THE STUDIES OF DEEP GEOLOGICAL REPOSITORIES IN DOMED SALT AND BASALT. Ramirez, A.L.; Mao, N.H. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 21 May 1980. Contract W-7405-ENG-48. 73p. NTIS, PC A04/MF A01.

This report briefly describes recent geophysical and geotechnical instrumentation developments relevant to the studies of deep geologic repositories. Special emphasis has been placed on techniques that appear to minimize measurement problems associated with repositories constructed in basalt or domed salt. Included in the listing are existing measurement capabilities and deficiencies that have been identified by a few authors and instrumentation workshops that have assessed the capabilities of existing instrumentation with respect to repository applications. These deficiencies have been compared with the reported advantages and limitations of the new developments described. Based on these comparisons, areas that merit further research and development have been identified. The report is based on a thorough literature review and on discussions with several instrumentation

specialists involved in instrumentation development.

2070 (UCRL--52749) RECOMMENDED NEW CRITERIA FOR THE SELECTION OF NUCLEAR WASTE REPOSITORY SITES IN COLUMBIA RIVER BASALT AND US GULF COAST DOMED SALT. Steinborn, T.L.; Wagoner, J.L.; Qualheim, B.; Fitts, C.R.; Stetkar, R.E.; Turnbull, R.W. (California Univ., Livermore (USA). Lawrence Livermore National Lab.). 16 Jun 1980. Contract W-7405-ENG-48. 66p. NTIS, PC A04/MF A01.

Screening criteria and specifications are recommended to aid in the evaluation of sites proposed for nuclear waste disposal in basalt and domed salt. The recommended new criteria proposed in this report are intended to supplement existing repository-related criteria for nuclear waste disposal. The existing criteria are contained in 10 CFR 60 sections which define siting criteria of the Nuclear Regulatory Commission (NRC), and ONWI 33(2) which defines siting criteria of the Office of Nuclear Waste Isolation (ONWI) for the Department of Energy. The specifications are conditions or parameter values that the authors recommend be applied in site acceptance evaluations. The siting concerns covered in this report include repository depth, host rock extent, seismic setting, structural and tectonic conditions, groundwater and rock geochemistry, volcanism, surface and subsurface hydrology, and socioeconomic issues, such as natural resources, land use, and population distribution.

2071 (UCRL--81147(Pt.2)(Rev.1)) LEACHING CHARACTERISTICS OF ACTINIDES FROM SIMULATED REACTOR WASTE. Weed, H.C.; Coles, D.G.; Bradley, D.J.; Mensing, R.W.; Schweiger, J.S.; Rego, J.H. (Battelle Pacific Northwest Labs., Richland, WA (USA); California Univ., Livermore (USA). Lawrence Livermore Lab.). 1979. Contract W-7405-ENG-48. 9p. (CONF-791112--69(Pt.2)(Rev.1)). NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Leach rates for ^{237}Np and ^{239}Pu are investigated with a single-pass leaching system. The factorial experimental design uses several combinations of solution composition and flow rate; and two temperatures, 25° and 75°C. The 25°C results are compared with those form a modified IAEA procedure. At 25°C, leach rates decrease with time. Agreement between results from the single-pass and modified IAEA methods is fair with WIPP brine leachant, good with $NaHCO_3$, and good with distilled H_2O. Leach rates are approximately independent of flow rates at room temperature, but increase with flow rates at high temperature. Rates for ^{237}Np increase with temperature, but those fro ^{239}Pu either decrease or do not change with temperature.

2072 (UCRL--82228(Rev.1)) MODELING OF BRINE MIGRATION IN HALITE. Cheung, H.; Fuller, M.E.; Gaffney, E.S. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 19 Oct 1979. Contract W-7405-ENG-48. 10p. (CONF-791112--53). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

When canisters containing radwastes are emplaced in a repository the heat produced by the decaying radwaste will cause moderate thermal gradients to develop which will cause the brine present in a halite medium (salt deposits) to accumulate around the canister. Four different models of the migration process have been reviewed to determine their suitability as a working model. One model predicts that inclusions smaller than 0.1 mm dimension probably will not migrate. The other models do not consider size as a factor. Thermal diffusion (Soret effect) is considered insignificant in three models, while in the fourth model it is added to the concentration diffusion term. The following conclusions can be made: Temperature is the most significant parameter in all models and must be known as a function of time, and distance from the canister. All four models predict about the same migration velocity for it is a given set of conditions; for 100°C and 1°C/cm thermal gradient, it is 3.0, 4.8, 5.6 and 6.4 mm/y. Diffusion of ions through the brine inclusions is the rate controlling mechanism. The difference between the thermal gradients in the liquid and in the solid should always be considered and is a function of droplet shape. The model based upon work by Nernst is easiest to use, but it predicts the lowest migration rate. The maximum volume of pure brine accumulated at the canister surface would be less than 20-40 liters in 50 years, for a canister initial thermal power of 3.5 kW.Bitterns would migrate proportionately less volume. A computer code, BRINE, was developed to make these calculations by means of any of the four models.

2073 (UCRL--82798) RADIOCHEMICAL SEPARATION OF NEPTUNIUM AND PLUTONIUM FROM LEACHING OF REACTOR WASTE GLASS IN BRINE SOLUTIONS. Rego, J. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 3 Oct 1979. Contract W-7405-ENG-48. 6p. (CONF-791049--3). Dep. NTIS, PC A02/MF A01.

From 23. conference on analytical chemistry in energy technology; Gatlinburg, TN, USA (9 Oct 1979).

The work described in this paper is part of a leaching study being conducted for the Battelle Pacific Northwest Laboratory's Waste Isolation Safety Assessment Program. Simulated high-level reactor waste glass was leached with three solutions, one of which was a saturated-salt brine. Because chemical separation of Np and Pu using organic extraction or anionic exchange is not effective for the brine samples, a procedure has been developed to first separate neptunium and plutonium from high concentrations of brine before proceeding with an extraction of neptunium from plutonium. Samples were equilibrated with tracers, Np and Pu were co-precipitated with $La(OH)_3$, and interfering ions were removed by washing the hydroxide precipitate with water. Pu and Np were separated by reducing Pu to Pu^{3+} and extracting the Np^{4+} into thenoyltrifluoroacetone; control of oxidation states and contaminant concentration is critical.

2074 (UCRL--83285) SOLVING THE GEOLOGIC ISSUES IN NUCLEAR WASTE DISPOSAL. Towse, D. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 7 Sep 1979. Contract W-7405-ENG-48. 33p. (CONF-790948--1). Dep. NTIS, PC A03/MF A01.

From Annual meeting of the American Institute of Professional Geologists; Lafayette, LA, USA (21 Sep 1979).

Technical problems with nuclear waste disposal are largely geological. If these are not solved, curtailment of nuclear power development may follow, resulting in loss of an important element in the national energy supply. Present knowledge and credible advances are capable of solving these problems provided a systems view is preserved and a national development plan is followed. This requires

identification of the critical controllable elements and a systematic underground test program to prove those critical elements. Waste migration can be understood and controlled by considering the key elements in the system: the system geometry, the hydrology, and the waste-rock-water chemistry. The waste program should: (1) identify and attack the critical problems first; (2) provide tests and demonstration at real disposal sites; and (3) schedule elements with long lead-times for early start and timely completion.

2075 (UCRL--83328) RADIATION SAFETY AND HEALTH EFFECTS RELATED TO LOW-LEVEL RADIOACTIVE WASTES. King, W.C. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 17 Sep 1979. Contract W-7405-ENG-48. 22p. (CONF-7710224--1). Dep. NTIS, PC A02/MF A01.

From Western occupational health conference; Monterey, CA, USA (11 Oct 1977).

The hazards associated with low-level radioactive waste, one of the nation's greatest concerns, are discussed from a health physicist's perspective. Potential biological hazards, four stages of the low-level radioactive waste disposal process, and suggested methods of reducing the risks of handling and disposal, based on previous studies, are defined. Also discussed are potential pathways of human exposure and two scenarios designed to demonstrate the complexity of modeling exposure pathways. The risks of developing a fatal cancer from exposure to the radioactive material, should it occur, is compared to other more commonly accepted risks.

2076 (UCRL--83488) COMPUTER MODELING OF NUCLEAR WASTE STORAGE CANISTER CORROSION. Cottrell, P.T.; Ludemann, W.D.; McCright, R.D. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 18 Oct 1979. Contract W-7405-ENG-48. 11p. (CONF-791112--25). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Current plans for nuclear waste disposal include placing the waste in a canister to isolate it from the repository environment for 1000 years. Corrosion prediction techniques are currently inadequate to guarantee the canister performance over this length of time. We are attempting to better predict the corrosion process with the help of computer modeling. We developed a program to calculate anodic and cathodic polarization curves using Tafel slopes, equilibrium exchange current densities, and other electrochemical parameters obtained from the experimental corrosion literature. The model generates and displays polarization curves for different values of environmetal parameters such as temperature, pH, and concentrations of pertinent species in the vicinity of the canister material. For the case of uniform corrosion in acidic media, our model predicts corrosion rates in fair agreement with literature values.

2077 (UCRL--83728) SPENT FUEL HANDLING SYSTEM FOR A GEOLOGIC STORAGE TEST AT THE NEVADA TEST SITE. Duncan, J.E.; House, P.A.; Wright, G.W. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 1 May 1980. Contract W-7405-ENG-48. 20p. (CONF-800607--54). NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

The Lawrence Livermore Laboratory is conducting a test of the geologic storage of encapsulated spent commercial reactor fuel assemblies in a granitic rock at the Nevada Test Site. The test, known as the Spent Fuel Test-Climax (SFT-C), is sponsored by the US Department of Energy, Nevada Operations Office. Eleven pressurized-water-reactor spent fuel assemblies are stored retrievably for three to five years in a linear array in the Climax stock at a depth of 420 m.

2078 (UCRL--83789) THERMAL CONDUCTIVITY, DIFFUSIVITY AND EXPANSION OF AVERY ISLAND SALT AT PRESSURE AND TEMPERATURE. Durham, W.B.; Abey, A.E.; Trimmer, D.A. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 4 Jan 1980. Contract W-7405-ENG-48. 18p. (CONF-791134--10). Dep. NTIS, PC A02/MF A01.

From 16. international thermal conductivity conference; Chicago, IL, USA (7 Nov 1979).

Preliminary data on the thermal properties of a coarse-grained rock salt from Avery Island, Louisiana, indicates that hydrostatic pressure to 50 MPa has little effect on the thermal conductivity, diffusivity and linear expansion at temperatures from 300 to 573 K. The measurements were made in a new apparatus under conditions of true hydrostatic loading. At room temperature and effective confining pressure increasing from 10 to 50 MPa, thermal conductivity and diffusivity are constant at roughly 7W/mK and 3.6×10^{-6} m^2/s, respectively. At 50 MPa and temperature increasing from 300 to 573K, both conductivity and diffusivity drop by a factor of 2. Thermal linear expansion at 0 MPa matches that at 50 MPa, increasing from roughly 4.2×10^{-5}/K at 300 K to 5.5×10^{-5} at 573 K. The lack of a pressure effect on all three properties is confirmed by previous work. Simple models of microcracking suggest that among common geological materials the lack of pressure dependence is unique to rock salt.

2079 (UCRL--83995) THERMAL ANALYSIS FOR A SPENT REACTOR FUEL STORAGE TEST IN GRANITE. Montan, D.N. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Sep 1980. Contract W-7405-ENG-48. 11p. (CONF-801124--8). NTIS, PC A02/MF A01.

From 3. annual meeting of the Materials Research Society; Boston, MA, USA (17 Nov 1980).

A test is conducted in which spent fuel assemblies from an operating commercial nuclear power reactor are emplaced in the Climax granite at the US Department of Energy's Nevada Test Site. In this generic test, 11 canisters of spent PWR fuel are emplaced vertically along with 6 electrical simulator canisters on 3 m centers, 4 m below the floor of a storage drift which is 420 m below the surface. Two adjacent parallel drifts contain electrical heaters, operated to simulate (in the vicinity of the storage drift) the temperature fields of a large repository. This test, planned for up to five years duration, uses fairly young fuel (2.5 years out of core) so that the thermal peak will occur during the time frame of the test and will not exceed the peak that would not occur until about 40 years of storage had older fuel (5 to 15 years out of core) been used. This paper describes the calculational techniques and summarizes the results of a large number of thermal calculations used in the concept, basic design and final design of the spent fuel test. The results of the preliminary calculations show the effects of spacing and spent fuel age. Either radiation or convection is sufficient to make the drifts much better thermal conductors than the rock that was removed to create them. The combination of radiation and convection causes the drift surfaces to be nearly isothermal even

though the heat source is below the floor. With a nominal ventilation rate of 2 m^3/s and an ambient rock temperature of 23°C, the maximum calculated rock temperature (near the center of the heat source) is about 100°C while the maximum air temperature in the drift is around 40°C. This ventilation (1 m^3/s through the main drift and 1/2 m^3/s through each of the side drifts) will remove about 1/3 of the heat generated during the first five years of storage.

2080 (UCRL--84152) EFFECTS OF ANNULAR AIR GAPS SURROUNDING AN EMPLACED NUCLEAR WASTE CANISTER IN DEEP GEOLOGIC STORAGE. Lowry, W.E.; Davis, B.W.; Cheung, H. (California Univ., Livermore (USA). Lawrence Livermore National Lab.; Northern Arizona Univ., Flagstaff (USA)). 5 Jun 1980. Contract W-7405-ENG-48. 9p. NTIS, PC A02/MF A01.

Annular air spaces surrounding an emplaced nuclear waste canister in deep geologic storage will have significant effects on the long-term performance of the waste form. Addressed specifically in this analysis is the influence of a gap on the thermal response of the waste package. Three dimensional numerical modeling predicts temperature effects for a series of parameter variations, including the influence of gap size, surface emissivities, initial thermal power generation of the canister, and the presence/absence of a sleeve. Particular emphasis is placed on determining the effects these variables have on the canister surface temperature. We have identified critical gap sizes at which the peak transient temperature occurs when gap widths are varied for a range of power levels. It is also shown that high emissivities for the heat exchanging surfaces are desirable, while that of the canister surface has the greatest influence. Gap effects are more pronounced, and therefore more effort should be devoted to optimal design, in situations where the absolute temperature of the near field medium is high. This occurs for higher power level emplacements and in geomedia with low thermal conductivities. Finally, loosely inserting a sleeve in the borehole effectively creates two gaps and drastically raises the canister peak temperature. It is possible to use these results in the design of an optimum package configuration which will maintain the canister at acceptable temperature levels. A discussion is provided which relates these findings to NRC regulatory considerations.

2081 (UCRL--84153) THREE-DIMENSIONAL THERMAL ANALYSIS OF A BASELINE SPENT FUEL REPOSITORY. Altenbach, T.J.; Lowry, W.E. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 5 Jun 1980. Contract W-7405-ENG-48. 9p. (CONF-801102--14). NTIS, PC A02/MF A01.

From ASME winter annual meeting; Chicago, IL, USA (16 Nov 1980).

A three-dimensional thermal analysis has been performed using finite difference techniques to determine the near-field response of a baseline spent fuel repository in a deep geologic salt medium. A baseline design incorporates previous thermal modeling experience and OWI recommendations for areal thermal loading in specifying the waste form properties, package details, and emplacement configuration. The base case in this thermal analysis considers one 10-year old PWR spent fuel assembly emplaced to yield a 36 kw/acre (8.9 w/m^2) loading. A unit cell model in an infinite array is used to simplify the problem and provide upper-bound temperatures. Boundary conditions are imposed which allow simulations to 1000 years. Variations studied include a comparison of ventilated and unventilated storage room conditions, emplacement packages with and without air gaps surrounding the canister, and room cool-down scenarios with ventilation following an unventilated state for retrieval purposes. At this low power level ventilating the emplacement room has an immediate cooling influence on the canister and effectively maintains the emplacement room floor near the temperature of the ventilating air. The annular gap separating the canister and sleeve causes the peak temperature of the canister surface to rise by 10°F (5.6°C) over that from a no gap case assuming perfect thermal contact. It was also shown that the time required for the emplacement room to cool down to 100°F (38°C) from an unventilated state ranged from 2 weeks to 6 months; when ventilation initiated after times of 5 years to 50 years, respectively. As the work was performed for the Nuclear Regulatory Commission, these results provide a significant addition to the regulatory data base for spent fuel performance in a geologic repository.

2082 (UCRL--84613) STATUS OF LLNL GRANITE PROJECTS. Ramspott, L.D. (California Univ., Livermore (USA). Lawrence Livermore National Lab.). 1980. Contract W-7405-ENG-48. 11p. (CONF-800751--3). NTIS, PC A02/MF A01.

From Workshop on thermomechanical-hydrochemical modeling for hardrock waste repository; Bereley, CA, USA (29 Jul 1980).

The status of LLNL Projects dealing with nuclear waste disposal in granitic rocks is reviewed. This review covers work done subsequent to the June 1979 Workshop on Thermomechanical Modeling for a Hardrock Waste Repository and is prepared for the July 1980 Workshop on Thermomechanical-Hydrochemical Modeling for a Hardrock Waste Repository. Topics reviewed include laboratory determination of thermal, mechanical, and transport properties of rocks at conditions simulating a deep geologic repository, and field testing at the Climax granitic stock at the USDOE Nevada Test Site.

2083 (UCRL--84643) REVIEW OF THE 1979 WORKSHOP ON THERMOMECHANICAL MODELING FOR A HARD ROCK WASTE REPOSITORY. Holzer, F. (California Univ., Livermore (USA). Lawrence Livermore National Lab.). 1980. Contract W-7405-ENG-48. 5p. (CONF-800751--2). NTIS, PC A02/MF A01.

From Workshop on thermomechanical-hydrochemical modeling for hardrock waste repository; Bereley, CA, USA (29 Jul 1980).

The 1979 Workshop discussed and considered issues and needs in the areas of Modeling, Laboratory Measurements, Instruments and Field Measurements, and In-situ Tests and Model Validation. A set of conclusions and recommendations was developed, which focused on the necessity of treating the rock mass response to the waste emplaced in it. The conclusions dealt with characterizing the fracture system, determining the mechanical and thermal properties, developing an understanding of the physical process, predicting and measuring the response, and carrying out meaningful validation tests. Measured against the stated objectives, the 1979 Workshop was successful. With respect to implementation of its recommendations, this conclusion is not so obvious, although some activities of the past year suggest the Workshop has had a beneficial influence.

2084 (UCRL--84918) NUCLEAR WASTE MANAGEMENT;

STORAGE AND DISPOSAL ASPECTS. Patterson, B.D.; Dave, S.A.; O'Connell, W.J. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 1980. Contract W-7405-ENG-48. 15p. (CONF-800904--2). NTIS, PC A02/MF A01.

From American Society of Civil Engineers specialty conference: civil engineering and nuclear power; Knoxville, TN, USA (15 Sep 1980).

Long-term disposal of nuclear wastes must resolve difficulties arising chiefly from the potential for contamination of the environment and the risk of misuse. Alternatives available for storage and disposal of wastes are examined in this overview paper. Guidelines and criteria which may govern in the development of methods of disposal are discussed.

2085 (UNI--1454) INTERIM REPORT ON CONCRETED URANIUM FINES AND CHIPS BILLET CURING TESTS: A BASIS FOR RESUMING SHIPMENT OF CONCRETED URANIUM SCRAP BILLETS. Weakley, E.A. (United Nuclear Industries, Inc., Richland, WA (USA)). 2 May 1980. Contract AC06-76RL01857. 37p. NTIS, PC A03/MF A01.

Through extensive testing and analyses of the concretion process, billets and shipping conditions, it has been determined that properly cured concreted billets can be safely shipped to National Lead Company of Ohio (NLO), Fernald. During curing, billets will be dried for 26 days prior to shipment with the last 10 days between 54 to 66°C (130 to 150°F). Such dried billets can withstand temperatures up to 85°C (185°F). The maximum billet temperature that can be expected to occur in shipment is 50°C (123°F). Thus, the drying cycle becomes a burning test at temperatures which the billets will not reach during shipment to NLO.

2086 (USGS--1543-4) GEOHYDROLOGY OF HOLE UE-17A, SYNCLINE RIDGE AREA, NEVADA TEST SITE. Weir, J.E. Jr.; Hodson, J.N. (Geological Survey, Denver, CO (USA)). Dec 1979. Contract EW-78-I-08-1543. 23p. Dep. NTIS, PC A02/MF A01.

Hole UE-17a was drilled as part of a study to evaluate the suitability of Unit J of the Eleana Formation of Mississippian age as a medium for storage of nuclear wastes. The 1214-foot (370-meter) hole penetrated alluvium of Quaternary age, a thrust plate of the Tippipah Limestone of Pennsylvania and Permian age, and 668 feet (204 meters) of the Eleana Formation. A small amount of groundwater occurs in fractured quartzites and limestones of the Eleana Formation; jetting produced only 20 gallons per minute (1.3 liters per second) from the completed hole. Approximate transmissivity, calculated from jetting test results, is 1.2 feet squared per day (0.11 meters squared per day). The hydraulic head has almost steadily declined in the hole since September 29, 1976, a few days after the hole was completed. Water from the Eleana Formation is a sodium bicarbonate and sodium sulfate type.

2087 (USGS--1543-6) PRELIMINARY GEOLOGIC AND GEOPHYSICAL DATA OF THE UE25A-3 EXPLORATORY DRILL HOLE, NEVADA TEST SITE, NEVADA. Maldonado, F.; Muller, D.C.; Morrison, J.N. (Geological Survey, Denver, CO (USA)). Sep 1979. Contract EW-78-I-08-1543. 61p. Dep. NTIS, PC A04/MF A01.

The UE25a-3 drill hole, located in the Calico Hills area, was drilled as part of an effort to evaluate the Calico Hills area as a possible nuclear waste repository site. The purpose of the drill hole was to verify the existence of an intrusive crystalline body in the subsurface and to determine the stratigraphy, structure, and nature of fractures of the cored rocks. Cored samples were obtained for mineral, chemical, and material property analyses. Numerous high-angle faults and brecciated zones were intersected by the drill hole. The units cored were intensely fractured with fracture analysis of the core consisting of frequency of fractures, dips of fractures, open and closed (sealed) fractures and types of fracture sealing or coating material. Twenty-four hundred and thirty fractures, representing approximately 30 percent of the fractures present, indicate an average fracture frequency of 13.2 fractures per meter, predominantly high-angle dips with 66 percent of the fractures closed. Fractures in the argillite interval are sealed or coated predominantly with kaolinite, nacrite, and dickite. Calcite, chlorite, and magnetite are present in fractures in the altered argillite interval. Fractures in the marble interval are sealed or coated with calcite, dolomite, and ferruginous clay. The core index indicates that the lower half of the drilled interval is more competent than the upper half. Borehole geophysical logs were run by the Birdwell Division of Seismograph Service Corporation for geologic correlations and lithologic characterizations. The logs include: caliper, density, resistivity, spontaneous potential, Vibroseis, 3-D velocity, neutron, and gamma-ray logs.

2088 (USGS-OFR--79-1212) SEISMIC-REFRACTION SURVEY TO THE TOP OF SALT IN THE NORTH END OF THE SALT VALLEY ANTICLINE, GRAND COUNTY, UTAH. Achermann, H.D. (Geological Survey, Washington, DC (USA)). 1979. 31p. US Dept. of Interior, Geological Survey, Washington, DC.

A sesimic-refraction survey, consisting of three lines about 2700, 2760, and 5460 meters long, was made at the north end of the Salt valley anticline of the Paradox Basin in eastern Utah. The target was the crest of a diapiric salt mass and the overlying, deformed caprock. The interpretations reveal an undulating salt surface with as much as 80 meters of relief. The minimum depth of about 165 meters is near the location of three holes drilled by the US Department of Energy for the purpose of evaluating the Salt Valley anticline as a potential site for radioactive waste storage. Caprock properties were difficult to estimate because the contorted nature of these beds invalidated a goelogic interpretation in terms of velocity layers. However, laterally varying velocities of the critically refracted rays throughout the area suggest differences in the gross physical properties of the caprock.

2089 (USGS-OFR--79-1244) PRELIMINARY REPORT ON THE GEOLOGY AND GEOPHYSICS OF DRILL HOLE UE25A-1, YUCCA MOUNTAIN, NEVADA TEST SITE. Spengler, R.W.; Muller, D.C.; Livermore, R.B. (Geological Survey, Denver, CO (USA); Fenix and Scisson, Inc., Mercury, NV (USA)). 1979. Contract EW-78-I-08-1543. 80p. Dep. NTIS, PC A05/MF A01.

A subsurface geologic study in connection with the Nevada Nuclear Waste Storage Investigations has furnished detailed stratigraphic and structural information about tuffs underlying northeastern Yucca Mountain on the Nevada Test Site. Drill hole UE25a-1 penetrated thick sequences of nonwelded to densely welded ash-flow and bedded tuffs of Tertiary age. Stratigraphic units that were identified from the drill-hole data include the Tiva Canyon and Topopah Spring Members of the Paintbrush Tuff, tuffaceous beds of Calico Hills, and the Prow Pass and Bullfrog Members

of the Crater Flat Tuff. Structural analysis of the core indicated densely welded zones to be highly fractured. Many fractures show near-vertical inclinations and are commonly coated with secondary silica, manganese and iron oxides, and calcite. Five falt zones were recognized, most of which occurred in the Topopah Spring Member. Shear fractures commonly show oblique-slip movement and some suggest a sizable component of lateral compression. Graphic logs are included that show the correlation of lithology, structural properties, and geophysical logs. Many rock units have characteristic log responses but highly fractured zones, occurring principally in the Tiva Canyon and Topopah Spring Members restricted log coverage to the lower half of the drill hole.

2090 (USGS-OFR--79-1675) FLUID INCLUSIONS IN SALT FROM THE RAYBURN AND VACHERIE DOMES, LOUISIANA. Roedder, E.; Belkin, H.E. (Geological Survey, Washington, DC (USA)). 1979. 25p. NTIS, PC A02/MF A01.

Core samples from the Rayburn and Vacherie salt domes in Louisiana were examined for fluid inclusions, in connection with the possible use of such domes for nuclear waste storage sites. Three types of fluid inclusions were found: brine, compressed gas, and oil (in decreasing volume percent abundance). The total amount of such fluids is small, certainly < 0.01 vol % and probably in the range 0.1 to 0.001 volume %, but the inclusions are highly erratic in distribution. Unlike many bedded salt deposits, the brine inclusions in this salt contain fluids that are not far from simple NaCl-H_2O solutions, with very little of other ions. One of three possible explanations for such fluids is that fresh water penetrated the salt at some unknown time in the past and was trapped; if such entry of fresh water has occurred in the past, it might also occur again in the future.

2091 (USGS-OFR--80-126) BOREHOLE GEOPHYSICAL MEASUREMENTS FOR HOLE UE25A-3, NEVADA TEST SITE, NUCLEAR WASTE ISOLATION PROGRAM. Daniels, J.J.; Scott, J.H. (Geological Survey, Washington, DC (USA)). 1980. Contract EW-78-I-08-1543. 31p. Dep. NTIS, PC A03/MF A01.

Borehole geophysical measurements made in drill hole UE25a-3 with a US Geological Survey research well-logging truck are presented in this paper. The purpose of these logging measurements is to provide in-situ physical properties information that is not commercially available on drill hole UE25a-3. Well logs are presented in this paper for dual-detector density, normal resistivity, gamma-ray, neutron-neutron, induced polarization, and magnetic susceptibility measurements. These data are analyzed correlations with the core lithology. Hole-to-surface measurements made from drill hole UE25a-3 indicate the presence of two resistive bodies at depth. The deeper resistive anomaly may be related to a granitic intrusion.

2092 (USGS-OFR--80-466) RESISTIVITY SOUNDING INVESTIGATION BY THE SCHLUMBERGER METHOD IN THE SYNCLINE RIDGE AREA, NEVADA TEST SITE, NEVADA. Anderson, L.A.; Bisdorf, R.J.; Schoenthaler, D.R. (Geological Survey, Denver, CO (USA)). 1980. Contract EW-78-A-08-1543. 67p. NTIS, PC A04/MF A01.

A resistivity survey was made in the north-central sector of the Nevada Test Site (NTS) as part of an extensive search for suitable geologic environments to be used as repositories for radioactive waste products. The area of interest, identified herein as Syncline Ridge after a locally prominent structural feature, lies within the Tippipah Spring Quadrangle. The surficial geology generalized from Orkild (1963), mapped and inferred faults, resistivity sounding sites, borehole emplacements, and alinements of resistivity cross sections compiled from the interpreted sounding data are included. The intent of the survey was to determine the horizontal continuity and thickness of unit J of the Eleana Formation. Ten distinct lithologic units make up the Eleana Formation but only units G, H, I, and J of Mississippian age are found in the Syncline Ridge area. Because of its relative importance in this survey, unit J is shown as a separate entity, whereas the G, H, and I units have been grouped under the general heading of Eleana Formation.

2093 (USGS-OFR--80-929) PRELIMINARY INTERPRETATIONS OF GEOLOGIC RESULTS OBTAINED FROM BOREHOLES UE25A-4, -5, -6, AND -7, YUCCA MOUNTAIN, NEVADA TEST SITE. Spengler, R.W.; Rosenbaum, J.G. (Geological Survey, Reston, VA (USA)). 1980. Contract AI08-78ET44802. 39p. NTIS, PC A03/MF A01.

Since 1978, the USGS (US Geological Survey) has been providing technical assistance in characterizing suitable rock masses at or contiguous to the NTS (Nevada Test Site) for long-term storage of high-level nuclear waste. Current efforts have been focused on investigating Yucca Mountain, a volcanic highland situated along the western boundary of NTS in southern Nevada. Detailed stratigraphic and structural studies have been in progress along a northeastern segment of the highland in a wedge-shaped area bounded by Basin and Range faults, most of which trend north-northeast. A series of four locally steep-walled, nearly parallel, linear washes transect the northeastern half of the area of interest and display trends similar to major faults to the northeast. Prior to the present study, drill hole UE25a-1, located about 1600 feet southeast of the edge of the area of interest, was cored to a depth of 2500 feet. Subsurface information derived from the upper 500 feet of this drill hole is included in this report to compare with recently acquired data. Surface electrical surveys have been conducted by both the University of Utah and the USGS perpendicular to the trend of the washes in an attempt to better understand factors that have influenced the present drainage pattern. Preliminary data of both pole-dipole and dipole-dipole resistivity/IP electrical methods indicate numerous vertical and horizontal discontinuities between adjacent resistive bodies that strongly suggest a broad zone of faulting, fracturing, and (or) brecciation. To verify the existence of structural discontinuities suggested by the linear washes and electrical anomalies, a drilling program was initiated in June 1979, to obtain geologic information within the southernmost of four northwest-trending washes.

2094 (USGS-OFR--80-941) INTERPRETATION OF GEOPHYSICAL WELL-LOG MEASUREMENTS IN DRILL HOLE UE25A-1, NEVADA TEST SITE, RADIOACTIVE WASTE PROGRAM. Hagstrum, J.T.; Daniels, J.J.; Scott, J.H. (Geological Survey, Las Vegas, NV (USA)). 1980. Contract AI08-78ET44802. 36p. NTIS, PC A03/MF A01.

An exploratory hole (UE25a-1) was drilled at Nevada Test Site (NTS) to determine the suitability of pyroclastic deposits as storage sites for radioactive waste. Studies have been conducted to investigate the stratigraphy, structure, mineralogy, petrology, and physical properties of the tuff units encountered in the

drill hole. This report deals with the interpretation of physical properties for the tuff units from geophysical well-log measurements. The ash-flow and bedded tuff sequences at NTS comprise complex lithologies of variously welded tuffs with superimposed crystallization and altered zones. To characterize these units, resistivity, density, neutron, gamma-ray, induced polarization, and magnetic susceptibility geophysical well-log measurements were made. Although inherently subjective, a consistent interpretation of the well-log measurements was facilitated by a computer program designed to interpret well logs either individually or simultaneously. The broad features of the welded tuff units are readily distinguished by the geophysical well-log measurements. However, many details revealed by the logs indicate that more work is necessary to clarify the casual elements of well-log response in welded tuffs.

2095 (Y/OWI/SUB--78/22340/4) EXECUTIVE-STYLE BRIEFINGS ON SELECTED REPOSITORY DESIGN ISSUES. (Science Applications, Inc., Oak Ridge, TN (USA)). 2 Jun 1978. Contract W-7405-ENG-26. 45p. Dep. NTIS, PC A03/MF A01.

This document is a collection of executive-style briefings on selected repository design issues. Most of the briefings discuss differences between the US repository design bases presented in US Working Draft on Repository Physical Descriptions in a Salt Formation, prepared in support of INFCE discussions of May 1978 and the FRG-Netherlands design bases, presented in Design Study of a Radioactive Waste Repository to be Mined in a Medium-Size Salt Dome by Hamstra and Velzeboer, Netherlands Energy Research Foundation, January 1978. Advantages and disadvantages of the two sets of design bases are discussed, and the impacts of adopting either of these bases on the other's programs and positions are identified.

2096 (Y/OWI/TM--37) AREAL THERMAL LOADING RECOMMENDATIONS FOR NUCLEAR WASTE REPOSITORIES IN SALT. Russell, J.E. (Union Carbide Corp., Oak Ridge, TN (USA). Office of Waste Isolation). Jun 1979. Contract W-7405-ENG-26. 50p. Dep. NTIS, PC A03/MF A01.

This document gives a wider understanding of the history of the recommended thermal loadings in salt for both high-level waste (HLW) from fresh UO_2-fueled, light-water reactors (LWR) with no recycle and spent unreprocessed fuel (SURF) from LWRs. Aspects of the current recommendations that need further study are identified. Finally, an interim set of design thermal-loading recommendations are given that have a common rationale of satisfying performance limits within our current state of knowledge. These recommendations are made on a generic rather than a site-specific basis. 11 figures, 5 tables.

2097 (Y/OWI/TM--43/9) OFFICE OF WASTE ISOLATION PROGESS REPORT, JUNE 1978. Rhines, R.C. (ed.). (Union Carbide Corp., Oak Ridge, TN (USA). Office of Waste Isolation). 28 Jul 1978. Contract W-7405-ENG-26. 56p. Dep. NTIS, PC A04/MF A01.

This document is the last monthly progress report, as the Office of Waste Isolation has ceased operation on June 30, 1978. The material in this report is divided into technical projects, facility projects, planning and analysis, and regulatory affairs. Sundry other activities are reported in appendices. (DLC)

2098 (ZfK--340, pp 16-19) FACILITY FOR LIQUID WASTES AND AQUEOUS RADIOACTIVE WASTES OF AN α, BETA, γ-LABORATORY. Krause, F.; Nebel, D. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)); Guder, R. Sep 1977. (In German).

Annual report 1977.

LABORATORY EQUIPMENT;LIQUID WASTES; RADIOACTIVE WASTE DISPOSAL;RADIOACTIVE WASTE FACILITIES;RADIOACTIVE WASTE STORAGE

2099 LONG-TERM GEOLOGIC STORAGE OF SPENT FUEL. Rossin, A. (Commonw Edison Co, Chicago, Ill). Journal of the Structural Division, Proceedings of the American Society of Civil Engineers ; 106: No. 7, 1475-1479(Jul 1980).

Spent nuclear fuel can be disposed of safely in deep geological formations. In fact, technology exists sufficient to provide assurance that permanent high-level waste disposal is feasible. Opponents to nuclear power argue that future nuclear plant operation should be curtailed until a high-level waste disposal facility is in operation. This ignores the fact that more than eighty million gallons of separated high-level wastes already exist from the nuclear weapons program and must be placed in safe, permanent geologic storage. Some groups that are trying to block experiments and demonstrations of geologic disposal seem satisfied that spent fuel could be disposed of in a similar manner. Demonstration of nuclear waste disposal in the near future is essential to public acceptance of nuclear power.

2100 MICROAUTORADIOGRAPHIC STUDIES OF THE SORPTION OF U AND AM ON NATURAL ROCK SAMPLES. Smyth, J.R.; Thompson, J.; Wolfsberg, K. (Los Alamos Scientific Lab., NM). Radioactive Waste Management (New York) ; 1: No. 1, 13-24(May 1980).

Selective sorption of uranium and americium by specific minerals in complex geologic materials (granite, argillite, tuff, and alluvium) has been investigated by means of autoradiography on rock thin sections. A standard 30 μm uncovered polished thin section is contacted with a droplet of ground-water solution of uranium or americium. After washing, a thin photographic emulsion is adhered to the section; the emulsion is then exposed and developed to show the alpha-particle tracks. Results indicate that low-temperature, hydrous (commonly secondary) mineral phases are much better sorbers of uranium than primary, high-temperature, anhydrous phases. This suggests that one percent or less of secondary alteration phases may completely dominate the sorption properties of a rock. Results for americium are believed inconclusive because of possible colloid formation or complexing in the slightly basic solutions.

2101 SAFE HANDLING AND STORAGE OF HIGH LEVEL RADIOACTIVE WASTE. Ahlstroem, P.E.; Loefverberg, S.; Nilsson, L.B.; Papp, T. Radioactive Waste Management (New York) ; 1: No. 1, 57-103(May 1980).

This is a condensed version of the proposals of the Swedish Nuclear Fuel Safety Project (KBS). It consists of two parts; safe final storage of vitrified waste, and safe final storage of spent nuclear fuel. In this report are proposals which are detailed and comprehensive to permit a safety evaluation. These proposals specify concretely in which form the waste or spent fuel is to be stored,

how the storage facility is to be designed and how transportation is to be effected. For unreprocessed spent nuclear fuel, proposals indicate how and where an absolutely safe final storage can be effected. Various stages in the handling of the fuel on its way to final storage are fully described. Briefly summarized, the report stipulates that the high-level radioactive waste will be in the form of borosilicate glass cylinders containing 9% fission products. The cylinders will be surrounded by 10 cm of lead, which is further encased in a titanium canister. The canisters are placed in deposition holes drilled in the tunnel floor. The holes are backfilled with a sand-clay mixture. The fuel assemblies are dismantled and the rods are encased in copper containers with 20 cm thick walls. The cylindrical containers are deposited into holes drilled in the floor of a tunnel system. The spaces between the rock and copper canisters are filled with compacted bentonite clay.

2102 LEAD AS A MATERIAL FOR ATOMIC WASTE CONTAINERS. ANALYSIS OF LEAD CORROSION BEHAVIOR ON THE BASIS OF ARCHAEOLOGICAL FINDS. Krysko, W.W. Metall. Internazionale Zeitschrift fuer Technik und Wirtschaft ; 34: No. 5, 433-436(May 1980). (In German).

From archaeological finds it has been observed that grain size and shape is the factor governing the corrosion durability of lead. For longterm corrosion stability, the grain size should not exceed 0.5 mm grain diameter. On the basis of an investigation of 2 000 year old lead artefacts, conclusions are drawn and manufacturing conditions for lead containers for the burial of high-level atomic waste are recommended.

2103 REACTION OF GRAPHITE WITH WATER AND ITS IMPLICATIONS FOR RADIOACTIVE WASTE STORAGE. Gray, W.J. (Pacific Northwest Lab., Richland, WA). Contract EY-76-C-06-1830. Radioactive Waste Management (New York) ; 1: No. 1, 105-109(May 1980).

This letter describes initial results from measuring oxidation of graphite in liquid water and air. They indicate that the reaction rates are extremely low at temperatures of interest for waste storage. Leach (oxidation) tests were conducted using deionized water and powdered graphite with a surface area of 5.4 m^2/g as measured by iodine absorption from aqueous solutions. The graphite and water were sealed inside a Pyrex vessel with air filling the remaining space. After 24 h at 200 to 300°C in an autoclave, gas from the vessel was extracted through a breakseal and analyzed, using a gas chromatograph, for CO_2 and other gases. CO_2 concentrations of 0.3 to 10 vol % were measured, but H_2 concentrations never exceeded 1000 ppM and CO and CH_4 were usually not detected and never exceeded 100 ppM.

2104 ANALYSIS, CRITIQUE, AND REEVALUATION OF HIGH-LEVEL WASTE REPOSITORY WATER INTRUSION SCENARIO STUDIES. Cohen, B.L. (Univ. of Pittsburgh, PA). Nuclear Technology ; 48: No. 1, 63-69(Apr 1980).

The several water intrusion scenario studies in the recent literature are all quite similar and may be easily understood if used to estimate the total number of eventual cancers per unit of energy generated, including their sensitivity to input parameters. However, these studies are grossly overpessimistic in several aspects of the problem, especially in using leach rate data from highly unrealistic experimental situations, and in ignoring geochemical considerations in both leaching and in transport. It is concluded that it is reasonable to expect removal and transport for an atom of buried waste to be similar to that for an atom of average rock. Under that assumption, the leach rate can be estimated from the chemical compositions of rock and of groundwater, coupled with the water flow through aquifers. The result (excluding ^{238}U) is 0.0008 eventual cancer/GW(electric)-yr. This treatment would be invalidated if the waste were released through fractures in the rock induced by the emplacement operations or by heat. If such fractures cannot be discounted, total reliance must be on leach resistance.

2105 FINAL DISPOSAL OF RADIOACTIVE WASTES. Kroebel, R.; Krause, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Glueckauf ; 116: No. 7, 336-339, 153-155(Apr 1980). (In German and English).

The paper discusses the possibilities of radioactive waste storage in West Germany and the related problems of waste treatment, disposal methods, and safety. Projected programmes of the neigbouring EC countries and the USA are mentioned. The authors state that present ways of final storage are sufficiently well known and safe but could be improved by further development. The remaining risk potential after 1000 years of storage of radioactive waste from reprocessing plants is lower than that of the known ore deposits.

2106 METHOD FOR LONG TIME STORAGE OF RADIOACTIVE MATERIAL IN THE BEDROCK. Hannerz, K. (to ASEA-ATOM AB, Vaesteraas (Sweden)). Swedish Patent 7,705,173-8/B/. Mar 1980. 7p. (In Swedish).

Between the body which contains radioactive materials and the rock an inner mass is introduced. The mass has a porous structure which is necessary for the penetration of water. The material must react with water while its volume is expanding. Outside the inner mass there is an outer mass made out of a material which can be plastically deformed. In this way the penetration of water into the outer parts of the inner mass via cracks or other holes in the outer mass renders the cracks and other holes in the other mass become packed by the inner mass due to its volume expansion. The penetration of the outer mass into any possible crack of the rock is attained so that the cracks are tightened. The volume expansion of the material must be larger than the pore volume of the inner mass. The material of the inner mass consists mainly of magnesium oxide, and the material of the outer mass consists mainly of bitumen or tar sands.

2107 ALL ABOARD THE RAINBOW WARRIOR. Walker, I. New Society (London) ; 51: No. 907, 388-389(21 Feb 1980).

An account is given of the attempt by Rainbow Warrior to intercept Pacific Swan at Cherbourg Harbour, to protest against the transport of spent nuclear fuel from England to France for reprocessing.

2108 NUCLEAR WASTE: A 5000 YEAR PROBLEM. Stevens, T. Architects Journal (London) ; 171: No. 8, 368-370(20 Feb 1980).

An account is given of the problem of disposal of radioactive waste from U.K. nuclear facilities. Specific reference is made to the UKAEA application for planning permission to undertake drilling of boreholes for the purpose of studying the properties and structures of the rocks [in the Loch Doon area] and movement of water in them. The place of this

application in the whole programme of test drilling, and the public attitude to proposals to search for suitable sites for underground disposal, are discussed.

2109 CEMETERIES SOUGHT FOR NUCLEAR WASTE. ANATOMY OF AN INQUIRY. Stevens, T. New Scientist ; 85: No. 1194, 491-493(14 Feb 1980).
The significance is discussed of the forthcoming public planning inquiry over proposals to drill in an area near Loch Doon in the Galloway Hills, Scotland. The UKAEA wishes to carry out the drilling to ascertain whether the hard granite in the area would provide a suitable underground store for nuclear waste. The terms of reference of the inquiry are considered and current government thinking on high level nuclear waste disposal is outlined.

2110 CEMETERIES SOUGHT FOR NUCLEAR WASTE. GEOLOGY OF A GRAVEYARD. Gibbs, A. (Bedford Coll., London (UK)). New Scientist ; 85: No. 1194, 488-491(14 Feb 1980).
Relevant geological criteria for safe long - term disposal of high level radioactive waste are listed. Having identified 127 sites throughout Britain, including both sedimentary and crystalline rock formations, 23 areas of crystalline rocks were short listed and it is hoped to carry out an extensive surveying and drilling program from which it will be possible to find the most suitable burial sites.

2111 GAS GENERATION BY SELF-RADIOLYSIS OF TRITIATED WASTE MATERIALS. Tadlock, W.E.; Abell, G.C.; Steinmeyer, R.H. (Monsanto Research Corp., Miamisburg, OH). Contract DE-AC-4-76-DP00053. Nuclear Technology ; 47: No. 2, 358-362(Feb 1980).
Studies simulating the effect of self-radiolysis in disposal packages containing tritiated waste materials show hydrogen to be the dominant gas-phase product. Pressure buildup and gas composition over various tritiated octane and tritiated water samples are designed to give worst case results. One effect of tritium fixation agents is to reduce pressure buildup. The results show that development of explosive gas mixtures is unlikely and that maximum pressure buildup in typical Mound Facility waste packages can be expected to be <0.25 MPa.

2112 BWIP - ANOTHER STEP ON THE WAY TO A WASTE REPOSITORY. Nuclear Engineering International ; 25: No. 295, 33-34(Feb 1980).
Of all the possible media for storing nuclear waste, basalt seems one of the most promising. The Basalt Waste Isolation Project at Hanford is investigating all aspects of using basalt for storing waste. The basic facility has now been excavated and work has just started on installing the instrumentation.

2113 WASTE DUMPING: WHY OPPOSE TEST BORES. Paulin, D. SCRAM (Scottish Campaign to Resist the Atomic Menace) Energy Bulletin ; No. 16, 5-6(Feb-Mar 1980).
BOREHOLES;HEARINGS;LICENSING;PUBLIC OPINION; GEOLOGIC DEPOSITS;RADIATION HAZARDS;RADIOACTIVE WASTE DISPOSAL;ROCK DRILLING;UKAEA;UNDERGROUND DISPOSAL;UNITED KINGDOM

2114 TEST BORES IRRELEVANT. Tolstoy, I. SCRAM (Scottish Campaign to Resist the Atomic Menace) Energy Bulletin ; No. 16, 7-8(Feb-Mar 1980).

2115 (PNL-TR--408) BEHAVIOR OF RADIOACTIVE WASTES INCORPORATED IN CONCRETE AND STORED ON OPEN-AIR BED AT CAMEN. Beltiore, A.; Lo Moro, A.; Orsini, T.; Panciatici, G. Translated from Energia Nucleare (Milan) ; 27: No. 2, vp(Feb 1980). 8p. NTIS, PC A02/MF A01.
A study was performed on the state of preservation of some 400 concrete containers used to condition radioactive wastes, stored in the temporary open-air bed at Centro Applicazioni Militari Energia Nucleare (CAMEN). The investigation, whose results are reported in the present note, showed the effectiveness of the adopted method of storing the containers in the open.

2116 (PNL-TR--384) CEDRA INFORME: NATIONAL COOPERATIVE ASSOCIATION FOR THE STORAGE OF RADIOACTIVE WASTES. 31 Jan 1980. Translation of CEDRA Informe, No. 6/1979 November 34p. Dep. NTIS, PC A03/MF A01.
Activities of the CEDRA, a Swiss organization, in the field of radioactive waste storage are reported. Besides various international cooperative projects, an underground laboratory will be constructed at Grimsel. International news briefs are included. The Swiss program for nuclear waste management is discussed. (DLC)

2117 TECHNICAL NOTE: 1957-1958 SOVIET NUCLEAR ACCIDENT IN THE URALS. Trabalka, J.R. (Oak Ridge National Lab., TN); Auerbach, S.I.; Eyman, L.D. Nuclear Safety ; 21: No. 1, 94-99(Jan 1980).
The available but limited information concerning the major airborne release of fission wastes in the Soviet Union in 1957-58 is discussed. A theory that the release was the result of unusual localized fallout from a Soviet atmospheric weapons test is rejected. An earlier article by Stratton, et. al. is criticized. The authors suggest that evidence points to an accident involving the high-level radioactive waste storage of plutonium.

2118 OCEAN DUMPING OF HIGH-LEVEL WASTE: AN ACCEPTABLE SOLUTION WE CAN ''GUARANTEE''. Cohen, B. (Argonne National Lab., IL). Nuclear Technology ; 47: No. 1, 163-172(Jan 1980).
What is needed for high-level radioactive waste is not necessarily a program for final disposal, but rather an early clear demonstration that an acceptable method is available. This would be especially easy for ocean dumping, since the environment in the water just above the ocean floor is much more uniform, stable, predictable, and more easily reproduced in a laboratory than other environments being considered for waste storage. Other probable advantages of ocean dumping are improved capability for monitoring and retrievability and reduced cost and transport problems. It is assumed that the waste is incorporated into glass and dumped in oceans distributed throughout the world. Calculations of environmental impacts are given for various assuptions about leach rates and failures and for a 30,000-yr delay in onset of leaching achieved by surrounding the waste with a protective coating. With normal leaching, there would be 0.17 eventual human fatalities per GW(electric)-yr, and for the worst case of

immediate complete dissolution, this is increased by only 30%. This is 150 times less than the fatalities due to wastes from coal-fired plants.

2119 LABORATORY SIMULATION OF HIGH-LEVEL LIQUID WASTE EVAPORATION AND STORAGE. Anderson, P.A. (Exxon Nuclear Idaho Co., Idaho Falls). Nuclear Technology ; 47: No. 1, 173-180(Jan 1980).

Simulated high-level liquid waste (HLLW) slurries were prepared by combining a series of soluble stock solutions composed of commonly available chemical reagents. The properties simulated included acidity, nitrate concentration, quantities and composition of undissolved solids, density, and vicosity of HLLW at various degrees of evaporation. Limits of concentration by evaporation and stability during storage were studied. Steeling rates and particle sizes of the undissolved solids were estimated for stored HLLW. While considerable effort was expended to closely simulate actual reprocessing wastes, these data should be confirmed under actual process conditions.

2120 INHERENTLY SAFE AIRCOOLING FOR THE STORAGE OF SELF-HEATING CONFIGURATIONS OF RADIONUCLIDES. Hame, W.; Klein, D.; Pirk, H. (Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.)). Atomkernenergie/Kerntechnik ; 35: No. 2, 111-122(1980). (In German).

NUKEM developed a technical concept of a radionuclide storage facility based on aircooling, which provides that - the radionuclides, i.e. spent fuel elements, are tightly canned in steel canisters - the canned elements are put into individual cooling channels, which form the storage rack within the storage cell - the produced heat is removed from the surface of the canisters through free convection. This cooling concept shows the following advantages: - The cooling is inherently safe, as the driving force of the coolant is reliably supplied by the heat production of the system to be cooled. - The system is self-controlled and self-regulated because of the physically based correlation of heat production, heat transfer coefficients and air flow resistances.

2121 Compte rendu d'une reunion de travail sur l'utisation des materiaux argileux pour l'isolement des dechets radioactifs. (PROCEEDINGS OF THE WORKSHOP ON THE USE OF ARGILLACEOUS MATERIALS FOR THE ISOLATION OF RADIOACTIVE WASTE). Paris, France: OECD (1980). 281p. (In English and French).

From NEA Workshop on the use of argillaceous materials for the isolation of radioactive waste; Paris, France (10 - 12 Sep 1979).

Argillaceous materials are characterized by favourable properties for radioactive waste isolation. In particular their low permeability and high sorption capacity make them a very effective barrier. Approaches to the utilisation of argillaceous materials for waste isolation are emplacement of the waste in a shale or claystone formation on land or in argillaceous sediments under the ocean floor. It is also feasible to use clays or a mixture of clay and sand as an artificial barrier around waste containers placed in cavities excavated in a different geological formation. Finally, clays could be used in different ways ro reduce the permeability of other formations or for backfilling, plugging and sealing of cavities, shafts, boreholes and fractures. There are still some unknowns in relation to the use of argillaceous materials, particularly for the containment of heat generating wastes. Additional difficulties exist for the in situ measurement of permeability and radionuclides migration. These proceedings represent a record of the papers and discussions at this meeting organised by the NEA.

2125 DEVELOPMENT OF REGULATORY PROCEDURES FOR THE DISPOSAL OF SOLID RADIOACTIVE WASTE IN DEEP, CONTINENTAL FORMATIONS. Vienna, Austria; IAEA (1980). 26p.

For the disposal of radioactive waste, and in particular, of the high-level and alpha-bearing waste from the nuclear fuel cycle, the most favoured solution in most countries is disposal in deep, continental geological formations. Commitment to this disposal method involves a number of issues related to the various stages of the disposal programme which must be addressed through some reasoned decision-making process. Most countries are opting for regulating such a programme through licensing actions by a body whose purpose is to review, certify and ensure the safety of all the stages of the disposal programme. This regulatory body may either be one single national authority or a system of authorities

designated by the government. The key to such regulation is the set of procedures, determined in advance, for the actions of the implementing organization, the review by the regulatory body and the involvement of other parties. This document concerns itself with the procedures which could logically be followed in reaching a set of rational decisions by the regulatory body. Care in the preparation and application of such procedures is an important element in the acceptability of the concept, the site and the other aspects of the disposal programme. The intention of this document is to give guidance as to what issues should be addressed in the licensing review, what decision points are important, and what guidance should be given to the applicant by the regulatory body in the course of the licensing actions. The procedures are keyed to be designed according to the logical steps involved in the development and operation of the repository. However, the document does not pretend to give guidance regarding the optimal interactions between the implementing organization and the regulatory body. This document is oriented to the disposal of solid radioactive waste in deep, continental geological formations using mining techniques.

2126 HAZARDOUS HIGH-LEVEL RADIOACTIVE WASTE DISPOSAL IN GEOLOGIC FORMATIONS. Neiheisel, J.; Holcomb, W.F. (Environmental Protection Agency, Washington, DC). pp 183-202 of Toxic and hazardous waste disposal. Volume 3. Impact of legislation and implementation on disposal management practices. Pojasek, R.B. (ed.). Ann Arbor, MI: Ann Arbor Science Publishers, Inc. (1980).

From 177. national meeting of the American Chemical Society; Honolulu, HI, USA (1 Apr 1979).

An overview is presented of the characteristics of the major candidate lithologies for high-level radioactive waste disposal in deep geologic formations. Salt (domes or bedded strata), basalt, granite and shale are candidate lithologies for the first high-level radioactive waste continental repository in the US, which is estimated to be constructed sometime between 1988 and 1995 in a deep geologic formation. The site selection will undoubtedly be inland from the west coast global plate boundary and within tectonically stable regions free of volcanic or excess earthquake activity, and avoiding regions apt to experience secular changes within the next million years. The lithologic candidates vary widely in intrinsic properties, although low permeability to avoid groundwater transport of radionuclides from the repository is similarily minimal for all potential lithologies. The inherent dryness of thick, massive salt domes in the most stable portion of the North American continent and the high plasticity, high thermal conductivities, and strain hardening capabilities of the salt domes are attractive features for a repository. Basalt and granite are the candidate lithologies which have greater mechanical strength and higher sorption capabilities than salt, but are otherwise of lower thermal conductivity, poorer plasticity, and higher mining costs. They are also fracture prone and have no self-sealing properties. Shale is widespread on the continent and combines properties of high plasticity and high sorption as attractive features for the repository. However, the effects of thermal loading are not understood, and some of the clay minerals (montmorillonite) release loosely bound waters at relatively low temperatures (100°C); the resulting fracturing could increase permeability.

2127 (ORNL-tr--4673) GEOLOGICAL ASPECTS OF WEAK SPOT ANALYSIS FOR THE FEDERAL REPOSITORY FOR RADIOACTIVE WASTES AT THE GORLEBEN SITE. Rischbieter, F.; Hintz, R.A.; Michelmann, K.; Schaepermeir, E. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.)). 1980. Translation of BF-R-63.861-2, January 1980 112p. NTIS, PC A06/MF A01.

This study deals with the geological aspects of the final disposal of radioactive wastes in the planned federal repository in the Gorleben salt dome. Because of halite's excellent leaktightness properties, which due to its flowing power are retained even during high plastic deformation, the salt dome assumes the function of a barrier against the escape of radioactive materials from the final repository products to the biosphere. This barrier must remain functional over long periods of time due to the long life of the actinides. The study treats the effects of conceivable events which could disturb the integrity of the salt dome and thus lead to contact between the final repository and the groundwater. The conceivable events in this sense which were identified and investigated include: inherent dynamics of the salt dome (diapirism) and possible reactivation through epirogenous effects (lifting or sinking of underground areas); mining from deposits below the salt dome, and heating of the salt dome by the final repository; thermomechanical stress on halite by the heat evolution of the final repository; erosion; natural external mechanical effects (earthquakes, vulcanism, and meteorites); and boring into the salt dome. The mined cavity of the mined final repository is not the subject of these investigations. The investigations lead to the conclusion that the release of final repository products can be excluded with great probability.

2128 REVIEW OF THE CONTINUED SUITABILITY OF THE DUMPING SITE FOR RADIOACTIVE WASTE IN THE NORTH-EAST ATLANTIC. Paris, France: OECD (1980). 107p.

The group of experts which reviewed the North-East Atlantic dumping site concluded that: (1) the physical, chemical, and biological properties of the site comply with the requirements for a site considered suitable for dumping packaged radioactive waste at sea as laid down by IAEA recommendations; (2) there is no scientific evidence to support that conditions at this site would lead to doses per unit rate of release of specific radionuclides significantly greater than those which could be calculated using the generic models described by the IAEA; (3) the calculated dose rates to the most exposed critical group due to recent average rates of dumping are no more than 0.1% of the relevant ICRP dose limits; (4) the actual doses received will probably be lower than those so calculated; (5) there is a need to develop a site-specific model of the transfer of radionuclides, from the dump area to human populations; (6) it is recommended that a review of the scientific basis for making the assessment and of the growing body of knowledge about radionuclide transport processes in the North-East Atlantic be undertaken before the normal 5 years; (6) the site would be suitable for the receipt of packaged radioactive wastes during the next 5 years at annual rates comparable to those reached in the past. (DP)

2129 GEOLOGICAL DISPOSAL AND THE TAXPAYER: THE PROBLEM OF THE EXPERTS. Mawson, C.A. (Atomic Energy of Canada Ltd., Ottawa, Ontario). pp 109-114 of Management of environment. Patel, B. (ed.). New Delhi,

India; Wiley Eastern Ltd. (1980).
Geological disposal of high level wastes such as plutonium and uranium ore tailing is discussed. The author feels such disposal is a waste of the taxpayer's money and suggests technical experts should stick to their own field of expertise in making pronouncements about the hazards of radoactive wastes. (DAD)

2130 ENCAPSULATING SPENT NUCLEAR FUEL. Fleischer, L.R.; Gunasekaran, M. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). British Patent 2,023,056/A/. 28 Dec 1979. 11p.
A system is described for encapsulating spent nuclear fuel discharged from nuclear reactors in the form of rods or multi-rod assemblies. The rods are completely and contiguously enclosed in concrete in which metallic fibres are incorporated to increase thermal conductivity and polymers to decrease fluid permeability. This technique provides the advantage of acceptable long-term stability for storage over the conventional underwater storage method. Examples are given of suitable concrete compositions.

2131 (PNL-TR--378) STATEMENT BY DR. ERNST ALBRECHT ON THE PROVINCIAL GOVERNMENT'S POSITION REGARDING THE PLANNED NUCLEAR WASTE DISPOSAL FACILITY (NEZ) IN GORLEBEN. PART II. POSITION TAKEN BY THE FEDERAL GOVERNMENT REGARDING THE POLICY STATEMENT BY THE NIEDERSACHSEN PROVINCIAL GOVERNMENT ON THE PLANNED NUCLEAR WASTE DISPOSAL FACILITY IN GORLEBEN. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 6 Dec 1979. Translation source information not available 15p. Dep. NTIS, PC A02/MF A01.
Questions regarding the safety and policy aspects of the proposed DWK waste disposal center in Gorleben are discussed. The position of the Niedersachsen provincial government is that the center should not be built; instead, the salt formations should be tested and interim fuel storage facilities provided. The response of the Federal government to the Niedersachsen statement is also listed.

2132 UNDERGROUND WASTE DISPOSAL; THE TIME TO GO AHEAD. Fitzpatrick, J. (Electrowatt Engineering Services Ltd., London (UK)). Nuclear Engineering International ; 24: No. 293, 13-15(Dec 1979).
The findings and status of several national and international research programmes were recently reported at an International Symposium on the Underground Disposal of Radioactive Wastes. A brief review is presented of the situation. Attention is drawn to the flexibility in design emerging to allow for differences in fuel cycle policy, and to the bias of countries towards research into geologic host formations available within their own borders. International co-operation in this field is good. Collaborative work in the nine Community countries is divided between them by geologic type. Disposal of low and medium active waste is discussed. Research into salt domes, crystalline rods, and argillaceous sediments is briefly summarised. Aspects of underground disposal of high-level waste and radionuclide migration are also considered.

2133 RADIONUCLIDE REDISTRIBUTION MECHANISMS AT THE 2800-M ATLANTIC NUCLEAR WASTE DISPOSAL SITE. Dayal, R.; Okubo, A.; Duedall, I.W.; Ramamoorthy, A. (State Univ of NY, Stony Brook). Deep-Sea Research, Part A: Oceanographic Research papers ; 26: No. 12A, 1329-1345(Dec 1979).
As part of an investigation of the abandoned 2800-m Atlantic nuclear waste disposal site, several box cores were taken at the site in August, 1976. In addition, a submersible was used to locate and examine waste canisters and to sample surrounding sediment. Results show that both /sup 137/Cs and /sup 314/Cs were present in significant concentrations in sediment sampled close to a waste canister. The presence, concentration levels, and distribution patterns of the cesium isotopes indicate that the waste canister is the source of the observed radionuclides and that these elevated radionuclide concentration levels are highly localized around the canister. Considering the fine-fraction mineralogy and exchange capacity of sediment and the adsorption characteristics of the cesium ion, it appears that sediment at the study site serves as a barrier to radionuclide migration. Refs.

2134 MEASURING THE HYDROLYTIC RESISTANCE OF SOLIDIFICATION PRODUCTS. Santarova, M.; Vojtech, O.; Halova, J. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Nukleon ; No. 4, 10-20(Dec 1979). (In Czech).
Hydrolytic resistance was determined using standard methods known in the glass and ceramics industries. Selective nuclide leaching was determined using the method recommended by the IAEA. Studied were the phosphate system (fission products - corrosion products - phosphoric acid) and the same system with $NaNO_3$ added in a wide range of starting materials concentrations and chemicals used. The rates are given of fixation product dissolution and of the depth of corrosion (cm/week) corresponding to the selective extract of Fe, Na, Cs, Sr, Mo for samples prepared at different fixation temperatures (900, 1100, 1200 degC). The concentration of elements in the extract was measured by atomic absorption spectroscopy. The results show that selective leaching of selected elements is affected by sample macro- and microinhomogeneities while the measurement of the total mass reduction may only be affected by the presence of macroinhomogeneities. Time dependences are shown of Cs and Sr leaching from phosphate glass as are the relations used for the calculation of the element leached fraction. The results of a mathematical analysis showed that the use of mathematical relations based on the principal mechanisms of the dissolution of more complex structures was justified.

2135 GEOCHEMISTRY OF RADIOACTIVE WASTE DISPOSAL. Bird, G.W. (Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). Geoscience Canada ; 6: No. 4, 199-204(Dec 1979).
Safe, permanent disposal of radioactive wastes requires isolation of a number of elements including Se, Tc, I, Sr, Cs, Pd, U, Np, Pu and Cm from the environment for a long period of time. The aquatic chemistry of these elements ranges from simple anionic (I^-,IO_3^-) and cationic (Cs^+,Sr^{++}) forms to multivalent hydrolyzed complexes which can be anionic or cationic ($Pu(OH)_2^+$,$Pu(OH)_3^+$, $PuO_2(CO_3)(OH)^-$,PuO_2Cl^-,etc.) depending on the chemical environment. The parameters which can affect repository safety are rate of access and composition of groundwater, stability of the waste container, stability of the waste form, rock-water-waste interactons, and dilution and dispersion as the waste moves away from the repository site. Our overall research program on radioactive waste disposal includes

corrosion studies of containment systems, hydrothermal stability of various waste forms, and geochemical behaviour of various nuclides including solubilities, redox equilibria, hydrolysis, colloid fomation and transport ion exchange equilibria and adsorption on mineral surfaces and irreversible precipitation reactions. This paper discusses the geochemistry of I, Se, Tc, Cs, Sr and the actinide elements and potential mechanisms by which the mobility could be retarded if necessary.

2136 USE OF GEOPHYSICS IN THE CANADIAN RADIOACTVE WASTE DISPOSAL PROGRAM, WITH EXAMPLES FROM THE CHALK RIVER RESEARCH AREA. Dence, M.R. (Department of Energy, Mines and Resources, Ottawa, Ontario (Canada). Earth Physics Branch); Scott, W.J. (Geological Survey of Canada, Ottawa, Ontario). Geoscience Canada ; 6: No. 4, 190-194(Dec 1979).

A program of integrated geophysical surveys has been developed within the Department of Energy, Mines and Resources in response to requests from Atomic Energy of Canada Ltd. for assistance in verifying the concept of deep underground storage of radioactive waste and in selecting suitable sites for a disposal vault. Both well established and innovative airborne, ground and borehole techniques are being tested for their usefulness in determining overall structure, lithological variations, rock quality, the character of specific fracture systems and long term stability of selected areas. Preliminary results from the Chalk River Nuclear Laboratories property illustrate the use of electrical, seismic and other methods in analysing complex fracture systems.

2137 PTB PROJECTS FOR THE SAFEGUARDING AND FINAL STORAGE OF RADIOACTIVE WASTE. Viehl, E. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.)). Bergbau ; 30: No. 12, 692-696(Dec 1979). (In German).

In the Federal Republic of Germany, Physikalisch-Technische Bundesanstalt (PTB) is responsible for the state-owned facilities for safeguarding and ultimate storage of radioactive waste. The planning concept incorporates not only the final storage site in a salt dome, but also storage facilities for vitrified high-activity waste and krypton and a facility where tritium-containing water is to be pressed into suitable geological formations. The site-independent plans for the final storage facility (shaft systems, storage techniques, ventilation, above-ground installations) are briefly described, and the state of the work on site exploration (Gorleben analysis programme, deep drilling) is reviewed. According to the present time schedule, it is expected that storage of low- and medium-activity waste can be started by about 1994.

2138 (UCRL-Trans--11550) FLOW PROPERTIES OF ROCK SALT: STUDY ON THE EXTRAPOLATION OF TEST RESULTS TO LONG TIME PERIODS. Hunsche, U. (Bundesanstalt fuer Geowissenschaften und Rohstoffe, Hannover (Germany, F.R.)). Dec 1979. Translation of 2nd interim report on research project SR 138, February 16, 1979 45p. Dep. NTIS, PC A03/MF A01.

This report reviews the status of knowledge on temperature-dependent flow properties of polycrystalline rock salt as now represented on the basis of theoretical and experimental studies. Various deformation mechanisms are active in steady-state creep. One of those mechanisms dominates in each of the different stress regions and thus largely determines the flow properties. Consequently, different deformation laws apply under different stress conditions (epsilon., sigma, T). Dislocation slip is active at high differential stresses above ca. 160 bar, but is not significant for long-duration flow. The most important mechanism in this regard is dislocation climb, which dominates at differential stresses of ca. 5 bar to ca. 160 bar. Theoretical and experimental studies in this region lead to a deformation law of the form: epsilon./sub s/ = A . exp (Q/sub eff//RT) . sigma/sup n/. Below ca. 5 bar, diffusion creep and grain-boundary slip with constants which depend on grain size and temperature may be the governing deformation mechanisms. All studies indicate that the magnitude of the hydrostatic pressure has only a slight influence on the deformation rate.

2139 DIAPHRAGM WALLS TO HOLD WINDSCALE LEAK. Hayward, D. New Civil Engineer ; No. 372, 23-25(29 Nov 1979).

A description is given of the concrete storage silo at the Windscale fuel reprocessing plant of British Nuclear Fuels Limited. The silos are used for the underwater storage of strips of swarf from the magnesium alloy casing of spent magnox fuel elements. The original silo has been leaking radioactive liquid: attempts to plug the leak and plans to contain it by building diaphragm walls are discussed. Improved designs for new silos are described.

2140 INTERNATIONAL RESEARCH PROGRAMME FOR DISPOSAL OF RADIOACTIVE WASTE. Schweizerische Bauzeitung ; 97: No. 46, 943-944(15 Nov 1979). (In German).

A worked out iron ore mine in Stripa (Sweden), 350 m deep in granite, is being investigated as a suitable place for storage of radioactive waste. Exhaustive measurements are in progress to determine the effect on the granite, including determination of the mechanical stresses caused by the heat generated, and the consequences of any water which may seep through the granite. Plans are drawn up for the installation of an underground laboratory in the rock of the Grimsel pass (Switzerland). Drilling will commence in January 1980.

2141 PROCESS FOR DISPOSAL OF AQUEOUS SOLUTIONS CONTAINING RADIOACTIVE ISOTOPES. Colombo, P.; Neilson, R.M. Jr.; Becker, W.W. (to Dept. of Energy). US Patent 4,174,293. 13 Nov 1979. Filed date 12 Oct 1977. 8p.

A process for disposing of radioactive aqueous waste solutions whereby the waste solution is utilized as the water of hydration to hydrate densified powdered portland cement in a leakproof container; said waste solution being dispersed without mechanical inter-mixing in situ in said bulk cement, thereafter the hydrated cement body is impregnated with a mixture of a monomer and polymerization catalyst to form polymer throughout the cement body. The entire process being carried out while maintaining the temperature of the components during the process at a temperature below 99°C. The container containing the solid polymer-impregnated body is thereafter stored at a radioactive waste storage dump such as an underground storage dump. (3 figures)

2142 INVESTIGATION OF UNDERGROUND CAVERNS. Nolte, E.; Lichter, D. (to Prakla-Seismos G.m.b.H., Hannover (Germany, F.R.)). German(FRG) Patent 2,807,551/A/. 8 Nov 1979. 22p. (In German).

By means of a probe the condition of the

boundary surfaces, other parameters, or the contents of the caverns, e.g. in salt rock may be investigated for ultimate storage of radioactive waste. The probe is hanging on a measuring cable designed as a suspending wire leading to a driving and remote-control mechanism and to evaluation units standing on the surface. At the lower end of the probe an extension arm is hinged as supporting arm for the testing equipment. The supporting arm can be rotated about the probe axis. As testing equipment e.g. ultrasonic probes, lasers, temperature and moisture sensors may be used.

2143 NEED TO EVALUATE WASTE DISPOSAL OPTIONS. Nuclear Engineering International ; 24: No. 292, 25-26(Nov 1979).

A summary is presented of a review of the British Government's White Paper (Command 884) on the control of radioactive wastes which was published in 1959. The review, by an Expert Group of independent scientists and representatives of the nuclear industry was initiated in 1976 to see which principles in the management of waste from nuclear power plants and its associated fuel cycle needed changing in the light of new knowledge and new technology. Amongst the conclusions drawn it is considered that exposure of the population to radiation from nuclear waste should be reduced to levels as low as reasonably achievable, although existing standard limits are satisfactory, and that more work is urgently required on geologic and sea-bed disposal to meet the demand in the next years when there will be waste from decommissioned plants in addition to that from the fuel cycle.

2144 UNDERGROUND DISPOSAL OF RADIOACTIVE WASTES. Knight, M.J. (Univ of New South Wales, Australia). Search. Science, Technology and Society ; 10: No. 11, 388-393(Nov 1979).

Methods proposed for the underground disposal of radioactive wastes are outlined. R and D programs conducted to determine proper rock type, geological barriers, and repository designs for high level radioactive waste disposal are surveyed. Standards that are being developed to guide the selection of radioactive waste disposal sites are considered. Findings of the 1979 Helsinki symposium on radioactive waste disposal methods are reviewed. (2 diagrams, 1 map, 1 photo, 5 references, 5 tables)

2145 ATOMIC WASTE DISPOSAL - THE SWISS WAY. ENVIRONMENTAL AND LANDSCAPE PROTECTION ARE MANDATORY. Weber, R. VDI (Verein Deutscher Ingenieure) Nachrichten ; 33: No. 46, 4(Nov 1979). (In German).

For two decades, preparative work has been done on the problem of radioactive waste disposal in Switzerland. In May last year, the Swiss citizens agreed on the amendment to their atomic energy law. According to this amendment, procedures of atomic waste must prove until December 31, 1985, that they can store their waste safely. Otherwise, the licences for operation of the five Swiss nuclear power plants would become invalid. Therefore, nuclear waste producers - including the Federal government itself - have alloted funds of 200 million sfr to an extensive research programme on a technically mature final storage project.

2146 WHAT TO DO WITH THE RADIOACTIVE WASTE.. Johansson, T.B. (Univ. of Lund, Sweden); Steen, P. Bulletin; 38-42(Nov 1979).

Before anymore nuclear reactors can be loaded with fuel in Sweden, the "Stipulation Act" states that the reactor operator must: (1) present a contract which provides for the reporcessing of spent fuel and show how and where radioactive wastes from processing will be deposited, and (2.) Show how and where the spent fuel can be finally stored with safety. The method of compliance of the nuclear industry in Sweden to these regulations are presented.

2147 RADIOACTIVE WASTE BACKUP THREATENS RESEARCH. Marshall, E. Science ; 206: 431-433(26 Oct 1979).

Problems in the disposal of low-level radioactive wastes are discussed. Due to the closing of the disposal site at Hanford, Washington, radioactive wastes from medical research at various universities and medical centers around the country have begun to stockpile. The reason given for the closing is that the wastes had been carelessly packaged.

2148 ARE PORTIONS OF THE URALS REALLY CONTAMINATED. Stratton, W. (Los Alamos Scientific Lab., NM); Stillman, D.; Barr, S.; Agnew, H. Science ; 206: 423-425(26 Oct 1979).

Rumors that radiation was released by accident in the Ural Mountain area received supporting testimony from Soviet refugee and biologist Zhores Medvedev, who reported that a large area was contaminated and many persons injured. The biologist's search of Soviet open literature for clues of soil and water contamination pinpointed the affected areas on the eastern slope of the Urals at the site of early military plutonium production reactors. The nature of the contamination led him to place the source of contamination as buried radioactive waste material which exploded or erupted. The authors challenge Medvedev's interpretation and suggest the contamination resulted, instead, from the localized fallout of Soviet atmospheric weapons tests. They cite the lack of plutonium contamination, weather and wind patterns, and the literature on atmospheric testing to support their conclusion. 10 references. (DCK)

2149 URANIUM WASTE AS FERTILIZER. Chemical Week ; 125: No. 17, 43-44(24 Oct 1979).

To determine if the ammonium nitrate byproduct of nuclear fuel production can be used safely in agriculture, cattle are being grazed on land treated with liquid waste (raffinate) from Kerr-McGee Nuclear Corp.'s Sequoyah, Okla., uranium enrichment facility. The cattle will be slaughtered some time in November 1979, and tissue, blood, and other specimens from the animals will be tested for traces of radium and heavy metals. If Kerr-McGee cannot gain permission to use treated raffinate in agriculture, other waste disposal alternatives will have to be considered. (1 photo)

2150 COAXIAL CAVITY FOR MEASURING LEVEL OF LIQUID IN A CONTAINER. Booman, G.L.; Phelps, F.R. (to Dept. of Energy). US Patent 4,170,135. 9 Oct 1979. Filed date 26 Sep 1978. 8p.

PAT-APPL-945,926.

A method and means for measuring the level of a liquid in a container are described. A coaxial cavity having a perforated outer conductor is partially submerged in the liquid in the container wherein the liquid enters and terminates the annular region of the coaxial cavity. The fundamental resonant frequency of

the portion of the coaxial cavity which does not contain liquid is determined experimentally and is used to calculate the length of the liquid-free portion of the coaxial cavity and thereby the level of liquid in the container. 15 claims.

2151 BURYING BRITAIN'S RADIOACTIVE WASTE. THE GEOLOGICAL AREAS UNDER INVESTIGATION. Mather, J.D.; Greenwood, D.A.; Greenwood, P.B. (Institute of Geological Sciences, London (UK)). Nature (London) ; 281: No. 5730, 332-334(4 Oct 1979).

A review is given of the major research effort being undertaken in the United Kingdom into the feasibility of the disposal of solidified, highly-radioactive heat-emitting wastes to geological formations. The present phase of the programme relates to the exploration of sites within the 127 different areas containing potentially suitable host rocks which have been identified by the application of relevant geological criteria. A map indicating these areas is presented. During this phase no radioactive wastes will be used. It is felt that the feasibility of the disposal of high-level radioactive wastes within the geological framework of the United Kingdom still remains to be demonstrated. The immediate need is for comprehensive site-specific field data from a range of potentially appropriate geological environments both to test the criteria on which these environments were chosen and to provide a data base from which potential disposal sites may be identified.

2152 RADIOACTIVE WASTE: A TECHNICAL SOLUTION. Abbotts, J. Bulletin of the Atomic Scientists ; 35: No. 8, 12-18(Oct 1979).

Commentary:Management of nuclear wastes has become much more than a problem of technology. Difficulties with institutional problems, political insensitivity to citizen participation in the nuclear waste disposal issue, and other non-technical issues have served to cancel nuclear waste projects long before any technological solution can be demonstrated. Federal governments' abortive efforts to establish a waste storage policy are chronicled. Increased citizen involvement in nuclear waste facility siting is recommended. (1 drawing, 23 references)

2153 IMMOBILIZATION OF KRYPTON BY INCORPORATION INTO A METALLIC MATRIX BY COMBINED ION IMPLANTATION AND SPUTTERING. Whitmell, D.S.; Nelson, R.S.; Williamson, R.; Smith, M.J.S. (UKAEA, Harwell. Atomic Energy Research Establishment). Nuclear Energy (Formerly Nuclear Energy Engineer) ; 18: No. 5, 349-352(Oct 1979).

A brief review of the technique of immobilizing krypton in a metallic matrix by combined ion implantation and sputtering is given. The principles of the process are discussed together with a description of the plant envisaged for the immobilization of radioactive krypton arising from the reprocessing of nuclear fuel. Preliminary results of the immobilization of inactive krypton in a copper matrix, obtained with a laboratory scale module, are described, together with a summary of the current work programme which includes the construction of a half-scale inactive pilot plant.

2154 INTERIM STORAGE DEVICE FOR SELF-HEATING, HIGHLY DANGEROUS MATERIALS. Schmidt, K. PTB Mitteilungen. Amts- und Mitteilungsblatt der Physikalisch-Technischen Bundesanstalt ; 89: No. 5, 341-343(Oct 1979). (In German).

For interim storage of irradiated fuel elements or vitrified high active wastes there are at present different concepts in discussion. These concepts are explained in a survey.

2155 FINAL DISPOSAL OF RADIOACTIVE WASTES. Merz, E. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)). Naturwissenschaften ; 66: No. 10, 517-518(Oct 1979). (In German).

2156 NUCLEAR WASTE: A PROBLEM THAT MUST BE SOLVED. Glenn, J.H. Jr. (U.S. Senate). Public Utilities Fortnightly ; 104: No. 7, 23-25(27 Sep 1979).

Sen. Glenn briefly appraises the problem of the disposal of nuclear wastes generated from power production. It has been assumed that the waste problem would be solved, but after 30 years of nuclear research and development, serious gaps exist in our scientific capabilities to dispose of these highly toxic and long-lived materials. Sen. Glenn sees at least three hurdles to be overcome: the scientific feasibility of deep geologic storage has yet to be demonstrated; there is at present no national plan for the disposal of radioactive wastes; and provision must be made for an integrated Federal effort with state, local, and public participation. Glenn and Sen. Charles H. Percy introduced the Nuclear Waste Management Reorganization Act of 1979 (S 742) to deal with the organizational aspects of the nuclear waste problem. The bill proposes to create a Nuclear Waste Coordinating Committee consisting of representatives that have jurisdiction over various segments of the nuclear waste management process. It also establishes a Nuclear Waste Management Planning Council composed of state and local elected officials and members of the public; and the third thrust of the bill pertains to Federal-state interaction and the process by which permanent nuclear waste repositories is sited and constructed. (MCW)

2157 SITUATION AT WEST VALLEY. Cohen, B.L. (Univ. of Pittsburgh, PA). Public Utilities Fortnightly ; 104: No. 7, 26-32(27 Sep 1979).

Spent fuel from nuclear reactors can be subjected to reprocessing - which means that it is put through chemical processes which remove such usables as uranium and plutonium, leaving some unusable high-level radioactive wastes. The only privately owned reprocessing plant in the United States, located in a rural area in western New York state, operated from 1966 until 1972. After that time the project became uneconomical, due to regulatory and other developments described in this article. While the project was abandoned by its owners, it remains the center of vigorous controversy and debate. This is because of the continuing presence of radioactive wastes, both high and low level, and heavy radioactive contamination of the plant itself. The article reviews the origins of this problem and the alternatives for its ultimate disposition. The author stresses that a solution is a national and not a strictly local obligation.

2158 STORE FOR NUCLEAR REACTOR FUEL ELEMENTS. Peehs, M. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.)); Deutsches

Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,823,376/B/. 13 Sep 1979. 8p. (In German).

The spent fuel elements are preserved in a pond or dry store. The removal of post-fission heat is carried out via heat removal pipes, which are connected to natural draught chimneys through the concrete wall of the pond or dry store. There is a good conducting connection of the heat removal pipes and the storage boxes, which is improved by filling the space between the fuel elements and the storage box with granular carbon.

2159 HIGHLY COMPACTED SODIUM BENTONITE FOR ISOLATING ROCK-DEPOSITED RADIOACTIVE WASTE PRODUCTS. Pusch, R. (Univ. of Lulea, Sweden). Nuclear Technology ; 45: No. 2, 153-157(Sep 1979).

Sodium saturated bentonite clay compacted to a high density is a very efficient isolation for preventing radiotoxic nuclides from deeply buried canisters with radioactive wastes from reaching the biosphere. The main function of the bentonite, which is applied in the form of blocks between the rock and the canisters in large boreholes, is to provide a practically impervious barrier. The bentonite blocks take up water and swell so that they completely fill the space between rock and canisters. The swelling potential, which is permanent, makes the bentonite self-sealing. This means that rock joints, which may be opened, are sealed by extruding bentonite.

2160 REDUCTION OF RADON FLUX FROM URANIUM TAILINGS. Overmyer, R.F.; Rogers, V.C.; Jensen, C.M. (Ford, Bacon and Davis Utah Inc). Mining Congress Journal ; 65: No. 9, 21-25(Sep 1979).

Because the inhalation of radon daughters from uranium tailings causes an increased risk of lung cancer, NRC has issued performance objectives for uranium mill tailings treatment. The performance objectives mandate a reduction of the radon flux from the tailings to twice the background flux in the surrounding environs. Experiments designed to measure the effectiveness of various tailing cover materials in reducing radon diffusion are described. A cost optimization study on a site-specific basis is required to select the most overall cost-effective method of flux reduction. (3 diagrams, 3 graphs, 2 references, 1 table)

2161 CHARACTERIZATION OF POLLUCITE AS A MATERIAL FOR LONG-TERM STORAGE OF CESIUM-137. Strachan, D.M.; Schulz, W.W. (Rockwell Hanford Operations, Richland, WA). American Ceramic Society Bulletin ; 58: No. 9, 865-868(Sep 1979).

From 30. Pacific Coast regional meeting of the Amercian Ceramic Society; Los Angeles, CA, USA (1 Nov 1977).

Pollucite ($Cs_2O.Al_2O_3.4SiO_2$) may be an acceptable material for the long-term storage of purified $^{137}CsCl$. Pollucite is made at near theoretical yields when CsCl (or any cesium salt) reacts at approx. = 970°K with a montmorillonite-containing clay. Pollucite dissolves in deionized water at rates < 2 x 10^{-7} kg/(m^2 d) based on cesium. Microstructural analyses showed that cesium reacts with montmorillonite clay to form ill-defined pollucite crystals containing low concentrations of the impurities found in the clay. Although further work needs to be done, pollucite is considered to be an excellent materials for the long-term storage of ^{137}Cs.

2162 HIGH-LEVEL ACTIVE WASTE DISPOSAL. Heseltine, M. (Department of the Environment, London (UK)). Atom (London) ; No. 275, 240-241(Sep 1979).

A statement made by Mr. Michael Heseltine, Secretary of State for the Environment, on 24 July 1979 setting out the Government's views on research into the disposal of high-level radioactive waste is reproduced. The statement dealt specifically with the geological research programme involving the drilling of test boreholes in some areas of the UK. The main elements in the responsibilities assumed by the Secretaries of State for the Environment, for Scotland and for Wales in this matter are set out and the role of the Radioactive Waste Management Advisory Committee mentioned.

2163 FINDING A SITE TO STORE SPENT FUEL IN THE PACIFIC BASIN. Selvaduray, G.S.; Goldstein, M.K.; Anderson, R.N. (San Jose State Univ., CA (USA)). Nuclear Engineering International ; 24: No. 290, 44-47(Sep 1979).

How can one decide on a site to store spent LWR fuel, after the Presidential embargo on reprocessing. Palmyra Island is identified as the best site for the nations bordering the Pacific to store spent fuel. The quantitative methods used to reach this decision are outlined.

2164 STORAGE TIME EVALUATION FOR ACTIVE SOLID WASTE PRODUCED IN HOSPITALS. Reggio, M. (Istituti Ospitalieri, Verona (Italy). Servizio Fisica Sanitaria). Health Physics ; 37: No. 3, 412-414(Sep 1979).

The use of radioisotopes in hospitals gives rise to solid radioactive waste consisting of objects such as gloves, and syringes that are contaminated to different extents and with many different isotopes. The activity level of such wastes is reduced to prescribed levels by storage before disposal into the environment. A method is given for calculating the necessary storage time. It is based on the types and activities of the radionuclides used and the maximum permissible concentration in the dispersion medium and/or the maximum disposable activity in a year for each nuclide. An example is given of the use of the method, where disposal is by incineration.

2165 DEFORMATION OF A JOINTED ROCK MASS. Stephansson, O.; Baeckblom, G. (Tekniska Hoegskolan, Luleaa (Sweden)); Groth, T.; Jonasson, P. (Kungliga Tekniska Hoegskolan, Stockholm (Sweden)). Geologiska Foereningens i Stockholm Foerhandlingar ; 100: No. 3, 287-294(Sep 1979).

The finite-element method and the discrete-block method have been used to study the deformational behaviour of a jointed rock mass subjected to simple shear displacement. Blocks in models with large sizes of block make contact at few points which cause large openings of joints and high stress concentrations in the blocks and surrounding joints. The introduction of more joints into the models evens out the forces, reduces the stresses and causes a gentle type of deformation. From this study, we draw the practical conclusion that joints in rock plinths are eligible for the storage of radio-active waste, if we take into account the effect of simple shear displacement from faulting.

2166 SAFETY ABOVE EVERYTHING. Rometsch, R. Electro-Revue ; 71: No. 34, 876-879(29 Aug

1979). (In French, German).
The great majority of waste products from a nuclear reactor have an ephemeral life, about one third have half-lives of between one hour and thirty years, and some e.g. plutonium 239 with a half-life of 24000 years, are active for a long time. In particular, disposal or storage of waste with long half-lives is a problem, and the worries and doubts of the population and of scientific sceptics concerning this are to be seriously considered. The author considers that in Switzerland radioactive waste can be stored in such a way that its effect on present and future generations will be negligible. (G.P.).

2167 LEAKAGE DETECTION SYSTEM FOR RADIOACTIVE WASTE STORAGE TANKS. Woods, W.W.; Eul, W.A. (to The Boeing Co.). US Patent 4,166,244. 28 Aug 1979. Filed date 19 Nov 1976. 12p.
The patent describes a combination of elements for detecting leakage of electrically conductive fluids from tanks, including a reference electrode, an AC generator connected between the tank and the reference electrode, and one or more sensing electrodes positioned between the tank and the reference electrode. The storage tank and reference electrode are in contact with the ground. When the AC generator is energized, current flows in the circuit, and creates an electric field in the ground between the tank and the reference electrode. The sensing electrodes are positioned so that they are within the electric field when the AC generator is energized. An electric potential measuring device, such as a voltmeter, is used to measure the electric potential at the sensing electrodes relative to the tank. A significant change in the electric potential at any one or more of the sensing electrodes is an indication that a leak has occurred in the tank.

2168 PROCESS FOR INTRODUCING RADIOACTIVE ARTICLES INTO A TRANSPORT AND/OR STORAGE CONTAINER AND TRANSPORTING AND/OR STORING THE CONTAINER AND LATER EXTRACTION OF THE ARTICLE FROM THE CONTAINER, AND CONTAINER FOR TRANSPORTING AND/OR STORING RADIOACTIVE ARTICLES. Vox, A.J. (to Vox lumatic G.m.b.H., Ostfildern (Germany, F.R.); Amtrust A.G., Luzern (Switzerland)). German(FRG) Patent 2,806,353/A/. 16 Aug 1979. 27p. (In German).
The articles, for example fuel elements, are introduced into the container and the remaining space inside the container is filled with lead, a salt or a mixture of salts of eutectic composition, which freezes at ambient temperature. This makes dry transport possible. To extract the fuel elements, it is sufficient to heat the container, which softens the protective and shielding material. The salt or mixture of salts is suitable for thermal conduction.

2169 DEVICE FOR THE ULTIMATE STORAGE OF RADIOACTIVE WASTE MATERIALS OF VARYING ACTIVITIES. Baatz, H.; Rittscher, D. (to STEAG Kernenergie G.m.b.H., Essen (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,631,769/B/. 2 Aug 1979. 4p. (In German).
The end storage container has a standard shape. Merely the dimensions of the enclosed auxiliary containers to take up the waste are adapted to the various activities, so that there is a space between these and the end storage container in which one can place shielding materials. Furthermore, it is possible to arrange auxiliary aggregates in the form of heating rods and spacers in the intermediate space.

2170 SWEDES DEVELOP NEW SYSTEM FOR NUCLEAR WASTE STORAGE. South African Mining and Engineering Journal ; 90: No. 4153, 18(Aug 1979).
RADIOACTIVE WASTE STORAGE;UNDERGROUND STORAGE;WASTE DISPOSAL;RADIOACTIVE WASTE DISPOSAL;UNDERGROUND DISPOSAL;RADIOACTIVE WASTE MANAGEMENT;SWEDEN

2171 REMARKS TO GORLEBEN. Borsch, P. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Programmgruppe Kernenergie und Umwelt). Naturwissenschaften ; 66: No. 8, 416-417(Aug 1979). (In German).
The author describes the problem of nuclear waste disposed by the example of the nuclear waste disposal center Gorleben, the final storage of radioactive waste from a technical view and also mentions the political aspects like governmental decisions and the criticism of the opponents of nuclear energy.

2172 DISPOSAL OF RADIONUCLIDES IN THE SEA. Van As, D.; Forster, Wm.O. (International Atomic Energy Agency, Vienna (Austria). Div. of Nuclear Safety and Environmental Protection). International Atomic Energy Agency Bulletin ; 21: No. 4, 24-31(Aug 1979).
The route to the sea according to the nature of the wastes is given. The need for acceptable international standards and regulations for preventing pollution of the sea is stressed. Finally, revised definitions and recommendations on this subject are summarized.

2173 PROCESS FOR TRANSPORTING AND/OR STORING OF RADIOACTIVE ARTICLES OR SUBSTANCES AND TRANSPORTABLE TRANSPORT AND/OR STORAGE CONTAINER, IN PARTICULAR FOR CARRYING OUT THE PROCESS. Vox, A.J. (to Vox Lumatic G.m.b.H., Ostfildern (Germany, F.R.); Amtrust A.G., Luzern (Switzerland); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,801,946/A/. 19 Jul 1979. 35p. (In German).
Radioactive articles are stored in the inner container of a double-walled vessel with outer cooling fins. The inside of the vessel, when articles are contained in it, is filled with liquid salt or salt mixture, which has a melting point of about 150°C. Electrodes are installed with the articles, by which, if the salt solidifies due to cooling, the salt can be melted at the destination. The intermediate space of the double vessel is filled with a salt of high melting point, concrete or shielding materials, such as lead, for example.

2174 RADIOACTIVE WASTE MANAGEMENT AT THE HANFORD RESERVATION. Nuclear Safety ; 20: No. 4, 434-445(Jul 1979).
During some 30 years of plutonium production, the Hanford Reservation has accumulated large quantities of low- and high-level radioactive wastes. The high-level wastes have been stored in underground tanks, and the low-level wastes have been percolated into the soil. In recent years some programs for solidification and separation of the high-level wastes have been initiated. The Hanford waste-management system was studied by a panel of the Committee on Radioactive Waste Management of the National Academy of Sciences. The panel concluded that Hanford waste-management practices were adequate at present and for the immediate future but recommended increased research and development programs related to

long-term isolation of the wastes. The panel also considered some alternatives for on-site disposal of the wastes. The Hanford Reservation was originally established for the production of plutonium for military purposes. During more than 30 years of operation, large volumes of high- and low-level radioactive wastes have been accumulated and contained at the site. The Management of these wastes has been the subject of controversy and criticism. To obtain a true technical evaluation of the Hanford waste situation, the Energy Research and Development Administration (now part of the Department of Energy) issued a contract to the National Academy of Sciences and the National Research Councilto conduct an independent review and evaluation of the Hanford waste-management practices and plans. A panel of the Committee on Radioactive Waste Management (CRWM) of the National Academy of Sciences conducted this study between the summer of 1976 and the summer of 1977. This article is a summary of the final report of that panel.

2175 ENVIRONMENTAL MONITORING AND DISPOSAL OF RADIOACTIVE WASTE FROM NAVAL NUCLEAR VESSELS AND SUPPORT FACILITIES IN 1978. Miles, M.E.; Sjoblom, G.L.; Eagles, J.D. (Dept. of the Navy, Washington, DC). Nuclear Safety ; 20: No. 4, 446-458(Jul 1979).

The environmental effect of disposal of radioactive wastes originating from the US Navy's nuclear propulsion plants and their support facilities is assessed. The total gamma radioactivity in liquids, less tritium, discharged to all ports and harbors from the more than 100 naval nuclear-powered ships and supporting tenders and from naval bases and shipyards was less than 0.002 Ci in 1978. The total amount of tritium released to all ports and harbors was less than 1 Ci in 1978. This article confirms that the procedures used by the US Navy to control releases of radioactivity from its nuclear-powered ships and their support facilities are effective in protecting the environment and the health and safety of the general public.

2176 NUCLEAR WASTE--DOES BURYING IT BURY THE PROBLEM. Thomas, R.A. Engineering and Mining Journal ; 180: No. 7, 131-134(Jul 1979).

This article discusses the Department of Energy (DOE)'s undergrounsd nuclear waste repository which is scheduled for startup in 1981 in New Mexico, and tries to explain why this project is being plagued by delays and uncertainties. The facility, known as the Waste Isolation Pilot Plant (WIPP), faces such problems as the question of the geologic security of the tentative site, citizens' objections about the location, as well as some licensing problems and concerns about overland transport of the large amounts of highly radioactive wastes that will fill the repository.

2177 SOLVING THE NUCLEAR WASTE DISPOSAL PROBLEM. deBoisblanc, D.R.; Grant, T.J. (Ebasco Serv, Inc). Combustion ; 51: No. 1, 38-42(Jul 1979).

The issue of nuclear waste disposal can be divided into two areas of concern--the more immediate, short-term part of the problem and the permanent long-term storage question. Solving the short-term problem now will necessarily give us more time to thoroughly investigate solutions to long-time storage. This discussion offers an approach to both the short- and long-term storage problems of nuclear waste and, at the same time, considers the attitudes of the public toward nuclear energy, and the roles of the government and the industry in the solution of these problems.

2178 REVIEW OF THE ENVIRONMENTAL PROBLEMS ASSOCIATED WITH THE DISPOSAL OF URANIUM TAILINGS. Bearman, P.J. (Imperial Coll. of Science and Technology, London (UK)). Minerals and the Environment ; 1: No. 2, 64-74(Jul 1979).

The major environmental problems of uranium tailings disposal are that the tailings release radioactive material to the air as radon gas and as airborne particulates, and to waterways as radionuclides leached out by precipitation, surface run-off, and from the waste solutions. A weak gamma irradiation field is created in the immediate vicinity of the tailings. Chemical pollutants including various heavy metals, sulphate and sulphuric acid, may also be leached from the tailings and pollute surface or subsurface waters. If the radionuclides and the radium could be extracted from the tailings by some method which is economically and technically acceptable, the concentrated radioactive waste and the tailings could be disposed of as normal mine tailings. The pollution control technology used to minimise pollution from tailings waste disposal systems is satisfactory provided that it is properly implemented. The initiation of a full scale monitoring programme to assess the efficiency of the tailings retention system should result in a reduction of the environmental problems. On abandonment of the impoundment it is necessary to continue to control and maintain the system and, if feasible, to establish vegetation on the exposed surfaces.

2179 ESTIMATION OF THE RADIATION EFFECT OF MEDIUM-ACTIVE ION-EXCHANGE RESINS WITH FINAL STORAGE AS RADIOACTIVE WASTES. Koerner, W.; Noack, W. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). Kernenergie ; 22: No. 6, 208-209(Jun 1979). (In German).

Absorbed dose, temperature increase, and the formation of hydrogen resulting from radiolysis have been estimated as a function of storage time. It is concluded that only the development of dangerous hydrogen concentrations in the air has to be observed in the separate storage of ion-exchange resins in closed caves.

2213 NUCLEAR WASTE: A PROBLEM OF PERSPECTIVE. Williams, I.G.K. (Organization for Economic Co-Operation and Development, 75 - Paris (France)). Archiv fuer Energiewirtschaft ; 33: No. 6, 501-511(Jun 1979). (In German).
In the light of the suspicion to be felt in the public towards the problem of nuclear waste management, the author in his article attempts to correct the impression created by somewhat sensational reports in the daily press by giving a more accurate description of nuclear waste management. He points out that responsible and fruitful research work has been done and should be made known to the public.

2214 DYNAMIC PROPERTIES OF ION EXCHANGE OF CESIUM INTO ZEOLITES. Mimura, H.; Kanno, T. (Tohoku Univ., Sendai (Japan). Research Inst. of Mineral Dressing and Metallurgy); Fukumori, M.; Otani, T. Tohoku Daigaku Senko Seiren Kenkyusho Iho (Bulletin of the Research Inst. of Mineral Dressing and Metallurgy, Tohoku University) ; 35: No. 1, 19-26(Jun 1979). (In Japanese).
The distribution of cesium ion and the properties of ion exchange was studied in various kinds of zeolites, i.e. synthetic mordenite, natural mordenites and clinoptilolites. The distribution coefficients of cesium ($K_{sub(cs)}$) exceeded 10^3 even in acidic region (pH -- 1), though the $K_{sub(cs)}$ values somewhat decreased with increasing acidity. The dynamic properties of ion exchange were examined by zeolite-column process and the break-through curves were obtained at different flow conditions. The break-through capacity, the total capacity and the column utilization increased with the increase in column temperature and with the decrease in the flow rate. Heat treatment resulted in an increase in the strength of zeolites, which was desirable for handling them. The zeolites heated at 300°C and 500°C increased in their total capacity of ion exchange of Cs and the granulated zeolites heated at 500°C improved in its exchange rate and column utilization.

2215 GEOLOGIC DISPOSAL OF NUCLEAR WASTES: SALT'S LEAD IS CHALLENGED. Kerr, R.A. Science ; 204: 603-606(11 May 1979).
The types of radioactive waste disposal sites available are outlined. The use of salt deposits and their advantages are discussed. The reasons for the selection of the present site for the Waste Isolation Pilot Plant are presented. The possibilities of using salt domes along the Gulf Coast and not-salt rocks as nuclear waste repositories are also discussed. The sea bed characteristics are described and advantages of this type of site selection are presented.

2216 MINING ASPECTS OF NUCLEAR WASTE DISPOSAL IN SALT DOMES. Velzeboer, P.Th. (Technische Hogeschool Delft (Netherlands)). Ingenieur (The Hague) ; 91: No. 19, 244-248(10 May 1979). (In Dutch).
The design of a storage place for nuclear waste depends upon the demands made upon it, now and in the future, as regards disposal. The quality will be dependent on the following observations. The disposal of nuclear waste requires that contamination of the biosphere be prevented. This means that water, as a transport medium, may come into contact with the nuclear waste. These demands are best approximated by large salt domes, where the rock-salt, NaCl, lends itself admirably to the purpose of disposal. Other salts, such as those of potassium and magnesium, have less favourable properties than rock-salt. The disposal of the waste in salt domes demands that there is the greatest possible certainty that these salt domes will not be eroded for a very long time, for example, a few thousand years. The mining aspects of such a storage place are described.

2217 FINAL STORAGE VESSEL FOR RADIOACTIVE

WASTE. Hofmann, J.; Iffland, N.; Wagner, G. (to Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,748,774/A/. 3 May 1979. 7p. (In German).

An insert made of separate workshop waste pieces welded together is introduced into the corrugated drum so that it is fixed in the drum by clamps and hooks. Contaminated waste can be used as the waste. The drum is then brought into the sloping position, rotated and filled via a dosing spiral with bitumen or concrete or with radioactive waste slurry e.g. concentrated waste from a BWR, via a bucket wheel elevator. In order to prevent overflowing of the paste during mixing, a collar must be fixed on the drum.

2218 HEATING OF RADIOACTIVE WASTE PROCESSING TANK. Noda, M. (to Ishikawajima-Harima Heavy Industries Co. Ltd., Tokyo (Japan)). Japanese Patent 1954-55,300/A/. 2 May 1979. 3p. (In Japanese).

Purpose: To prevent crystallization from in the condensed liquid waste by arranging a heated fluid flow on the exterior surfaces of a tank which receives the liquid waste from a nuclear power station. Constitution: On the exterior surfaces of a tank there is provided a space which is surrounded by insulators. Preheated fluid such as water or air is flowed in the space to heat the outside surfaces of the tank. The crystallization of Na_2SO_4 is prevented because the condensed waste liquid in the tank is heated above the crystallization temperature. Uniform temperature distribution throughout the tank body prevents the occurrence of local temperature gradient, thus enabling the use of lining materials having low heat-resisting temperature.

2219 METHOD FOR CALCINING RADIOACTIVE WASTES. Bjorklund, W.J.; McElroy, J.L.; Mendel, J.E. (to Exxon Nuclear Co., Inc.). US Patent 4,152,287. 1 May 1979. Filed date 10 Nov 1976. 6p.

A method for the preparation of radioactive wastes in a low leachability form involves calcining the radioactive waste on a fluidized bed of glass frit, removing the calcined waste to melter to form a homogeneous melt of the glass and the calcined waste, and then solidifying the melt to encapsulate the radioactive calcine in a glass matrix.

2220 RADIOACTIVE WASTE DISPOSAL. Wilkinson, D. (Department of the Environment, London (UK)). Atom (London) ; No. 271, 123(May 1979).

BOREHOLES;ENVIRONMENT;GOVERNMENT POLICIES; HIGH-LEVEL RADIOACTIVE WASTES;MARINE DISPOSAL; PLANNING;RADIOACTIVE WASTE DISPOSAL;RESEARCH PROGRAMS;UNDERGROUND DISPOSAL;UNITED KINGDOM

2221 PRESENT STATE AND MOOT POINTS IN JAPAN. LOW-LEVEL RADIOACTIVE WASTE MANAGEMENT. Sakata, S. (JGC Corp., Tokyo (Japan)). Kogai To Taisaku (Journal of Environmental Pollution Control) ; 15: No. 5, 634-642(May 1979). (In Japanese).

The management of low-level radioactive wastes in Japan is described, especially for those resulting from the utilizations of radioisotopes, as follows: the nature of the management, the countermeasures to wastes and waste types; the present situation in the laws and regulations, management practices, and future outlook; and overseas trends in the radioactive waste management in West Germany, the US, the UK, France, etc. In Japan, the efforts have been expanded from the treatment toward both upstream, i.e. the sources, and downstream, i.e. disposal. For radioactive waste management, there are The Law Concerning Prevention from Radiation Injuries Due to Radioisotopes, Etc. for RI utilizations and The Law Concerning the Regulations of Nuclear Source Materials, Nuclear Fuel Materials and Reactors for nuclear power generation. At present, those wastes from the former are collected from RI users and treated by a special enterprise, and subsequently stored in the Japan Atomic Energy Research Institute. In the future, with rapidly rising quantities of radioactive wastes, the cooperation between private and government circles in this field is essential. (J.P.N.).

2222 CHARACTERIZATION OF BOROSILICATE GLASSES CONTAINING SIMULATED HIGH-LEVEL RADIOACTIVE WASTES. Terai, R.; Eguchi, K.; Yamanaka, H.; Wakabayashi, H.; Hara, S. (Government Industrial Research Inst., Osaka, I. (Japan)). Nippon Genshiryoku Gakkaishi (Journal of the Atomic Energy Society of Japan) ; 21: No. 5, 424-433(May 1979). (In Japanese).

In connection with the development of vitrified solidification processes of high-level liquid wastes at Power Reactor and Nuclear Fuel Development Corp. (PNC), the characterization of the various borosilicate glasses containing the simulated high-level radioactive wastes have been carried out at Government Industrial Research Institute, Osaka. The volatility, the viscosity and the electrical conductivity of glasses in molten states have been measured, and the thermal conductivity, the elastic modulus, the chemical durability and the crystallization behavior in solid states have been also investigated. These data seem to be useful in the construction and operation of the engineering scale facility at PNC. The low-melting temperature glasses have large volatilization rates, low viscosities in molten states, low crystallization temperatures and less durabilities with water in solid states. Therefore, the high-melting temperature glasses seem to be suitable for storage of wastes from the view point of safety evaluation, although in this case it is necessary to improve the melting technique to avoid violent evaporation.

2223 LOW-LEVEL RADIOACTIVE WASTES MANAGEMENTS IN UNIVERSITIES, INSTITUTES AND HOSPITALS. ON RADIOPHARMACEUTICAL WASTE DISPOSAL. Kato, S. (Japan Radioisotope Association, Tokyo). Kogai To Taisaku (Journal of Environmental Pollution Control) ; 15: No. 5, 667-676(May 1979). (In Japanese).

Japan Radioisotope Association, which is distributing radioisotopes, also is collecting radioactive wastes from hospitals and other establishments using radioisotopes across the country. These wastes are then transferred to Japan Atomic Energy Research Institute for treatment. However, the capacity of JAERI is currently insufficient for the quantities transferred from JRA. A main cause for such difficulty as above is the increase in medical isotopes, i.e. radiopharmaceuticals, which are used in vivo and in vitro. From the RI consumptions thus far, the future demands and waste quantities are estimated for the purpose of establishing an overall joint treatment system. The following matters are described; the present situation of waste management in JRA and JAERI; current transitional phase; and radiopharmaceutical wastes (radiopharmaceuticals, their consumptions and future demands, and resultant waste RIs).

2224 DISPOSAL OF LOW-LEVEL RADIOACTIVE WASTE INTO THE SEA. Saruhashi, K. (Meteorological Research Inst., Tokyo (Japan)). Kogai To Taisaku (Journal of Environmental Pollution Control) ; 15: No. 5, 690-695(May 1979). (In Japanese).

Disposal of low-level radioactive wastes is made both on land and in sea. Though the land disposal has been already carried out in the U.S.A. and the U.S.S.R., it is impossible in the narrow land of Japan. In the United States, the wastes solidified with cement in drums were previously abandoned in deep seas of the Pacific and the Atlantic. This is no longer done. Instead, the land disposal is employed due to its lower costs. In European countries, sea disposal is performed under OECDNEA. There was trial disposal in 1961 and full-scale disposal since 1967 in the Atlantic. Meanwhile in Japan, test sea disposal will be carried out in the near future in deep sea of the northern Pacific, which in an important sea area for fisheries. International trends of deep sea disposal of low-level wastes and the its corresponding trend in Japan in the past years are described.

2225 DEVICE TO ABSORB SOLID RADIOACTIVE WASTE SUSPENDED IN WATER. Kucherer, H.D. (to Westinghouse Electric Corp., Pittsburgh, PA (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,001,936/B/. 12 Apr 1979. 4p. (In German).

A double reversable container is suggested in which the space between the inner and outer wall is filled with dry, powdered material (mixture of building cement and vermiculite) which hardens when water is added. The container can take up radioactive suspensions without previous drainage. One obtains a radiation safe package as the inner space is entirely surrounded by hydraulic hardening material. Equipment with vacuum filling device is described.

2226 LEACH RATES OF HIGH ACTIVITY WASTE FROM BOROSILICATE GLASS. Wiley, J.R. (E.I. du Pont de Nemours and Co., Aiken, SC). Nuclear Technology ; 43: No. 2, 268-272(Apr 1979).

Borosilicate glasses containing actual high-level Savannah River Plant waste were leached in static, distilled water. Leach rates based on ^{90}Sr, ^{137}Cs, and plutonium analyses were similar: 10^{-5} to 10^{-6} g of glass/(cm^2.day) initially, 10^{-7} to 10^{-8} g/(cm^2.day) after two weeks, and 10^{-8} to 10^{-9} g/(cm^2.day) after 100 days. The leach rates were not directly correlated with waste composition, but were qualitatively related to the tendency of the glass to devitrify that could be caused by certain combinations of waste components. According to a proposed model, leach rates were diffusion-controlled during the entire 100-day test. 5 figures, 4 tables.

2227 RECOMMENDED OPERATIONAL PROCEDURES FOR SEA DUMPING OF RADIOACTIVE WASTE. Paris, France; OECD (Apr 1979). 15p.

The purpose of this document is to establish procedures for the organisation and control of radioactive waste sea dumping operations carried out under the NEA Mechanism. These procedures are designed to ensure the safe disposal of the radioactive waste in such a way that any radiation exposure is kept as low as reasonably achievable within designated dose limits, and that other risks are also adequately controlled.

2228 GUIDELINES FOR SEA DUMPING PACKAGES OF RADIOACTIVE WASTE. Paris, France; OECD (Apr 1979). 32p.

The purpose of these Guidelines is to establish general requirements and provide practical information for the design and manufacture of packages for sea dumping of radioactive waste, in accordance with the terms of the OECD Council Decision establishing a Multilateral Consultation and Surveillance Mechanism for Sea Dumping of Radioactive Waste. These Guidelines are in compliance with the IAEA Revised Definition and Recommendations of 1978, for applying the London Dumping Convention to radioactive waste, and are intended for application under the responsibility of the appropriate national authorities of countries participating in the NEA Mechanism.

2229 ENGINEERED STORAGE FACILITY FOR RADIOACTIVE KRYPTON. Yamamoto, Y.; Sawada, Y.; Tsuda, K. (Kobe Steel Ltd. (Japan)). 29: No. 2, 29-32(Apr 1979). (In Japanese).

In this paper, a conceptual design for an engineered storage facility for radioactive Krypton recovered from reprocessing, is described. Long term reliability and safety are obtained with this new process, which utilizes a double cylinder and activated charcoal. The facility is composed of two operation systems: one is the system which fills the double cylinders with Krypton, and the other is that which stores the double cylinders; they are both remote controlled to protect workers from radiation exposure.

2230 SHARP DROP AND A LONG TAIL. THE FUTURE FOR NUCLEAR WASTE DISPOSAL. Crossley, D. Ascent ; 1: No. 1, 13-15, 23(Spr 1979).

Research has been carried out in Canada since 1953 on nuclear waste disposal. Underground disposal has been chosen, and a list of around 100 suitable locations in the Canadian Shield is being drawn up. Surrounding communities will be involved in the final decision on disposal sites. Plans for transportation and processing of wastes are described. A disposal site will not be needed until the beginning of the next century, and will be able to handle all wastes produced over 50 years.

2231 HIGH LEVEL NUCLEAR WASTE - CONSEQUENCE ANALYSIS FOR DISPOSAL IN BEDROCK. Nielsen, P. O. (Scandpower A/S, Oslo (Norway)). Teknisk Ukeblad ; 126: No. 11, 33-34(1 Mar 1979). (In Norwegian).

The consequence analysis performed in the Swedish K B S (Nuclear Fuel Safety project) is summarised and discussed in this short article. The basic assumptions are that the vitrified high level waste is placed in a stainless steel container provided with a lead jacket and an outer shell of titanium. These containers are placed in individual holes in bedrock at a depth of 500m and the holes and access tunnels are filled with a mixture of bentonite and quartz sand. It is assumed that the ground water will eventually come into contact with, and erode the waste. The time scale for this is estimated to be in the range 1000 years for contact and 30,000 years for complete destruction of the glass. The transport time for the ground water to the surface is found to be 400 years. Delay times in the rock for various components are given. In the final instance this is found to lead to an increase in radiation dose of 13 mrem/year in the worst instance. This is presumed to satisfy the

conditions imposed by Swedish law and the only criticism in the hearings was that the rock boring programme was not adequate.

2232 ADVANCE PAYMENTS ON THE COST OF THE FEDERAL REPOSITORY FOR RADIOACTIVE WASTE. Strassburg, W. (Deutsche Gesellschaft fuer Wiederaufarbeitung von Kernbrennstoffen m.b.H. (DWK), Hannover (Germany, F.R.)). Atomwritschaft, Atomtechnik ; 24: No. 3, 130-132(Mar 1979). (In German).

The costs for the final storage of radioactive waste will be charged to those obliged to deliver their radioactive waste. The Federal Government intends to cover, by advance payments, the costs of preparation, planning, and investment. However, legal examination reveals that, at least before an operating permit has been granted, no such obligation to pay charges exists for the operating company of the reprocessing centre, or for the utilities operating nuclear power plants, such obligation cannot be enforced either by an amendment of the Act.

2233 INTERNATIONAL SYMPOSIUM OF THE IAEA/NEA ON THE DECOMMISSIONING OF NUCLEAR FACILITIES. A COMMENT FROM THE OPERATOR'S POINT OF VIEW. Watzel, G.V.P. Brennstoff-Waerme-Kraft ; 31: No. 3, 105-111(Mar 1979). (In German).

The report comments on the symposium papers from the point of view of the operator of nuclear facilities. In particular, it deals with decommissioning procedures, licensing aspects, wast storage and disposal or recycling. Several decommissioning studies are compared with regard to their findings (amount of waste, radiation exposure, costs).

2234 REVISED DEFINITION OF HIGH-LEVEL RADIOACTIVE WASTES UNSUITABLE FOR DUMPING AT SEA. Morley, F. (National Radiological Protection Board, Harwell (UK)). Radiological Protection Bulletin ; No. 27, 3-6(Mar 1979).

The IAEA is responsible for defining these wastes, and makes recommendations to be used as a basis for the issue of special permits for the dumping at sea of those radioactive materials not defined as 'unsuitable'. Two IAEA information Circulars list in detail the Provisional (INF CIRC/205/Add. 1. Vienna, IAEA (January 1975)) and Revised (INF/ CIRC/205/Add. 1/Rev. 1. Vienna, IAEA (August 1978)) Definitions with annex material. These two definitions are set out for comparison purposes. The definitions were based on oceanographic and radiological evidence, and a summary is given of the procedures followed during their preparation.

2235 MEASUREMENT OF RADIOLYTIC HYDROGEN AT THE HIGH LEVEL WASTE STORAGE FACILITY OF WIEDERAUFARBEITUNGSANLAGE KARLSRUHE (WAK). Beaulean, H.W.; Tillessen, U. (Gesellschaft zur Wiederaufarbeitung von Kernbrennstoffen m.b.H., Eggenstein-Leopoldshafen (Germany, F.R.)); Burkhardt, H.G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Heisse Chemie). Atomwritschaft, Atomtechnik ; 24: No. 3, 135-136(Mar 1979). (In German).

2236 NUCLEAR WASTES AND PUBLIC ACCEPTANCE. Hammond, R.P. (Univ of California, Los Angeles). American Scientist ; 67: No. 2, 146-150(Mar-Apr 1979).

Storage and disposal of nuclear wastes is the foremost problem blocking public acceptance of nuclear power use. Although proponents of nuclear energy insist that technology is available to store nuclear wastes safely, no concrete programs for effective storage have materialized. Improvements in nuclear waste storage techniques are presented. Any concept for near-term nuclear storage must account for both the solid and liquid wastes that now exist. Previous errors in judgment by nuclear technicians that led to the waste disposal problem included an overabundance of knowledge about radiation, not enough knowledge about geology, and an acute ignorance of dealing with the public. Criteria for waste disposal schemes should include provisions for containment endurance, container maintenance, storage isolation, longevity of the storage facility, and interchangability for processed waste and spent fuel elements. A plan for an underground storage facility to meet the above standards is presented. (2 diagrams, 10 references)

2237 GORLEBEN-RAMBOW SALT DOME IS NOT SUITED FOR THE FINAL STORAGE OF RADIOACTIVE WASTE. Grimmel, E. (Hamburg Univ. (Germany, F.R.). Inst. fuer Geographie und Wirtschaftsgeographie). Umschau in Wissenschaft und Technik ; 79: No. 6, 168-171(Mar 1979). (In German).

The Gorleben salt dome does not fulfill the safety requirements for a nuclear waste disposal site. The dome is situated in a fault zone, which is an extension of the Rhinegraben.

2238 RESPONSIBILITY WITHOUT A PARALLEL. Herrmann, A.G. (Goettingen Univ. (Germany, F.R.). Geochemisches Inst.). Umschau in Wissenschaft und Technik ; 79: No. 6, 176-178(Mar 1979). (In German).

The feasibility of the 'evaporite concept' for the disposal of high-level waste from nuclear reactors has to be based on understanding of the origin and metamorphism of marine salt deposits. (orig.).

2239 SOME QUESTIONS CAN ONLY BE ANSWERED BY DRILLING. Jaritz, W. (Bundesanstalt fuer Geowissenschaften und Rohstoffe, Hannover (Germany, F.R.)). Umschau in Wissenschaft und Technik ; 79: No. 6, 179-182(Mar 1979). (In German).

Some geological questions, which are of interest in connection with the disposal of high level radioactive waste, are discussed. A repository located in a salt dome is regarded as a good solution to the final disposal problem. The result of the projected investigations will show whether the Gorleben salt dome is suitable for the repository or not.

2240 OBJECTIONS TO GORLEBEN FROM THE GEOMORPHOLOGICAL POINT OF VIEW. Semmel, A. (Frankfurt Univ. (Germany, F.R.). Geographisches Inst.). Umschau in Wissenschaft und Technik ; 79: No. 6, 174-175(Mar 1979). (In German).

Grimmel's objections concerning the geological suitability of the Gorleben salt plug do not seem to be completly unjustified. They should, however, be checked by field studies. It remains to be seen which arguments will be presented by Venzlaff, who in his article did not deal with these problems in detail.

2241 WASTE STORAGE GLASS STANDS UP TO THE TEST. Nuclear Engineering International ; 24:

No. 281, 52(Feb 1979).
GLASS;LEACHING;MATERIALS TESTING;PLUTONIUM; RADIOACTIVE WASTE DISPOSAL;RADIOACTIVE WASTES; VITRIFICATION;RADIOACTIVE WASTE STORAGE

2242 MANAGEMENT OF RADIONUCLIDES FROM REPROCESSING PLANT GASEOUS EFFLUENTS. Zabaluev, Y.V. (International Atomic Energy Agency, Vienna (Austria). Div. of Nuclear Safety and Environmental Protection). International Atomic Energy Agency Bulletin ; 21: No. 1, 23-31(Feb 1979).
Available technology and techniques for removal and storage of long-lived isotopes are considered, with emphasis on krypton-85, carbon-14, tritium and iodine-129.

2243 INVESTIGATIONS OF TEMPERATURE DEVELOPMENT IN THE ULTIMATE STORAGE OF RADIOACTIVE WASTE. PT. 1. CALCULATION OF TIME- AND SITE-DEPENDENT TEMPERATURE FIELDS. Ploumen, P.; Strickmann, G.; Winske, P. (Technische Hochschule Aachen (Germany, F.R.). Lehrstuhl und Inst. fuer Elektrische Anlagen und Energiewirtschaft). Atomwritschaft, Atomtechnik ; 24: No. 2, 85-91(Feb 1979). (In German).
For the envisaged deep storage of vitrified high-activity waste in salt rock formations, knowledge of temperature build-up and distribution is an important parameter to determine the storage geometry. To determine the temperature distribution, calculation methods have been developed that enable detailed calculation of instationary temperature fields for the ultimate storage of high-activity waste in a geological ultimate storage site. These methods are explained in the article.

2244 STUDIES OF THE TEMPERATURE BEHAVIOR ASSOCIATED WITH THE ULTIMATE STORAGE OF HIGH LEVEL RADIOACTIVE WASTE. Ploumen, P.; Stickman, G.; Winske, P.; Durr, K.; Korthaus, E.; Donath, P. (Institut fur Elektrische Anlagen und Energiewirtschaft Achen, W. Germany). Atomwritschaft, Atomtechnik ; 24: No. 2, 85-94(Feb 1979).
A W. German methodology for storing high level radioactive waste is outlined. Waste produced in fuel reprocessing will be converted into a solid (e.g., borosilicate glass), then permanently stored in a geological salt formation. The heat dissipation associated with the ultimate storage of this waste is examined. Temperature fields are calculated as a function of time and position. Computation techniques and computer programs developed for this purpose are described. Simulation experiments with various geometries and heat outputs at the Asse mine are also presented. A comparison of test and computed results verifies the accuracy with which the computer programs can predict the temperatures. (in German) (6 diagrams, 11 graphs, 5 references, 4 tables)

2245 SEA DISPOSAL TEST OF RADIOACTIVE WASTES INTO THE PACIFIC: NATIONAL SITUATION. Emura, S. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Genshiryoku Kogyo (Nuclear Engineering) ; 25: No. 2, 17-23(Feb 1979). (In Japanese).
In association with the revision of the laws on the regulation of reactors, etc. and on radiation injury protection in July 1978, the technology standard on the sea disposal of low-level radioactive solid wastes was greatly improved. This led to a large step forward in the test sea disposal of such wastes. Studies in this field are being made strenously in various organizations. First, review is made on the background and the studies made since about 1960 by the Atomic Energy Commission of Japan concerning the sea disposal of low-level radioactive wastes. The descriptions are made on the courses of the technology development and safety evaluation on sea-disposal packages started almost simultaneously. The results on cement packages intended for test sea disposal, in particular, are given as follows: the physical integrity of cement solid packages, the leachability of radionuclides from cement packages, etc. Finally, the technology standard is explained.

2246 NEW TECHNICAL STANDARDS FOR RADIOACTIVE WASTE MANAGEMENT IN JAPAN. Sakata, S. (JGC Corp., Tokyo (Japan)). Nippon Genshiryoku Gakkaishi (Journal of the Atomic Energy Society of Japan) ; 21: No. 2, 142-146(Feb 1979). (In Japanese).
The technical standards for radioactive waste disposal, prepared by the ad hoc committee and reported to the Atomic Energy Commission of Japan, and approved by the latter, are explained. The feature of the new standards is to divide the disposal of radioactive wastes into that in the factories and enterprises concerned and that outside organizations; for the latter, sea disposal of radioactive wastes is stipulated. Thereby, the long-range points of view concerning the management are introduced. In the sea disposal, the international standards are extensively incorporated. In the management on the sites of factories and enterprises, radioactive wastes are grouped in gas, liquid and solid ones; and the respective techniques of disposal are specified. In the disposal outside organizations, storage on the sites and sea disposal are performed. For sea disposal, radioactive wastes are contained in vessels, or otherwise, they are solidified within metallic vessels using hydraulic cement. (J.P.N.).

2247 URANIUM TAILINGS. A HOT ISSUE IN NORTH AMERICA - BUT WHAT OF SA. Robertson, A. South African Mining and Engineering Journal ; 90: No. 4147, 41-43, 47(Feb 1979).
The hazards presented by the radioactivity in tailings from uranium bearing ores has become a sensitive issue in North America. South Africa has the advantage of following in the footsteps of North America, and with foresight may be able to avoid some costly mistakes. The author discusses the issues as they have developed in America and how they relate to the South African situation.

2248 A FLOOD OF HOT WASTE. Gwynne, P.; Cook, W.J.; Copeland, J.B.; Mitchelmore, C.; Begley, S. Newsweek ; 93: No. 3, 83-85(15 Jan 1979).
Nearly 5200 tons of nuclear waste are temporarily stockpiled in the U.S. today. Total tonnage may rise to 37,900 by 1990. The problem of permanent disposal is growing urgent. DOE's budget allowance for disposal technology is $449 million this year, compared with $28 million in 1970. Disposal methods are needed for both the spent fuel rods of nuclear reactors and the radioactive wastes from weapons production. DOE's present plan for fuel rod disposal is to bury the rods in a geologically stable area; the first site chosen is a salt bed formation near Carlsbad, N. Mex. International research on vitrification, compaction, and ceramification disposal techniques for wastes from weapons production is being reviewed. (3 photos)

2249 NO TECHNICAL BARRIERS TO WASTE DISPOSAL. Knox, R. Nuclear Engineering International ; 24: No. 280, 22-23(Jan 1979).

In a report to the President by the Interagency Review Group on Nuclear Waste Management the most important conclusion is that an acceptable solution to the waste disposal problem is possible. Many of the findings of the report were discussed at a recent AIF Study Group on waste management and at the ANS Winter Meeting. These discussions are reported.

2250 UNCONVENTIONAL FURNACE FOR SPECIAL WASTE. Ahearne, J. Atom-US: 16: No. 1, 10-15(Jan-Feb 1979).

The construction of a Treatment Development Facility was undertaken by U.S. Los Alamos Lab. to meet the problem of waste disposal at nuclear installations. The facility uses the process of controlled air incineration to reduce the volume of solid wastes. The incineration and cleaning processes are described. The incinerator is a commercially purchased conventional device that was altered to handle radioactive materials. The total expense for the construction was $1.65 million. Success in the experiments has led designers of the facility to project widespread use of controlled air incineration for the disposal of radioactive and toxic wastes. (9 photos)

2251 NUCLEAR WASTE DISPOSAL. Costello, J.M. (Australian Atomic Energy Commission Research Establishment, Lucas Heights). Atomic Energy in Australia ; 2: No. 1, 11-19(Jan 1979).

The disposal of high level waste or spent fuel is discussed with particular attention being paid to solidification in glass and ceramic materials. The long-term stability of these materials is discussed, as is the suitability of deep geologic formations for final disposal.

2252 HELIUM FORMATION FROM α-DECAY AND ITS SIGNIFICANCE FOR RADIOACTIVE WASTE GLASSES. Malow, G.; Andresen, H. (Hahn-Meitner-Institut fuer Kernforschung, Berlin, Germany). pp 109-115 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

To produce high radiation damage and excessive helium concentrations, the $^{10}B(n,\alpha)^{7}Li$ nuclear reaction was applied to a zinc-borosilicate glass. The number of displaced atoms could be estimated by using a collision model. The fraction of displaced atoms in glasses containing actinide elements was calculated to be orders of magnitude larger from α-decay than from β,γ-decay and spontaneous fission. Helium diffusion was measured between approx. 120 and approx. 650° and was found to be dependent upon the α-dose up to 500°C. The activation enthalpy increased from 79 to 111 kJ/mole when the α-dose rose from 10^{17} to 10^{19} per cm^3. The activation enthalpy as a function of the number of displacements per atom (dpa) revealed a saturation at about 0.1 dpa. At higher temperatures the diffusion dependency upon the α-dose disappeared and the activation enthalpy was 45 kJ/mole. With respect to the long-term situation, the above results gave evidence that helium will remain in the waste glass and a saturation of radiation damage will only be reached after some ten thousand years.

2253 CHEMISTRY OF NUCLEAR WASTE GLASS REACTIONS: PROBLEMS AND POTENTIAL OF PREDICTION. Adams, P.B. (Corning Glass Works, NY). pp 123-129 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

Many commonly accepted principles of glass corrosion testing can lead to false conclusions if they are accepted as generalities. It is essential to recognize the effects of changing chemistry in test solutions, of temperature on reaction rates, of cycling conditions and of anomalous reactions. One then concludes that simulation modeling is essential, that better standard tests are needed, that wet site disposal may be a good choice and that anomalous failure can be avoided by proper glass design.

2254 CHARACTERIZATION OF LEACHED SURFACE LAYERS ON SIMULATED HIGH-LEVEL WASTE GLASSES BY SPUTTER-INDUCED OPTICAL EMISSION. Houser, C.; Tsong, I.S.T.; White, W.B. (Pennsylvania State Univ., University Park, PA). pp 131-139 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

The leaching process in simulated waste encapsulant glasses was studied by measuring the compositional depth-profiles of H (from water), the glass framework formers Si and B, the alkalis Na and Cs, the alkaline earths Ca and Sr, the transition metals Mo and Fe, the rare-earths La, Ce, and Nd, using the technique of sputter-induced optical emission. The leaching process of these glasses is highly complex. In addition to alkali/hydrogen exchange, there is breakdown of the glass framework, build-up of barrier layers on the surface, and formation of layered reaction zones of distinctly different chemistry all within the outer micrometer of the glass.

2255 LEACH RATE CHARACTERIZATION OF SOLID RADIOACTIVE WASTE FORMS. Flynn, K.F.; Barletta, R.E.; Jardine, L.J.; Steindler, M.J. (Argonne National Lab., IL). pp 149-155 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

Leach rates for a number of proposed radioactive waste forms have been measured. A neutron activation analysis technique has been used exclusively for these measurements. Leach rates as low as $10^{-9}g/cm^2d$ were easily determined. Problems associated with surface area determination, sample preparation and data interpretation are discussed.

2256 CALCULATIONS OF RADIOACTIVITY RELEASE DUE TO LEACHING OF VITRIFIED HIGH LEVEL WASTE. Ewest, E. (Hahn-Meitner-Institut fuer Kernforschung, Berlin, Germany). pp 161-168 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY: Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

A model is presented for the calculation of radioactivity release from vitrified waste. The calculation is demonstrated for a borosilicate glass block which has been assumed to be exposed to water for 1,000,000 years. How far this model can be used in safety studies on the final disposal of vitrified waste in a geologic

repository is discussed.

2257 POLLUCITE AND ITS ALTERATION IN GEOLOGICAL OCCURRENCES AND IN DEEP-BURIAL RADIOACTIVE WASTE DISPOSAL. Cerny, P. (Univ. of Manitoba, Winnipeg). pp 231-236 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

The properties, occurrences, and alterations of natural pollucite are reviewed. Four general conclusions may be derived from the geological history of pollucite, and from the scanty experimental work, which may help to predict the behavior of the synthetic ^{137}Cs-based pollucite in deep-burial waste storage: natural pollucite phases show a wide range of Cs/Na ratios, and laboratory synthesis produced isomorphous compounds with substantial K, Rb, Ca, Sr, and several other cations. The rarity, specialized paragenesis, and limited conditions of formation of natural pollucite and cesian analcime are caused much more by geochemical scarity and migration pattern of Cs rather than by their restricted stability. The wide variety of alteration products replacing natural pollucite indicates easy breakdown under diverse conditions. Natural alteration of pollucite invariably leads to efficient dispersal of the released Cs.

2258 SCIENTIFIC BASIS FOR, AND EXPERIENCE WITH, UNDERGROUND STORAGE OF LIQUID RADIOACTIVE WASTES IN THE USSR. Spitsyn, V.I.; Balukova, V.D. (Inst. of Physical Chemistry, Moscow, USSR). pp 237-248 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

Factors considered in the selection of deep absorbing horizons (strata collectors) for underground storage of liquid wastes are given. The pretreatment of wastes and processes occurring in the strata collector are discussed. All the aspects discussed have been verified in actual underground storage installations. The methodology for prediction of sorption and migration behavior of radionuclides, for evaluation of the heat field in the stratum and for radiolysis processes and their influence on the storage of liquid wastes in strata collectors was confirmed.

2259 INFLUENCE OF RADIATION ON THE SYSTEM LIQUID RADIOACTIVE WASTES: GEOLOGIC FORMATION. Spitsyn, V.I.; Balukova, V.D.; Kabakchi, S.A.; Medvedeva, M.L. (Institute of Physical Chemistry, Moscow, USSR). pp 249-255 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

Introduction of liquid radioactive wastes into deep strata-collectors results in a number of physical-chemical processes: precipitation, dissolution, complex formation, sorption, etc. The area occupied by the injected waste and changes in the nature of the liquid phase depend primarily on radiolysis processes in the heterogeneous system of liquid waste-stratal material occurring at elevated temperatures and pressures. Experiments that simulate actual conditions of temperature, pressure and high radiation levels on this system have been performed. Results are presented for radiolytic gas formation and for changes in the liquid phase and sorption capacity of stratal minerals. It is shown that the temperature increase in the stratum-collector significantly enhances waste decomposition processes, promotes sorption of radionuclides and decreases the mobility of the waste in the formation.

2260 ROCK-MELT APPROACH TO NUCLEAR WASTE DISPOSAL IN GEOLOGICAL MEDIA. Cohen, J.L.; Steinborn, T.L. (Lawrence Livermore Lab., CA). pp 261-264 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

An unconventional method for geologic disposal of nuclear waste has been proposed which uses decay heat for beneficial purposes. This is the rock-melt concept which calls for the direct addition of high-level waste either in solution or slurry form into a deep mined cavity in silicate rock. Following the period of waste addition, the cavity is allowed to boil dry. Subsequently, the decay heat melts the waste and the surrounding rock. The molten rock dissolves the waste and the molten mixture grows, reaching its maximum radius in times typically estimated at tens to hundreds of years. When the rate of conductive heat loss from the system exceeds that of heat input from radioactive decay, the system begins to cool and solidify. Total resolidification could require several centuries. During that period, fission products will have essentially decayed away, leaving the actinide components. The ultimate result would be the encapsulation of this radioactive material in a relatively insoluble rock matrix deep underground.

2261 INTERACTION OF A GLASS-BASED NUCLEAR WASTE SIMULANT AND NATURAL ROCK. Hlava, P.F.; Chambers, W.F. (Sandia Labs., Albuquerque, NM). pp 265-270 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

The basic experiment consisted of inserting a simulant glass containing stable isotopes in a hole bored into a 0.9 m x 0.9 m x 1.4 m block of microgabbro. Electron microprobe analysis provided significant information about the convection behavior and waste-rock interactions that occurred during the experiment. Results of this investigation are summarized.

2262 CORROSION RESISTANCE OF CANISTERS FOR FINAL DISPOSAL OF SPENT NUCLEAR FUEL. Mattsson, E. (Swedish Corrosion Inst., Stockholm). pp 271-281 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

A group of Swedish scientists has evaluated from the corrosion point of view three alternative canister types for final disposal of waste from nuclear reactors in boreholes in rock 500 m below ground. Titanium canisters with a wall-thickness of 6 mm and 100 mm thick lead lining have been estimated to have a life of at least thousands of years, and probably tens of thousands of years. Copper canisters with 200-mm-thick walls would last for hundreds of thousands of years. The third type, α-alumina sintered under isostatic pressure, is a very promising canister material.

2263 PRELIMINARY CORROSION TEST OF A GLASS-CERAMIC CANDIDATE FOR A NUCLEAR WASTE CANISTER.

Sundquist, J.D. (Corning Glass Works, NY). pp 289-296 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

Preliminary corrosion studies of Corning Glass Works glass-ceramic Code 9617 as a storage canister for spent nuclear fuel rods indicates a corrosion rate of 0.013 cm/1000 y when stored in a granite repository at an initial temperature of 110°C. This is well within the targeted rate of 0.1 cm/1000 y.

2264 APPLICATION OF PHYSICAL CHEMISTRY OF FLUIDS IN ROCK SALT AT ELEVATED TEMPERATURE AND PRESSURE TO REPOSITORIES FOR RADIOACTIVE WASTE. Stewart, D.B. (Geological Survey, Reston, VA); Potter, R.W. pp 297-311 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

The compositions of natural brines are described; some limits are set on their compositions and physical properties under repository conditions; and the nature and implications of the freezing-point depressions in polycomponent systems such as are likely to occur in salt repositories are discussed.

2265 APPLICATION OF STUDIES OF FLUID INCLUSIONS IN PERMIAN SALADO SALT, NEW MEXICO, TO PROBLEMS OF SITING THE WASTE ISOLATION PILOT PLANT. Roedder, E.; Belkin, H.E. (Geological Survey, Reston, VA). pp 313-321 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

The data obtained when inclusions in cores from the proposed WIPP site were examined pettrographically, and with microscope freezing, heating, and crushing stages are summarized. Fluid now present in the samples studied ranges widely from < 0.1 to 1.7 wt %; the total in situ fluid content of the rock is certainly greater. The inclusion fluid is not just saturated NaCl solution but a variable and extremely saline bittern containing some noncondensable gases under pressure. The inclusions move in thermal gradients and react quickly to uniaxial stress, but decrepitation is estimated to be a more important mechanism of fluid release under thermal loading. Subsequent movement of the released fluids is not considered.

2266 P-T-X RELATIONS OF ANHYDRITE AND BRINE AND THEIR IMPLICATIONS FOR THE SUITABILITY OF ANHYDRITE AS A NUCLEAR WASTE REPOSITORY MEDIUM. Clynne, M.A.; Potter, R.W. II. (Geological Survey, Menlo Park, CA). pp 323-328 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

The solubility properties of anhydrite indicate that it could serve as a suitable repository medium. The solubility of $CaSO_4$ has been confirmed to remain low despite the high activity of chloride ions. At 200°C the solubility of anhydrite in saturated NaCl solutions (0.0205 molal) is approximately 3.9 x 10^2 times less soluble than Nacl. (8.014 molal). In addition, the solubility of anhydrite in NaCl-saturated water exhibits a negative temperature coefficient up to 235 +- 20°C. We have shown that the solubility of anhydrite in NBT-6, a synthetic bittern, is significantly less than in NaCl-saturated water, and that its negative temperature coefficient persists to higher temperatures (250 +- 20°C). Consequently, fluid inclusions will migrate down a thermal gradient, i.e., away from radioactive waste containers. The suitability of anhydrite as a repository medium is further enhanced by its thermal conductivity; its favorable occurrence in evaporite basins; and its generally low fluid inclusion content (commonly lower than halite). Anhydrite could also be employed as an overpack in a salt repository to help protect the canisters from the brines mobilized by the thermal pulse.

2267 HYDROTHERMAL REACTIVITY OF SIMULATED NUCLEAR WASTE FORMS AND WATER-CATALYSED WASTE-ROCK INTERACTIONS. McCarthy, G.J.; Komarneni, S.; Scheetz, B.E.; White, W.B. (Pennsylvania State Univ., University Park, PA). pp 329-340 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

Hydrothermal interactions of three waste forms (spent fuel, a glass, and a crystalline ceramic) and three repository rock types (basalt, shale, and salt) are considered. The results presented illustrate three types of hydrothermal waste-rock interactions experimentation: reactivity of waste forms in the presence of aqueous solutions; reactivity among waste, rock, and water; and mechanistic studies of potentially important radionuclide fixation reactions. It was shown that if pressurized water should contact nuclear waste during the thermal period of a geologic repository, alteration of the waste and waste-rock interactions can occur. Prototype waste materials react to various degrees in the presence of groundwater. At 300°C glass is altered and devitrified with some elements being extracted into solution. The synthetic minerals of crystalline ceramics show little reaction. The UO_2 matrix of spent fuel shows very little reaction but some fission products can be dissolved. All three waste forms are very reactive with bittern brines. It should be emphasized that alteration of the more reactive waste forms does not necessarily lead to massive releases of radioactivity away form the repository. With certain classes of repository rocks, waste-rock interactions could lead to the formation of new mineral-like phases that could be far more stable in the long term than was the original waste form.

2268 HYDROTHERMAL GLASS REACTIONS IN SALT BRINE. Westsik, J.H. Jr.; Turcotte, R.P. (Battelle Pacific Northwest Labs., Richland, WA). pp 341-344 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

A simulated high-level waste glass was exposed to high-temperature salt brine and deionized water. The glass undergoes partial crystallization, depending on the conditions, and yields $NaFeSi_2O_6$ as the primary alteration product. At the extreme temperature of these tests, cesium, rubidium, strontium and molybdenum show moderate-to-high solubilities in salt brine. Solubility in deionized water is an order of magnitude lower than in salt brine, but the glass alteration rate is higher. In a similar salt brine test, a supercalcine showed similar cesium and strontium releases when compared to the glass.

2269 RADIATION DAMAGE STUDIES ON NATURAL AND SYNTHETIC ROCK SALT FOR WASTE DISPOSAL APPLICATIONS. Swyler, K.J.; Klaffky, R.W.; Levy, P.W. (Brookhaven National Lab., Upton, NY). pp 349-354 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

Natural rock salt and synthetic NaCl develop negative ion defects (F centers) when irradiated between 20 and 300°C. Both form high concentrations of sodium metal colloid particles when irradiated in the 125 to 200°C region. Based on the current data, it is estimated that the exposures expected from high-level waste disposal canister will cause 0.01 to 0.1 mole percent of the sodium in the surrounding rock salt to be converted to sodium metal colloid particles. Defect formation is dependent on temperature, crystal strain, dose, dose rate, origin of crystals and possibly other factors.

2270 THERMODYNAMIC CONSIDERATIONS UNDERLYING THE MIGRATION OF RADIONUCLIDES IN GEOMEDIA: OKLO AND OTHER EXAMPLES. Brookins, D.G. (Univ. of New Mexico, Albuquerque). pp 355-366 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

The prediction of migration or retention of radionuclides in geomedia is one of the major problems associated with radioactive waste disposal. Use of Eh-pH diagrams based on sound thermodynamic data has proven useful for both the Oklo Natural Reactor and for sedimentary uranium deposits. Appropriate diagrams for temperatures in the range from 25 to 200°C allow predictions to be made which are entirely consistent with available measurements. For geomedia where organics are present and for brines, experimental data must be employed to supplement any predictions made on a purely inorganic thermodynamic data base.

2271 MEASUREMENTS OF PARAMETERS ESSENTIAL TO PREDICTING NUCLIDE MIGRATION. Fried, S.; Friedman, A.; Schreiner, F.; Sjoblom, R.; Hines, J.; Strickert, R.; Rickert, P. (Argonne National Lab., IL). pp 367-377 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

In order to determine the gross rate of migration of radionuclides in rocks the movement of radioactive traces through hornblende schists and through Bandelier tuff was studied. The results of the measurements of tracer mobilities in tuff and hornblende schist demonstrate that the gross flow rate is not a simple parameter. In addition to the measurement of migration rates, experiments were begun to determine the long-term stable valence states of actinide elements. The valence state is a significant parameter governing the chemical interaction of migrating species with the environment. In the case of nuclides such as uranium, plutonium, and neptunium, which can exist in oxidation states varying from 3 to 6, the most stable configuration will be determined by the redox potential of the surrounding medium. In order to predict the behavior of these nuclides it is necessary not only to predict the behavior of these that will ultimately be stable but also the rates of conversion from other oxidation states. Optical spectroscopy was chosen as a convenient means for monitoring the valence states. Preparation of the spectroscopic samples is discussed.

2272 INTERACTION OF WASTE RADIONUCLIDES WITH GEOMEDIA; PROGRAM APPROACH AND PROGRESS. Relyea, J.F.; Rai, D.; Serne, R.J. (Battelle Pacific Northwest Labs., Richland, WA). pp 379-394 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

The Waste Isolation Safety Assessment Program (WISAP) approach is discussed. The data for formation-dissolution of solid phases of the radionuclides and adsorption and exchange of radionuclides by the geomedia are needed for determining radionuclide-geomedia interactions. In order to evaluate the effect of formation and dissolution of minerals and precipitates on solution composition and concentration, the available thermodynamic data were summarized. From these data, solid phase and solution species diagrams were developed to predict the most stable solid and solution phases and the radionuclide concentrations at equilibrium with them in different environments. Computer codes are being developed or modified to handle the thermodynamic data to (i) avoid repetitive calculations by hand and (ii) allow easy modification or inclusion of new data. Solubility isotherms of different elements for a few selected minerals will also be generated. Kinetic effects are ignored in thermodynamic calculations. If the reaction kinetics can be ignored, these calculations should be valid for the required isolation period. Some of the problems that have been encountered in carrying out this problem are discussed. Data analysis and validation techniques are covered.

2273 RADIONUCLIDE MIGRATION STUDIES ASSOCIATED WITH THE WIPP SITE IN SOUTHERN NEW MEXICO. Dosch, R.G. (Sandia Labs., Albuquerque, NM). pp 395-398 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

Sorption coefficients (K_d's) were determined by batch contacting less than or equal to 74 μm particles of rock or non-halite minerals or a 350 to 840 μm particle range of halite minerals with solutions doped at 1 μCi/ml or less with ^{137}Cs, ^{85}Sr, ^{131}I, ^{144}Ce, ^{125}Sb, ^{99}Tc, ^{152}Eu, ^{153}Gd, ^{106}Ru, ^{243}Am, ^{244}Cm, or ^{238}Pu. Samples of the liquid phase were taken through 0.8 μm filters after periods of 14 to 20 days and 30 to 35 days for the fission products and 170 days for the actinides. A general summation of the Kd results in brine simulants is as follows. Anionic species, pertechnetate and isodide, showed little or no tendency to sorb on any of the samples ($K_d < 1$), with the possible exception of a clay from a halite stratum ($K_d < 5$); cesium and strontium K_d's were also generally less than 1, but values in the range of 10 to 20 were observed on several minerals; ruthenium K_d's were in the range 2540 > 1000, depending on the brine and the geomedia; the actinide and lanthanide K_d's were typically > 1000, with only polyhalite showing significantly lower sorption; in the ground water simulant, pertechnetate and iodine showed the same behavior; and the K_d's of the other nuclides were slightly higher, particularly those of cesium and strontium.

2274 VARIABLES AFFECTING SORPTION AND TRANSPORT OF RADIONUCLIDES IN HANFORD SUBSOILS. Barney, G.S. (Rockwell Hanford Operations, Richland, WA). pp 435-438 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
Factors initially considered to control radionuclide sorption on Hanford sediments are: waste composition, groundwater components, sediment characteristics, chemical species of radionuclides, temperature, and time. Ten variables selected for study in the screening experiments were: Na^+, K^+, Ca^{2+}, Mg^{2+}, NO_3^-, NO_2^-, SO_4^{2-}, humic acid concentrations, sediment particle size, and source. The radionuuclides chosen for study were ^{137}Cs, ^{85}Sr, ^{99}Tc, ^{60}Cs, and ^{106}Ru. Sediments were obtained from four different well cores. Variables which were found to significantly affect sorption of ^{137}Cs are K^+, Na^+, humic acid, and sediment source. For ^{85}Sr the variables are Ca^{2+}, Na^+, humic acid, and Mg^+; for ^{60}Co they are NO_2^-, humic acid, and K^+; and for ^{106}Ru they are NO_2^-, humic acid, and Ca^{2+}. None of the variables had a detectable effect on ^{99}Tc sorption.

2275 PERMEABILITY MEASUREMENTS ON CEMENTITIOUS MATERIAL FOR NUCLEAR WASTE ISOLATION. White, E.L.; Scheetz, B.E.; Roy, D.M.; Zimmerman, K.G.; Grutzeck, M.W. (Pennsylvania State Univ., University Park). pp 471-478 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
Gas and liquid permeability measurement methods have been developed and utilized for characterization of cement composites and rocks for application to nuclear waste geologic repository problems. Permeabilities in the millidarcy to tens of nanodarcys range have been measured reproducibly and are related to problems of borehole plugging and shaft sealing.

2276 COMPARISON OF SOME GEOLOGIC AND OCEAN DISPOSAL CONCEPTS REGARDING REALISTIC MODELING THAT ALLOWS OBJECTIVE RISK ASSESSMENT TO BE MADE. Nielsen, S.O. (Symplexor Engineering Consultants, Inc., Holte, Denmark). pp 549-554 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
The following disposal concepts are compared: spent fuel or non-partitioned high-level waste (HLW) in geologic formation; partitioned HLW in geologic formation; non-partitioned HLW in submarine geologic formation; and partitioned, vitrified HLW, isolated by engineered containment, and emplaced on the deep ocean floor. Assuming that biofouling can be neglected, the last disposed concept is the most desirable.

2277 RECOMMENDED OPERATIONAL PROCEDURES FOR SEA DUMPING OF RADIOACTIVE WASTE. Paris, France; Organisation for Economic Co-operation and Development (1979). 18p.
The purpose of this document is to establish procedures for the organization and control of radioactive waste sea dumping operations carried out under the Nuclear Energy Agency Mechanism. These procedures are designed to insure the safe disposal of the radioactive waste in such a way that any radiation exposure is kept as low as reasonably achievable within designated dose limits, and that other risks are also adequately controlled. Phases included are advance preparation of the operation, ship loading phase, navigational phase, dumping conditions, and ship monitoring after disposal is completed.

2278 GUIDELINES FOR SEA DUMPING PACKAGES OF RADIOACTIVE WASTE. Paris, France; Organisation for Economic Co-operation and Development (1979). 35p.
The purpose of these Guidelines is to establish general requirements for the design and manufacture of packages for sea dumping of radioactive waste. These Guidelines refer only to packing of those radioactive wastes which fall outside the IAEA's Revised Definition of 1978 for high-level radioactive waste or other high-level radioactive matter considered to be unsuitable for dumping at sea under the London Dumping Convention. The design basis for packages is outlined, as are radiological safety considerations, manufacture and assembly. 10 figures.

2279 ASEA IS PRODUCING FULL-SCALE CANISTERS FOR NUCLEAR WASTE. ASEA (Allmaenna Svenska Elektriska Aktiebolaget) Journal ; 52: No. 1, 19(1979).
ASEA has successfully fabricated the first full-scale containers for nuclear waste. The first containers in an experimental series have been produced in the high-pressure plant constructed in record time at Robertsfors in the north of Sweden. This full scale experiment is an important milestone in the work on demonstrating a fully safe method for the containment of spent nuclear fuel for direct disposal. A container has sufficient space for nearly 150 fuel rods.

2280 MONITORING FOR THE DISPERSION OF DISCHARGED TRITIUM IN SEA-WATER AROUND THE TOKAI-MURA FUEL REPROCESSING PLANT. Nomura, T.; Kishimoto, Y.; Hirayama, A.; Fukuda, S.; Iwasaki, K. (Power Reactor and Nuclear Fuel Development Corp., Tokai, Ibaraki (Japan). Tokai Works). pp 257-269 of Behaviour of tritium in the environment. Vienna; International Atomic Energy Agency (1979).
From Symposium on the behavior of tritium in the environment; San Francisco, CA, USA (16 Oct 1978).
Low-level liquid waste effluent has been released batchwise into the Pacific Ocean from the fuel reprocessing plant of PNC sited in Tokai-mura since September 1977. The liquid effluent is discharged from the nozzle located about 17 m below the surface of the sea and is dispersed by the ambient cross stream. Approximately 800 Ci of tritium were released into the sea from October 1977 to June 1978. Tritium concentrations in sea-water were measured in accordance with a special monitoring programme to examine the dilution and dispersion of effluent in sea-water. The results of the tritium measurement showed that the effluent was diluted by two or three orders of magnitude by mechanical jet mixing immediately after the discharge from the nozzle, and was further diluted by one or two orders of magnitude by travelling several hundred metres along the current. It was observed that the concentration of tritium in surface water was raised temporarily after the discharge of more than several tens of curies, but returned to the background level within a day or so.

2281 PRODUCTION AND EMISSION OF TRITIUM FROM NUCLEAR FACILITIES, AND THE RESULTING PROBLEMS. Bonka, H. (Technische Hochschule Aachen (Germany, F.R.)). pp 105-122 of Behaviour of tritium in the environment. Vienna; International Atomic Energy Agency (1979).

From Symposium on the behavior of tritium in the environment; San Francisco, CA, USA (16 Oct 1978).

The production rate of ^3H by various nuclear reactions is calculated for the various parts of nuclear power reactors. The ^3H-production per MW(e) and year for boiling-water reactors, pressurized-water reactors, MAGNOX, AGR, high-temperature reactors, heavy-water reactors and fast breeders is: 20 Ci, 19 Ci, 26 Ci, 18 Ci, 15 Ci, 170 and 32 Ci respectively. If the total ^3H of a large reprocessing plant is released through a 100-m high stack, the maximum radiation exposure exceeds the permissible total body dose of 30 mrem/a in the Federal Republic of Germany. By increasing the height of the stack, only the maximum radiation exposure can be reduced, not the collective dose. The collective dose over the first pass exposure is approximately 0.017 man.rem/Ci and after global distribution $9x10^{-4}$ man.rem/Ci. From the radiation protection point of view, between 80 and 90% of ^3H should be retained in reprocessing plants. At the moment it is advisable to mix the tritium with ocean water. From this mixed tritium the radiation exposure of the total body will be lower than 0.1 mrem yearly in the next century. For the disposal of tritium in the ocean an international agreement is required.

2282 DISPOSAL OF RADIOACTIVE WASTES. CHAPTER 11. Skitt, J. pp 122-125 of Waste disposal management and practice. Skitt, J. (Staffordshire County Council (UK)). London, England; Charles Knight (1979).

An account is given of the history and present position of legislation in the United Kingdom on the disposal of radioactive wastes. The sections are headed: introduction and definitions; history; the Radioactive Substances Act 1960; disposal of solid radioactive wastes through Local Authority services; function of Local Authorities; exemptions; national radioactive waste disposal service; incidents involving radioactivity.

2283 EVALUATION OF SYSTEMS INCORPORATING TRANSMUTATION FOR THE REDUCTION OF THE LONG TERM TOXICITY OF HIGH-LEVEL WASTE. Davidson, J.W. Austin, TX; University of Texas (1979). 412p. University Microfilms Order No. 79-20,101.

Thesis (Ph. D.).

One of the alternative high-level nuclear waste (HLW) management/disposal concepts proposed involves the separation from HLW of the elements with isotopes which dominate the radiotoxicity and the transmutation of these nuclides to shortlived or stable products. The waste management system required for transmutation employs chemical processing of HLW to recover waste nuclides for irradiation with neutrons in a transmutation device. The transmuter periodically requires replenishment of the target nuclides and chemical processing to remove the transmutation products. The waste streams from HLW processing and product recovery together comprise the discharge from the system. An imploding liner fusion reactor (ILFR) is assumed for the transmuter with the waste nuclides dissolved in a molten lead-lithium alloy blanket. The potential transmutation candidates are defined as the elements with toxicities per unit volume (toxicity indexes) in solidified HLW at 1000 years which are greater than that for 0.2% uranium ore (carnotite). The candidates which require separation for transmutation are the actinides; Np, Pu, Am, and Cu and the fission products; I and Tc. Certain assumptions were made for the parameters for the ILFR and its operating conditions, and a system evaluation was done. System evaluations indicate that blanket waste loadings on the order of several percent of the total concentration result in attractive performance in terms of high transmutation capacities and low blanket processing requirments. It appears that transmutation system goals in terms of toxicity reduction are achievable with a modest number of transmuters. In addition, requirements for transmuter performance, chemical processing capacity and chemical separation efficiency appear to be within projected values for this technology.

2284 (BNL-tr--691) INVESTIGATION OF RADIATION RESISTANCE OF NATURAL ROCK SALT. Spitsyn, V.I.; Barsova, L.I.; Kabakchi, S.A.; Zyazyulya, I.I.; Lebedeva, I.E. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow). 1979. Translation of Preprint IAEA-SM--243/109 17p. Dep. NTIS, PC A02/MF A01.

The physicochemical processes in samples of rock salt of different deposits, which occur as a result of the action of γ radiation in a wide dose range, are investigated. The nature and kinetics of accumulation of electron and hole centers are investigated relative to the impurity content, absorbed dose, and temperature. The formation of F, M, and V centers is demonstrated and the processes of thermal and radiation coagulation of these centers to colloidal sodium and chlorine gas are studied. The dose absorbed by the crystal can be determined from the number of produced F centers. The efficiency of liberating gaseous products, mainly molecular chlorine, depends on the impurity content. The molecular hydrogen and hydrogen peroxide are produced as a result of dissolving irradiated samples of rock salt. There is a linear correlation between the quantity of produced hydrogen and the concentration of F centers in the sample. A method of determining the energy stored by the crystal from the amount of liberated hydrogen is proposed. The variation of microhardness and brittleness of the rock salt samples of different deposits, which were irradiated in a wide dose range (to 8000 Mrad), is investigated. It is shown that the kinetics of variation of microhardness and maximum radiation hardening of crystals depend on the radiation-induced defects and on impurities.

2285 TRANSPORT THROUGH A TRENCH COVER OF GASEOUS TRITIATED COMPOUNDS FROM BURIED RADIOACTIVE WASTES. Lu, A.H.; Matuszek, J.M. (New York State Dept. of Health, Albany (USA)). pp 655-669 of Behaviour of tritium in the environment. Vienna, Austria; International Atomic Energy Agency (1979).

From Symposium on the behavior of tritium in the environment; San Francisco, CA, USA (16 Oct 1978).

The wastes in commercial radioactive-waste land burial sites produce anaerobic decomposition products such as CH_4, CO, CO_2, NH_3 and H_2S which permit migration of ^3H and ^{14}C to the atmosphere. In the low-level radioactive-waste trenches at West Valley, New York, the most abundant radioactive gas was $^3HCH_3$ (as high as $2nCi/cm^3$ in some samples). A new empirical method has been developed to determine the bulk permeability of the trench cover and to estimate rates of gas production

and gas release. The pressure differential between trench gas and atmosphere is measured with a sensitive, electrically operated transducer. At West Valley the trench covers were found to be highly permeable to pressure-induced flow of gases and air. Interconnected fractures apparently penetrate through the trench cap and determine the rate of flow of $^{3}HCH_{3}$ and other radioactive gases from the trenches. The pressure of gas in the trench has been reproduced with an empirical model, GASFLO, using pressure differentials measured in the field and parameters chosen to obtain the best fit to the experimentally observed pressures. The amount of $^{3}HCH_{3}$ released to the environment was estimated at approximately 1 to 8Ci annually from various trenches.

2286 RADIOACTIVE WASTE DISPOSAL-A COMPARISON OF ALTERNATIVE NUCLEAR FUEL CYCLES. Krugmann, H.H.L. Princeton, NJ; Princeton Univ (1979). 319p. University Microfilms Order No. 79-10,121.

Thesis (Ph. D.).

The bearing of issues relating to radioactive waste disposal on policy choices between alternative nuclear fuel cycles is examined. Two principal choices are discussed. One is between retaining the current once-through fuel cycle and establishing a more uranium efficient fission economy involving the recycle of plutonium produced by neutron absorption in the nonchain-reacting uranium isotope ^{238}U. The other is between introducing this plutonium economy and embarking on an alternative uranium efficient fission economy which would involve the recycle of the artificial isotope ^{233}U produced by neutron bombardment of thorium. Two major policy questions relevant to choices between fission economies are explored: (i) what are the consequences for radioactive waste disposal of switching from one nuclear fuel cycle to another and how significant are these consequences relative to other concerns. The effects of changing to another fuel cycle on the radioactive waste disposal problem are discussed in terms of waste properties; (ii) what is the influence of choice of fuel cycle on the amount and concentration of fissile plutonium in nuclear wastes and the possible diversion of this plutonium to weapons uses. Fissile plutonium inventories in wastes from alternative fuel cycles are compared and the nature and commercial attractiveness of spent fuel repositories as plutonium mines is discussed.

2287 HANDLING AND STORAGE OF HIGH-LEVEL RADIOACTIVE LIQUID WASTES REQUIRING COOLING. Vienna; IAEA (1979). 115p.

The technology of high-level liquid wastes storage and experience in this field gained over the past 25 years are reviewed in this report. It considers the design requirements for storage facilities, describes the systems currently in use, together with essential accessories such as the transfer and off-gas cleaning systems, and examines the safety and environmental factors.

2288 SHALE AS A RADIOACTIVE WASTE REPOSITORY: THE IMPORTANCE OF VERMICULITE. Komarneni, S.; Roy, D.M. ;Pennsylvania State Univ., University Park ;USA). Materials Research Labs.). Journal of Inorganic and Nuclear Chemistry ; 41: No. 12, 1793-1796(1979).

Cesium sorption and fixation properties of thirty shale minerals and shales were investigated in search of a criterion for the suitability of shales for a radioactive waste repository. Shales and illites containing vermiculite fixed the largest proportion of total Cs sorbed (up to 91%) against displacement with 0.1 N KCl. For example, a slate sample fixed 33% of the total Cs sorbed while its weathered counterpart in which chlorite had altered to vermiculite fixed 89% of the total Cs sorbed. Since Cs is one of the most soluble and hazardous radioactive ions, its containment is of great importance in safe radioactive waste disposal. Presence of vermiculite in a shale body may therefore, serve as one criterion in the selection of a suitable shale for radioactive waste disposal if and when shales in geologically stable areas are selected for repositories.

2289 Sicherheit und Umweltschutz bei der nuklearen Entsorgung. (SAFETY AND ENVIRONMENTAL PROTECTION IN NUCLEAR WASTE MANAGEMENT). Baumgaertner, F. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Heisse Chemie). Bonn, Germany, F.R.; BMFT (1979). 77p. (In German).

With the salt domes of North-West Germany Federal Germany, has nearly ideal conditions for a safe final storage of nuclear waste. The practical results show that all technical safety requirements in nuclear waste management can be met at the present state of the art. This assures technical and scientific experts of the fact that there will be only conventional risks in the nuclear waste management centre. The risk may be even lower than what we have learned to accept in our daily life.

2290 HOW TO STORE WASTES. Gruhier, Fabien. Sciences et Avenir ; No. 27, 44, 46, 48-51(1979). (In French).

The different solutions to store radioactive wastes are exposed, as no technical solution is satisfactory for their elimination. Liquid wastes temporary storage in tanks, vitrification, storage in suitable geological formations, reprocessing problems are evoked.

2291 Der Gorleben-Report. Ungewissheit und Gefahren der nuklearen Entsorgung. Auszuege aus den Gutachten und dem Hearing der niedersaechischen Landesregierung. (GORLEBEN REPORT. INSECURITY AND DANGERS OF NUCLEAR WASTE MANAGEMENT. EXCERPTS FROM THE EXPERT'S REPORTS AND THE HEAVING HELD BY THE LOWER SAXONY GOVERNMENT). Hatzfeld, H. Graf; Hirsch, H.; Kollert, R. (eds.). Frankfurt am Main, Germany, F.R.; Fischer (1979). 207p. (In German).

The building of the reprocessing plant in Gorleben was declared 'politcally not feasible'. This means: the socio-political and the safety-political objections of a broad publicity against an entrance into the plutonium-society which seems unavoidable make a consensus impossible. This has given the public discussion about nuclear energy a new dimension. By commenting the Gorleben-hearing, the editors of this book show the most important reasons of this development. For the first time, a large technical project and its long-term consequences over generations were discussed in public which at the same time formed a model for interest-independent debates about other topics.

2292 LOW-FLOW, LOW-PERMEABILITY MEASUREMENTS IN LARGELY IMPERMEABLE ROCKS. PROCEEDINGS OF THE NEA/AIEA WORKSHOP, PARIS, 19-21 MAR 1979. Paris, France; OECD (1979). 306p.

From Workshop on low-flow, low-permeability measurements in largely impermeable rocks; Paris, France (19 - 21 Mar 1979).

Geological formations considered as potential candidates for the siting of radioactive waste repositories must contain no or little circulating ground water since, over the long term, ground water could transport particular radionuclides over long distances and even back to the biosphere. It is therefore essential that every candidate disposal formation be carefully evaluated in relation to its potential for transmitting fluids. Since suitable formations are necessarily characterized by negligible fluid flows, the above requirement implies some capability of measuring extremely low permeabilities in situ. The types of rocks that have been frequently considered as potential host materials for radioactive waste are rock salt, argillaceous sediments and crystalline rocks. Some countries with geologic disposal programmes are conducting or planning field experiments of various kinds. They are all confronted with the problem of how to measure very low permeabilities in situ. The OECD Nuclear Energy Agency in cooperation with the International Atomic Energy Agency organized this meeting. These proceedings constitute a record of the papers presented and the discussions held during the workshop.

2293 GEOCHEMICAL CONSIDERATIONS IN THE CHOICE OF A HOST ROCK FOR THE DISPOSAL OF HIGH-LEVEL RADIOACTIVE WASTES. Chapman, N.A. London; HMSO (1979). 41p.

The disposal of the long lived and highly active ('high-level') radioactive wastes resulting from the reprocessing of nuclear fuels is a complex international problem. Entombment at depth in an engineered 'repository' in a suitable rock body is presently under investigation. Such disposal calls for a considerable broadly based research effort, not least in the fields of hydrogeology, rock mechanics and geochemistry. The present report is a preliminary appraisal of the most pertinent factors affecting choice of rock type and disposal management in one of these fields, geochemistry. As such it dwells largely on one single aspect of the problem, that of the thermal effects of the emplaced wastes (which emit heat for up to 600 years after their burial) on the various rock types advanced as possible hosts for a repository. The study is basically a compilation of available data on the behaviour of the constituent minerals of granites, argillaceous rocks and evaporites under the physico-chemical conditions likely to occur in an active repository at depth. These data are combined to provide guidelines and geochemical constraints on choice of rock types and their maximum admissible thermal loadings.

2294 TRANSURANIC WASTE DEGRADATION UNDER WASTE ISOLATION PILOT PLANT (WIPP) CONDITIONS. Kosiewicz, S.T.; Zerwekh, A. (Los Alamos Scientific Lab., NM). Transactions of the American Nuclear Society ; 33: 426(1979). (CONF-791103--).

2298 FINAL ENVIRONMENTAL IMPACT STATEMENT. HANDLING AND STORAGE OF SPENT LIGHT WATER POWER REACTOR FUEL. Washington, DC; Nuclear Regulatory Commission (1979). v, 3 volumesp. (NUREG--0575). Information Resources Press, 2100 M Street, NW, Suite 316, Washington, DC. (MF or HC) Order No. 79-1153.

Alternative methods for storage of light water reactor spent fuel through the year 2000 are proposed. At-reactor (AR) and away-from-reactor (AFR) storage techniques or termination of the generation of spent fuel through the shutdown of nuclear power plants and the replacement with coal-fired units are considered. A cumulative total of 82,000 metric tons of heavy metal spent fuel is projected for the year 2000, and storage capacity of reactor storage pools at existing plants or those under construction would be inadequate. The preferred course of action would provide for increased AR storage through compact storage in the fuel pools to furnish immediate relief of the capacity problem; when present AR capacity is exhausted, discharged spent fuel would be shipped immediately to AFR facilities for perpetual storage.

2299 La migration des radionucleides a vie longue dans la geosphere. Compte rendu. (MIGRATION OF LONG-LIVED RADIONUCLIDES IN THE GEOSPHERE. PROCEEDINGS). Paris, France; OECD (1979). 337p. (In English and French).

From Workshop on the migration of long-lived radionuclides in the geosphere; Brussels, Belgium (29 - 31 Jan 1979).

The most promising solution for the disposal of long-lived radioactive wastes is the emplacement into suitable, deep geological formations. Safety analyses normally assume that over the long term ground water may come into contact with radioactive waste as a consequence of the failure of the various barriers. The assessment of the possible consequences of this breach of containment

requires a good understanding of the physico-chemical mechanisms that control the migration of radionuclides through the disposal formation and the geologic materials that intervene between the disposal formation and the surface. Research programmes are being pursued in several countries to investigate the migration of radionuclides in geological formations. Recognizing that scientists working in this field need to meet periodically in order to discuss their respective experiences and coordinate future work, the Commission of the European Communities and the OECD Nuclear Energy Agency decided to organize this workshop. These proceedings represent a record of the papers and the discussions at the meeting.

2317 DECOMMISSIONING OF THE SURFACE FACILITIES ASSOCIATED WITH REPOSITORIES FOR THE DEEP GEOLOGICAL DISPOSAL OF HIGH-LEVEL NUCLEAR WASTE. Heckman, R.A. (California Univ., Livermore (USA). Lawrence Livermore Lab.). pp 105-119 of Decommissioning of nuclear facilities. Proceedings of an international symposium jointly organized by the IAEA and the OECD NEA and held in Vienna, 13-17 November 1978. Vienna: IAEA (1979).
From International symposium on the decommissioning of nuclear facilities: Vienna, Austria (13 Nov 1978).
A methodology is presented in this paper to evaluate the decommissioning of the surface facilities associated with repositories for the deep geological disposal of high-level nuclear wastes. A cost/risk index (figure of merit), expressed as man.rem, is proposed as an evaluation criterion. On the basis of this cost/risk index, we gain insight into the advisability of adapting certain decontamination design options into the original facility. Three modes are considered: protective storage, entombment, and dismantlement. Cost estimates are made for the direct labour involved in each of the alternative modes for a baseline design case. Similarly, occupational radiation exposures are estimated, with a larger degree of uncertainty, for each of the modes. Combination of these estimates produces the cost/risk index. To illustrate the methodology, an example using a preliminary baseline repository design is discussed.

2318 DISPOSAL OF WASTE RESULTING FROM THE DISMANTLING OF NUCLEAR FACILITIES. Lavie, J.M.; Giraud, R.G. (CEA, 75 - Paris (France)); Bardet, G.B.; Pouteaux, M.P. (Societe INFRATOME, 75 - Paris (France)); Charamathieu, A.C. (Societe de travaux en milieux ionisants, Paris, France). pp 337-352 of Decommissioning of nuclear facilities. Proceedings of an international symposium jointly organized by the IAEA and the OECD NEA and held in Vienna, 13-17 November 1978. Vienna: IAEA (1979). (In French)
From International symposium on the decommissioning of nuclear facilities: Vienna, Austria (13 Nov 1978).
The decommissioning of nuclear facilities will raise the problem of ultimate disposal of materials and equipment contaminated by a wide range of natural and artificial radioactive products. Classification of the waste stemming from the dismantling of nuclear facilities is based on the nature and half-life of the contaminating radionuclides. The presence of large quantities of noble metals and alloys among such waste is an incentive to devise decontamination procedures which would allow them to be reused. The problem has been solved as far as the storage and disposal of waste contaminated by activation products and fission products are concerned; the approach is described and illustrated by its application at the La Manche storage site in France. With regard to alpha-contaminated waste where the decay times are very long, the aim is to find and develop effective decontamination procedures for treating the waste and concentrating the alpha radioactivity. Furthermore, in the international organizations the representatives of the countries concerned are seeking to promote a consistent policy in seeking solutions to the problem of final storage of waste contaminated by transuranium elements. Studies have already begun, and will be continued, aimed at thorough decontamination of metal waste with a view to eliminating the 'extrinsic' radioactivity. The limits accessible by chemical and mechanical processes are inadequate and a research programme is now under way to ascertain how effective the fusion

decontamination process may be.

2319 DISPOSAL OF IODINE-129. Morgan, M.T.; Moore, J.G.; Devaney, H.E.; Rogers, G.C.; Williams, C.; Newman, E. (Oak Ridge National Lab., TN). Contract W-7405-ENG-26. pp 453-459 of Scientific basis for nuclear waste management. Volume 1. McCarthy, G.J. (ed.). New York, NY; Plenum Publishing Corporation (1979).

One of the problems to be solved in the nuclear waste management field is the disposal of radioactive iodine-129. This nuclide is one of the more volatile and long-lived fission products. Studies at ORNL have shown that fission products can be fixed in concrete for permanent disposal. Current studies have demonstrated that practical cementitious grouts may contain up to 18% iodine as barium iodate. The waste disposal criterion is based on the fact that harmful effects to present or future generations can be avoided by isolation and/or dilution. Long-term isolation is effective in deep, dry repositories; however, since penetration by water is possible, although unlikely, release was calculated based on leach rates into water. Further considerations have indicated that sea disposal on or in the ocean floor may be a more acceptable alternative.

2320 SELECTING SITES FOR URANIUM MILL WASTE DISPOSAL FACILITIES. Robinette, M.; Williams, R.E. (Univ of Idaho, Moscow). pp 244-265 of Uranium resource/technology seminar 2, 1979. Golden, CO; Colorado School of Mines (1979).

From Uranium resource technology seminar; Golden, CO, USA (12 Mar 1979).

This paper deals only with dsite selection properly interpreted geophysical well logs reduce drillings costs by guiding the location, proper drilling and construction of test holes, production or disposal wells. Geophysical well logs can provide information about water quality, fluid movement and lithology. These parameters are important for evaluation of a site where ground-water pollution may be a factor. 13 refs.

2321 PILOT HEATER TEST OF THE SWEDISH NUCLEAR FUEL SAFETY PROGRAM. Carlsson, H.; Stephanson, O.; Leijon, B. (Univ of Lulea, Swed). pp 85-90 of Fourth international congress on rock mechanics. Vol. 1. Salem, NH; A.A. Balkema (1979).

From 4. international congress on rock mechanics; Montreux, Switzerland (2 Sep 1979).

In the Stripa mine in Sweden, a pilot heater test has been carried out at 348 m level in a jointed granite. A central main heater was placed at the bottom of a 10 m deep borehole. At different distances from the heater, stress and temperature changes were monitored. Measurements of movements along major fractures on the surface and changes of water inflow in boreholes were also carried out. 6 refs.

2322 INFLUENCE OF THE TEMPERATURE ON GROUNDWATER MOVEMENTS IN JOINTED ROCK MASSES WITH APPLICATIONS TO RADIOACTIVE WASTE DISPOSAL. Lindblom, U.E. (Hagconsult, Goteborg, Swed). pp 229-236 of Fourth international congress on rock mechanics. Vol. 1. Salem, NH; A.A. Balkema (1979).

From 4. international congress on rock mechanics; Montreux, Switzerland (2 Sep 1979).

In the Swedish radioactive waste repository concept, influences of temperatures on groundwater flow are indirect on hydraulic conductivity and direct on thermally induced flow. The latter does not lead to the formation of convective cells but causes a slight upheaval of the regional flow above the repository. The effect on instrinsic permeability and viscosity is more pronounced which is demonstrated. 7 refs.

2323 FINAL STORAGE CONTAINER FOR RADIOACTIVE WASTE. Hempelmann, W.; Schuchardt, M.; Schilling, F. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,726,335/A/. 21 Dec 1978. 12p. (In German).

The final storage container system makes it possible to store materials with high tritium or nuclear fuel activity in an underground storage location. The materials are placed in a container with cast steel shielding, which fits into an iron-hooped barrel. The intermediate space in the barrel is filled with concrete or bitumen, and the iron-hooped barrel is closed with a double lid system. The iron-hooped barrel is, in turn, accommodated in concrete shielding. The container and the iron-hooped barrel are sealed so as to be gastight.

2324 TVA TO BE FIRST AT CLEANING UP OLD URANIUM SITE. Koster, J. (South Dakota Resources Coalition). High Country News; 10: No. 23, 1-3(1 Dec 1978).

Scores of western towns share the problem of defunct uranium mills and millions of tons of mill tailings. People who live in these towns may run a higher risk of contracting cancer and birth defects, and may have a generally decreased life expectancy due to radiation from tailings piles. Remedial action has begun in Edgemont, S.D. Its uranium mill will probably be the first in the country to be decommissioned and have its tailings buried. The population could be exposed to radiation from the mill site in five possible ways: inhaled radon gas and radon ''''daughters''''; gamma radiation from the tailings and contaminated mill structures; inhalation and ingestion of alpha radiation from radium and thorium in the windblown tailings; contaminated water; and internal radiation due to uptake of radioactive elements by plants and animals. Plans for decommissioning the mill site are discussed. (2 maps, 2 photos)

2325 PROBLEMS OF RADIOACTIVE WASTE DISPOSAL IN A NUCLEAR MEDICINE DEPARTMENT. Havlik, E.; Bergmann, H.; Hoefer, R. (Vienna Univ. (Austria). 2. Medizinische Klinik). Radiobiologia, Radiotherapia ; 19: No. 6, 803-809(Dec 1978). (In German).

According to the increasing application of unsealed radioactive materials in nuclear medicine facilities the radiation exposure of medical and allied health personnel aggravates at the same rate. The main groups of radioactive wastes originate from diagnostic and therapeutic procedures, from test preparations as well as from excretions of patients treated with radiopharmaceuticals. The waste disposal methods differ according to the nature of the wastes (solid, liquid, gaseous) and to the half-life of the radionuclides used. As to the the disposal of radioactive excretions, measuring results of bedlinen and dishes contaminated with ^{131}I are discussed.

2326 WASTE MANAGEMENT. Nuclear News (La Grange Park, Illinois) ; 21: No. 15, 67-69(Dec 1978).

After an exceptionally smooth test period, the high-level waste vitrification plant at Marcoule, France, (initially a demonstration

plant) now operates on a routine industrial basis. At the plant, backlogged military waste is solidified, and natural uranium fuel is reprocessed. Boro-silicate glass was selected as the preferred solidification route. The pilot plant at Marcoule opened in 1969 and produced some 12 tons of glass containing five MCi of fission product activity. W. Germany, Belgium, and Japan are showing interest in the Vitrification de Marcoule (AVM) process. (2 diagrams, 2 photos)

2327 RADIOACTIVITY LEACH TESTS UNDER HIGH HYDROSTATIC PRESSURE ON FULL SIZE MONOLITHIC CEMENT PACKAGES OF LWR WASTES FOR SEA DUMPING. Seki, S.; Ouchi, K.; H., Isamu; Ito, A. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Nippon Genshiryoku Gakkaishi (Journal of the Atomic Energy Society of Japan) ; 20: No. 12, 887-896(Dec 1978). (In Japanese).

Monolithic cement-solidified products of simulated evaporator concentrates from LWR packaged in 200 l drums have been subjected to leach tests of radionuclides. The leach tests were crrried out under the condition which simulates hydrostatic pressure, temperature and flow velocity on the sea bed of 5,000 m depth. The principal results are obtained as follows: (1) No radioactivity in the leachant could be detected during the test extended to 675 hr on a cement-solidified product with asphalt capping. Water ingress through the asphalt capping layer was not perceived. (2) Solidified packages with intentionally prepared bare surface were tested to find out leaching coefficients(apparent diffusion coefficients) F sub(1). Values of F sub(1) were found to be 1.6 x 10^{-4} for ^{137}Cs and 1.2 x 10^{-9} cm^2/day for ^{60}Co, in case of the blast furnace slag cement (C-class) solidified product of simulated waste from BWR. As to the Portland cement-solidified product of simulated PWR waste, F sub(1) was 1.5 x 10^{-3} cm^2/day for ^{137}Cs. (3) By using these leaching coefficients, a long-term estimation of the amounts leached out was attempted considering the decay of radionuclides.

2328 CONTROL AND MONITORING SYSTEM OF RADIOACTIVE EFFLUENTS IN RADIOISOTOPE FACILITIES. Yamaguchi, K.; Matsuno, K.; Inagaki, S.; Maekawa, Y. (Fuji Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Fuji Jiho (The Fuji Electric Journal) ; 51: No. 12, 691-696(Dec 1978). (In Japanese).

This paper is described on the control and monitoring system for low-level radioactive effluents in radioisotope facilities. At first, this paper presents general description of the methods for radioactive effluent treatment. The methods are storing the effluent in tanks, dilution, and concentration. The effluents are usually stored in storage tanks, then transferred into dilution tanks. After dilution, the effluents are discharged. Intensity of radioactivity is measured before and during discharge. A system for the control and monitoring of radioactive effluents was designed and constructed for the use of Tohoku University. The system consists of three storage tanks and a dilution tank. The transfer of effluents is made by valve control. The control can be done automatically. When the level of activity is lower than the pre-set valve, the effluent is discharged. Another system was designed and constructed for the use of Hokkaido University. The system consists of a cesspool, two draining tanks, eight storage tanks and a dilution tank. The transfer of effluents is made by a tandem method. The operation can be made automatically. When the radioactive concentration is larger than the permissible valve, the dilution of effluents is made automatically.

2329 BUILDING FOR TREATMENT OR STORAGE OF TOXIC OR RADIOACTIVE MATERIAL. Stoll, W.; Hagenberg, W. (to Alpha Chemie und Metallurgie G.m.b.H. (ALKEM), Hanau (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,620,585/B/. 16 Nov 1978. 3p. (In German).

In order to shield a building, in which toxic or radioactive material is stored, with relatively small effort there is proposed to place it in a water pool. According to the invention the roof shall be so far below the water surface that the water volume above is at least equal to the inner volume of the house. Other subclaims of the patent refer to the access to the building, the ventilation system, the cleaning of the water and the cover of the water surface.

2330 GEOLOGICAL CONDITIONS OF THE USE OF THE SALIFERON STRATA OF THE UKRAINIAN SSR FOR WASTE DISPOSAL. Lepkij, S.D.; Khrushchov, D.P. Visnik Akademii Nauk Ukrains'koi RSR ; No. 11, 78-81(Nov 1978). (In Ucrainian).

Analyzed are geological peculiarities of the saliferon formations of the Ukrainian-Dnepropetrovsk-Donetsk hollow, of the north-west Donas, Prikarpatija and Zakarpatian cavity to find out the suitable places for the burial of highly toxical and radioactive wastes. The solid and liquid wastes should be transformed to the pasty state before the burial with the further pumping into the underground cavities.

2331 TECHNICAL STANDARD ON DISPOSAL OF RADIOACTIVE WASTES. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 8, 2-5(Nov 1978). (In Japanese).

The technical standard on the disposal of radioactive wastes submitted to the Atomic Energy Commission of Japan by the subcommittee on radioactive waste management techniques is presented. Disposal of radioactive wastes is made on the sites of enterprises concerned and in areas outside the sites (including the sea). Appropriate measures must be taken in both cases, according to the nature of wastes (gas, liquid and solid) and to the method of the disposal (discharge, storage, and open abandonment). In the disposal of radioactive wastes on the site of a factory or enterprise, direct release, tank containment, incineration, etc. are used. In the disposal in areas outside the sites, and appropriate storage facility of sea disposal is used. In the latter case, the sealing in vessels or the solidification within metallic vessels using hydraulic cement is used.

2332 METHOD OF TAKING SLUDGES OUT OF RADIOACTIVE LIQUID WASTES STORAGE VESSEL. Tokuda, T. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1953-122,099/A/. 25 Oct 1978. 2p. (In Japanese).

Purpose: To facilitate the exhaustion of sludges and prevent the increase in the concentration of radioactivity within the vessel. Method: A bucket is inserted into the liquid wastes within a radioactive waste storage vessel, and the quantity of sludges in the liquid wastes accumulated in the bucket is detected. According to the results of detection, when a predetermined quantity of sludges has been accumulated in the bucket, the bucket is taken out of the storage vessel and the sludges are treated in other facilities.

2333 METHOD AND DEVICE FOR MARINE DISPOSAL OF RADIOACTIVE WASTES. Tsuda, S. (to Utoku Express Co., Yokohama (Japan)). Japanese Patent 1953-122,100/A/. 25 Oct 1978. 6p. (In Japanese).

Purpose: To provide the subject method and device wherein a unit throw-away can body formed by firmly tying a several drum vessels is thrown away in seawater thereby carrying out a throw-away operation rapidly, safely and highly efficiently. Method: In the hatch is stacked in multistage a unit throw-away can body formed by firmly tying four drums. A self-travelling suspended bedplate with a thrown away rail device runs on rails, and is fixed to a necessary position. An accomodation and throwing away operation control chamber applied with radiation protection is attached to this self-travelling suspended bedplate to perform surveillance of the interior of the chamber, and accommodation and throwing away operation is carried out by a picture image sent from a television camera and safe and accurate operations.

2334 RADIO-ACTIVE WASTE DISPOSAL AND DEEP-SEA BIOLOGY. Rice, A.L. (Institute of Oceanographic Sciences, Wormley, Godalming, Surrey (U.K.)). Oceanologica Acta ; 1: No. 4, 483-491(Oct 1978).

The deep-sea has been widely thought of as a remote, sparsely populated, and biologically inactive environment, well suited to receive the noxious products of nuclear fission processes. Much of what is known of abyssal biology tends to support this view, but there are a few disquieting contra-indications. The realisation, in recent years, that many animal groups show a previously unsuspected high species diversity in the deep-sea emphasized the paucity of our knowledge of this environment. More dramatically, the discovery of a large, active, and highly mobile abysso-bentho-pelagic fauna changed the whole concept of abyssal life. Finally, while there is little evidence for the existence of vertical migration patterns linking the deep-sea bottom communities with those of the overlying water layers, there are similarly too few negative results for the possibility of such transport mechanisms to be dismissed. In summary, biological knowledge of the abyss is insufficient to answer the questions raised in connection with deep-sea dumping, but in the absence of adequate answers it might be dangerous to ignore the questions.

2335 SORPTION AND MIGRATION STUDIES OF FISSION PRODUCTS FOR GROUND WASTE DISPOSAL. Lee, S.H.; Chun, K.S. (Korea Atomic Energy Research Inst., Seoul (Republic of Korea)); Yoon, Y.K. (Korea Inst. of Science and Technology, Seoul (Korea)). Journal of the Korean Nuclear Society ; 10: No. 3, 153-164(Sep 1978).

The problems of solid waste disposal into the ground in connection with environmental aspects in the vicinity of a site would be very significant, though ground disposal for solid waste is a safe and economical method. Studies of the waste-movement and migration of radionuclides (Sr-90 and Cs-137) for the disposal into the ground were performed under laboratory and field conditions. Affinity of the soils for radionuclide solution was higher than that in the acid solution. The sorption of radionuclides by the soils showed a time-dependent reaction. The migration rates of radiostrontium and radiocesium were a range of 3.73×10^{-3} to 10.9×10^{-3} cm/day. The nuclides in the soil migrate much more slowly than the water, probably due to its high exchange capacity. The observed distribution of tritium was compared with that calculated by a mathematical model based on diffusivity. This study suggests that the tritiated water can be used to trace the movement of ground water.

2336 DISPOSAL O RADIOACTIVE WASTES FROM FISSION REACTORS. Cohen, B.L. (Pittsburgh Univ., PA (USA). Nuclear Physics Lab.). Uspekhi Fizicheskikh Nauk ; 126: No. 1, 101-121(Sep 1978). (In Russian).

The properties of radioactive wastes formed during the operation of nuclear reactors are presented in a popular form, and their possible effects on human health and environment is studied. The plans of their disposal in safe underground waste storages are discussed. A variant of the disposal of radioactive wastes at the depth of 600 meters in salt stratum is considered. Annual wastes of all nuclear power plants of the USA (after the complete transition to nuclear energetics) would occupy less than a half of a square kilometer, taking account of heat evolution of containers with borosilicate glass. The possibility of waste leakage from a storage is considered; a conclusion is made that this results in 0.4 lethal cases for the first mullion years plus 4 more cases for next 100 million years. Thus, from the point of view of long prospects, nuclear energetics provides the means for cleaning the Earth from natural radioactivity, which causes about 50 lethal cases for each million years.

2337 HANDLING OF SPENT NUCLEAR FUEL AND FINAL STORAGE OF VITRIFIED HIGH LEVEL REPROCESSING WASTE. NUCLEAR FUEL SAFETY PROJECT. Neue Technik ; 20: No. 9, 443-447(Sep 1978).

From 5. International fair and technical meetings of nuclear industries; Basel, Switzerland (3 - 7 Oct 1978).

In April 1977 the Swedish Parliament passed a Law, which stipulates that new nuclear power units can not be put into operation unless the owner is able to show that the waste problem has been solved in a completely safe way. The task of investigating how radioactive waste from a nuclear power plant should be handled and stored was previously the responsibility of the National Council for Radioactive Waste Management (PRAV). This Council was formed in November 1975 as the result of a proposal made by the Government Committee on Radioactive Waste (AKA Committee). In response to the Government bill proposing the Law, the power industry decided in December 1976 to give top priority to the investigation of the waste problem in order to meet the requirements of the Law. Therefore, the Nuclear Fuel Safety Project (KBS) was organized. The first report from the KBS project entitled 'Handling of spent nuclear fuel and final storage of vitrified high level reprocessing waste' was submitted in December 1977.

2338 SHAFT CONVEYOR. Nolte, K.H.; Simmich, K.; Verhoeven, J.; Sondermann, W.; Frotscher, H.; Schuchardt, M.; Wolf, R.; Kolditz, H.; Schwaegermann, H.F. (to Siemag Transplan G.m.b.H., Netphen (Germany, F.R.)); Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Muenchen (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,703,279/A/. 10 Aug 1978. 15p. (In German).

This device for the conveyance along shafts of radioactive waste usually enclosed in metal

barrels is based on a single mechanism which has proved successful in mining. The rope-hauled conveying vessel runs on 4 rollers above and below between guide rails on a vertical shaft and in its highest position is above ground in front of a loading device. A motor driven rolling table moves a standing barrel with the material being conveyed to in front of the loading opening of the conveying vessel, where a lever prevents further movement until the conveying vessel is in exactly the right position. After retraction of the interlocking lever, the rolling table moves the material being conveyed on the further rollers in a framework in the conveying vessel. This roller framework with its slightly transverse position leans the transport barrel against the vessel rear wall during transport. In the deep position of the conveying vessel the barrel moving downwards runs off the roller framework due to a slight tilting movement and falls into the cavern. Levers which can rotate around vertical axes grip the barrel in the conveying vessel and secure its position during transport. In the loading and unloading positions, i.e. in the highest and lowest position of the conveying vessel in the shaft, projecting rollers run on the back of the conveying basket on solid control curve paths. Rods connected to the rollers move the stop lever in the conveying vessel back against spring tensions. A barrel can be tipped out below or a new barrel can be loaded above. The tipping of he roller framework (at the lower end of the shaft) is controlled in the same way. The rolling table of the loading device automatically matches its height to the roller framework in the conveying vessel. A moving arm with contact shoe follows the standing barrel in the conveying vessel and checks its correct position. It takes over its task if the rolling table fails.

2339 MANUFACTURING HIGH-INTEGRITY STAINLESS-STEEL WASTE STORAGE TANKS. Gifford, A.F.; Mitra, S.; Holmes, M. Nuclear Engineering International ; 23: No. 275, 47-49(Aug 1978).

The construction and testing of storage tanks for handling highly active liquid wastes from British Nuclear Fuels' reprocessing operations are described. The tanks, 20 ft dia. 20 ft high, 18/13/1 Nb stainless steel, are housed in thick-walled concrete cells and are cooled to remove fission product decay heat. The internal fittings, also of the same steel, include cooling coils and various small vessels. To reduce site work to a minimum the tank is split into three sections, the welding and testing of which are discussed. The cooling coil assembly is split into three works fabricated and tested units in order to reduce the number of site welds. The standards for site work are as exacting as those employed at the works. The controls which are exercised for quality assurance are outlined.

2340 NATIONAL AND INTERNATIONAL ACTIVITIES IN THE FIELD OF UNDERGROUND DISPOSAL OF RADIOACTIVE WASTES. Richter, D.K. (International Atomic Energy Agency, Vienna (Austria). Div. of Nuclear Safety and Environmental Protection). International Atomic Energy Agency Bulletin ; 20: No. 4, 30-41(Aug 1978).

The paper underscores the importance of the safe disposal of radioactive waste originating from nuclear power plants. In many countries the continued industrial development of nuclear power has been made dependent on acceptable solutions to the problems of radioactive waste disposal. A brief summary is given of the work done in this area by fifteen Member States of the IAEA as well as an outline of the assistance and coordination that has been provided to this research effort by four international organizations including the IAEA.

2341 RADIOACTIVE WASTE. Blaylock, B.G. (Oak Ridge National Lab., TN). Journal of the Water Pollution Control Federation ; 1286-1291(Jun 1978).

42 papers dealing with high-level and long-lived radioactive wastes are reviewed. Many of these are general review papers covering a large body of literature. Different methods of waste disposal, i.e., disposal in geologic formations, ice sheet disposal, ocean disposal, and land burial and storage, are assessed as to their effects on human health through water pollution by the leached radioactivity. (BLM)

2342 INDUSTRIAL WASTES: RADIOACTIVE WASTE. Blaylock, B.G. (ORNL). Journal of the Water Pollution Control Federation ; 50: No. 6, 1286-1291(Jun 1978).

To render high level radioactive waste nontoxic, isolation from humans and their environment is necessary for 500,000-1,000,000 years. A consensus is that only geological formations will maintain integrity this long. Numerous methods have been proposed. Literature on radioactive waste disposal is reviewed. Ice sheet disposal, ocean disposal, routine release of low level waste, treatment, land burial and storage, mathematic models for transport of dissolved radionuclides, and transuranics are surveyed. (42 references)

2343 SHIELDING THICKNESS CALCULATIONS FOR LINE GAMMA-RAY SOURCES IN REGULAR GEOMETRICAL ARRAY. Lee, C.C.; Ro, S.G. (Korea Nuclear Fuel Development Inst., Taejon (Republic of Korea)). Bangason Bango Hakhoe Chi ; 3: No. 1, 29-32(Jun 1978).

A shielding calculation has carried out for a storage vault of 5292(42x42x3) waste drums in which the mixed radioactive gamma-emitters of fission products are contained. The required ordinary concrete shielding thickness seems to be approximately 50cm. The results in terms of dose rate for polyenergy gammas appear to be considerably higher than those of the averaged energy gamma.

2344 METHOD TO CLOSE ROCK CAVITIES. Holman, R.R. (to Westinghouse Electric Corp., East Pittsburgh, PA (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,749,110/A/. 18 May 1978. 14p. (In German).

There is described a device allowing to close openings in rock (e.g. in case of storage facilities for radioactive waste in salt beds) by means of molten rock of the same composition in such a way that there will be possible almost equivalent values of density and lower permeabilities than in the solid rock. An elongated tubular shell is introduced into the cavity to be closed and through an inner tube running inside it gravel is supplied under pressure. A heating facility arranged between the tubes is heating up the gravel and the surrounding rock until gravel as well as rock will melt and restore the original ground formation. The device is described in detail.

2345 PREPARATIONS FOR SEA DISPOSAL OF LOW LEVEL RADIOACTIVE WASTES. Tsuchiya, M. (Waste Management Center (Japan)). Nippon Genshiryoku Gakkaishi (Journal of the Atomic Energy Society of Japan) ; 20: No. 5, 319-

322(May 1978). (In Japanese).
The establishment of processing and disposal systems for radioactive wastes is one of the most important things in the promotion of nuclear power development. Among these, those for low level wastes are urgent because of their large quantities. Concerning the trial sea disposal of such wastes being planned, the following matters are described: survey of candidate sea areas, safety assessment of sea disposal, solidification of waste, and a disposal ship.

2346 EFFECT OF DIMENSION OF SPECIMEN ON AMOUNTS OF CESIUM-137, STRONTIUM-90, AND COBALT-60 LEACHED FROM MATRIX OF HARDENED CEMENT GROUT. Matsuzuru, H.; Ito, A. (Japan Atomic Energy Research Inst). Journal of Nuclear Science and Technology (Tokyo) ; 15: No. 4, 296-301(Apr 1978).
The relationship between the fraction leached and the ratio of surface area and volume of a specimen is examined to assess the safety of a cement composite for disposal. For strontium-90, cesium-137, and cobalt-60, the amount leached is directly proportional to the surface area-volume ratio. (3 graphs, 16 references, 2 tables)

2347 DURABILITY OF CONTAINERS FOR STORING SOLIDIFIED RADIOACTIVE WASTES. Angerman, C.L.; Rankin, W.N. (Savannah River Lab., Aiken, SC). Contract AT(07-2)-1. Materials Performance ; 17: No. 4, 9-18(Apr 1978).
Details are given of an analysis designed to identify materials suitable for storage of radioactive wastes incorporated into concrete or glass in above ground ambient air. Materials evaluated were carbon and low alloy steels, 304L steel, and Inconels 600 and 625. Wall thicknesses required for waste canisters were estimated from considerations of oxidation of the external surface, reaction with the waste-bearing concrete or glass, and strength to withstand the high internal pressures possible during thermal accidents. No material is expected to suffer excessive general, intergranular or pitting attack or any deterioration sufficient to disqualify it for the anticipated 100 year service life. The most desirable material from the standpoint of both properties and cost was 1020 carbon steel. For the glass waste form, can walls 1.27 cm (0.5 in.) would be required. For the concrete waste form, can walls 25.4 cm (10 in.) would be required if fire survival was chosen as a design-basis accident.

2348 UNDERGROUND STORAGE OF NUCLEAR INDUSTRY WASTES. de Marsily, G.; Ledoux, E. (Ecole Nationale Superieure des Mines, 75 - Paris (France)); Margat, J. (Bureau de Recherches Geologiques et Minieres (BRGM), 75 - Paris (France)); Barbreau, A. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette . Annales des Mines ; 184: No. 4, 35-52(Apr 1978). (In French).
The nature of nuclear cycle wastes and the various solutions for their elimination are briefly described. The part played by the geological barrier in the radioactivity containment is considered. Some radionuclides have a long life at a geological scale. So, it seems that waste disposal safety could not be based on a low probability of incident occurrence but rather on the proof that even in the case of a geological accident a relative containment of wastes could be assured. The element migration due to ground water has been modeled. This model has been applied to various theoretical geological formations in order to determine the most important parameters.

2349 (ORNL-tr--4672) PREPARATIONS FOR SEA DISPOSAL OF LOW-LEVEL RADIOACTIVE WASTE. Tsuchiya, M. Translated from Nippon Genshiryoku Gakkaishi (Journal of the Atomic Energy Society of Japan) ; 20: 319-322(7 Mar 1978). 8p. NTIS, PC A02/MF A01.
Establishment of a radioactive waste disposal system is one of the most important items in nuclear energy development. Among the wastes, low-level radioactive waste is produced in large quantities; thus a system for its disposal has to be established as soon as possible. The preparation for sea disposal tests which will be carried out in the near future in order to establish a sea disposal system, safety evaluation of sea disposal based on the results of investigation of the proposed sea site, the conditions which are necessary for waste disposal, and ships which may be used for the operation are discussed.

2350 WILL VITRIFIED HIGH ACTIVE REACTOR WASTE BE DEPOSITED ON THE SEABED. Koksvik, R.M. Ingenioer-nytt ; 14: No. 16, 6-7(24 Feb 1978). (In Norwegian).
The NRPB in the UK has carried out a preliminary study on the consequences of the disposal of high active waste on the ocean bed at great depths. This is reported in 'Assessment of the radiological protection aspects of disposal of high level waste on the ocean floor', by P.D. Grimswood and G.A.M. Webb (NRPB-R 48). This report is here briefly summarised and commented on. It deals with the radiological consequences to man of the erosion and corrosion of glassified (vitrified) radioactive waste, in the deep (>4000m) ocean, radionuclide migration and path ways to man. The conclusion is that considerations of radiological protection do not preclude the disposal of specially treated radioactive waste on the ocean bed.

2351 DISPOSAL OF NUCLEAR WASTE. Lorentzen, J. Teknisk Ukeblad ; 125: No. 9, 42(23 Feb 1978). (In Norwegian).
In reviewing Noyes Data Corporation's new book 'Radioactive waste disposal' the reviewer criticises the omission of the Swedish proposal to deposit vitrified waste clad in stainless steel in 500m deep shafts in bedrock. This in spite of a claim that the most advanced typographical methods have been used to ensure up-to-dateness. It is also pointed out that the chapter on fusion reactors presents outdated material. Otherwise the reviewer praises the thoroughness and completeness of the book, which has altogether 200 literature references.

2352 ARRANGEMENT FOR STORAGE OF RADIOACTIVE WASTE MATERIALS. (to STEAG Kernenergie G.m.b.H., Essen (Germany, F.R.)). Netherlands Patent 7,800,628/A/. 18 Jan 1978. 7p. (In Dutch).
The arrangement for the storage of radioactive wastes, and esp. that of radioactive products from nuclear power stations, with a storage reservoir with a standardised screening protection function, which is manufactured from a screening material in which is contained a collection space for the waste materials, characterised by in that the collection space for the waste materials includes a smaller insertable container is associated with an external collection reservoir and a number of auxiliary reservoirs of different sizes which may be selected, whilst the inner space between the inner wall

of the terminal wall reservoir and the auxiliary reservoir is subsequently filled with a screenining substance.

2353 STORAGE AND DISPOSAL OF NUCLEAR WASTES: PROSPECTS FOR THE NEXT 25 YEARS. Lyons, W.C. (Sci Appl, Inc, Hydro and Geoeng Div). Proceedings, Intersociety Energy Conversion Engineering Conference ; 2: 1290-1294(1978). (CONF-780801--P2).

From 13. intersociety energy conversion engineering conference; San Diego, CA, USA (20 Aug 1978).

This paper discusses the processing, handling, storage, and disposal options available for both commercial high-level radioactive wastes and defense radioactive wastes. A review is made of the past performance of government in finding solutions for these pressing problems. The present inventory of commercial and defense waste is discussed and the inventory for the near future projected. The relationships between storage and disposal technologies and the commercial and defense wastes are discussed. It is suggested that the commercial fuel cycle will be delayed as long as defense and commercial wastes disposal technologies are not demonstrated. An assessment is made as to which technologies and techniques appear to be the most useful for accomplishing the critical near term task of isolating the defense wastes. A discussion is then made as to how these technologies and techniques will be used for the commercial fuel cycle.

2354 STABILIZATION OF URANIUM MILL TAILINGS. Tibbs, N.H. (Southeast Missouri State Univ., Cape Girardeau); Rath, D.L.; Otto, E.E.; Alsup, L.F. pp 219-232 of Fifth annual UMR-DNR conference on energy. Morgan, J.D. (ed.). Rolla, MO: Univ. of Missouri (1978).

From 5. conference on energy; Rolla, MO, USA (Oct 1978).

Large volumes of uranium mill tailings are being generated, requiring comprehensive long-term management programs to reduce health and environmental risks. Management programs are available which provide adequate secure long-term storage, but research on innovative concepts is necessary to develop improved, more efficient methods.

2355 (ANL-Trans--1181) HANDLING HIGH-LEVEL RADIOACTIVE WASTES. Heimerl, W. Translated from Chemie in Unserer Zeit ; 12: No. 3, 82-88(1978). 21p. Dep. NTIS, PC A02/MF A01.

High-activity waste (HAW) solutions which result from the reprocessing of irradiated reactor fuels is a problem because of the long-lived radioactivity. Tank storage is only an intermediate solution. Solidification of HAW solutions is a better solution, particularly vitrification. The German PAMELA process is described in detail; it involves producing the glass in the form of beads in a heavy metal matrix. Plans to store the solidified HAW in salt domes are discussed. From the technical standpoint, a large facility can be built by the 1990's for disposing of the waste from an industrial reprocessing plant. 9 figures, 2 tables. (DLC)

2356 INVESTIGATION OF GAS FORMATION ON A LOW-LEVEL RADIOACTIVE WASTE DISPOSAL SITE. Eng, J.; Giardina, P.A. (Environmental Protection Agency, New York, NY). pp 519-524 of Energy and the environment. Proceedings of the fifth national conference. Nichols, D.G.; Rolinski, E.J.; Servais, R.A.; Theodore, L.; Buonicore, A.J. (eds.). Dayton, OH: American Institute of Chemical Engineers (1978).

From 5. national conference on energy and the environment; Cincinnati, OH, USA (31 Oct 1977).

The results of work at low-level radioactive waste disposal sites will assist EPA in fulfilling its responsibility to establish requirements for protection of the environment and public health. Two workshops have already been held to discuss public policy. It is expected that low-level standards will follow in late 1981.

2357 RELEVANCE OF NATURAL RETENTION EXPERIENCE TO NUCLEAR WASTE MANAGEMENT. Leachman, R.B.; Bishop, W.P. (Nuclear Regulatory Commission, Washington, DC (USA)). pp 700-707 of Les reacteurs de fission naturels. Vienna, Austria: International Atomic Energy Agency (1978).

A current need exists for providing the public and its representatives with enough information to judge the effectiveness and safety of nuclear waste disposal. This need might be largely fulfilled by careful and understandable presentations of relevant information from the experiences of retaining Oklo wastes and other radioactive materials in inadvertent repositories in geological media. This information would be particularly helpful during the interim while deliberate repositories for wastes are being designed, licensed, built and proven. Experiences with natural and inadvertent repositories give information on a broad range of factors. Factors of interest include time-spans of demonstrations, nature of the solidified waste form, geological surroundings of the wastes, and the different radioactive elements involved.

2358 FAR FIELD HEATING EFFECTS OF A RADIOACTIVE WASTE DEPOSITORY IN HARD ROCK. Hodgkinson, D.P.; Bourke, P.J. (UKAEA, Harwell. Atomic Energy Research Establishment). pp 237-249 of In situ heating experiments in geological formations. Seminar, Ludvika, Sweden, 13-15 Sep 1978. Proceedings. Paris, France: OECD (1978).

Fission product heating of the rock surrounding a depository for high level radioactive waste, will result in high temperatures and high thermal gradients over distances of several hundred metres for many centuries. The consequent thermal expansion of the rock leads to stresses which could alter the fracture pattern and therefore the permeability of the rock. These problems are assessed by considering an idealised model of a depository for which analytic solutions to the temperature and stress fields are derived. A related problem is that any water present in the fissures will tend to rise because of its decrease in density on heating. If the water had previously leached away some of the radionuclides in the waste, then this convective transport constitutes a possible leakage path back to the biosphere. For the low permeabilities expected at a depository site, it is possible to linearise the resulting equations and derive analytic solutions for the flow velocities. This procedure has been carried out for the idealised depository model, in order to estimate the magnitude of these effects.

2359 Experiences de degagement de chaleur in situ dans les formations geologiques. Compte rendu. (IN SITU HEATING EXPERIMENTS IN GEOLOGICAL FORMATIONS. PROCEEDINGS). Paris,

France; OECD (1978). 282p. (In English and French).

From Seminar on in situ heating experiments in geological formations; Ludvika, Sweden (13 - 15 Sep 1978).

Emplacement into appropriate deep geological formations is considered the most promising solution for the disposal of long-lived radioactive wastes. Certain types of waste generate significant amounts of decay heat and, after emplacement in the disposal formation, may be responsible for complex chemical and physical changes. Practically all countries with geologic disposal programmes are involved in the study of the behavior of potential disposal rocks when exposed to heat sources. These investigations are conducted in the laboratory and in the field, both at shallow depths and in mines hundreds of metres underground. Deep experiments are obviously the most interesting since they approach actual disposal conditions. The Swedish Nuclear Fuel Supply Company (SKBF), which has been responsible for a very intense programme of research and development in the field of geologic disposal in crystalline rocks has been conducting the experimental programme at the Stripa mine. These proceedings represent a record of the papers and the discussions at the meeting and reflect the state of the art in this important field.

2360 Experiences de degagement de chaleur in situ dans les formations geologigues. (IN SITU HEATING EXPERIMENTS IN GEOLOGICAL FORMATIONS). Paris, France; OECD (1978). vp. (In French). (CONF-7809154--).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

Separate abstracts are prepared for individual items.

2361 THERMAL EFFECTS IN DISPOSAL OF RADIOACTIVE WASTE IN HARD ROCK. Bourke, P.J.; Hodgkinson, D.P. (UKAEA, Harwell. Atomic Energy Research Establishment); Batchelor, A.S. (Camborne School of Mines, Pool, Cornwall, England). pp 109-117 of Experiences de degagement de chaleur in situ dans les formations geologigues. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

The first objective of the UKAEA programme of field heating experiments is to study any variations in thermal conductivity of granite over long (10 - 100m) distances heated to high (100's°C) temperatures for about a year. A description is given of the first tests with an 18 kW heater at 50 m depth and 72 thermocouples in the surrounding 25m radius sphere of rock. The reasons for choice of this scale of experiment are presented and the problems encountered and initial results are described. The further objectives of these experiments are to investigate thermal stresses and any cracking of the granite so that thermally induced movement of water through rock with both its natural and any increased permeability can be quantified. Measurements to be made of the mechanical and permeable properties as the rock heats are described.

2362 PILOT HEATER TEST IN THE STRIPA GRANITE. Carlsson, H.; Stephansson, O. (Division of Rock Mechanics, University of Lulea, Lulea, Sweden). pp 177-189 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

In the Stripa mine, situated in the central part of Sweden, a pilot heater test has been carried out at 348 m level. The type of rock is a granite with a rather high frequency of fractures. A central main heater with a length of 3 m, a diameter of 30 cm and a total power of 6 kW was placed at the bottom of a 10 m deep borehole. At different distances, varying from .85 up to 2.95 m from the heater, stress and temperature changes were monitored. Additional measurements of movements along major fractures on the surface and changes of water inflow in boreholes were carried out. To some extent these measurements have been found adequate for the acquisition of full-scale testing.

2363 APPLICATION OF LABORATORY HYDROTHERMAL STUDIES TO HEATING EXPERIMENTS. Chapman, N.A. (Institute of Geological Sciences, London (UK)). pp 229-235 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

One of the anticipated effects of emplacing high-level radioactive waste in a mined repository will be the generation of widespread hydrothermal reactions involving the rock, the waste and any fluid phase present. No rock unit is entirely free of fluid as it can exist both as groundwater and physically and chemically bound species. The resultant reactions could cause severe damage to the rock and change its ability to contain the waste. Laboratory studies of these reactions at high pressure and temperature are described and the need for related geochemical studies during the course of large scale heating experiments is emphasized. The type of co-operative research envisaged between those involved in field heating and laboratory studies is discussed.

2364 HYDROGEOLOGICAL INVESTIGATIONS IN TWO BOREHOLES IN THE STRIPA TEST STATION. Hansson, K.; Almen, K.E.; Ekman, L. (Geological Survey of Sweden, Uppsala). pp 133-143 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

The investigations included the following: water injection tests in a horizontal core-borehole, Dbh 2; hydrostatic pressure tests in Dbh2; determination of permeability in a vertical core-borehole, Dbh VI. The results of the water injection tests gave very little information due to the fact, that an air cushion was trapped in the borehole. The hydrostatic pressure tests in Dbh 2 were made in that part of the borehole, which is situated beyond the drift (45 - 97 m). Most of the pressure curves were difficult to interpret. The hydrostatic pressure in the section 89 - 97 m (end of the hole) was calculated to 1.67 Mpa. Near the end of the drift (46.00 - 49.71 m) the pressure was 0.22 Mpa. The permeability tests in Dbh VI were performed by measuring the water-flow and hydrostatic pressure in different levels. The calculated average permeability was 6.5×10^{-10} m/s.

2365 BEHAVIOR OF CLAY EXPOSED TO HEATING. Heremans, R.; Buyens, M.; Manfroy, P. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)).

pp 13-30 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978). (In French)

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

In the frame of their R and D program on geological burial of solidified radioactive waste, the C.E.N./S.C.K. undertook experimental and theoretical work on the behavior of the Boom clay against heat. The work is performed under contract with the Commission of European Communities. In a first phase a series of chemical and physical properties were determined on clay samples taken at various depths during the core boring performed on the C.E.N./S.C.K. site in 1975. In a second phase, a simulated high level waste heat source was developed and tested in view of representative heat transfer experiments into the geological formation. In parallel to the experimental work, computerized theoretical studies were undertaken aiming an evaluation of heat effect of a vitrified high level waste repository on an underground structure in clay.

2366 STATUS OF THE SIMULATION EXPERIMENTS IN CASED BOREHOLES TO BE RUN IN THE ASSE SALT MINE. Hofmann, B.H.W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). pp 83-93 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

The investigation of the rock mechanical behavior of cased boreholes in salt after the insertion of heat sources is a main subject of the joint experimental program being performed by the Gesellschaft fuer Strahlen- und Umweltforschung (GSF) and Kernforschungszentrum Karlsruhe (KfK) groups in the Asse Salt Mine. The experiments will provide rock mechanical data, e.g., stress distribution and strain within an inhomogeneous temperature field, for comparison with theoretical calculations. Technical data will be obtained for the construction of a tubing granting the retrievability of HLW-canisters over a period of 10-20 years.

2367 EXPERIENCE OF DIAMOND-COREDRILLING IN STRIPA. Hugo-Persson, T. (Hagby Bruk AB, Sweden). pp 221-225 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

The subsurface drilling operation was carried out in the full scale, time scale, extensometer and ventilation drifts. Over 150 boreholes ranging in diameter from 38 mm to 406 mm and varying in depth from 4.5m to 14.5m were diamond drilled using Toram, Diamec and XF 60/90 H drill machines. All boreholes were cored and all core from boreholes larger than 56 mm was oriented.

2368 GEOTHERMAL IN SITU EXPERIMENTS IN THE ASSE SALT-MINE. Kopietz, J.; Jung, R. (Bundesanstalt fuer Geowissenschaften und Rohstoffe, Hannover (Germany, F.R.)). pp 45-59 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

The paper presents design and results of in situ experiments carried out by the Bundesanstat fuer Geowissenschaften und Rohstoffe (Federal Institute for Geosciences and Natural Resources, F.R. of Germany) in the Asse salt-mine. With reference to model calculations of the temperature field which is produced in salt formations by radioactive waste, temperature measurements in the area of electrical heating elements and in situ measurements of thermal conductivity have been performed. The measured temperatures are in good accordance with the theoretical prediction. Preliminary results of the thermal conductivity measurements correspond with the data of single NaCl crystals published by Birch and Clark. At present a heating experiment is being conducted in the Asse mine to investigate thermo-mechanical effects of a cylindrical heat source upon the surrounding rock salt. Possible thermal induced fractures monitored by permeability changes and seismoacoustical phenomena are the main objects of this experiment.

2369 LARGE SCALE PERMEABILITY TESTS IN THE GRANITE OF THE STRIPA MINE, SWEDEN. Lindblom, U.E.; Lundstroem, L.; Stille, H. (Hagconsult AB, Sweden). pp 207-220 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

The granitic rock at depth in the Stripa mine was investigated with regard to its permeability on a relatively large scale. At two test sites, 16 peripheral injection holes were drilled to a depth of 10 m in a circle of 3 m diameter and with a large-diameter withdrawal hole in the centre. By applicaton of a constant water pressure in all peripheral holes the flow of water from the centre hole under stable conditions was recorded at ambient (abt +10°C) and at increased bed rock temperature (abt +35°C). For the two cases, average permeability values of 4 to 5 . exp.-11 m/s and about 2 . exp.-11 m/s, respectively, were recorded.

2370 GEOLOGICAL DOCUMENTATION OF THE STRIPA TEST STATION. Olkiewicz, A. (Geological Survey of Sweden, Uppsala, Sweden). pp 119-132 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

The four mapped areas are wholly dominated by a reddish, medium grained, massively formed monzogranite, but show different grades of tectonic activity. When one compares the dips and strikes of the fractures one finds a high degree of conformity between all four areas. The greater majority of fractures are closed and often infilled with chlorite and occasionally with calcite. The water leakage which occur in the surveyed tunnels consist only of damp surfaces or slow dripping. The mapping of the drillcore shows that it is dominated by reddish, medium-grained, massive monzogranite. The frequency of joints and joints sets is relatively high and unevenly distributed. The joints are usually lined with chlorite, occasionally with calcite.

2371 INVESTIGATIONS ON THE BOREHOLE CLIMATE IN AN IN-SITU SIMULATION EXPERIMENT IN THE ASSE

SALT MINE. A PRESENTATION OF THE CONCEPT AND PRELIMINARY WORKS. Rothfuchs, T. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg (Germany, F.R.)). pp 61-70 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

Natural rock salt contains a certain amount of water which is enclosed in the salt in the form of small brine droplets. It could be observed, that the brine droplets tend to migrate up a temperature gradient induced by a heating source inside a borehole. This fact causes an undesirable inflow of water into nuclear waste crypts. A simulation experiment with electric heaters shall be performed in the Asse salt mine in order to investigate the resulting climate (temperature, humidity and gas pressure) inside a sealed borehole.

2372 MECHANICAL PROPERTIES OF STRIPA GRANITE. Stephansson, O.; Swan, G.; Leijon, B. (Division of Rock Mechanics, University of Lulea, Lulea, Sweden). pp 191-204 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

For the determination of the mechanical properties of Stripa Granite samples were taken from the boreholes in the vicinity of the test site. The granite type taken from these different sources is of variable character. For the purpose of numerical calculations performed in projects related to the waste storage research program the following parameters have been determined: Young's modulus, Poisson's ratio, compressive fracture stress and expansion coefficient as a function of temperature 20<T<200C; Young's modulus and compressive fracture stress as a function of confining pressure; Brazilian tensile fracture stress; residual shear stress as a function of normal stress; anisotropy ratio for Young's modulus and compressive fracture stress; dilatational wave velocity and deduced dynamic Young's modulus. A brief description of the test methods and the results for each test are presented.

2373 PROGRESS REPORT ON THE CANADIAN UNDERGROUND HEATER EXPERIMENT. Tammemagi, H.Y. (Atomic Energy of Canada Ltd., Ottawa, Ontario); Larocque, G. (Department of Energy, Mines and Resources, Ottawa, Ontario (Canada)). pp 227 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

Lawrence Berkeley Lab.; California Univ., Berkeley (USA). Dept. of Materials Science and Engineering). pp 97-108 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

Of the many alternatives that are being considered for the disposal of nuclear wastes, deep underground burial is favored. The wealth of experience concerning the design and construction of underground excavations does not include the unique effects of heating excavations by radioactive decay, nor the issue of long-term isolation. The effects of heating are important in establishing the feasibility of this method of disposal and are essential for the design of an underground repository. Near-field phenomena around individual canisters can be studied by full-scale experiments, using electrical heaters. The thermal diffusivity of rock is so low that information concerning the interaction between full-scale heaters and of the effects of heating a large volume of rock cannot be measured in full-scale experiments lasting less than a few decades. To overcome this difficulty, a time-scaled heating experiment has been developed in which a reduction in linear scale is accompanied by an acceleration of the time scale to the second power. In this experiment, the linear scale is about a third, so that the time scale is about ten fold.

2377 FULL-SCALE AND TIME-SCALE HEATING EXPERIMENTS AT STRIPA: PRELIMINARY RESULTS. Cook, N.G.W.; Hood, M. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.; California Univ., Berkeley (USA). Dept. of Materials Science and Engineering). pp 147-159 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

Two full-scale heating experiments and a time-scale heating experiment have recently been started in granite 340 meters below surface. The purpose of the full-scale heating experiments is to assess the near-field effects

of thermal loading for the design of an underground repository of nuclear wastes. That of the time-scale heating experiments is to obtain field data of the interaction between heaters and its effect on the rock mass during a period of about two years, which corresponds to about twenty years of full-scale operation. Geological features of the rock around each experiment have been mapped carefully, and temperatures, stresses and displacements induced in the rock by heating have been calculated in advance of the experiments. Some 800 different measurements are recorded at frequent intervals by a computer system situated underground. These data can be compared at any time with predictions made earlier on video display units underground.

2378 APPROACH TO THE FRACTURE HYDROLOGY AT STRIPA: PRELIMINARY RESULTS. Gale, J.E. (Waterloo Univ., Ontario (Canada)); Witherspoon, P.A. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.; California Univ., Berkeley (USA). Dept. of Materials Science and Engineering). pp 161-176 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

There are two main problems associated with the concept of geologic storage of radioactive waste in fractured crystalline rock. These problems are the thermomechanical effects of the heat generated by the waste and the potential for transport of radioactive materials by the groundwater system. In both problems, fractures play a dominant role. An assessment of the hydraulic and mechanical characteristics of fractured rocks requires a careful series of laboratory and field investigations. A good example of the complexity of the problem is illustrated by the field studies in a fractured granite that are currently underway in an abandoned iron-ore mine at Stripa, Sweden. Much information is being gathered from an extensive series of boreholes and fracture maps. The approach being taken to integrate these data into an analysis of the fracture hydrology is reviewed and preliminary results from the hydrology program are presented.

2379 DESIGN, INSTALLATION, AND OPERATION OF HEATER TESTS IN DOME SALT. van Sambeek, L.L. (RE/SPEC, Inc., Rapid City, SD (USA)); Heck, J.L. (Oak Ridge National Lab., TN (USA)). pp 71-82 of Experiences de degagement de chaleur in situ dans les formations geologiques. Paris, France; OECD (1978).

From OECD seminar on in situ heating experiments in geological formations; Ludvika, Sweden (Sep 1978).

Three in situ heater tests are currently in the heating phase in the Avery Island dome salt mine. Three power levels are being used for the three heater tests. The three heater tests include the use of protective steel sleeves, wherein the heater resides at depth. Data being gathered includes both scientific and engineering data concerning salt properties determination, corrosion potential, retrievability, and data for comparison of measured and predicted responses. The heating phase is only some 100 days into its duration, thus only limited data can be presented.

2380 PROSPECTS OF NEW METHODS OF NUCLEAR WASTE DISPOSED. Nohel, P. Trend, Prognosticke Informace ; 10: No. 4, 19-20(1978). (In Czech).

The questions of radioactive waste disposal mainly in deep layers of the earth crust are discussed in respect of possible radioactivity release into the environment. The amounts of radioactive wastes in the near future are forecast as are the methods of the fixation of waste containing long-lived radioisotopes. Attention is paid to possible chemical reactions of some radioisotopes in transport through geological formations. The geochemical and geophysical properties of geologic formations affect the rate of radioactivity transport following the decay of the metal container and the glass matrix containing the radioactive waste. This time may be 200 years and more.

2381 Chemie der Nuklearen Entsorgung. T. 1. (CHEMISTRY OF RADIOACTIVE WASTE DISPOSAL. PT. 1). Baumgaertner, F. (ed.). Muenchen, Germany, F.R.; Thiemig (1978). 252p. (In German).

The specialists' lectures held at a closed meeting seminar in Gerlos (Tyrol) on the subject of disposal are summarized in two volumes to a status report. It deals with the entire manifold problem complex from electricity supply, fuel element production, safety technical designs, reprocessing up to safe ultimate storage of radioactive wastes. The problems of head ends, purex process and of the treatment and storage of different radioactive wastes are discussed in volume 2. (HPH).

2382 DOE PROGRAM FOR THE MANAGEMENT OF RADIOACTIVE WASTE AND SPENT REACTOR FUEL. Cooley, C.R. (US DOE, Washington, DC). Thermal Power Conference Proceedings ; 165-181(1978). (CONF-7811153--).

From Thermal power conference; Pullman, WA, USA (8 Nov 1978).

The development of nuclear energy is seen by the Administration and the Department of Energy (DOE) as one of the important sources of energy for the country. Nuclear energy now provides a major fraction of the electrical power generation in some parts of the United States. In the northwest, with a wealth of hydroelectric power, nuclear power is expected to provide an increasing share of the total electrical energy. However, a great deal of public concern is being expressed about waste management associated with nuclear power. On current Research and Development programs, this paper considers several of the key activities which include work on disposal of spent fuel. 2 refs.

2383 APPARATUS FOR SEALING ACCESS HOLES TO CAVITIES WITHIN THE EARTH WITH ROCK GLASS. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). British Patent 1,553,339/A/. 4 Nov 1977. 4p.

An apparatus is described for sealing access holes to cavities within the earth which may be used for the disposal of radioactive waste. The method provides a fused seal integral with the rock formation.

2384 GREAT BRITAIN PREPARES PERMANENT STORAGE OF RADIOACTIVE WASTE. Ingenioer-nytt ; 13: No. 80, 23(7 Oct 1977). (In Norwegian).

A brief outline is presented of the background and reasearch programme for the disposal of vitrified radioactive wastes in granite formations in the United Kingdom. This programme is coordinated with those of other member countries of EC, financed by EC, in

which Germany, Italy, Belgium and Holland study formations such as clay and salt, while the UK and France study hard crystalline rocks, such as granite. The UK studies are concentrated on Newton Stewart in Scotland where the granite at great depths is thought to be free from cracks, in the North of England and in Cornwall. Heat transfer studies are to be done in Cornwall where the rock is so cracked as to be otherwise unuseable. A public meeting with representatives from local authorities and Parliament has been held in Newton Stewart to inform on the project.

2385 DISPOSAL OF RADIOACTIVE WASTE. PROMISING PROJECT IDENTIFIES PROSPECTIVE SEA ZONES. Lein, M. Teknisk Ukeblad ; 124: No. 38, 4-5(15 Sep 1977). (In Norwegian).

The conclusions reached by the ERDA Seabed Emplacement Program as a result of a three-year study of the disposal of radioactive waste in the seabed are presented. After vitrification the radioactive waste is placed in titanium-zirconium containers and buried in sedimentary layers in the deep ocean bed at the centre of circulating ocean currents. The glassified structure is expected to be thermally decomposed by decay heat in about 1000 years, while the container is expected to be resistant for some thousands of years. Tests have shown that diffusion through sedimentary clays by fission products is restricted to a zone of 100m diameter for chlorine and 30m diameter for strontium and cesium, per million years. It is also feasible to deposit the waste containers in holes drilled in lithified sediments or crustal rock (basalt).

2386 METHOD FOR CONTINUOUS RECOVERY OF FINE-GRAINED RADIOACTIVE RAW MATERIALS FROM WASTE SLUDGES. Sefl, K. Czech Patent 169,997/B/. 15 Jun 1977. 3p. (In Czech).

Waste sludge is thickened and flocculated by gradually adding 2 to 5% zinc sulfate solution and 0.1% polyacrylamide solution. The sludge is transported by gravity to vacuum filtration. The sludge concentrate obtained can not only be transported but is also suitable for hydrometallurgical processing in view of the 15 to 20% water content. The zinc sulfate consumption is about 60 g/m^3, polyacrylamide consumption about 3 g/m^3 of processed sludge.

2387 UNDERGROUND DISPOSAL OF CANADA'S NUCLEAR WASTE. Tammemagi, H.Y. (Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment); Gale, J.E.; Sanford, B.V. (Geological Survey of Canada, Ottawa, Ontario). Geoscience Canada ; 4: No. 2, 71-76(Jun 1977).

The Canadian program for geological disposal of vitrified (or otherwise solidified) high-level wastes is outlined. Three alternatives were being considered: disposal in igneous batholiths, salt deposits or (less probably) serpentinite. Batholiths, although stable, have the disadvantage that they contain cracks and fissures, through which groundwater, after leaching radioactive materials, may search the surface. Salt beds may underly or overly productive aquifers, or valuable reserves of oil, gas, or potash. Various other criteria for a decision are outlined. The time-table calls for selection of the site by 1981, construction of a demonstration repository by 1986, and availability of a commercial repository by 2000. During the period of demonstration and testing, all wastes will remain retrievable.

2388 DEVICE TO STORE RADIOACTIVE WASTES AND RECOVERY OF HEAT LIBERATED BY THESE WASTES. Girard, Edmond. (to Messier-Hispano-Bugatti, 92 - Montrouge (France)). French Patent 2,388,380/A/. 22 Apr 1977. 12p. (In French).

Storage unit for radioactive waste, comprising an initial closed spherical shell containing the waste and placed inside a second closed shell, generally spherical in shape and bristling with outward pointing spikes, fluid encouraging the transfer of heat from the cooling of the waste from the first to the second shell whose spikes act as radiators with respect to the outside environment.

2389 RADIOACTIVE WASTE STORAGE. Boldt, A.L. (to Energy Research and Development Administration, Washington, DC (USA)). Canadian Patent 1,006,631/A/. 8 Mar 1977. 9p.

The present invention provides a storage cask for solid, high-level radioactive wastes consisting of a thick-walled unitary carbon steel cask including a plug sealed in place with a deep penetration weld, the cask wall thickness being sufficient to reduce radiation levels to a tolerable level and permit cask storage in the open where natural convection of air over the cask removes the decay heat. After about 150 years the cask can be removed to a hard rock mine since the thermal conductivity of rock is sufficient that excessive temperature increases in the wastes will not occur. If the waste is solely from plutonium-recycle pressurized-water reactors, the high neutron dose rate around the cask must be reduced by surrounding the cask in its storage position with crushed graphite or placing cooling fins on the cask and employing neutron shielding material such as polyethylene between the fins.

2390 CALIBRATOR FOR LEVEL INDICATOR OF LIQUID WASTE IN A STORAGE TANK. Imaizumi, S. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1953-10,2497/A/. 18 Feb 1977. 3p. (In Japanese).

Purpose: To enable safety calibration for diaphragm seal type detectors for the contained liquid for use with a power plant without accessing the administration area at high radioactive level. Constitution: An electromagnetic valve is disposed between a sludge storage tank and a seal pot containing radioactive contaminated liquid at the primary side and displacing liquid at the secondary side and it is adapted to be switched by a turn over switch provided in a low radioactive level area, and a pressure pipe way whose junction to a calibrator opens in the low radioactive level area is connected. By switching the electromagnetic valve in the high radioactive level area by way of the turn over switch and closing the tank side and opening the conduit side. After confirming the above opening and closure by a pilot lamp, a calibrator tool is connected to the calibrator to monitor and calibrate the detector while applying a pressure to the diaphragm in the seal pot.

2391 PARTICLE SIZE DISTRIBUTION ANALYSIS AND CESIUM SORPTION CAPACITY OF SOME BENTONITES. Abdel-Gawad, A.S.; Sayyah, T.; Mizak, N.Z.; Shafik, A. Arab Journal of Nuclear Sciences and Applications ; 10: No. 2, 168-183(1977).

The particle size distribution and the cesium sorption capacity for some bentonites were studied. The equivalent diameter of particles for any given fraction of the four bentonites was determined. The effect of the

presence of Na^+ and K^+ ions on cesium sorption was investigated. It was found that both Na^+ and K^+ ions exhibit a competing ion effect on the sorption of cesium. The presence of Na^+ ions caused a gradual decrease in the capacity of the mineral investigated, while the presence of the K^+ ions resulted in an abrupt decrease followed by a constant capacity value all over the range of k^+ ion concentration studied.

2392 RESPONSE OF SALT MIGRATION TO DISSOLUTION IN SALT DOMES AND HOW IT AFFECTS A RADIOACTIVE WASTE ISOLATION FACILITY DESIGN. Hamstra, J. (Netherlands Energy Research Foundation, Petten, Netherlands). pp 76-92 of Salt dome utilization and environmental considerations. Martinez, J.D.; Thoms, R.L. (eds.). Baton Rouge, LA; Louisiana State University (1977).

From Symposium on salt dome utilization and environmental considerations; Baton Rouge, LA, USA (22 Nov 1976).

Both in the United States and Europe salt domes are being considered as structures in which radioactive waste isolation facilities for a long-term isolation. The major potential failure mechanism for this long-term isolation is that ground-water will contract the rock salt containment shield and a pathway for the buried radionuclides to reenter the biosphere. When dealing with assessment models for a containment breach, the assumption is commonly made that the ground-water will find its way through the containment wall into the waste burial area. This paper provides evidence that a salt dome which is still in contact with its mother salt layer will, under certain conditions, respond to a continuous ground-water attack by a salt migration towards the surface area where the dissolving action takes place. The driving force behind this salt migration will be the buoyant force of the sediments overlying and surrounding the dome structure. Several parameters that contribute to promote salt flow will increase with the depth and the extent of this mass transport oof rock salt in the solid state will increase accordingly as the dissolving action takes place at a greater depth. The mass transport of dissolved rock salt into an aquifer will decrease with the depth, because the permeability of that aquifer will decrease with the depth. There will be a break-even point in depth beyond which a salt dome will maintain its piercement shape despite the continuing dissolving actions. A model approach indicates that it is realistic to assume that this break-even point will be situated at an attainable. depth. Model calculations also indicate that the salt migration, as a response to dissolving actions, should be considered as one of starting points for the radioactive waste isolation facility design, such that if this salt migration should prove to be a containment failure mechanism, it only will affect the facility to a limited extent and after a very long period of time.

2393 HIGH PECISION MEASUREMENT OF HORIZONTAL AND VERTICAL MOVEMENT OVER SALT DOMES. Huggett, G.R. pp 352-365 of Salt dome utilization and environmental considerations. Martinez, J.D.; Thoms, R.L. (eds.). Baton Rouge, LA; Louisiana State University (1977).

From Symposium on salt dome utilization and environmental considerations; Baton Rouge, LA, USA (22 Nov 1976).

It has been suggested that radioactive wastes might be stored in salt domes. However, the domes would have to be relatively stable. Since these domes move vertically during their formation, any present-day movement must be accurately determined before they can be selected as repositories of radioactive waste. The most accurate way to measure such movement would be the complementary use of a multiwavelength distance measuring (MWDM) instrument and a two-fluid tiltmeter. The MWDM instrument, which measures distance through the atmosphere without the usual meteorological observations and corrections, is capable of making consecutive distance determinations with a standard deviation from the man as small as 4 parts in 10^8. Its long-term stability and precision are better than 1 part in 10^7 over distances up to 15 km. The two-fluid tiltmeter is designed to measure relative vertical movement between two distant piers. This instrument is not affected (to the frst order) by local tilting, which grossly contaminates the data taken with short baseline instruments. Nor is it affected by thermal gradients, which are the bain of single-fluid tiltmeters. This instrument could measure vertical displacement over long baselines to a precision of about 10^5 and regional tilt to a precision of about 10^{-8}. The complementary measurements of the horizontal distance across the dome and the vertical displacement of the surface over the dome should be good indicators of any relative upward salt dome movement.

2394 LEGAL PROBLEMS IN THE UTILIZATION OF SALT DOMES. Harrell, T.A. pp 397-423 of Salt dome utilization and environmental considerations. Martinez, J.D.; Thoms, R.L. (eds.). Baton Rouge, LA; Louisiana State University (1977).

From Symposium on salt dome utilization and environmental considerations; Baton Rouge, LA, USA (22 Nov 1976).

This paper will consider the legal problems which may be encountered in the use of salt domes for such purposes as the storage of hydrocarbons or industrial or nuclear waste products. From the view point of the lawyer such activities appear to present few difficult or unique problems, and with one exception those problems which are present seem to be easily resolvable within the framework of existing legal principles. The one exception relates to the proposed storage of nuclear or other highly toxic or dangerous wastes with extremely long lies and portending considerable danger to the public if the integrity of the project is not maintained for a period which, within our civilization's frame of reference, may be said to be one of perpetuity. The majority of the salt domes which are being considered for storage of hydrocarbons lie within the states of Texas and Louisiana. The present discussion will be primarily concerned with the laws of Louisiana although note will be made of those instances where the laws of Texas might materially differ. For purposes of analysis it may be convenient to divide the problems into three general categories: firstly, those relating to the acquisition of the right to conduct the activity in question; secondly, those arising from public or regulatory requirements which might limit, regulate, or interfere with the free conduct of the activity; and thirdly, those relating to the liability of the person using the dome for the unintended and adverse consequences to other property owners or the public generally arising out of his activities.

2395 POTENTIAL OF GULF COAST SALT DOMES FOR ISOLATION OF RADIOACTIVE WASTES. Martinez, J.D. pp 127-144 of Salt dome utilization and environmental considerations. Martinez, J.D.; Thoms, R.L. (eds.). Baton Rouge, LA; Louisiana State University (1977).

From Symposium on salt dome utilization and environmental considerations; Baton Rouge, LA, USA (22 Nov 1976).

Salt deposits have been recognized for a number of years as a particularly suitable rock type for the isolation of radioactive wastes. These deposits are common in sedimentary basins in the US and elsewhere and salt has physical properties which are advantageous for this purpose. Natural occurrences of rock salt are generally categorized morphologically as either bedded or domal types. Early studies of the potential use of salt for the isolation of radioactive wastes were focused on bedded salt. In the last several years attention has been directed to possible utility of Gulf Coast salt domes for this purpose. The toxicity of plutonium, a component of the waste, and its long decay period, 24,360 years half-life, requires special care in evaluating the degree of isolation provided by salt domes or other rock types. Feasibility studies have applied geologic, hydrologic and engineering disciplines to an assessment of the tectonic and hydrologic stability of Guld Coast salt domes. These studies range in perspective from an evaluation of evidence provided by older geologic formations to current monitoring by various geophysical techniques. The scientific studies coupled with an analysis of cultural setting have narrowed the possibilities from more than 400 domes in the Gulf Coast to a few promising study areas. So far, 3 areas have been selected for further study in both the North Louisiana Salt Dome Basin and the Northeast Texas Salt Dome Basin. New field work is expected to provide firmer conclusions regarding the suitability of these domes for radioactive waste isolation.

2396 TIMES AND RATES OF SALT MOVEMENT IN NORTH LOUISIANA. Kupfer, D.H. pp 145-170 of Salt dome utilization and environmental considerations. Martinez, J.D.; Thoms, R.L. (eds.). Baton Rouge, LA; Louisiana State University (1977).

From Symposium on salt dome utilization and environmental considerations; Baton Rouge, LA, USA (22 Nov 1976).

This report concerns the salt dome basin in the west-central part of northern Louisiana, herein called the North Louisiana Basin. The study centers on the Vacherie salt dome in the Vacherie sub-basin of the northern or Minden Trough. Observed changes in the character of the isopach maps of this basin are used to approximate the rates of salt movement from under the basin and into the domes. Individual parameters show a high degree of variability when compared with each other, and times vary by over 100 million years. But average values for each group of parameters show greater consistancy. Each suggest that salt movement ceased some time in the past. A crude average of the above values is 29 million years ago. All of these figures need to be checked by further studies and more statistical analyses applied to them. This is just a progress report on a continuing project. The variability of all of these measures is such as to indicate caution, but the weight of the evidence appears to indicate that movement has ceased; probably about 30 million years ago or sometime in the Miocene. This appears to agree very well with the geological record.

2397 MONITORING CURRENT RATES OF SALT DOME MOVEMENT. Thoms, R.L.; Manning, T.A. pp 171-187 of Salt dome utilization and environmental considerations. Martinez, J.D.; Thoms, R.L. (eds.). Baton Rouge, LA; Louisiana State University (1977).

From Symposium on salt dome utilization and environmental considerations; Baton Rouge, LA, USA (22 Nov 1976).

The tectonic stability of salt domes is a major concern for long-term domal storage of noxious wastes. A necessary phase of the many faceted dome storage study includes obtaining a measure of current vertical movement of any potential storage dome. This information then can be combined with data obtained from studies involving geologic time scales so as to provide a history of dome movement that includes present time. A system of instrumentation for monitoring current rates of dome movement is described. Complimentary finite element modelling of plausible dome movement also is presented. The proposed instrumentation system includes tiltmeters, precise levelling, laser ranging, and monitoring of microseisms. Thus, components of rotation and vertical and horizontal movements at the ground surface over a dome can be monitored. In addition, a measure of dome movement also may be obtained acoustically. The finite element modelling furnishes an aid for: (1) locating instrument sites over a dome so as to maximize instrument sensitivity, and (2) interpreting data obtained from the instrumentation system. An example of tiltmeter installation and operation over a dome in northwest Louisiana is included. Typical tiltmeter output is presented and discussed.

2398 HYDROLOGIC STABILITY OF SALT DOMES. Smith, C.G. Jr. pp 188-198 of Salt dome utilization and environmental considerations. Martinez, J.D.; Thoms, R.L. (eds.). Baton Rouge, LA; Louisiana State University (1977).

From Symposium on salt dome utilization and environmental considerations; Baton Rouge, LA, USA (22 Nov 1976).

The potential storage or disposal of high-level radioactive wastes in Gulf Coast salt domes requires that the storage cavities be free from ground-water dissolution for a period of 250,000 years. The investigation of the salinity variations of groundwater near selected domes is a preliminary step toward selecting a salt dome that will prove satisfactorily isolated from circulating round water. Saline ground-water anomalies (saline plumes) in aquifers peirced or uplifted by the dome may be the result of salt solution by groundwater. Other factors being equal, a salt dome without a saline ground-water plume is judged more hydrologically stable than a dome with a saline ground-water plume. In the Northeast Texas salt dome basin electric logs of oil and gas wells have been used to estimate ground water salinities in aquifers near selected domes. Generally, salinity determinations were limited to shallow (less than 600 meters), Tertiary age Wilcox sands. Thus far, the analyses have revealed saline ground water anomalies aroung 4 of the 9 domes studies. Estimates of the rate of dissolution from domes associated with saline ground water plumes indicate that less than 30 meters of salt will be removed from the upper surfaces of the dome in 250,000 years. Thus, these preliminary studies show that even apparently unstable domes may be sufficiently stable to serve as waste disposal sites. Prior to the selection of a specific storage site additional field investigations will be required to more accurately define hydrologic stability.

2399 SALT DOME UTILIZATION AND ENVIRONMENTAL CONSIDERATIONS. Martinez, J.D.; Thoms, R.L. (eds.). Baton Rouge, LA; Louisiana State University (1977). 433p. (CONF-761175--).

From Symposium on salt dome utilization and

environmental considerations; Baton Rouge, LA, USA (22 Nov 1976).
New developments in salt dome technology were reviewed. The current status of environmental protection required in connection with modern utilization of Gulf Coast domes was discussed. Legal considerations in the use of salt domes were also discussed. Separate abstracts were prepared for individual items. (DC)

2400 LONG TERM CHEMICAL AND PHYSICAL INTEGRITY AND STABILITY OF CONDENSED PHASES OF ACTINIDES. Nevitt, M.V. (Argonne National Lab., IL (USA)). pp 81-90 of 2. International conference on the electronic structure of the actinides. Mulak, J.; Suski, W.; Troc, R. (eds.). Wroclaw, Poland; Zaklad Narodowy Imienia Ossolinskich (1977).
From 2. international conference on the electronic structures on the actinides; Wroclaw, Poland (13 Sep 1976).
A preliminary review is made of the crystalline materials that will probably serve as long-term repositories for actinide and fission-product wastes from nuclear power plants. Their occurrence, crystal chemistry and defect characteristics have been briefly considered in terms of the modest amount of information now in the literature, relating this information to actinide electronic structure and ionic-size effects. Questions are asked in order to point up the need to enlarge the present state of knowledge.

2401 DISPOSAL OF HIGH LEVEL NUCLEAR WASTE IN THE OCEANS. Vilks, G. (Environmental Marine Geology, Atlantic Geoscience Centre, Bedford Institute of Oceanography, Dartmouth, Nova Scotia (Canada)). Geoscience Canada ; 3: No. 4, 295-298(Nov 1976).
A report is given on a meeting held at Woods Hole, Massachusetts to consider the feasibility of using the sea bed as a disposal site for highly radioactive nuclear waste. Some disadvantages are explained, the chief being that ocean water alone, regardless of depth, is a poor barrier. Some delegates discussed emplacement of vitrified waste on the ocean floor, and others its burial in rock or sediment below the floor. The most suitable sites are the mid-plate/mid-gyse localities of abyssal hills. Some engineering work on submarine burial has been done by Sandia Labs., in the U.S.A. Ocean disposal is particularly interesting to Britain and Japan. Data on biological transport rates are needed.

2402 STATE OF RESEARCH AND DEVELOPMENT WORK ON FINAL STORAGE. Kuehn, K. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Clausthal-Zellerfeld (Germany, F.R.). Inst. fuer Tieflagerung). pp 32-33 of Die Problematik des radioaktiven Abfalls in der Kernenergietechnik. Steinmetz, E. (ed.). Essen, Germany, F.R.; Vulkan-Verl. (Ind]). (In German)
From Conference on the problems of radioactive wastes in nuclear technology; Essen, F.R. Germany (20 Oct 1977).
The German R and D program for the storage of intermediate-level radioactive waste in the salt mine Asse and the participation in the European R and D work on high-level waste disposal. FEDERAL REPUBLIC OF GERMANY;SALT DEPOSITS;INTERNATIONAL COOPERATION;RADIOACTIVE WASTE STORAGE;RESEARCH PROGRAMS;SAFETY; INTERMEDIATE-LEVEL RADIOACTIVE WASTES;HIGH-LEVEL RADIOACTIVE WASTES

2403 RADIOACTIVE WASTE DUMPING AT SEA: CAUSES FOR CONCERN. Alton, D.; Atkinson, N.; Barrett, H.A. London; Greenpeace Ltd. (Ind]). 3p.
The dumping of various low-level radioactive wastes at sea has been carried out for many years and has been accepted as a satisfactory means of disposal by national and international regulatory authorities. There are, however, grounds for concern from an environmental standpoint which centre around two particular issues: the likely extent of mobilisation of an increasing radioactive inventory over time and the likely effects of such radioactivity if and when it should make contact with living organisms. The subject is discussed under the headings: mobilisation; effects on the marine environment; physical and biological considerations; future exploitation of the oceans (for food, minerals); and the effects of radiation.

2404 MATERIAL FOR RADIOACTIVE PROTECTION. Taylor, R.S.; Boyer, N.W. US Patent Application 003,840. Ind]. 13p.
A boron containing burn resistant, low-level radiation protection material useful, for example, as a liner for radioactive waste disposal and storage, a component for neutron absorber, and a shield for a neutron source is described. The material is basically composed of borax in the range of 25 to 50%, coal tar in the range of 25 to 37.5%, with the remainder being an epoxy resin mix. A preferred composition is 50% borax, 25% coal tar and 25% epoxy resin. The material is not susceptible to burning and is about 1/5 the cost of existing radiation protection material utilized in similar applications.

2405 (RFP-Trans--286) MANAGEMENT AND DISPOSAL OF WASTES CONTAMINATED BY ALPHA EMITTERS. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). Ind]. Translation of IAEA-SM--246/58 10p. NTIS, PC A02/MF A01.
With the development of the French nuclear reactor program, the Public Authorities intensified their efforts toward disposal of wastes by establishing a central organization, ANDRA, on November 7, 1979. ANDRA has the responsibility for: assuring management of long-term storage centers; designing, laying out and constructing new long-term storage centers, and carrying out all the studies necessary for that purpose; promoting, together with the waste producers, specifications for fixation and storage of radioactive wastes before they are evacuated to the long-term storage centers; and contributing to the research, study and work concerning long-term storage of radioactive wastes as well as the future of such wastes. Through these processes of cooperation and exchanges, ANDRA regulates all the problems of wastes, and particularly the questions posed by alpha wastes. This paper goes on to elaborate on the following topics: definition of alpha waste; storage policy; regulations; specifications; inspection; methods of storage of alpha wastes; delivery provisions; management strategy; and economic aspects.

2406 SUBMERGIBLE BARGE RETRIEVABLE STORAGE AND PERMANENT DISPOSAL SYSTEM FOR RADIOACTIVE WASTE. (to Dept. of Energy). US Patent Application 106,203. Ind]. 17p.
A submergible barge and process for submerging and storing radioactive waste material along a seabed are described. A submergible barge receives individual packages of radwaste within segregated cells. The cells

are formed integrally within the barge, preferably surrounded by reinforced concrete. The cells are individually sealed by a concrete decking and by concrete hatch covers. Seawater may be vented into the cells for cooling, through an integral vent arrangement. The vent ducts may be attached to pumps when the barge is bouyant. The ducts are also arranged to promote passive ventilation of the cells when the barge is submerged. Packages of the radwaste are loaded into individual cells within the barge. The cells are then sealed and the barge is towed to the designated disposal-storage site. There, the individual cells are flooded and the barge will begin descent controlled by a powered submarine control device to the seabed storage site. The submerged barge will rest on the seabed permanently or until recovered by a submarine control device.

Environmental Aspects

2407 (AAEC/E--467) ENVIRONMENTAL SURVEY AT THE AAEC RESEARCH ESTABLISHMENT LUCAS HEIGHTS, RESULTS FOR 1975, 1976 AND 1977. Hespe, E.D. (Australian Atomic Energy Commission Research Establishment, Lucas Heights). Jan 1979. 67p. Dep. NTIS (US Sales Only), PC A05/MF A01.

An environmental survey program has been in operation since 1959 at the Australian Atomic Energy Commission's Research Establishment at Lucas Heights, N.S.W. The results for 1975, 1976 and 1977 show that the amounts of radionuclides of AAECRE origin are not greater than the amounts found in earlier years. The possible annual radiation dose to the most highly exposed member of the public, as calculated from the results, represents about one ten-thousandth of that considered acceptable by the NSW Health Commission and the National Health and Medical Research Council of Australia.

2408 (ALO--0789-T14) MATERIAL PROPERTIES OF ELEANA ARGILLITE: EXTRAPOLATION TO OTHER ARGILLACEOUS ROCKS, AND IMPLICATIONS FOR WASTE MANAGEMENT. Lappin, A.R.; Olsson, W.A. (Sandia Labs., Albuquerque, NM (USA)). Oct 1979. Contract EY-76-C-04-0789. 15p. Dep. NTIS, PC A02/MF A01.

Results of a near-surface heater test in the Eleana argillite suggest the possibility that the high-temperature (> 100°C) thermomechanical response of argillite to waste emplacement may be dominated by behavior of expandable clays. Enough expandable clay is probably present in most argillaceous rocks to cause a similar response. In-situ thermal conductivities may be markedly reduced by even small amounts of clay contraction which results in opening of pre-existing joints. A simple model predicts that such behavior may continue to operate to considerable depths, though several factors affecting determination of this depth remain poorly defined at present.

2409 (ANL--79-30) STUDIES OF NUCLEAR-WASTE MIGRATION IN GEOLOGIC MEDIA. ANNUAL REPORT, OCTOBER 1977-SEPTEMBER 1978. Seitz, M.G.; Rickert, P.G.; Fried, S.M.; Friedman, A.M.; Steindler, M.J. (Argonne National Lab., IL (USA)). Jul 1979. Contract W-31-109-ENG-38. 70p. Dep. NTIS, PC A04/MF A01.

The first phenomenon studied is incomplete water-nuclide-rock reaction because of slow reaction kinetics. A kinetic factor derived from the experimental results for strontium migration through glauconite (a hydrous silicate) was expressed in terms of the linear flow rate of solution and can be used to predict migration due to solution flow at rates of 0 to about 12 cm/min (60 km/y). Continuous-flow infiltration experiments with americium in fissures gave results that are predicted by a migration model that includes kinetic factors measured in experiments with static fluids. The results suggest that kinetic factors are as important as equilibrium adsorption parameters in predicting nuclide migration. The second phenomenon studied was the amount of adsorbed nuclide not being proportional to the nuclide concentration in solution (nonlinear adsorption isotherm). For cesium adsorption on limestone, a nonlinear isotherm was found to occur in the range of initial cesium concentrations from about 10^{-3} to 10^{-9}M. This adsorption property was confirmed by results of column-infiltration experiments in which cesium migration through oolitic limestone was found to be sensitive to the amount of cesium in solution. The existence of a nonlinear isotherm precludes the use of a single partition value (K/sub D/) to describe cesium migration in limestone at cesium concentrations above about 10^{-9}M. Therefore, the effects of nonlinear isotherms are germane to nuclide migration. 24 figures, 6 tables.

2410 (ANL/ES--79) ENVIRONMENTAL ANALYSIS OF A FORMERLY UTILIZED MED/AEC SITE: SITE A AND PLOT M, PALOS FOREST PRESERVE, PALOS PARK, ILLINOIS. (Argonne National Lab., IL (USA)). Sep 1979. Contract W-31-109-ENG-38. 107p. Dep. NTIS, PC A06/MF A01.

This environmental analysis report describes the existing site environment and evaluates the environmental impacts of 8 options for remedial action, including allowing buried waste to remain undisturbed. Conformity or conflict with governmental statutes, regulations and standards was determined, especially with regard to compliance with contamination criteria and guidelines. The program of measurements, documentation, and control to demonstrate compliance with these criteria and guidelines was identified.

2411 (ARH--1733) LEACH AND SOIL COLUMN TESTS WITH STORED REDOX SLUDGE. Schulz, W.W.; Ritter, G.L. (Atlantic Richfield Hanford Co., Richland, WA (USA)). May 1970. Contract EY-77-C-06-1030. 26p. NTIS, PC A03/MF A01.

The leachabilities of ^{90}Sr, ^{239}Pu, and ^{137}Cs from solids in Tank 108-SX were determined. Through 21 leach cycles covering a 3.5 day period, 63 volumes of leachate removed 1.4, 4.6, and 19.2% of the ^{239}Pu, ^{90}Sr, and ^{137}Cs, respectively, from the 108-SX solids. With the exception of the first few leachates, the ^{239}Pu concentrations in the leachates were less than maximum permissible concentration in drinking water for 168-h/wk exposure. A composite of the TK-108-SX leachate was passed through a column containing typical Hanford soil. Column distribution coefficients with 108-SX leachate of 14, 24, and 20 were obtained for ^{239}Pu, ^{90}Sr, and ^{137}Cs, respectively, indicating appreciable sorption of all these radionuclides by the soil. The radionuclides were not readily removed from the loaded soil columns with 12 column volumes of dilute leachate solution. Laboratory results with the 108-SX sludge were carefully evaluated to determine their significance to the overall analysis of the safety of long-term storage of Redox sludge in existing underground tanks. The primary deterrent to movement of the radionuclides from such solids to the water table is the absence of moving water in the storage zone. Incident precipitation does not migrate to the storage depth. The leaching characteristics of the

solids and the ion exchange properties of the soil are secondary factors in preventing dispersion of the radionuclides to the environment. Based upon leaching and soil column results with 108-SX sludge, very large volumes of water would be required to move small amounts of radionuclides from the Redox sludge in the tanks to the deep water table.

2412 (BARC--1032) DEVELOPMENT OF IMPROVED LEACHING TECHNIQUES FOR VITRIFIED RADIOACTIVE WASTE PRODUCTS. Vaswani, G.A.; Yeotikar, R.G.; Rastogi, R.C.; Sunder Rajan, N.S. (Bhabha Atomic Research Centre, Bombay (India)). 1979. 36p. NTIS (US Sales Only), PC A03/MF A01.

A critical review of the current techniques for evaluating the leach resistance of vitrified radioactive wastes has been made. Inadequacy of the available leaching techniques, with respect to their adoption as standard technique on an international scale, has been brought out for the three broad categories of aqueous attack viz., (i) simple contact with leachant at a particular temperature, (ii) once-through or recirculatory flow of leachant at variable temperatures and flow rates, and (iii) contact with freshly distilled hot water in soxhelet type of extractor. In an effort to evolve a standard leaching technique in the latter two categories of aqueous attack, development of two leaching units viz., 'Dynamic Leaching Unit' and 'Modified Soxhlet Unit' is described. Both these units offer good control and wide flexibility on the important parameters affecting leaching such as leachant temperature, flow rate of residence time of leachant and ratio of leachant volume to sample surface area. The dynamic leaching units also offers a good control and flexibility on the two additional parameters viz., the composition and pH of the leachant. In the modified soxhlet unit the composition and pH of the leachant remains near to that of distilled water. The leach rate results have been found to be reproducible. A need for framing the set of standard conditions for adoption of these units in evolution of standard leaching techniques has been indicated.

2413 (BM-RI--8396) ABSORPTION OF RADIUM AND THORIUM FROM WYOMING AND UTAH URANIUM MILL TAILINGS SOLUTIONS. Beard, H.R.; Nichols, I.L.; Seidel, D.C. (Bureau of Mines, Salt Lake City, UT (USA). Salt Lake City Metallurgy Research Center). 1979. 18p. Bureau of Mines, Washington, DC.

An investigation was made of the absorption of radium and thorium from waste uranium leach liquor by clays and other materials. Tailings and soil samples from Wyoming and Utah were contacted with tailings liquors to determine the degree of absorption. Absorption ranged from 0 to 99% for radium and from 0 to 31% for thorium. Some samples, which readily absorbed radium, were contacted with various salt solutions that could be present in tailings solutions to determine their effectiveness as desorbents. The desorption of radium ranged from 0.06 to 100%. An alpha-spectrometric method was used to determine the radium and thorium concentrations in the solutions and the solids.

2414 (CONF-780506--(Vol.2), pp 537-539) RADIOLOGICAL SURVEYS OF RADIOACTIVE SHIPMENTS: ARE THEY ADEQUATE. Nichols, C.E. (Allied Chemical Corp., Idaho Falls, ID). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

The Idaho Chemical Processing Plant (ICPP) is one of the largest receivers of high-enriched irradiated reactor fuels in the world. The fuel shipments comprise approximately 50% of the two thousand shipments handled per year and present the greatest potential for serious contamination problems. However, new developments in radiological survey techniques and three years of experience in using these techniques indicate that the limit's for removable and non-removable radioactive contamination may be excessive. The paper describes these new techniques and their impact on radiological surveys. Sensitive radiological surveys have lowered radioactive contamination limits on every item leaving our plant. It is not reasonable to consider shipments with allowable contamination levels which would require control measures in most plants in the industry to be allowed in warehouses, loading docks, etc. where no control measures are required. Not only are radiological surveys adequate, but perhaps it's time to reevaluate contamination levels that are now allowed, consistent with the improvements made for surveying shipments.

2415 (DOE/EV--0005/20) FORMERLY UTILIZED MED/AEC SITES REMEDIAL ACTION PROGRAM. RADIOLOGICAL SURVEY OF THE MIDDLESEX MUNICIPAL LANDFILL, MIDDLESEX, NEW JERSEY. FINAL REPORT. Leggett, R.W.; Cottrell, W.D.; Goldsmith, W.A.; Christian, D.J.; Haywood, F.F.; Wagner, E.B.; Crawford, D.J.; Doane, R.W.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Apr 1980. Contract W-7405-ENG-26. 98p. NTIS, PC A05/MF A01.

A radiological survey was conducted at the Middlesex Municipal Landfill in Middlesex, New Jersey. In 1948, dirt contaminated with pitchblende ores was brought to this site from a former ore sampling plant in Middlesex. This survey was conducted in order to characterize the present radiological condition of the site and to determine the extent to which contamination is being transported from the site by natural means such as by drainage. The survey included measurement of (1) radionuclide concentrations in surface and subsurface soil on the site; (2) radionuclide concentrations in surface and subsurface water on the site and in Bound Brook; (3) beta-gamma dose rates and external gamma radiation levels on and near the site; and (4) the rate of ^{222}Rn emanation from the soil on the site. It was found that most of the contamination on the site is in the top 14 ft of soil; however, there is little contamination of surface soil on the site. Average radon emanation rates, average external gamma radiation levels, and average beta-gamma dose rates on the site do not appear to be significantly higher than background levels. Furthermore, radionuclide concentrations in water taken from Bound Brook near the site were far below guide values stated in federal guidelines.

2416 (DOE/EV--0046(Vol.2)) PROCEEDINGS OF THE US DEPARTMENT OF ENERGY ENVIRONMENTAL CONTROL SYMPOSIUM. VOLUME 2. NUCLEAR ENERGY AND TRANSPORTATION. (Department of Energy, Washington, DC (USA). Div. of Environmental Control Technology; Argonne National Lab., IL (USA)). Sep 1979. Contract W-31-109-ENG-38. 617p. (CONF-781109--(Vol.2)). Dep. NTIS, PC A99/MF A01.

From Environmental control symposium; Washington, DC, USA (28 Nov 1978).

Volume 2 contains papers from the following sessions: environmental control of fission/fusion power; nuclear waste disposal;

decontamination and decommissioning; environmental control aspects of transportation; and hazardous materials transportation. Individual papers were processed.

2417 (DOE/EV--0060) ANNUAL STATUS REPORT ON THE INACTIVE URANIUM MILL TAILINGS SITES REMEDIAL ACTION PROGRAM. (Department of Energy, Washington, DC (USA). Div. of Environmental Control Technology). Dec 1979. 202p. Dep. NTIS, PC A10/MF A01.

Assessments of inactive uranium mill tailings sites in the United States led to the designation of 25 processing sites for remedial action under the provisions of Section 102(a) Public Law 95-604. The Department of Energy assessed the potential health effects to the public from the residual radioactive materials on or near the 25 sites; and, with the advice of the Environmental Protection Agency, the Secretary established priorities for performing remedial action. In designating the 25 sites and establishing the priorities for performing remedial action, the Department of Energy consulted with the Environmental Protection Agency, Nuclear Regulatory Commission, Department of the Interior, governors of the affected States, Navajo Nation, and appropriate property owners. Public participation in this process was encouraged. During Fiscal Year 1980, Department of Energy will be conducting surveys to verify the radiological characterization at the designated processing sites; developing cooperative agreements with the affected States; and initiating the appropriate National Environmental Policy Act documentation prior to conducting specific remedial actions.

2418 (ENICO--1022) CONTINUOUS TRITIUM MONITOR FOR NUCLEAR FACILITY OFF-GAS STREAMS. Fernandez, S.J.; Pierce, G.D.; Motes, B.G. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Jan 1980. Contract AC07-79ID01675. 36p. Dep. NTIS, PC A03/MF A01.

The development of a continuous tritium monitor for nuclear fuel reprocessing plants and waste solidification facilities, such as the Waste Calcination Facility (WCF) at the Idaho Chemical Processing Plant (ICPP), is described. The laboratory and in-plant evaluations of the monitor is also reported.

2419 (ENICO--1054) CONTINUOUS PLUTONIUM MONITOR FOR NUCLEAR FACILITY OFF-GAS STREAMS. McDonald, F.N.; Fernandez, S.J.; Motes, B.G. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Oct 1980. Contract AC07-79ID01675. 40p. NTIS, PC A03/MF A01.

This document is the final report of the project to develop a continuous, real-line monitor for ICPP plutonium emissions in the presence of naturally occurring radon daughters. The developed monitor collects the plutonium sample on a glass fiber filter followed by in-situ x-ray spectroscopy. The monitor was developed in two phases; laboratory testing and on-line demonstration. The major conclusions were the following: A Low-Energy Photon Spectrometer (LEPS) had sufficient sensitivity and resolution to detect the 40 hour occupational plutonium limit of 2 x 10^{-6} pCi/cc in 24 hours. There were no detectable biases or inaccuracies due to unattended operation of the monitor. Therefore, the continuous plutonium monitor was deemed to be suitable for ICPP off-gas streams.

2420 (EUR--6088) RADIOACTIVE EFFLUENTS FROM NUCLEAR POWER STATIONS AND NUCLEAR FUEL REPROCESSING PLANTS IN THE EUROPEAN COMMUNITY. DISCHARGE DATA 1972-1976 RADIOLOGICAL ASPECTS. Luykx, F.; Fraser, G. (Commission of the European Communities, Brussels (Belgium)). Apr 1978. vp. Dep. NTIS (US Sales Only), PC A06/MF A01.

The report presents the available data on radioactive gaseous and liquid effluents discharged by nuclear power stations and nuclear fuel reprocessing plants in the European Community from 1972 to 1976. Discharges are expressed both in absolute terms and relative to the net production of electricity from the fuel. On the basis of the discharges recorded for 1976 the resulting maximum exposure of members of the population is quantified and compared with the dose limits prescribed by Euratom radiological protection standards and with the exposure resulting from natural radioactivity. It is concluded that there is no case in which a discharge could have given rise to an exposure exceeding the relevant prescribed limit. Not only did the possible maximum exposures incurred by individuals leave an appreciable safety margin relative to that limit but, for the vast majority of installations, they were comparable with or were considerably lower than the geographical and temporal variations in exposures resulting from natural radioactivity. Where environmental levels have been detectable the measured results have of course been used but, with few exceptions, the levels have remained less than the very low limits of detection currently possible. In general, where theoretical models are used to evaluate exposure, they are designed to give conservative results and hence it is likely that the true exposures are even less than those calculated.

2421 (GJBX--170(79), pp 28p, Paper 6) ENVIRONMENTAL IMPLICATIONS OF DEVELOPMENT OF THE CHATTANOOGA SHALE AS A FUTURE SOURCE OF URANIUM. Nov 1979.

From Chattanooga shale conference; Oak Ridge, TN, USA (14 Nov 1978).

A preliminary environmental feasibility analysis must address itself to some fixed prototype project description that encompasses a realistic spectrum of potential impacts. The analysis discussed has been based upon a synthesis of typical project designs that utilize large raw shale ore throughputs, and site-specific parameters tailored to the constraints introduced by the physical characteristics of the shale environment. The study has concentrated upon identifying the potential environmental impacts of one mining and processing complex. Elements of the environment that have emerged as those most sensitive to exploitation of the Chattanooga Shale resource are: water resources, air, and socioeconomic structure. The nature and extent of the impacts which may be exerted upon these elements by Chattanooga Shale development are described.

2422 (IAEA--212, pp 139-149) MARINE EXAMPLE OF A SITE PROTECTION STUDY. Coulon, R. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). 1978.

From IAEA regional seminar on the application of environmental impact analysis to the nulcear power industry; Buenos Aires, Argentina (29 Aug 1977).

The paper describes the application of critical pathway analysis to a marine site: i.e. the La Hague reprocessing plant. The behaviour of radionuclides in water is first assessed through dispersion, retention and

transfer processes. An assessment of man exposure is also made in the particular case of a marine study. A detailed description of the work performed in the La Hague environment is also presented. The critical population is defined and some details are given on the monitoring programme.

2423 (IAEA--212, pp 87-91) LIMITS TO RADIOACTIVE EFFLUENTS AND COUNTERMEASURES IN ACCIDENTAL SITUATIONS. Nowotny, G.; Gonzalez, A. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Proteccion Radiologica y Seguridad). 1978. (In Spanish).
From IAEA regional seminar on the application of environmental impact analysis to the nulcear power industry; Buenos Aires, Argentina (29 Aug 1977).
The paper discusses the criteria used by the Argentine Atomic Energy Commission, as competent authority, to set limits to radioactive effluents from nuclear installations. It also discusses the selection of action levels for carrying out countermeasures in accidental situations.

2424 (IAEA--212, pp 37-55) IMPLEMENTATION OF RADIATION PROTECTION REQUIREMENTS IN THE LIMITATION OF THE RELEASE OF RADIOACTIVE EFFLUENTS. Beninson, D. (United Nations Scientific Committee on the Effects of Atomic Radiation). 1978.
From IAEA regional seminar on the application of environmental impact analysis to the nulcear power industry; Buenos Aires, Argentina (29 Aug 1977).
The paper describes procedures of implementation of the radiation protection requirements referring to the control of radioactive effluents. Derived limits are introduced on the basis of environmental models of the concentration factor type. Optimization of control is discussed for the case where decision between several levels of protection is required, an example being presented. A procedure for restricting future exposures by limiting the dose commitment per unit practice is discussed. An appendix summarizes assessments of collective dose commitments from environmental releases in the nuclear fuel cycle.

2425 (INIS-mf--4551, pp 233-238) AIR RADIOACTIVITY IN THE NRI AND ITS SURROUNDINGS DURING 1974. Bazant, Z.; Horyna, J.; Prazakova, H. 1976. (In Czech).
From Scientific and technical conference commemorating the 20. anniversary of the Nuclear Research Institute's foundation; Rez, Czechoslovakia (10 Jun 1975).
Methods of measuring the radioactivity of the air in the ambient area of the Nuclear Research Institute, emissions in the forced ventilation and in the installations of the Institute are described. The average volume activity of radioactive aerosols in the environment did not exceed 1% of the value for ^{90}Sr. The average volume radioactivity of radioactive aerosols and radioiodine in the emissions is lower than the maximal permissible volume activity for long-term inhalation by the population for ^{239}Pu, ^{90}Sr and ^{131}I. The determined signal levels for radioactive gaseous emissions were not exceeded in any one case.

2426 (INIS-mf--4637, pp 39) RADIOACTIVE EFFLUENT CONTROL FOR NUCLEAR RESEARCH INSTITUTE, REZ. Horyna, J.; Hajek, P.; Keller, M. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Jun 1976. (In Czech).

2429 (INIS-mf--5194) ANNUAL REPORT ON RADIOACTIVE DISCHARGES AND MONITORING OF THE ENVIRONMENT, 1977. Atherton, R.S. (British Nuclear Fuels Ltd., Risley). Oct 1978. 64p. Dep. NTIS (US Sales Only), PC A04/MF A01.
The principal activity of British Nuclear Fuels Limited (BNFL) is the provision of nuclear fuel cycle services, i.e. the purification and processing or uranium ore concentrates, the enrichment of uranium, the manufacture of uranium and plutonium based fuels and the reprocessing of irradiated fuel. The Company also owns and operates two Magnox type nuclear power stations Chapelcross and Calder Hall. This report identifies and quantifies the discharges of radioactive isotopes to the environment and the monitoring of their environmental impact. The data refer to the sites on which the Company's Works are situated. Where a site also encompasses laboratories of the United Kingdom Atomic Energy Authority (UKAEA), reference is made to the significance of the discharge from the latter. The report includes assessments of maximum radiological exposures to individual members of the general public expressed in terms of Dose Limits recommended by the International Commission on Radiological Protection (ICRP). For this purpose the ICRP primary and secondary standards, applicable at time of the discharges, were used, ie prior to the most recent ICRP primary standards and the yet unpublished secondary standards. This report is the first in which information on radioactive discharges and environmental monitoring is given for all the Company's Works and Sites, i.e. the Windscale and Calder Works and the Drigg Storage and Disposal Sites; Chapelcross Works; Springfields Works and the Ulnes Walton Disposal Site; and the Capenhurst Works. Copies of certificates for

authorisation for the disposal of radioactive waste are given in an Appendix.

2430 (INIS-mf--5572, pp 24-28) EXPRESS-METHOD FOR CONTROL OF RADIONUCLIDES MIGRATION OF THE STRATUM-COLLECTOR OF UNDERGROUND BURIAL SITE FOR LIQUID RADIOACTIVE WASTES. Pimenov, M.K.; Rybal'chenko, A.I. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Express-methods are described for determination of radionuclides diffusion in geological formations during underground storage of liquid radioactive wastes. Control of radionuclides diffusion in stratums is performed:: by means of hydrodynamic investigations, - flow rate and pressure monitoring of the wastes pumped, investigation of the field of the stratum pressures at the area of the stratum-collector; by means of conducting hydrogeochemical investigations, - sampling of liquids from observation boreholes with subsequent radiochemical analysis ore express determination of radioactive nuclides; by means of geophysical investigations, - express determination of radionuclides directly in observation boreholes and examination of geothermal field changes caused by the wastes pumped. As the methods for express determination of nuclides in samples, beta-radiometric measurments of samples and also gamma and beta well-logging of observation boreholes were used. The results are given of application of express-methods of analysis in safety control of underground burial site for liquid radioactive wastes.

2431 (JAERI-M--7962) ^{14}C BEHAVIOR IN HTR FUEL REPROCESSING AND PRELIMINARY EVALUATION OF ITS RELEASE REDUCTION PROCESS. Maeda, M.; Tsujino, T. (Japan Atomic Energy Research Inst., Tokyo). Nov 1978. 41p. (In Japanese). Dep. NTIS (US Sales Only), PC A03/MF A01.

On the basis of a literature survey of ^{14}C behavior in HTR and the fuel reprocessing, and evaluation methods of the radiation doses, the formation of ^{14}C, its distribution in the fuel reprocessing and the annual VHTR which is being environmental doses are calculated for developed in JAERI; the necessary decontamination factor of ^{14}C is then indicated. Through these results, the processes of reducing the environmental release of ^{14}C are preliminarily evaluated.

2432 (KFK--2750, pp 4800-10-4800-12) INVESTIGATION OF THE PHYSICAL AND CHEMICAL ENVIRONMENTAL BEHAVIOUR OF RADIONUCLIDES CHARACTERIZED BY A PARTICULAR BIOLOGICAL EFFECTIVENESS - PU, AM, CM. Schuettelkopf, H.; Pimpl, M. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Sicherheit - Bereich 1). Oct 1979. (In German).

Semiannual report 1978/2.

Using the developed analytical method for Pu, a technician is able to perform 4 analyses per day. Chemical yield: 70-80%, Lower detection limit: < 0,1 fCi/g. The monthly determined releases of plutonium in the gaseous effluents of Karlsruhe reprocessing plant range over several orders of magnitude. The released Pu-238 and Pu-239+240 remains below the releases of gross alpha activity. The plutonium concentrations in liquid effluents range in the average between 0,1-1 pCi Pu/l. Concentrations of Pu were measured in: soil, plants, sediments, air, animals and water.

2433 (KY--690) UF_6 RELEASE EXPERIENCE AND PREVENTION IN UNITED STATES GASEOUS DIFFUSION PLANTS. Hull, G.T. (Paducah Gaseous Diffusion Plant, KY (USA)). 27 Jun 1978. Contract W-7405-ENG-26. 16p. (CONF-780669--2). Dep. NTIS, PC A02/MF A01.

From Specialist meeting; Boekelo, Netherlands (27 Jun 1978).

The three United States gaseous diffusion plants in operation at Oak Ridge, Tennessee, Paducah, Kentucky, and Portsmouth, Ohio have been in operation for a combined total of over 80 years, and in that period have produced or processed many thousands of tonnes of UF_6. Releases of UF_6 are reviewed. Release frequency has decreased sharply since the early period of plant operation. The impact and consequences of these releases are assessed. It is significant that there has never been a serious injury caused by UF_6 exposure from a gaseous diffusion plant, and no release has caused a serious disruption of plant operations.

2434 (L--7893-PR) LABORATORY STUDIES OF RADIONUCLIDE DISTRIBUTIONS BETWEEN SELECTED GROUNDWATERS AND GEOLOGIC MEDIA. PROGESS REPORT, APRIL 1-JUNE 30, 1979. Erdal, B.R. (comp.). (Los Alamos Scientific Lab., NM (USA)). Nov 1979. Contract W-7405-ENG-36. 56p. Dep. NTIS, PC A04/MF A01.

The Los Alamos Scientific Laboratory contribution to the Waste Isolation Safety Assessment Program, Task 4, for the third quarter of FY-79 involved plutonium, americium, and uranium(VI) batch sorption studies. The technetium sorption ratio on tuff was not found to be dependent on technetium concentration. Studies of the behavior of plutonium and americium in aqueous solutions at pH approx. = 8 were continued. Studies of the sorption of strontium, cesium, barium, cerium, europium, uranium, and americium on salt dome materials were made under atmospheric and controlled atmosphere conditions. The first experiments to assess the dependence of sorption ratio on groundwater composition were started. Migration rate studies using crushed rock columns and fractured cores were continued. Additional chemical analyses were made, as were some studies of the sorption of plutonium and neptunium using a microautoradiographic technique.

2435 (LA--8309-PR) RESEARCH AND DEVELOPMENT RELATED TO THE NEVADA NUCLEAR WASTE STORAGE INVESTIGATIONS. PROGRESS REPORT, OCTOBER 1-DECEMBER 31, 1979. Crowe, B.M. (comp.). (Los Alamos Scientific Lab., NM (USA)). Apr 1980. Contract W-7405-ENG-36. 22p. NTIS, PC A02/MF A01.

Batch sorption measurements in air with Sr, Cs, Ba, Ce, and Eu were conducted with four additional tuff samples. Additional results for sorption of Pu and Am are presented. Results for sorption of Tc, Sr, Cs, Ba, Ce, Eu, and U(VI) are given and compared with results in air. Migration rate studies with crushed tuff are continuing, and, in some cases, uniform peakless elution is being observed. Methods for studying the migration rate of uranium (VI) are being developed. Nuclides are being infiltrated into various types of solid cores for study after sectioning. Microautoradiographic examination of crushed tuff samples used in the batch determinations indicate that large species of americium are sorbed. Methods for determination of iron(II) in both rocks and waters are described. The probability of disruption of a repository site at Yucca

Mountain by future volcanic activity is bracketed by the range 10^{-8} to 10^{-10}/y. Partitioning functions for selected elements in plagioclase and olivine phenocrysts were examined for estimates of near-liquidus temperatures of representative melt compositions of the basalts of Crater Flat. Higher temperature estimates were calculated for glomeroperphyritic clots in the oldest basalts of Crater Flat.

2436 (LA--8539-PR) FISSION PRODUCT RELEASE. PROGRESS REPORT, APRIL 1-JUNE 30, 1980. Norris, A.E. (comp.). (Los Alamos Scientific Lab., NM (USA)). Sep 1980. Contract W-7405-ENG-36. 23p. (ONWI/Sub--80/E511-01200-7). NTIS, PC A02/MF A01.

The analysis of data collected from nuclear waste leaching experiments is under way to determine what differences are important when one spent fuel element wafer is leached under aqueous reducing conditions while the other is leached under oxidizing conditions. The concentrations of radioactive species in the leachant solutions are being investigated in terms of dissolution congruent with that of the UO_2 matrix and, for the lanthanide and actinide elements, in terms of precipitation reactions that result in limiting the concentrations of the species in solution. The concentrations of uranium and plutonium is solution under reducing conditions, however, are much higher than would be expected from the oxygen fugacity of the leachant derived from the measured Eh value. It is inferred that the actual reducing conditions in this pH 4 solution were much more oxidizing than desired for the experiment. The solubility of pure uraninite measured in deionized water was used in conjunction with thermodynamic calculations to infer that the oxygen fugacity in the apparatus, which differed from that used for the spentfuel leaching, was approx. 10^{-50} bars and that CO_2 was either absent or present in such low concentrations that the UO_2 solubility was not appreciably affected. 14 figures.

2437 (NTIS/PS--79/0139) URANIUM MINING AND MILLING ENVIRONMENTAL STUDIES (CITATIONS FROM THE NTIS DATA BASE). REPORT FOR 1964-JANUARY 1979. Hundemann, A.S. (National Technical Information Service, Springfield, VA (USA)). Mar 1979. 211p. NTIS, PC N01/MF N01.

Pollution, public and occupational health, and waste management associated with uranium ore recovery and processing are cited. The monitoring and control of contamination in air and effluents in the mining vicinities are discussed in this collection of Federally-funded research. (This updated bibliography contains 203 abstracts, 78 of which are new entries to the previous edition.)

2438 (NTIS/PS--79/0140) URANIUM MINING AND MILLING ENVIRONMENTAL STUDIES (CITATIONS FROM THE ENGINEERING INDEX DATA BASE). REPORT FOR 1970-JANUARY 1979. Hundemann, A.S. (National Technical Information Service, Springfield, VA (USA)). Mar 1979. 90p. NTIS, PC N01/MF N01.

Worldwide research is cited on uranium mining waste management and effluent control. Studies on mining practices, radon monitoring, health hazards, and land reclamation are covered. Government policies and regulations concerning present and long term waste handling are included. (This updated bibliography contains 86 abstracts, 15 of which are new entries to the previous edition.)

2439 (NUREG/CR--1081) CHARACTERIZATION OF URANIUM TAILINGS COVER MATERIALS FOR RADON FLUX REDUCTION. Rogers, V.C.; Overmyer, R.F.; Putzig, K.M.; Jensen, C.M.; Nielson, K.K.; Sermon, B.W. (Argonne National Lab., IL (USA); Ford, Bacon and Davis Utah, Inc., Salt Lake City (USA)). Mar 1980. Contract W-31-109-ENG-38. 163p. (FBDU--218-2). Dep. NTIS, PC A08/MF A01.

The attenuation of radon through uranium tailings cover material is usually described with diffusion theory expressions. One of the main parameters characterizing the diffusion is the diffusion coefficient. Measured values of the diffusion coefficient for several Wyoming and New Mexico soils are presented. An interpretation of various approximations to the diffusion equation is also given. Finally, the diffusion coefficient dependence on moisture is presented and the data are represented by a simple correlation.

2440 (ONWI--11(AECL-6325)) MODEL FOR THE TRANSPORT OF RADIONUCLIDES AND THEIR DECAY PRODUCTS THROUGH GEOLOGIC MEDIA. Burkholder, H.C.; Rosinger, E.L.J. (Battelle Memorial Inst., Columbus, OH (USA); Atomic Energy of Canada Ltd., Ottawa, Ontario). Sep 1979. Contract EY-76-C-06-1830. 31p. Dep. NTIS, PC A03/MF A01.

The one-dimensional transport of radionuclides and their decay products from an underground nuclear waste isolation site through the surrounding geologic media to a surface environment is modeled. An ambiguity in the application of the previously reported mathematical solution for this problem has been clarified. The results of applying the solution described here compare favorably with the results of applying the former solution, but the present solution is computationally more efficient and less subject to numerical errors. Thus, this solution is presently being used by the authors and others to evaluate the sensitivity of potential radioactivity releases into the environment to the characteristics of various nuclear waste isolation systems. The model is expected to be used in the future as an analytical standard to which the accuracy of numerical codes can be compared.

2441 (ONWI--88, pp 186-196) PSE: RELEASE SCENARIO ANALYSIS. Storck, R. (Technische Universitaet, Berlin, Germany). 1979.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

The Project Safetystudies Entsorgung (PSE) is concerned with risk type analysis of engineered and geological systems. A generalized method has been developed which is applicable to both. The essential element of this method is the so-called release tree. This paper presents a short description of the general method and shows its application to the final repository. During execution of the analysis, many difficulties arose, especially in the understanding of some physical processes. These difficulties are mentioned and will be subject to detailed investigation in the future.

2442 (ONWI--88, pp 197-212) GENERAL MODELING, CONSIDERATIONS AND DATA REQUIREMENTS FOR CONSEQUENCE ANALYSIS. Memmert, G. (Technische Universitaet, Berlin, Germany). 1979.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

Within the PSE (Safety-Studies-Entsorgung),

theoretical hydrological investigations are being conducted of the flow of ground water above and around a salt dome and of the transport of contaminants by the water. (DLC)

2443 (ONWI--88, pp 213-225) RELEASE CONSEQUENCE ANALYSIS. Pahwa, S. (Intera Environmental Consultants Inc., Houston, TX). 1979.

From US/FRG bilateral workshop on waste isolation performance assessment and in-situ testing; Berlin, F.R. Germany (1 Oct 1979).

This paper outlines the steps involved in hydrology and contaminant transport modeling, approaches within various waste management programs, modeling strategies, data needs, strength/limitations of model types, model development needs, and validation an crosschecking. (DLC)

2444 (ORNL--5447) ASSESSMENT OF THE RADIOLOGICAL IMPACT OF THE INACTIVE URANIUM-MILL TAILINGS AT SHIPROCK, NEW MEXICO. Haywood, F.F.; Goldsmith, W.A.; Lantz, P.M.; Fox, W.F.; Shinpaugh, W.H.; Hubbard, H.M. Jr. (Oak Ridge National Lab., TN (USA)). Dec 1979. Contract W-7405-ENG-26. 94p. Dep. NTIS, PC A05/MF A01.

Uranium-mill tailings at an inactive site near Shiprock, New Mexico, contain an estimated 950 curies (Ci) of ^{226}Ra together with its radioactive daughters. A radiological survey was conducted at this site in February 1976. Decontamination work and tailings stabilization performed at the site since that time have greatly changed conditions there and little effort was applied to quantification of potential health effects in comparison to the earlier consideration of the site at Salt Lake City. The present report delineates the radiological conditions that existed at the time of the survey including information on the surface and below-surface distribution of ^{226}Ra. The data presented support the conclusion that diffusion of radon and inhalation of radon daughters is the principal mode of exposure of offsite population groups.

2445 (ORNL--5449) ASSESSMENT OF THE RADIOLOGICAL IMPACT OF THE INACTIVE URANIUM-MILL TAILINGS AT MONUMENT VALLEY, ARIZONA. Haywood, F.F.; Goldsmith, W.A.; Hubbard, H.M. Jr.; Fox, W.F.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Dec 1979. Contract W-7405-ENG-26. 74p. Dep. NTIS, PC A04/MF A01.

Results of a radiological survey that was conducted at the inactive uranium-mill site at Monument Valley, Arizona, in March 1976, in cooperation with a team from Ford, Bacon and Davis Utah Inc., are presented. Consideration of these data and of previously published information on radiological conditions at the site lead to the conclusion that potential health effects from exposure to radionuclides in the mill tailings are relatively small. The occupants of three residences within 0.8 km (0.5 mile) of the tailings constitute the principal population at risk, but direct gamma-exposure rate measurements near the two residences closest to the tailings and calculations of radon dispersion indicate that the tailings do not raise either pathway of radiation exposure significantly above the background level. Data are not available to evaluate fully other possible exposure pathways, but the available information indicates that it is unlikely that doses through these pathways will add significantly to the total population dose. The low estimates of potential health effects from exposure to direct radiation and to exposure to radionuclides in the Monument Valley tailings piles are ascribed to the low ^{226}Ra inventory, to almost complete absence of small particles that are readily moved by wind and water, and to a small population in the vicinity of the tailings.

2446 (ORNL--5567) FEMWATER: A FINITE-ELEMENT MODEL OF WATER FLOW THROUGH SATURATED-UNSATURATED POROUS MEDIA. Yeh, G.T.; Ward, D.S. (Oak Ridge National Lab., TN (USA)). Oct 1980. Contract W-7405-ENG-26. 162p. NTIS, PC A08/MF A01.

Upon examining the Water Movement Through Saturated-Unsaturated Porous Media: A Finite-Element Galerkin Model, it was felt that the model should be modified and expanded. The modification is made in calculating the flow field in a manner consistent with the finite element approach, in evaluating the moisture-content increasing rate within the region of interest, and in numerically computing the nonlinear terms. With these modifications, the flow field is continuous everywhere in the flow regime, including element boundaries and nodal points, and the mass loss through boundaries is much reduced. Expansion is made to include four additional numerical schemes which would be more appropriate for many situations. Also, to save computer storage, all arrays pertaining to the boundary condition information are compressed to smaller dimension, and to ease the treatment of different problems, all arrays are variably dimensioned in all subroutines. This report is intended to document these efforts. In addition, in the derivation of finite-element equations, matrix component representation is used, which is believed more readable than the matrix representation in its entirety. Two identical sample problems are simulated to show the difference between the original and revised models.

2447 (PB--299754) CONTINUED CARE OF URANIUM MILL SITES: SOME ECONOMIC CONSIDERATIONS. Harrington, W.; Sawyer, J.W. Jr. (Resources for the Future, Inc., Washington, DC (USA)). Jan 1978. Contract NSF-AER75-16163. 28p. NTIS, PC A03/MF A01.

A critique of recently enacted legislation authorizing the New Mexico Environmental Improvement Agency to regulate uranium mills in the state is presented. Under this new legislation, the Agency is authorized to require payment of up to 10 cents per pound of yellowcake from each licensed mill in the state until a total of $1 million has been deposited by that mill. The continued care fund thus created will provide for maintenance in perpetuity of mill sites after being decommissioned. Arguments are presented, based on calculations for a typical 5,000 ton per day mill, that even the maximum amount is not likely to generate sufficient income to support an adequate maintenance program. The matter is further aggravated by the rate of inflation which will increase costs beyond the coverage provided by a fixed funding system. To correct this situation, it is proposed that (1) the fund should generate an income stream sufficient to meet all maintenance costs based on currently available information on costs, interest, and inflation rates, and (2) the terms of the continued care contribution should be readily alterable as new information becomes available. The latter condition should be coupled with removal of the upper statutory limit now established for the fund.

2448 (PNCT--841-78-49) MEASUREMENT OF ^{85}KR

CONCENTRATION IN THE ENVIRONMENTAL AIR DURING THE HOT-TEST OPERATION OF TOKAI REPROCESSING PLANT. Hirayama, A.; Kishimoto, Y.; Kurosu, G.; Sudou, M.; Fujioka, A. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Aug 1978. 49p. (In Japanese). Dep. NTIS (US Sales Only), PC A04/MF A01.

^{85}Kr concentration in air in the vicinity of the reprocessing plant was measured when it was released from the plant stack during the hot-test operation using PWR spent fuels. Charcoal absorption method was devised for this experiment as a rapid, simple and inexpensive technique for the measurement of ^{85}Kr concentration at about 10^{-9} $\mu Ci/cm^3$. Special air samplers were located at few kilometers distant from the stack and the air was collected for an hour at a flow-rate of 1.5 liters per minute. About thirty air samples were taken and analyzed for ^{85}Kr concentration successfully. The performance of sampling and analytical methods employed was good, although some improvements were found to be necessary. An example is that an air-collection bag should be made of ''saran'' so that the leakage be minimized. Usually in the atmospheric diffusion study sulfur hexafluoride gas is used as an air-tracer, and analytical procedure for the gas concentration down to 10^{-3} ppb is well established. In this experiment SF_6 gas was injected into the stack during the discharge of ^{85}Kr and the concentration in sampled air was also determined. The results show a good correlation between ^{85}Kr and SF_6 concentration in sampled air.

2449 (PNL--2286) DESCRIPTIONS OF REFERENCE LWR FACILITIES FOR ANALYSIS OF NUCLEAR FUEL CYCLES. Schneider, K.J.; Kabele, T.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Sep 1979. Contract EY-76-C-06-1830. 528p. Dep. NTIS, PC A28/MF A01.

To contribute to the Department of Energy's identification of needs for improved environmental controls in nuclear fuel cycles, a study was made of a light water reactor system. A reference LWR fuel cycle was defined, and each step in this cycle was characterized by facility description and mainline and effluent treatment process performance. The reference fuel cycle uses fresh uranium in light water reactors. Final treatment and ultimate disposition of waste from the fuel cycle steps were not included, and the waste is assumed to be disposed of by approved but currently undefined means. The characterization of the reference fuel cycle system is intended as basic information for further evaluation of alternative effluent control systems.

2450 (PNL--2287) SURVEY OF LWR ENVIRONMENTAL CONTROL TECHNOLOGY PERFORMANCE AND COST. Heeb, C.M.; Aaberg, R.L.; Cole, B.M.; Engel, R.L.; Kennedy, W.E. Jr.; Lewallen, M.A. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Mar 1980. Contract EY-76-C-06-1830. 194p. Dep. NTIS, PC A09/MF A01.

This study attempts to establish a ranking for species that are routinely released to the environment for a projected nuclear power growth scenario. Unlike comparisons made to existing standards, which are subject to frequent revision, the ranking of releases can be used to form a more logical basis for identifying the areas where further development of control technology could be required. This report describes projections of releases for several fuel cycle scenarios, identifies areas where alternative control technologies may be implemented, and discusses the available alternative control technologies. The release factors were used in a computer code system called ENFORM, which calculates the annual release of any species from any part of the LWR nuclear fuel cycle given a projection of installed nuclear generation capacity. This survey of fuel cycle releases was performed for three reprocessing scenarios (stowaway, reprocessing without recycle of Pu and reprocessing with full recycle of U and Pu) for a 100-year period beginning in 1977. The radioactivity releases were ranked on the basis of a relative ranking factor. The relative ranking factor is based on the 100-year summation of the 50-year population dose commitment from an annual release of radioactive effluents. The nonradioactive releases were ranked on the basis of dilution factor. The twenty highest ranking radioactive releases were identified and each of these was analyzed in terms of the basis for calculating the release and a description of the currently employed control method. Alternative control technology is then discussed, along with the available capital and operating cost figures for alternative control methods.

2451 (PNL--2652) WASTE ISOLATION SAFETY ASSESSMENT PROGRAM. A BRIEF DESCRIPTION OF THE THREE-DIMENSIONAL FINITE ELEMENT GROUND-WATER FLOW MODEL ADAPTED FOR WASTE ISOLATION SAFETY ASSESSMENTS. Cole, C.R.; Gupta, S.K. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Aug 1979. Contract EY-76-C-06-1830. 57p. Dep. NTIS, PC A04/MF A01.

Four levels of hydrologic models have been categorized to handle varying complexities and degrees of available input parameters. The first level is for the simplest one-dimensional models having analytical solutions; the second level includes idealized analytic or hybrid analytic models for single aquifer systems with scanty input data; the third level deals with more complex single or quasi-multilayered systems; and the fourth level is for complex multilayered systems. The three-dimensional finite element ground-water model described in this report falls under the fourth level of hydrologic models. This model is capable of simulating single-layered systems having variable thickness or multilayered systems where not only thickness can be varied, but the number of layers can be changed to agree with the vertical geologic section. Supporting programs have been developed to plot grid values, contour maps and three-dimensional graphics of the input data used in simulation as well as the results obtained. At present, the model considers only confined aquifers. The capabilities of the model were demonstrated by using a test case consisting of the multilayered ground-water system beneath Long Island, New York.

2452 (PNL--2774) CHARACTERIZATION OF THE HANFORD 300 AREA BURIAL GROUNDS. TASK IV. BIOLOGICAL TRANSPORT. Fitzner, R.E.; Gano, K.A.; Rickard, W.H.; Rogers, L.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Oct 1979. Contract EY-76-C-06-1830. 86p. Dep. NTIS, PC A05/MF A01.

The characteristics of radioactive waste burial sites at the 300 area burial grounds on the Department of Energy's Hanford Site, southeastern Washington were studied. The potential vectors of radionuclide transport studied were vegetation and animals. The overall results showed a low potential for uptake and transport of radionuclides from the 300 area sites. However, additional methods to control physical and biological mechanisms may contribute to the effectiveness of waste burial practices. From the results, the Biological

Transport task recommended field studies which include reduction of soil erosion and addition of biobarriers to plants and animals. Vegetation plays a major role in reducing soil erosion, and thereby maintaining the backfill over the burial sites. Of the several species found on the 300 area sites, cheatgrass (Bromus tectorum) appears to be the most desirable as a cover. Besides retarding erosion, it has a shallow root system (does not easily penetrate buried material); it has a low affinity for radionuclide uptake; and its tissues are not easily blown away. Small mammals (specifically, mice) appear to have the most potential for radionuclide exposure and uptake. Small mammals were live-trapped within 10 x 10-meter trap grids. Each animal trapped was surgically implanted with a thermoluminescent dosimeter. When the animal was recaptured, the dosimeter was removed and read for exposure. Exposures were reported in milli-Roentgens. The most consistently trapped small mammals were the Great Basin pocket mouse (Perognathus parvus) and the deer mouse (Peromyscus maniculatus). Results from the dosimeter readings showed that some of those animals had higher than background exposures. Biobarriers to animals could be considered as a mechanism to reduce the potential for radionuclide transport.

2453 (PNL--2970) GETOUT: A COMPUTER PROGRAM FOR PREDICTING RADIONUCLIDE DECAY CHAIN TRANSPORT THROUGH GEOLOGIC MEDIA. DeMier, W.V.; Cloninger, M.O.; Burkholder, H.C.; Liddell, P.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Aug 1979. Contract EY-76-C-06-1830. 342p. Dep. NTIS, PC A15/MF A01.

A guide to the use of the GETOUT code is presented. The code models the migration of radionuclides from an underground source to a surface body of water. Output from the code comprises: (1) a nuclide discharge summary file in a format suitable for input to an existing biosphere model, and (2) printed reports showing discharge profiles for selected nuclides by four release modes. The guide provides a general description of the GETOUT system, program listings, sample output, and instructions, with examples for executing the code.

2454 (PNL--3129) ENVIRONMENTAL CONTROL ASPECTS FOR FABRICATION, REPROCESSING AND WASTE DISPOSAL OF ALTERNATIVE LWR AND LMFBR FUELS. Nolan, A.M.; Lewallen, M.A.; McNair, G.W. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Nov 1979. Contract EY-76-C-06-1830. 94p. Dep. NTIS, PC A05/MF A01.

Environmental control aspects of alternative fuel cycles have been analyzed by evaluating fabrication, reprocessing, and waste disposal operations. Various indices have been used to assess potential environmental control requirements. For the fabrication and reprocessing operations, 50-year dose commitments were used. Waste disposal was evaluated by comparing projected nuclide concentrations in ground water at various time periods with maximum permissible concentrations (MPCs). Three different fabrication plants were analyzed: a fuel fabrication plant (FFP) to produce low-activity uranium and uranium-thorium fuel rods; a plutonium fuel refabrication plant (PFRFP) to produce plutonium-uranium and plutonium-thorium fuel rods; and a uranium fuel refabrication plant (UFRFP) to produce fuel rods containing the high-activity isotopes ^{232}U and ^{233}U. Each plant's dose commitments are discussed separately. Source terms for the analysis of effluents from the fuel reprocessing plant (FRP) were calculated using the fuel burnup codes LEOPARD, CINDER and ORIGEN. Effluent quantities are estimated for each fuel type. Bedded salt was chosen for the waste repository analysis. The repository site is modeled on the Waste Isolation Pilot Program site in New Mexico. Wastes assumed to be stored in the repository include high-level vitrified waste from the FRP, packaged fuel residue from the FRP, and transuranic (TRU) contaminated wastes from the FFP, PFRFP, and UFRFP. The potential environmental significance was determined by estimating the ground-water concentrations of the various nuclides over a time span of a million years. The MPC for each nuclide was used along with the estimated ground-water concentration to generate a biohazard index for the comparison among fuel compositions.

2455 (PNL--3253) ENVIRONMENTAL CONTROL TECHNOLOGY FOR MINING, MILLING, AND REFINING THORIUM. Weakley, S.A.; Blahnik, D.E.; Young, J.K.; Bloomster, C.H. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Feb 1980. Contract AC06-76RL01830. 253p. NTIS, PC A12/MF A01.

The purpose of this report is to evaluate, in terms of cost and effectiveness, the various environmental control technologies that would be used to control the radioactive wastes generated in the mining, milling, and refining of thorium from domestic resources. The technologies, in order to be considered for study, had to reduce the radioactivity in the waste streams to meet Atomic Energy Commission (10 CFR 20) standards for natural thorium's maximum permissible concentration (MPC) in air and water. Further regulatory standards or licensing requirements, either federal, state, or local, were not examined. The availability and cost of producing thorium from domestic resources is addressed in a companion volume. The objectives of this study were: (1) to identify the major waste streams generated during the mining, milling, and refining of reactor-grade thorium oxide from domestic resources; and (2) to determine the cost and levels of control of existing and advanced environmental control technologies for these waste streams. Six potential domestic deposits of thorium oxide, in addition to stockpiled thorium sludges, are discussed in this report. A summary of the location and characteristics of the potential domestic thorium resources and the mining, milling, and refining processes that will be needed to produce reactor-grade thorium oxide is presented in Section 2. The wastes from existing and potential domestic thorium oxide mines, mills, and refineries are identified in Section 3. Section 3 also presents the state-of-the-art technology and the costs associated with controlling the wastes from the mines, mills, and refineries. In Section 4, the available environmental control technologies for mines, mills, and refineries are assessed. Section 5 presents the cost and effectiveness estimates for the various environmental control technologies applicable to the mine, mill, and refinery for each domestic resource.

2456 (PNL--3300(Pt.5), pp 43-49) ANALYSIS OF NUCLEAR FUEL CYCLES. Feb 1980.

Pacific Northwest Laboratory annual report for 1979 to the DOE Assistant Secretary for Environment. Part 5. Environmental assessment, control, health, and safety.

The operation of nuclear fuel cycle facilities will introduce noxious materials, both radiological and chemical, into the environment through routine discharges of both liquid and airborne effluents. The

environmental control implications of continuing to develop existing nuclear fuel cycles and implementing new fuel cycles must be systematically determined so technologies that control or eliminate the discharge of noxious materials to the environment can be quickly developed and demonstrated. The objective of this program is to identify areas in developing nuclear fuel cycles where (1) inadequate consideration is being given to environmental controls, (2) inconsistencies and conflicts exist in environmental policy, and (3) environmental control improvements can be justified on a cost/risk/benefit basis to ensure that funds are not expended for control in instances where neither the potential effects nor public concerns warrant such expenditures.

2457 (PNL--3304) MONITORING AND PHYSICAL CHARACTERIZATION OF UNSATURATED ZONE TRANSPORT. LABORATORY ANALYSIS. Gee, G.W.; Campbell, A.C. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Mar 1980. Contract EY-76-C-06-1830. 67p. Dep. NTIS, PC A04/MF A01.

Batch Kd screening tests on Hanford sediments indicated that anionic radionuclide mobility is dependent upon specie and concentration. Technetium, as TcO_4^-, is not sorbed to any extent and will move as rapidly as water. Iodine, as I^-, will also move at high concentrations (>5 ppB) but is retarded at very low concentrations (<1 ppB). Neutral species such as tritium and complexed nuclides such as cobalt-60 (EDTA) are only slightly retarded while uncomplexed cobalt-60 is strongly bound to the sediments under the conditions studied. Strontium sorption is controlled by ion exchange-like reactions and sorption is predictable from a knowledge of soil and solution characteristics. Cesium is strongly bound to the Hanford sediments under typical conditions and appears to be sorbed independent of salt concentration for the synthetic ground waters tested. The sorption of relatively mobile nuclides such as tritium, cobalt-EDTA, and technetium could be measured with greater precision using the unsaturated column tests than with batch methods. Little or no difference in sorption was observed when the flow rates were changed by more than an order of magnitude (2 to 50 cm/day). Changes in saturation percentage of the soil, from 56 to 31%, also had only a minor effect on nuclide sorption. For layered sediments, the effective sorption of a layered sequence is controlled by the sorption characteristics of the most sorbing layer.

2458 (PNL-SA--7245) PRELIMINARY RESULTS ON COMPARISON OF ADSORPTION-DESORPTION METHODS AND STATISTICAL TECHNIQUES TO GENERATE KD PREDICTOR EQUATIONS. Serne, R.J.; Rai, D.; Relyea, J.F. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1979. Contract EY-76-C-06-1830. 12p. Dep. NTIS, PC A02/MF A01.

The radioactive waste isolation safety assessment program (WISAP) is being performed for the United States Department of Energy. A large bank of data have been collected under this program. A part of the program is devoted to the evaluation of radionuclide-geomedia interactions in order to determine the behavior of different elements in the environment. This paper introduces and briefly summarizes data collected thus far on methods of determining adsorption coefficients, thermodynamic predictions of stable solid and solution species, Kd data, and studies for determining adsorption mechanisms.

2459 (PNL-SA--7352(Vol.1), pp 331-403) CHROMATOGRAPHIC K/SUB D/ VALUES OF RADIONUCLIDES AND THE EFFECT OF REDOX POTENTIALS ON SORPTION OF RADIONUCLIDES BY GEOLOGIC MEDIA. Francis, C.W.; Reeves, M. III; Bondietti, E.A.; Smith, B.A. (Oak Ridge National Lab., TN). 1978.

From 2. contractor information meeting; Seattle, WA, USA (1 Oct 1978).

Distribution and selectivity coefficients for ^{85}Sr and ^{63}Ni were determined in the presence of various Ca concentrations in channel chromatographs packed with Conasauga shale. These coefficients were obtained using a coupled-equations model consisting of (1) moisture transport in a partially saturated media, (2) mass transport of the calcium and radionuclide species contained in the influent, and (3) ion exchange between the ionic species in the solution phase and those sorbed on the solid matrix. A normalization procedure was developed so that profile data from one column or channel could be compared to data from other channels. Dispersivity measurements in the channel chromatographs were found to be the largest source of error in determining K/sub d/ values. Values for ^{85}Sr ranged from 2.4 to 3.6 and for ^{63}Ni from 5.3 to 8.6, and compared closely to those determined by a batch equilibrium method, 2.4 for ^{85}Sr and 6.5 for ^{63}Ni. Redox measurements of igneous rock suspensions in anoxic stirred cells predicted that the species of TcO_4^- and NpO_2^+ would not be the stable forms of these elements. Adding T/sub c/O_4^- and NpO_2^+ to similar anoxic suspensions revealed that the species are reduced to less soluble states. Thus, current risk assessments, which consider the oxidized forms (TcO_4^- and NpO_2^+) as potentially migrating from high-level radioactive waste repositories, may be overestimating their potential hazard to the public.

2460 (PNL-SA--7468) WORKSHOP ON TRANSPORT MODELING FOR NUCLEAR WASTE REPOSITORIES. Raymond, J.R. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jul 1977. Contract EY-76-C-06-1830. 18p. Dep. NTIS, PC A02/MF A01.

The Transport Modeling task includes developing methods to describe the transport and impact of radiocontaminants accidentally released from waste repositories; demonstrating the use of these methods; and making the methods and techniques available to the repository managers for application at specific sites. The workshop on Transfer Modeling for the Waste Isolation Safety Assessment Program was held at the Battelle Seattle Research Center on 25 and 26 July 1977. The objectives of the workshop were to: 1) discuss needs and criteria for the models, 2) obtain critiques of proposed model systems from experts in the field, and 3) obtain ideas for making models more useful to the safety assessment program. The proceedings of the workshop were presented.

2461 (PNL-SA--7875) NUMERICAL ANALYSIS OF RADIONUCLIDE MOVEMENT FROM A HYPOTHETICAL NUCLEAR WASTE REPOSITORY. Raymond, J.R.; Segol, G. (Battelle Pacific Northwest Labs., Richland, WA (USA); Bechtel National, Inc., San Francisco, CA (USA)). 1979. Contract EY-76-C-06-1830. 27p. Dep. NTIS, PC A03/MF A01.

A numerical analysis of the consequences of radionuclide release from a hypothetical nuclear waste repository located in bedded salt and of their subsequent transport by ground water has been performed. The study was based on available geologic and hydrologic information for the reference location. The

initial run was based on a best estimate of geologic and hydrologic parameters for this reference location. Its results indicate that those isotopes which reach the natural discharge point remain below MPC levels for uncontrolled water use. The initial run was followed by a parametric study to evaluate the sensitivity of the model to the values of input parameters. This analysis shows that the model is sensitive to the assumed values of hydraulic conductivity, dispersivity and retardation factor, as expected. But this analysis also emphasizes that there exist complex interactions between such parameters which are less intuitively evident. The influence of waste leach rates is being investigated.

2462 (PNL-SA--8571(Vol.2)) WASTE ISOLATION SAFETY ASSESSMENT PROGRAM. TASK 4. THIRD CONTRACTOR INFORMATION MEETING . (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jun 1980. Contract AC06-76RL01830. 392p. (CONF-7910160--(Vol.2)). NTIS, PC A17/MF A01.

From 3. contractor information meeting on waste isolation safety assessment program task 4; Seattle, WA, USA (14 Oct 1979).

The study subject of this meeting was the adsorption and desorption of radionuclides on geologic media under repository conditions. This volume contans eight papers. Separate abstracts were prepared for all eight papers. (DLC)

2463 (PNL-SA--8571(Vol.2), pp 1-79) SYSTEMATIC STUDY OF NUCLIDE ADSORPTION ON SELECTED GEOLOGIC MEDIA. ANNUAL PROGRESS REPORT, OCTOBER 1, 1978-SEPTEMBER 17, 1979. Meyer, R.E. (comp.). (Oak Ridge National Lab., TN). Jun 1980.

From 3. contractor information meeting on waste isolation safety assessment program task 4; Seattle, WA, USA (14 Oct 1979).

This report summarizes the past year's work concerning the adsorption of nuclides of interest to nuclear waste on clays, hydrous oxides, and other geologic media as a function of the pertinent variables of salt concentration, pH, and loading. Most of the adsorbent-adsorbate systems were investigated in the pH range 5 to 10 and the salt concentration range from 0.01 to 5 M NaCl in order to cover the most probable compositions of groundwaters in the region of waste repositories located in bedded salt formations or salt domes. A batch method was generally used to obtain the data, but for some special conditions, the axial filter was used. For adsorption on clay minerals at pH values of about 5 where hydrolysis reactions are not likely to occur, a strong salt dependence was observed, and the data could be fairly well described by ideal ion exchange equations. As the pH was increased, for some of the systems, e.g. for Eu(III) adsorption on montmorillonite, distribution coefficients increased significantly with pH and the salt dependence decreased or disappeared entirely. For adsorption of Sr(II) and Eu(III) on hydrous oxides, usually a form of Al_2O_3, significant increases in distribution coefficients with pH were observed and the salt dependence was very small, but often increasing somewhat as the pH was increased. Distribution coefficients for adsorption of I^- on a large variety of minerals and rocks were almost always very small, generally almost zero, and only for a few adsorbents under special conditions were distribution coefficients as high as 10 liters/kilogram observed. These results demonstrate that a large number of experiments are required for a complete and systematic investigation of a single nuclide-adsorbent system but also show that the dependence of the distribution coefficient on the variables show regularities which may be used to interpolate and extrapolate the data to nontested conditions.

2464 (PNL-SA--8571(Vol.2), pp 235-260) WASTE/ROCK INTERACTION TECHNOLOGY. SOLUBILITY OF PLUTONIUM COMPOUNDS AND THEIR BEHAVIOR IN SOILS. Rai, D.; Serne, R.J.; Moore, D.A. (Pacific Northwest Labs., Richland, WA). 1 Feb 1980.

From 3. contractor information meeting on waste isolation safety assessment program task 4; Seattle, WA, USA (14 Oct 1979).

The solubilities of $^{239}PuO_2(c)$ and $^{239}Pu(OH)_4(am)$ under natural environmental conditions were determined. These data were then used to predict the (1) nature of the solid phases present in contaminated soils, and (2) total concentration of Pu that can be expected in soil solutions when these Pu solids are present. Based upon solubility measurements, an estimated value of the log K/sup c/ for the dissolution of $^{239}PuO_2(c)$ [$PuO_2(c)$ reversible $PuO_2 + e^-$] was found to be -14.8. The estimated value of the log K/sup c/ for the dissolution of $^{239}Pu(OH)_4(am)$ [$Pu(OH)_4(am)$ reversible $PuO_2 + 2\ H_2O + e^-$] was found to be -12.8. Comparison of Pu concentration in equilibrium solutions of contaminated Hanford soils with the $PuO_2(c)$ and $Pu(OH)_4(am)$ solubility lines suggested that $Pu(OH)_4(am)$ was absent from all the samples and that two of the samples contained $PuO_2(c)$. The presence of $PuO_2(c)$ was also confirmed by X-ray diffraction of Pu particles isolated from one of the samples.

2465 (PNL-SA--8571(Vol.2), pp 213-234) WASTE/ROCK INTERACTIONS TECHNOLOGY. INTERACTIONS OF PLUTONYL (VI) WITH SOIL MINERALS. Rai, D.; Serne, R.J.; Moore, D.A. (Pacific Northwest Labs., Richland, WA). Feb 1980.

From 3. contractor information meeting on waste isolation safety assessment program task 4; Seattle, WA, USA (14 Oct 1979).

Plutonium-239 adsorption by differnt minerals from aerated 0.005 M $CaCl_2$ solutions containing 7.3×10^{-9} M Pu(VI) was studied. At pH 4, adsorption by the selected minerals differed significantly, with adsorption increasing in the following order: gibbsite < kaolinite < montmorillonite < nontronite approx. = hematite < vermiculite approx. = biotite. At pH 7, the adsorption on these minerals did not differ significantly and exceeded 93% in all cases. Several mechanisms that contributed to Pu adsorption were identified: ion exchange, specific adsorption, reduction of Pu(VI), and Pu(VI) hydrolysis. Vermiculite, biotite, and hematite, containing structural Fe(II), were found to reduce Pu(VI) even in the well aerated suspensions. Although the initial ^{239}Pu concentration added to the mineral suspensions was 22 times the MPC of ^{239}Pu in unregulated water, the concentration in equilibrated solutions at pH 7 were near or lower than the MPC. This was also true for vermiculite, biotite, and hematite at pH 4. A very small percentage of the adsorbed Pu was released when the minerals were contacted with 1 M NaCl. These results indicate that Pu in general and Pu(VI) specifically would be relatively immobile in geomedia that do not contain significant quantities of complexing ligands.

2466 (PNL-SA--8571(Vol.2), pp 81-133) SORPTION-DESORPTION OF LONG-LIVED RADIONUCLIDE SPECIES ON GEOLOGIC MEDIA. ANNUAL REPORT.

Francis, C.W.; Bondietti, E.A. (Oak Ridge National Lab., TN). 1 Oct 1979.
From 3. contractor information meeting on waste isolation safety assessment program task 4; Seattle, WA, USA (14 Oct 1979).
Influence of time, temperature, pH, Eh, Fe^{+2}, and Tc concentrations on sorption-desorption of Tc on basalt, granite, and shale was investigated. Loss of TcO^{-}_{4} from solution appears not to be due to sorption, but rather due to the reduction to a lower oxidation state, probably TcO_2 which is insoluble. Loss of TcO^{-}_{4} increased with time. Increasing the temperature enhanced the initial reduction rate, but the rate exponentially decayed at high temperatures (72 vs 22°C). Basalt reduced TcO^{-}_{4} faster and in greater quantities than the granite or shale samples. 10^6 more Tc-99 was retained on anoxic basalt columns than Tc-95m; however, the Sorption Concentration Ratios (0.64 and 3.54 ml/9) were not appreciably different. The additions of Fe^{+2} prior to TcO^{-}_{4} additions did not affect TcO^{-}_{4} reduction; but, additions of Fe^{+2} to Tc-rock suspensions reduced TcO^{-}_{4}. The reduced form of Tc is slowly oxidized to the TcO^{-}_{4} under oxic conditions. In Eh-pH monitored stirred suspensions, the sngle most important variable influencing the loss of TcO^{-}_{4} was Eh of the suspension. Losses of TcO^{-}_{4} from basalt suspensions occurred at measured Eh's 0.240 volts higher than theoretically required for the formation of the water-insoluble TcO_2. Pertechnetate (μM) was observed to be stable in the presence of 100 μM Fe^{+2}, pH 5, and Eh approx. +0.400 volts; even at Fe^{+2}/TcO^{-}_{4} ratios > 10^6, the pertechnetate was observed to be stable at pH's between 4.5 and 5.5. As the pH was increased to 6.5 and greater the loss of TcO^{-}_{4} from solution was directly proportional to the loss of Fe^{+2}. TcO^{-}_{4} was reduced by Fe^{+2} as the pH was increased, and Tc^{+4} was isomorphically substituted into the lattice of $Fe(OH)_3$ because of the similarity in ionic radii (0.65 A) of Tc^{+4} and Fe^{+3}.

LABORATORY STUDIES OF PU-237 SORPTION ON SELECTED MINERALS UNDER ANOXIC CONDITIONS. Relyea, J.F.; Serne, R.J.; Fulton, R.W.; Washburne, C.D.; Martin, W.J. (Pacific Northwest Lab., Richland, WA). 1 Oct 1979.
From 3. contractor information meeting on waste isolation safety assessment program task 4; Seattle, WA, USA (14 Oct 1979).
Corrections have been made for measured Kd values for plutonium under anoxic conditions after 30 days of shaking. Values for Kd(Pu) were highest for the phyllosilicate minerals illite, montmorillonite, vermiculite and biotite. Corrected Kd/sub a/(Pu) values were generally higher under anoxic than ambient atmospheric conditions in both 5.13 N NaCl and 0.03 N $CaCl_2$. Lower values for Kd/sub a/(Pu) were observed in 0.03 N $NaHCO_3$ under anoxic than under ambient conditions. There were no statistically significant differences in Kd/sub a/(Pu) for the two oxygen conditions for the 0.03 N NaCl solution. Thermodynamic data suggest that Pu sorption would be greater under anoxic conditions as shown in two of the four solutions used. There is no explanation for the apparent lack of agreement of the other two solutions. In general Pu adsorption by the minerals was high with the lowest mean value for corrected data being Kd/sub a/(Pu) = 92 for quartz under anoxic conditions. Of the 96 permutations (12 minerals x 4 solutions x 2 oxygen conditions) in only 14 instances did the Kd/sub a/(Pu) fall below 1000 ml/g and in only 5 instances did Kd/sub a/(Pu) fall below 500 ml/g.

2468 (PNL-SA--8571(Vol.2), pp 261-315)
KINETICS AND REVERSIBILITY OF RADIONUCLIDE SORPTION REACTIONS WITH ROCKS. PROGRESS REPORT FOR FISCAL YEAR 1979. Barney, G.S.; Brown, G.E. (Rockwell International, Richland, WA). Sep 1979.
From 3. contractor information meeting on waste isolation safety assessment program task 4; Seattle, WA, USA (14 Oct 1979).
Sorption-desorption reactions of cesium, strontium, neptunium, americium, and plutonium on basalt, granite, and argillite were observed for 218 days. Equilibrium in batch experiments was not reached for most radionuclides even after this long time. Reactions of the crushed rock with ground waters (dissolution, hydrolysis, precipitation, etc.) also did not reach equilibrium after 150 days. The dissolution of basalt is accompanied by the formation of colloidal particles which contain Si, Fe, Ca, and Al. These colloids sorb Cs, Sr, Am, and Pu during equilibration. Some of the colloids pass through 0.3-μm filters, are not retained even on 0.01-μm filters and, therefore, cause calculated K/sub d/ values to be too low. Samples of crushed basalt, granite, and argillite were artificially weathered by continuous leaching with distilled water for 6 months both in air and in an oxygen-free stream of nitrogen gas. The weathered rock was then characterized for surface area, surface structure, cation exchange capacity, and composition of weathered surface on the rock. Comparisons were made of radionuclide sorption (after 14 days) on fresh rock, rock weathered in air, and rock weathered in N_2. Sorption on rocks weathered in N_2 generally is less than on rock weathered in air. This is possibly due to the lack of an $Fe(OH)_3$ coating on the rock weathered in N_2. The $Fe(OH)_3$ is known to scavenge cations and silica from solution. Sorption of Cs, Si, Am, and Pu is strongly affected by weathering basalt and argillite. However, the cation exchange capacity is changed very little, suggesting that ion exchange plays a minor role in sorption of these radionuclides.

2469 (PNL-SA--8571(Vol.2), pp 159-171)
EFFECTS OF HYDROGEN PEROXIDE PRETREATMENT OF CLAY MINERALS ON THE ADSORPTION OF SR-85 AND TC-95M UNDER ANOXIC CONDITIONS. Relyea, J.F.; Washburne, C.D. (Pacific Northwest Lab., Richland, WA). Jul 1979.
From 3. contractor information meeting on waste isolation safety assessment program task 4; Seattle, WA, USA (14 Oct 1979).
Treatment of three clay minerals with hydrogen peroxide affects the observed adsorption behavior of technetium relative to untreated clay under anoxic conditions. A possible adsorption mechanism of Tc is the reduction of TcO^{-}_{4} to a more positively charged or better adsorbed species. Oxidation of the clay by H_2O_2 would hinder the reduction of TcO^{-}_{4} by buffering the clay-water system at a higher Eh value, although a difference in measured Eh value may go undetected. Sorption of strontium by the clays under the same conditions is not affected by a pretreatment with H_2O_2. The behavior of strontium follows that expected from ion exchange theory. 13 tables.

SORPTION BEHAVIOR OF ^{85}SR, ^{137}CS AND /SUP 95M/ TC UNDER NORMAL ATMOSPHERIC AND REDUCED OXYGEN LEVELS. Relyea, J.F.; Washburne, C.D.; Fulton, R.W. (Pacific Northwest Lab., Richland, WA). Jul 1979.
From 3. contractor information meeting on waste isolation safety assessment program task

4; Seattle, WA, USA (14 Oct 1979).
Identical mineral samples and simulated groundwaters were used in a study of the sorption of technetium, strontium and cesium under anoxic conditions. Results from these experiments show that the anoxic sorption of strontium and cesium is generally unchanged or lower than sorption under ambient atmospheric conditions. The sorption of both Cs and Sr is inhibited by the presence of high NaCl concentrations (brines), and Sr sorption is reduced by the presence of Ca^{2+} in solution. Values for Kd(Cs) and Kd(Sr) often change with time, as both the mineral properties and solution chemical composition change due to weathering of the minerals. In these instances equilibrium has not been attained; differences between ambient and anoxic Kd values found at short contact times may disappear at equilibrium. Both Kd values and their variability were increased for technetium under anoxic conditions. Technetium adsorption is greatest on the hard rock minerals (tektosilicates and inosilicates) which may be influenced by small chunks of metal from the apparatus used to grind the minerals to power form. 21 tables.

2471 (RHO-BWI-C--65) CHARACTERIZATION OF THE PHYSICAL PARAMETERS AND SAMPLING PROCEDURE OF A MODIFIED ROCKING AUTOCLAVE APPARATUS. Scheetz, B.E. (Pennsylvania State Univ., University Park (USA)). Apr 1980. Contract AC06-77RL01030. 18p. NTIS, PC A02/MF A01.
Purpose of the apparatus is to investigate the stability of several candidate radwaste forms under simulated deep geological disposal. (DLC)

2472 (RPDE--79-023) PNEUMATIC TRANSPORT SYSTEM DEVELOPMENT: RESIDUALS AND RELEASES PROGRAM AT WESTINGHOUSE CHESWICK SITE. Larouere, P.J.; Shoulders, J.L. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Nuclear Fuel Div.). Jan 1979. Contract EN-77-C-06-1058-002. 71p. Dep. NTIS, PC A04/MF A01.
Plutonium oxide and uranium oxide powders are processed within glove boxes or within confinement systems during the fabrication of mixed oxide (MOX) pellets for recycle fuel. The release of these powders to the glove box or to the confinement results in some airborne material that is deposited in the enclosure or is carried in the air streams to the effluent air filtration system. Release tests on simulated leaks in pneumatic transport equipment and release tests on simulated failures with powder blending equipment were conducted. A task to develop pneumatic transport for the movement of powders within an MOX fabrication plant has been underway at the Westinghouse Research Laboratories. While testing and evaluating selected pneumatic transport components on a full scale were in progress, it was deemed necessary that final verification of the technology would have to be performed with plutonium-bearing powders because of the marked differences in certain properties of plutonium from those of uranium oxides. A smaller was designed and constructed for the planned installation in glove boxes at the Westinghouse Plutonium Fuel Development Laboratory. However, prior to use with plutonium it was agreed that this system be set up and tested with uranium oxide powder. The test program conducted at the Westinghouse Cheswick site was divided into two major parts. The first of these examined the residuals left as a result of the pneumatic transport of nuclear fuel powders and verified the operability of this one-third scale system. The second part of the program studied the amount of powder released to the air when off-standard process procedures or maintenance operations were conducted on the pneumatic transport system. Air samplers located within the walk-in box housing the transport loop were used to measure the solids concentration in the air. From this information, the total amount of airborne powder was determined.

2473 (SAND--79-0896C) SENSITIVITY STUDIES OF THE SWIFT RADIONUCLIDE TRANSPORT MODEL. Campbell, J.E.; Langkopf, B.S.; Iman, R.L. (Sandia Labs., Albuquerque, NM (USA); INTERA Environmental Consultants, Inc., Houston, TX (USA)). 1979. Contract EY-76-C-04-0789. Pp. (CONF-791112--22). Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
There are large uncertainties in the input waste depository. The aim of the sensitivity studies was to identify these uncertainties and to reduce the number of SWIFT transport calculations. The sensitivity analysis was applied to a hypothetical problem consisting of both a reference site containing a nuclear waste depository and a disruptive-event scenario for the possible release of radioactive materials to the biosphere. Results are presented for the total radionuclide discharge to a river in the 10^6-year time period following depository closure. (DLC)

2474 (SAND--79-0900C) BRINE CHEMISTRY EFFECTS ON THE DURABILITY OF A SIMULATED NUCLEAR WASTE GLASS. Braithwaite, J.W. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 8p. (CONF-791112--16). Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
The effects of various solution chemistry parameters on the alteration and leaching characteristics of a copper borosilicate simulated waste glass have been determined under hydrothermal conditions. Results are presented which demonstrate that leachant salinity, volume/glass surface area ratio, pH, cation content, and dissolved SiO_2 concentration effects are important. A brief explanation of these results is given which is based on ion exchange and solution saturation equilibria.

2475 (SAND--79-0955C) DEVELOPMENT OF SCENARIOS FOR LONG-TERM RELEASE OF RADIONUCLIDES FROM THE PROPOSED WASTE ISOLATION PILOT PLANT IN SOUTHEASTERN NEW MEXICO. Bingham, F.W.; Barr, G.E. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 7p. (CONF-791112--7). Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
As fault-tree analysis had its faults, the WIPP group switched its attention to the construction of event trees and of scenarios from the cut sets of these event trees. The scenarios were grouped into three classes for computer modeling: those that expose waste directly to the biosphere, those that begin with water flow between two aquifers at the site, and those that begin with water flow from only one aquifer. Each of the scenarios can be modeled by one of four general models. The current analyses of the long-term effects of the WIPP repository are derived from these models. Predicted doses from these hypothetical releases fall far below those from natural background radiation. (DLC)

2476 (SAND--79-1016C) RADIONUCLIDE TRANSPORT IN A DOLOMITE AQUIFER. Dosch, R.G.; Lynch, A.W. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 8p. (CONF-791112--15). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

The most probable paths for radionuclide transport between the biosphere and the proposed bedded salt repository (WIPP) in Southeastern New Mexico are through dolomite formations which are the only currently water-bearing units overlying the repository horizon. This paper describes some of the experimental work performed to determine the potential for radionuclide migration in these formations. Included are the results of radionuclide sorption studies on natural dolomites (Magenta and Culebra) and on synthetic dolomite (protodolomite). Sorption on natural dolomites was evaluated with respect to core sample location, groundwater composition, nuclide concentration, and water volume to rock mass ratios used in making the measurements. Results show that a discrete value such as a distribution coefficient (Kd) assigned to a given radionuclide does not accurately describe its interactions with site-specific geological formation.

2477 (SAND--79-1665C) THERMAL CONDUCTIVITY OF ROCKSALT AND OTHER GEOLOGIC MATERIALS FROM THE SITE OF THE PROPOSED WASTE ISOLATION PILOT PLANT. Sweet, J.N.; McCreight, J.E. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 25p. (CONF-791134--7). Dep. NTIS, PC A02/MF A01.

From 16. international thermal conductivity conference; Chicago, IL, USA (7 Nov 1979).

The measurements first reported by Acton on the thermal conductivity of samples taken from a borehole at the site of the proposed nuclear waste isolation pilot plant (WIPP) near Carlsbad, NM, have been extended to include additional samples and higher temperature measurements. Samples for our measurements were taken from several depths of three wells, including the well AEC 8 from which Acton obtained his samples. These samples ranged from relatively pure rocksalt (NaCl) with small amounts of interstitial anhydrite to essentially nonsalt samples composed of gypsum or clay. The measurements in this latest series were conducted at Sandia using the longitudinal heat flow apparatus described by Acton, at the Los Alamos Scientific Laboratory (LASL) using a transient line source technique, and at Dynatech Corp., Cambridge, MA using a linear heat flow comparative technique. On the basis of these experiments, we have concluded that the thermal conductivity of materials found at the site can be predicted to an accuracy approx. +- 30% from knowledge of the composition and grain size of these materials.

2478 (SAND--80-7107) METEOROLOGICAL AND AIR QUALITY DATA QUARTERLY REPORT. WIPP SITE: EDDY COUNTY, NEW MEXICO. SUMMER QUARTER, JUNE 1977-AUGUST 1977. Pocalujka, L.P.; Babij, E.; Catizone, P.A.; Church, H.W. (TRC Environmental Consultants, Wethersfield, CT (USA); Sandia National Labs., Albuquerque, NM (USA)). Jun 1980. Contract AC04-76DP00789. 26p. NTIS, PC E02/MF $3.50.

The purpose of the WIPP meteorological, air quality, and radiological measurements program was to support the environmental effort for the evaluation of the site suitability. This data report is the latest in a series of seasonal quarterly data summaries to be issued for the southeastern New Mexico site.

2479 (STUDSVIK-K2--79/92) DOSE AND DOSE COMMITMENT FROM RADIOACTIVE SUBSTANCES CARRIED BY GROUNDWATER FROM A NUCLEAR FUEL REPOSITORY. Bergman, R.; Bergstroem, U.; Evans, S. (Aktiebolaget Atomenergi, Studsvik (Sweden)). Feb 1979. 103p. (In Swedish). (KBS--100). Dep. NTIS (US Sales Only), PC A06/MF A01.

The turnover of radioactive matter entering the biosphere with the groundwater has been studied with regard to exposure and doses for critical groups and populations. The main alternatives considered for the outflow of radioactive effluents to the biosphere are: outflow in a valley containing wells and to a nearby lake, outflow to a freshwater lake and to the downstream lake system, outflow in a coastal region of the Baltic Sea. Mathematical models of a set of coupled ecosystems on, regional, intermediate and global levels have been used for calculations of doses. The intermediate system refers to the Baltic Sea. The mathematical analysis, based on first order kinetics for the exchange or matter in a system according to compartment principles, also includes products in decay chains, i.e. daughter nuclides generated by decay of nuclides during ecological cycling. The time-dependent exposures have been studied for certain long-lived nuclides of radiological interest in waste from disposed fuel. Dose and dose commitment have been calculated for different episodes for outflow to the biosphere. The source strength is equal to the outflow at the boundary between geosphere and biosphere calculated by use of a geospheric model.

2480 (UCID--18136) WASTE PIPE CALCULUS EXTENSIONS. O'Connell, W.J. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 8 Nov 1979. Contract W-7405-ENG-48. 20p. Dep. NTIS, PC A02/MF A01.

The waste pipe calculus provides a rapid method, using Laplace transforms, to calculate the transport of a pollutant such as nuclear waste, by a network of one-dimensional flow paths. The present note extends previous work as follows: (1) It provides an alternate approximation to the time-domain function (inverse Laplace transform) for the resulting transport. This algebraic approximation may be viewed as a simpler and more approximate model of the transport process. (2) It identifies two scalar quantities which may be used as summary consequence measures of the waste transport (or inversely, waste retention) system, and provides algebraic expressions for them. (3) It includes the effects of radioactive decay on the scalar quantity results, and further provides simplifying approximations for the cases of medium and long half-lives. This algebraic method can be used for quick approximate analyses of expected results, uncertainty and sensitivity, in evaluating selection and design choices for nuclear waste disposal systems.

2481 (UCRL--15102) EFFECTS OF BRINE MIGRATION ON WASTE STORAGE SYSTEMS. FINAL REPORT. Gaffney, E.S.; Nickell, R.E. (Pacifica Technology, Del Mar, CA (USA)). 15 May 1979. Contract W-7405-ENG-48. 51p. Dep. NTIS, PC A04/MF A01.

Processes which can lead to mobilization of brine adjacent to spent fuel or nuclear waste canisters and some of the thermomechanical consequences have been investigated. Velocities as high as 4×10^{-7} m s^{-1} (13 m y^{-1}) are calculated at the salt/canister boundary. As

much as 40 liters of pure NaCl brine could accumulate around each canister during a 10-year storage period. Accumulations of bittern brines would probably be less, in the range of 2 to 5 liters. With 0.5% water, NaCl brine accumulation over a 10-year storage cycle around a spent fuel canister producing 0.6 kW of heat is expected to be less than 1 liter for centimeter-size inclusions and less than 0.5 liter for millimeter-size inclusions. For bittern brines, about 25 years would be required to accumulate 0.4 liter. The most serious mechanical consequence of brine migration would be the increased mobility of the waste canister due to pressure solution. In pressure solution enhanced deformation, the existence of a thin film of fluid either between grains or between media (such as between a canister and the salt) provides a pathway by which the salt can be redistributed leading to a marked increase in strain rates in wet rock relative to dry rock. In salt, intergranular water will probably form discontinuous layers rather than films so that they would dominate pressure solution. A mathematical model of pressure solution indicates that pressure solution will not lead to appreciable canister motions except possibly in fine grained rocks (less than 10^{-4} m). In fine grained salts, details of the contact surface between the canister and the salt bed may lead to large pressure solution motions. A numerical model indicates that heat transfer in the brine layer surrounding a spent fuel canister is not conduction dominated but has a significant convective component.

2482 (UCRL--15150) NUTRAN: A COMPUTER MODEL OF LONG-TERM HAZARDS FROM WASTE REPOSITORIES. Ross, B.; Koplik, C.M.; Giuffre, M.S.; Hodgin, S.P.; Duffy, J.J. (Analytic Sciences Corp., Reading, MA (USA)). 7 Dec 1979. Contract W-7405-ENG-48. 118p. (TR--1797-7). Dep. NTIS, PC A06/MF A01.

The NUTRAN package of computer programs calculates doses to humans from radioactivity carried out of deep geologic waste repositories by groundwater. It consists of four codes: ORIGEN (developed by Oak Ridge National Laboratory), which treats the formation and decay of radionuclides, WASTE, which computes the transport of radionuclides in ground water, BIODOSE, which calculates radionuclide transport in surface waters and ecosystems and human exposures, and WPPLOT, which combines the results of WASTE and BIODOSE into usefully formatted outputs. This report describes what the WASTE, BIODOSE, and WPPLOT codes do. The equations they compute are presented in detail and their meaning is explained. Auxiliary programs which facilitate input and data management operations are also described.

2483 (UCRL--81147(Pt.2)) LEACHING CHARACTERISTICS OF ACTINIDES FROM SIMULATED REACTOR WASTE, PART 2. Weed, H.C.; Coles, D.G.; Bradley, D.J.; Mensing, R.W.; Schweiger, J.S.; Rego, J.H. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 5 Oct 1979. Contract W-7405-ENG-48. 9p. (CONF-791112--10(Pt.2)). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Leach rates for ^{237}Np and ^{239}Pu are investigated with a single-pass leaching system. The factorial experimental design uses several combinations of solution composition and flow rate, and two temperatures, 25 and 75°C. The 25°C results are compared with those from a modified IAEA procedure. At 25°C, leach rates decrease with time. Agreement between results from the single-pass and modified IAEA methods is fair with WIPP brine leachant, good with $NaHCO_3$, and good with distilled H_2O. Leach rates are approximately independent of flow rates at room temperature, but increase with flow rates at high temperature. Rates for ^{237}Np increase with temperature, but those for ^{239}Pu either decrease or do not change with temperature. 7 figures.

2484 (UCRL--82228) MODELING OF BRINE MIGRATION IN HALITE. Cheung, H.; Fuller, M.E.; Gaffney, E.S. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 19 Oct 1979. Contract W-7405-ENG-48. 11p. (CONF-791112--9). Dep. NTIS, PC A02/MF A01.

From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).

Four different models of the migration process have been reviewed to determine their suitability as a working model. While there are several common factors in the models additional factors are included to account for several possible effects. The detail of each model leads to a certain degree of difficulty in applying the model to the problem at hand. One model predicts that inclusions smaller than 0.1 mm dimension probably will not migrate. The other models do not consider size as a factor. Thermal diffusion (Soret effect) is considered insignificant in three models, while in the fourth model it is added to the concentration diffusion term. The following conclusions are made: (1) Temperature is the most significant parameter in all models and must be known as a function of time, and distance from the canister. (2) All four models predict about the same migration velocity for a given set of conditions. For 100°C and 1°C/cm thermal gradient, the individual values are 3.0, 4.8, 5.6 and 6.4 mm/y. (3) The diffusion of ions through the brine inclusions is the rate controlling mechanism. (4) The difference between the thermal gradients in the liquid and in the solid should always be considered, and is a function of droplet shape. (5) The model based upon work by Nernst is easiest to use since all necessary parameters are readily available in the literature. However, of the four models is predicts the lowest migration rate. (6) The maximum volume of pure brine accumulated at the canister surface would be less than 20-40 liters in 50 years, for a canister initial thermal power of 3.5 kW. Bitterns would migrate proportionately less volume. A compuber code, BRINE, was developed to make these calculations by means of any of the four models.

2485 TECHNETIUM: A TOXIC WASTE PRODUCT OF THE NUCLEAR FUEL CYCLE: EFFECTS ON SOYBEAN GROWTH AND DEVELOPMENT. Berlyn, G.P.; Dhillon, S.S.; Koslow, E.E. (Yale Univ, New Haven, Conn). Environmental Management ; 4: No. 2, 149-156(Mar 1980).

The effects of technetium on soybeans were studied in relation to cytochemical events in the apical meristems of germinating seedlings; growth responses to 0, 0.04, 0.2, 1.0, 5.0, and 20.0 ppm Tc; growth responses to varying levels of Tc after a prior 5-day germination on Tc-free media, and response to Tc in the presence of added manganese. By 20 days, reductions in growth were evident at all levels of Tc except 0.04 ppm. Root growth was most severely affected, and seedling abnormality at 20 ppm was fivefold greater than that of the controls. Observation of mitotic figures did not reveal any chromosome aberrations, micronuclei, or chromosome bridges. The lowest level of Tc showing toxicity was 0.2 ppm which resulted in a 31% reduction in growth at 20 days. It is quite probable that the growth effects are due

to chemical toxicity possibly due to nutrient competition and/or substitution in uptake or metabolism. Refs.

2486 RADIONUCLIDE TRANSPORT THROUGH HETEOGENEOUS MEDIA. Hadermann, J. (Swiss Federal Int. for Reactor Research, Wuerenlingen, Switzerland). Nuclear Technology ; 47: No. 2, 312-323(Feb 1980).

One-dimensional radionuclide migration for conevective water transport with sorption and longitudinal dispersion is investigated. A semianalytic solution for layered media with piecewise constant parametes can be written when taking into account mass conservation and approximate flux conservation at interlayer boundaries. The solution is analytic in the first layer and allows for a recursive calculation in the following layers. Scaling laws for the relevant parameters can be formulated. Numerical examples exhibit the importance of at least a single highly sorbing layer. Small values of dispersivity may not lead to a conservative estimate of conservation at the geological column's end.

2487 LIMITATION OF THE RELEASE OF RADIOACTIVE EFFLUENTS. Beninson, D. (Comision Nacional de Energia Atomica, Buenos Aires, Argentina). pp 115-124 of Management of environment. Patel, B. (ed.). New Delhi, India; Wiley Eastern Ltd. (1980).

The basic principles of radiation protection require that the following criteria be met when setting release limits to the environment: (1) control of the release must be optimized; (2) dose limits for individual members of the public must not be exceeded; release limits must take into account the presence of other sources of radiation exposure, the continuing operation of all these sources in the future, and the eventual installation of new sources. (DAD)

2488 INTERLABORATORY COMPARISON OF ARSENIC, MOLYBDENUM AND SELENIUM ANALYSES FROM URANIUM MILL TAILINGS. Dreesen, D.R.; Gladney, E.S.; Owens, J.W. (Los Alamos Scientific Lab., NM). Journal of the Water Pollution Control Federation ; 51: No. 10, 2447-2456(Oct 1979).

In order to evaluate the analytical results coming from various laboratories on water samples analyzed for leached elements from uranium mill tailings piles or ponds, groundwater samples were collected from wells on top of and hydrologically downgradient from tailings piles produced by a uranium mill using a carbonate leach process. These samples were spiked with As, Mo, and Se at levels of 500 µg/l, 250 µg/l, and 500 µg/l, respectively, and submitted to various laboratories for analysis. The various methods used by the different laboratories for the analyses were broadly categorized as follows: flameless atomic absorption, flame atomic absorption, hydride generation flame atomic absorption, spectrophotometric-calorimetric, instrumental neutron activation analysis, neutron activation analysis with radiochemical separation, x-ray fluorescence spectroscopy, and fluorimetry. For comparison, the results of the different analyses for each element are tabulated. It was concluded that the wide spectrum of laboratories provide questionable data for trace elements in complex matrixes. It was felt that much improvement of methods and better understanding of the complexities of the matrixes are necessary before results of analyses are available on which to base judgments concerning the environmental pollution by these elements, particularly Se. (BLM)

2489 ENVIRONMENTAL ASPECTS OF TRITIUM. Quisenberry, D.R. (Mercer Univ). Environmental Pollution (London) ; 20: No. 1, 33-42(Sep 1979).

Potential radiological implications of environmental tritium releases must be determined to develop a program for dealing with the tritium inventory predicted for the nuclear power industry; development of predicted fusion power capacity will create a potential source for large releases of gaseous tritium. At present, about 90% of the tritium produced enters the environment through gaseous and liquid effluents. Tritium can be assimilated by plants and animals and organically bound, regardless of the exposure pathway. However, the body burden for humans and animals is dependent on the exposure pathway. Tissue-bound fractions in humans are primarily the result of organically bound tritium in food. (2 graphs, 27 references)

2490 MEASUREMENT OF RADON DIFFUSION AND EXHALATION FROM URANIUM MILL TAILINGS PILES. Silker, W.B.; Wogman, N.A.; Thomas, C.W.; Carr, D.B.; Heasler, P.C. (Pac Northwest Lab, Richland, Wash). Environmental Science and Technology ; 13: No. 8, 962-964(Aug 1979).

The concentrations of ;sup 226;Ra and ;sup 222;Rn (;sup 214;Pb) were measured as a function of depth within a uranium mill tailings pile by in situ ;gamma;-ray spectrometry. Radon diffusion and exhalation rates were determined from the concentration gradients by employing an integral solution of the diffusion equation that accomodates a nonuniform depth distribution of the parent radium. Radon diffusion coefficients of 0.0002 and 0.0017 cm;sup 2;s;sup -1; and exhalation rates of 60--275 atoms cm;sup -2;s;sup -1; were determined for two locations with differing soil moisture content. 12 refs.

2491 LET THEM MINE YELLOWCAKETHE IMPACT OF URANIUM MINING ON NEW MEXICANS. Robinson, G.; Feldman, D. Env. Action; 11: No. 1, 3-9(Jun 1979).

Feature article:According to the Council of Energy Resource Tribes, 75-80% of U.S. uranium reserves are on Indian lands. Uranium mining in New Mexico and Wyoming has lowered local water tables, has polluted acres of land with mine stream wastes, has disrupted land with access roads and mines and mills, and has polluted the air with dangerous radon gas and radioactive dust. Tailings from yellowcake refining are a major waste disposal problem. Navajos are suing six government agencies for allowing companies to drill for uranium on government land without preparing the required environmental impact statements. In Marquez, N. Mex., a land grant community 37 mi from Albuquerque, the villagers' health and traditional way of life are threatened by uranium mining by Bokum Resources, Inc. Bokum's uranium will supply two Long Island Lighting Co. nuclear plants that are now under construction. (1 map, 10 photos)

2492 ENVIRONMENTAL FACTORS RELATED TO THE DEVELOPMENT OF A NEW URANIUM REFINERY. Jarrell, J.P.; Chambers, D.B. (MacLaren (James F.) Ltd., Willowdale, Ontario (Canada)). CIM (Canadian Institute of Mining and Metallurgy) Bulletin ; 72: No. 806, 157-161(Jun 1979).

This paper examines the experience gained in Eldorado Nuclear's proposed expansion of refining capacity as viewed by an environmental engineering consultant. The history of the

project and the relationship to process design functions in the two-year period prior to the Port Granby environmental hearings are reviewed. During the Port Granby public hearing, there was a consensus that normal operation of the proposed refinery could be successfully integrated with the site's natural environmental constraints. Moreover, the radiological impact from plant operations was demonstrated to be inconsequential. However, concerns were raised relating to plant upset and accident situations. These concerns are summarized. Process data requirements identified during the environmental hearings are discussed. Finally, the concerns for on-site burial of radioactive waste are reviewed. These concerns focussed on long-term stability of the waste in the presence of groundwater transport, erosion and glaciers. The AECB's position on waste management with regard to this project is reviewed in light of the implications for design.

2493 PHOTON SPECTRA OF GAMMA-RAYS BACK-SCATTERED BY INFINITE AIR. PART I: AREA-SKYLINE. Swarup, J. (Bhabha Atomic Research Centre, Bombay (India). Health Physics Div.). 17: No. 6, 381-384(Jun 1979).

Counts-spectra of gamma-rays of different energies originating from the area used for burying radioactive wastes (dose 0.5 mR/hr) and back-scattered by infinite air above ground (area-skyshine), have been measured at different locations with a 5 cm dia x 5 cm long NaI(Tl) detector collimated in the vertical direction. Gold's iterative technique has been used to unfold these spectra. It is found that the photon-spectra show peaks at energies 55, 72, 110, 160 and 210 keV. Out of these peaks, the one at 72 keV is the highest. A valley, indicating absence of photons, is also seen around 140 keV energy.

2494 FIXATION OF RADIOACTIVE IONS IN POROUS MEDIA WITH ION EXCHANGE GELS. Mercer, B.W. Jr.; Godfrey, W.L. (to Dept. of Energy). US Patent 4,156,658. 29 May 1979. Filed date 28 Jun 1974. 4p.

PAT-APPL-484,011.

A method is provided for fixing radioactive ions in porous media by injecting into the porous media water-soluble organic monomers which are polymerizable to gel structures with ion exchange sites and polymerizing the monomers to form ion exchange gels. The ions and the particles of the porous media are thereby physically fixed in place by the gel structure and, in addition, the ions are chemically fixed by the ion exchange properties of the resulting gel.

2495 WHAT DO YOU DO WITH LAND THAT CAN NEVER BE RECLAIMED. Dunnington, J.F. Landscape Architecture ; 69: No. 3, 292-299(May 1979).

Land that is used for production and storage of nuclear materials cannot be reclaimed by any known technology. The maximum useful life of nuclear reactors is estimated to be about 40 yr; the spent plant must decay some of its radioactivity for about 100 yr before decommissioning can be achieved. Dismantling costs for presently existing nuclear facilities are in the billions of dollars, yet high level wastes will remain for another 500,000 yr. Decommissioning technology is outlined; deficiencies are identified. Overall land use of nuclear facilities is difficult to assess since questions about waste disposal methods are unsolved. Land used in the U.S. for nuclear industry, nuclear medicine, nuclear weapons, nuclear accelerators, and terminal waste disposal is discussed. (2 diagrams, 1 map, 2 photos, 9 references)

2497 RATE CONTROLLING PROCESSES IN THE RELEASE OF RADIUM-226 FROM URANIUM MILL TAILINGS--2. KINETIC STUDY. Nathwani, J.S.; Phillips, C.R. (Univ of Toronto, Ont). Water, Air, and Soil Pollution ; 11: No. 3, 309-317(Apr 1979).

A kinetic study to examine the leaching mechanisms and the rate controlling steps in the release of Ra from loose granular U mill tailings was undertaken. A batch procedure was chosen in which the kinetics of desorption of ; sup 226;Ra from tailings were determined by observing the increase in radioactivity in the solution with time. Intra-particle diffusion was found to be the rate controlling step for desorption periods >84 h; for leaching periods less than this, the desorption rate was described by a semi-logarithmic relationship involving either film diffusion or a chemical exchange mechanism as the rate controlling step. 11 refs.

2498 RATE CONTROLLING PROCESSES IN THE RELEASE OF RADIUM-226 FROM URANIUM MILL TAILINGS. I. LEACHING STUDY. Nathwani, J.S.; Phillips, C.R. (Toronto Univ., Ontario (Canada). Dept. of Chemical Engineering and Applied Chemistry). Water, Air, and Soil Pollution ; 11: No. 3, 301-308(Apr 1979).

Uranium mill tailings (a pyritic quartz conglomerate ore) obtained from a Canadian operation were leached according to a modification of the method recommended by I.A.E.A. for the leaching of radioactive ions from solidified wastes. A static leach test procedure was chosen to provide information to permit an assessment of hazard due to release of Ra-226 to the environment. Narrow range size fractions (53 to 75 μm) of both fresh material obtained directly from a tailings line and material weathered for approximately 10 to 15 yr in a tailings basin were leached for up to 70 days. Distilled water and an acidic synthetic effluent (pH 2.5) were chosen as leachants. Two sequential desorption processes were observed, one before and the other after a leaching period of approximately 10 to 15 days. In the later and more significant stage of desorption, the leaching behaviour could be described in terms of a diffusion mechanism. Significantly greater quantities of ^{226}Ra were leached over relatively short leaching periods by the acidic effluent; thus the quality of the effluent and percolating water in a tailings disposal area would markedly affect the leachability of Ra from tailings. It was also found that the quantities of ^{226}Ra leached were significantly influenced by the solid:liquid ratio at low leaching volumes.

2499 RATE CONTROLLING PROCESSES IN THE RELEASE OF RADIUM-226 FROM URANIUM MILL TAILINGS. II. KINETIC STUDY. Nathwani, J.S.; Phillips, C.R. (Toronto Univ., Ontario (Canada). Dept. of Chemical Engineering and Applied Chemistry). Water, Air, and Soil Pollution ; 11: No. 3, 309-317(Apr 1979).

A kinetic study to examine the leaching mechanisms and the rate controlling steps in the release of Ra from loose granular U mill

tailings was undertaken. A batch procedure was chosen in which the kinetics of desorption of ^{226}Ra from tailings were determined by observing the increase in radioactivity in the solution with time. Intra-particle diffusion was found to be the rate controlling step for desorption periods > 84 h; for leaching periods less than this, the desorption rate was described by a semi-logarithmic relationship involving either film diffusion or a chemical exchange mechanism as the rate controlling step. It is postulated that the intraparticle diffusion constant, B, correlates and defines the internal structure and hence the binding properties of ^{226}Ra within the tailings aggregate. Values of the intraparticle diffusion coefficient, Dsub(p), have been calculated and the effect of pH on Dsub(p) was studied. It was found that the diffusion coefficient at a specific pH does not significantly differ from 'fresh' or 'weathered' samples. However, a minimum value of Dsub(p) was obtained at a pH of about 7.6. Values of Dsub(p) were found to range from 2.5×10^{-13} to 20.0×10^{-13} cm^2 h^{-1}.

2500 TECHNETIUM: REDUCTION AND SORPTION IN GRANITIC BEDROCK. Allard, B.; Kigatsi, H.; Torstenfelt, B. (Chalmers Tekniska Hoegskola, Goeteborg (Sweden)). Radiochemical and Radioanalytical Letters ; 37: No. 4-5, 223-229(22 Feb 1979).

The reduction of technetium in aqueous solution from TcO_4^- ion to $TcO_2(s)$ may be accomplished in some natural ground waters. The retention of technetium by granite is at least 50 times higher for tetravalent species than for TcO_4^-. Thus, the long-term biological hazard from technetium released from a depository for high-level radioactive waste in deep granitic bedrock will be lower than previous estimations from sorption measurements in non-reducing systems.

2501 ENVIRONMENTAL PROBLEMS RELATING TO URANIUM MINING AND MILLING. Friedman, F.B. (Arco Chemical Co., Philadelphia, PA). Public Land and Resources Law Digest, The ; 16: No. 1, 95-121(1979).

The regulations of the mining and milling of uranium as they relate to the environment are discussed. The industry is primarily under the jurisdiction of the federal government and administered by the Nuclear Regulatory Commission (NRC). This authority can in some instances be relegated to the states. Certain areas of jurisdiction have been given over to Environmental Protection Agency (EPA) by the courts. The Safe Drinking Water Act is discussed as it relates to in situ leach mining. The role of the Department of Interior in the regulating of uranium mining, as described in the Federal Land Policy Management Act of 1976, is discussed. The requirement for environmental impact statements prior to licensing by the NRC or the individual states is also discussed. Air quality and radioactive waste disposal as they relate to uranium mining are also discussed. (DMC)

2502 COMPUTER-CONTROLLED REMOTE GAMMA-RAY SPECTROMETER. Nieschmidt, E.B.; Coates, R.A.; Johnson, L.O.; Killian, E.W. (Idaho National Engineering Lab., Idaho Falls). pp 698-707 of Computers in activation analysis and gamma-ray spectroscopy. Carpenter, B.S.; D'Agostino, M.D.; Yule, H.P. (eds.). Washington, DC; Department of Energy (1979).

From Conference on computers in activation analysis and gamma-ray spectroscopy; Mayaguez, Puerto Rico (30 Apr 1978).

The nuclear-power industry must monitor various effluents of power plants as well as plant operations. Programs under way at INEL to meet these objectives require the use of several remote, real-time, gamma-ray-spectrometer systems. Measurements performed by these systems include radioactive-effluent monitoring, irradiated reactor-fuel scanning, fission-product analysis for fuel condition, and monitoring of plant operations. It was decided to develop a standardized data-accumulation system having significant flexibility to meet all objectives and allowing development and training costs to be shared by the various programs. The development of such a standardized system requires a reliable method of data accumulation remote from a control computer system which has the responsibility for verification, analysis, and interpretation of the data. In the designing of such a system, three goals were established: (1) the data accumulation and transfer of data must be completely automated and under control of a central processor, (2) the remote system must be able to monitor and verify its own operation, and (3) the remote system must be able to control external devices. The development of a remote analyzer system that would meet all required goals was carried out in three phases: (1) implementation of a commercial hard-wired analyzer that could be controlled remotely via commands received from a central computer; (2) implementation of a minicomputer as the controlling device for the analyzer system in which the computer receives and interprets commands from the central computer and performs the required functions; (3) incorporation of all functions developed for phase 2 in a microcomputer-controlled system (currently in progress).

2503 IN SITU DATA ON VARIOUS SITES OF RADIOACTIVE RELEASES INTO THE MARINE ENVIRONMENT. pp 126-184 of Marine radioecology. A study of the fate of radionuclides released into the marine environment and applications to radiation protection. Ancellin, J.; Gueguenlat, P.; Germain, P. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). Paris, France; Eyrolles (1979). (In French)

In situ data on various sites of radioactive releases (La Hague (FR), Windscale (GB), Bradwell (GB) Columbia River (USA)).

2504 FINAL ENVIRONMENTAL IMPACT STATEMENT. PLATEAU RESOURCES LIMITED SHOOTERING CANYON URANIUM PROJECT, GARFIELD COUNTY, UTAH. Washington, DC; Nuclear Regulatory Commission (1979). 256p. Information Resources Press, 2100 M Street, NW, Suite 316, Washington, DC. (MF or HC) Order No. 79-1144.

Construction and operation of the Shoottering Canyon uranium mill project on roughly 350 acres in Garfield County, Utah is proposed. The mill would use the conventional acid-leaching, solvent-extraction process to produce uranium oxide; ore would be obtained from an ore-buying station and nearby applicant-owned mines. Tailings would be stored on site as slurry in a tailings impoundment. The project would have an estimated lifetime of 10 to 15 years, based on known ore deposits.

2505 EMISSION AND CONTROL OF RADON AT ACTIVE URANIUM MINES AND MILLS. Roberts, C.J. (Argonne National Lab., IL). Transactions of the American Nuclear Society ; 33: 154-155(1979). (CONF-791103--).

2511 SOVIET SCIENCE. Medvedev, Zh.A. Oxford; University Press (1979). 274p.
In this brief history of science in the Soviet Union the emphasis is on the interaction between scientific and technological developments and the political objectives of the Soviet government. Reference is made to the development of nuclear energy for military and for peaceful purposes. In an appendix, a rather detailed account is given of a 'nuclear disaster in the South Urals area'; reference is made to ecological, genetic and population researches in the areas contaminated by long-lived products of radioactive waste (e.g. Sr-90 and Cs-137). Section headings are: lakes; mammals; population genetics and radiation genetics (covering plants, animals and soil activity).

2512 ASSESSMENT OF THERMALLY INDUCED WATER MOVEMENT AROUND A RADIOACTIVE WASTE DEPOSITORY IN HARD ROCK. Bourke, P.J.; Hodgkinson, D.P. (UKAEA Research Group, Harwell. Atomic Energy Research Establishment). pp 221-235 of Low flow, low-permeability measurements in largely impermeable rocks. Paris, France; OECD (1979).
From Workshop on Low-Flow Low permeability measurements in Langley Impermeable rocks; Paris, France (19 Mar 1979).
An assessment is made of the relative importance of thermally induced and naturally occurring water movement in the vicinity of a hard rock depository. The rock is treated as a uniformly permeable medium. Both simple approximations and more comprehensive analysis of the fluid mechanics lead to the conclusion that thermal movement could be the more important for several millenia.

2513 RADIOACTIVE WASTE DISPOSAL. Berci, K. (Eroemue es Halozattervezoe Vallalat Eroeterv, Budapest (Hungary)). Eroeterv Koezlemenyek ; 17: 100-106(1979). (In Hungarian).
During development work connected with the erection of the Paks Nuclear Power Plant, ERDETERV paid great attention to the problem of radioactive waste. As one of the relevent tasks a model describing the migration of isotopes in the soil has been elaborated. Apart from the description of this model, the necessary laboratory tests for application, and two examples of the model's use are also presented.

2514 RADIOECOLOGICAL IMPLICATIONS OF URANIUM MINING AND MILLING. Wicker, F.W. (Colo State Univ, Fort Collins). pp 309-325 of Uranium resource/technology seminar 2, 1979. Golden, CO; Colorado School of Mines (1979).
From Uranium resource technology seminar; Golden, CO, USA (12 Mar 1979).
This paper reviews concerns regarding environmental transport of radionuclides associated with uranium production, the apparent ecological and human health significance of such concerns, and the need for radioecological investigations. 19 refs.

2515 SOME ENVIRONMENTAL ASPECTS OF URANIUM MINING AND MILLING IN NORTHERN AUSTRALIA. Myhra, S. (Griffith Univ., Brisbane (Australia). School of Science). Search. Science, Technology and Society ; 9: No. 11, 400-409(Nov 1978).
A review of present knowledge and research efforts relating to environmental consequences of uranium mining and milling in the Northern Territory is given, with emphasis on establishing the basic scientific and technological parameters. The hazards arising from radioactive emissions and discharge of toxic materials are evaluated in relation to accepted safe levels. Particular attention is drawn to the potential hazards associated with long-term containment of tailings and contaminated water run-off from ore and waste-rock stockpiles.

2516 PLUTONIUM AS AN ENVIRONMENTAL PROBLEM. Stemerding, D. Wetenschap en Samenleving ; No. 7, 42-50(Oct 1978). (In Dutch).
Plutonium is a fission product which originates in reactor cores from the unfissionable ^{238}U. In a 'plutonium economy', large quantities of plutonium will be produced, processed, stored and transported as fissionable material for use in a growing number of reactors following an enhanced possibility of the proliferation of nuclear weapons. Such a development may lead to an increased dispersion of plutonium in the envioronment.

2517 WINDSCALE INQUIRY AND SAFETY ASSESSMENT. OXFORD REPORT NO. 4. Oxford; Political Ecology Research Froup (Aug 1978). 7p.
The procedure and general subject matter of the Windscale Inquiry are outlined. The evidence presented on major potential hazards and the treatment accorded this evidence is discussed. Some conclusions are drawn on decision making.

2518 EMANATING POWER AND DIFFUSION OF RADON THROUGH URANIUM MILL TAILINGS. Jensen, C.M.; Overmyer, R.F.; Macbeth, P.J.; Rogers, V.C.; Chatwin, T.D. (Ford, Bacon and Davis Utah, Inc., Salt Lake City (USA)). pp 35-49 of Management, Stabilization, and environmental impact of uranium mill tailings. Paris, France; OECD Nuclear Energy Agency (1978).
From Management, stabilization, and environmental impact of uranium mill trailings; Albuquerque, NM, USA (24 Jul 1978).
Radon emanation from uranium mill tailings particles, radon exhalation from tailings, and methods that could be used to reduce radon exhalation from tailings are discussed. Surface radon flux and soil gas concentrations were measured in experimental columns consisting of uranium tailings and various types and thicknesses of cover materials. The applicability of diffusion theory was examined and effective diffusion coefficients were determined for diffusion of radon gas through clay, soil, and sand covers over tailings.

2519 SOURCE TERMS FOR AIRBORNE RADIOACTIVITY ARISING FROM URANIUM MILL WASTES. O'Riordan, M.C. (National Radiological Protection Board, Harwell (UK)); Downing, A.L. (Binnie and Partners, London (UK)). pp 21-33 of Management, Stabilization, and environmental impact of uranium mill tailings. Paris, France; OECD Nuclear Energy Agency (1978).
From Management, stabilization, and environmental impact of uranium mill trailings; Albuquerque, NM, USA (24 Jul 1978).
One of the problems in assessing the radiological impact of uranium milling is to determine the rates of release to the air of material from the various sources of radioactivity. Such source terms are required for modelling the transport of radioactive material in the atmosphere. Activity arises from various point and area sources in the mill itself and from the mill tailings. The state of the tailings changes in time from slurry to solid. A layer of water may be maintained over the solids during the life of the mine, and the tailings may be covered with inert material on abandonment. Releases may be both gaseous and particulate. This paper indicates ways in which radon emanation and the suspension of long-lived particulate activity might be quantified, and areas requiring further exploration are identified.

2520 ENVIRONMENTAL PROBLEMS OF THE URANIUM MINING AND MILLING INDUSTRY. Savignac, N. (United Nuclear Corp., Albuquerque, NM). pp 122-132 of Uranium resource/technology update: front end of the nuclear fuel cycle. Morse, J.G. (ed.). Golden, CO; Colorao School of Mines (1978).
From Uranium resource/technology update - front end of the nuclear fuel cycle; Golden, CO, USA (14 Mar 1978).
The environmental impacts (resources committed, radioactive and nonactive effluents, radioactive sources for population exposures) are compared for oil, coal, and U, using 100-MW(e) plants operating at 75% capacity as basis. Results show that U as a source of energy costs less, uses less resources, and has less environmental impact than oil or coal. A general sampling and monitoring program is presented. 8 tables. (DLC)

2521 INFLUENCE OF URANIUM MILL TAILINGS ON TREE GROWTH AT ELLIOT LAKE. Murray, D.R. (Dep of Energy, Mines and Resour, Elliot Lake, Ont). Transactions - the Canadian Institute of Mining and Metallurgy and the Mining Society of Nova Scotia ; 81: 185-187(1978).
A four-year study was carried out to determine the ability of coniferous trees to aid in the reclamation of uranium tailings. Five species were planted: white cedar, white spruce, jack pine, scotch pine and red pine. More than 570 bare-root, two-year-old seedlings were planted on bare tailings and in areas of established grasses. A further division was made between areas of coarse and fine tailings. Over-all survival and growth of the trees has been far below expectations based on previous experience. The survival and growth of the coniferous trees have been related to species, environmental conditions and tailings properties. 2 refs.

Health and Safety

2522 (CEGB-RD/B/N--4440) INDIVIDUAL AND COLLECTIVE DOSES ASSOCIATED WITH THE TRANSPORT OF IRRADIATED MAGNOX FUEL WITHIN THE UK. Macdonald, H.F.; Mairs, J.H. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Dec 1978. 26p. Dep. NTIS (US Sales Only), PC A03/MF A01.
A method is described of evaluating the individual and collective doses arising during the transport of irradiated fuel from a system of nuclear power stations to a central reprocessing plant. The doses associated with irradiated Magnox fuel movements in the UK are estimated and compared with those resulting from other phases of the nuclear fuel cycle. In addition, the individual and collective doses implied by the accidental activity release limits contained within the 1973 IAEA Tranport Regulations are discussed.

2523 (CONF-800304--11) MIGRATION OF RADIONUCLIDES FOLLOWING SHALLOW LAND BURIAL. Sedlet, J.; Golchert, N.W. (Argonne National Lab., IL (USA)). 1980. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01.
From 5. international congress of the International Radiation Protection Association; Jerusalem, Israel (8 Mar 1980).
A study of radionuclide migration was conducted at a facility used from 1944 to 1949 for the shallow land burial of radwaste produced during operations with two reactors and related nuclear research. It is situated in glacial drift 45 m thick. Underlying the drift is a generally level Silurian dolomite bedrock

60 m thick. The thickness of the drift decreases as the surface slopes downhill (north) until the dolomite reaches the surface and forms the bed of a river, 700 m to the north. This study was begun after tritiated water was detected in two picnic wells north of the facility, between the burial plot and the river. Surface and subsurface measurements indicate that tritium is migrating out of the burial site, but no other radionuclides have left the plot. The tritium concentrations decrease with distance from the plot. Tritium was found in the subsoil at all depths sampled, so the ground beneath and immediately around the plot contains tritium down to the dolomite aquifer. Time of travel of water from the burial plot to the nearest well is estimated to be 54 months. This would imply the peak concentration would reach the dolomite in about 35 years. By this time, 86% of the tritium would have disappeared by radioactive decay. The cyclical nature of the tritium content in the two wells implies that tritiated water is carried from the burial site by the spring rains when they recharge the groundwater supply.

524 (DOE/EV--0046(Vol.2), pp 273-292) ANALYSIS OF MIGRATION PATHWAYS FOR GEOLOGIC RADIOACTIVE WASTE REPOSITORIES. Shipler, D.B. (Battelle Memorial Inst., Columbus, OH); Raymond, J.R.; Gnirk, P.F. Sep 1979.
From Environmental control symposium; Washington, DC, USA (28 Nov 1978).
The major tasks of the National Waste Terminal Storage safety assessment programs are to: (1) develop modeling systems and data for predicting potential natural and man-induced release mechanisms; (2) determine release rates of various waste forms; (3) develop modeling systems to predict the transport of radioactive materials from repositories to the biosphere and to evaluate the potential radiation dose to humans; and (4) determine the various parametric values of rocks and rock formations necessary to carry out the modeling activities. This paper reviews the ongoing program for analyzing the significance of various suggested pathways by which radioactivity might migrate from deep geologic repositories. The analyses consider both the probability of the suggested cause occurring, and the probable impact of the occurrence. The pathways include those involved in sudden natural phenomena, such as earthquakes and vulcanism; pathways provided by slowly-evolving natural phenomena, such as erosion; pathways provided by phenomena due to the waste itself, such as stresses from radioactive decay heat or subsidence induced by incomplete back-filling of the repository; and pathways provided by human instrusion, such as drilling for mineral resources. A detailed analysis is provided for a natural faulting event that disrupts a spent fuel repository in a reference bedded salt regime. The analysis starts with the post faulting conditions and covers the transport of the waste to an aquifer and on through the aquifer to surface discharge. The results are given in concentrations of the waste in the discharge. The exercise was conducted to demonstrate the development of the transport modeling system and its potential use in repository design and site selection and qualification.

2525 (DOE/EV--0046(Vol.2), pp 529-545) RISK ASSESSMENT OF ENERGY MATERIAL TRANSPORTATION SYSTEMS. Rhoads, R.E.; Geffen, C.A. (Battelle Pacific Northwest Labs., Richland, WA). Sep 1979.
From Environmental control symposium; Washington, DC, USA (28 Nov 1978).
An assessment of the environmental impacts of energy systems should include an analysis of the transportation of required energy materials. Risk assessment techniques can help to define the potential environmental impacts and evaluate the safety of a transportation system. This paper presents the risk assessment methodology developed in Pacific Northwest Laboratory's Transportation Safety Studies Project, which was conducted for the Transportation Branch of DOE's Division of Environmental Control Technology and reviews the results of studies that have been completed to date. The risk methodology includes four basic components. A detailed system description is first obtained to provide projected industry characteristics, size and number of material shipments required, material characteristics, container types, transportation modes and routes, and weather and population zones. Fault tree analysis is then used to identify the sequences of events that could lead to a release of material from the transport vehicle. The probabilities of a particular release sequence occurring and the consequences of that release are evaluated next, using container failure data and mathematical models for dispersion and health effects. The environmental behavior characteristics and health effects of the material must be developed individually for each substance transported. Finally, the risks associated with each shipping route are calculated and summed to obtain total risk. The results of the risk assessment are analyzed to determine the primary contributors to the risk and to specify and evaluate alternatives that could reduce the system risk, if the current risk is judged by society to be unacceptable. Sensitivity studies are also carried out to test the effect on the system risk of assumptions and approximations that were made to develop key pieces of information. These studies may identify areas where further analysis is required.

2526 (DP-MS--79-21) ESCA STUDIES ON LEACHED GLASS FORMS. Dawkins, B.G. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). 1979. Contract EY-76-C-09-0001. 11p. Dep. NTIS, PC A02/MF A01.
Electron Spectroscopy for Chemical Analysis (ESCA) results for frit, obsidian, NBS standard, and Savannah River Laboratory (SRL) glass forms that have been subjected to cumulative water leachings of 36 hours show that [Na] exhibits the largest and fastest change of all the elements observed. Leaching of surface Na occurred within minutes. Surface Na depletion increased with leach time. Continuous x-ray irradiation and argon ion milling induced Na mobility, precluding semiquantitative ESCA analysis at normal operating temperatures. However, the sample stage has been equipped with a liquid nitrogen supply and alkali mobility should be eliminated in future work.

2527 (IAEA--212, pp 23-33) ASSESSMENT OF DOSE TO THE CRITICAL GROUP AND THE WORLD POPULATION. Coulon, R. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). 1978.
From IAEA regional seminar on the application of environmental impact analysis to the nulcear power industry; Buenos Aires, Argentina (29 Aug 1977).
This paper reviews the basic principles of radiation protection and analyses the exposure of the public through radioactive transfers. The evaluation of the dose to the ''critical group'' is described and an application of the philosophy is proposed. A parallel study is

conducted in the case of the evaluation of the dose to the world population.

2528 (IEA-INF--062) SOME ASPECTS OF RADIOLOGICAL PROTECTION IN URANIUM MINES. Palacios, E.; Napolitano, C.M. (Instituto de Energia Atomica, Sao Paulo (Brazil). Centro de Protecao Radiologica e Dosimetria). Nov 1978. 10p. (In Portuguese). Dep. NTIS (US Sales Only), PC A02X/MF A01.
The basic principles of radiation protection recommended by the International Commission on Radiological Protection - ICRP are presented and the main radiological risks for the uranium mining workers are discussed. Finally some criteria for planning the radioactive waste management in uranium mines are given.

2529 (INIS-mf--5012) STATISTICAL INFORMATION 1971-76. FROM THE NATIONAL INSTITUTE OF RADIATION PROTECTION. (Statens Straalskyddsinstitut, Stockholm (Sweden)). 1978. 57p. (In Swedish). Dep. NTIS (US Sales Only), PC A04/MF A01.
This report includes statistical information about the work performed at the National Institute of Radiation Protection, Sweden, during the period 1971-1976, as well as about the different fields causing the intervention by the Institute.

2530 (INIS-mf--5319, pp 70) INTERNAL IRRADIATION OF ORGANISM WITH RADIOACTIVE RARE GASES. Wilhelmova, M.; Cejnar, F. (Ceskoslovenska Akademie Ved, Prague. Ustav Dozimetrie Zareni). [nd]. (In Czech).
From 8. meeting on radiation hygiene; Medlov, Czechoslovakia (31 Oct 1977).
ENVIRONMENTAL IMPACTS;HUMAN POPULATIONS; INTERNAL IRRADIATION;NUCLEAR FACILITIES; RADIATION DOSES;RADIATION HAZARDS;RADIOACTIVE WASTES;RADIONUCLIDE KINETICS;RARE GASES

2531 (INIS-mf--5372, pp 62-63) MINIMUM RISK BASED SELECTION OF WASTE FUEL DUMPING SITE. Sharma, D.D.; Chatterjee, D.; Sri Ram, K. (Indian Inst. of Tech., Kanpur). 1979.
From 6. Indian Association for Radiation Protection conference; Bombay, India (7 Mar 1979).

2532 (KFK--2866) DOSE EXPOSURE OF THE ENVIRONMENTAL POPULATION BY NATURAL AND RELEASED RA-226 FROM A URANIUM MINE PROSPECT. RADIOECOLOGICAL RESEARCHES IN THE REGION OF FELDBERG. Schuettelkopf, H.; Kiefer, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Sicherheit). 1979. 86p. (In German). NTIS (US Sales Only), PC A05/MF A01.
The Ra-226 releases of an uranium prospect were measured. The Ra-226 concentrations in the environment and in foods of the southern Black Forest were determined. The dose exposure of Ra-226 of the population was calculated. Transfer factors for the most important transport processes of radium in the biosphere are given. (orig.).

2533 (NRPB-R--86) ANALYSIS OF THE EFFECT OF VARIATIONS IN PARAMETER VALUES ON THE PREDICTED RADIOLOGICAL CONSEQUENCES OF GEOLOGIC DISPOSAL OF HIGH-LEVEL WASTE. Hill, M.D. (National Radiological Protection Board, Harwell (UK)). Jun 1979. 81p. Dep. NTIS (US Sales Only), PC A05atMF A01.
A preliminary assessment of the radiological consequences of geologic disposal of high-level waste (Hill and Grimwood. NRPB-R69 (1978)) identified several areas where further research is required before this disposal option can be fully evaluated. This report is an analysis of the sensitivity of the results of the preliminary assessment to the assumptions made and the values of the parameters used. The parameters considered include the leach rate of the waste, the ground-water velocity, the length of the flow path from the repository to a source of drinking water and the sorption constants of the principle radionuclides. The results obtained by varying these parameters are used to examine the effects of assumptions such as the time at which leaching of the waste begins. The sensitivity analysis shows the relative importance of the waste canisters, the waste form and the geologic barrier to radionuclide migration in determining potential doses. These results are used to identify research priorities, establish preliminary design criteria and indicate developments needed in the mathematical modelling of the movement of radionuclides from a repository to the biosphere.

2534 (NUREG/CR--0635) EXCESS CANCER INCIDENCE IN MESA COUNTY, COLORADO. FINAL REPORT. Cunningham, M.C.; Ferguson, S.W.; Foreman, T. (Colorado Dept. of Health, Denver (USA). Disease Control and Epidemiology Div.). Jul 1979. 99p. NTIS.
The initial phase of this investigation has determined that there is a twofold excess of leukemia incidence for all ages in Mesa County, Colorado, for the period 1970 to 1976. The greatest excess was observed among residents over 65 years of age who developed leukemia 2-1/2 times the expected rate. No excess incidence of lung cancer has been identified. The second phase of the investigation has been case-control study of all adult leukemia deaths since 1960. No significant differences were found beween cases and controls with respect to: years of residence in Mesa Couty, general health status prior to diagnosis, and radiation exposure from tailings buildings. Only two cases and two controls had ever lived in houses with elevated gamma radiation from uranium mill tailings used in construction. Only one case and one control has a cumulative and average annual exposure significantly higher than the other subjects. Leukemia cases had higher socioeconomic levels and more positive family histories of leukemia than controls. No association between tailings structures and leukemia excess was observed.

2535 (NVO--0624-2) COMPARISON OF PREDICTED AND OBSERVED SUBSURFACE-SURFACE SEISMIC SPECTRAL RATIOS. O'Brien, L.J.; Saunier, J. (Computer Sciences Corp., Falls Church, VA (USA)). Mar 1980. Contract EY-76-C-08-0624. 91p. Dep. NTIS, PC A05/MF A01.
A mathematical model has been developed which describes the influence of depth on recorded seismic ground motion. Comparison of the predicted transfer functions obtained from the model with actual field measurements indicates that the model performs reasonably well under a wide variety of complex geological conditions with varying physical properties. The model has been tested at five distinct sites at the NTS with the subsurface depth ranging from 200 to 2200 feet. No discernible performance deviation was detected as the subsurface depth was increased over this region. Although the comparisons deal

exclusively with sites located within the NTS boundary, the results are equally applicable to other geographic regions being considered as potential waste isolation sites.

2536 (ORNL--5457) ASSESSMENT OF THE RADIOLOGICAL IMPACT OF THE INACTIVE URANIUM-MILL TAILINGS AT GRAND JUNCTION, COLORADO. Haywood, F.F.; Goldsmith, W.A.; Jacobs, D.G.; Perdue, P.T.; Ellis, B.S.; Hubbard, H.M. Jr.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Apr 1980. Contract W-7405-ENG-26. 92p. Dep. NTIS, PC A06/MF A01.

Results of a radiological survey of the inactive uranium-mill site at Grand Junction, Colorado, made in May and June 1976, are presented along with descriptions of techniques and equipment used to obtain the data and an assessment of increased risk of health effects attributable to radiation and radionuclides from the tailings. An estimate of potential health effects of exposure to gamma rays around a former mill building and to radon daughters produced by radon dispersed from the tailings has been made for occupants of the site.

2537 (ORNL/Sub--80/31048/1) ACTINIDE PARTITIONING-TRANSMUTATION PROGRAM FINAL REPORT. VI. SHORT-TERM RISK ANALYSIS OF REPROCESSING, REFABRICATION, AND TRANSPORTATION: APPENDIX. Fullwood, R.R.; Jackson, R. (Science Applications, Inc., Palo Alto, CA (USA)). Jan 1980. Contract W-7405-ENG-26. 355p. (SAI--099-78-PA). NTIS, PC A16/MF A01.

The Chemical Technology Division of the Oak Ridge National Laboratory has prepared a set of documents that evaluate a Partitioning-Transmutation (PT) fuel cycle relative to a Reference cycle employing conventional fuel-material recovery methods. The PT cycle uses enhanced recovery methods so that most of the long-lived actinides are recycled to nuclear power plants and transmuted to shorter-lived materials, thereby reducing the waste toxicity. This report compares the two fuel cycles on the basis of the short-term radiological and nonradiological risks they present to the public and to workers. The accidental radiological risk to the public is analyzed by estimating the probabilities of sets of accidents; the consequences are calculated using the CRAC code appropriately modified for the material composition. Routine radiological risks to the public are estimated from the calculated release amounts; the effects are calculated using the CRAC code. Radiological occupational risks are determined from prior experience, projected standards, and estimates of accident risk. Nonradiological risks are calculated from the number of personnel involved, historical experience, and epidemiological studies. The result of this analysis is that the short-term risk of PT is 2.9 times greater than that of the Reference cycle, primarily due to the larger amount of industry. This conclusion is strongly dominated by the nonradiological risk, which is about 150 times greater than the radiological risk. The absolute risk as estimated for the fuel cycle portions considered in this report is 0.91 fatalities/GWe-year for the PT cycle and 0.34 fatalities/GWe-year for the Reference cycle. This should be compared with Inhaber's estimate of 1.5 for nuclear and 150 for coal. All of the risks assumed here are associated with the production of one billion watts of electricity (GWe) per year.

2538 (PB--296947, pp 270-279) USE OF A RISK LIMIT AS AN ENVIRONMENTAL SAFETY STANDARD FOR RADIOACTIVE WASTE DISPOSAL SITES. Desrosiers, A.E. (Battelle Pacific Northwest Labs., Richland, WA); Njoku, E. May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

this paper demonstrates how the recommendations of ICRP Publication 26 may be applied to setting environmental radiation standards for radioactive waste disposal sites. Traditionally, such standards prescribe the allowable radiation dose to the maximally exposed offsite individual. Dose limits are usually established for the total body and for individual organs. In this paper, the risk factors recommended by ICRP for individual organs and the doses to those organs are combined to calculate the total risk per unit of ingested radioactivity. The allowable ingestion of radioactivity is then calculated from ICRP's individual risk limit. When these data are compared to normally derived ingestion limits, significant differences appear whenever a relatively insensitive organ receives the majority of the dose. Maximum allowable concentrations of radionuclides in water are derived from the ingestion limits and the concept of an effective water consumption rate. Using risk assessments in environmental standards for waste disposal sites would allow (1) a rapid and conservative (cautious) assessment of the potential health impact of a waste disposal facility, and (2) a simpler evaluation of the impact of ingesting several radionuclides even if each radionuclide affects different human organs.

2539 (PB--296947, pp 280-283) RADON: AN ENVIRONMENTAL POLLUTANT. Mills, W.A. (Environmental Protection Agency, Washington, DC). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

Radiological concerns with the disposal and use of mining and milling residues have heightened to the point that federal agencies are asking or being asked to formulate new regulactions for controlling radon daughters from a variety of sources - radioactivity previously considered to be part of our natural environment. Based on information derived from epidemiologic studies of underground miners, particularly uranium miners, the health impact on the general public is being projected. Depending on the assumptions made, these projections vary widely. Because of these variations in health risks, decisions on control measures have even wider implications on economic and social considerations. Thus the question: is radon an environmental pollutant. While not fully answering the question, recognizing the uncertainties in assessing and controlling radon daughters can put the question in better perspective.

2540 (PB--296947, pp 329-336) DOSE MODELLING FOR RADON-PRODUCING ACTIVITIES IN HEAVILY POPULATED AREAS. Bettenhausen, L.; Burrows, V. (Environmental Protection Agency, Philadelphia, PA). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

The Area Source Radiological Emission Analysis Code (AREAC) was used to estimate population and individual exposures resulting from radon effusion sources in two heavily populated areas. One situation results from disposal of radium and uranium processing wastes at a plant site over the past sixty years. The other situation occurs as a result

of mining operations. The mining operation results in radon contamination of the air near a metropolitan area. The source could affect 234,386 persons living within a ten-mile radius. Results of the AREAC model calculations for radon diffusion and subsequent population exposure using meteorology and demography for the region are presented. The waste disposal situation was modelled using measured concentrations of radium in soil and relating these concentrations to radon emanation rates and consequent area source strengths for radon. This provided input to the diffusion calculations employing regional meteorology and demography. The resulting radon concentrations at specific receptor sites and at sector centroids gave population exposure estimates. The disposal site is located in an area of many small population centers on the fringe of ametropolitan area, where 47,351 persons live within ten miles.

2541 (PB--296947, pp 400-419) MANAGING LOW-LEVEL RADIOACTIVE WASTES: BIOETHICAL CONCERNS. Maxey, M.N. (Univ. of Detroit, MI). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

Equitable management of hazards having the potential for harmful health effects and social consequences is discussed. Three major problems are addressed: the adequacy of conceptual tools for assessing biohazards; the disagreement among scientific experts; and the origins of value-conflicts underlying expert disagreement. Principles to serve as guidance in the formulation of social policies for radiation health protection are recommended. (DC)

2542 (PNL--2851, pp II.1-II.19) PACIFIC NORTHWEST GEOMORPHOLOGY AND HYDROLOGY: RATES AND PROBABILITIES OF SELECTED PROCESSES AND EVENTS. Tubbs, D.W. (Univ. of Kansas, Lawrence). Nov 1979.

Summary of FY-1978 consultation input for Scenario Methodology Development.

This report presents results of one of the geomorphological and hydrological studies that have been conducted for the release scenario analysis of the Waste Isolation Safety Assessment Program (WISAP). Three general topics are considered: (1) determination of rates of denudation, (2) estimation of the probability of flooding due to each of several causes, and (3) evaluation of other surface processes that should be considered in the release scenario analysis. The third general topic was ultimately narrowed to the possible effects of landsliding. Rates of erosion are expressed as centimeters per 100 years, except that the original units are retained in figures taken from other sources. Probabilities are also expressed per 100 years.

2543 (PNL--2851, pp III.1-III.21) ANALYSIS OF THE SEISMIC HAZARD TO AN UNDERGROUND WASTE REPOSITORY. Wight, L.H. (Tera Corp., Berkeley, CA). Nov 1979.

Summary of FY-1978 consultation input for Scenario Methodology Development.

Conclusions are: The consequence associated with intense vibratory shaking of a well-designed repository is essentially negligible. The specification of an appropriate seismic vibratory design criteria could best be accomplished with a Bayesian seismic hazard assessment, using geologic slip rates as input. The consequence associated with fault displacement is very site specific and dependent on the host geologic media and its permeability changes in response to fault displacement. The probability of faulting through a repository in its million year design life is rather high, principally because of a high probability of primary or secondary faulting on undetected faults. The faulting probability can be minimized by deploying sophisticated site certification programs. High resolution microseismic surveillance seems to be most appropriate. The author's judgement is that the repository simulation program can neglect consequences associated with shaking of the repository, but that the probability of significant fault displacement through the repository during its design life should be conservatively taken as one.

2544 (PNL--2851, pp IV.1-IV.13) GLACIOLOGICAL PARAMETERS OF DISRUPTIVE EVENT ANALYSIS. Bull, C. (Ohio State Univ., Columbus). Nov 1979.

Summary of FY-1978 consultation input for Scenario Methodology Development.

The following disruptive events caused by ice sheets are considered: continental glaciation, erosion, loading and subsidence, deep ground water recharge, flood erosion, isostatic rebound rates, melting, and periodicity of ice ages. (DLC)

2545 (PNL--2851, pp V.1-V.8) GEOLOGIC FACTORS IN THE ISOLATION OF NUCLEAR WASTE: EVALUATION OF LONG-TERM GEOMORPHIC PROCESSES AND EVENTS. Mara, S.J. Nov 1979.

Summary of FY-1978 consultation input for Scenario Methodology Development.

In this report the rate, duration, and magnitude of changes from geomorphic processes and events in the Southwest and the Gulf Coast over the next million years are projected. The projections were made by reviewing the pertinent literature; evaluating the geomorphic history of each region, especially that during the Quaternary Period; identifying the geomorphic processes and events likely to be significant in the two regions of interest; and estimating the average and worst-case conditions expected over the next million years.

2546 (PNL--2851, pp VI.1-VI.15) LONG-TERM METEORITE HAZARDS TO BURIED NUCLEAR WASTE. REPORT 2. Hartmann, W.K. (Planetary Sciences Inst., Santa Clara, CA). Nov 1979.

Summary of FY-1978 consultation input for Scenario Methodology Development.

Part 1 presents new data on the relation between crater size and total impact energy, with equation (1) expressing the relation. Part 2 derives an equation which gives the rate of accumulation of area covered by craters larger than diameter D. A graphical relation between D and the depth of disturbance is given. This section concludes that the probability of a single site 600 m deep being disturbed in a million years is of the order 2.5×10^{-6}. Part 4 points out that meteorite impacts are also sources of seismic disturbance and should be factored into the seismic model for the hazard study. Another equation gives a methodology for including meteorite impacts in the seismic model. Part 5 and an equation give a methodology for dealing with repositories with extended surface area. Part 6 gives examples of applications.

2547 (PNL--2851, pp X.1-X.3) HYDROLOGIC EFFECTS OF NATURAL DISRUPTIVE EVENTS ON NUCLEAR REPOSITORIES. Davis, S.N. (Univ. of Arizona, Tucson). Nov 1979.

Summary of FY-1978 consultation input for Scenario Methodology Development.
This report describes some possible hydrogeologic effects of disruptive events which may affect repositories for nuclear waste. The report concentrates on the effects of natural events which are judged to be most probable.

2548 (PNL--2851, pp XIII.1-XIII.8) PROBABILITY OF EXPECTED CLIMATE STRESSES IN NORTH AMERICA IN THE NEXT ONE MY. Kukla, G. (Lamont-Doherty Geological Observatory, Palisades, NY). Nov 1979.
Summary of FY-1978 consultation input for Scenario Methodology Development.
Climates one million years ahead were predicted upon the assumption that the natural climate variability during the past My will continue. Response of environment and climate in the Basin and Range province of the western USA to global fluctuations was reconstructed; the most remarkable change was the filling of closed basins with large freshwater lakes. Probabilities of permanent ice cover and floods are discussed. It is believed that a site with minimal probability of climate-related breach can be selected. (DLC)

2549 (PNL--3180) ASSESSMENT OF EFFECTIVENESS OF GEOLOGIC ISOLATION SYSTEMS. ARRRG AND FOOD: COMPUTER PROGRAMS FOR CALCULATING RADIATION DOSE TO MAN FROM RADIONUCLIDES IN THE ENVIRONMENT. Napier, B.A.; Roswell, R.L.; Kennedy, W.E. Jr.; Strenge, D.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jun 1980. Contract AC06-76RL01830. 203p. NTIS, PC A10/MF A01.
The computer programs ARRRG and FOOD were written to facilitate the calculation of internal radiation doses to man from the radionuclides in the environment and external radiation doses from radionuclides in the environment. Using ARRRG, radiation doses to man may be calculated for radionuclides released to bodies of water from which people might obtain fish, other aquatic foods, or drinking water, and in which they might fish, swim or boat. With the FOOD program, radiation doses to man may be calculated from deposition on farm or garden soil and crops during either an atmospheric or water release of radionuclides. Deposition may be either directly from the air or from irrigation water. Fifteen crop or animal product pathways may be chosen. ARRAG and FOOD doses may be calculated for either a maximum-exposed individual or for a population group. Doses calculated are a one-year dose and a committed dose from one year of exposure. The exposure is usually considered as chronic; however, equations are included to calculate dose and dose commitment from acute (one-time) exposure. The equations for calculating internal dose and dose commitment are derived from those given by the International Commission on Radiological Protection (ICRP) for body burdens and Maximum Permissible Concentration (MPC) of each radionuclide. The radiation doses from external exposure to contaminated farm fields or shorelines are calculated assuming an infinite flat plane source of radionuclides. A factor of two is included for surface roughness. A modifying factor to compensate for finite extent is included in the shoreline calculations.

2550 (PNL--3340) ESTIMATED AIRBORNE RELEASE OF PLUTONIUM FROM THE EXXON NUCLEAR MIXED OXIDE FUEL PLANT AT RICHLAND, WASHINGTON AS A RESULT OF POSTULATED DAMAGE FROM SEVERE WIND AND EARTHQUAKE HAZARD. Mishima, J.; Schwendiman, L.C.; Ayer, J.E.; Owzarski, E.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Feb 1980. Contract AC06-76RL01830. 45p. NTIS, PC A03/MF A01.
The potential airborne releases of plutonium from postulated damage sustained by the Exxon Nuclear Company's Mixed Oxide Fabrication Plant at Richland, Washington, as a result of various levels of wind and earthquake hazard, are estimated. The releases are based on damage scenarios that range up to 250 mph for wind hazard and in excess of 1.0 g ground acceleration for seismic hazard, which were developed by other specialists. The approaches and factors used to estimate the releases (inventories of dispersible materials at risk, damage levels and ratios, fractional airborne releases of dispersible materials under stress, atmosphere exchange rates, and source term ranges) are discussed. Release estimates range from less than 10^{-7} g to greater than 14 g of plutonium over a four-day period.

2551 (PNL-SA--6523) CONSIDERATIONS IN THE TRANSPORTATION OF SPENT FUEL AND OTHER RADIOACTIVE MATERIALS BY SEA. Rhoads, R.E.; Heaberlin, S.W.; Brobst, W.A. (Battelle Pacific Northwest Labs., Richland, WA (USA)). May 1978. Contract EY-76-C-06-1830. 9p. (CONF-780506--43). Dep. NTIS, PC A02/MF A01.
From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).
A study was made of what would happen to casks and plutonium packages in the unlikely event of a serious sea accident involving shipments of spent fuel or plutonium, and what the radiological consequences might be to man through the marine food chain. Four postulated loss scenarios were considered: loss on the continental shelf and in the deep ocean of an undamaged package, and a package exposed to a severe fire. Conservative estimates of the maximum population doses are comparable to those expected from natural background sources. Areas where futher research is needed are identified. 3 tables. (DLC)

2552 (SAND--79-7107) WASTE ISOLATION PILOT PLANT TITLE I OPERATOR DOSE CALCULATIONS. FINAL REPORT, LATA REPORT NO. 90. Hughes, P.S.; Rigdon, L.D. (Los Alamos Technical Associates, Inc., NM (USA)). Feb 1980. Contract EY-76-C-04-0789. 115p. Dep. NTIS, PC A06/MF A01.
The radiation exposure dose was estimated for the Waste Isolation Pilot Plant (WIPP) operating personnel who do the unloading and transporting of the transuranic contact-handled waste. Estimates of the radiation source terms for typical TRU contact-handled waste were based on known composition and properties of the waste. The operations sequence for waste movement and storage in the repository was based upon the WIPP Title I data package. Previous calculations had been based on Conceptual Design Report data. A time and motion sequence was developed for personnel performing the waste handling operations both above and below ground. Radiation exposure calculations were then performed in several fixed geometries and folded with the time and motion studies for individual workers in order to determine worker exposure on an annual basis.

2553 (SAND--80-0794C) ALARA ASSESSMENT OF SPENT FUEL AND NUCLEAR WASTE TRANSPORTATION SYSTEMS. Sutherland, S.H. (Sandia National

Labs., Albuquerque, NM (USA)). 1980. Contract AC04-76DP00789. 21p. (CONF-801115--6). NTIS, PC A02/MF A01.

From 6. international symposium on packaging and transporting radioactive material; Berlin, F.R. Germany (10 Nov 1980).

The effects of ALARA (as low as reasonably achievable) on transportation system costs were evaluated for LWR spent fuel, high-level commercial and defense wastes, and remotely handled TRU waste. Three dose rate specifications were used: 10 mrem/h at 2m, 5 mrem/h, and 2 mrem/h. The evaluation was done for wastes and LWR spent fuel 1, 3, 5, and 10 years old. Gamma shield materials were depleted uranium, lead, and steel; the neutron shield material was water. Results for a 7-element PWR cask show that uranium shielding is the lightest, and that the increased weight of the low dose rate casks results in 1 to 2 million dollars increase in lifetime transportation costs. 6 figures, 3 tables. (DLC)

2554 (SGAE--2889) ABSORPTION DOSE RATE IN GREAT BITUMEN BLOCKS. EXPERIMENTAL DETECTION. Patek, P. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Vienna). Feb 1978. 12p. (In German). (CH--228/78). NTIS (US Sales Only), PC A02/MF A01.

By mixing together glass dosemeters with a big amount of coated particles and irradiating these dosemeters for a certain time, it is possible to measure the dose rate inside this active material. These values are helpful in the decision on results of research work on bitumen-waste-mixtures for better interpretation, as well as for the determination of exact dose rate values by conditioning real waste. An arithmetic evaluation shows good agreement with the measured results.

2555 (SGAE--3023) BURNING TEST ON A STORAGE DRUM FILLED WITH A MIXTURE OF SODIUM NITRATE AND BITUMEN. Knotik, K.; Leichter, P.; Spalek, K. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Vienna). Jan 1979. 15p. (In German). (CH--245/79). Dep. NTIS (US Sales Only), PC A03/MF A01.

A burning test on a common storage drum filled with a mixture of sodium nitrate and bitumen was carried out to show the incinerability of said mixture. A 50 l mild steel drum was filled with 80,7 kg sodum nitrate/bitumen-mixture. The drum was packed in a 200 l mild steel drum, the remaining space was filled with enough sand to cover the top of the inner drum with 15 cm of sand. The sand packing was then soaked with 70 l of light distillate fuel and ignited. The fuel burned until self-extinguishing occurred. 30 % (22,2 l) of the fuel was burned. 0,7 % of the energy potential was absorbed in the sand layer. The highest measured temperature was 34°C at the top of the test drum. It can be concluded, that even under severe external actions the ignition temperature of 400°C for bitumen/waste mixtures cannot be reached, providing correct technical storage conditions, which means that the void space in the cavities is filled with unburnable absorbing material like sand or salt.

2556 (SR--0980-10) WET AND DRY DEPOSITION AND RESUSPENSION OF AFCT/TFCT FUEL PROCESSING RADIONUCLIDES. FINAL REPORT. Slinn, W.G.N.; Katen, P.C.; Wolf, M.A.; Loveland, W.D.; Radke, L.F.; Miller, E.L.; Ghannam, L.J.; Reynolds, B.W.; Vickers, D. (Oregon State Univ., Corvallis (USA)). Sep 1979. Contract EY-77-S-09-0980. 529p. Dep. NTIS, PC A23/MF A01.

After short summary and introductory chapters, Chapter IV contains a critical analysis of available parameterizations for resuspension and for wet and dry removal processes and recommends interim parameterizations for use in radiation dose calculations. Chapter V describes methods and experimental results from field studies of in-cloud vs below-cloud scavenging, precipitation efficiency, and modifications of aerosols by clouds. In Chapter VI are contained descriptions of methods and results from four different approaches to the problem of measuring the dry deposition velocities of submicron aerosol particles depositing on vegetation. Chapter VII describes experimental results from a study of resuspension and weathering of tracer aerosol particles deposited on soil, grass and gravel; typical resuspension rates were found to be of the order of 10^{-8} s^{-1} and it is recommended that the concept of weathering be reassessed. In Chapter VIII, National Weather Service data are used to obtain Lagrangian statistics for use in a regional-scale study of wet and dry removal. Chapter IX develops new concepts in reservoir models for application at regional to global scales. In the final chapter are some comments about the results found in this study and recommendations for future research.

2557 (STUDSVIK/K1/4--78/9) HANDLING OF ALPHA ACTIVE MATERIAL. Berggren, G. (Aktiebolaget Atomenergi, Studsvik (Sweden)). Oct 1978. 22p. (In Swedish). Dep. NTIS (US Sales Only), PC A03/MF A01.

The handling of alpha active material involves many problems. Some of these are discussed in this report particularly those concerning monitoring and ventilation. The report summarizes the experiences from the handling of Pu in boxes at Studsvik, Sweden.

2558 (UCID--17930) METEOROLOGY AND DEMOGRAPHY MODELS FOR RISK ASSESSMENTS OF ACCIDENTAL ATMOSPHERIC RELEASES OF NUCLEAR WASTE. PHASE 2 METHODOLOGY. Peterson, K.R.; Harvey, T.F. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Sep 1980. Contract W-7405-ENG-48. 20p. NTIS, PC A02/MF A01.

Models are derived for determining the risk of release to the atmosphere of radioactive materials during nuclear waste handling. Such releases might occur in three phases of the nuclear waste handling cycle: (1) at fuel reprocessing plants during handling and interim storage, (2) during transportation to a permanent storage area, or (3) at the permanent disposal area (federal waste repository). Gaussian diffusion equations for both plume- and puff-type releases are used with demographic models to assess relative integrated population doses. Given a unit release and assuming an equal accident probability, we conclude that the largest risk would be from a transportation accident in a metropolitan area. The effect of a release during transportation in a rural area or at a fuel reprocessing plant would be one to two orders of magnitude less, while at a federal waste repository the population dose would be three or more orders of magnitude less than for the metropolitan transportation accident.

2559 (UCRL--15121) RELATIVE POTENTIAL HAZARDS OF RADIOACTIVE WASTE IN VARIOUS WATER SYSTEMS. Duffy, J.J.; Mealy, G.L. (Analytic Sciences Corp., Reading, MA (USA)). 15 Jun 1979. Contract W-7405-ENG-48. 74p. Dep.

NTIS, PC A04/MF A01.

The potential hazard to man arising from the hypothetical release of radioactive spent fuel waste into various water systems has been evaluated. Radionuclide transport and human exposure were simulated for six water systems: a large Northwestern river, a small Northeastern river, a small Northwestern river, a large Central Region river, a lake with no outflow in an arid region, and an aquifer discharging directly into an ocean.

2560 (UCRL--82236) REPOSITORY POST-SEALING RISK ANALYSIS USING MACRO. Kaufman, A.M.; Edwards, L.L.; O'Connell, W.J. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 14 Feb 1980. Contract W-7405-ENG-48. 18p. (CONF-800313--4). Dep. NTIS, PC A02/MF A01.

From Waste management conference; Tucson, AZ, USA (10 Mar 1980).

MACRO, a code to propagate probability distributions through a set of linked models, is currently under development at Lawrence Livermore Laboratory. An early version of this code, MACRO1, has been used to assess post-sealing dose to man for simple repository and site models based on actual site data.

2561 POST-KEMENY NUCLEAR INDUSTRY IN THE UNITED STATES. Dodd, B. (Oregon State Univ., Corvallis (USA). Dept. of Nuclear Engineering). Nuclear Engineering Incorporating Nuclear Power ; 21: No. 3, 78-80(May-Jun 1980).

An account is given of the nuclear industry in the USA as it tries to come to terms with the findings of the Kemeny enquiry which reported on the incident at the Three Mile Island - 2 Reactor. The major points raised by the enquiry are reviewed and the areas currently receiving most attention; the Nuclear Regulatory Commission itself, operator training, emergency planning, licensing, waste disposal, and transportation, discussed.

2562 PROBABILITY ANALYSIS OF GEOLOGICAL PROCESSES: A USEFUL TOOL FOR THE SAFETY ASSESSMENT OF RADIOACTIVE WASTE DISPOSAL. D'Alessandro, M.; Murray, C.N.; Bertozzi, G.; Girardi, F. (Commission of the European Communities, Ispra, Italy). Radioactive Waste Management (New York) ; 1: No. 1, 25-42(May 1980).

In the development of methods for the assessment of the risk associated with the disposal of radioactive wastes over periods up to 10^6 years, much discussion has occurred on the use of probability analysis for geological processes. The applicability and limitations of this concept are related to the proper use of the geological data-base and the critical interpretation of probability distributions. The interpretation of geological phenomena in terms of probability is discussed and an example of application to the determination of faulting probability is illustrated. The method has been used for the determination of failure probability of geological segregation of a waste repository in a clay formation.

2563 NUCLEAR ENERGY: PRODUCTION AND PROBLEMS. Berlyn, G.P.; Dhillon, S.S.; Koslow, E.E. (Yale Univ, New Haven, Conn). Environmental Management ; 4: No. 2, 95-102(Mar 1980).

It is possible that nuclear energy may be a necessary interim solution to energy problems, but the risks and hazards of nuclear energy such as that posed by technetium-99 should be openly studied and discussed so that the citizens who will be taking the risks are given an appropriate voice in the hard decisions that must be made regarding the use of nuclear energy. A major problem of present nuclear reactors is the generation of toxic and radioactive wastes. Another major problem with nuclear power plants is that a nuclear reactor has the capacity to heat up and melt down or even to explode; and under either of these conditions, the toxic wastes may be spewed out into the environment. The article discusses the fission process, nuclear fuel cycle, types of reactors, and biological effects. Refs.

2564 RADIATION PROTECTION AND SAFETY IN CONNECTION WITH RADIOACTIVE WASTE. REPORT ABOUT THE 7TH IRPA REGIONAL CONGRESS AND 13TH ANNUAL MEETING OF FS AT COLOGNE. Pfeffer, W. (Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.)). Atomwritschaft, Atomtechnik ; No. 2, 79-80(Feb 1980). (In German).

INTERMEDIATE-LEVEL RADIOACTIVE WASTES;LOW-LEVEL RADIOACTIVE WASTES;MEETINGS;RADIATION PROTECTION;RADIOACTIVE WASTE DISPOSAL;REVIEWS; SAFETY

2565 SEISMIC RISK AND TOXIC WASTE DISPOSAL. A DISCUSSION. Berry, M.J.; Hasegawa, H.S. (Department of Energy, Mines and Resources, Ottawa, Ontario (Canada). Earth Physics Branch). Geoscience Canada ; 6: No. 4, 195-198(Dec 1979).

Earthquakes, whether natural or induced, pose a significant risk to the disposal of toxic wastes by burial or fluid injection in the crust. Methodology exists for assessing the ambient seismic risk at moderately low levels of probability, but for greater degrees of conservatism the assessment is essentially deterministic. Such estimates are considered appropriate for periods comparable to that of the available seismic history but an improved understanding of the nature of currently active seismic zones is required for the estimates to be applied with confidence to periods of time measured in thousands of years. The potential hazards associated with this natural seismic risk can be mitigated by appropriate engineering design and practce. Induced seismicity associated with mining excavations thermally induced stresses or fluid injection can be controlled by appropriate engineering design and operational procedure.

2566 RELEASES OF RADIOACTIVE SUBSTANCES FROM REPROCESSING PLANTS IN THE EC IN 1972-1976. Atomwritschaft, Atomtechnik ; 24: No. 12, 612-613(Dec 1979). (In German).

In its latest, fourth issue of the report on the release of radioactive substances from nuclear power plants, covering the period from 1972 to 1976, the EC commission for the first time presented data including the releases from reprocessing plants in the EC. Thus this latest report considers, the two main sections of the nuclear fuel cycle involving the possibility of radioactivity release.

2567 ENERGY; WHAT ABOUT THE WASTE.. Goldman, M.I. (NUS Corp, Rockville, Md). Chemical Engineering Progress ; 75: No. 11, 65-70(Nov 1979).

It is noteworthy that the comparisons of health effects that have been made between coal and nuclear power have usually included the projected consequences associated with the handling and disposal of high-level radioactive wastes. They have not, however, considered the potential problems associated with coal plant operations. This article compares the toxicity

of nuclear high-level waste with the toxicity of the waste from burning coal to produce an equivalent amount of energy. In addition, some comparisons are presented of radon gas emanated from coal ash and from uranium mill tailings. A detailed discussion of health hazards involved in nuclear waste and coal ash, which is waste from coal-firing power plant, is followed by a conclusion which states that coal ash has an equal or greater inherent hazard than an energy equivalent amount of uranium ore. Further, since the constituents in coal ash do not decay with time, this toxicity index extends undiminished for an infinite time into the future.

2568 NUCLEAR DISASTER IN THE URALS. Medvedev, Z. (National Inst. for Medical Research, London (UK)). New Scientist ; 84: No. 1176, 115-117(11 Oct 1979).

In this article, extracted from 'Nuclear Disaster in the Urals' written by the present author, mechanisms are considered that could have been responsible for the explosion which occurred in the Urals in late 1957 or early 1958, causing a great many casualties and contaminating a vast territory, resulting from the improper storage of reactor products. Possibilities reviewed include; (1) an explosion due to thermal heating of selectively adsorbed residual plutonium, resulting from a chain reaction begun by the moderating action of water on the plutonium (2) an explosion in a storage tank that was insufficiently cooled, (3) an explosion in a geological formation into which high level wastes had been pumped under pressure.

2569 METHODS FOR PREDICTING THE EFFECTIVENESS OF URANIUM MILL TAILINGS COVERS. Cohen, B.L. (Argonne National Lab., IL (USA)). Nuclear Instruments amp Methods ; 164: No. 3, 595-599(1 Sep 1979).

The theory for diffusion of radon through uranium mill tailings piles and covers placed over them is developed in a simple but reasonably accurate form. The results depend on a knowledge of diffusion constants. Methods for measuring these in a laboratory are considered and a much simpler method than those in use is developed and recommended.

2570 REDUCTION OF RADON FLUX FROM URANIUM TAILINGS. Overmyer, R.F.; Rogers, V.C.; Jensen, C.M. (Ford, Bacon and Davis, Utah, Inc). Mining Congress Journal ; 65: No. 9, 21-25(Sep 1979).

The article pertains to experiments designed to measure the effectiveness of various tailings cover materials in reducing radon flux, the theoretical analysis of radon diffusion, and experiment results. 2 refs.

2571 INFLUENCE OF THE MODE OF UPTAKE ON THE ELIMINATION OF COBALT 60 BY A PHANEROGAM, A MOLLUSC, A CRUSTACEAN AND A FRESHWATER TELEOST. Amiard-Triquet, C. (Centre National de la Recherche Scientifique, 44 - Nantes (France). Lab. de Biologie Marine). Environmental Pollution (London) ; 20: No. 1, 65-78(Sep 1979). (In French).

^{60}Co enters the environment with radioactive wastes from nuclear power reactors and fuel reprocessing plants as well as a component of fallout from nuclear tests. A study of ^{60}Co in freshwater organisms has been carried out in order to compare the influence of different modes of uptake (immersion in contaminated water, ingestion of radioactive food, contamination by both food and water) upon the subsequent elimination. The loss of ^{60}Co by Canadian pondweed Elodea canadensis is monophasic. For animal species, this phenomenon is biphasic, independently of the mode of uptake. On the other hand, the biological half-life changes in relation to the vector of contamination. The same result is observed for the relative importance of the different compartments. This is easily explained because the mode of uptake determines the distribution of ^{60}Co in the organisms. The turnover of ^{60}Co in the organisms is slow and the physical half-life of this radionuclide is relatively important (Tsub(p) = 5.27 years). Thus, the possible consequences of the release of this pollutant on freshwater life must not be neglected.

2572 CONTAMINATION IN AN OFFICE AND EXPOSURE OF OFFICE WORKERS. Hughes, J.S. (National Radiological Protection Board, Leeds (UK)). Radiological Protection Bulletin ; No. 29, 27-28(Jul 1979).

It has been estimated that doses ranging from 5 to 23 mSv perquarter were received over periods of several years by three office workers. Several thousand small radium-luminized metal discs had been removed from the display panels of several hundred items of control equipment and stored for at least eight years in four lead canisters on the floor on an office. The discs had been handled initially in bulk, without regard to radiological hazards and precautions. A considerable level of removable α contamination was found on the surface of the canisters, but the most significant radiological hazard was external γ radiation from the canisters. The incident emphasizes that radioactive material should be disposed of promptly and appropriately when no longer required.

2573 URINARY ^{90}SR CONCENTRATION IN OCCUPATIONALLY EXPOSED AND NONEXPOSED PERSONS IN AUSTRIA. Irlweck, K.; Streit, S. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Seibersdorf. Forschungszentrum). Health Physics ; 37: No. 1, 163-165(Jul 1979).

Personnel monitoring at Seibersdorf Research Centre includes analysis of ^{90}Sr in urine of employees who handle low-level radioactive wastes. Results for the two year period 1976-77 are reported. ^{90}Sr concentrations were mainly between 0.5 and 5.0pCi/l, except in the cases of two employees who incorporated ^{90}Sr as a result of an accident. Urine samples from 21 non-exposed persons not employed at Seibersdorf all gave results below 2pCi/l. These results agree with a ^{90}Sr concentration of 0.2-2.0pCi/l of urine estimated from global fallout data. If individual differences, e.g. in metabolism, diet etc. are taken into account, it is concluded that a ^{90}Sr incorporation above fallout level should be assumed with certainty only if the ^{90}Sr concentration exceeds 5pCi/l of urine. (author).

2578 PRELIMINARY EXAMINATION OF HAZARDS ARISING FROM HYPOTHETICAL FAILURE OF A LONG-TERM DISPOSAL FACILITY FOR HIGH LEVEL RADIOACTIVE WASTES FROM THERMAL REACTORS. Bell, G.D. (UKAEA, Harwell. Atomic Energy Research Establishment); Fryer, L.S. Nuclear Energy (Formerly Nuclear Energy Engineer) ; 18: No. 1, 47-51(Feb 1979).
The return to the biosphere of buried highly active vitrified wastes by some unknown cataclysm at a time following decay of most of the fission product activity, that is 500 years from irradiation is postulated. The various ways in which people could receive radiation doses are considered and compared. External radiation is shown to be the most important if the hazard is undetected; the extent of the hazard is shown to be limited to a relatively small area. It is concluded that there would be no risk to continuing life in the country concerned or to life on the planet as a whole, even in the extremely unlikely and hypothetical circumstances postulated.

2579 ASSEMBLY OF LABORATORY LINE FOR NUCLEAR FUEL REPROCESSING. Fidler, J.; Chotivka, V. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Nukleon ; No. 4/78, 13-15(Jan 1979). (In Czech).
The dismantling of a laboratory line for spent fuel reprocessing after the termination of the research programme and the procedures for hot and semi-hot cell decontamination are described. The equipment was mostly disassembled in smaller parts which were then decontaminated by wiping them with cotton wool soaked in detergent and citric acid, varnished with two-component epoxi varnish, wrapped into multiple polyethylene foils, sealed in PVC bags and thus ready for transport.

2580 PRINCIPLES OF SAFETY CRITERIA FOR NUCLEAR FUEL FACILITIES. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 9, 208-213(Jan 1979). (In Japanese).
This report was prepared by the "Committee for the Investigation of Nuclear Fuel Cycle Safety Criteria" and was submitted to the Director of Nuclear Safety Bureau. It summarizes the basic idea of safety regulation for the following facilities: uranium and plutonium fuel fabrication facilities; reprocessing and spent fuel storage facilities; facilities which deal with a large amount of plutonium and hot laboratories dealing with a large amount of spent fuel. Fundamental concepts for securing the safety of these facilities are considered and discussed for the following areas: the conditions of location such as the distance from public residential areas; control and monitoring of radiation; criticality management; maintenance, inspection, shielding, instrumentation, and many other measures for preventing accidents. Explanations of the technical terms used in this document are also made.

2581 NUCLIDE TRANSPORT BY GROUNDWATER IN SWEDISH BEDROCK. Allard, B.; Kipatsi, H.; Torstenfelt, B.; Rydberg, J. (Chalmers Univ. of Tech., Goeteborh, Sweden). pp 403-410 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
The sorption of 14 different elements (Cs, Sr, Ra, Zr, Tc, I, Nd, Ce, Eu, Th, U, Np, Pu and Am) has been measured on granite and on a bentonite/quartz mixture (10:90) under environmental conditions. Retention factors have been calculated. The investigation was performed within the Swedish Nuclear Fuel Safety Project.

2582 ANALYSIS OF PU-RELEASE CONSEQUENCES ON THE ENVIRONMENTAL GEOCHEMISTRY. Jakubick, A.T. (Kernforschungszentrum, Karlsruhe, Germany). pp 427-434 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).
The fallout plutonium depth distribution in soil was estimated at seven undisturbed sites. The mobility of plutonium in these natural soils was derived as 0.2 to 2 cm/y. By relating the flow velocity of soil water to the migration rate, the retardation factor was thereby obtained. The typical magnitude of plutonium transfer response to the partially saturated water flow is 10^{-3}. A linear relationship exists between the fallout plutonium retardation factor and three soil parameters: surface exchange capacity, porosity and pH. Also, in the course of the investigations the Pu-base-line was established for SW-Germany. Thus, any local deviation can be identified by using a log-probability plot with these background data. By means of the relationship derived, realistic predictions concerning persistence and dispersion of Pu-anomalies can be made for any site chosen.

2583 PRELIMINARY SAFETY ASSESSMENT OF THE WIPP FACILITY. Balestri, R.J. (BDM Corp., Albuquerque, NM); Torres, B.W.; Pahwa, S.B.; Brannen, J.P. pp 513-520 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).
From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

The efforts to perform a safety assessment of the WIPP facility being proposed for southeastern New Mexico are summarized. This preliminary safety assessment of the WIPP facility is limited to a consequence assessment in terms of the dose to a maximally exposed individual as a result of introducing the radionuclides into the biosphere. No attempt has been made to extend the consequences to population dose or to weight the dose with probability of the events. The general methodology, geosphere transport, and biosphere transport are described. The consequences of the various models developed to represent the loss of containment are summarized.

2584 COMPUTER ENHANCED RELEASE SCENARIO ANALYSIS FOR A NUCLEAR WASTE REPOSITORY. Stottlemyre, J.A.; Petrie, G.M.; Mullen, M.F. (Battelle Pacific Northwest Labs.). pp 521-531 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

An interactive (user-oriented) computer tool is being developed at PNL to assist in the analysis of release scenarios for long-term safety assessment of a continental geologic nuclear waste repository. Emphasis is on characterizing the various ways the geologic and hydrologic system surrounding a repository might vary over the 10^6 to 10^7 years subsequent to final closure of the cavern. The potential disruptive phenomena are categorized as natural geologic and man-caused and tend to be synergistic in nature. The computer tool is designed to permit simulation of the system response as a function of the ongoing disruptive phenomena and time. It is designed to be operated in a determinatic manner, i.e., user selection of the desired scenarios and associated rate, magnitude, and lag time data; or in a stochastic mode. The stochastic mode involves establishing distributions for individual phenomena occurrence probabilities, rates, magnitudes, and phase relationships. A Monte-Carlo technique is then employed to generate a multitude of disruptive event scenarios, scan for breaches of the repository isolation, and develop input to the release consequence analysis task. To date, only a simplified one-dimensional version of the code has been completed. Significant modification and development is required to expand its dimensionality and apply the tool to any specific site.

2585 RELEASE OF RADIONUCLIDES FROM HIGH-LEVEL WASTE DURING TRANSPORTATION FIRES. Ensminger, D.A. (Analytic Sciences Corp., Reading, MA); Sutherland, A.A.; Oston, S.G.; Van Konynenburg, R.A. pp 541-548 of Scientific basis for nuclear waste management. McCarthy, G.J. (ed.). New York, NY; Plenum Press (1979).

From Annual meeting of Materials Research Society; Boston, MA, USA (28 Nov 1978).

An analysis is performed to determine doses to humans that result from fire accidents in rail or truck transportation of solidified high-level nuclear waste. Four waste forms are analyzed: spray calcine, fluidized-bed calcine, borosilicate glass, and a special multibarrier waste form. It is possible to establish discrete containment failure temperatures for each waste form. Using probabilistic models for fire accidents in truck and rail transportation modes, the expected value of population dose for each of the four waste forms is computed.

2586 Strahlenexposition im Jahr 1976 durch kerntechnische Anlagen in der Bundesrepublik Deutschland. (RADIATION EXPOSURE DUE TO NUCLEAR FACILITIES IN WEST GERMANY IN 1976). Huber, O.; Gans, I.; Haubelt, R. Berlin, Germany, F.R.; Reimer (1979). 22p. (In German).

Apart from the calculated results of radiation exposure for 1976, this report contains data on the discharge rates from nuclear installations, their radionuclide composition as well as the applied calculation procedures input data. It may be concluded that the maximum exposure values of individuals, calculated for various pathways, from the discharge of radioactive substances with gaseous and liquid effluents from nuclear installations did not exceed the dose limits established in the Radiation Protection Ordinance. In 1976, the contribution of nuclear installations to whole population exposure was again below 1 mrem/a.

2598 RADON: CHARACTERISTICS, NATURAL OCCURRENCE, TECHNOLOGICAL ENHANCEMENT, AND HEALTH EFFECTS. Cohen, B.L. (Pittsburgh Univ., PA (USA)). Progress in Nuclear Energy ; 4: No. 1, 1-24(1979).
An extensive review is presented on radon, with the purpose of examining its effects on human health. First the occurrence, nuclear and other properties are surveyed. Techniques are described for measuring the concentration of radon and its daughters, and the use of the working level (WL) unit widely accepted for specifying such concentrations, is explained. The behaviour of radon in both soil and in the atmosphere is discussed. The effect of inhalation of radon is then examined, particularly the data relating to lung cancer amongst uranium miners, and exposure received by the average person in normal environments. The effect of the nuclear industry on radon concentrations is considered. The principal contribution is from the waste (tailings) from uranium ore processing mills, and doses and health effects are examined in some detail together with discussion on reduction of radon emissions. Finally enhancement of radiation exposures due to non-nuclear activities, especially combustion of coal, mining of phosphates, the use of natural gas and of potable water, is considered.

2599 DEVELOPMENT AND TESTING OF LONG-TERM SAFETY ASSESSMENT METHODOLOGY FOR GEOLOGIC WASTE REPOSITORIES. Brandstetter, A. (Battelle Pacific Northwest Labs., Richland, WA). Transactions of the American Nuclear Society ; 33: 140(1979). (CONF-791103--).

2605 CRITICALITY SAFETY DETERMINATION OF SPENT FUEL STORAGE VAULT. Yook, C.C. (Hanyang Univ., Seoul (Republic of Korea) Coll. of Engineering). Bangason Bango Hakhoe Chi ; 4: No. 1, 1-4(1979). (In Korean).
Effective multiplication factor has been calculated for one PWR fresh fuel assembly immersed in a spent fuel storage vault on the basis of the neutron transport theory. A numerical calculation has been carried out by means of Sn approximation. The method employed in this study is that the energy domain is broken into 16 groups, the angular variable is divided into four discrete direction, i.e., S_4, and the spatial variable which is divided into fine meshes at the interface between different materials is discretized into 27 mesh points. The calculated Ksub(eff) value of 0.6145 seems to be far smaller in comparison with the value obtained by other author for an infinite array of fuel assemblies. (author).

2606 METHODS FOR ESTIMATING POPULATION DETRIMENT AND THEIR APPLICATION IN SETTING ENVIRONMENTAL DISCHARGE LIMITS. Clarke, R.H.; Webb, G.A.M. (National Radiological Protection Board, Harwell (UK)). pp 127-144 of Biological implications of radionuclides released from nuclear industries. Vol. 2. Vienna, Austria; IAEA (1979).
From International symposium on biological implications of radionuclides released from nuclear industries; Vienna, Austria (26 Mar 1979).
The relative emphasis in the objectives of radiological protection has changed with the system of dose limitation recommended in the latest recommendations of the ICRP. There is now a requirement to carry out optimization of protection using the techniques of cost benefit analysis. The paper is not concerned with the formal techniques of the differential cost benefit analysis, but rather with the assessment of the detriment that is to be used in the optimization procedure, in particular for effluents released in the nuclear industry. We consider the calculation of detriment and discuss to what extent the existing defined dosimetric quantities, such as Committed Effective Dose Equivalent or Collective Effective Dose Equivalent Commitment, may be used in its assessment. We also indicate the procedure to be followed for the most realistic estimates of the total health effects. Having derived the dosimetric quantities to be used in assessing detriment, we outline the environmental models that need to be developed to complete the calculation of detriment from environmental releases. Finally, we have identified research and investigation needs, both in the biological and environmental fields, to fulfil the objective of realistic estimation of detriment.

2607 UPDATE ON EPA URANIUM FUEL CYCLE STANDARDS. Smith, P.B. (US EPA, Denver, Colo). pp 344-366 of Uranium resource/ technology seminar 2, 1979. Golden, CO; Colorado School of Mines (1979).
From Uranium resource technology seminar; Golden, CO, USA (12 Mar 1979).
EPA's role in setting radiation protection standards is reviewed. Emphasis is given to EPA's uranium fuel cycle standards program, and the implication for industry. 9 refs.

2608 RADIOLOGICAL SAFETY ASSESSMENT FOR A LOW-LEVEL RADIOACTIVE SOLID WASTE STORAGE FACILITY: PRELIMINARY RISK EVALUATION BY RELIABILITY TECHNIQUES. Morisawa, S.; Inoue, Y. (Kyoto Univ. (Japan). Faculty of Engineering); Wadachi, Y.; Kato, K. Health Physics ; 35: No. 6, 817-834(Dec 1978).
The applicability of reliability techniques was examined to the determination of quantitative risks presented by a low-level radioactive solid waste storage facility. Fault trees and event trees were defined based on many relevant assumptions to obtain the average occurrence rate of rare accidents which could lead to potential hazards to the general public. The amount of radioactivity which would be transported into the environment from a storage facility was calculated using assumptions and/or estimates of the magnitude of each accident, together with estimates of probability of occurrence, and was used as an index for measuring the potential risks. Some valuable results were obtained in this study under the limits considered. These are as follows: (1) Reliability techniques are effective and promising for assessing the quantitative risks due to storing radioactive wastes in a waste package storage facility for long periods; (2) The main failures associated with an accident are summarized and listed; (3) The advantages and disadvantages of two types of waste package storage room and the amounts of radioactivity which would be released accidentally from them are also summarized and listed; and (4) The improvements to a storage facility that are desirable from a radiological safety aspect are proposed.

2609 SHUTDOWN OF THE EUROCHEMIC PLANTS: PROGRAM, EVOLUTION AND TEACHINGS. Detilleux, E. (Societe Europeenne pour le Traitement Chimique des Combustibles Irradies (EUROCHEMIC), Mol (Belgium)). Revue Generale Nucleaire ; No. 3, 177-186(Jun-Jul 1978). (In

French).
The work carried out at Eurochemic since the shutdown of the reprocessing plant is described. The results of this work show that the decommissioning of nuclear plants can be made perfectly well using conventional means.

2610 FIELD APPLICATIONS OF A RADON BARRIER TO REDUCE INDOOR AIRBORNE PROGENY. Culot, M.V.J. (Westinghouse Electric Corp., Monroeville, PA (USA). Nuclear Energy Systems); Olson, H.G.; Schiager, K.J. Health Physics ; 34: No. 5, 498-501(May 1978).
The use of uranium mill tailings in the foundations of dwellings has resulted in indoor radon progeny concentrations and gamma exposures in excess of levels presently allowed for the general public. An account is given of the applications of an epoxy coating on the indoor faces of the concrete foundations of three buildings in Grand Junction, Colorado. Epoxy barriers were shown to be effective for preventing radon influx into structures. Gamma exposure rates must be analyzed to ensure that buildup behind the barrier will not introduce an unacceptable gamma exposure level. The use of a sealant is especially economical in situations where structural integrity may be jeopardized by physical removal of uranium mill tailings.

2611 RADIATION PROTECTION FEATURES OF THE NEW WASTE CALCINING FACILITY. Bingham, G.E.; Wheeler, B.R. (Allied Chemical Corp., Idaho Falls, ID (USA)). pp 135-142 of Radiation protection in nuclear power plants and the fuel cycle. Volume 1. London, England: British Nuclear Energy Society (1978).
From Conference on radiation protection in nuclear power plants and the fuel cycle; Bristol, UK (27 Nov 1978).
A new Waste Calcining Facility is being built at the Idaho Chemical Processing Plant to replace the existing Waste Calcining Facility which was built to demonstrate fluidized-bed solidification of highly radioactive liquid wastes. The new facility will include significant features and provisions for effecting major reductions in the annual personnel radiation exposures being experienced at the Idaho Chemical Processing Plant. Past Chemical Processing Plant personnel radiation exposure histories are described along with corrective actions being taken in the new facility to reduce exposures and the anticipated results of these actions. (author).

2612 MEASUREMENTS OF RADON DAUGHTER CONCENTRATIONS IN STRUCTURES BUILT ON OR NEAR URANIUM MINE TAILINGS. Haywood, F.F.; Kerr, G.D.; Goldsmith, W.A. (Oak Ridge National Lab., TN (USA)). pp 219-229 of Personal dosimetry and area monitoring suitable for radon and daughter products. Paris, France: OECD (1977).
From Specialist meeting on personal dosimetry and area monitoring suitable for radon and daughter products; Ontario, Canada (4 Oct 1976).
A technique is discussed that has been used to measure air concentrations of short-lived daughters of ^{222}Rn in residential and commercial structures built on or near uuranium mill tailings in the western part of the United States. In this technique, the concentrations of RaA, RaB and RaC are calculated from one integral count of the RaA and two integral counts of the RaC' alpha-particle activity collected on a filter with an air sampling device. A computer program is available to calculate the concentrations of RaA, RaB and RaC in air and to estimate the accuracy in these calculated concentrations. This program is written in the BASIC language. Also discussed in this paper are the alpha-particle spectrometer used to count activity on the air filters and the results of our radon daughter measurements in Colorado, Utah, and New Mexico. Results of these and other measurements are now being used in a comprehensive study of potential radiation exposures to the public from uranium mill tailing piles.

Regulations

2613 (PB--296947, pp 284-292) PROPOSED FEDERAL RADIATION GUIDANCE FOR RADIOACTIVE WASTES. Martin, J.E.; Pettengill, H.J.; Lichtman, S. (Environmental Protection Agency, Washington, DC). May 1979.
From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).
The Administrator of EPA, in his role of providing federal radiation guidance, will soon forward radiation protection guidance for radioactive wastes to the President for approval. The recommended guidance addresses: (1) the types of materials to be categorized as radioactive wastes and considered for control; (2) the use of institutional functions, engineered controls, and naural barriers to isolate wastes; (3) the potential health risks associated with wastes, and the factors involved in determining them; (4) factors which determine the unacceptability of various levels of risk; and (5) other considerations such as retrievability, site locations, and communication to succeeding generations to assure continued isolation. When approved by the President, the recommendations will guide federal agencies in making policy, programmatic, operational, and standard-setting decisions in providing radiation protection for radioactive wastes.

Accountability and Safeguards

2614 (BARC--986) PASSIVE GAMMA SCANNER FOR ESTIMATION OF PLUTONIUM IN FABRICATION WASTE. Venkatesan, P.P.; Burte, P.P.; Manohar, S.B.; Satya Prakash; Ramaniah, M.V. (Bhabha Atomic Research Centre, Bombay (India)). 1978. 11p. Dep. NTIS (US Sales Only), PC A03/MF A01.
The solid plutonium wastes arising from plutonium handling laboratories and fuel fabrication facilities by their very nature (heterogeneous) are not amenable to proper sampling and hence to the standard techniques of estimation. For the proper accounting of nuclear materials a non-destructive method of waste assay is essential. A passive gamma-ray scanner developed in the Radiochemistry Division is described in the present report. The scanner detects the 384 KeV gamma complex of plutonium in a ($3^{1/4}$ x $3^{1/2}$) NaI(Tl) detector. The rotation-collimation technique is used to achieve the flat response with respect to the plutonium distribution inside the waste can. The sensitivity of the scanner is 200 mg of Pu per can at 2 sigma level and 20% accuracy for a total scan time of 2000 sec. The assay results of typical waste cans and comparison of a few of these with chemical assay results are presented. This non-destructive method is fast, simple and has satisfactory accuracy.

2615 (BNL--27660) LASER SURVEILLANCE SYSTEM FOR SPENT FUEL. Fiarman, S.; Zucker, M.S.;

Bieber, A.M. Jr. (Brookhaven National Lab., Upton, NY (USA)). 1980. Contract EY-76-C-02-0016. 22p. (CONF-800315--20). NTIS, PC A02/MF A01.
From 2. symposium of the European Safeguards Research and Development Association; Edinburgh, UK (26 Mar 1980).
A laser surveillance system installed at spent fuel storage pools (SFSP's) will provide the safeguard inspector with specific knowledge of spent fuel movement that cannot be obtained with current surveillance systems. The laser system will allow for the division of the pool's spent fuel inventory into two populations - those assemblies which have been moved and those which haven't - which is essential for maximizing the efficiency and effectiveness of the inspection effort. We have designed, constructed, and tested a full size laser system operating in air and have used an array of 6 zircaloy BWR tubes to simulate an assembly. The reflective signal from the zircaloy rods is a strong function of position of the assembly, but in all cases is easily discernable from the reference scan of the background with no assembly. A design for a SFSP laser surveillance system incorporating laser ranging is discussed. 10 figures.

2616 (BNL--28054) LASER SURVEILLANCE SYSTEM FOR SPENT FUEL. Fiarman, S.; Zucker, M.S.; Bieber, A.M. Jr. (Brookhaven National Lab., Upton, NY (USA)). 1980. Contract AC02-76CH00016. 13p. (CONF-800655--29). NTIS, PC A02/MF A01.
From 21. annual meeting of the Institute of Nuclear Materials Management; Palm Beach, FL, USA (30 Jun 1980).
A laser surveillance system installed at spent fuel storage pools will provide the safeguard inspector with specific knowledge of spent fuel movement that cannot be obtained with current surveillance systems. The laser system will allow for the division of the pool's spent fuel inventory into two populations - those assemblies which have been moved and those which haven't - which is essential for maximizing the efficiency and effectiveness of the inspection effort. We have designed, constructed, and tested a laser system and have used it with a simulated BWR assembly. The reflected signal from the zircaloy rods depends on the position of the assembly, but in all cases is easily discernable from the reference scan of background with no assembly.

2617 (CONF-800943--(Summ.), pp 145-146) NONDESTRUCTIVE MEASUREMENTS ON SPENT FUEL FOR AWAY-FROM-REACTOR STORAGE FACILITIES. Phillips, J.R.; Cobb, D.D. (Los Alamos, scientific Lab., NM). 1980.
From National topical meeting of fuel cycles for the 80's; Gatlinburg, TN, USA (29 Sep 1980).
NONDESTRUCTIVE ANALYSIS;SPENT FUELS;AWAY-FROM-REACTOR STORAGE;RADIOACTIVE WASTE FACILITIES;SAFEGUARDS;STORAGE FACILITIES; NEUTRON DETECTORS

2618 (CONF-801107--13) CRITICALITY AND SAFEGUARDS AT THE IDAHO CHEMICAL PROCESSING PLANT. Kodman, G.P.; Wilson, R.E. (EG and G Idaho, Inc., Idaho Falls (USA)). 1980. Contract AC07-79ID01675. 7p. NTIS, PC A02/MF A01.
From ANS international conference; Washington, DC, USA (17 Nov 1980).
Reprocessing of high enriched irradiated reactor fuel at the Idaho Chemical Processing Plant (ICPP) presents significant potential problems to the Criticality Safety (CS) and Safeguards and Security (S and S) Sections. Two major interactions between these sections occurs when irradiated fuel is stored and fuel is dissolved. S and S is assigned the responsibility of maintaining a centralized records and reporting system which provides detailed, timely knowledge of the location, quantity and measurement uncertainties associated with accountable nuclear material, including uranium and plutonium. The Criticality Safety Section uses this information in providing criticality safety evaluations with support analyses, inspection, field surveillance and audits to ensure criticality safety implementation. The interactions of these sections has minimized operational constraints and maximized criticality safeguards controls.

2619 (DOE/NE--0001(Vol.2)) NUCLEAR PROLIFERATION AND CIVILIAN NUCLEAR POWER: REPORT OF THE NONPROLIFERATION ALTERNATIVE SYSTEMS ASSESSMENT PROGRAM. VOLUME II. PROLIFERATION RESISTANCE. (Department of Energy, Washington, DC (USA)). Dec 1979. 192p. Dep. NTIS, PC A09/MF A01.
Volume II assesses proliferation resistance. Chapters are devoted to: assessment of civilian nuclear systems (once-through fuel-cycle systems, closed fuel cycle systems, research reactors and critical facilities); assessment of associated sensitive materials and facilities (enrichment, problems with storage of spent fuel and plutonium content, and reprocessing and refabrication facilities); and safeguards for alternative fuel cycles.

2620 (DOE/NE--0001(Vol.9)) NUCLEAR PROLIFERATION AND CIVILIAN NUCLEAR POWER: REPORT OF THE NONPROLIFERATION ALTERNATIVE SYSTEMS ASSESSMENT PROGRAM. VOLUME IX. REACTOR AND FUEL CYCLE DESCRIPTIONS. (Department of Energy, Washington, DC (USA)). Dec 1979. 612p. Dep. NTIS, PC A99/MF A01.
The Nonproliferation Alternative Systems Assessment Program (NASAP) has characterized and assessed various reactor/fuel-cycle systems. Volume IX provides, in summary form, the technical descriptions of the reactor/fuel-cycle systems studied. This includes the status of the system technology, as well as a discussion of the safety, environmental, and licensing needs from a technical perspective. This information was then used in developing the research, development, and demonstration (RD and D) program, including its cost and time frame, to advance the existing technology to the level needed for commercial use. Wherever possible, the cost data are given as ranges to reflect the uncertainties in the estimates. Volume IX is divided into three sections: Chapter 1, Reactor Systems; Chapter 2, Fuel-Cycle Systems; and the Appendixes. Chapter 1 contains the characterizations of the following 12 reactor types: light-water reactor; heavy-water reactor; water-cooled breeder reactor; high-temperature gas-cooled reactor; gas-cooled fast reactor; liquid-metal fast breeder reactor; spectral-shift-controlled reactor; accelerator-driven reactor; molten-salt reactor; gaseous-core reactor; tokamak fusion-fisson hybrid reactor; and fast mixed-spectrum reactor. Chapter 2 contains similar information developed for fuel-cycle facilities in the following categories: mining and milling; conversion and enrichment; fuel fabrication; spent fuel reprocessing; waste handling and disposal; and transportation of nuclear materials.

2621 (INIS-mf--5130, pp 20-28) NPT AND THE ROLE OF THE INTERNATIONAL ATOMIC ENERGY AGENCY IN SAFEGUARDS. Rometsch, R. (International Atomic Energy Agency, Vienna (Austria)). 1977.

From Symposium on the proliferation and the safeguarding of the peaceful application of nuclear power; The Hague, Netherlands (8 Dec 1976).

The safeguards agreements in the NPT framework are compared. Up to now 139 safeguards agreements have been concluded. All these safeguards requests have been developed in a consistent way by the Agency in a safeguards system laid down in the document INFCIRC/66, and its revisions in the form of guidelines for conclusion of safeguards agreements. Today 100 states have ratified the NPT Treaty. 63 have negotiated the concluded safeguards agreements in connection with the Treaty, out of which 45 have entered into force. 76 safeguards agreements have so far been concluded with states not party to NPT. Due to expiration or suspension in favour of a safeguards agreement in connection with NPT, the Agency is now applying safeguards pursuant to 43 agreements outside NPT. Plutonium management under IAEA auspices are discussed. During the next two decades the spread of plutonium in spent fuel or separated form, represents the greatest potential dissemination of the capacity to make nuclear explosives. A comprehensive non-proliferation regime around the Treaty on the Non-Proliferation of Nuclear Weapons is supported by a series of measures. Except for the export policy the IAEA plays a role in all of them and has a particular mandate to implement international safeguards.

2622 (LA--7838-MS) IRRADIATED FUEL MONITORING BY CERENKOV GLOW INTENSITY MEASUREMENTS. Dowdy, E.J.; Nicholson, N.; Caldwell, J.T. (Los Alamos Scientific Lab., NM (USA)). Sep 1979. Contract W-7405-ENG-36. 14p. Dep. NTIS, PC A02/MF A01.

Attribute measurement techniques for confirmation of declared irradiated fuel inventories at nuclear installations under safeguards surveillance are being investigated. High-gain measurements of the intensity of the Cerenkov glow from exposed assemblies in water-filled storage ponds are promising for this purpose. Such measurements have been made of Materials Testing Reactor plate-type fuel assemblies and Pressurized Water Reactor pin-type fuel assemblies. The measured intensities depend on cooling times as calculations predict.

2623 (LA--8103-M) SAVANNAH RIVER PLANT CALIFORNIUM-252 SHUFFLER ELECTRONICS MANUAL. Bourret, S.C.; Crane, T.W.; Eccleston, G.W.; Gallegos, E.A.; Garcia, D.L. (Los Alamos Scientific Lab., NM (USA)). Mar 1980. Contract W-7405-ENG-36. 32p. Dep. NTIS, PC A03/MF A01.

Detailed information is presented in this report, an electronics manual for the Savannah River Plant Shuffler, about the electronics associated with the various control and data acquisition functions of the Shuffler subsystems. Circuit diagrams, interconnection information, and details about computer control and programming are included.

2624 (LA-UR--79-3218) MONTE CARLO CALCULATIONAL DESIGN OF AN NDA INSTRUMENT FOR THE ASSAY OF WASTE PRODUCTS FROM HIGH ENRICHED URANIUM SPENT FUELS. Eccleston, G.W.; Schrandt, R.G.; MacDonald, J.L.; Cverna, F.H. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 25p. (CONF-791117--4). Dep. NTIS, PC A02/MF A01.

From ANS topical conference; Kiawah Island, SC, USA (26 Nov 1979).

The Monte Carlo design of the waste assay region of a dual assay system, to be installed at the Fluorinal and Storage Facility, is described. The instrument will be used by the facility operator to assay high-enriched spent fuel packages and waste solids produced from dissolution of the fuels. The fissile content discharged in the waste is expected to vary between 0 and 400 g of ^{235}U. Material accountability measurements of the waste must be obtained in the presence of large neutron (0.5×10^6 n/s) and gamma (50,000 R/hr) backgrounds. The assay system employs fast-neutron irradiation of the sample, using a 5 mg ^{252}Cf source, followed by delayed neutron counting after the source is transferred to storage. Calculations indicate a +-4-g (2 sigma) assay for a waste canister containing 300 g of ^{235}U is achievable with an end-of-life (1 mg) ^{252}Cf source and a background rate of 0.5×10^6 n/s.

2625 (LA-UR--80-689) NONINTRUSIVE IRRADIATED FUEL INVENTORY CONFIRMATION TECHNIQUE. Dowdy, E.J.; Nicholson, N.; Caldwell, J.T. (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 6p. (CONF-800315--14). Dep. NTIS, PC A02/MF A01.

From 2. symposium of the European Safeguards Research and Development Association; Edinburgh, UK (26 Mar 1980).

Successful tests showing correlation between the intensity of the Cerenkov glow surrounding irradiated fuel assemblies in water-filled spent fuel storage ponds and the exposure and cooling times of assemblies have been concluded. Fieldable instruments used in subsequent tests confirmed that such measurements can be made easily and rapidly, without fuel assembly movement or the introduction of apparatus into the storage ponds.

2626 (LA-UR--80-1797) SCINTILLATOR SPENT FUEL MONITOR. Moss, C.E.; Nixon, K.V.; Bernard, W. (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 10p. (CONF-800655--7). NTIS, PC A02/MF A01.

From 21. annual meeting of the Institute of Nuclear Materials Management; Palm Beach, FL, USA (30 Jun 1980).

A monitor for rapidly measuring the gross gamma-ray flux immediately above spent fuel assemblies in underwater storage racks has been developed. It consists of a plastic scintillator, photomultiplier, collimator, and a small battery-powered electronics package. The crosstalk from an isolated fuel assembly to an adjacent void is only about 2%. The mean difference between the measured gamma-ray flux and the flux estimated from the declared burnup and cooling time with a simple formula is 22%.

2627 (MLM--2755(OP)) METHOD FOR CALIBRATION OF PLUTONIUM NDA. Lemming, J.F.; Campbell, A.R.; Rodenburg, W.W. (Mound Facility, Miamisburg, OH (USA)). 1980. Contract AC04-76DP00053. 5p. (CONF-790928--2). NTIS, PC A02/MF A01.

From International meeting on monitoring of Pu-contaminated waste; Ispra, Italy (25 Sep 1979).

Calibration materials characterized by calorimetric assay can be a practical alternative to synthetic standards for the calibration of plutonium nondestructive assay.

Calorimetric assay is an effective measurement system for the characterization because: it can give an absolute assay from first principles when the isotopic composition is known, it is insensitive to most matrix effects, and its traceability to international measurement systems has been demonstrated.

2628 (PB--296947, pp 492-496) RESPONSE TO A WIDESPREAD, UNAUTHORIZED DISPERSAL OF RADIOACTIVE WASTE IN THE PUBLIC DOMAIN. Wenslawski, F.A.; North, H.S. (Nuclear Regulatory Commission, Walnut Creek, CA). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

In March 1976 State of Nevada radiological health officials became aware that radioactive items destined for disposal at a radioactive waste burial facility near Beatty, Nevada had instead been distributed to wide segments of the public domain. Because the facility was jointly licensed by the State of Nevada and the Federal Nuclear Regulatory Commission, both agencies quickly responded. It was learned that over a period of several years a practice existed at the disposal facility of opening containers, removing contents and allowing employees to take items of worth or fancy. Numerous items such as hand tools, electric motors, laboratory instruments, shipping containers, etc., had received widespread and uncontrolled distribution in the town of Beatty as well as lesser distributions to other locations. Because the situation might have had the potential for a significant health and safety impact, a comprehensive recovery operation was conducted. During the course of seven days of intense effort, thirty-five individuals became involved in a comprehensive door by door survey and search of the town. Aerial surveys were performed using a helicopter equipped with sensitive radiation detectors, while ground level scans were conducted using a van containing similar instrumentation. Aerial reconnaissance photographs were taken, a special town meeting was held and numerous persons were interviewed. The recovery effort resulted in a retrieval of an estimated 20 to 25 pickup truck loads of radioactively contaminated equipment as well as several loads of large items returned on a 40-foot flatbed trailer.

2629 (PB--296947, pp 497-503) HEALTH AND SAFETY IMPLICATION OF A WIDESPREAD, UNAUTHORIZED DISPERSAL OF RADIOACTIVE WASTE IN THE PUBLIC DOMAIN. North, H.S. Jr.; Wenslawski, F.A. (Nuclear Regulatory Commission, Walnut Creek, CA). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

As a result of the distribution of contaminated and potentially contaminated articles and containers in the public domain, assessment of the possible threat to public health and safety was required. An extensive effort was made to identify radioisotopes and assess the hazard associated with the large number of items recovered during surveys. Exposure by direct radiation appeared minimal, and the majority of effort was devoted toward identifying potential internal exposures. Many of the recovered articles were intact obsolete military equipment with luminous radium facings. Other typical items included a plutonium contaminated balance scale and weights, a strontium-90 contaminated stainless steel plate, a centrifuge with carbon-14 and cobalt-60 contamination and a hoist assembly with plutonium contamination. A large number of specially fabricated waste containers which had previously been used to ship significant quantities of americium, plutonium and other nuclides were found in use for grain storage, water supply tanks and other applications. Sensitive gamma radiation surveys and smear and water samples identified no significant contamination in those tanks which had been located. Based on available information of isotopic identification and quantification, and location and use of contaminated items individuals with the highest potential for internal deposition were identified for whole body counting and bioassay. The results of whole body counting, including phoswich counts for plutonium and bioassays for tritium, carbon-14, strontium 89-90 and plutonium-238 and 239 did not yield any evidence of internal deposition. Two employees of the waste disposal facility indicated higher than usual tritium urine levels which returned to normal on resampling. Based on consideration of all factors, this uncontrolled release of contaminated waste in the public domain had no identifiable effect on the exposed population.

2630 ANALYSIS OF THE CONCENTRATE OF LIQUID HAW IN THE WAK. Berndt, J.; Berg, R.; Damerow, H.; Henn, K.H.; Schaarschmidt, U.; Weiler, W. (Gesellschaft zur Wiederaufarbeitung von Kernbrennstoffen m.b.H., Eggenstein-Leopoldshafen (Germany, F.R.)). pp 425-428 of Jahrestagung Kerntechnik '80 - Reaktortagung 1980. Tagungsbericht. 2631 DETECTION OF FREE LIQUID IN DRUMS OF RADIOACTIVE WASTE. (to Dept. of Energy). US Patent Application 085,370. 16 Oct 1979. 20p.

A nondestructive thermal imaging method for detecting the presence of a liquid such as water within a sealed container is described. The process includes application of a low amplitude heat pulse to an exterior surface area of the container, terminating the heat input and quickly mapping the resulting surface temperatures. The various mapped temperature values can be compared with those known to be normal for the container material and substances in contact. The mapped temperature values show up in different shades of light or darkness that denote different physical substances. The different substances can be determined by direct observation or by comparison with known standards. The method is particularly applicable to the detection of liquids above solidified radioactive wastes stored in sealed containers.

2632 DIFFICULTY OF CLANDESTINELY BUILDING AN ATOMIC BOMB. Closs, K.D. Bild der Wissenschaft ; 16: No. 7, 68-75(Jul 1979). (In German).

Wherever breeder reactors and reprocessing are discussed there is a problem of serious

impact: the risk of proliferation, which means the spreading of nuclear weapons. But not only in the case of these two components of a future fuel cycle are there proliferation paths, points at which fissionable material might possibly be diverted. They exist from the uranium ore mine up to the depositing of burnt out fuel elements. However, the path from possessing uranium to the finished bomb is a long one, and it is paved with very great technical difficulties.

2633 STUDY OF GAMMA-RAY SPECTROSCOPY FOR SPENT-FUEL VERIFICATION AT THE BRUCE CANDU REACTORS. Lipsett, J.J.; Irvine, J.C.; Williams, W.J. (Atomic Energy of Canada, Ltd., Ontario). Transactions of the American Nuclear Society, Supplement ; 33: No. 1, 36(1979).

2639 CHAPTER 10. MULTINATIONAL AND INTERNATIONAL CONTROLS. PAPER 18. NUCLEAR PROLIFERATION: ARRANGEMENTS FOR INTERNATIONAL CONTROL. Rotblat, J. pp 271-286 of Nuclear energy and nuclear weapon proliferation. London; Taylor and Francis (1979).
From Stockholm International Peace Research Institute symposium; Stockholm, Sweden (12 Oct 1978).
In the context of nuclear proliferation, the role of Third World countries is crucial since they constitute the great majority of nations, but only a few of them have as yet decided on their future energy programmes. Both the IAEA and the nuclear energy industries are urging them to opt for nuclear power. This is undesirable, because nuclear energy is an unsuitable energy source for most of these countries; it would create a new economic dependence on industrialized countries and would greatly increase the dangers of a nuclear war. To counteract this, measures are needed (a) to encourage Third World countries to meet their energy need from sources other than nuclear ones; (b) to reduce pressures on countries to acquire nuclear reactors; and (c) to eliminate the threat of new hegemonies to countries that already have nuclear power. To achieve this, it is proposed that two new international organizations be set up. One, a World Energy Organization (WEO), would be a specialized agency of the United Nations, with functions similar to those of WHO or FAO but with sufficient funds to make loans to individual countries which accept WEO's advice about their energy programmes. The second, an International Nuclear Fuel Agency (INFA), would be the sole authority to operate enrichment, fuel fabrication, reprocessing and waste disposal plants. Organizationally, it could be part of the IAEA, but the latter would have to separate its promotional and safeguarding activities. An amendment to the NPT would be needed to oblige all countries both nuclear and non-nuclear weapon states, equally to accept INFA controls.

2640 PROCEEDINGS OF 20TH ANNUAL MEETING OF INSTITUTE OF NUCLEAR MATERIALS MANAGEMENT, 1979. (Inst of Nucl Mater Manage, Piketon, Ohio). Nuclear Materials Management ; 8: vp(1979).
The proceedings contain 83 papers, of which 72 are indexed separately. In general, papers deal with the field of nuclear materials management. Various aspects of safeguard systems are presented and new instrumentation and surveillance systems are discussed.

2641 SAFEGUARDS ASSESSMENT OF SPENT FUEL DISPOSAL ALTERNATIVES. Lessler, R.M.; Ahluwalia, A.S. (Bechtel Natl Inc, San Francisco, Calif). Nuclear Materials Management ; 8: 790-806(1979).
A study has been performed for Battelle's Office of Nuclear Waste Isolation (ONWI) to compare three spent fuel disposal alternatives

with the disposal of high level waste from spent fuel reprocessing. Assessments of these four cases have been made in several areas, including domestic safeguards. The study examines each case as a system, starting with spent fuel discharge from the reactor and ending with geologic disposal of wastes. 7 refs.

2642 UNITED STATES NUCLEAR REGULATORY COMMISSION AND THE AGREEMENT STATES: LICENSING STATISTICS AND OTHER DATA, JULY TO DECEMBER 1978. Washington, DC; Nuclear Regulatory Commission (1978). 30p. (NP--23904). The Publisher, Washington, DC.

Information and data are presented on the following topics: NRC materials licenses (December 1978); NRC materials licensees (December 1978); agreement states licenses (December 1978); agreement state licensees (December 1978); NRC and agreement state inspection data (July 1, 1978 to December 31, 1978); incidents and over-exposures (July 1, 1978 to December 31, 1978); leaking sources (July 1, 1978 to December 31, 1978); and waste disposal licensees (July 1, 1978 to December 31, 1978). (JGB)

Administrative and Regulatory

2643 (CONF-780506--(Vol.2), pp 797-803) EVOLUTION IN STRUCTURAL DESIGN METHODS FOR LARGE QUANTITY PACKAGES. Waymire, G.R. (Exxon Nuclear Co., Inc., Bellevue, WA). 1978.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

The Nuclear Regulatory Commission (NRC) imposes formal criteria on the design of shipping containers through the regulations published in 10 CFR 71. These criteria include a series of normal and accident conditions which form key inputs to the structural design of large quantity packages, such as spent fuel transporters. This paper describes the key structural design areas which are of particular importance to a new spent fuel transporter design and highlights areas of uncertainty which may still exist in interpreting the regulations. Further definition in these areas of uncertainty through consensus standards or NRC Regulatory Guides would be of value to package designers and would improve package licensing schedules. The paper reviews previously acceptable methods for demonstrating the structural integrity of spent fuel transporters in which dynamic loads were evaluated using quasi-static methods and large safety factors. Existing criteria and guidelines are then reviewed following a discussion of several key issues which require definition and evaluation. Among these are a more complete definition of containment integrity, a cohesive set of requirements concerning codes and standards, a more complete definition of normal conditions of transport, better materials data for dynamic analysis and more fully defined and realistic load combinations. The paper also reviews existing R and D efforts by government and industry and finally concludes that the most cost-effective way to resolve and define the methods and guidance needed for regulatory purposes would be by joint industry-government participation which would be coordinated through a central program office. Through continued industry/government cooperation many of the regulatory problems posed above can be defined with sound technical bases - in a minimum time.

2644 (DOE/NE--0007(Supp.1)) PROPOSED RULEMAKING ON THE STORAGE AND DISPOSAL OF NUCLEAR WASTE. CROSS-STATEMENT OF THE UNITED STATES DEPARTMENT OF ENERGY. (Department of Energy, Washington, DC (USA)). 5 Sep 1980. 298p. NTIS, PC A13/MF A01.

The US DOE cross-statement in the matter of proposed rulemaking in the storage and disposal of nuclear wastes is presented. It is concluded from evidence contained in the document that: (1) spent fuel can be disposed of in a manner that is safe and environmentally acceptable; (2) present plans for establishing geological repositories are an effective and reasonable means of disposal; (3) spent nuclear fuel from licensed facilities can be stored in a safe and environmentally acceptable manner on-site or off-site until disposal facilities are ready; (4) sufficient additional storage capacity for spent fuel will be established; and (5) the disposal and interim storage systems for spent nuclear fuel will be integrated into an acceptable operating system. It was recommended that the commission should promulgate a rule providing that the safety and environmental implications of spent nuclear fuel remaining on site after the anticipated expiration of the facility licenses involved need not be considered in individual facility licensing proceedings. A prompt finding of confidence in the nuclear waste disposal and storage area by the commission is also recommeded. (DMC)

2645 (ER--77-2, pp 35-39) CONTROL: THE CAPABILITY AND COMMITMENT. Prince, A.T. (Atomic Energy Control Board, Ottawa, Ontario (Canada)). [nd].

Nuclear option for Canada. The renewable energy resources.

The activities of the Atomic Energy Control Board are described in such fields as licencing, security, safeguards, uranium resource management, radioactive waste management, radioactive contamination, nuclear liability, nuclear regulatory R and D, and planning for the future.

2646 (ORNL/TM--7262) OPERATING SAFETY REQUIREMENTS FOR THE INTERMEDIATE LEVEL LIQUID WASTE SYSTEM. (Oak Ridge National Lab., TN (USA)). Jul 1980. Contract W-7405-ENG-26. 38p. NTIS, PC A03/MF A01.

The operation of the Intermediate Level Liquid Waste (ILW) System, which is described in the Final Safety Analysis, consists of two types of operations, namely: (1) the operation of a tank farm which involves the storage and transportation through pipelines of various radioactive liquids; and (2) concentration of the radioactive liquids by evaporation including rejection of the decontaminated condensate to the Waste Treatment Plant and retention of the concentrate. The following safety requirements in regard to these operations are presented: safety limits and limiting control settings; limiting conditions for operation; and surveillance requirements. Staffing requirements, reporting requirements, and steps to be taken in the event of an abnormal occurrence are also described. (DC)

2647 (PB--299080) LICENSED FUEL FACILITY STATUS REPORT. VOLUME 1, NUMBER 3. DATA FOR DECISIONS, FUEL CYCLE OPERATIONS. STATUS SUMMARY REPORT. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Inspection and Enforcement). Jul 1979. 77p. NTIS PC A05.

The Licensed Fuel Facility Status Report (NUREG-0430) is a periodic report routinely

providing information on licensed fuel facilities. This report identifies the licensee and the plant status, along with NRC inspection results and summaries through Dec. 31, 1978. The report includes licensee performance data as identified: (1) Licensee event reports as required by 10 CFR Parts 20, 40, 50, 70, 71 and 73 and by license conditions; (2) The quantities of radioactive materials released to the environment via gaseous or liquid effluent as required to be reported by 10 CFR 40.65 and 70.59; and (3) Inventory difference data, commonly referred to as 'MUF' (Material Unaccounted For), for those fuel cycle facilities which possess significant quantities of strategic special nuclear material or low enriched uranium. The time period covered by the data in this report is July 1, 1978 - December 31, 1978.

2648 (SAND--78-1332) STATE POLICIES AND REQUIREMENTS FOR MANAGEMENT OF URANIUM MINING AND MILLING IN NEW MEXICO. VOLUME III. ADVERSE EFFECTS OF URANIUM MINING AND MILLING ON THE PHYSICAL ENVIRONMENT. Tierney, M.S.; Vandevender, S.G. (Sandia National Labs., Albuquerque, NM (USA)). Aug 1979. Contract AC04-76DP00789. 173p. NTIS, PC A08/MF A01.

This volume contains two parts. The first part is a summary of issues. It complements the second part which is a program plan proposed by the New Mexico Environmental Improvement Division (NMEID) for the study and mitigation of environmental effects of uranium mining and milling. The NMEID program plan was begun when the lack of an adequate data base upon which the NMEID could base recommendations for new environmental laws and regulations applying to the uranium mining and milling industry was perceived. The NMEID planning document notes that, in the absence of adequate scientific data, State decisions regarding the regulation of the uranium industry may prove to be overly restrictive or not as restrictive as is necessary to assure protection of the public and the environment. To counter these tendencies, certain plans for cooperative studies involving Federal and State agencies are proposed. In particular, there is the need to improve the data base for determining population radiation exposure in affected areas and to evaluate the data needs for developing an ambient radon standard. It is concluded that the DOE's mission of energy development would be advanced by the provision of technical assistance and, in some cases, funds for certain State programs that demonstrably contribute to the State's ability to deal with Federal regulatory agencies as an informed, independent agent in regard to problems of uranium development.

2649 (UCID--18709) EARLY IDENTIFICATION OF TECHNICAL ISSUES: A SENSITIVITY STUDY TO CHECK LISTRA1A INTERNAL CONSISTENCY AND STRUCTURE. Harvey, T.F.; Maninger, R.C.; Rabsatt, S. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 13 Dec 1979. Contract W-7405-ENG-48. 22p. NTIS, PC A02/MF A01.

This report describes a sensitivity study using LISTRA1A, a model for use in the development of a long-range, time-dependent plan for licensing nuclear waste repositories. The objectives of the model are: (1) to provide information concerning the impact of various licensing strategies on the ability to dispose of nuclear waste effectively; and (2) to provide long-range budget forecasts for differing strategies of the Nuclear Regulatory Commission (NRC) and the Department of Energy (DOE). The model is designed to analyze the interaction between NRC regulatory policy and DOE technical programs. A sensitivity study is reported for a single parameter in a hypothetical review process.

2650 SITE-SPECIFIC EIS ORDERED BUT INJUNCTIVE RELIEF DEINED IN NUCLEAR WASTE STORAGE CASE. Barnhart y Chavez, S. Natural Resources Journal ; 20: No. 1, 173-177(Jan 1980).

The Energy Research and Development Administration (ERDA) received appropriations in 1976-77 to construct 22 tanks for storage of high level radioactive wastes generated by its nuclear weapons materials production program. The tanks were to replace older, leaking tanks at the Hanford Reservation in Richland, Washington and the Savannah River Plant in Aiken, South Carolina. The Natural Resources Defense Council (NRDC) had unsuccessfully requested that ERDA obtain a construction permit from the Nuclear Regulatory Commission (NRC). NRDC also petitioned NRC to exercise its licensing authority over the tanks under Section 202(4) of the Energy Reorganization Act of 1974. In response to the NRDC request, ERDA claimed the tanks were only for short-term storage and therefore a license was unnecessary. NRC claimed it lacked jurisdiction over the tanks. NRDC filed suit in United States District Court for the District of Columbia, alleging that ERDA had violated Section 102(2)(C) of the National Environmental Policy Act, and that both ERDA and NRC had violated Section 202(4) of the Energy Reorganization Act. NRDC requested an injunction against further construction of the tanks. Although ERDA did not have to obtain an NRC construction permit for the nuclear waste storage tanks at Hanford Reservation and Savannah River Plant, the programmatic Environmental Impact Statement submitted was insufficient and site-specific statements must be prepared. Injunctive relief pending the statements was denied for the social and economic costs of delaying the tanks project. NRC decisions even remotely connected to its licensing power should be contested in federal courts of appeals, not district courts. The court gave NRDC a hollow victory by ordering a more specific EIS, but denying an injunction.

2651 LICENSING AND REGULATION OF NUCLEAR WASTE. Shapar, H.K. (National Research Council, Washington, DC (USA)). No. 23, 78-90(Jun 1979). (In English, French).

This analysis of the licensing and regulation of nuclear waste in the US is confined mainly to the regulatory role of the Nuclear Regulatory Commission (NRC) regarding nuclear waste, including interactions with other Federal Agencies and States. It focusses on existing statutory authority and current proposals for licensing and regulation of radioactive waste. The NRC's authority derives from the amended 1954 Atomic Energy Act, the National Environmental Policy Act and the 1974 Energy Reorganization Act, and more recently, from the 1978 Uranium Mill Tailings Radiation Control Act. The Department of Energy (DOE), and the Environmental Protection Agency (EPA) have responsibility for radioactive waste storage and disposal together with the NRC; other Federal Agencies are also involved to some extent.

2652 WASTE ISOLATION PILOT PLANT. Washington, DC: US Government Printing Office (1979). 42p.

Testimony from DOE witnesses relating to the Waste Isolation Pilot Plant near Carlsbad, NM, is recorded. Topics covered include: the power of the State of New Mexico to stop construction

or operation of the project at any stage; the DOE authorization bill, and licensing of the project by the DOE and the NRC. (DC)

2653 ""URANIUM MILL REGULATION FOR COLORADO--RATIONALE AND EFFECTIVENESS"". Montgomery, J.L. (Colo Dep of Health, Denver). pp 367-373 of Uranium resource/technology seminar 2, 1979. Golden, CO; Colorado School of Mines (1979).
From Uranium resource technology seminar; Golden, CO, USA (12 Mar 1979).
This paper discusses the current laws, regulations and policies governing uranium mills in Colorado. A brief review of public heaslth and environmental impacts is presented followeid by a description of the mill aipplication review process.

2654 NUCLEAR WASTE AND NUCLEAR REGULATORY COMMISSION LICENSING. Smith, A.L. Natural Resources Journal ; 18: No. 1, 217-220(Jan 1978).
The Nuclear Regulatory Commission (NRC) must consider the environmental effects of nuclear wastes before issuing operating licenses to nuclear power plants. The NRC must address the problem either in individual licensing proceedings or in generic administrative proceedings in which the NRC makes decisions or rules concerning the future issuance of licenses. Any decision or rule so made must be supported by an administrative record that indicates the issue of nuclear waste disposal has been thoroughly ventilated. Natural Resources Defense Council v. US Nuclear Regulatory Commission, 547 F.2d 633 (D.D.C. 1976), cert. granted, 429 US 1090 (1977).

2655 NEAR-SURFACE HEATER EXPERIMENTS IN ARGILLACEOUS ROCKS. Tyler, L.D.; Cuderman, J.F.; Krumhansl, J.L.; Lappin, A. (Sandia Labs., Albuquerque, NM (USA)). pp 31-43 of In situ heating experiments in geological formations. Seminar, Ludvika, Sweden, 13-15 Sep 1978. Proceedings. Paris, France; OECD (1978).
Full-scale near-surface heater experiments are presently being conducted by Sandia Laboratories in the Conasauga Formation at Oak Ridge, Tennessee, and in the Eleana Formation on the Nevada Test Site, Nevada. The purposes of these experiments are: 1) to determine if argillaceous media can withstand thermal loads characteristic of high level waste; 2) to provide data for improvement of thermomechanical modeling of argillaceous rocks; 3) to identify instrumentation development needed for further in situ testing; and 4) to identify unexpected general types of behavior, if any. The basic instrumentation of these tests consists of a heater in a central hole, surrounded by arrays of holes containing various instrumentation. Temperatures, thermal profiles, vertical displacements, volatile pressurization, and changes in in situ stresses are measured in each experiment as a function of time, and compared with pretest modeling results. Results to date, though in general agreement with modeling results assuming conductive heat transfer within the rock, indicate that the presence of even small amounts of water can drastically affect heat transfer within the heater hole itself and that small amounts of upward convection of water may be occurring in the higher temperature areas of the Conasauga experiments.

2656 REGULATIONS CONCERNING THE REPROCESSING BUSINESS OF SPENT FUELS. pp 45/45/63/3-45/45/63/35 of Genshiryoku kankei hokishu. V. 1(Pt.2). Tokyo, Japan; Taisei (1978). (In Japanese)
In compliance with ""The law for the regulations of nuclear source material, nuclear fuel material and reactors"" these regulations prescribe concerning reprocessing facilities: The procedures to apply for the approval of the design and method of construction and the approval of the change thereof; as well as the procedure to apply for the inspection of the facilities, and details of the inspection (in sections 2-6). After that, the regulations require the enterpriser of reprocessing business to keep necessary records and take necessary measures for safety concerning the facilities, operation of reprocessing equipments, and transportation, storage on disposal of used fuel, materials separated therefrom or materials contaminated by either of them (in sections 8-16). Further, the regulations prescribe the procedure to apply for the approval of the safety rule required to the enterpriser of reprocessing business by above mentioned law and specifies items which should be included into the rule (section 17). Moreover, the regulations require the enterpriser to submit reports of each use of the internationally controllled material and specifies the items which should be included into these reports (section 19).

FUSION FUELS

Processing

Reprocessing

2657 REMOVAL OF TRITIUM AND TRITIUM-CONTAINING COMPOUNDS FROM A GASEOUS STREAM. Collins, M.F.; Michalek, R. (to Engelhard Minerals and Chemicals Corp.). US Patent 4,178,350. 11 Dec 1979. Filed date 27 Aug 1973. 8p.
Tritiated species, e.g., tritium, tritiated water, and/or tritiated hydrocarbons, are removed from gas streams containing these by reacting the same over a precious metal ca^{3}alyst with sufficient air or oxygen to insure conversion of all tritiated species to tritiated water and, if hydrocarbons are present in the gaseous feedstock, carbon dioxide. The tritiated water and any other moisture that might be present in the reaction effluent are next adsorbed by a desiccant dryer, preferably to a level of less than one part per million. Most desirably, the desiccant dryer effluent is then diluted with non-radioactive water such that the tritiated water is diluted by a factor of at least about 1,000 to 1; the resulting water mixture can be adsorbed from the diluted effluent by a second desiccant dryer to provide a value in the ultimate effluent gas of less than about one-half parts per billion tritiated water.

Health and Safety

2658 (ORNL--5308, pp 56-64) ENVIRONMENTAL HEALTH STUDIES. Easterly, C.E.; Shank, K.E. Jul 1978.
Health physics division annual progress report for period ending June 30, 1977.
The two major thrusts of the environmental health studies have been in the areas of health physics aspects of fusion power and methodology for assessing health effects related to nuclear facilities. Researchers were unable to discern

a dose-response relationship or to find adverse health effects in the local population around nuclear facilities which might be related to radiation exposure. A second study analyzed the trends in incidence of cancer, congenital malformation, and fetal and infant mortality for Oak Ridge, Anderson County, and Roane County relative to Tennessee. Finally, a more in-depth study on congenital malformations and fetal mortality trends for nine East Tennessee counties surrounding Oak Ridge was completed. The objective of the Health Physics Aspects of Fusion Power Program is to provide, on a timely basis, scientific information and technical evaluations on the potential impacts of fusion power to occupational workers and to members of the public. The primary areas of study in this program during the past year have been (1) factors affecting calculations of dose resulting from a release of tritium, (2) an assessment of the potential for reducing occupational risk from exposures to tritium, and (3) experimental studies of tritium conversion from molecular hydrogen to tritiated water.

Waste Management

2659 (BNL--27784) HYPERFUSE: A NOVEL INERTIAL CONFINEMENT SYSTEM UTILIZING HYPERVELOCITY PROJECTILES FOR FUSION ENERGY PRODUCTION AND FISSION WASTE TRANSMUTATION. Makowitz, H.; Powell, J.R.; Wiswall, R. (Brookhaven National Lab., Upton, NY (USA)). 1980. Contract AC02-76-CH00016. 14p. (CONF-800446--4). NTIS, PC A02/MF A01.

From 2. international conference on emerging nuclear energy systems; Lausanne, Switzerland (8 Apr 1980).

Parametric system studies of an inertial confinement fusion (ICF) reactor system to transmute fission products from an LWR economy have been carried out. The ICF reactors would produce net power in addition to transmuting fission products. The particular ICF concept examined is an impact fusion approach termed HYPERFUSE, in which hypervelocity pellets, traveling on the order of 100 to 300 km/sec, collide with each other or a target block in a reactor chamber and initiate a thermonuclear reaction. The DT fusion fuel is contained in a shell of the material to be transmuted, e.g., ^{137}Cs or ^{90}Sr. The 14-MeV fusion neutrons released during the pellet burn cause transmutation reactions (e.g., (n, 2n), (n, α), etc.) that convert the long lived fission products (FP's) either to stable products or to species that decay with a short half-life to a stable product.

2660 (BNL--28067) HYPERFUSE: A HYPERVELOCITY INERTIAL CONFINEMENT SYSTEM FOR FUSION ENERGY PRODUCTION AND FISSION WASTE TRANSMUTATION. Makowitz, H.; Powell, J.R.; Wiswall, R. (Brookhaven National Lab., Upton, NY (USA)). 1980. Contract AC02-76CH00016. 19p. (CONF-800743--7). NTIS, PC A02/MF A01.

From International conference on nuclear waste transmutation; Austin, TX, USA (22 Jul 1980).

Parametric system studies of an inertial confinement fusion (ICF) reactor system to transmute fission products from an LWR economy have been carried out. The ICF reactors would produce net power in addition to transmuting fission products. The particular ICF concept examined is an impact fusion approach termed HYPERFUSE, in which hypervelocity pellets, traveling on the order of 100 to 300 km/sec, collide with each other or a target block in a reactor chamber and initiate a thermonuclear reaction. The DT fusion fuel is contained in a shell of the material to be transmuted, e.g., ^{137}Cs, ^{90}Sr, ^{129}I, ^{99}Tc, etc. The 14-MeV fusion neutrons released during the pellet burn cause transmutation reactions (e.g., (n,2n), (n,α), (n,γ), etc.) that convert the long-lived fission products (FP's) either to stable products or to species that decay with a short half-life to a stable product. The transmutation parametric studies conclude that the design of the hypervelocity projectiles should emphasize the achievement of high densities in the transmutation regions (greater than the DT fusion fuel density), as well as the DT ignition and burn criterion (rho R=1.0 to 3.0) requirements.

2661 (UCRL--82969) BURNING NUCLEAR WASTES IN FUSION REACTORS. Meldner, H.W.; Howard, W.M. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 20 Feb 1980. Contract W-7405-ENG-48. 5p. (CONF-791058--66). Dep. NTIS, PC A02/MF A01.

From International conference on nuclear cross sections for technology; Knoxville, TN, USA (22 Oct 1979).

We have studied actinide burn-up in ICF reactor pellets; i.e., 14 MeV neutron fission of the very long-lived actinides that pose storage problems. A major advantage of pellet fuel region burn-up is safety: only milligrams of highly toxic and active material need to be present in the fusion chamber, whereas blanket burn-up requires the continued presence of tons of actinides in a small volume. The actinide data tables required for Monte Carlo calculations of the burn-up of ^{241}Am and ^{243}Am are discussed in connection with a study of the sensitivity to cross section uncertainties. More accurate and complete cross sections are required for realistic quantitative calculations.

2663 HANDBOOK OF HAZARDOUS WASTE MANAGEMENT. Metry, A.A. Westport, CT; Technomic Publishing Company, Inc. (1980). 451p.

The contents of this work are arranged so as to give the reader a detailed understanding of the elements of hazardous waste management. Generalized management concepts are covered in Chapters 1 through 5 which are entitled: Introduction, Regulations Affecting Hazardous Waste Management, Comprehensive Hazardous Waste Management, Control of Hazardous Waste Transportation, and Emergency Hazardous Waste Management. Chapters 6 through 11 deal with treatment concepts and are entitled: General Considerations for Hazardous Waste Management Facilities, Physical Treatment of Hazardous Wastes, Chemical Treatment of Hazardous Wastes, Biological Treatment of Hazardous Wastes, Incineration of Hazardous Wastes, and Hazardous Waste Management of Selected Industries. Chapters 12 through 15 are devoted to ultimate disposal concepts and are entitled: Land Disposal Facilities, Ocean Dumping of Hazardous Wastes, Disposal of Extremely Hazardous Wastes, and Generalized Criteria for Hazardous Waste Management Facilities. (BLM)

NUCLEAR POWER PLANTS

2664 (EMD--80-67) EXISTING NUCLEAR SITES CAN BE USED FOR NEW POWERPLANTS AND NUCLEAR WASTE STORAGE. Staats, E.B. (General Accounting Office, Washington, DC (USA)). 1 Apr 1980. 32p. General Accounting Office, Washington, DC.

Locating future nuclear powerplants at existing sites offers important advantages which warrant consideration by the Nuclear Regulatory Commission. The number of locations committed to long-term restricted use and periodic surveillance and maintenance could be limited. The burden of long-term care and final disposition of retired nuclear powerplants could be eased. Overall environmental impacts from the construction and operation of the powerplants could be reduced. Time and money in completing licensing proceedings could be saved. GAO also found that low-level wastes can be stored at nuclear powerplant sites, but such storage only postpones the inevitable need for disposal. Finally, permanent waste disposal at powerplant sites should only be permitted when sites conform to the national low-level waste disposal plan being prepared by the Department of Energy.

2665 (ER--77-2, pp 30-34) NUCLEAR POWER OPTION - PROBLEMS AND CONSTRAINTS. Wynne-Edwards, H.R. (British Columbia Univ., Vancouver (Canada). Dept. of Geological Sciences). [nd].

Nuclear option for Canada. The renewable energy resources.

Some ethical and public perception problems related to nuclear power and radioactive waste disposal are dealt with.

2666 (INIS-mf--4620) CURRENT CHALLENGES TO U.S. NUCLEAR FUEL CYCLE POLICIES: ARGUMENTS AND TACTICS. Freeman, G.C. Jr. (Hunton and Williams, Richmond, VA (USA)). 1978. 23p. (CONF-780584--19). Dep. NTIS (US Sales Only), PC A03/MF A01.

From International conference on regulating nuclear energy; Brussels, Belgium (16 May 1978).

The nuclear debate has become virulent in the United States in recent years. Opponents of nuclear power have developed the debate in Congress, in Federal Courts and Federal Agencies which are the principal forums. They use mass media, elaborate strategies, adopt arguments and tactics of a political, economic and technical nature. This paper examines several aspects of their intervention in the nuclear decision-making process of the authorities.

2667 (INIS-mf--5198) ENERGY FOR TOMORROW - PLANNING OF TODAY. NO. 1. Goergmaier, D.; Scholz, L.; Bayer, A.; Schmidtner, F.X.; Gottschlich, H.; Reiter, K.; Birkhofer, A.; Mansfeld, G.; Hofrichter, E.; Renn, O. (Bayerische Landeszentrale fuer Politische Bildungsarbeit, Muenchen (Germany, F.R.)). 1978. vp. (In German). Dep. NTIS (US Sales Only), PC A09/MF A01.

The present book, which has many maps and coloured illustrations, shows the many facets of the Federal Republic of Germany and EC energy policy. Apart from the fundamental problem of economic growth and future energy demand, present alternatives to nuclear power are presented and the limitations of primary energy carriers are pointed out. A team of twelve authors from science research, industry, and administrative authorities introduces the reader to all problems of nuclear power, from the basics of reactor functioning to reactor types, siting, and reactor technology. Problems of environmental protection (immission protection, avoiding water pollution and heat-up, local climate, etc.) are discussed in detail in the context of power generation from coal and nuclear energy.

2668 (NP--25098) ILLINOIS AND NUCLEAR ENERGY. Etchison, D. (Illinois State House Republican Committee, Springfield (USA)). Jun 1978. 51p. TIC.

Information is presented concerning a historical perspective of nuclear energy in Illinois; and the Illinois nuclear scene in 1977-1978.

2669 WORLD NUCLEAR ENERGY PATHS. Connolly, T.J.; Hansen, U.; Jaek, W.; Beckurts, K.H. New York, NY; International Consultative Group on Nuclear Energy (1979). 195p. The Rockefeller Foundation, P.O. Box 1265, Radio City Station, New York, NY 10019.

In examing the world nuclear energy paths, the following assumptions were adopted: the world economy will grow somewhat more slowly than in the past, leading to reductions in electricity demand growth rates; national and international political impediments to the deployment of nuclear power will gradually disappear over the next few years; further development of nuclear power will proceed steadily, without serious interruption but with realistic lead times for the introduction of advanced technologies. Given these assumptions, this paper attempts a study of possible world nuclear energy developments, disaggregated on a regional and national basis. The scenario technique was used and a few alternative fuel-cycle scenarios were developed. Each is an internally consistent model of technically and economically feasible paths to the further development of nuclear power in an aggregate of individual countries and regions of the world. The main purpose of this modeling exercise was to gain some insight into the probable international locations of reactors and other nuclear facilities, the future requirements for uranium and for fuel-cycle services, and the problems of spent-fuel storage and waste management. The study also presents an assessment of the role that nuclear power might actually play in meeting future world energy demand. (MCW)

2670 Atomnaya ehnergetika. (NUCLEAR ENERGY. INTRODUCTION TO THE CONCEPTS, SYSTEMS, AND APPLICATIONS OF NUCLEAR PROCESSES). Murray, R.L. (North Carolina State Univ., Raleigh ; USA). Dept. of Nuclear Engineering). Moscow; Ehnergiya (1979). 280p. (In Russian).

The summary of some problems of nuclear science, technology, power and medicine is presented in a popular form. The first part of the book is devoted to the basis of nuclear physics. Structure of atoms and nuclei, radioactivity, effect of radiation of materials, physical properties of fission processes and nuclei fusion are considered in this part. The second part is devoted to nuclear devices. The accelerators of elementary particles, systems of isotope separation, radiation monitoring devices, fusion and fission reactors are considered. The effect of radiation on living organisms, radiation protection and safety with the use of nuclear devices are described in detail in the third part. The conclusion is made that the

application of nuclear energy in various branches is justified in spite of the possible danger.

2671 EFFECTS OF PROPOSED CHANGES IN REGULATIONS ON LOW-LEVEL RADWASTE SHIPMENTS. Mallory, C.W. (Hittman Nuclear and Development Corp., Columbia, MD). Transactions of the American Nuclear Society ; 33: 765-766(1979). (CONF-791103--).

2672 (BLG--524) ANNUAL SCIENTIFIC REPORT 1977. Proost, J.; Billiau, R.; Kirk, F. (eds.). (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). 1978. vp. Dep. NTIS (US Sales Only), PC A09/MF A01.
This report of the Centre d'Etude de l'Energie Nucleaire - Studiecentrum voor Kernenergie gives a survey of the scientific and technical work done in 1977. The research areas are: 1. The sodium cooled fast reactors and namely the mixed oxide fuels, the carbide fuel, the materials development, the reprocessing, the fast reactor physics, the safety and instrumentation and the sodium technology. 2. The gas cooled reactors as gas cooled fast and high temperature reactors. 3. The light water reactors namely the BR3 reactor, the light water reactor fuels and the plutonium recycling. 4. The applied nuclear research, waste conditioning and disposal as the safeguards, the fusion research and the lithium technology. 5. The basic and exploraty research namely the materials science and the nuclear physics and finally 6. Non-nuclear reseach and development such as the air pollution, the pollution abatement and waste handling, the fuel cells and applied electrochemistry.

2673 (DNS-D--1-016(Vol.7)) TECHNICAL STUDY FOR THE CHEMICAL CLEANING OF DRESDEN-1 DNS-D1-016. VOLUME VII. APPENDICES IX THRU XIV. (Dow Chemical Co., Midland, MI (USA)). 15 Jun 1977. Contract AC02-76ET34205. 130p. NTIS, PC A07/MF A01.
Portions of document are illegible.
Appendices are presented which contain information concerning the decontamination of Dresden-1; consultant's opinions; proceedings of the American Power Conference, Volume 37, 1975; health physics reports; toxicological properties and industrial handling hazards of Dow solvent NS-1; and expected radiation dose rates in the new Dresden station radioactive waste processing building.

2674 (DP-MS--80-24) ECONOMICS OF SPENT LWR FUEL STORAGE. Clark, H.J.; O'Neill, G.F. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 6p. (CONF-800901--1). NTIS, PC A02/MF A01.
From Symposium on intermediate range atmospheric transport processes and technology assessment; Gatlinburg, TN, USA (29 Sep 1980).
A power reactor operator, confronted with rising spent fuel inventories that would soon exceed his storage capacity, has to decide what to do with this fuel if he wants to continue reactor operations. A low cost option would be to ship excess fuel from the overburdened reactor to another reactor in the utility's system that has available space. The only cost would be for cask leasing and shipping. Three other alternatives all require considerable capital expenditures: reracking, new at-reactor (AR) basins for storage, and away-from-reactor (AFR) basins for storage. Economic considerations for each of the alternatives are compared.

2675 (INIS-mf--5666) QUARTERLY REPORT FROM THE SWEDISH NUCLEAR POWER INSPECTORATE JUL - SEP 1979. (Statens Kaernkraftinspektion, Stockholm (Sweden)). 1979. 20p. (In Swedish). NTIS (US Sales Only), PC A02/MF A01.
Thesis.
Brief reports of the operation of the six nuclear power plants in service in Sweden together with basic operating statistics are given. The Swedish research reactors (two), the fuel fabrication plant, transport of radioactive materials and radioactive waste storage are also covered.

2676 (PNL-SA--7381) IMPACT OF LWR DECONTAMINATION ON RADWASTE SYSTEMS. Perrigo, L.D.; Divine, J.R. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1979. Contract EY-76-C-06-1830. 13p. (CONF-790313--5). Dep. NTIS, PC A02/MF A01.
From NACE/Corrosion 1979 meeting; Atlanta, GA, USA (12 Mar 1979).
Increased radiation levels around certain reactors in the United States and accompanying increases in personnel exposures are causing a reexamination of options available to utilities to continue operation. One of the options is decontamination of the primary system to reduce radiation levels. The Battelle-Northwest study of decontamination and its impact on radwaste systems has been directed towards existing reactors and allied systems as they are employed during their operational lifetimes. Decommissioning and cleanup during such work are not within the scope of this project although certain processes and waste systems might be similar. Rupture debris cleanup represents a special situation that requires different design features and concepts and it is not a part of this study.

2677 (PNL-SA--7535) IMPACT OF DECONTAMINATION ON LWR RADIOACTIVE WASTE TREATMENT SYSTEMS. Hoenes, G.R.; Perrigo, L.D.; Divine, J.R.; Faust, L.G. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 1979. Contract EY-76-C-06-1830. 34p. (CONF-790923--10). Dep. NTIS, PC A03/MF A01.
From Decontamination and decommissioning of nuclear facilities conference; Sun Valley, ID, USA (16 Sep 1979).
Only at N-Reactor is there a means to accommodate radwaste produced during decontamination. The Dresden system is expected to be ready to accommodate such solutions by the summer of 1979. Solidification of the processed decontamination waste may be a significant problem. There is doubt that the materials in current radwaste treatment systems can handle chemicals from a concentrated process. The total storage volume, for concentrated decontamination, is not sufficient in existing radwaste treatment systems. Greater attention should be placed on designing reactors and radwaste treatment systems for decontamination. A means of handling waste material resulting from leaks in the primary system during the decontamination must be

developed. On-site storage of solidified decontamination wastes may be a viable option, but license amendments will be necessary.

2678 (UCRL--15186) SPENT FUEL DATA BASE: COMMERCIAL LIGHT WATER REACTORS. Hauf, M.J.; Kniazewycz, B.G. (TERA Corp., Berkeley, CA (USA)). Dec 1979. Contract W-7405-ENG-48. 309p. Dep. NTIS, PC A14/MF A01.
As a consequence of this country's non-proliferation policy, the reprocessing of spent nuclear fuel has been delayed indefinitely. This has resulted in spent light water reactor (LWR) fuel being considered as a potential waste form for disposal. Since the Nuclear Regulatory Commission (NRC) is currently developing methodologies for use in the regulation of the management and disposal of high-level and transuranic wastes, a comprehensive data base describing LWR fuel technology must be compiled. This document provides that technology baseline and, as such, will support the development of those evaluation standards and criteria applicable to spent nuclear fuel.

2679 PUBLICATION BY THE STATE MINISTER FOR AREA DEVELOPMENT AND ENVIRONMENT AFFAIRS OF THE PROJECT OF RHEINISCH-WESTFAELISCHES ELEKTRIZITAETSWERK AG, BAYERNWERK AG, KERNKRAFTWERK GUNDREMMINGEN VERWALTUNGSGESELLSCHAFT MBH, GUNDREMMINGEN, KRAFTWERK UNION AG, FRANKFURT, AND HOCHTIEF AG, FRANKFURT, TO INCREASE THE STORAGE CAPACITY FOR SPENT FUEL ELEMENT CLUSTERS AT KERNKRAFTWERK GUNDREMMINGEN II BY INSTALLING COMPACT STORAGE RACKS. 2680 OPTIMUM FUEL LOADING AND OPERATION PLANNING FOR LIGHT WATER REACTOR POWER STATIONS. PART II: BOILING WATER REACTOR CASE STUDY. Hoshino, T. (Kyoto Univ., Gokanosho, Japan). Nuclear Technology ; 47: No. 3, 421-435(Mar 1980).
An extended application of the FAPMAN planning model has been made to typical boiling water reactor (BWR) fuel loading and generation planning problems. The additional constraint on reactive fuel loading pertinent to BWRs was implemented, together with some improvements on the back-end fuel cycle economic model and the gradient projection method of searching for better generation plans. The flexibility of the FAPMAN planning tool has been demonstrated in numerical studies made in several degrees of optimization, for disposal or reprocessing options in the back end of the fuel cycle and for the bounded or free refueling cycle length.

2682 ACTIVE CARBON FILTERS FOR WASTE GAS DECONTAMINATION IN NUCLEAR POWER STATIONS, AND EXCHANGE OF CONTAMINATED CARBON. Looser, W. (Brown, Boveri and Co. Ltd., Baden (Switzerland)). Neue Technik ; 22: No. 3, 34-35(Mar 1980). (In German).
Active carbon filters for removing noble gas fission products from waste gases of boiling water reactors are described. It is stated that a 1000 MW nuclear power station may require 60 to 80 tons of filter carbon, distributed in five cascade-connected conical filter containers. Up to 20 Kg of radioactive carbon may have to be removed at a time, and the precautions necessary in handling this material are described in detail. The filters themselves are normally run under slight vacuum. Storage of used carbon for some weeks or months, in concrete vats, is recommended and it is suggested that exposure of personnel during carbon change is of the order of 3 mrem per 200 liter waste container.

2683 FISSION GAS RELEASE IN LWR FUEL RODS EXHIBITING VERY HIGH BURN-UP. Carlsen, H. (Risoe National Lab. (Denmark). Metallurgy Dept). Nuclear Engineering and Design ; 56: No. 1, 183-187(Feb 1980).
From IAEA specialists' meeting on fuel element performance computer modelling; Blackpool, UK (13 - 17 Mar 1978).
Two UO_2-Zr BWR type test fuel rods were irradiated to a burn-up of about 3800 MWd/tUO_2. After non-destructive characterization, the fission gas released to the internal free volume was extracted and analysed. The irradiation was simulated by means of the Danish fuel performance code WAFER-2, which uses an empirical gas release model combined with a strongly burn-up dependent correction term, developed by the US Nuclear Regulatory Commission. The paper presents the experimental results and the code calculations. It is concluded that the model predictions are in reasonable agreement (within 15%) with the experimental results. No similar agreement could be obtained without the burn-up dependency of the release model.

2684 MECHANISTIC PREDICTION OF TRANSIENT FISSION-GAS RELEASE FROM LWR FUEL. Rest, J.; Gehl, S.M. (Argonne National Lab., IL (USA). Materials Science Div.). Nuclear Engineering and Design ; 56: No. 1, 233-256(Feb 1980).
From IAEA specialists' meeting on fuel element performance computer modelling; Blackpool, UK (13 - 17 Mar 1978).
The steady-state and transient gas release and swelling subroutine (GRASS-SST) is a mechanistic computer code for the prediction of fission-gas behavior in UO_2-base fuels. GRASS-SST treats fission-gas release and fuel swelling on an equal basis and simultaneously treats all major mechanisms that influence fission-gas behavior. The GRASS-SST transient analysis has evolved through comparisons of code predictions with the fission-gas release and physical phenomena that occur during reactor operation and transient direct-electrical heating (DEH) testing of irradiated light-water reactor fuel. The GRASS-SST steady-state analysis has undergone verification for end-of-life fission-gas release and intragranular bubble-size distributions. The results of GRASS-SST predictions for transient fission-gas release during DEH tests are in good agreement with experimental data. Comparisons of GRASS-SST predictions of gas release and bubble-size distributions with the results of DEH transient tests indicate that (1) coalescing bubbles do not have sufficient time to grow to equilibrium size during most transient conditions, (2) mobilities of fission-gas bubbles in UO_2 are enhanced nonequilibrium conditions if the excess pressure in the bubble is sufficient to generate an equivalent stress greater or equal to the yield stress of the surrounding matrix, and (3) channel formation on grain surfaces and coalescence of the channels with each other and with the tunnels of gas along the grain edges can contribute to

grain-boundary separation and/or the rapid, long-range interconnection of porosity. The phenomena of grain-boundary separation and/or long-range interconnection of porosity provides an important release mechanism for fission gas that has moved out of the grains of irradiated fuel.

2685 TREATMENT OF NUCLEAR DRAIN WASTES WITH AN ELECTRO MAGNETIC FILTER AND ULTRAFILTRATION SYSTEM. Kurihara, Y.; Oda, M.; Okugawa, K.; Sunaoka, Y.; Kleper, M.H.; Markind, J.; Goldsmith, R.L.; Ryan, J.M. (Jpn At Power Co, Tokyo). Industrial Water Engineering ; 17: No. 1, 14-19(Jan-Feb 1980).
The system design and its initial operation at the nuclear power plant in Japan are discussed.

2687 ON-SITE MANAGEMENT OF POWER REACTOR WASTES. REPORT ON THE INTERNATIONAL SYMPOSIUM HELD AT ZUERICH FROM 26 TO 30 MARCH 1979. Morozov, V.A. (International Atomic Energy Agency, Vienna (Austria)). Atomic Energy Review ; 17: No. 3, 789-792(Sep 1979).
In response to the growing interest in the topic of waste management problems at nuclear power plants, resulting from the increasing use of nuclear power in both developed and developing countries, a symposium was held dealing specifically with this subject. It was jointly organized by the IAEA and OECD/NEA, in co-operation with the Swiss Office for Science and Research. The Symposium was attended by 182 participants from 26 countries and one international organization. Thirty-four papers were presented in seven sessions. The main topics discussed during the Symposium were: radioactive waste management practices at nuclear power plants; waste arisings and operating experience; coolant and liquid waste treatment; solidification methods; volume reduction methods; and solid waste containment.

2688 PUBLICATION CONCERNING THE PLANNED INCLUSION AND OPERATION OF COMPACT STORAGE DEVICES FOR SPENT FUEL ELEMENTS IN THE PHILIPPSBURG-1 REACTOR. DATED 17TH JULY, 1979. 2689 DEVICE FOR PURIFYING WATER STORED IN PRESSURE SUPPRESSION CHAMBER. Kimura, K. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 54-84,196/A/. 4 Jul 1979. 3p. (In Japanese).
Purpose: To arrange tubes so that water stored in a pressure suppression chamber is purified by a filtration desalting device and to maintain the quality of stored water excellently thereby to lighten the burden of a radioactive waste processing system. Constitution: A fuel storage pool cooling system provided with a filtration desalting device is communicated with a pressure suppression chamber by means of a pump, valves and pipes, and water stored in the pressure suppression chamber is purifiable by the filtration desalting device.

2690 LA CROSSE BWR SPENT-FUEL STORAGE MODIFICATION AND REFUELING EXPERIENCE. Parkyn, J.D. (Dairyland Power Cooperative, Stoddard, WI). Transactions of the American Nuclear Society ; 32: 672(Jun 1979). (CONF-790602--(Summ.)).

2692 CRUD REDUCTION STUDY OF PRIMARY COOLANT SYSTEM AT TSURUGA NUCLEAR POWER STATION. Nagayama, S. (Japan Atomic Power Co., Tsuruga, Fukui. Tsuruga Power Station); Kurihara, Y.; Meguro, Y. Karyoku Genshiryoku Hatsuden (Thermal and Nuclear Power) ; 30: No. 6, 563-572(Jun 1979). (In Japanese).
With accumulation of the operational experiences in BWR nuclear power stations, some technical problems have been revealed. In spite of the severe control of water quality and the consideration for selecting proper materials so far, existence of the trace amount of metal impurities (iron crud, cobalt and other corrosion products) in the primary cooling system caused the problems of increasing radiation dose rate and of waste management due to the increase of loads in various purification systems. This paper is described on the present status in corrosion products and radiation dose rate in Tsuruga Nuclear Power Station and explains the countermeasures for crud reduction. As the countermeasures, the production of protecting film on the inner surfaces of feed water and condensate pipings during operation and its maintenance even in shut-down, flushing these systems prior to start-up, improvement of condensate demineralizer performance to include crud removal, upgrading feed water quality, improvement of sampling system, etc. have been carried out. These measures resulted in the reduction of iron concentration in feed and reactor water to 1/10 of that in the past or less, down to 1 to 3 ppb and 10 ppb, respectively. The concentrations of Co-60 and Mn-54 in reactor coolant were also reduced to 1/10 of the values so far. Back washing frequency in every purification system was decreased to 1/2 of that in the past or less, and this is expected to result in 20 mCi/year or less, a half of the activity thus far or lower in cleaning and liquid waste system.

2693 DEVICE FOR COOLING AND CLEANING FUEL POOL. Inoue, A. (Toshiba Corp., Kawasaki, Kanagawa (Japan)); Hara, H. (to Toshiba Corp., Kawasaki, Kanagawa (Japan); Nippon Atomic Industry Group Co. Ltd., Tokyo). Japanese Patent 54-67,895/A/. 31 May 1979. 6p. (In Japanese).
A method is described of providing the subject device wherein when the temperature of water in the pool is high, water is cooled by heat exchangers and thereafter passed through

cleanup devices, whereas when the temperature of the water is low, water is cleaned by cleaning devices, and thereafter passed through heat exchangers, thereby improving the safety of not only the equipment but the entire system and reducing radioactive contamination. When the temperature of pool water is low, pool water is circulated through a pump, valve, cleaning device, valve, heat exchanger, valve, and fuel storage pool, in the indicated order. When the temperature of pool water becomes high because of an accident, the valve is closed and the bias valve is opened, and pool water is circulated through a pump, bias valve, cleaning device, bias valve and fuel storage pool, in the indicated order. As a result, since the cleaning device is positioned downstream of the heat exchanger and the low-temperature water passes therethrough, it is not undergo damaged by heat.

2694 Messung fluessiger radioaktiver Stoffe zur Ueberwachung der radioaktiven Ableitungen. Sicherheitstechnische Anforderungen. (MEASUREMENT OF LIQUID RADIOACTIVE MATERIALS FOR THE MONITORING OF RADIOACTIVE EMISSIONS. UTA SAFETY REGULATION). Berlin, Germany, F.R.; Beuth (Mar 1979). 14p. (In German). (DIN--25465).

The rule pertains to systems for the measurement of liquid radioactive materials for monitoring the radioactive effluents of stationary nuclear plants with LWR or HTR during normal operation and in case of accidents. In particular, the measures and demands are presented which are to be made on 1) the measurement necessary to decide on the permissibility of liquid radioactive effluents, 2) the methods to determine the amount of radioactive materials contained in the effluents, 3) the balancing of radionuclides or radionuclide groups, 4) the setting of limiting values for the automatic release of signals required for safety measures and 5) the tests to be carried out on the measuring equipment.

2695 Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. (PROCEEDINGS OF THE SYMPOSIUM ON THE ON-SITE MANAGEMENT OF POWER REACTOR WASTES). Paris, France; OECD (1979). 551p. (In English, French).

From Symposium on the on-site management of power reactor wastes; Zurich, Switzerland (26 - 30 Mar 1979).

This symposium represents a synthesis of some current practices and research and development work in the field of radioactive waste management at nuclear power plants. It includes the following sessions: radioactive waste management practices at nuclear power plants; waste production and operating experiences; coolant and liquid waste processing; solidification methods; volume reduction methods; solid waste containment.

2698 WASTES ARISING FROM NUCLEAR POWER PLANTS. Rometsch, R. (National Cooperative for the Storage of Radioactive Waste, Head Office, Baden (Switzerland)). pp 21-30 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 Mars 1979. Paris, France; OECD (1979).

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

The origin of radioactive wastes arising during normal operation of nuclear power plants is described. Average quantities per year are given for light water reactors and compared with those of other reactor types. Waste classification and waste composition are briefly discussed.

2699 MANAGEMENT OF RADIOACTIVE WASTES AT POWER REACTOR SITES IN INDIA. Amalraj, R.V.; Balu, K. (Bhabha Atomic Research Centre, Bombay (India)). pp 69-81 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 Mars 1979. Paris, France; OECD (1979).

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

Indian Nuclear Power Programme, at the present stage, is based on natural uranium fuelled heavy water moderated CANDU type reactors except for the first nuclear power station consisting of two units of enriched uranium fuelled, light water moderated, BWR type of reactors. Some of the salient aspects of radioactive waste management at power reactor sites in India are discussed. Brief reviews are presented on treatment of wastes, their disposal and environmental aspects. Indian experience in power reactor waste management is also summarized identifying some of the areas needing further work.

2700 REACTOR WASTE MANAGEMENT PRACTICES IN THE FEDERAL REPUBLIC OF GERMANY. Ambros, R. (Rheinisch-Westfaelisches Elektrizitaetswerk A.G., Biblis (Germany, F.R.). Betriebsverwaltung); Baatz, H.; Rittscher, D. (Gesellschaft fuer Nuclear-Service mbH, Essen (Germany, F.R.)); Hepp, H. (Preussenelektra, Hannover (Germany, F.R.)). pp 31-51 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 Mars 1979. Paris, France; OECD (1979).

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

The paper discusses the systems for the treatment and preconcentration of radioactive elements and other radioactive waste generated during the operation of large boiling water and pressurized water reactors. The actual waste generation is compared with the corresponding design data. The in situ conditioning and packaging and the final disposal of the preconcentrated liquid waste and other waste products based on mobile equipment is

described.

2701 Anlagen zur Behandlung von radioaktiv kontaminiertem Wasser in Kernkraftwerken. Sicherheitstechnische Anforderungen. Entwurf. (TREATMENT OF RADIOACTIVE CONTAMINATED WATER IN NUCLEAR POWER PLANTS. SAFETY REQUIREMENTS. DRAFT). Berlin, Germany, F.R.; Beuth (Dec 1978). 17p. (In German). (DIN--25416(Pt.1)).

This rule is to be applied to the design, construction, and operation of facilities for treatment of water contaminated with radioactive material in stationary nuclear power plants with LWRs and HTRs. According to the requirements of the rule these facilities are to be designed, constructed, and operated in such a way that a) uncontrolled discharge of water contaminated with radioactive material is avoided, b) the activity discharged with water is as low as possible, c) water contaminated with radioactive material will not reach the ground, d) the radiation exposure as a consequence of direct radiation, contamination, and inhalation of the persons occupied in the facilities is as low as possible and as a maximum corresponds to the values laid down in the radiation protection regulation or to the values of the operating license. This rule is not to be applied to facilities for coolant and storage pit clean-up as well as facilities for the treatment of concentrates produced during the contamination of the water.

2702 EXPERIENCE IN OPERATION OF NUCLEAR POWER PLANT. POSITIVE RESULTS FOR BARDEBAECK. Hansson, Aa. (Sydsvenska Kraft AB, Malmoe (Sweden)). Ingenioer-nytt ; 14: No. 92, 2-5(17 Nov 1978). (In Norwegian).

From Nuclear power seminar; Oslo, Norway (23 - 24 Oct 1978).

Following a brief description of the structure, financing and generating plant of Sydkraft, the Barsebaeck plant is briefly described. The construction schedule and personnel are outlined as are the investment and operating costs, which are compared with the utility's oil-fired generating costs. The causes of outages are briefly presented and discussed. The wastes from generating the same amount of power as Barsebaeck in 1977 using oil fuel are compared with the radioactive waste for that year. (JIW).

2703 OPERATING EXPERIENCE WITH WEST EUROPEAN LIGHT-WATER REACTORS. Leicman, J. Jaderna Energie ; 24: No. 11, 426-431(Nov 1978). (In Czech).

Experience is summed up gained with the operation of western European nuclear power plants with light water reactors commissioned before 1st January, 1973 and having a nominal output of more than 100 MWe. Tabulated are non-availability factors depending on causes, the numbers of removed leaking fuel elements, the numbers of personnel in operation, maintenance, radiation protection, administration, etc., the numbers of reactor shutdown, the annual values of stack disposal, release of liquid and solid radioactive wastes, integral doses received by personnel and outside workers, and additional investment.

2704 METHOD AND DEVICE FOR STORING IRRADIATED RESPECTIVELY SPENT FUEL ASSEMBLIES FROM PRESSURIZED AND BOILING WATER REACTORS. Pirk, H.; Klein, D. (to Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,711,405/A/. 21 Sep 1978. 10p. (In German).

The storage compartment for the fuel elements from the PWR and the BWR consists of a concrete chamber containing at least one grating serving for vertical holding of supporting boxes e.g. of boron steel for the fuel assemblies. Further, the non-used openings of the supporting grid may be closed by means of lids so that to the space above it an underpressure may be applied for safety reasons. In the lower part of the concrete chamber there open out supply and exhaust air shafts guided in the same duct but separately from one another towards respectively away from the concrete chamber. The supply air shafts open out below or sideways from the boxes while the exhaust air shafts discharge below the upper most grid. The critical distance between the boxes or the fuel assemblies retained.

2705 MODIFICATION OF REACTOR INSTALLATION FOR THE FUKUSHIMA FIRST NUCLEAR POWER STATION OF TOKYO ELECTRIC POWER COMPANY (MODIFICATION OF NO. 1, NO. 2, NO. 3 AND NO. 6 REACTOR FACILITIES). Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 22: No. 12, 26-27(Apr 1978). (In Japanese).

Investigations based on the application for the above items have concluded on Dec. 3, 1977 that their safety concerning the modification will be sufficiently secured. Details of the modification include the changes for (1) containment vessels (No. 1, No. 2 and No. 3 reactors), (2) disposing facility of solid wastes (No. 3 reactor), (3) thermal limit values (No. 6 reactor), and (4) recirculation flow rate control system (No. 6 reactor). The first item is to install the flammable gas concentration control system in consideration of the radiolysis of emergency coolant in a loss of coolant accident. The second item is to install underground storage tanks, one for spent resin and one for waste sludge, adjacent to the No. 3 reactor building. Their capacities are approximately 140 m^3 and 300 m^3, respectively. The third item means that the analysis results of thermohydrodynamics and transient phenomena have been investigated, and the property of thermal limit values has been confirmed, because the thermal limit values by using minimum critical power ratio was adopted in lieu of conventional minimum critical heat flux ratio as a new core thermal characteristics evaluation method. The fourth item is to change the recirculation flow rate control system from flow rate control valve scheme to speed control of the recirculating pump.

2706 RACK FOR STORING FUEL ELEMENTS. Schabert, H.P.; Weber, R.; Schwabe, I. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,629,938/A/. 5 Jan 1978. 15p. (In German).

In order to increase the storage capacity for the fuel element pond in LWR's, a storage rack is introduced, where the use of absorber sheets made of boron-aluminium permits the moving closer together of the insertion openings.

2707 NEUTRON ANALYSIS OF SPENT FUEL POOLS. Caro, R.; Cano, J.M.; Donoso, E.; Esteban, A.; Martinez-Val, J.M.; Pereyra, J. (Junta de Energia Nuclear, Madrid (Spain)). pp 291-309 of Compte rendu du seminaire de l'AEN sur le stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel

elements; Madrid, Spain (Jun 1978).

The nuclear energy industry in Spain, as everywhere in the world, is facing the problem of increasing the capacity of the existing pools for storing spent fuel elements. At JEN the problems related with this circumstance are being analyzed. In this work part of the corresponding research is included, and it is expected to publish in the very near future a more detailed comprehensive work including neutronics, thermal-hydraulic and shielding aspects of the spent fuel pool design.

2708 NORMAL AND COMPACT SPENT FUEL STORAGE IN LIGHT WATER REACTOR POWER PLANTS. Kuehnel, R.R. (Kraftwerk Union A.G., Offenbach am Main (Germany, F.R.)). pp 255-267 of Compte rendu du seminaire de l'AEN sur le stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

The compact storage of light water reactor spent fuel is a safe, cheap and reliable contribution towards overcoming the momentarily existing shortage in spent fuel reprocessing. The technical concept is described and physical behavior discussed. The introduction of compact storage racks in nuclear power plants increases the capacity from 100 to about 240%. The increase in decay heat is not more than about 14%, the increase in activity inventory and hazard potential does not exceed 20%. In most cases the existing power plant equipment fulfils the new requirements.

2709 BEHAVIOR OF SPENT LWR FUEL ASSEMBLIES. Peehs, M.; Petri, W.; Fuchs, H.P.; Schlemmer, F. (Kraftwerk Union A.G., Erlangen (Germany, F.R.)). pp 223-233 of Compte rendu du seminaire de l'AEN sur le stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

Fuel assemblies are stored under water at T=40°C. The inner pressure loading on the cladding amounts to only 10% of the yield point. Cladding tube degradation from corrosion can be neglected, as well as corrosion of the stainless steel and Inconel structural parts of the fuel assembly. Both the micro- and macro-hydrogen distribution in the claddings are sufficiently stable. Experiments to investigate water hydrolysis by stored fuel elements have been started. Also, investigations have been initiated to determine the fission product release from defective fuel rods.

2710 MONITORING OF RADIOACTIVE RELEASES AT THE GARIGLIANO NUCLEAR POWER STATION OF THE ENTE NAZIONALE PER L'ENERGIA ELETTRICA (ENEL), ITALY. Antonucci, L. pp 64-81 of Monitoring of airborne and liquid radioactive releases from nuclear facilities to the environment. Vienna, Austria; International Atomic Energy Agency (1978).

This article deals with the radioactive effluent treatment, sampling points and techniques, measurement techniques and the results of the monitoring of radioactive releases at the Garigliano Nuclear Power Station of the Ente Nazionale per l'Energia Elettrica (ENEL), Italy.

2711 NON-DESTRUCTIVE GAMMA SCANNING MEASUREMENT ON DISCHARGED FUEL BUNDLES FROM TARAPUR REACTORS. Deniz, V.C.; Dhodapkar, S.D.; Gubbi, G.K.; Arora, K.K.; Jindal, R.N.; Mistry, A.H. (Bhabha Atomic Research Centre, Bombay (India)). pp 434-437 of Reactor physics. Bombay, India; Department of Atomic Energy (1978).

From Symposium on reactor physics; Bombay, India (1 Mar 1976).

Gamma scanning measurements were carried out on discharged fuel bundles in the storage pool of the Tarapur reactors. These measurements, made on bundles in the range 2000 to 6000 MWD/ST, were carried out to measure the axial distributions of burnup for comparison with code predictions. Gamma spectra were measured in the range 600 Kev to 800 Kev using a Ge(Li) detector, and the axial distributions of ^{137}Cs and of the ratio $^{134}Cs/^{137}Cs$ were measured. The experimental procedure and the results obtained are presented.

2712 SPENT FUEL STORAGE - PHILOSOPHIES AND EXPERIENCE. Huppert, K.L. (Gesellschaft zur Wiederaufarbeitung von Kernbrennstoffen m.b.H., Eggenstein-Leopoldshafen (Germany, F.R.)). pp 19-29 of Compte rendu du seminaire de l'AEN sur le stockage des elements combustibles irradies. Madrid, 20-23 Juin 1978. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

In the past, spent fuel storage was considered as standard practice and an interim step in the nuclear fuel cycle, hardly worth mentioning. This part of the fuel cycle has gained actual interest because the establishment of reprocessing capacity has not taken place as planned in some states or because the recovery of fissile material has been deferred. Independent of the differing policies, interim storage is indispensable after discharge of fuel elements from the reactor. Experience shows that high burn-up oxide fuel with corrosion resistant cladding may be stored under water over several decades, provided that favourable pool water conditions can be maintained. Dry storage of element bundles which is discussed for final disposal of fuel, is under development in the U.S., but not yet exercised.

2713 CONTROL OF RADIOACTIVE POLLUTANTS IN LIQUID EFFLUENTS FROM LARGE NUCLEAR POWER PLANTS. Bhat, I.S.; Gurg, R.P.; Kamath, P.R. (Bhabha Atomic Research Centre, Bombay (India). Health Physics Div.). pp 315-321 of Operating experience of nuclear reactors and power plants. Bombay; Department of Atomic Energy (1977).

From Symposium on operating experience of nuclear reactors and power plants; Bombay, India (7 Feb 1977).

Control of radioactive pollutants in liquid effluents from Tarapur Atomic Power Plant has been described. The experience gained by studying the problems already faced by similar BWR type reactors abroad are enumerated. The modifications done to suit the local environmental conditions as well as the exceptions to zero discharge which had to be adopted are also enumerated.

2714 RADWASTE PROCESS SYSTEM EXPERIENCE AT TARAPUR. Srinivasan, V.S.; Kulkarni, P.C.; George, V.C. (Tarapur Atomic Power Station (India)). pp 347-352 of Operating experience of nuclear reactors and power plants. Bombay; Department of Atomic Energy (1977).

From Symposium on operating experience of nuclear reactors and power plants; Bombay, India (7 Feb 1977).

Experience in handling the solid, liquid and gaseous radioactive wastes at the Tarapur Atomic Power Station, India is described in

detail. A functional description of the waste handling system is presented with special reference to each kind of waste. Also, the problems faced in these processes and the corrective action taken are reported.

2715 MANAGEMENT OF RADIOACTIVE WASTE FROM TARAPUR ATOMIC POWER STATION. Balu, K.; Ramachandran, S.; Gandhi, P.M.; Chander, M. (Bhabha Atomic Research Centre, Bombay (India)). pp 353-357 of Operating experience of nuclear reactors and power plants. Bombay, India; Department of Atomic Energy (1977).
From Symposium on operating experience of nuclear reactors and power plants; Bombay, India (7 Feb 1977).
The procedure adopted for radioactive waste management at the Tarapur Atomic Power Station is explained. The radwaste augmentation plant put up for the purpose is described. The gross activity figures for Cs^{137}, Cs^{134} and Co^{60} are reported. The performance of this plant, with due allowance for Iodine decay, over a period of 5 months is discussed. The installation of a spent-resin storage tank, which is expected to bring down the man-rem expenditure, is also described.

2716 BASKET FOR STORING NUCLEAR FUELS IN A COOLING POOL. (to Ateliers de Chaudronnerie, de Tolerie Industrielle, de Mecanique et d'Electricite (ACTIME), 28 - Dreux (France)). French Patent 2,358,733/A/. 16 Jul 1976. 8p. (In French).
The fuel bundles from PWR or BWR nuclear power stations, after they have been used in nuclear reactor cores, are processed in order to remove the fission products, (cutting up followed by the dissolving of the bundle pieces in a solvent). Prior to being cut up and treated in the solvent, they are generally stored in a cooling pool. The basket for storing the fuel includes, under the invention, a nest of parallel vertical wells. Each well is appreciably rectangular in shape and formed by a pair of vertical metal sheets bent to a U shape and place at right angles to each other. These wells are kept in position by several (generally two) horizontal plates provided with openings in which the ends of the wells are inserted. Each pair of vertical metal sheets forming a well is stiffened and joined by a series of horizontal tags welded between two plates. Additionnally, each nest of wells forming the storage basket is circled by a number of buffers (preferably three) fabricated in shaped steel sheeting welded to the vertical sheet metal sides of the wells on the outer edges of the nest. In accordance with a preferential design mode of the invention, the metal components forming the basket are in low carbon stainless steel withstanding well the action of the pool demineralised water.

Power Reactors, Non-Breeding, Light-Water Moderated, Non-Boiling Water Cooled

2717 (CONF-791118--6) MEASUREMENTS OF RADIONUCLIDE CONCENTRATIONS IN LIQUID AND GASEOUS STREAMS IN PWR'S. Mandler, J.W.; Motes, B.G. (EG and G Idaho, Inc., Idaho Falls (USA); Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). 1979. Contract EY-76-C-07-1570. 27p. Dep. NTIS, PC A03/MF A01.
From 7. water reactor safety research information meeting; Gaithersburg, MD, USA (5 Nov 1979).
Measurements of radionuclide concentrations in liquid and gaseous streams in pressurized water reactors (PWR's) were performed as part of the In-Plant Source Term Measurement Study which is being carried out under NRC sponsorship. Some of the measurement results obtained together with brief descriptions of the measurement program and the methods used in the study are presented.

2718 (CONF-800802--13) FLOWSHEET DEVELOPMENT STUDIES FOR THE DECONTAMINATION OF HIGH-ACTIVITY-LEVEL WATER AT THREE MILE ISLAND UNIT 2. Collins, E.D.; Bigelow, J.E.; Campbell, D.O.; King, L.J.; Knauer, J.B. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 33p. NTIS, PC A03/MF A01.
From 89. annual meeting of the American Institute of Chemical Engineers; Portland, OR, USA (17 Aug 1980).
Several chemical processing flowsheets were considered for the decontamination of high-activity-level water at the Three Mile Island (TMI) Unit 2. A zeolite ion exchange process was evaluated and recommended for absorption of the bulk of the highly radioactive cesium and strontium. Standard organic ion-exchange resins were selected to remove the remaining traces of radioactive nuclides (except tritium which cannot be removed by any practical process). Process conditions were evaluated using both synthetic, tracer-level solutions and samples of actual, high-activity level water from TMI Unit 2.

2719 (CS-INIS--258, pp 16-22) RADIONUCLIDES FROM NUCLEAR POWER FACILITIES OPERATION IN HYDROSPHERE. Mayer, J. (Vyzkumny Ustav Vodniho Hospodarstvi, Bratislava (Czechoslovakia)). Sep 1978. (In Slovak).
From 9. national conference on radionuclides and ionizing radiation in water management; Liberec, Czechoslovakia (28 Sep 1978).
The problem is discussed of the contamination of the hydrosphere with fission products from nuclear reactors, especially WWER type reactors. Liquid wastes are the major threat for water management; they are produced in a limited area, they contain a relatively small amount of fission and corrosion products, the treated water is recycled. The amount of discharged fission products is thus reduced, the fission products are solidified and stored on a suitable storage site. The techniques are briefly described of waste water processing in WWER nuclear power plants. It is envisaged that in future, operating conditions in waste water treatment plants will improve, the radiation stability of ion exchangers will increase and their efficient regeneration will be introduced. The problem which still remains to be solved is tritium removal from waste waters and, in Czechoslovaki, the definite selection of a storage site for solidified wastes.

2720 (INIS-mf--4770) SAFETY ASPECTS OF THE DESIGN OF A PWR GASEOUS RADWASTE TREATMENT SYSTEM USING HYDROGEN RECOMBINERS. Glibert, R.; Nuyt, G.; Herin, S.; Fossion, P. (Societe Belge pour l'Industrie Nucleaire, Brussels). 1978. 12p. Dep. NTIS (US Sales Only), PC A02/MF A01.
PWR Gaseous radwaste treatment system is essential for the reduction of impact on environment of the nuclear power plants. Decay tank system has been used for the retention of the radioactive gaseous fission products generated in the primary coolant. The use of a system combining decay tanks and hydrogen recombiner units is described. Accent is put on the safety aspects of this gaseous radwaste treatment facility studied by BN for a Belgian Power Plant.

2721 (INIS-mf--5464) RADIOECOLOGICAL EXPERTS' OPINIONS ON WASTE WATER OF ESENSHAM NUCLEAR POWER PLANT. FINAL REPORT OF A PART OF THE PROJECT: POLLUTION AT THE PLACE OF WORK AND IN THE LOWER WESER INDUSTRIALIZED REGION. Bliefert, M.; Marks, R.; Meier, A.; Wallenschus, M. (Bremen Univ. (Germany, F.R.)). Jul 1978. vpp. (In German). NTIS (US Sales Only), PC A04/MF A01.

In December 1977, there was a public hearing by the Oldenburg administrative court where, among others, evidence was heard on whether the experts' opinions on the discharge of liquid radioactive waste into the river Weser, for which licence has already been granted, contain some major errors so that the licences already granted would have to be revoked. This part of the long and tedious administrative lawsuit is reported.

2722 (Juel--1586) IMPROVEMENT OF CHEMICAL AND PHYSICAL PROCESSES TO TREAT THE WASTE WATER FROM NUCLEAR POWER PLANTS. Oschmann, W. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Chemische Technologie; Technische Hochschule Aachen (Germany, F.R.)). May 1979. 98p. (In German). Dep. NTIS (US Sales Only), PC A06/MF A01.

The author presents a flocculation precipitation process for radioactive waste water from PWRs. It eliminates especially Sb^{124}. This process makes it possible to obtain the legally prescribed waste water minimum values of $5x10^{-4}$ Ci/m^3 of total α-activity. As for the purification of the radioactive waste water by means of evaporators, special emphases is placed on the separation of aerosols from the steam phase. Up to now columns with perforated bottoms or bubble trays have been used for this purpose. The author describes a considerably more effective method for the decontamination of the steam phase, the separation of the aerosols being done by means of an electrostatic filter. First test results with a model evaporator are described.

2723 (ORNL/TM--7081) POST-ACCIDENT CLEANUP OF RADIOACTIVITY AT THE THREE MILE ISLAND NUCLEAR POWER STATION. Brooksbank, R.E.; Armento, W.J. (comps.). (Oak Ridge National Lab., TN (USA)). Feb 1980. Contract W-7405-ENG-26. 67p. Dep. NTIS, PC A04/MF A01.

The technical staff of the President's Commission on the Accident at Three Mile Island (TMI) requested that Oak Ridge National Laboratory (ORNL) prepare documentation concerned with the cleanup of radioactivity on the Three Mile Island site following the March 28, 1979 accident. The objective of this report is to provide information in a summarized form, which will be of direct usefulness to the commissioners. The information contained herein includes discussion of on-site assistance and accomplishments following the accident, flowsheet development for the TMI recovery team (by the Technical Advisory Group), and the numerous reports already generated on the TMI cleanup and recovery.

2724 (PB--295036) EVALUATION OF TRITIUM RECYCLE AND BUILDUP IN A PRESSURIZED WATER REACTOR. TECHNICAL NOTE. Smith, C.B. (Office of Radiation Programs, Washington, DC (USA). Technology Assessment Div.). Mar 1977. 46p. NTIS PC A03/MF A01.

Recycling radioactive liquid wastes at light-water cooled nuclear power reactors is becoming a popular method of limiting release levels to as low as practicable. As a result of recycling the liquid wastes the tritium in the liquid waste streams is not removed. Combined with its relatively long half life (12.33 years), recycling results in a buildup of large volumes of tritium contaminated liquids. To evaluate the magnitude of the potential tritium handling problem and to develop recommendations for solutions, a computerized model of tritium buildup in a PWR was developed. The results from this model will be used to assess the potential environmental impact of tritium recycle for the entire nuclear power reactor industry and will be instrumental in developing standards or guidance concerning tritium recycle.

2725 (VEIKI--15.98-041-2) INVESTIGATION OF GENERATION OF LIQUID RADIOACTIVE WASTES AND POSSIBILITIES TO REDUCE THEIR VOLUME IN NPP PAKS PT. 2. COMPUTER PROGRAM FOR THE SIMULATION OF RADIOACTIVE WATER SYSTEMS CONTAMINATION. Horvath, L.G. (Villamosenergiaipari Kutato Intezet, Budapest (Hungary)). Dec 1978. 53p. (In Hungarian). Library of Institute for Electrical Power Research, 1368 Budapest, P.O.B. 233, Hungary.

A numerical computer model (RADTRAN) has been developed to simulate the contamination of radioactive water systems, the generation of liquid radioactive wastes in the technological equipment in a PWR type NPP, taking into account the water systems' working regimes, using graph theory methods. The program is able to simulate a number of different working regimes during the burn-up cycle, in water systems of different construction. As a result the program gives the amounts of water, inactive components and activity in tanks and on the filters. The aims of investigations are: to determine the factors influencing the generation of activity and radioactive wastes, to minimise the plant's operation costs and to ease the plant's operation.

2726 PUBLICATION OF ONE PARTIAL LICENSE EACH FOR AN INCREASE OF THE SPENT FUEL STORAGE CAPACITY FROM FIVE THIRDS OF A CORE CHARGE TO NINE THIRDS OF A CORE CHARGE IN THE BIBLIS A AND B UNITS. Bundesanzeiger ; 32: No. 57, 2(Mar 1980). (In German).

BIBLIS-A REACTOR;BIBLIS-B REACTOR;FUEL POOLS; LICENSING;OPERATING LICENSES;OPTIMIZATION;SPENT FUEL STORAGE

2727 RADIOACTIVE WASTE AT BIBLIS NUCLEAR POWER PLANT. Ambros, R.; Schroeder, H.J. (Rheinisch-Westfaelisches Elektrizitaetswerk A.G., Biblis (Germany, F.R.). Betriebsverwaltung). VGB Kraftwerkstechnik ; 59: No. 12, 990-994(Dec 1979). (In German).

The type and amount of radioactive waste from Biblis A und B (until end of 1978) that was sent to the Asse mine for final storage are described. Radioactive emissions with waste air and absorber are left out of account. The conditioning and disposal of the radioactive waste (radioactive metal parts from the core excluded) went according to routine until the end of 1978 (Asse was closed down at the beginning of 1979). Per year and unit, there was an average of 400 drums of low-activity waste, about 20 drums of waste with higher dose rates, and 70 to 80 m^3 of concentrates and sludges.

2728 PUBLICATION CONCERNING THE PLANNED INCLUSION AND OPERATION OF COMPACT STORAGE DEVICES FOR SPENT FUEL ELEMENTS IN THE NECKAR

REACTOR. DATED 17TH JULY, 1979. Grawe (Ministerium fuer Wirtschaft, Mittelstand und Verkehr Baden-Wuerttemberg, Stuttgart (Germany, F.R.)). Bundesanzeiger ; 31: No. 136, 6(25 Jul 1979). (In German).
FUEL POOLS;NECKAR REACTOR;PLANNING;SPENT FUEL STORAGE;FUEL RACKS

2729 WATERFILLED STORAGE POND. Weber, R.; Gallwas, J. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,758,670/A/. 5 Jul 1979. 12p. (In German).
The storage pond for spent fuel elements is part of a concrete building, which is adjacent to the steel safety containment of a PWR. The lower part contains a storage rack, into which the fuel elements are set vertically by means of a fuel element grab. To increase the capacity of the storage pond, steel consoles are arranged in the concrete walls above this storage frame, on which a supporting floor is laid. On this support there is room for a further storage frame, which is also situated below the water level (of the pond).

2730 MEASURING AND MONITORING OF GASEOUS RELEASES AND AEROSOL-BOUND RADIOACTIVE MATERIAL. PT. 1. MEASURING AND MONITORING OF RADIOACTIVE MATERIAL RELEASED TOGETHER WITH THE STACK EXHAUST AIR IN REGULAR OPERATION. KTA SAFETY REGULATION. Bundesanzeiger Beilage ; No. 27, 3-13(Jul 1979). (In German).
This part of the standard is to be applied to devices for stationary nuclear power plants with LWR's and HTR's during regular operation. Their duties are a) balancing of the radioactive material released with the stack exhaust air as a basis for the assessment of the radiological consequences. b) automatic release of signals if limits are exceeded c) contributing to meeting the requirements of paragraph 46, section 1, number 3 of the radiation protection regulation.

2734 ATOMIC WASTE FOREVER. Damveld, H. Wetenschap en Samenleving ; 79: No. 5, 68-74(Jun-Jul 1979). (In Dutch).
Recent developments in the problem area of radioactive waste are reported. A new working contract between the French firm Cogema in la Hague and the nuclear centre Borssele for the treatment of fission product waste is critically discussed and a few fundamental doubts raised. A new report concerning the storage of atomic waste in salt domes in the Netherlands is commented upon. The author wants the government to prevent the treatment contract, to close the nuclear plants at Borssele and Dodewaard, to stop the dumping of atomic waste in the sea and to finish all examinations into the storage of atomic waste.

2735 METHOD FOR CLEANING LIQUID WASTES CONTAMINATED WITH RADIOACTIVE MATERIAL. Brendl, R.; Fischer, G.; Martin, J.; Puthawala, A. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,745,544/A/. 12 Apr 1979. 5p. (In German).
In order to improve the decontamination rate in decontamination evaporators for e.g. the liquid wastes from PWR's a well soluble carrier substance, containing the non-radioactive isotopes of the contaminating elements, is added to the washing liquid. The carrier substance consists of salts, e.g. KI for separating ^{131}I, and is added to the washing liquid in a concentration of 1-10g/m^3. (DG).

2736 FRAMEWORK FOR STORING LONG FUEL ELEMENTS. Langhammer, K.H.; Weber, R. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,742,735/A/. 5 Apr 1979. 12p. (In German).
The fuel elements of polygonal cross section for the PWR are surrounded by boron steel sheaths. The fuel elements are fixed at the upper end at the framework and are lined up at the lower and relative to the framework or the sheaths by a centring device. The centring devices are spherical and grip the corners of the sheaths. Both devices can be fixed to one another by fixing screws and the fuel element can be supported in the sheath so that no lateral forces are exerted on the sheaths. One of the spherical devices is supported on the framework and the other surrounds the fuel element. Austenitic steel sheets can be welded to the upper and lower ends of the sheaths, which can be mechanically connected to the framework.

2737 PUBLICATION OF THE PROJECT OF RHEINISCH-WESTFAELISCHE ELEKTRIZITAETSWERK AG, ESSEN, TO INCREASE THE CAPACITY OF THE FUEL STORAGE POOL OF UNITS A AND B OF BIBLIS NUCLEAR POWER PLANT FROM FIVE THIRDS OF ONE CORE CHARGE EACH TO NINE THIRDS OF ONE CORE CHARGE EACH. Bundesanzeiger ; 31: No. 73, 7(Apr 1979). (In German).

2738 PUBLICATION OF THE PROJECT OF BAYERNWERK AG, MUNICH, AND KRAFTWERK UNION AG, FRANKFURT, TO RAISE THE CAPACITY OF THE SPENT FUEL PIT AT GRAFENRHEINFELD NUCLEAR POWER PLANT BY INSTALLING COMPACT STORAGE RACKS.

Bundesanzeiger ; 31: No. 33, 4(Feb 1979). (In German).
Applications for a licence according to article 7, paragraph 1 of the Atomic Energy Act for the installation and operation of fuel storage racks in the spent fuel pit of Grafenrheinfeld nuclear power plant in order to increase the storage capacity from about 4/3 nuclear charges to about 11/3 nuclear charges.

2739 FUEL ELEMENT STORAGE POND FOR NUCLEAR INSTALLATIONS. Schneider, W. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,731,035/A/. 25 Jan 1979. 7p. (In German).
The water level in the concrete storage pond for the rod-shaped fuel elements of a PWR (1300 MWe) is lowered below the edge of the pond during operation. To reduce irradiation, in the pond area, a strip along the pond walls is covered with shielding (50mm of steel or lead) in the shape of a shielding plate projecting horizontally above the water. It has a continuation vertical to the water surface at its free edge. A horizontal pipe with flat beam nozzles is fixed at the continuation below this shielding. Using these nozzles, the edge of the basin can be cleared of contaminated particles using a cleaning liquid (e.g. water).

2742 REMOTELY OPERATED ULTRASONIC DECONTAMINATION SYSTEM FOR FUEL TRANSFER POOL. Okamoto, H. (Central Research Inst. of Electric Power Industry, Tokyo, Japan); Yoshimura, S.; Fukumoto, H.; Sakurada, O. pp 129-135 of Proceedings of the 27th conference on remote systems technology. Wallin, D.R. (ed.). La Grange Park, IL; American Nuclear Society, Inc. (1979).
From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).
A decontamination method using ultrasonic waves was developed for use in decontaminating the fuel transfer pool wall of the light water reactor. From the results of on-site basic experiments, a remotely operated ultrasonic decontamination installation was designed and fabricated, and on-site operational experiments with it were carried out. The results of basic experiments, the remotely operated ultrasonic decontamination system, and the results of on-site operational experiments with the system are described.

2743 NOTIFICATION CONCERNING PLANS FOR THE INSTALLATION AND OPERATION OF COMPACT-TYPE FUEL STORAGES IN UNTERWESER NUCLEAR POWER PLANT. GRS (Gesellschaft fuer Reaktorsicherheit) Kurz-Information, Reihe E ; No. 23, 1-2(1979). (In German).

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
High temperature electromagnetic filtration can be applied to relatively high water flow rates; in this way, the harmful contamination of primary circuits components, resulting mainly from neutron activation of the metallic oxides during their long stay as deposits in the reactor core, is prevented in a large extent. The fraction of the total flow rate to be filtered in this purpose is estimated. The nature, composition and concentration level of cruds to be removed are specified; then the principle of an electromagnetic filter is outlined and its main practical characteristics are reviewed. The feasibility of on-line hot flushing this type of filter is emphasized, such providing a valuable in-service flexibility. The performances obtained during testing by means of out-of-pile or in-pile loops at CEN/Saclay are shown. Moreover, a demonstration experiment is under way on the prototype reactor CAP at CEN/Cadarache. Studies now in progress are directed towards the design of an optimized industrial filter. The conditions and benefits of the application for a power reactor are considered.

2745 RADIOACTIVE CONTAMINATION OF THE ATMOSPHERE AND ITS EFFECTS ON POPULATION IN THE NEIGHBOURHOOD. Berczi, K.; Liptak, L.; Pajer, I. (Eroemue es Halozattervezoe Vallalat Eroeterv, Budapest (Hungary)). Eroeterv Koezlemenyek ; 17: 106-110(1979). (In Hungarian).
A briefing is given of the technological development work concerned with calculating the effects of atmospherical releases, carried out in connection with the environmental analyses of nuclear power stations. The article follows the route of propagation of gaseous radioactive waste starting from the power plant air chimney through atmospheric dilution to the determination of components in the dosage rate reaching the population.

2746 SOME ASPECTS OF DESIGN, CONSTRUCTION AND OPERATION IN ORDER TO MINIMIZE THE BUILD-UP OF RADIOACTIVE WASTE - REFLECTIONS AND EXPERIENCE FROM LOVIISA 1 NPS. Jaernstroem, R.T. (Loviisa Nuclear Power Plant (Finland)). pp 145-151 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 Mars 1979. Paris, France; OECD (1979).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
When minimizing the build-up of radioactive waste in a nuclear power plant with respect to fission and corrosion products there are some

well-known factors as choice of materials, plant operation, fuel performance, chemistry and purification systems and especially the chemistry surveillance, which are of great importance. Experience gathered from Loviisa 1 operation during the first two fuel cycles will shortly be described in this paper.

2747 WASTE MANAGEMENT AT THE ARDENNES POWER PLANT. Abraham, J.P. (Societe d'Energie Nucleaire Franco-Belge des Ardennes, 08 - Chooz-lez-Givet (France)). pp 395-404 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 Mars 1979. Paris, France; OECD (1979). (In French)

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

In 1976, the SENA (with the participation of EDF, CEA and CEC in the framework of a research program on the management and storage of radioactive wastes) has developed an industrial pilot plant for the encapsulation of wastes in thermosetting polyester resins. The industrial putting in operation of the plant will enable most of the wastes from the nuclear station to be processed. The quality of products will be improved and the volume and processing cost reduced.

2748 SOLIDIFICATON OF EVAPORATOR CONCENTRATES BY HYDRAULIC BINDING AGENTS. Bernard, A.; Nomine, J.C. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service des Elements Combustibles et Structures). pp 361-371 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 Mars 1979. Paris, France; OECD (1979). (In French)

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

The CEN-SACLAY Concretes and Coating Materials Laboratory specialised in the research and development of special high-performance concretes in the field of biological protection particularly, has been investigating formulae based on hydraulic binding agents to solidify liquid radioactive wastes, especially evaporator concentrates from P.W.R. stations. The development of the materials and the operational technology, tried on inactive then on active samples, were applied next on an industrial scale. The main transposition difficulties, now solved, are due to possible variations in the physico-chemical properties of the mortar components (water content of the granulates in particular). The concentrate solidification method finally developed, taking place in concrete shells at the station itself is fast, versatile and inexpensive.

2749 FUTURE OUTLOOK OF WASTE PACKAGING AT ELECTRICITE DE FRANCE. Beunardeau, M.B. (Electricite de France, 75 - Paris). pp 513-523 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 Mars 1979. Paris, France; OECD (1979). (In French)

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

Electricite de France intends, for its nuclear power plants in the future, to pack the wastes in metal drums instead of concrete blocks. Cost of treatment is expected to be reduced by 50%. This target can be reached under two conditions: 1. Construction of transportation vessels well fitted to the activity of the wastes (optimisation of the thickness of the biological protections); 2. easiness of the operation (reduced time of handling).

2750 RECOVERY OF BROKEN FUEL PIN AND THE INVESTIGATION ON THE SAFETY OF RE-OPERATION OF THE MIHAMA UNIT 1 PLANT, KANSAI ELECTRIC POWER CO. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 7, 16-19(Sep 1978). (In Japanese).

Japanese ministries (Science and Technology and International Trade and Industry) have ordered the Kansai Electric Power Co. to investigate the cause of the fuel pin failure and to establish the safety of re-operation of the Mihama Unit 1 nuclear power plant. This report was prepared by the two ministries as the announcement that they think the plant is now ready for re-operation. In the first part, brief information is provided on the fuel pin failure, such as the amount of broken pellets (1,206 g) and cladding material (217 g). The methods of identification and recovery of these lost materials are explained in the second part together with the results of these activities. The amount of recovered materials is reported. In the third part, the locations of the unrecovered materials are considered. The safety problems concerning the re-operation of the plant are analyzed in the fourth part. The fifth part briefly shows several conditions that the utility must observe to secure the safety of the plant re-operation.

2751 MEASUREMENT OF TRITIUM AND TRITIATED WATER VAPOUR IN NUCLEAR POWER INSTALLATIONS. I. TRITIUM FORMATION AND TRANSPORT IN NUCLEAR POWER INSTALLATIONS. Gilar, O.; Kubalek, J.; Sedakov, V. (Tesla, Premysleni (Czechoslovakia). Vyzkumny Ustav Pristroju Jaderne Techniky). Jaderna Energie ; 24: No. 8, 290-296(Aug 1978). (In Russian).

The formation of tritium is described in heavy water-cooled, WWER-type and LMFBR-type reactors. In heavy water reactors tritium results, among others, as the product of reaction D(n,γ)T and its amount depends on the reactor output and the duration of D_2O irradiation. In a reactor with a mean neutron flux density of 10^{13} $cm^{-2}s^{-1}$ after one year of operation in 1 kg D_2O about 1.85×10^{10} s^{-1} tritium is formed, this in the form of gas or oxides. In WWER type reactors tritium results from uranium fission in fuel elements and neutron capture by boron. It has the form of HTO or tritiated water vapours. In a power unit fitted with two WWER reactors with an output of 2x500 MWsub(th), the amount of tritium in the primary circuit is stabilized at 3.7×10^{10} $s^{-1}m^{-3}$ and in the reactor water regime at 7.4×10^{9} $s^{-1}m^{-3}$. In LMFBR reactors tritium is formed also from actinide fission and by neutron capture in boron and lithium. Tritium activity is in fast reactors higher than in PWR's and its transport depends on the content of tritium in the primary circuit and in the coolant cover atmosphere. Tritium formation is also described in research reactors, reprocessing facilities, in radiochemical and radiological laboratories, and in particle accelerator laboratories.

2752 NUCLEAR REACTOR PLANT. Weber, R.; Kaetscher, E. (to Siemens A.G., Berlin (Germany, F.R.); Siemens A.G., Muenchen (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,253,232/8/. 24 May 1978. 8p. (In

German).

Next to the fuel element storage pond in a pressurised water reactor a lowering shaft for the fuel element transport container is arranged. The shaft and container act like a piston and cylinder, so that the hydraulic braking prevents a bump on setting down the fuel element endangering it.

2753 RADIOCHROMATOGRAPHIC SYSTEM FOR OFF-GAS DECONTAMINATION AT THE WWER NUCLEAR POWER PLANTS. Nakhutin, I.E.; Ochkin, D.V.; Pis'man, B.Ya.; Babenko, E.A.; Krasikov, A.N.; Tret'yak, S.A.; Khlyustova, T.M. Atomnaya Energiya ; 44: No. 3, 251-252(Mar 1978). (In Russian).

2754 MEASURES OF REDUCING ACCUMULATION OF RADIOACTIVITY IN PRIMARY COOLING SYSTEM OF PRESSURIZED WATER REACTORS. Kuwashima, K. (N.T.S. Co. Ltd. (Japan)); Maii, I. pp 103-131 of Keisuiro ichiji reikyakukei no hoshano chikuseki yokusei taisaku to josen. Koyama, H. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)); Iimura, H.; Ikegame, R.; Hashimoto, T.; Hamazaki, K. Tokyo, Japan; I.S.U. Co. (1978). (In Japanese)

The flow sheets for the primary cooling system, the chemical and volume control system, the decay heat removal system and the waste disposal system in PWR plants are shown. The special features of PWRs regarding the reactor cooling system are explained, for example, water quality control, accumulation of radioactivity and radiation level in the primary system, and radiation dose rate at the time of working. The average cumulative radiation dose rate in primary system pipes is estimated at about 200 - 300 mR/h except special local high level points. The radiation dose rate on the surfaces of primary system pipes at the time of periodic inspection of a PWR was 300 - 900 mR/h immediately after shut down, and about 150 - 500 mR/h 10 - 15 days after shut down. output of 1100 MWe is about 11,500 - 12,400 Ci/year. The utilization of ^{7}Li, the control of dissolved oxygen, the purification of the primary coolant, etc, are explained as the above described countermeasures.

2755 NUCLEAR REACTOR POWER STATION WITH TWO DIFFERENT POOLS. (to Societe Franco-Americaine de Constructions Atomiques (FRAMATOME), 92 - Courbevoie (France)). French Patent 2,405,540/A/. 4 Oct 1977. 10p. (In French).

The nuclear reactor power station described includes a building containing a nuclear reactor capped by a first pool for handling fuel assemblies under water; an ancillary building with a second pool for transferring fuel assemblies and for storing and cooling spent assemblies; a horizontal tube for transferring the assemblies between the two pools.

2756 ALTERATION OF REACTOR INSTALLATION (UNIT 2) IN GENKAI NUCLEAR POWER STATION OF KYUSHU ELECTRIC POWER CO., INC. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 22: No. 6, 32-33(Sep 1977). (In Japanese).

The report of the Committee on Examination of Reactor Safety to the Atomic Energy Commission of Japan concerning the alteration is given, which is attached to the reply from the commission to the prime minister, and its safety was confirmed. The alterations are change to magnetic-jack drive for a control-rod cluster to regulate the power distribution; change to concentration type control of waste hydrogen gas treatment system; and change to drum asphalt solidification of waste concentrate.

2757 STUDIES ON THE TREATMENT OF RADIOACTIVE WASTE WATER FORMED FROM THE STEAM GENERATOR OF PWR TYPE REACTOR USING ION EXCHANGE RESINS. Lee, S.H.; Park, S.H. (Korea Atomic Energy Research Inst., Seoul (Republic of Korea)). Bangason Bango Hakhoe Chi ; 2: No. 1, 24-30(Jul 1977). (In French).

To establish an efficient treatment of waste water from PWR reactor, decontamination experiments of radionuclides were carried out using ion exchange resin columns under alkaline pH. A serial connection of anionic and cationic exchange resin column was quite efficient showing higher values of decontamination factors for ^{137}Cs and ^{90}Sr. (author).

Power Reactors, Non-Breeding, Graphite Moderated

2758 (CEGB-RD/B/N--4231) RADIOACTIVE INVENTORY OF A DECOMMISSIONED MAGNOX POWER STATION STRUCTURE. 1. MEASUREMENTS OF NEUTRON INDUCED ACTIVITY IN SAMPLES FROM THE REACTOR ISLAND. Woollam, P.B. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Sep 1978. 51p. Dep. NTIS (US Sales Only), PC A04/MF A01.

This report is the first of a series which, together, aim to produce an accurate assessment of neutron induced activation levels in the fixed structural components of a reactor of the steel pressure vessel Magnox type. It describes the measurements made of induced activation, necessary in order to establish credibility in the complex calculations described in the subsequent reports. The report also attempts systematically to assess the potential contributions to the dose and disposal problem from all isotopes with a half-life in excess of 5 years. This is necessary in order to ensure that no isotope has been overlooked which could limit any part of the plan for the decommissioning of a Magnox reactor. In addition the report aims to determine concentrations, in each major material type, of trace elements which lead to the isotopes limiting in decommissioning.

2759 (INFCE/DEP/WG--7/3) WASTE ARISINGS FROM A HIGH-TEMPERATURE REACTOR WITH A URANIUM-THORIUM FUEL CYCLE. (INFCE (USA)). Sep 1979. 8p. NTIS (US Sales Only), PC A02/MF A01.

This paper presents an equilibrium-recycle condition flow sheet for a high-temperature gas-cooled reactor (HTR) fuel cycle which uses thorium and high-enriched uranium (93% U-235) as makeup fuel. INFCE Working Group 7 defined percentage losses to various waste streams are used to adjust the heavy-element mass flows per gigawatt-year of electricity generated. Thorium and bred U-233 are recycled following Thorex reprocessing. Fissile U-235 is recycled one time following Purex reprocessing and then is discarded to waste. Plutonium and other transuranics are discarded to waste. Included are estimates of volume, radioactivity, and heavy-element content of wastes arising from HTR fuel element fabrication; HTR operation, maintenance, and decommissioning; and reprocessing spent fuel where the waste is unique to the HTR fuel cycle.

2760 (INIS-mf--4697) STOCK-TAKING OF THE SAFETY DESIGN OF THE NUCLEAR POWER PLANT WITH HTR 1160 AND THE RADIATION EXPOSURE CONNECTED WITH ITS OPERATION. PHASE 1. 2762 (JAERI-M--8063) USE OF LOW ENRICHED URANIUM FUEL CYCLE IN HIGH TEMPERATURE GAS-COOLED REACTORS. (Japan Atomic Energy Research Inst., Tokyo). Jan 1979. 60p. NTIS (US Sales Only), PC A04/MF A01.

In Japan, research and development of the experimental multipurpose VHTR (Very High Temperature gas-cooled Reactor) have been carried out with aiming at application of the reactor to process heat. The reactor employs the LEU fuel cycle because the cycle is compatible with the LWR-FBR line calling for Pu recycle in Japan. On the basis of the experience gained from these works and the above philosophy of fuel cycle, core models are constructed for commercial high temperature gas-cooled reactors (HTGR) with thermal output of 3000 MW, and the material balances of the reactor and the fuel cycle system are studied. Two core models are assumed for comparison; one is a VHTR with an outlet temperature of 1000°C for process heat application and the other a steam cycle HTGR with an outlet temperature of 750°C. Material balances are estimated for each model, which are uranium requirements during the life of 30 years, separative work, plutonium productions, generations of fission products (including ^{3}H and ^{14}C). The results are compared with each other and with LWR data. The comparison indicates that the savings of separative work and uranium requirements are larger in VHTR than in HTGR and that uranium requirements and plutonium productions per unit electric output are smaller in these HTR's than in LWR's. should be recycled to LWR's or FBR's, the integrated system of the fuel cycle consisting of fabrication of fuels, reprocessing and waste management are studied. In addition, the status and R and D requirements of each process are surveyed and some processes are also assessed from the viewpoints of proliferation resistance and environmental impact.

2763 (Juel--1603) INVESTIGATIONS ON THE GENERATION OF ACTINIDES IN THE HIGH TEMPERATURE REACTOR. Mirza, N. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung; Technische Hochschule Aachen (Germany, F.R.)). Jul 1979. 111p. (In German). NTIS (US Sales Only), PC A07/MF A01.

Thesis.

The actinides, especially the long lived α-emitters, generated in a fuel cycle, demand a safe storage of the nuclear waste due to their high contribution to the total radioactivity. In this work it has been investigated whether a possible limitation of actinide production can be achieved in the inner fuel cycle by means of proper arrangements and strategies. Concerning this problem a mathematical comparison of different HTR fuel cycles indicates that the Th-U cycle is the most suitable since it has relatively good conversion rate. A special feature of the Th-cycle is that an almost negligible small fraction of 100 ppm of Th-230 in Th-232 produces a considerable amount of U-232. This serves as the mother substance of further α-emitters like Th-228 and Ra-224 leading to a high level of γ-radiation. A combined HTR system of a conventional reactor and a near breeder has been investigated mathematically regarding its radioactive waste. The elements Pa, Np, Am and Cm as well as a 1% loss of Th, U and Pu pass into the waste during fuel reprocessing. However, due to the simultaneous operation of both reactors such an α-waste presents only a moderately higher level of radioactivity than that of the natural uranium used for this purpose. Furthermore, calculations have shown that in case nuclear energy is exclusively applied to meet the demand of the world population, by the help of described strategy the permanently growing nuclear waste would never reach the present level of radioactivity caused by all the natural uranium reserves.

2764 (UJV--4666-CH) PROCESSING OF SPENT NUCLEAR FUEL FROM HTGR REACTORS. REVIEW OF CURRENT STATE OF ART. Sraier, V. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Jan 1979. 26p. (In Czech). Dep. NTIS (US Sales Only), PC A03/MF A01.

A review is presented of problems connected with the regeneration of irradiated HTGR fuel and of the present status of regeneration process and equipment development. In addition to irradiated fuel regeneration and waste management, attention is paid to possible fuel cycles (the most significant is the Th-^{233}U fuel cycle).

2765 WYLFA DRY STORE. Maxwell, E.O.; Deacon, D. Nuclear Energy (Formerly Nuclear Energy Engineer) ; 19: No. 1, 41-51(Feb 1980).

The world's first air-cooled dry store for irradiated Magnox fuel elements has been built and commissioned at Wylfa nuclear power station. A second identical store is in its construction phase. Each new store has a capacity of 350 t of uranium. Irradiated fuel discharged from the reactors is stored in the existing CO_2 cooled dry store cells for a period of 150 days before it is transferred for storage in an air-cooled store. Safety

philosophy and design principles are discussed. Details are given of plant layout, design and operation development work and is described.

2768 ACCELERATOR MOLTEN-SALT BREEDER REACTOR. Furukawa, K.; Kuroi, H.; Kato, Y.; Oomichi, T. (to Japan Atomic Energy Research Inst., Tokyo). Japanese Patent 1954-120,399/A/. 18 Sep 1979. 3p. (In Japanese).
Purpose: To obtain fission products and to transmute transuranium elements and other radioactive wastes by the use of Accelerator Molten-Salt Breeder Reactor. Constitution: Beams from an accelerator pipe at one end of a target vessel is injected through a window into target molten salts filled inside of the target vessel. The target molten salts are subjected to pump recycling or spontaneous convection while forcively cooled by blanket molten salts in an outer vessel. Then, energy is recovered from the blanket molten salts or the target molten salts at high temperatures through electric power generation or the like. Those salts containing such as thorium 232 and uranium 238 are used as the blanket molten salts so that fission products may be produced by neutrons generated in the target molten salts. $PbCl_2$-PbF_2 and LiF-BeF_2-ThF_4 can be used as the target molten salts and as the blanket molten salts respectively.

2769 DEVICE FOR THE STORAGE OF IRRADIATED OR SPENT FUEL ELEMENTS FROM HIGH TEMPERATURE NUCLEAR REACTORS. Klein, D.; Pirk, H. (to Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,730,729/A/. 25 Jan 1979. 7p. (In German).
The intermediate storage space for the fuel elements of the THTR consists of a concrete chamber, in which there is a storage framework on a baseplate provided with ventilation ducts, which is made as a pipework framework, and which contains the fuel element containers. The walls of the concrete chamber are surrounded by an intermediate space on the outside, which has ambient air flowing through it with natural draught. The ambient air is led in and out through inlet and outlet ducts respectiveley for cooling the concrete the chamber and therefore the fuel elements. The concrete chamber itself is surrounded by further concrete shielding.

2770 ENCAPSULATION OF MAGNOX TYPE FUEL ELEMENTS FOR EXTENDED STORAGE IN COOLING PONDS. Baker, D.W.C.; Burt, G.A. (Central Electricity Generating Board, London (UK)). pp 269-289 of Compte rendu du seminaire de l'AEN sur le stockage des elements combustibles irradies. Paris, France; OECD (1978).
From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).
A method of encapsulating spent fuel elements in a protective plastics medium to enable them to be stored for protracted periods under water, without risk of further significant corrosion, has been developed. It is visualised that the elements after discharge from the reactor would be allowed to cool under water for a period of at least 100 days and would then be encapsulated while remaining immersed. A suitable two pack system based on a solvent free epoxy resin cured with an aromatic amine adduct has been identified. The equipment and processes which have been developed for handling, conditioning and encapsulating the fuel are described.

2771 RADIOLOGICAL ASPECTS OF THE DESIGN OF A FACILITY TO SOLIDIFY RADIOACTIVE SLUDGE. Smitton, C. (Central Electricity Generating Board, Manchester (UK). Scientific Services Dept.); Williams, W.M. (Central Electricity Generating Board, Gwynedd (UK). Trawsfynydd Power Station). pp 143-150 of Radiation protection in nuclear power plants and the fuel cycle. Volume 1. London, England; British Nuclear Energy Society (1978).
From Conference on radiation protection in nuclear power plants and the fuel cycle; Bristol, UK (27 Nov 1978).
Corrosion of irradiated magnox fuel in the cooling ponds at Trawsfynydd Power Station led to an accumulation of radioactive sludge. It was necessary to solidify this sludge in a concrete matrix prior to transport and disposal off-site. The radiological aspects of the design philosophy of the solidification plant are described together with relevant aspects of the design, construction, commissioning, safety assessments and anticipated mode of operation.

2772 Stockage des elements combustibles irradies. (STORAGE OF SPENT FUEL ELEMENTS). Paris, France; OECD (1977). vp. (In French). (CONF-780658--).
From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).
Separate abstracts have been prepared for items within the scope of the energy data base. (FS)

Power Reactors, Non-Breeding, Otherwise Moderated or Unmoderated

2773 (AECL--6534) DEVELOPMENT OF TECHNIQUES FOR RADWASTE SYSTEMS IN CANDU POWER STATIONS.

Bourns, W.T.; Buckley, L.P.; Burrill, K.A. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Apr 1979. 26p. (CONF-790374--2). Dep. NTIS (US Sales Only), PC A03/MF A01.

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

Techniques to reduce the volume of CANDU reactor wastes and to bituminize them are being developed at Chalk River Nuclear Laboratories (CRNL). Reverse osmosis is suitable for initial purification of dilute radioactive aqueous wastes. Tubular membranes are used to concentrate wastes to 5 wt % solids, and while the membranes do foul, they may be cleaned mechanically, chemically, or with fresh feed. A wiped-film evaporator then concentrates the retentate to a 20 wt % slurry. A twin screw extruder-evaporator has been used to bituminize this slurry, and it will also handle ion exchange resin and dry incinerator ash. Work on a wiped-film evaporator as a bituminizer for various feeds is in progress. More experience in handling solid feeds is needed before work can proceed to the demonstration phase.

2774 (CS-INIS--206, pp 6) FISSION PRODUCT DETERMINATION IN A-1 NUCLEAR POWER PLANT WASTE WATERS. Prochazka, H.; Kabelova, B. (Vyzkumny Ustav Veterinarniho Lekarstvi, Brno-Medlanky (Czechoslovakia)). [nd]. (In Czech).

From 4. colloquium on low level radioactivities; Salasky, Czechoslovakia (13 Sep 1977).

FISSION PRODUCTS;GEIGER-MUELLER COUNTERS;LI-DRIFTED GE DETECTORS;LIQUID CONTAMINATION MONITORS;LIQUID WASTES;RADIOACTIVE EFFLUENTS; BOHUNICE A-1 REACTOR;SOLID SCINTILLATION DETECTORS

2775 (IAEA-R--1710-F) COLLECTION OF GAMMA SPECTRA DATA AND CORRELATED ISOTOPIC DATA OF IRRADIATED MIXED OXIDE FUEL AND STUDY OF THE APPLICABILITY FOR SAFEGUARDS. FINAL REPORT FOR THE PERIOD 1 DECEMBER 1975 - 31 MARCH 1979. Natsume, H. (International Atomic Energy Agency, Vienna (Austria)). Jan 1980. 45p. NTIS (US Sales Only), PC A03/MF A01.

Gamma-ray spectrum data were obtained by means of non-destructive measurements with a Ge(Li) detector and associated equipment set up in a spent fuel storage pool at JPDR on a PuO_2 - UO_2 fuel rod taken out of an instrumented fuel assembly, IFA-159, which had been irradiated in the Halden Boiling Water Reactor (HBWR). Calibration of the non-destructive measurement was made based on the results of the destructive chemical analysis carried out on the ten samples. The chemical analysis results about uranium, neptunium, plutonium, americium, curium, neodymium and the gamma-ray emitting fission products are presented, as well as the values of burnup determined from those results. Procedures of the chemical analysis are also described in details.

2776 (IAEA-R--1733-F) INVESTIGATION OF TECHNIQUES FOR THE APPLICATION OF SAFEGUARDS TO A CONTINUOUSLY FUELLED REACTOR. FINAL REPORT FOR THE PERIOD 1 DECEMBER 1975 - 30 SEPTEMBER 1977. Hodgkinson, J.G.; Head, D.A. (International Atomic Energy Agency, Vienna (Austria)). Mar 1978. 10p. NTIS (US Sales Only), PC A02/atMF A01.

The following three areas of prime safeguards concern are analyzed: 1) at the reactor face, where spent fuel is first removed from the channel, 2) along the system for transporting spent fuel from the reactor to the storage bay, and 3) in the spent fuel storage bay. The program is designed to develop techniques and instruments to safeguard these areas.

2777 (N--79-22876) GAS CORE REACTORS FOR ACTINIDE TRANSMUTATION. ANNUAL REPORT. Clement, J.D.; Rust, J.H.; Wan, P.T.; Chow, S. (Georgia Inst. of Tech., Atlanta (USA). School of Nuclear Engineering). 1 Apr 1979. 75p. NTIS PC A04/MF A01.

The preliminary design of a uranium hexafluoride actinide transmutation reactor to convert long-lived actinide wastes to shorter-lived fission product wastes was analyzed. It is shown that externally moderated gas core reactors are ideal radiators. They provide an abundant supply of thermal neutrons and are insensitive to composition changes in the blanket. For the present reactor, an initial load of 6 metric tons of actinides is loaded. This is equivalent to the quantity produced by 300 LWR-years of operation. At the beginning, the core produces 2000 MWt while the blanket generates only 239 MWt. After four years of irradiation, the actinide mass is reduced to 3.9 metric tonnes. During this time, the blanket is becoming more fissile and its power rapidly approaches 1600 MWt. At the end of four years, continuous refueling of actinides is carried out and the actinide mass is held constant. Equilibrium is essentially achieved at the end of eight years. At equilibrium, the core is producing 1400 MWt and the blanket 1600 MWt. At this power level, the actinide destruction rate is equal to the production rate from 32 LWRs.

2778 REPORT OF THE TECHNOLOGICAL STUDY WORKING GROUP OF THE AEC COMMITTEE ON DEVELOPMENT OF ADVANCED POWER REACTORS. No. 110, 30-79(May 1979). (In Japanese).

Emphasis in the studies of the technological study working group of the AEC Committee on Development of Advanced Power Reactors was placed on the appreciation of current state of affairs in the technology of the advanced thermal reactor of Japan, CANDU reactors of Canada, and Pu utilization in LWRs, and on the exposure of problems in their usage for the nuclear power generation in Japan. The differences in the development stage and progress, the reactor types (D_2O, and light water), and the safety aspect were taken into consideration. The following matters are described: fundamental points of view; the advanced thermal reactor of Japan (development program, development of the demonstration reactor, the technological features of the demonstration reactor, and the developments in associated fields); CANDU reactors of Canada (600 MW standard-design reactors, technological features, compatibility with Japanese standards, and the developments in associated fields); Pu utilization in LWRs (significance, technology, and research/development); and conclusions.

2779 ENVIRONMENTAL ASPECTS OF TRITIUM FROM CANDU STATION RELEASES. Gorman, D.J.; Wong, K.Y. (Ontario Hydro, Toronto (Canada)). pp 623-633 of Behaviour of tritium in the environment. Vienna: International Atomic Energy Agency (1979).

From Symposium on the behavior of tritium in the environment; San Francisco, CA, USA (16 Oct 1978).

The sources, production and releases of tritium in gaseous and liquid effluents from CANDU stations as well as applicable regulatory and derived emission standards are discussed. To assess the environmental impact of these

releases, Ontario Hydro has been carrying out an environmental monitoring programme at all nuclear generating sites since 1971. The programme monitors critical and potentially important pathways and consists of monitoring tritium in air, precipitation, milk, drinking water and vegetation. Tritium releases from stations are of the order of 0.1% of the derived release limits leading to doses to individuals in the vicinity of the stations of about 1 mrem/a^{-1}. The environmental impact from an expanded CANDU programme is discussed. The effects on the Great Lakes basin are of particular importance since it is expected that the bulk of Ontario Hydro's future nuclear sites will be located along the shores of the Great Lakes. The implication of the recently promulgated International Joint Commission water quality objective is examined.

2780 SAFEGUARDS SCHEME FOR 600-MW CANDU GENERATING STATIONS. Tolchenkov, D.; Honami, M.; Jung, D. (International Atomic Energy Agency, Vienna (Austria)); Smith, R.M.; Vodrazka, P. (Atomic Energy of Canada Ltd., Mississauga, Ontario); Head, D.A. (Atomic Energy Control Board, Ottawa, Ontario (Canada)). pp 407-423 of Nuclear safeguards technology 1978. Vol. 1. Vienna, Austria; International Atomic Energy Agency (1979).

From IAEA symposium on nuclear material safeguards; Vienna, Austria (2 Oct 1978).

The on-power fuelling of CANDU reactors results in the continual discharge of spent fuel and input of fresh fuel, a feature which poses some unique safeguarding problems. This paper presents one possible safeguards approach for the CANDU 600-MW PHWR, developed by Atomic Energy of Canada Limited (AECL), Atomic Energy Control Board (AECB) and the International Atomic Energy Agency (IAEA). The safeguards approach suggested in this paper is based on the use of item accounting of fuel bundles and containment/surveillance measures. It enables the IAEA to meet its objective of the timely detection of the diversion of significant quantities of nuclear material. An inspection scenario, including the frequency of inspection and the inspection activities which could be used, is presented to indicate the function of various items of safeguards equipment in the scheme, although other frequencies and procedures can be equally valid.

2781 CONTAINMENT VESSEL, ITS AUXILIARY SYSTEM AND PLANT AIR CONDITIONING SYSTEM OF ADVANCED THERMAL REACTOR FUGEN. Kon-ya, K. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)); Usui, K. Doryokuro Giho (Power Reactor Technology (Tokyo)) ; No. 28, 41-98(Nov 1978). (In Japanese).

The functional requirement for, the design and the construction of, and the functional test on the containment vessel, its auxiliary system, the plant air conditioning and ventilation system of the advanced thermal reactor, Fugen, are described in detail. The main specifications of the containment vessel are as follows: The type enclosed cylinder, the maximum operating pressure 1.35 kg/cm^2g, the maximum operating temperature 100 deg C, the leak rate 0.4%/day, the inner diameter 36 m. The height 64 m, the volume 40,900 m^3, and the material JIS G3118, SGV-49. The containment vessel is provided with an hatch of 5 m diameter for carrying equipments in two air locks, many high and low voltage cable penetrations, pipe penetrations, a transfer shoot and isolation values. The functions and the specifications of the containment vessel and its auxiliary equipments are explained. The relating auxiliary systems are composed of the containment vessel spray system, the pool facility for steam blow-down, the recirculation system for the air in the vessel, the annulus evacuation system and its pressure control devices, the pressure measuring instruments and pressure relief valves and the temperature measuring devices for the containment vessel, and the object, function, layout and installation of these systems are explained. Concerning the air conditioning system, each main building has the special subsystem, and they are introduced. The progress stage of construction works and the procedure and results of the functional test at the site are described. (Nakai, Y.).

2782 CANDU STORY. Pon, G.A. (Atomic Energy of Canada Ltd., Sheridan Park, Ontario. Power Projects). In-Site ; 1: No. 10, 48-50(Oct 1978).

Some history of the CANDU reactor program is presented along with considerable emphasis on present and future construction and export programs. Radioactive waste disposal programs and fuel cycle studies are very briefly touched upon.

2783 PRE-COMMISSIONING OF HEAVY WATER REACTOR 'FUGEN'. Ando, T.; Moriyama, T. (Fuji Electric Co. Ltd., Kawasaki, Kanagawa (Japan)); Mizushima, T. FAPIG (Tokyo) ; No. 90, 2-10(Oct 1978). (In Japanese).

The advanced thermal prototype reactor ''Fugen'' is a heavy water-moderated, boiling light water-cooled reactor constructed by Power Reactor and Nuclear Fuel Development Corp. in Tsuruga City, and it was developed for the first time independently in Japan. The electric power output is 165 MW, and its features are good neutron economy, diversity of usable fuel and small amount of required uranium, and easy replacement of fuel. It is intended to develop toward the design and construction of a next larger reactor by accumulating operational experiences and technologies regarding heavy water moderated reactors. The main installations, of which FAPIG has taken charge, are the fuel-handling and storage facility, the technological safety protection facility, the radioactive waste treatment facility, the radiation monitoring system, and the broken fuel detection system. The object of precommissioning test is to prove the overall performance of the plant so that it is sufficiently safe to load the core with fuel by carrying out the function-proving test of each facility or system and the system combination test. The ranking, basic plan, execution plan, organization and the content of the precommissioning test on the main facilities ordered from FAPIG are described. Various problems arose during the test, but they were solved satisfactorily, and the test of raising the output power is in progress now.

2784 PRE-COMMISSIONING TEST OF HEAVY WATER REACTOR ''FUGEN''. Andoh, T.; Moriyama, T. (Fuji Electric Co. Ltd., Kawasaki, Kanagawa (Japan)); Kushima, T. Fuji Jiho (The Fuji Electric Journal) ; 51: No. 9, 474-481(Sep 1978). (In Japanese).

The advanced thermal prototype reactor ''Fugen'' is a power-generating reactor of heavy water moderated, boiling light water cooled, pressure tube type, and is constructed in Tsuruga City by Power Reactor and Nuclear Fuel Development Corporation. It has been developed independently in Japan, and the electric power output is rated at 165 MW. The features of Fugen are good neutron economy, the diversity of usable fuel, the small amount of

required uranium as compared with LWRs, and the construction of easy fuel exchange. The design and construction of the demonstration reactor are expected after accumulating the operational experience and obtaining the technological data. The object of pre-commissioning test is to confirm the overall performance of the plant so that it is sufficiently safe to charge the core with fuel. The basic and practical plans of the pre-commissioning test and the contents of the test are explained. Fuji Electric Co., Ltd. carried out the tests on fuel-handling equipments, waste treatment facilities, technological safety and protection equipments, radiation-monitoring equipments and broken fuel detection equipment. Good results were obtained in the tests carried out so far. Several problems occurred during the tests, but they were solved satisfactorily. The power-up test is under way, and all tests will be completed in March, 1979.

2785 IMPACTS OF REACTOR-INDUCED DEFECTS ON SPENT FUEL STORAGE. Johnson, A.B. Jr. (Battelle Pacific Northwest Labs., Richland, WA (USA)). pp 235-253 of Compte rendu du seminaire de l'AEN sur le stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

Defects arise in the fuel cladding on a small fraction of fuel rods during irradiation in water-cooled power reactors. Defects from mechanical damage in fuel handling and shipping have been almost negligible. No commercial water reactor fuel has yet been observed to develop defects while stored in spent fuel pools. In some pools, defective fuel is placed in closed canisters as it is removed from the reactor. However, hundreds of defective fuel bundles are stored in numerous pools on the same basis as intact fuel. Radioactive species carried into the pool from the reactor coolant must be dealt with by the pool purification system. However, additional radiation releases from the defective fuel during storage appear to be minimal, with the possible exception of fuel discharged while the reactor is operating (CANDU fuel). Over approximately two decades, defective commercial fuel has been handled, stored, shipped and reprocessed.

2786 MONITORING OF GASEOUS EFFLUENTS IN ONTARIO HYDRO. Kabat, M.J. pp 45-53 of Monitoring of airborne and liquid radioactive releases from nuclear facilities to the environment. Vienna, Austria; International Atomic Energy Agency (1978).

A method for generating hypoiodous acid was developed for the purpose of ventilation filter testing. A selective iodine species sampler was also developed and used for the selective sampling of iodine species in Candu power station areas. It is now possible to perform an analysis of iodine species in gaseous effluents when a significant iodine release occurs.

2787 NUCLEAR ENERGY IN OUR TIME. Jervis, R.E.; Hewitt, J.S. (Toronto Univ., Ontario (Canada)). pp 101-131 of Our energy options. Seven important aspects of electric power planning examined by well-known authorities. Toronto, Canada; Royal Commission on Electric Power Planning (1978).

A layman's guide to nuclear power is presented, with particular emphasis on the history and characteristics of the Canadian nuclear program.

2788 MANAGEMENT OF RADIOACTIVE WASTE FROM RAJASTHAN ATOMIC POWER STATION. Balu, K.; Bhatia, S.C.; Ali, S.S. (Bhabha Atomic Research Centre, Bombay (India)). pp 358-362 of Operating experience of nuclear reactors and power plants. Bombay, India; Department of Atomic Energy (1977).

From Symposium on operating experience of nuclear reactors and power plants; Bombay, India (7 Feb 1977).

Handling of radioactive waste from the Rajasthan Atomic Power Station, India, over the last 4.5 years is explained. The experiences encountered are rather unique and serious since RAPP is an inland station, where the criteria for environmental discharges are more stringent. The wastes are handled either as primary systems waste or as waste from secondary service facilities. The present waste management practices followed in either case are described in detail. The volume of waste handled and the gross activity level are reported. Problems likely to be encountered in future especially in the spent resin/filter cakes generated from the SFSB, moderator or the PHT system are also discussed, along with the remedial actions planned.

2789 RADIOACTIVE SOLID WASTE MANAGEMENT AT TROMBAY. Jayaraman, A.P.; Balu, K. pp 363-370 of Operating experience of nuclear reactors and power plants. Bombay, India; Department of Atomic Energy (1977).

From Symposium on operating experience of nuclear reactors and power plants; Bombay, India (7 Feb 1977).

The Radioactive solid waste management programme at BARC, India during 1965-1975 is described in detail. The operational experience, which includes the handling treatment and disposal of these solid wastes is reported alongwith the special problems faced in the case of large volume low hazard potential wastes from the nuclear fuel cycle.

2790 CANADIAN NUCLEAR POWER PROGRAM. Foster, J.S. (Atomic Energy of Canada Ltd., Ottawa, Ontario). Canadian Electrical Engineering Journal ; 1: No. 1, 3-14(Jan 1976).

Nuclear-electric generating stations, predominantly the 2000 MWe Pickering station near Toronto, currently produce 5 per cent of Canada's electric energy. By the year 2000 nuclear plants will probably supply more than 40 per cent of the country's electricity. The CANDU system, featuring pressure tube reactors, heavy water moderator and natural uranium fuel, is the preferred type and will remain so for many years to come. Envisaged is the evolutionary development of the CANDU fuel cycle to embrace the use of thorium and thereby extend nuclear fuel resources by a matter of centuries. The history of the Canadian nuclear power program, its present status and future outlook are reviewed, as are the safety and environmental aspects of nuclear power.

Power Reactors, Breeding

2791 (BNL--50991, pp 287-295) REACTOR APPLICATION OF ACTINIDE CROSS SECTION DATA. Beaman, S.L.; Cowan, C.L. (General Electric Co., Sunnyvale, CA). May 1979.

From Conference on the nuclear data of higher plutonium and americium isotopes for reactor applications; Upton, NY, USA (20 Nov 1978).

Uncertainties in the cross section data for the higher plutonium and americium isotopes

have been investigated to determine their impact on the important LMFBR design parameters. The results of this investigation have indicated that the design calculations are sensitive to the uncertainties in the capture and fission data for ^{240}Pu and ^{241}Pu, and for long-term design applications these uncertainties should be reduced to less than about 10%. The uncertainties in the data for ^{242}Pu and for the americium isotopes have only a small impact on the fast reactor design studies but may be important in the development of schemes for the management of actinide waste discharge and for plutonium burnout.

2792 (SAND--78-2317) DEVELOPMENT OF BORON CARBIDE-COPPER CERMETS. STATUS REPORT. (Sandia Labs., Albuquerque, NM (USA)). Sep 1979. Contract EY-76-C-04-0789. 58p. Dep. NTIS, PC A04/MF A01.

The status of a program to develop a B_4C-Cu cermet for Breeder Reactor spent-fuel shipping cask neutron shields is presented. It is shown that inspectable 6 to 7 cm thick 60 to 70 volume percent B_4C cermets can be fabricated using hot isostatic powder processing procedures. An alternative manufacturing method, rheocasting, also appears to be a promising, perhaps more cost-effective method for producing these cermets. Recommendations for further development of these manufacturing processes are given.

2793 (SAND--79-1366) THERMAL EVALUATION FACILITY FOR LMFBR SPENT FUEL TRANSPORT. Wesley, D.A. (Sandia Labs., Albuquerque, NM (USA)). Apr 1980. Contract AC04-76DP00789. 107p. NTIS, PC A06/MF A01.

A full-scale mock-up of a 217 pin breeder reactor fuel assembly in a cylindrical pipe was initially designed and constructed by Oak Ridge National Laboratory (ORNL). It was transferred to Sandia where it was extensively redesigned and modified. The 217 pin hexagonal core assembly was installed in a smaller diameter stainless steel pipe which more closely represents the diameter of a shipping canister or shipping cask basket wall. Two-hundred four of the tubes are electrically heated over an active length of 4-feet and the remaining thirteen are instrumented with multiple junction thermocouples which can be traversed axially. Thermocouples and heat-flux gauges are located on the hex core and canister perimeters at several axial locations.

2794 FUEL CYCLE IN FAST NEUTRON REACTORS. Guillet, M. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Service de Developpement et d'Essais d'Elements Combustibles). Revue Generale Nucleaire ; No. 6, 647-658(Nov-Dec 1979). (In French).

After discussing the overall fuel in fast neutron reactors, the author successively examines questions relating to the properties and use of plutonium in breeder reactors, fuel materials and transport, handling and storage of radioactive material. He then analyzes re-processing and work presently being done in this field.

2795 POWER PRODUCTION AND ACTINIDE ELIMINATION BY FAST REACTOR RECYCLE. Murphy, D.J. Jr.; Farr, W.M.; Ganapol, B.D. (Univ. of Arizona, Tucson). Nuclear Technology ; 45: No. 3, 299-306(Oct 1979).

Elimination of long-lived transplutonium actinides by fissioning in a generic actinide burner reactor (a reactor fueled solely with waste actinides) was investigated. The results showed that actinide elimination by fissioning is enhanced by increasing the average energy of the neutron flux spectrum. In addition, the reactivity worths and the fission-to-capture rate ratios of the individual actinide nuclides increased with increasing flux spectrum energy. This suggests that specially designed fast reactors of relatively small size and having metal alloy fuel may effectively dispose of the waste actinides produced by several large light water reactors in a mixed reactor community. The fuel value of waste actinides was studied, and the replacement of at least some conventional mixed-oxide fast reactor fuel by waste actinides (to conserve a fuel resource) was proposed. It is calculated that the time required to reach equilibrium actinide concentrations in the reactor core, after many refueling periods, is shorter for reactors having higher neutron flux energies. Also, increasing the specific power density within the reactor core both decreases the equilibrium actinide concentrations in the core and increases the time required for equilibrium conditions.

2796 CONTRIBUTION OF DOUNREAY TO THE DEVELOPMENT OF FAST REACTORS. Blumfield, C.W. (UKAEA Dounreay Nuclear Power Development Establishment). Nuclear Energy (Formerly Nuclear Energy Engineer) ; 18: No. 5, 311-326(Oct 1979).

A review is presented of the fast reactor work performed at Dounreay on fuel and core materials, the reactor system, and fuel reprocessing. The following topics are discussed:-Dounreay's role in the development work on ceramic fuels leading to a specification for PFR fuel; irradiation behaviour of materials, eg., quantification of effects of irradiation in mechanical properties, irradiation creep of stainless steels and work on void swelling; monitoring or reactor components and coolant; investigation of the performance of highly rated fuel under adverse conditions; and testing of oxide fuel elements in PFR. The determination of the behaviour of PFR boiler tubes and the study of the features large leaks, including the sodium-water reaction have been investigated in the large Super-NoaH rig at Dounreay are described. Finally development work for PFR fuel reprocessing is discussed. This includes the dismantling of fuel assemblies, fuel dissolution, volume reduction and segregation of contaminated waste, and treatment of radioactive waste.

2797 FUEL TRANSPORTING DEVICE. Shiratori, H. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 54-99,894/A/. 7 Aug 1979. 2p. (In Japanese).

For a liquid-metal cooled reactor, a method is described of reducing the waiting time of fuel handling apparatuses and shorten the fuel exchange time. A fuel transporting machine is arranged between a reactor vessel and an out-pile storage tank, thereby dividing the transportation line of the pot for contracting fuel and transporting the same. By assuming such a construction, the flow of fuel transportation which has heretofore been carried out through fuel transportation pipes is not limited to one direction but the take-out of fuels from the reactor and the take-in thereof from the storage tank can be carried out constantly, and much time is not required for fuel exchange.

2798 SOME PROBLEMS OF THE RADIATION SAFETY OF

FAST REACTOR FUEL CYCLE. Bakumenko, O.D.; Ikhlov, E.M.; Kulakovskij, M.Ya. Atomnaya Energiya ; 46: No. 6, 378-381(Jun 1979). (In Russian).

Investigated is the main physical parameters of fuel in fast power reactors which determine the radiation situation when handling fuel at various stages of the external fuel cycle, in particular when fuel is fabricated from reprocessed material and spent fuel is transported from a nuclear power plant to a chemical reprocessing plant. Results of calculations can serve as the initial data when designing technological circuits for fabricating fast-reactor fuel from reprocessed material and when transporting spent fuel.

2799 FUEL ASSEMBLIES. Nakatsuka, M. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 54-30,396/A/. 6 Mar 1979. 3p. (In Japanese).

Purpose: To prevent scattering of gaseous fission products released from fuel assemblies stored in an FBR type reactor. Constitution: A cap provided with means capable of storing gas is adapted to amount to the assembly handling head, for example, by way of threading in a storage rack of spent fuel assemblies consisting of a bottom plate, a top plate and an assembly support mechanism. By previously eliminating the gas inside of the assembly and the cap in the storage rack, gaseous fission products upon loading, if released from fuel rods during storage, are stored in the cap and do not scatter in the storage rack. (Horiuchi, T.).

2800 VESSEL FOR SPENT FUEL STORAGE. Nakatsuka, M. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 1954-8294/A/. 22 Jan 1979. 3p. (In Japanese).

Purpose: To safely store fuel rods used in a fbr type reactor and generating internal pressure by fission products and the like after irradiation without failure thereof. Constitution: The spent fuel storage is of a pressure vessel type. Water is used as a pressure medium, and an inert gas such as argon or the like is sealed in a part of said vessel or only the gaseous body is used as a pressure medium. The vessel constituted as above described can retain the pressure up to a value of 20 kg/cm^2. Accordingly, the stress generated in the cladding tube can be made into zero by balance adjusting and controlling the same with the internal pressure within the cladding tube, thereby preventing the failure of the cladding tube in storage.

2801 CASE STUDY TWO. THE FAST BREEDER REACTOR. pp 12-24 of Assessment of technical decisions. Case studies. Braun, E.; Collingridge, D.; Hinton, K. London; Butterworths (1979).

Short descriptions are given of the Magnox type thermal reactor and the sodium cooled fast breeder reactor. The arguments in favour of a UK breeder programme are summarized. The objections are set out at greater length, under the headings: doubts about the energy gap, uranium supplies, reactor safety, reactor siting, protection of radioactive substances (in particular, Pu), waste disposal, proliferation of nuclear weapons, research and development expenditure.

2802 STATUS OF THE SAFEGUARDS SYSTEM DEVELOPED FOR THE LMFBR PROTOTYPE POWER PLANT SNR-300 (KKW KALKAR). Krinninger, H. (Internationale Natrium-Brutreaktor-Bau G.m.b.H., Bergisch Gladbach (Germany, F.R.)); Brueckner, C. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)); Quandt, U.; Ruppert, E. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)); Tschampel, H. (Dr. Seufert GmbH, Karlsruhe, Germany, F.R.); Hulst, P. van der (Schnell-Brueter-Kernkraftwerksgesellschaft m.b.H. (SBK), Essen (Germany, F.R.)). pp 483-506 of Nuclear safeguards technology 1978. Vol. 1. Vienna, Austria: International Atomic Energy Agency (1979).

From IAEA symposium on nuclear material safeguards; Vienna, Austria (2 Oct 1978).

In this report the features of the safeguards system developed for the LMFBR Prototype Power Plant SNR-300 (KKW Kalkar) are described. Due to the fact that LMFBR fuel assemblies are mostly handled in a sodium or inert gas environment, visual control and counting of the assemblies containing nuclear material, as routinely used in a LWR power plant, cannot be applied for LMFBRs. Consequently, for safeguarding the Kalkar Nuclear Power Station, an automatic and continuous monitoring of the fissile material inventory is the main objective of special instrumentation, the "Inaccessible Inventory Instrumentation System" (IIIS). For a qualitative distinction between the various types of assembly the detection of the emitted neutron and gamma radiation turned out to be most adequate. Based upon this conclusion and taking into account its tasks, the IIIS is composed of an activity measurement system, a position-sensing system and a micro-computer system (MCS). The high reliability, high fraud resistance and low maintenance requirements have had an important influence on the IIIS design. Access to IIIS data is protected by special hardware and software measures. To protect the system against the results of power failures the IIIS possesses an automatic restart facility and a battery-buffered power supply for the RAM-unit of the microprocessor system used for data acquisition and evaluation.

2803 SEALED CONNECTION BETWEEN FISSION GAS OUTLET DUCTS. Jung, W.; Peehs, M.; Rau, P.; Krug, W.; Stechemesser, H. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,633,192/C/. 21 Sep 1978. 6p. (In German).

The fuel element of the gas cooled (e.g. helium cooled) fast breeder reactor is conical at the transition to the core support plate and sits in a cone of the core support plate. There is a standard leakage position at this transition point. Through this, a fission gas flow is taken from the fuel element by part of the main coolant gas flow through a duct in the core support plate. The standard leakage position is accommodated in a sealed connection. The connection consists mainly of a capsule. In this there is an annulus with a central hole, which is connected to the duct in the core support plate and the fuel element. The annulus is pressed tightly to the core in the support plate by a compression spring. The play in the annulus is limited by a central pin. A radial hole in the annulus acts as the standard leakage position, which is situated in the connection between the central hole in the annulus and the main coolant gas flow.

2804 OUTLINE OF THE PRELIMINARY WORKING DESIGN (1) OF PROTOTYPE FBR "MONJU". Doryokuro Giho (Power Reactor Technology

(Tokyo)) ; No. 27, 78-104(Aug 1978). (In Japanese).

Following the conceptual design, the preliminary working design (1) of the prototype fast breeder reactor "Monju" has been completed by five industrial firms. The design connects the conceptual design to the actual working design. In this design, therefore, the designs were detailed in coordination of machinery, pipings, wirings, etc. with building structures. Prior to the design, recheck was made on the basis of the results of design studies and research and development, and the specifications were partially modified. It serves also for the purpose of governmental safeguard inspection. The features of the prototype FBR Monju are heat output of 714 MW, electric output of 300 MW, fuel of PuO_2-UO_2, breeding ratio of 1.2, and coolant of sodium. The following matters are described: reactor core, reactor construction, fuel handling system, heat transfer system, steam generating system, turbo-generator system, plant operation mode, electric, instrumentation and control equipments, radioactive waste treatment facility, layout, buildings and containment, etc..

Regulation and Licensing

2805 (INIS-mf--4767) OPERATIONAL SAFETY EXPERIENCE REPORTING IN THE UNITED STATES. Hartfield, R.A. (Nuclear Regulatory Commission, Washington, DC (USA)). 1978. 10p. (CONF-781022--68). Dep. NTIS (US Sales Only), PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

Licensees of nuclear power plants in the United States have many reporting requirements included in their technical specifications and the code of federal regulations, title 10. The Nuclear Regulatory Commisson receives these reports and utilizes them in its regulatory program. Part of this usage includes collecting and publishing this operating experience data in various reports and storing information in various data systems. This paper discusses the data systems and reports on operating experience published and used by the NRC. In addition, some observations on operating experience are made. Subjects included are the Licensee Event Report (LER) Data File, the Operating Unit Status Report (Gray Book), Radiation Exposure Reports, Effluents Reports, the Nuclear Plant Reliability Data System, Current Events, Bulletin Wrapups and Annual Summaries. Some of the uses of the reports and systems will be discussed. The Abnormal Occurence Report to the US Congress is described and discussed.

2806 (NUREG/CP--0008) STATE WORKSHOPS FOR REVIEW OF THE NUCLEAR REGULATORY COMMISSION'S DECOMMISSIONING POLICY. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Standards Development). Dec 1979. 520p. (CONF-7909106--; CONF-7909107--). NTIS.

From State workshop of review of the Nuclear Regulatory Commission's decommissioning policy; Seattle, WA, USA (25 Sep 1979).

Separate abstracts are included for each presentation concerning the US NRC policies on the decommissioning of nuclear power plants, fuel fabrication plants, fuel reprocessing plants, and radioactive waste burial sites.

2807 (NUREG/CP--0008, pp 375-399) SUGGESTED POLICY AND RULE CHANGES. Calkins, G.D. Dec 1979.

From State workshop of review of the Nuclear Regulatory Commission's decommissioning policy; Seattle, WA, USA (25 Sep 1979).

Preliminary thoughts on regulatory changes for decommissioning are presented. The technical reports from Battelle, Pacific Northwest Laboratory, the preliminary staff studies on financial assurance and radioactive residues, and the preliminary draft generic environmental impact statement of Carl Feldman are the sources of information.

2808 (NUREG/CP--0008, pp 137-157) BOILING WATER REACTOR. Smith, R.I. Dec 1979.

From State workshop of review of the Nuclear Regulatory Commission's decommissioning policy; Seattle, WA, USA (25 Sep 1979).

The preliminary results are presented from the boiling water reactor analyses which are still going on. The questions that are presented in the addendum to the original pressurized water study are discussed.

2809 (NUREG/CP--0008, pp 164-194) PRESSURIZED WATER REACTOR ADDENDUM. Smith, R.I. Dec 1979.

From State workshop of review of the Nuclear Regulatory Commission's decommissioning policy; Seattle, WA, USA (25 Sep 1979).

The Trojan plant located near Portland, Oregon, a 1175 megawatt machine with a four-loop Westinghouse nuclear steam supply system, is analyzed in terms of decommissioning.

2810 (NUREG/CP--0008, pp 268-306) RESIDUAL RADIOACTIVITY. Battist, L. Dec 1979.

From State workshop of review of the Nuclear Regulatory Commission's decommissioning policy; Seattle, WA, USA (25 Sep 1979).

The establishment of a standard concerning the acceptable residual radioactivity for a decommissioned nuclear facility is described. The nuclear facilities discussed include nuclear power plants, fuel fabrication plants, fuel reprocessing plants, and radioactive waste burial grounds.

2811 (NUREG/CP--0008, pp 314-371) GENERIC ENVIRONMENTAL IMPACT STATEMENT. Feldman, C. Dec 1979.

From State workshop of review of the Nuclear Regulatory Commission's decommissioning policy; Seattle, WA, USA (25 Sep 1979).

NRC is reexamining its policy and rule-making concerning decommissioning, and that can have a major impact on the quality of the environment, and, therefore, an environmental impact statement is required. The technical alternatives, and the major environmental impacts are discussed.

2812 (STI/PUB--500) DECOMMISSIONING OF NUCLEAR FACILITIES. (International Atomic Energy Agency, Vienna (Austria)). Jul 1979. 706p. (CONF-781180--). IAEA.

From International symposium on the decommissioning of nuclear facilities; Vienna, Austria (13 Nov 1978).

Information on the decommissioning of nuclear facilities is presented under the following main topics: policy and standards development; engineering considerations to decommissioning; radiological release considerations and waste classification; decommissioning experience; and decontamination and remote operations.

2813 PARTICIPATION OF THE PUBLIC IN THE

LICENSING PROCEDURE UNDER SECTION 6 OF THE ATOMIC ENERGY ACT. LICENSING PROCEDURE FOR INTERMEDIATE STORAGE. Strassburg, W. (Deutsche Gesellschaft fuer Wiederaufarbeitung von Kernbrennstoffen m.b.H. (DWK), Hannover (Germany, F.R.)). Atomwirtschaft, Atomtechnik ; 25: No. 5, 254-258(May 1980). (In German).

The licensing procedure under Section 6 of the German Atomic Energy Act, which must be carried out also for temporary storage facilities for spent nuclear fuels, does not provide for a participation by the public. However, political demands want a broad public involvement in this procedure to be established. This political demand would mean a loss of the simplicity of the licensing procedure under Section 6 and the flexibility attached to it. In a positive vein, this could be regarded as an accelerating factor, it it helped to avoid legal disputes at some later date, as is the case with Section 7 of the Atomic Energy Act. However, despite the participation of the public in a procedure under Section 6 as applied to the temporary spent fuel storage facility, nobody would be prevented from raising objections in the current procedure which he could have submitted in writing during the phase of public display.

2814 STATUS OF SPENT-FUEL STORAGE POOL APPLICATIONS. Carter, T.J. (Nuclear Regulatory Commission, Washington, DC). Transactions of the American Nuclear Society ; 32: 677-678(Jun 1979). (CONF-790602--(Summ.)).

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

2816 DECOMMISSIONING NUCLEAR POWER PLANTS: WHAT ARE THE PROBLEMS THAT NEED TO BE OVERCOME. Martin, A. (Associated Nuclear Services, London (UK)). Nuclear Engineering International ; 24: No. 286, 37-42(Jun 1979).

Increasing attention is being given nationally and internationally to the treatment of redundant nuclear power stations. Useful, if limited, practical experience has been gained in decommissioning research reactors, and development programmes are being undertaken well in advance of actual need into the problems of decommissioning commercial plants. This broad survey of the main issues involved looks at the radioactive inventory, costs, waste disposal, site considerations, time scales, regulatory requirements and plant design. It concludes that on balance the preferred choice may be to defer final dismantling of the reactor except in special cases.

2817 RADIOACTIVE MATERIALS IN CALIFORNIA. Johnson, H.D. Sacramento, CA: Resources Agency (1979). 599p. (NP--24441).

The Task Force has focused on four broad issue areas. In each case an effort has been made to identify the State and Federal agencies with jurisdictional responsibilities, and to determine the nature of current regulatory programs. These issue areas are: state regulation of users of radioactive materials; environmental surveillance and radiation monitoring; decontamination and decommissioning of facilities (including nuclear power plants) at which radioactive materials are used; and transportation of radioactive materials. The Task Force has also conducted a cursory examination of a number of issues relevant to nuclear power plants. These issues are: nuclear power plant emergency plans; low-level radioactive waste disposal; high-level radioactive waste disposal; spent fuel storage; and reactor safety.

2818 RADIOACTIVE MATERIALS IN CALIFORNIA. Sacramento, CA; Resources Agency (1979). 149p. (NP--24441(Exec.Summ.)).

Information on the State of California regulations related to radioactive materials is presented concerning radioactive materials at nonpower facilities; nuclear power plants and radioactive wastes; environmental surveillance and radiation monitoring; decommissioning and decontamination of radioactive facilities; and transportation of radioactive materials.

2819 APPLICATION FOR A LICENSE FOR COMPACT STORAGE OF SPENT FUEL ELEMENTS IN BLOCK 1 OF PHILIPPSBURG NUCLEAR POWER PLANT AND GK NECKAR NUCLEAR POWER PLANT. GRS (Gesellschaft fuer Reaktorsicherheit) Kurz-Information, Reihe E ; No. 22, 1(1979). (In German).

FUEL POOLS;LICENSING;NECKAR REACTOR; PHILIPPSBURG-1 REACTOR;SPENT FUEL STORAGE

2820 MATERIALS ON ATOMIC ENERGY PROBLEMS. Kollert, R. Frankfurter Hefte. Zeitschrift fuer Kultur und Politik ; 34: No. 3, 10-12(1979). (In German).

The author cites and comments legal opinions on problems of atomic energy, i.e. the decision of the Federal Constitutional Court concerning kalkar and the plutonium economy; Judges of the Federal Constitutional Court on technology and hazards; the 'atomic state'; plutonium at Gorleben; a new safty philosphy after Harrisburg; salt domes unsuitable for atomic waste.

2821 ALTERATION OF REACTOR INSTALLATIONS (UNIT 1 AND 2 REACTOR FACILITIES AND SPENT FUEL DISPOSAL) IN HAMAOKA NUCLEAR POWER STATION OF THE CHUBU ELECTRIC POWER CO., LTD. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 7, 2-5(Sep 1978). (In Japanese).

A report of the Committee on Examination of Reactor Safety to the Atomic Energy Commission of Japan concerning the alterations of reactor installations in Hamaoka Nuclear Power Station of The Chubu Electric Power Co., Ltd. is presented. Their safety was confirmed. The alterations are as follows. For disposal of radioactive solid wastes (from both Unit 1 and 2): the capacity of the solid waste storage is increased; tanks storing powder resin in condensate system are installed; a miscellaneous solid waste storage is installed; an incinerator burning miscellaneous combustible solid wastes is installed; and a site bunker for storing spent in-core structures is installed. In the condensate desalting equipment (for Unit 2), a filtration desalting system is installed. In the reactor containment facility (Unit 1), a system for controlling inflammable gas concentration is installed.

2822 ALTERATION OF REACTOR INSTALLATION (UNIT 1 REACTOR FACILITY) IN FUKUSHIMA NUCLEAR POWER STATION NO. 2 OF THE TOKYO ELECTRIC POWER COMPANY, INC. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 7, 5-6(Sep 1978). (In Japanese).

A report of the Committee on Examination of Reactor Safety to the Atomic Energy Commission of Japan concerning the alteration of reactor installation in Fukushima Nuclear Power Station No. 2 of The Tokyo Electric Power Company, Inc. is presented. Its safety was confirmed. The alteration is as follows. Capacity of the spent fuel storage is increased to about 230% as much as the amount of reactor core from the previous capacity of about 140%. Instead of the conventional type, the control rods each with a stainless steel follower are used. For flow control in coolant recirculation, the means of controlling the speed of recirculation pumps is used instead of flow control valves. Of the systems controlling gas concentration in containment vessels, an inert gas system is abolished.

2823 ALTERATION OF REACTOR INSTALLATION (ADDITION OF UNIT 2) IN THE FUKUSHIMA NUCLEAR POWER STATION NO. 2 OF THE TOKYO ELECTRIC POWER COMPANY, INC. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 6, 3-43(Aug 1978). (In Japanese).

A report of the Committee on Examination of Reactor Safety to the Atomic Energy Commission of Japan concerning the alteration of reactor installation is presented. Its safety was confirmed. The alteration of reactor installation in Fukushima Nuclear Power Station No. 2, The Tokyo Electric Power Company, Inc., is addition of Unit 2 as follows. Adjoining to Unit 1 now under construction, the power plant Unit 2 is installed, which is the same type and power output as Unit 1, i.e. a BWR type with enriched uranium fuel, light water moderated and cooled, having heat output of 3,300 MW and electric output of 1,100 MW. It consists of reactor proper, reactor cooling system facility, reactor containment facility, nuclear fuel material handling and storage facilities, instrumentation/control system facilities, radioactive waste disposal facility and radiation control facility.

2824 REPORT ON INSTALLATION OF REACTOR IN THE SENDAI NUCLEAR POWER PLANT OF KYUSHU ELECTRIC COMPANY. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 22: No. 12, 27-66(Apr 1978). (In Japanese).

The report of the above title was presented from the chairman of Japan Atomic Energy Commission to the Prime Minister about the authorization of installing a reactor and the conformity to the regulating act of nuclear reactors. The report from the chairman of the Reactor Safety Committee to the chairman of the Japan Atomic Energy Commission was presented as the separately attached paper. These reports are concerned with the safety evaluation of this plant, and the evaluated result confirmed the safety. As the contents of the application, the siting of this plant, seismic history, atmospheric phenomena, water supply and social environment, and the structures and facilities of the reactor plant including reactor proper, cooling system, instrument and control systems, waste disposal system, radiation monitoring facility and other facilities are outlined. As the contents of the examination, the basic policy and procedure of examination, the siting condition, the safety evaluation of reactor facility including aseismic design, core design, dynamic analysis, reactor shutdown system, reactor control system, safety protection system, reactor cooling system, decay heat removal system, containment vessel, refueling and waste disposal systems, exposure dose for public, estimation of released radioactive material, analysis of abnormal transient condition in several cases, analysis of accidents, disaster evaluation in serious accident and hypothetical accident, and the members of this committee are described.

2825 ALTERATION OF REACTOR INSTALLATION (UNIT 1) IN FUKUSHIMA NUCLEAR POWER STATION II OF THE TOKYO ELECTRIC POWER COMPANY, INCORPORATED. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 22: No. 7, 11-15(Sep 1977). (In Japanese).

The report of the Committee on Examination of Reactor Safety to the Atomic Energy Commission of Japan concerning the alteration is given, and its safety was confirmed. The alterations are the change to 8 x 8 type fuel assembly from 7 x 7 type; adoption of MCPR as thermal limiting value; installation of an inflammable gas concentration control system in the reactor containment vessel; installation of a leakage suppression system to the main steam isolation valve, etc.

Economics

2826 (INIS-mf--5129) COSTS OF NUCLEAR POWER IN THE NETHERLANDS. (Koninklijk Inst. van Ingenieurs, The Hague (Netherlands)). 1978. 64p. (In Dutch). Dep. NTIS (US Sales Only), PC A04/MF A01.

A study on the costs of nuclear power generation in the Netherlands is presented. Light water cooled reactors are chosen as nuclear power plants and no difference is made in calculating the costs between a PWR type reactor and a BWR type reactor. The power plants have an output of 1000 MWe. From each part of the whole fuel cycle the costs are determined, taking into account interest, investments, time of construction, labor costs, insurances etc. Also are determined from each part of the fuel cycle the energy costs; the costs per kWh. Finally a comparison is made in costs between a 1000 MWe power plant and a 600 MWe power plant.

2827 (INIS-mf--5131) SUMMARY OF 'THE COSTS OF ENERGY FROM COAL' AND 'COSTS OF NUCLEAR POWER IN THE NETHERLANDS'. (Koninklijk Inst. van Ingenieurs, The Hague (Netherlands)). Mar 1978. 14p. (In Dutch). Dep. NTIS (US Sales Only), PC A02/MF A01.

The results of the reports 'The costs of energy from coal' and 'The costs of nuclear power in the Netherlands' are presented in this summary. A comparison is made between the costs of generating electricity by coal fired power plants and nuclear power plants. The size of the power plants taken into account are 600 MWe for the coal fired plant and 1000 MWe for the nuclear power plant. For calculation of the price per kWh, a comparison has been made between investment costs, fuel costs and exploitation costs. The comparison leads to the conclusion that in case of nuclear power generation the price per kWh generation costs is not directly affected by changes in price of the used natural uranium. Secondly, the costs of nuclear waste treatment is of underlying importance. In case of coal fired electric power generation the costs per generated kWh electricity are very much affected by changes in fuel costs. Thirdly the costs of flue gas

desulfurization means an increase of 20 percent of the generation costs.

2828 (PNL--2429) ENFORM II: A CALCULATIONAL SYSTEM FOR LIGHT WATER REACTOR LOGISTICS AND EFFLUENT ANALYSIS. Heeb, C.M.; Lewallen, M.A.; Purcell, W.L.; Cole, B.M. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Sep 1979. Contract EY-76-C-06-1830. 133p. Dep. NTIS, PC A07/MF A01.
ENFORM is a computer-based information system that addresses the material logistics, environmental releases and economics of light water reactor (LWR) operation. The most important system inputs consist of electric energy generation requirements, details of plant construction scheduling, unit costs, and environmental release factors. From these inputs the ENFORM system computes the mass balances and generates the environmental release information for noxious chemicals and radionuclides from various fuel cycle facilities (except waste disposal). Fuel cycle costs and electric power costs are also computed. All code development subsequent to 1977 is summarized. Programming instructions are provided for the modules that are comprised in the ENFORM system. ENGEN, a code that uses a generation schedule specified by the user and isotopic data generated by ORIGEN, has been developed to produce a scenario-specific data base. Other codes (ENMAT, ENRAD, etc) have been developed to use data base information to estimate radioactive and nonradioactive release information.

2829 ATOMIC POWER IS 'ONLY ANSWER'. Mining Week ; 1: No. 10, 12(27 Jun 1979).
Research into wind, wave, tidal and solar power has produced depressing results. The cost of producing power from these sources has been shown to be unacceptably high, Sir John Hill, chairman of the United Kingdom Atomic Energy Authority said recently. Speaking at a Strathclyde University symposium 'Power for the 90's', Sir John said nuclear power was the sensible choice for electricity generation in Scotland. Hydro-electric power was being exploited to the maximum reasonable available extent and the real choice lay between coal and nuclear power. However, geological conditions in the Scottish coalfields were often difficult and coal had an important role to play as an oil substitute for steam raising in factories, central heating and district heating schemes. For electricity generation, nuclear power was the entirely sensible choice.

2830 DECOMMISSIONING NUCLEAR FACILITIES. Brosche, D. (Bayernwerk A.G., Muenchen (Germany, F.R.)); Klein, K. (Badenwerk A.G., Karlsruhe (Germany, F.R.)); Vollradt, J. (Vereinigte Elektrizitaetswerke Westfalen A.G. (VEW), Dortmund (Germany, F.R.)). Atomwritschaft, Atomtechnik ; 24: No. 4, 170-173(Apr 1979). (In German).
As the number of nuclear power plants commissioned is increasing worldwide, both the responsible goverment agencies and the public are more and more concerned about decommissioning nuclear facilities after they have been shut down for good. IAEA organized a symposium on November 13-17, 1978 which dealt with problems of decommissioning, covering national objectives, technical processes, radiological questions, experience in plant decommissioning, decontamination techniques and remote handling procedures. It turned out that sufficient practical experience and highly developed decommissioning concepts and techniques are now available. Experts feel that also in the future no insoluble technical problems or problems must be expected which could only be solved at inordinately high technical expenditure. The article contains a survey of the present staus of problem solutions. Current work is being dedicated to the dose rates accumulated by decommissioning personnel and to the costs of decommissioning.

2831 NUCLEAR AND THERMAL POWER PLANTS AND THE ENVIRONMENT. Mejstrik, V. (Ceskoslovenska Akademie Ved, Pruhonice. Ustav Krajinne Ekologie). Radioaktivita a Zivotne Prostredie ; No. 4, 1-35(1978). (In Czech).
The growth is briefly outlined of world daily power consumption and the possibilities are discussed of meeting this demand. Coal and nuclear power are of primary importance as energy resources for the present and the near future. Production costs per 1 kWh of electric power in nuclear power plants are already lower than in fossil fuel power plants and both types of power plants have an environmental impact. Activities are presented of radioisotopes resulting from nuclear reactor operation and their release and environmental impact are discussed. An analysis is made of emissions from combustion processes and of wastes from fossil-fuel power plant operation. The environmental impacts of nuclear and fossil fuel power plants are compared.

Construction and Operation

2832 (DOE/TIC--10259) UPDATE: NUCLEAR POWER PROGRAM INFORMATION AND DATA, JULY-AUGUST 1979. (Department of Energy, Washington, DC (USA). Div. of Nuclear Power Development). 1979. 151p. Dep. NTIS, PC A08/MF A01.
UPDATE is published every two months by the Division of Nuclear Power Development to provide a quick reference source on the current status of nuclear power plant construction and operation in the United States, and for information on the economics, fuel requirements and performance of nuclear generating units. Similar information is included on other means of electric generation as they relate to nuclear power.

2833 RESULTS OF GERMAN NUCLEAR POWER PLANT OPERATION IN 1978. PT. 1. INDUSTRIAL NUCLEAR POWER STATIONS. DATA FROM THE ANNUAL REPORT BY THE ABE COMMITTEE. Atomwritschaft, Atomtechnik ; 24: No. 8/9, 437-447(Aug-Sep 1979). (In German).
According to the annual report by the ABE Committee of the Deutsches Atomforum, nuclear power plants in the Federal Republic of Germany, which had increased their electricity generation by 46% over the previous year's level in 1977, were not able to achieve further increases in their electricity production in 1978. However, their generation of 35.9 TWh (1977: 36.0 TWh) represents 10.2% (1977: 10.8%) of the total electricity generation in the Federal Republic of 353 TWh (1977: 335 TWh). The KKI (907 MWe) and KKU (1300 MWe) plants generated electricity for the first time in 1978. However, KWL and KRB were down for the whole year. Unplanned outages and revision periods were encountered in 1978 also by some other plants which had been in operation for years. The report informs about the results of plant operation of each nuclear power station, giving plant diagrams and presenting surveys of the releases of radioactive substances etc. (orig.).

2834 NUCLEAR ENERGY IN CANADA: POTENTIAL AND PROBLEMS. Perry, T.L. Nature Canada ; 3: No. 2, 3-13(1974).
Survey report:the extraordinary performance of the four new reactors at pickering, ontario, canada, has triggered what may soon become a full-scale transition to a nuclear age in that country. pickering's total capacity of 2060 mw makes it the largest nuclear station in the world supplying one-seventh of ontario's electrical energy at a cost competitive with fossil fuel plants. the operation of candu reactors is discussed, emphasizing its advantageous safety features over other reactor models. management of radioactive wastes, the basis for radiation protection standards, and problems in the nuclear fuel cycle are also discussed. (6 diagrams, 1 graph, 1 photo, 44 references, 4 tables)

Fuel Cycle

2835 (ANL--80-40, pp 192-279) PART 5. FUEL CYCLE OPTIONS. Lineberry, M.J.; McFarlane, H.F.; Amundson, P.I.; Goin, R.W.; Webster, D.S. Jul 1980.
Fast Breeder Reactor studies.
The results of the FBR fuel cycle study that supported US contributions to the INFCE are presented. Fuel cycle technology is reviewed from both generic and historical standpoints. Technology requirements are developed within the framework of three deployment scenarios: the reference international, the secured area, and the integral cycle. Reprocessing, fabrication, waste handling, transportation, and safeguards are discussed for each deployment scenario. Fuel cycle modifications designed to increase proliferation defenses are described and assessed for effectiveness and technology feasibility. The present status of fuel cycle technology is reviewed and key issues that require resolution are identified.

2836 (ANL--80-40, pp 280-304) PART 6. INTERNATIONALIZATION AND COLLOCATION OF FBR FUEL CYCLE FACILITIES. Stevenson, M.G. (Los Alamos Scientific Lab., NM); Abramson, P.B.; LeSage, L.G. Jul 1980.
Fast Breeder Reactor studies.
This report examines some of the non-proliferation, technical, and institutional aspects of internationalization and/or collocation of major facilities of the Fast Breeder Reactor (FBR) fuel cycle. The national incentives and disincentives for establishment of FBR Fuel Cycle Centers are enumerated. The technical, legal, and administrative considerations in determining the feasibility of FBR Fuel Cycle Centers are addressed by making comparisons with Light Water Reactor (LWR) centers which have been studied in detail by the IAEA and UNSRC.

2837 (CONF-800943--(Summ.), pp 155-158) BACK-END FUEL CYCLE COSTS FOR ALTERNATIVE FUELS. Rainey, R.H.(Oak Ridge Assoc. Univ., TN); Burch, W.D.; Haire, M.J.; Unger, W.E. 1980.
From National topical meeting of fuel cycles for the 80's; Gatlinburg, TN, USA (29 Sep 1980).
FUEL CYCLE;PROLIFERATION;COST;REPROCESSING; RECYCLING;RADIOACTIVE WASTE PROCESSING; RADIOACTIVE WASTE DISPOSAL;TRANSPORT;THORIUM CYCLE;URANIUM;SPENT FUELS;SPENT FUEL STORAGE; AWAY-FROM-REACTOR STORAGE;ECONOMIC ANALYSIS

2838 (DOE/EIA/8589--2) SPENT NUCLEAR FUEL STORAGE PROGRAM USER'S GUIDE. (Orkand Corp., Silver Spring, MD (USA)). 5 Sep 1978. Contract EM-77-C-01-8589. 47p. Dep. NTIS, PC A03/MF A01.
The purpose of this manual is to present procedures to execute the Spent Nuclear Fuel Storage Model (SNFSM) program. This manual includes an overview of the model, operating environment, input and output specifications and user procedures. An example of the execution of the program is included to assist potential users.

2839 (DOE/NE--0003/7) FUEL-CYCLE FACILITIES: PRELIMINARY SAFETY AND ENVIRONMENTAL INFORMATION DOCUMENT. VOLUME VII. (Department of Energy, Washington, DC (USA)). Jan 1980. Contract W-31-109-ENG-38;W-7405-ENG-26. 223p. Dep. NTIS, PC A10/MF A01.
Information is presented concerning the mining and milling of uranium and thorium; uranium hexafluoride conversion; enrichment; fuel fabrication; reprocessing; storage options; waste disposal options; transportation; heavy-water-production facilities; and international fuel service centers.

2840 EX-REACTOR FUEL CYCLE NUCLEAR SAFETY. Valentine, A.M.; Smith, D.R. (Los Alamos Scientific Lab., NM). Transactions of the American Nuclear Society ; 32: 3-4(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
PWR TYPE REACTORS;BWR TYPE REACTORS;FUEL CYCLE;NUCLEAR FUELS;URANIUM ORES;MINING;ISOTOPE SEPARATION;REPROCESSING;RADIOACTIVE WASTE DISPOSAL

2841 SPENT-FUEL DISPOSITION: EUROPEAN STRATEGIES. von Osten, W. Energy Technology (Washington, D.C.) ; 6: 862-870(Apr 1979). (CONF-790213--).
From 6. energy technology conference and exposition; Washington, DC, USA (26 Feb 1979).
The view of West European countries on spent-fuel disposition and the efforts being made to close the nuclear fuel cycle is generally uniform in the accepted definitions because of the shared economic, environmental, and energy situations. The countries vary, however, in their emphasis. The approach taken is based on the recovery and recycling of reusable material and the transfer of radioactive wastes to stable geologic formations. National and international factors entering into the discussions of safe management and disposal are reviewed and five strategy categories are outlined in this context. The decision to reprocess spent fuels is justified on both environmental and resource-conservation grounds. (DCK)

2842 CHAPTER 3. REPROCESSING. PAPER 5. PROLIFERATION RISKS ASSOCIATED WITH DIFFERENT BACK-END FUEL CYCLES FOR LIGHT WATER REACTORS. Hannerz, K.; Segerberg, F. (ASEA-ATOM AB, Vaesteraas (Sweden)). pp 91-103 of Nuclear energy and nuclear weapon proliferation. London; Taylor and Francis (1979).
From Stockholm International Peace Research Institute symposium; Stockholm, Sweden (12 Oct 1978).
This paper contains a comparison of the proliferation risks associated with two alternatives for the back-end of the light water reactor fuel cycle. One employs reprocessing of spent fuel in a foreign plant and re-use of recovered uranium and plutonium

in domestic light water reactors. The other alternative represents a once-through fuel cycle, in which the spent fuel is regarded as waste for final geological disposal following long-term (20- to 40-year) pool storage. Conclusions are presented.

Process Heat Reactors

2843 DISTRICT HEATING. PT. 9. NUCLEAR POWER FOR CHP GENERATION. Diamant, R.M.E. Heating and Ventilating Review ; 20: No. 3, 42-43(Jan 1980).

This is the first part of a paper on nuclear power for CHP generation. A brief introduction surveys alternative energy sources and concludes that it will be necessary to utilise nuclear power if we are to avoid running out of energy. The basis of nuclear power (nuclear fission, nuclear fusion) is outlined. Some estimates are made of the years of fuel supply on certain economic and other assumptions, for thermal and fast breeder reactors, and a programme of building large breeder reactors is advocated. Two main objections to such a programme are discussed and felt not to stand up to clear reasoning: danger of terrorists making their own bombs; and radioactive waste materials, produced during nuclear fission, having a very high radiation intensity.

NUCLEAR REACTOR TECHNOLOGY

2844 (K/ET--5007) REMOVAL OF NOBLE GASES BY SELECTIVE ABSORPTION. Merriman, J.R.; Stephenson, M.J.; Kanak, B.E.; Little, D.K. (Oak Ridge National Lab., TN (USA)). Jan 1980. Contract W-7405-ENG-26. 20p. (CONF-800211--3). Dep. NTIS, PC A02/MF A01.

From International symposium on management of gaseous wastes from nuclear facilities; Vienna, Austria (18 Feb 1980).

Process performance and reliability have been demonstrated on an engineering scale with 10 years of pilot plant operation, including extended testing with ^{85}Kr, ^{133}Xe, and ^{131}I. The selective absorption process is based on exploitation of solubility differences which exist among the noble gases and other gas-phase constituents in a fluorcarbon solvent. Much information now exists on the solubilities of various components in CCl_2F_2, which is the reference solvent, and on other aspects of this fluorocarbon system. The effects of carrier gas coabsorption and solvent vaporization/condensation on noble gas mass transfer inside the absorption and stripping zones have been determined. The effects of column size on mass transfer have also been measured and rigorous engineering models have been derived for the process hardware. Many improvements and simplifications have been made to the original version of the process, and depending upon the separation task, a variety of system configurations is possible. The selective absorption process is applicable to essentially all types of nuclear facilities, and several gas cleanup tasks have been considered. One of these, post-accident reactor cleanup, is described.

2845 Donen Ju-nenshi. (TEN YEARS' HISTORY OF POWER REACTOR AND NUCLEAR FUEL DEVELOPMENT CORPORATION). Tokyo, Japan: Power Reactor and Nuclear Fuel Development Corp. (Dec 1978). 636p. (In Japanese).

Power Reactor and Nuclear Fuel Development Corporation (PNC) has advanced steadily for ten years since its establishment along the policy lines of Japan's own nuclear energy development. Brilliant results thus include: the world's fifth nation of possessing an experimental fast reactor, completion of a (prototype) heavy-water power reactor, establishment of uranium ores prospecting and refining technology, successful approach to uranium enrichment, and fuel reprocessing and waste management leading to Japan's nuclear fuel cycle. Intended for further efforts by PNC personnel and for report to the those people concerned, the present volume of PNC's ten years' history is in chapters of power reactors development, nuclear fuel development, safety management, general administration, and safeguards and nuclear materials control.

Theory and Calculation

2846 (ASO/R--3) GAMMA RAY MEASUREMENT OF SPENT HIFAR FUEL ELEMENTS FOR SAFEGUARDS VERIFICATION. 2. THEORETICAL EVALUATION OF METHOD. Hanna, G.L. (Australian Safeguards Office, Sydney). Jul 1978. 19p. Dep. NTIS (US Sales Only), PC A02/MF A01.

An empirical method of estimating burnup and cooling times of irradiated MTR fuel elements from gamma ray measurements of fission product ratios was developed by the IAEA for safeguards applications. Experimental evaluation of the method was discussed in Part 1 of this report and showed the method to be too imprecise as presently applied. A theoretical evaluation is reported here which shows that neutron flux density during irradiation will have an important influence on experimental results and suggests that failure to take due account of this could have lead to inherent imprecision in the empirical method.

2847 DECAY HEAT. Tobias, A. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). *Progress in Nuclear Energy* ; 5: No. 1, 3-93(1980).

Many aspects of the nuclear fuel cycle require accurate and detailed knowledge of the energy release rate from the decay of radioactive nuclides produced in an operating reactor. In addition to the safety assessment of nuclear power plant, decay heat estimates are needed for the evaluation of shielding requirements on fuel discharge and transport routes and for the safe management of radioactive waste products extracted from spent fuel during reprocessing. The decay heat estimates may be derived by either summation calculations or Standard equations. The development of these evaluation methods is revised and their evolution since the first studies of the 1940s is traced. In contrast to many of the previous reviews of this subject, both actinide and fission product evaluation methods are reviewed in parallel. Data requirements for summation calculations are examined and a summary given of available codes and their data libraries. The capabilities of present day summation methods are illustrated through comparisons with available experimental results. Uncertainties in summation results are examined in terms of those in the basic nuclear data, irradiation details and method of calculation. The evolution of decay heat Standards is described and a brief examination made of their reliability and ability to provide suitably conservative decay heat estimates. Finally, to illustrate the use of present summation methods, comparisons are given of both the actinide and fission product decay heat levels from typical fuel samples in a variety of reactor systems.

Components and Accessories

2848 (HEDL-TC--1283) DATA PACKAGE FOR THE TURKEY POINT MATERIAL INTERACTION TEST CAPSULES. Krogness, J.C.; Davis, R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1979. Contract EY-76-C-14-2170. 94p. Dep. NTIS, PC A05/MF A01.

Objective of the Materials Interaction Test (MIT) is to obtain interaction information on candidate package storage materials and geologies under prototypic temperatures in gamma and low level neutron fields. Compatibility, structural properties, and chemical transformations will be studied. The multiple test samples are contained within test capsules connected end-to-end to form a test train. Only passive instrumentation has been used to monitor temperatures and record neutron fluence. The test train contains seven capsules: three to test compatibility, two for structural tests, and two for chemical transformation studies. The materials tested are potential candidates for the spent fuel package canister and repository geologies.

2849 (UCRL--15185) SEISMIC SAFETY MARGINS RESEARCH PROGRAM (PHASE I). PROJECT IV. STRUCTURAL BUILDING RESPONSE; STRUCTURAL BUILDING RESPONSE REVIEW. Healey, J.J.; Wu, S.T.; Murga, M. (Ebasco Services, Inc., New York (USA)). Feb 1980. Contract W-7405-ENG-48. 181p. Dep. NTIS, PC A09/MF A01.

As part of the Phase I effort of the Seismic Safety Margins Research Program (SSMRP) being performed by the University of California Lawrence Livermore Laboratory for the US Nuclear Regulatory Commission, the basic objective of Subtask IV.1 (Structural Building Response Review) is to review and summarize current methods and data pertaining to seismic response calculations particularly as they relate to the objectives of the SSMRP. This material forms one component in the development of the overall computational methodology involving state of the art computations including explicit consideration of uncertainty and aimed at ultimately deriving estimates of the probability of radioactive releases due to seismic effects on nuclear power plant facilities.

2850 DRUM FOR STORING NUCLEAR REACTOR FUEL ELEMENTS. Batjukov, V.I.; Schapkin, A.F.; Fadeev, A.I.; Schchian, C.G.; Sumatochin, V.A. (to Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,800,686/A/. 12 Jul 1979. 17p. (In German).

The drum is used for accommodating spent fuel elements, e.g., during refuelling. It consists chiefly of a coverplate, a floor plate and spacers between the two. The fuel elements of circular or multi-lateral crossection are suspended in pipes, whose length is shorter than the fuel element, and which stand on the floor plate. The length of the pipes is such that the bending of the fuel element is taken into account, i.e. the bent part of the fuel element lies outside the pipe.

2851 METHOD OF DECONTAMINATING RADIOACTIVE SUBSTANCES. Hori, T. (to Mitsubishi Heavy Industries Ltd., Tokyo (Japan)). Japanese Patent 54-47,100/A/. 13 Apr 1979. 2p. (In Japanese).

The purpose is to obtain sufficient decontamination effects by use of a small quantity of a decontamination agent, and to render the disposal quantity of the decontamination agent after the decontamination is reduced as less as possible thereby to facilitate the processing. A contaminated object to be decontaminated such as a manifold is dipped in a decontamination solution in a decontamination tank and, at the same time, a sealed body such as a polyethylene bag filled with air is put in the tank in an overlapped state, and the apparent volume of the decontamination agent is increased to clean the manifold. The sealed body can be easily crushed and compressed, and the actual disposal quantity of the decontamination agent is extremely small.

2852 FRAMEWORK FOR STORING FUEL ELEMENTS. Weber, R. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,742,736/A/. 5 Apr 1979. 10p. (In German).

The sheaths for the PWR fuel elements are the supporting parts of the storage framework. A supporting sheath of square cross section made of stainless steel is provided. Absorber sheets made of boron steel are mechanically fixed to the supporting sheaths in the active zone of the fuel elements. Angle pieces, clamps, countersunk flat headed screws or rivets are suitable for fixing. If the absorber sheets project beyond the ends of the supporting sheaths, then they can be latched together or mutually supported by bars.

2853 CHARGING DEVICE FOR FILTER MATERIALS. Revell, A. (to American Air Filter Co., Inc., Louisville, KY; Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,822,282/A/. 8 Feb 1979. 33p. (In German).

The proposal relates to a filtering device designed to remove radioactive pollutants from gas streams in nuclear reactor facilities, especially to the loading device used to remove charcoal and fill fresh charcoal. The charcoal is contained in cells open at the top, above which there is an oblong feeder duct through which the charcoal is fed. The invention relates to the design details of this duct (23 claims, 11 diagrams).

2854 BEHAVIOR OF B_4C MATERIALS IN SPENT-FUEL STORAGE POOLS. Macmillan, N.H. (Pennsylvania State Univ., University Park); Naum, R.G.; Shaffer, P.T.B. Transactions of the American Nuclear Society ; 33: 288-290(1979).

SPENT FUEL STORAGE;FUEL RACKS;NEUTRON ABSORBERS;BORON CARBIDES;PHYSICAL RADIATION EFFECTS;MECHANICAL PROPERTIES

2855 NUCLEAR POWER PLANT. Nonaka, A.; Hayashi, K.; Endo, T.; Kuribayashi, Y.; Motomiya, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 53-143,899/A/. 14 Dec 1978. 4p. (In Japanese).

Discharge of liquid wastes to the surrounding atmosphere are completely eliminated by collecting floor drains, a part of processing water for the regeneration of liquid wastes, non-radioactive steam drains and laundry drains conventionally discharged so far out of the system, processing them in a concentrator, a desalter or the like into water of a high purity and extremely low radioactive concentration, storing the water in an exclusive storage tank and supplying it as a steam or supplementing water to each portion in the plant that requires water of such high purity and extremely low radioactivity.

2856 ARRANGEMENT FOR THE PREVENTION OF CONTAMINATION OF A FUEL ELEMENT STORAGE POOL. Peehs, M.; Petri, W. (to Kraftwerk Union A.G.; Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,722,870/A/. 23 Nov 1978. 8p. (In German).

Fuel elements are stored in metal casings with caps in fuel element storage pools filled with water. In case that any gaseous fission products or radiolysis hydrogen escapes from a failed fuel element, they are lead over the casing caps into a bell-shaped hood above the cap. This hood acts as a floating gasometer-bell. Its position can be observed. The gas in the gasometer-bell is pumped out through a hose, may be also with a valve. The gasometer-bell may have a lifting handle as well.

2857 FACILITY FOR AVOIDING CONTAMINATION OF A FUEL STORAGE POOL. Dyck, H.P.; Kuehnel, R. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,718,305/A/. 2 Nov 1978. 13p. (In German).

For intermediate storage the fuel assemblies are inserted into transport casks made of metal with B-, Cd-, or Gd-alloying and into storage pools filled with water. These transport casks are either closed or have got at the botton an opening with a hold-up device for solid particles. In both cases they are filled with water flowing in through the bottom opening or being specially filled in. Additionally the transport casks can be centered in the storage rack by means of external ribs.

2858 RADIOACTIVITY REDUCING DEVICE. Nonaka, A. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1953-93,299/A/. 16 Aug 1978. 4p. (In Japanese).

Purpose: To provide a radioactivity reducing device in a nuclear power plant, which prevents the discharge of radioactive substances into a building. Constitution: Drains and vent gases exhausted from main machinery and tools of a nuclear power plant are introduced into a sump tank and a vent tank, respectively, and treated in a radioactivity processing device comprising an iodine removing device, a rare gas removing device and the like. In this case, the sump tank, vent tank and various tanks in the radioactive waste processing device are all of enclosed structure, vent gases exhausted from these tanks are collected in the vent tank, and discharged into the atmosphere through the radioactivity processing device.

2859 RADIATION MONITORING SYSTEM OF NUCLEAR POWER STATION. Filipiak, B.; Mlicki, K.; Siwicki, R. (Institute of Nuclear Research, Warsaw (Poland)). Nukleonika ; 23: No. 6, 767-775(Jun-Jul 1978). (In Russian).

The radiation monitoring system of nuclear station is defined, as well as the main functions of it. The main sources of radiation danger are: the primary cooling circuit, the secondary steam - water circuit, solid and liquid wastes, the ventillation system. Further, the radiation monitoring system is described, consisting of the installed one, of the portable personnel and laboratory instruments and of environmental monitoring equipment. For each measuring channel and instrument, the required ranges are given.

2860 CONTAINER FOR THE TRANSPORT AND DOSABLE REMOVAL OF RADIOACTIVE AND FOR TOXIC MEDIA. Dillmann, H.G.; Gerlach, K.; Wilhelm, J. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,649,295/A/. 3 May 1978. 10p. (In German).

The transport container can be used, e.g., to move organically bound or elemental iodine to nuclear ventilation systems where the gases are to be fed into these systems as test agents. The container accomodating the first of which, which comes next to the gas container, is designed as a shield. For this purpose, the space between the gas container and the shielding vessel is filled with lead shot. The shielding vessel is surrounded by the second protection vessel at some distance; the interior of the second vessel can be evacuated or scavenged with gas, respectively. The instruments are installed in the two protection vessels. Since the transport volume is relatively large, autoradiolysis of the test gas can be reduced. In addition, the protection vessels can be kept in a transport crate together with a wheelframe. (DG) 901 RW.

2861 PROBLEMS ASSOCIATED WITH THE PLACEMENT OF FIXED AREA MONITORS AROUND IRRADIATED FUEL STORAGE POOLS. McKean, D.W. (Ontario Hydro Research Lab., Toronto (Canada)). pp 59-64 of Radiation protection in nuclear power plants and the fuel cycle. Vol. 2. London, England; British Nuclear Energy Society (1978).

From Conference on radiation protection in nuclear power plants and the fuel cycle; Bristol, UK (27 Nov 1978).

Area monitoring design considerations which are unique to underwater storage of irradiated fuel are described. A methodology for fixed area monitor location based on the comparison of various radiation transport codes with measurement is presented.

2862 METHOD AND APPARATUS FOR THE DECONTAMINATION AND COOLING OF NUCLEAR POWER PLANT. Sanada, T. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1953-83,000/A/. 28 Dec 1976. 6p. (In Japanese).

Purpose: To prevent radioactive contamination area from prevailing, as well as radioactive wastes from increasing by injecting purified coolants into a nuclear power plant and removing deposits on the inner walls and the inner structures of the power plant. Method: At a reactor operation and shutdown, coolants are injected through a by-pass, jetted out from injection device to wash out impurities deposited on the inner wall surface of a pressure vessel, the surface of the inner structures and of the reactor core causing the impurities to float in the coolants. The coolants used are then cooled in a non-regenerative heat exchanger, purified, and returned to the by-pass to thereby conduct decontamination for the nuclear power plant. During separated high temperature stand-by running of the nuclear power plant, the coolants taken out from the nuclear power plant are cooled in the regenerative heat exchanger and the non-regenerative heat exchanger, purified thereafter to be removed with impurties and then recycled to the nuclear power plant.

2863 METHOD OF REMOVING ACCUMULATED SLUDGE WITHIN REACTOR CONTAINER BOTTOM HOUSING. Tashiro, H. (to Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Japanese Patent 1953-56,492/A/. 2 Nov 1976. 3p. (In Japanese).

Purpose: To permit effective discharge of sludge, particularly radioactive sludge, accumulated in a housing, which accommodates a control rod drive mechanism provided at the bottom of the container of a reactor such as a light-water nuclear reactor. Constitution: A water jet port is provided in a bottom portion of a gap between a housing accommodating control rod drive mechanism or the like and the object inside the housing such that a cyclon stream is produced in the gap. Water issuring from the jet port into the bottom portion of the gap forms a cyclon stream rising through the annular gap and is circulated through the entire gap. In this way, it is possible to efficiently discharge the sludge accumulated within the gap to the outside of the housing.

Fuel Elements

2864 (LA--8389-PR) FISSION PRODUCT RELEASE. PROGRESS REPORT, JANUARY 1-MARCH 31, 1980. Norris, A.E. (comp.). (Los Alamos Scientific Lab., NM (USA)). Jun 1980. Contract W-7405-ENG-36;AC06-76RL01830. 18p. NTIS, PC A02/MF A01.

Iron foil was used this quarter to help produce reducing conditions in a basic aqueous environment that resulted in only 0.02 ppB uranium in solution from the dissolution of sintered UO_2, after one week's contact time. This concentration of uranium is the lower limit of detection in our analytical procedure. Additional work with powdered UO_2 to understand the conditions that result in low solubilities of uranium in aqueous solution has resulted in measured uranium concentrations of 8 ppB when hydrogen is used with palladium-black as the reducing agent. Calculations for this system show that CO_2 in solution is not affecting the results at pH 6 or lower. Electron microprobe analyses of a spent fuel segment have been completed. Plutonium concentrations were higher in the outer 500 μm of the fuel element than in the interior. Strontium, antimony, and cesium did not display any radial trends in concentrations.

2865 (PB--291013) AN ASSESSMENT OF THE LONG-TERM STORAGE OF ZIRCALOY FUEL RODS IN WATER. FINAL REPORT. Munir, Z.A. (California Univ., Davis (USA). Dept. of Mechanical Engineering). 15 Oct 1978. 29p. NTIS, PC A03/MF A01.

The corrosion mechanisms which might affect Zircaloy-clad nuclear fuel rods during long periods of underwater storage prior to reprocessing are discussed in this report. A literature search was made to evaluate the current knowledge about possible long term degradation of Zircaloy-2 and Zircaloy-4. No potential degradation problems result from the general corrosion of Zircaloy stored in pool water for prolonged periods (10-20 years). Also, at pool temperatures of less than 50C, the diffusion of hydrogen in Zircaloy is too slow to contribute to degradation during the expected storage times. However, degradation during storage may result from the earlier thermal, chemical, or radiological histories of the cladding material. Further tests are recommended to determine the effect on Zircaloy cladding considering: (a) the degree of residual stress in the rods; (b) fission product uptake and the degree of prior embrittlement; (c) galvanic coupling with other metals of the fuel rod storage assembly; and (d) the nature and concentration levels of contaminants accumulated in surface layers during its use in the reactor.

2866 (SGAE--2971) STUDY OF THE SENSITIVITY AND INFLUENCE OF THE DESIGN PARAMETERS OF A HIGH DENSITY SPENT FUEL RACK IN REGARD OF THE SAFETY AGAINST CRITICALITY. Suda, M.; Woloch, F.; Sdouz, G. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Vienna). Sep 1978. 48p. (In German). (RS--137/78; PH--255/78). Dep. NTIS (US Sales Only), PC A04/MF A01.

In this report the influence of variations in the boron concentration, boron plate thickness and water gap thickness on the k infinity value of the high density spent fuel rack is discussed. At the same time the influence of the choice of number of fast neutron groups is investigated in the calculation of the k_{oo} value. With the help of the results conclusions can be drawn about the significance of the considered design and fabrication parameters.

2867 (STUDSVIK-K4--78/12) STRESS CORROSION CRACK GROWTH IN UNIRRADIATED ZIRCALOY. Pettersson, K. (Aktiebolaget Atomenergi, Studsvik (Sweden)). Oct 1978. 22p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Experimental techniques suitable for the determination of stress corrosion crack growth rates in irradiated Zircaloy tube have been developed. The techniques have been tested on unirradiated. Zircaloy and it was found that the results were in good agreement with the results of other investigations. Some of the results were obtained at very low stress intensities and the crack growth rates observed, gave no indication of the existance of a K sub(ISCC) for iodine induced stress corrosion cracking in Zircaloy. This is of importance both for fuel rod behavior after a power ramp and for long term storage of spent Zircaloy-clad fuel.

2868 MICROSTRUCTURE-DEPENDENT MODEL FOR FISSION PRODUCT GAS RELEASE AND SWELLING IN UO_2 FUEL. Notley, M.J.F.; Hastings, I.J. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Nuclear Engineering and Design ; 56: No. 1, 163-175(Feb 1980).

From IAEA specialists' meeting on fuel element performance computer modelling; Blackpool, UK (13 - 17 Mar 1978).

A model for the release of fission gas from irradiated UO_2 fuel is presented. It incorporates the relevant physical processes: fission gas diffusion, bubble and grain boundary movement, intergranular bubble formation and interlinkage. In addition, the model allows estimates of the extent of structural change and fuel swelling. In the latter, contributions of thermal expansion, densification solid fission products, and gas bubbles are considered. When included in the ELESIM fuel performance code, the model yields predictions which are in good agreement with data from UO_2 fuel elements irradiated over a range of water-cooled reactor conditions: linear power outputs between 40 and 120 kW m^{-1}, burnups between 10 and 300 MW h(kg U)$^{-1}$, and power histories including constant, high-to-low and low-to-high power periods. The predictions of the model are shown to be most sensitive to fuel power (temperature), the choice of diffusion coefficient for fission gas in UO_2, and burnup. The predictions are less sensitive to variables such as fuel restraint, initial grain size and the rate of grain growth.

2869 NUCLEAR FUEL STORAGE. Bevilacqua, F. (to Combustion Engineering Inc.). US Patent

4,177,385. 4 Dec 1979. Filed date 19 Sep 1977. 4p.

A method and apparatus for the storage of fuel in a stainless steel egg crate structure within a storage pool are described. Fuel is initially stored in a checkerboard pattern or in each opening if the fuel is of low enrichment. Additional fuel (or fuel of higher enrichment) is later stored by adding stainless steel angled plates within each opening, thereby forming flux traps between the openings. Still higher enrichment fuel is later stored by adding poison plates either with or without the stainless steel angles. 8 claims.

2870 DYNAMIC INTRAGRANULAR FISSION GAS BEHAVIOR MODEL. Griesmeyer, J.M.; Ghoniem, N.M.; Okrent, D. (California Univ., Los Angeles (USA). Dept. of Chemical, Nuclear, and Thermal Engineering). Nuclear Engineering and Design ; 55: No. 1, 69-95(Dec 1979).

A model for the non-equilibrium behavior of intragranular fission gas in uranium oxide fuel is developed to study the fundamental phenomena that determine fission gas effects. The dynamic behavior of point defects and the variations in stoichiometry are explicitly represented in the model. The principle of distribution moment invariance is used to allow approximations that significantly reduce computational expense without sacrifcing accuracy. A dynamic intragranular gas release and swelling (DIGRAS) computer code, that is based on the non-equilibrium model, was developed for both steady-state and transient applications. The code utilizes implicit multistep numerical integration methods, and is designed to give detailed information on all the physical processes that contribute to fission gas behavior. Simulations of steady-state irradiations indicate that the gas bubble re-solution process is very significant and results in very few large bubbles. The assumptions of equilibrium bubble size for normal steady-state irradiations in fast reactors appears to be adequate. On the contrary, a fully dynamic fission gas and point defect treatment was found necessary for transient simulations. The fuel stoichiometry was found to play an important role in determining bubble kinetics. This is mainly due to the strong dependence of point defect populations on stoichiometry. In fast transients, bubbles were found to be highly overpressurized, which suggests that a mechanistic plastic growth model is also needed.

2871 DEVICE AND PROCESS FOR STORING GROUPS OF FISSION ELEMENTS. Wachter, W.J.; Robbins, T.R. German(FRG) Patent 2,905,951/A/. 29 Nov 1979. 23p. (In German).

The storage device consists of square storage cells, which are arranged like a chess board. The cell walls consist of neutron absorbing material and the store is filled with water. To simplify storage of fuel rods, the storage cells are provided with hoods alternately, which act as guide elements. The hoods can be removed and fixed to the other storage cells, so that the previously empty storage cells can be filled.

2872 DEVICE FOR THE STORAGE OF LONG NUCLEAR REACTOR FUEL ELEMENTS IN A WATER-FILLED POND. Dose, G.F. (to Babcock - Brown Boveri Reaktor G.m.b.H., Mannheim (Germany, F.R.)). German(FRG) Patent 2,814,887/A/. 11 Oct 1979. 8p. (In German).

A single level storage rack with guide rails at the upper edge rests on the floor of the pond. Individual small storage racks for fuel elements can be moved on these guide rails, where transverse lanes are left free. The single level storage rack can be filled and emptied via these transverse lanes, without dropping below the water covering level which is laid down.

2873 COOLING SYSTEM FOR COOLING A SET OF FUEL ELEMENTS IN NUCLEAR REACTOR CONTAINMENTS. Ljubivyj, A.G.; Batjukov, V.I.; Schchijan, C.G.; Fadeev, A.I. (to Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,720,434/B/. 23 Aug 1979. 3p. (In German).

The used fuel elements are accommodated in a drum, which is in turn arranged in a housing. The sodium coolant covers the fuel elements. Sodium is brought in by a pipeline which enters the containment at the sodium level and extends to its bottom. In order to prevent the sodium from escaping from the containment through the pipeline, if there is an external pipeline failure, there is an opening in the pipe wall near the level of the coolant. If the level drops to the opening, gas is introduced into the pipeline and stops the loss of coolant. Cooling of the fuel elements is then provided by the natural circulation of the sodium.

2874 NUCLEAR FUEL RACK LATERAL SUPPORT AND PRELOAD DEVICE. Knight, C.B. (to Westinghouse Electric Corp.). US Patent 4,165,255. 21 Aug 1979. Filed date 22 Apr 1977. 6p.

A lateral support device for a nuclear fuel rack is described. It is vertically positioned within a walled enclosure which provides a preload to maintain effective support. The device includes a scissors-jack which is mounted so that the drive screw is vertical. Upon rotation of the drive screw the jack expands horizontally, seating a load pad against a vertical wall. The load pad is affixed to the jack by an arm having a stack of spring washers which compress between the pad and the jack, thereby applying a selected preload.

2875 PROCESS FOR EXTRACTING AND PREPARING FUEL ELEMENTS FROM A REACTOR FOR TRANSPORT AND DEVICE FOR CARRYING OUT THE PROCESS. Vox, A.J. (to Vox Lumatic G.m.b.H., Ostfildern (Germany, F.R.); Amtrust A.G., Luzern (Switzerland); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,801,944/A/. 19 Jul 1979. 21p. (In German).

The fuel element is lifted from the reactor using the lifting device of a bridge crane, is taken over the opening of a transport container, and is lowered into this. During transfer the fuel element is situated in a shielding hood at the end of the crane chain. The transport container contains liquid salt or a slate mixture, which solidifies after one or several fuel elements are inserted in it.

2876 SWIVEL BASE FOR FUEL ASSEMBLY STORAGE. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). British Patent 1,547,152/A/. 6 Jun 1979. 5p.

An invention is described the principal object of which is to provide a nuclear fuel assembly storage rack capable of supporting spent fuel assemblies without generating stresses in the fuel assemblies. The storage rack consists of a lower and upper support for supporting and retaining the spent fuel assemblies in their vertical positions. Relief

from any stresses in the fuel assembly during storage is obtained by the provision of a swivel base in the lower support.

2877 PROBLEMS ENCOUNTERED DURING UNDERWATER REPLACEMENT OF STORAGE RACKS IN ACTIVE SPENT-FUEL POOLS. Weissburg, J.A. (Wachter Association, Gibsonia, PA). Transactions of the American Nuclear Society ; 32: 672-674(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
SPENT FUEL ELEMENTS;SPENT FUEL STORAGE;FUEL RACKS;MODIFICATIONS;REMOTE HANDLING EQUIPMENT; REACTOR MAINTENANCE

2878 CLAD REMOVING DEVICE IN REACTOR. Ishii, Y.; Yoshida, T.; Saito, T.; Ichie, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 54-30,398/A/. 6 Mar 1979. 6p. (In Japanese).
Purpose: To remove radioactive substances deposited in a thermal sleeve or on ISI pads by semiautomatic remote handling in water by the provision of a device for cleaning, removing and recovering claddings on the wall of reactor container. Method: A clad removing device is engaged to stud bolts for mounting the upper cap plate using an overhead crane. A clad recovery vessel of the cleanining device is contacted at an adequate position on the inner wall of the pressure vessel by the vertical movement of a lance and pressurized water from a pressurized water feed pipe is jetted out from a nozzle to remove claddings. The claddings thus removed are sucked together with reactor water in the recovery vessel by way of a pump, filtered and returned to the pressure vessel.

2879 METHOD OF STORING FUEL ASSEMBLIES. Tada, Y. (to Mitsubishi Heavy Industries Ltd., Tokyo (Japan)). Japanese Patent 54-28,996/A/. 3 Mar 1979. 3p. (In Japanese).
Purpose: To decrease the storing space required for collective storage of fuel assemblies. Method: After inserting neutron absorbers in guide tubes such as control rod clusters provided to the fuel assembly, fuel assemblies are stored collectively. The neutron absorbers consist of boron carbide or the like and are contained in stainless steel pipes. Since neutrons produced from the fuel assemblies are absorbed in the above absorbers, attainment to the criticality can be avoided if the inter-assembly space is narrow.

2880 COOLING SYSTEM FOR COOLING A SET OF FUEL ELEMENTS IN NUCLEAR REACTOR CONTAINMENT VESSELS. Liubivyi, A.G.; Batiukov, V.I.; Schchiian, C.G.; Fadeev, A.I. (to Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,720,434/A/. 16 Nov 1978. 10p. (In German).
Used fuel elements stored in a drum are cooled with sodium. The inlet cooling pipes are such that the coolant enters near the floor of the drum, but reaches to nearly beneath the required coolant level. There is an opeing there through which gas can flow from the drum into the coolant inlet pipe if a fracture or similar accident prevents further entry of coolant. This gurantees a minimum level of coolant, so that sodium circulation guarantees cooling until the fuel element is removed. A drop in pressure and running out of the coolant is prevented.

2881 DEVICE FOR STORING NUCLEAR FUEL ELEMENTS. Kaminski, D.J.; Boyd, C.H. (to Westinghouse Electric Corp., Pittsburgh, PA (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,808,989/A/. 21 Sep 1978. 15p. (In German).
Some frameworks of rectangular construction are accommodated in a pit with concrete or metal cladding, where the frameworks are used for storing used fuel elements. The frameworks are supported and the pit is filled with boronated water. A number of horizontally arranged piston-cylinder damping units accept differential thermal expansion or movement in case of earthquakes. They are supported on the pit walls and the sides of the frameworks turned towards these. Each damping unit consists of the cylinder fixed to the framework wall and the piston which is pressed against the pit wall by a spring. Piston and cylinder can be held relative to each other by a pin. The damping can be increased by the boronated water, which can flow into and out of the cylinder and thus acts as a damping medium.

2882 TREATMENT OF IRRADIATED NUCLEAR FUEL MATERIAL. Astill, M.; Waine, M.G. (to British Nuclear Fuels Ltd., Risley). British Patent 2,022,912/A/. 5 Jun 1978. 8p.
A method is described to facilitate the removal of corrosion products from magnesium alloy clad spent fuel elements while stored under water in skips prior to reprocessing.

2883 SIDE SUPPORT FOR A NUCLEAR FUEL STORAGE RACK AND PRE-LOADING DEVICE. Knight, C.B. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). French Patent 2,388,377/A/. 19 Apr 1978. 12p. (In French).
Nuclear fuel storage racks comprising a side support and pre-loading system to absorb their relative movement and maintain an anti-seismic support between these racks and their containment vessel.

2884 STORAGE RACK FOR TAKING USED FUEL ELEMENTS FOR NUCLEAR POWER STATIONS. Krieger, F. (to Noell (G.) und Co., Wuerzburg (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,629,363/A/. 5 Jan 1978. 11p. (In German).
The wall plates of a storage chamber are made as a double skin in a storage rack for burnt-up fuel elements, in order to reduce thermal stresses. The outer skin is made of two equilateral side sheets and the inner skin is made from a closed square tube.

2885 EXPANSION OF CAPACITY OF SPENT FUEL POOLS AND ASSOCIATED PROBLEMS. de Francisco, J.L.; Lopez-Cotarelo, J.; Ramos, J.M. (Bechtel Espana, Madrid). pp 197-210 of Compte rendu du seminaire de l'AEN sur le stockage des elements combustibles irradies. Paris, France; OECD (1978).
From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).
Expanding the spent fuel storage pool capacity is a good solution for utilities facing the current shortage in fuel reprocessing capacity. This paper reviews the problems more likely to be found when expanding a spent fuel storage facility by using high density storage racks. Basically three types of problem arise: problems related with the characteristics of the new facility, problems related with the works of expansion, and problems related with the long term storage of large quantities of spent fuel.

2886 DESIGN BASES FOR U.S. DEPARTMENT OF ENERGY STORAGE BASIN. King, F.D. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). pp 211-219 of Compte rendu du seminaire de l'AEN sur le stockage des elements combustibles irradies. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

Bases were developed for the conceptual design of a water basin to store 5000 MT of irradiated light water reactor fuel. The basin, which could be operational by 1983, is designed to receive over 2000 MT per year of spent fuel and to provide interim storage of U.S. and some foreign fuel in support of U.S. policy of receiving and taking title to spent fuel rather than reprocessing this fuel. The bases for various design decisions are discussed.

2887 DEVICE FOR HANDLING AND EXAMINING REMOVABLE PENCILS OF FUEL ASSEMBLIES. (to Societe Franco-Americaine de Constructions Atomiques (FRAMATOME), 92 - Courbevoie (France)). French Patent 2,395,571/A/. 23 Jun 1977. 16p. (In French).

A device is described for handling and examining removable pins of fuel assemblies in the cooling pond of a nuclear reactor. It features a vertical knock-down and transportable tubular structure, resting when in use on the bottom of the cooling pond, at least one examination station carried by the tubular structure, a system for extracting, inserting and handling removable pins, gear for moving and guiding the extraction apparatus, facilities for the automatic control of the positioning of the extraction system.

2888 IMPROVEMENTS IN AND RELATING TO DRUMS FOR STORING FUEL ASSEMBLIES OF NUCLEAR REACTORS. Artemiev, L.N.; Batjukov, V.I.; Fadeev, A.I. British Patent 1,553,013/A/. 13 May 1977. 5p.

A specification is given for an improved design of drums used for storing nuclear reactor fuel assemblies. It is claimed that this new design reduces wear, increases reliability and enables the recharging operation to be speeded up.

Control Systems

2889 RECENT IMPROVEMENT OF TOSHIBA BWR INSTRUMENTATION AND CONTROL SYSTEM. Hashimoto, H.; Ito, M.; Ike, M.; Ikekita, I. (Toshiba Corp., Kawasaki, Kanagawa (Japan)). Toshiba Rebyu (Toshiba Review) ; 33: No. 12, 1003-1008(Dec 1978). (In Japanese).

The instrumentation and control system, being a part with direct contact with the personnel engaged in the operation and supervision of nuclear power plants, gives immediate effects to plant operation. Outlined here are the central control room as it ought to be, a new control system utilizing the current electronics for improving the reliability and availability of plants, and radiation measurement systems.

2890 FUEL, BREEDER, OR ABSORBER ELEMENT WITH ELEMENTS FOR FISSION GAS REMOVAL. Bestenreiner, G.; Duenner, P.; Dreyer, G.; Schmitz, K.J. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,649,434/A/. 3 May 1978. 10p. (In German).

The assembly consists of rods filled with fissile, fertile (UO_2) or absorber (B_4C) materials arranged in a hexagonal matrix within a shroud tube. The fission gas generated flows into a common bottom expansion chamber (or into one top and one bottom subchamber) which is filled up to a certain level with coolant introduced from the outside. This coolant is displaced by the fission gas through a blowdown tube from the expansion chamber into the reactor plenum; the blowdown tube extends into the expansion chamber (diving bell principle). It is connected with the reactor plenum through the center of the assembly. In addition, it can be designed also as a structural rod. After having displaced the coolant from the expansion chamber and having released the bottom opening of the blowdown and riser tube, respectively, the fission gas directly enters the reactor plenum.

Environmental Aspects

2891 (EPA--520/6-78-009) ENVIRONMENTAL IMPLICATIONS OF THORIUM USE IN SELECTED NUCLEAR FUEL CYCLES. FINAL. Buckley, D.W.; Simmons, G.L.; Ziskind, R.A. (Science Applications, Inc., La Jolla, CA (USA)). 31 Oct 1978. 35p. (SAI--78-943-LJ). NTIS.

The objective of this study was to assess the environmental implications of the nuclear fuel cycle associated with the highly enriched uranium concept of the High Temperature Gas Cooled Reactor. Model fuel cycles were constructed for the HTGR and a reference light water reactor (LWR) cycle. Mass flows were developed, control technology cases proposed and costed, effluents determined, and population doses calculated. Emphasis was given to the intercomparison of the fuel cycles to delineate areas which show pronounced departure. The dose commitment received by the population both within and outside a radius of 50 miles of each facility was determined. The 100 year population dose commitments due to a single year's plant operation was selected to facilitate intercomparison among fuel cycle components. No account was taken for long term waste sources associated with the fuel cycle such as mill tailing piles or terminal waste storage (study groundrule). The resource utilization and radionuclide activity of various fuel cycle options for using thorium in a Pressurized Water Reactor were studied. These data were contrasted with similar results obtained for a uranium fuel PWR.

2892 (INTAT--78.147) FAST BREEDERS AND ENVIRONMENT. Hoerning, H. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). Dec 1978. 28p. (In German). (CONF-7809171--1; INKA-Conf--78-271-003). Dep. NTIS (US Sales Only), PC A03/MF A01.

From Conference on the role of the fast breeder reactor; Essen, F.R. Germany (27 Sep 1978).

The waste heat of a fust breeder has a thermal effricency of 40%. This is the same as in conventional power plants, i.e. not typical of nuclear power plants. Wet and dry cooling towers are built with increasing frequency in order to protect rivers. The potential danger due to high radioactivity inventaries in all fuel cycle stages is not the same as its actual danger. Radioactivity sources in fast breeders are listed and compared with those of LWR reactors. Activity sources and inventaris are similar. Exposure pathways are listed which might endanger the popululion in the vicinity

of fast breeders and other nuclear facilities in case of radioactivity release. In addition to the rated values stated in the Radiation Protection Ordinance for normal operation and accidents the very low radiation doses calculated for the SNR-300 are given. This is also proved by a comparison with natural and man-made radiation and theis variation in West Germany. Fuel element reprocessing, experience so for, and waste conditioning are dealt with. The toxicity of high-activity waste of fast breeders and LWR reacters is compared, and its reduction on storage is shown. The West German concept for final storage is outlined.

2893 (Juel--1573) APPLIED SYSTEMS ANALYSIS NO. 11: INTRODUCTION OF NUCLEAR LONG-DISTANCE ENERGY. ENVIRONMENTAL IMPACT AND ITS ASSESSMENT. Bartholdi, J. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Programmgruppe Systemforschung und Technologische Entwicklung; Technische Hochschule Aachen (Germany, F.R.)). Jan 1979. 155p. (In German). Dep. NTIS (US Sales Only), PC A08/MF A01.
Thesis.
The process of planning for the introduction of new energy technologies requires, together with economic and technical analyses, the quantification and evaluation of the environmental effects of their introduction. It is the goal of this work to determine the environmental impact of individual components of the energy system 'nuclear long distance energy' and to investigate the possible protection of the environment which the energy technology can offer on a regional basis. Results for four areas of environmental damage in North Rhine-Westphalia, Hessen and Rhineland-Pfalz show that nuclear long distance energy can yield a positive benefit to the environment.

2894 (NUREG/CR--1247) STABLY STRATIFIED BUILDING WAKES. Kothari, K.M.; Peterka, J.A.; Meroney, R.N. (Colorado State Univ., Fort Collins (USA). Fluid Dynamics and Diffusion Lab.; Colorado State Univ., Fort Collins (USA). Dept. of Civil Engineering). Jan 1980. 158p. NTIS.
The velocity and temperature wake behind an isolated building placed in a stably stratified turbulent boundary layer has been investigated utilizing wind tunnel tests and mathematical analysis. The mean velocity and mean temperature decrease but turbulence intensity and temperature fluctuation intensity increase as a result of the momentum wake. However, the vortex wake increases mean velocity and mean temperature, and decreases turbulence intensity and temperature fluctuation intensity along the centerline of the wake.

2895 (NUREG/CR--1286) RANCHO SECO BUILDING WAKE EFFECTS ON ATMOSPHERIC DIFFUSION: SIMULATION IN A METEOROLOGICAL WIND TUNNEL. Allwine, K.J.; Meroney, R.N.; Peterka, J.A. (Colorado State Univ., Fort Collins (USA). Dept. of Civil Engineering). Feb 1980. 189p. NTIS.
Wind tunnel diffusion tests were conducted on 1:500 scale models of the Rancho Seco Nuclear Power Station, California; surrounding buildings, hyperbolic cooling towers, and terrain were similarly modeled in the Meteorological Wind Tunnel at Colorado State University. The purpose was to quantify the effects on diffusion of buildings perturbing the mean flow. The test program consisted of three gaseous tracer releases of gases having no appreciable plume rise from ground, building, and containment vessel top heights. The program was repeated for eight wind directions and cases of unstable, neutral, and stable atmospheric stratification conditions. Results show that the buildings significantly perturb the dispersion patterns from the flat terrain isolated source release case, hence buildings, hyperbolic towers, and terrain in the immediate vicinity of the release have a major effect.

2896 (PNL--3276) SIMULATION OF ATMOSPHERIC TURBULENCE. Cliff, W.C.; Hall, D.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jan 1980. Contract EY-76-C-06-1830. 29p. Dep. NTIS, PC A03/MF A01.
A method is described for constructing an artificial temporal sequence of velocity values for simulating atmospheric turbulence. The method develops the conditional probability density distribution of velocity given that the previous value of velocity is known. A value is randomly selected from the conditional probability density which then serves as a known value for the next conditional probability density function. Continuing this procedure provides the desired simulated sequence of velocity values. Based upon this simulation method a program is developed for the Hewlett-Packard HP-29C hand-held calculator for simulating the longitudinal component of atmospheric turbulence during neutra. or strong wind conditions.

2897 RISK RELATIVITIES. Fremlin, J.H. (Birmingham Univ. (UK). Dept. of Physics). Atom (London) ; No. 283, 128-131(May 1980).
A discussion is presented on the quantitative significance of the radiation exposure of members of the public resulting from the operations of the nuclear industry. The effects of such exposure are compared with those due to other activities. Consideration is given in particular to the probability of deaths from cancer from ingestion of plutonium and from other causes. The radiation effects arising from the long-term disposal of radioactive wastes are also discussed.

2898 PUBLICATION OF THE SAFETY REGULATION KTA 3603 OF THE COMMITTEE FOR NUCLEAR TECHNOLOGY (KTA). FROM MARCH 12, 1980. Bundesanzeiger ; 32: No. 96, 1-4(May 1980). (In German).
The regulation applies to the planning, construction, and operation of plants for the treatment of radioactive, contaminated water from stationary nuclear power plants with LWR- and HTR-type reactors. According to the regulation, plants for the treatment of contaminated nature are to be planned, constructed, and operated in such a way that - uncontrolled discharge of contaminated water will be avoided (article 46, paragraph 1, no. 1 StrlSchV), - the activity discharged with water is as low as possible (article 46, paragraph 1, no. 2 StrlSchV), - radioactive contaminated water will not be discharged into the ground, - personnel exposure due to direct radiation, contamination, and inhalation will be as low as possible even below the limiting values fixed in the Radiation Protection Ordinance (article 28, paragraph 1 StrlSchV). Furthermore, discharge of liquid waste into bodies of water requires special permission (articles 2, 3, 7 WHG).

2899 RADIOACTIVE PLUME FROM THE THREE MILE ISLAND ACCIDENT: XENON-133 IN AIR AT A DISTANCE OF 375 KILOMETERS. Wahlen, M.; Kunz, C.O.; Matuszek, J.M.; Mahoney, W.E.; Thompson,

R.C. (New York State Dept. of Health, Albany). Science ; 207: 639-640(8 Feb 1980).
The transit of an air mass containing radioactive gas released from the Three Mile Island reactor was recorded in Albany, New York, by measuring xenon-133. These measurements provide an evaluation of Three Mile Island effluents to distances greater than 100 kilometers. Two independent techniques identified xenon-133 in ambient air at concentrations as high as 3900 picocuries per cubic meter. The local γ-ray whole-body dose from the passing radioactivity amounted to 0.004 millirem, or 0.004% of the annual dose from natural sources.

2900 NUCLEAR POWER PLANTS AND ENVIRONMENT PROTECTION. Chambolle, T.; Gaillot, J.C. (Ministere de l'Environnement et du Cadre de Vie, 75 - Paris (France)). Revue Generale Nucleaire ; No. 1, 19-22(Jan-Feb 1980). (In French).
Descriptions are presented concerning the way environmental problems are taken into account at the different stages of the building of a nuclear plant. Included are descriptions of preliminary studies, environment protection during the project stage, inspection programs.

2901 ORGANIZATION OF NUCLEAR PLANTS ENVIRONMENTAL STUDIES. Le Marechal, M. (Electricite de France, 75 - Paris. Direction de l'Equipement). Revue Generale Nucleaire ; No. 1, 23-30(Jan-Feb 1980). (In French).
The objectives of environmental studies are defined and the scope and organization of sites studies are described along with biological and radioecological general studies. The available means that are used for such studies and the different offices responsible for their achievement are given.

2902 RELEASES OF RADIOACTIVE SUBSTANCES FROM NUCLEAR POWER PLANTS IN THE EUROPEAN COMMUNITIES IN 1972-1976. Atomwritschaft, Atomtechnik ; 24: No. 12, 606-611(Dec 1979). (In German).
In its latest report on the releases of radioactive substances from nuclear power plants, the EC commission presents a survey of the years 1972-1976. In this period, too, releases in the EC member states have been below the various official maximum permissible values, in most cases even far below these limits. The maximum releases of radioactive substances from nuclear power plants are, now as before, less than 5% of the natural radiation exposure to the population and are within the local variations of exposure values.

2903 UPDATING RADWASTE PROCESSING, STORAGE. Oyen, L.C.; Tucker, R.F. (Sargent and Lundy). Power ; 123: No. 10, 81-87(Oct 1979).
Since 1970, nuclear power plant designs have been modified to improve their capability for handling low level radioactive wastes. Design alterations have stressed greater capacity, safety, and reliability. Volume reduction methods are used extensively to minimize overall disposal costs for both liquid and solid wastes. Also discussed are: gaseous waste design improvements; liquid segregation; evaporator processes; filter performances; and water management strategies. Volume reduction methods considered include: dehydration, evaporation, crystallization, compaction, and incineration. Ways of controlling operating costs are reviewed. The merits and problems of waste burial vs. storage are examined. (13 diagrams, 1 table)

2904 ENVIRONMENTAL EFFECTS OF NUCLEAR POWER STATIONS. Viragh, E. (Budapesti Muszaki Egyetem (Hungary). Egyetemi Reaktor). Meres es Automatika ; 27: No. 2, 41-47(1979). (In Hungarian).
The increasing power demand will not be satisfied by the traditional fuels, therefore more nuclear power stations have to be built until 2000. The most frequently used types of nuclear power stations are summarized and their environmental effects are investigated under working conditions and emergency situations. The problem of eliminating radioactive wastes is dealt with. The system of measurements for the protection of population in the immediate vicinity of reactors is illustrated by an example.

2905 Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 Mars 1979. (PROCEEDINGS OF THE SYMPOSIUM ON THE ON-SITE MANAGEMENT OF POWER REACTOR WASTES. ZURICH, 26-30 MARCH 1979). Paris, France; OECD (1979). vp. (CONF-790374--).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
Separate abstracts have been prepared for items within the scope of the energy data base.

2906 METEOROLOGICAL ASPECTS OF ENVIRONMENTAL HEALTH AND SAFETY PLANNING IN NUCLEAR POWER PLANT SITES. Shirvaikar, V.V.; Sitaraman, V. (Bhabha Atomic Research Centre, Bombay (India). Health Physics Div.). Bulletin of Radiation Protection ; 1: No. 3, 3-8(Jul-Sep 1978).
Micrometeorological data, i.e., those dealing with the properties of atmosphere in the first 100 meters or so above the earth's surface are required in planning and control of environmental impact of gaseous effluent releases from a nuclear power plant. Data of various types to be collected during the stages of site survey, site evaluation, normal operation of the plant and accident contingency planning are described. Atmospheric dispersion models in general and one suggested by Pasquill in particular are outlined. These models relate the dispersion parameters to the meteorological observables and are used in evaluating environmental dose. Cautions to be exercised while applying these models to the real situation are mentioned. The use of meteorological data for accident analysis while evaluating plant design parameters is discussed.

2907 MONITORING OF THE RELEASE OF RADIOACTIVE SUBSTANCES FROM NUCLEAR FACILITIES INTO SURFACE WATERS. Schwibach, J. pp 59-63 of Monitoring of airborne and liquid radioactive releases from nuclear facilities to the environment. Vienna, Austria; International Atomic Energy Agency (1978).
The first part of the article deals with the conditions for discharge, the second with the related radioactivity measurements.

2908 PROBLEMS LINKED TO THE LONG-TERM DEVELOPMENT OF ELECTRICITY PRODUCTION. PT.2. NUCLEAR AND CLASSICAL POWER PLANTS. pp 119-155 of Rapport sur les relations entre le secteur de l'energie et l'environnement dans une perspective a long terme. Paris, France; Documentation Francaise (1974). (In French)
Energy demands lead to the forecasting of

thermal power plants to be built before the year 2000. The review falls under the following headings; type and size of reactors, cooling possibilities, reprocessing, radioactive wastes, environmental impact, site selection, possibilities of electricity production by classical origin at the turn of the century.

2909 Les centrales nucleaires. (NUCLEAR POWER PLANTS). Jauffret, C. Lille, France; Universite des Sciences et Techniques (Ind]). v.2 p.166-280p. (In French).
The fourth part of the manual deals with ecological problems: ionizing radiations, thermal and chlorine effects.

Siting

2910 (INIS-mf--4778) RISK BENEFIT ANALYSIS OF SITE ALTERNATIVES FOR A NUCLEAR POWER PLANT PRODUCING BOTH ELECTRICITY AND DISTRICT HEAT. Savolainen, I.; Vuori, S. (Valtion Teknillinen Tutkimuskeskus, Helsinki (Finland)). 1978. 11p. (CONF-781022--76). Dep. NTIS (US Sales Only), PC A02/MF A01.
From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).
The environmental impacts due to radioactive releases in normal operation and accidents are primarily assessed for each site as also the district heat transmission costs. Secondarily the risk components are converted to a compatible form, expressed in monetary units, and compared directly to district heat transmission costs. Annual savings from the shortening of the district heat transmission line are clearly larger than the monetary value given to the expectation of the increased risk.

2911 (ORAU/IEA--80-3(P), pp 57-60) POLICY BASED ON EXPANSION OF EXISTING SITES. Burwell, C.C. Mar 1980.
Acceptable future nuclear energy system. Gatlinburg II condensed workshop proceedings, December 10-12, 1979, Gatlinburg, Tennessee.

2912 SOVIET NUCLEAR PROGRAMME IN SITE OF DIFFICULTY. Moss, J. Electrical Review (London) ; 206: No. 2, 16-17(11 Jan 1980).
The Soviet Union nuclear power programme is discussed, with particular emphasis on the problems of siting new plants or nuclear complexes containing a group of power stations, fabrication, reprocessing and waste treatment plants, and waste burial sites. (U.K.).

2913 THERMO- AND FLUIDDYNAMIC INFLUENCES OF NUCLEAR POWER PLANTS ON THE ENVIRONMENT. Brosche, D. (Bayernwerk A.G., Muenchen (Germany, F.R.)). Atomkernenergie/Kerntechnik ; 35: No. 2, 145-147(1980). (In German).
Both topics treated in this seminary, aerodynamics, in connection with buildings and hydraulics, are very important for the planning of nuclear power plants. Aerodynamic investigations have been performed only in the last few years in order to understand the effects of the plant on the diffusion of radioactive materials in the near environment and to modify these effects. In both topics it is not possible to describe the complex flow processes mathematically in a satisfactory manner, so that only experimental investigations with a wind tunnel or with a hydraulic model, respectively, can be used to get useful solutions of the problems. In both cases the investigations must be performed already during the planning phase of the plant. Individual technical solutions must be found because stadardizing is not possible.

2914 SITING POLICY FOR AN ACCEPTABLE NUCLEAR FUTURE. Burwell, C.C. (Inst. for Energy Analysis, Oak Ridge, TN); Ohanian, M.J.; Weinberg, A.M. Science ; 204: 1043-1051(8 Jun 1979).
This article is an outgrowth of studies aimed at devising an acceptable nuclear energy system for the United States. It is argued that a nuclear siting policy leading to a few, large concentrated sites is preferable in the long run to the present policy which could lead to many dispersed sites. Such a policy could be implemented incrementally if requirements for new nuclear generating capacity were met by adding reactors to the existing 100-odd sites. Such a concentrated nuclear siting policy would, to some extent, isolate nuclear activities while augmenting the strengths of the institutions responsible for managing them. Additionally, it would confer an element of permanence on the sites and thereby open new options for managing low level wastes and reactor decommissioning. These actions may improve the public acceptability of nuclear energy in the United States as well as lead to a more rational contained nuclear system in the long run. 3 figures, 3 tables. (DP)

2915 NEW TEST SET UP FOR THE IN SITU DETERMINATION OF PERCOLATION PARAMETERS IN ROCK. Schneider, H.J. (Federal Institute of Geosciences and Natural Resources, Hannover (Germany)). pp 59-68 of Low flow, low-permeability measurements in largely impermeable rocks. Proceedings of the NEA/AIEA workshop, Paris, 19-21 Mar 1979. Paris, France; OECD (1979).
From Workshop on Low-Flow Low permeability measurements in Langley Impermeable rocks; Paris, France (19 Mar 1979).
In a study on the underground siting of nuclear power plants in rock caverns, the protective effect of the overlaying rock is determined for a hypothetical nuclear accident in which contaminated water from the reactor cavern is pressed into the surrounding rock. A test set-up has been developed for the experimental analysis of these percolation processes in the rock, with which the spatial and temporal expansion of the percolation temperature fields and contamination can be observed. The test arrangement is a modified water injection test. A salt tracer is pumped into a central borehole into the rock. The percolation processes are observed in neighboring boreholes. Initial results are reported.

2916 NUCLEAR POWER PLANTS IN NORWAY - SITING AND EFFECT ON SURROUNDINGS. Haga, I (Norges Vassdrags- og Elektrisitetsvesen, Oslo). Ingenioer-nytt ; 14: No. 94, 10-11,24(24 Nov 1978). (In Norwegian).
From Nuclear power seminar; Oslo, Norway (23 - 24 Oct 1978).
The factors affecting site selection for a nuclear power plant are first presented. Thereafter the effects on the surrounding district of the construction phase are discussed. It is probable that the first plant in Norway would be sited by the Oslofjord, where it is found that the effects are acceptable. The effects of releases of radioactive substances during routine operation, and of thermal pollution are then

discussed and it is concluded that there would be no significant adverse effects. Finally the radiation hazards from a reactor accident and its consequences are briefly discussed.

Radioactive Effluents

2917 (AECL--6544) RECOVERY OF TRITIUM FROM CANDU REACTORS, ITS STORAGE AND MONITORING OF ITS MIGRATION IN THE ENVIRONMENT. Holtslander, W.J.; Osborne, R.V.; Drolet, T.S. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Jul 1979. 18p. NTIS (US Sales Only), PC A02/MF A01.

Tritium is produced in CANDU heavy water reactors mainly by neutron activation of deuterium. The typical production rate is 2.4 kCi per megawatt-year (89 TBq. per megawatt-year. In Pickering Generating Station the average concentration of tritium in the moderators has reached 16 $Ci.kg^{-1}$ (0.6 $TBq.kg^{-1}$) and in coolants, 0.5 $Ci.kg^{-1}$ (0.02 $TBq.kg^{-1}$). Concentrations will continue to increase towards an equilibrium determined by the production rate, the tritium decay rate and heavy water replacement. Tritium removal methods that are being considered for a pilot plant design are catalytic exchange of DTO with D_2 and electrolysis of D_2O/DTO to provide feed for cryogenic distillation of D_2/DT/T_2. Storage methods for the removed tritium -- as elemental gas, as metal hydrides and in cements - are also being investigated. Transport of tritiated wastes should not be a particularly difficult problem in light of extensive experience in transporting tritiated heavy water. Methods for determining the presence of tritium in the environment of any tritium handling facility are well established and have the capability of measuring concentrations of tritium down to current ambient values. (author).

2918 (BNL--26970) CRITIQUE OF SOURCE TERM AND ENVIRONMENTAL MEASUREMENT AT THREE MILE ISLAND. Hull, A.P. (Brookhaven National Lab., Upton, NY (USA)). 1979. Contract EY-76-C-02-0016. 20p. (CONF-791037--14). Dep. NTIS, PC A02/MF A01.

From IEEE nuclear science/nuclear power systems symposium; San Francisco, CA, USA (17 Oct 1979).

The most serious malfunction to date at an operating power reactor in the US occurred at Unit 2 of the Three Mile Island Nuclear Power Station (TMI) at 0400 est on March 28, 1979. Subsequently, between 3X and 10 x 10^6 Ci of radiogases (principally ^{133}Xe) were released to the atmosphere from the plant vent in decreasing concentrations over the next few weeks, accompanied by abut 10 Ci of ^{131}I. During this period, the plant's typical effluent monitors and field radiation monitoring program were unable to supply prompt and reliable radiological information. In order to provide a sufficient radioanalytical capability for the large number of in-plant and environmental samples (air, water, soil, vegetation and milk) which were obtained, the existing on-site facilities were augmented by mobile laboratories. The laboratory facilities of the Bureau of Radiological Health (BRH-PA) of the Pennsylvania Department of Environmental Conservation were supplemented by a nearby temporary facility for gamma analysis set up by the Department of Energy (DOE). Many environmental samples, principally of milk, were also transported to more remotely established radioanalytical laboratories of state and federal agencies.

2919 (CONF-800403--13) ESTIMATES OF DOSE TO THE POPULATION WITHIN FIFTY MILES DUE TO NOBLE GAS RELEASES FROM THE THREE MILE ISLAND INCIDENT. Miller, C.W.; Cotter, S.J.; Moore, R.E.; Little, C.A. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 8p. Dep. NTIS, PC A02/MF A01.

From ANS thermal reactor safety meeting; Knoxville, TN, USA (8 Apr 1980).

Estimates have been made of the dose to the population within 80 km (50 miles) due to noble gas releases from the Three Mile Island Unit 2 incident for the period March 28 to April 15, 1979. Source term, meteorological, and monitoring data used in these estimates were supplied by the Task Group on Health Physics and Dosimetry of the President's Commission on the Accident at Three Mile Island. The 22.5° sector-averaged form of the Gaussian plume atmospheric dispersion model was used to calculate doses due to immersion in air and inhalation. The best estimate of the population dose to the total body is 15 person-sieverts (1500 person-rem).

2920 (CONF-800607--9) MEASURED PERFORMANCE OF FOUR PWR LIQUID RADIOACTIVE WASTE TREATMENT SYSTEMS. McIsaac, C.V.; Mandler, J.W.; Stalker, A.C. (EG and G Idaho, Inc., Idaho Falls (USA)). 1980. Contract EY-76-C-07-1570. 6p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

This paper presents results of a study of the liquid radwaste treatment and boron recovery systems of four operating PWR power plants. The performance of a given system was determined from measurements of radionuclide inventories in samples drawn from demineralizers, evaporators, filters, and gaseous cleanup systems. The plants at which measurements were made are Fort Calhoun, Zion 1 and 2, Turkey Point 3 and 4, and Rancho Seco.

2921 (CONF-800802--14) UNIT OPERATIONS USED TO TREAT PROCESS AND/OR WASTE STREAMS AT NUCLEAR POWER PLANTS. Godbee, H.W.; Kibbey, A.H. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 47p. NTIS, PC A03/MF A01.

From 89. annual meeting of the American Institute of Chemical Engineers; Portland, OR, USA (17 Aug 1980).

Estimates are given of the annual amounts of each generic type of LLW [i.e., Government and commerical (fuel cycle and non-fuel cycle)] that is generated at LWR plants. Many different chemical engineering unit operations used to treat process and/or waste streams at LWR plants include adsorption, evaporation, calcination, centrifugation, compaction, crystallization, drying, filtration, incineration, reverse osmosis, and solidification of waste residues. The treatment of these various streams and the secondary wet solid wastes thus generated is described. The various treatment options for concentrates or solid wet wastes, and for dry wastes are discussed. Among the dry waste treatment methods are compaction, baling, and incineration, as well as chopping, cutting and shredding. Organic materials [liquids (e.g., oils or solvents) and/or solids], could be incinerated in most cases. The filter sludges, spent resins, and concentrated liquids (e.g., evaporator concentrates) are usually solidified in cement, or urea-formaldehyde or unsaturated polyester resins prior to burial. Incinerator ashes can also be incorporated in these binding agents. Asphalt has not yet been used. This

paper presents a brief survey of operational experience at LWRs with various unit operations, including a short discussion of problems and some observations on recent trends.

2922 (EPRI-NP--1269) IODINE SPECIES IN REACTOR EFFLUENTS AND IN THE ENVIRONMENT. FINAL REPORT. Voilleque, P.G. (Science Applications, Inc., Rockville, MD (USA). Nuclear Environmental Services Div.). Dec 1979. 204p. Dep. NTIS, PC A10/MF A01.

The air-to-vegetation transfer velocity, an important parameter in evaluating dose to man from I-131 in the environment, has been used to establish an environmental reactivity ranking for the radioiodine species. In these terms, the hierarchy of reactivities is I_2 > particulate > HOI > organic iodides. Previous measurements showing that the least reactive forms, HOI and organic iodides, comprise 50% or more of the total I-131 release from boiling water reactors were confirmed in this study. Measurements of the chemical forms of I-131 and stable iodine in the environment were made using radioiodine species sampler media and a stable iodine species sampler. The compound HOI-131 was observed in the environment 1.5 km from the plant release point. Organic forms were prevalent in environmental samples. Organic iodide residence times calculated using the measured variability of ambient concentrations are > 80 days.

2923 (EPRI-NP--1380) BUILDING EFFECTS ON EFFLUENT DISPERSION FROM ROOF VENTS AT NUCLEAR POWER PLANTS. FINAL REPORT. Thuillier, R.H.; Mancuso, R.L. (SRI International, Menlo Park, CA (USA)). Apr 1980. 232p. NTIS, PC A11/MF A01.

During the summer of 1978, a series of dispersion tests was conducted by SRI International using gas tracer and lidar techniques. Tests were conducted at a specially selected nuclear power facility in the Midwest and were designed to diagnose the effect of nuclear power plant structures on the three-dimensional characteristics of effluent plumes within 1 kilometer of the release point. For the purpose of the tests, sulfur hexafluoride (SF_6) gas and zinc oxide smoke were released simultaneously from one of the three release points at different heights on a plant structure and one of two ground-level locations removed from the influence of the structural wake.

2924 (EPRI-NP--1389) ^{131}I STUDIES AT TMI UNIT 2. FINAL REPORT. Cline, J.E.; Voilleque, P.G.; Pelletier, C.A.; Thomas, C.D. (Nuclear Environmental Services, Rockville, MD (USA)). Apr 1980. 100p. NTIS, PC A05/MF A01.

Subsequent to the accident at TMI-2 on March 28, 1979, a program of measurements was set up to: (1) identify sources of radioiodine release to the environment, (2) measure retention efficiencies of charcoal adsorbers in the plant's ventilation exhaust system, and (3) measure protection factors for respirators using charcoal canisters. Measurements of radioiodine sources showed that, when normalized for reactor coolant concentrations, radioiodine releases were approximately the same at TMI-2 as at other PWRs.

2925 (IAEA--212, pp 97-119) TRANSFER PARAMETERS OF FISSION AND ACTIVATION PRODUCTS PRESENT IN EFFLUENTS OF NUCLEAR POWER REACTORS. Cancio, D.; Menossi, C.A.; Ciallella, N.R. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Proteccion Radiologica y Seguridad). 1978. (In Spanish).

From IAEA regional seminar on the application of environmental impact analysis to the nulcear power industry; Buenos Aires, Argentina (29 Aug 1977).

The paper presents results of research carried out in Argentina on transfer parameters of fission and activation products which may be present in the effluents of nuclear power reactors. For some nuclides, as Sr-90, Co-137 and I-131, the parameters were obtained by studies of the fallout, from measurements of integrated levels in the environment and in the food chains. Other values are concentration factors derived from laboratory and field experiments. They refer to fish, molluscs, crustaces and fresh water plants, for several fission and activation nuclides. Transfer parameters obtained have been of significant importance for environmental assessments, relating to nuclear installations in Argentina.

2926 (IAEA--212, pp 1-17) RADIATION PROTECTION REQUIREMENTS IN THE LIMITATION OF THE RELEASE OF RADIOACTIVE EFFLUENTS. Beninson, D. (United Nations Scientific Committee on the Effects of Atomic Radiation). 1978.

From IAEA regional seminar on the application of environmental impact analysis to the nulcear power industry; Buenos Aires, Argentina (29 Aug 1977).

The paper summarizes the requirements of radiation protection, as presented in the new ICRP recommendation, in relation to the limitation of the release of radioactive effluents. The concepts of effective dose equivalent and collective dose equivalent are used in the presentation of the optimization procedures and the dose limitation to individuals. The dose commitment is used for the procedures applied to control future exposures. An appendix describes the basic concepts and quantities used in assessments of human exposures and risks.

2927 (INIS-mf--4637, pp 120) ISOTOPE COMPOSITION OF IODINE IN GASEOUS EFFLUENTS OF NUCLEAR FACILITIES AND IODINE FILTER EFFICIENCY. Tomasek, M. (Ceskoslovenska Akademie Ved, Prague. Laborator Radiologicke Dozimetrie). Jun 1976. (In Czech).

From 4. national symposium on ionizing radiation dosimetry; Marianake Lazne, Czechoslovakia (8 Nov 1976).

ACTIVATED CARBON;ADSORPTION;AIR FILTERS; EFFICIENCY;GASEOUS WASTES;HUMIDITY;IMPREGNATION; IODINE COMPOUNDS;IODINE 131;ISOTOPE RATIO; NUCLEAR POWER PLANTS;RADIOACTIVE EFFLUENTS

2928 (INIS-mf--4698) STOCK-TAKING OF THE SAFETY DESIGN OF THE NUCLEAR POWER PLANT WITH PWR TYPE BIBLIS B AND THE RADIATION EXPOSURE CONNECTED WITH ITS OPERATION. PHASE 1. Orescher, H.P.; Geiser, H.; Roedder, P.; Dagbjartsson, S.; Ernst, H.; Ledermann, H.; van Hecke, R. (Bonnenberg und Drescher Ingenieurgesellschaft m.b.H., Aldenhoven (Germany, F.R.); Fichtner, Beratende Ingenieure fuer Energie- und Waermewirtschaft G.m.b.H. und Co. K.G., Stuttgart (Germany, F.R.)). Jun 1976. vp. (In German). Dep. NTIS (US Sales Only), PC A11/MF A01.

The study comprises: 1) Environmental pollution due to radioactive emissions; 2) personnel exposure during operation, maintenance, inspection, and repair; 3) environmental pollution due to the closing of

the fuel cycle; 4) safety requirements; 5) state of the art of safety design; 6) reliability analysis; 7) the importance of the testability of systems and components relevant for safety. (HP) 891 HP.

2929 (INIS-mf--4957) DETERMINATION OF THE SOURCES OF THE AIRBORNE PHYSICO-CHEMICAL ^{131}I SPECIES IN A PWR POWER PLANT. Deuber, H.; Wilhelm, J.G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Lab. fuer Aerosolphysik und Filtertechnik 1). 1978. 10p. Dep. NTIS (US Sales Only), PC A02/MF A01.

In a 1300 MWE PWR power plant the sources of the airborne ^{131}I species were determined over a period of 5 months. During power operation the main source of the radiologically decisive elemental ^{131}I was the exhaust from the hoods in which samples from the primary coolant are taken and processed. During refueling outage elemental ^{131}I was mainly contributed by the containment purge air. By efficient filtration of these exhausts, a reduction of the ingestion dose, caused by the total ^{131}I stack release, by a factor of nearly 4 during power operation and of possibly 10 during refueling outage can be accomplished.

2930 (INIS-mf--5570, pp 83-86) AUTOMATIC INSTALLATIONS WITH EVAPORATORS AND ION EXCHANGE FILTERS FOR PROCESSING TRAPPED WATERS AND BORON CONTAINING SOLUTIONS WITH REGENERATION OF BORIC ACID FROM THEM CONFORMABLY TO THE NUCLEAR POWER PLANT WITH WWR-1000 REACTOR PROJECT. Matskevich, G.V.; Matkovskii, L.V.; Shevtsova, A.G. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Installation is described for processing of trapped and washing waters, desactivation of liquid discharges, reprocessing of technological boric acid solution. This installation is intended for nuclear power plant with WWR type reactors. There are two independent devices in the installation. One is for processing of liquid wastes and the second is especially intended for boric acid solution reprocessing. But in the case of necessity these devices can replace each other in processing either radioactive effluents or boric acid solution. Main method for processing of highly mineralizated liquid wastes at nuclear power plant is evaporation. Liquid wastes of high activity prior evaporation are subject to preliminary purification by means of ion exchange filters. Installation has automatic systems for starting and shutdown and maintaning of the normal technological regime.

2931 (INIS-mf--5570, pp 117-124) TECHNOLOGICAL SYSTEM FOR RECEPTION AND STORAGE OF LIQUID RADIOACTIVE CONCENTRATED WASTES AND SPENT SORBENTS FOR THE FINISH NUCLEAR POWER PLANT LOVIISA AND SERIAL NUCLEAR POWER PLANT BLOCKS WITH WWR-440 TYPE REACTORS (SYSTEM TW). Matskevich, G.V.; Novikov, V.D. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Technological system for reception and storage of concentrated liquid radioactive wastes from nuclear power plant is described. The system includes: subsystem for purification of the primary coolant circuit water; subsystem for processing of drained coolant; subsystem for trapped waters processing; subsystem for processing of boron containing solutions; subsystem for purification of water from storage and reloading pools; subsystem for purification of scavenging water from steam generators; special sewage subsystem; decontamination subsystem; subsystem for liquid wastes storage; subsystem for gases processing and subsystem for radioactive wastes solidification. Parameters are given for equipment used and wastes coming into the system. Water and chemical conditions for liquid radioactive wastes storage are considered.

2932 (INIS-mf--5570, pp 45-49) PURIFICATION OF RADIOACTIVE SEWAGE CONTAINING LARGE QUANTITIES OF DETERGENTS. Pawlik, O.; Fridrich, V.; Reti, D. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

It is proved that from the economical and technical points of view there is no reason to build devices for purification of small amounts of radioactive sewage in the points of their origin. Great amounts of liquid wastes with different composition in respect with type of waste and concentration of nuclides is originated at nuclear power plants and isotope laboratories. These liquid wastes is expedient to purify at the place of their origin. It is practical to collect and process liquid radioactive wastes separatelly depending on their type. Problems of purification of great amounts of sewage from the atomic power plant laundry are discussed. These sewage contain great amounts of detergents and little salts and radionuclides. Main processes of the sewage processing include precipitation, filtration, concentration of slurries by centrifugation, solidification of slurries and solid wastes burial. Normally, precipitation and coagulation are the chemical processing methods for radioactive sewage. Presence of detergents in sewage makes difficulties for the precipitation and coagulation processes. Satisfactory results of the radioactive sewage purification, when these sewage contain different detergents, can be obtained by means of combination of different chemical and physical an chemical methods. Results of laboratory investigations on different methods of purification of radioactive sewage with high concentration of detergents are given.

2933 (INIS-mf--5570, pp 96-99) OPERATION EXPERIENCE ON INDUSTRIAL ELECTRODIALYSIS PLANT EDU-50 USED IN THE SEWAGE PURIFICATION LINE AT THE CENTRAL STATION OF RADIATION SAFETY (CSRS). Sobolev, I.A.; Kuleshov, N.F.; Khomchik, L.M.; Panteleev, V.I.; Golubchik, R.S. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Results of testing serial model of electrodialysis device EOU NIIPM-25 type in industrial line for purification of liquid radioactive wastes are stated. Composition of liquid wastes and scheme of purification and also results of desalination, concentration and purification of sewage on industrial installation EDU-50 are given. It is shown that content of basic radionuclides in sewage, strontium-90 and cesium-137 was reduced, in everage, in 1,5 times. Influence of the electrodialysis desalination of sewage with subsequent radionuclides separation by ion exchange method is discussed. Some economic estimations of the discussed process of wastes

purification are given.

2934 (INKA-Conf--79-187-001) RADIOLOGICAL IMPACT FROM MODEL COAL-FIRED POWER PLANTS AND FROM NUCLEAR SYSTEMS. Braeutigam, K.R.; Halbritter, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Abt. fuer Angewandte Systemanalyse). (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Abt. fuer Angewandte Systemanalyse). 1979. 9p. (CONF-7905119--2). Dep. NTIS (US Sales Only), PC A02/MF A01.

From Annual meeting of the task group on water chemistry of the Gesellschaft Deutscher Chemiker; Bad Pyrmont, F.R. Germany (21 May 1979).

The radiation dose rate from airborne releases of radionuclides are compared for model 1000 MW(e) coal-fired and 1000 MW(e) LWR power plants including reprocessing.

2935 (JEN--423) REY: A COMPUTER CODE FOR THE DETERMINATION OF THE RADIONUCLIDES ACTIVITIES FROM THE GAMMA-RAY SPECTRUM DATA. Palomares, J.; Perez, A.; Travesi, A. (Junta de Energia Nuclear, Madrid (Spain)). 1978. 27p. (In Spanish). Dep. NTIS (US Sales Only), PC A04/MF A01.

The Fortran IV computer Code, REY (REsolution and Identification), has been developed for the automatic resolution of the gamma-ray spectra from high resolution Ge-Li detectors. The Code searches the full energy peaks in the spectra background as the base line under the peak and calculates the energy of the statistically significant peaks. Also the Code assigns each peak to the most probable isotope and makes a selection of all the possible radioisotopes of the spectra, according the relative intensities of all the peaks in the whole spectra. Finally, it obtains the activities, in microcuries of each isotope, according the geometry used in the measurement. Although the Code is a general purpose one, the actual library of nuclear data is adapted for the analysis of liquid effluents from nuclear power plants. A computer with a 16 core memory and a hard disk are sufficient for this code.

2936 (NUREG--0396) PLANNING BASIS FOR THE DEVELOPMENT OF STATE AND LOCAL GOVERNMENT RADIOLOGICAL EMERGENCY RESPONSE PLANS IN SUPPORT OF LIGHT WATER NUCLEAR POWER PLANTS. Collins, H.E.; Grimes, B.K.; Galpin, F. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation; Environmental Protection Agency, Washington, DC (USA). Office of Radiation Programs). Dec 1978. 126p. (EPA--520/1-78-016). NTIS.

Information on radiological emergency response plans for light water reactors is presented concerning the recommended planning basis; planning needs; and accident considerations.

2937 (NUREG--0543) METHODS FOR DEMONSTRATING LWR COMPLIANCE WITH THE EPA URANIUM FUEL CYCLE STANDARD: 40 CFR PART 190. Congel, F.J. (Nuclear Regulatory Commission, Washington, DC (USA). Div. of Site Safety and Environmental Analysis). Feb 1980. 16p. NTIS.

The purpose of this document is to: (1) present the specifications that implement 40 CFR Part 190 and Appendix I to 10 CFR Part 50, (2) explain the rationale for using Appendix I to demonstrate compliance with 40 CFR Part 190 for sites with four or less nuclear power reactors, and (3) describe acceptable methods for demonstrating compliance with 40 CFR Part 190 for sites whose radioactive effluents exceed the Appendix I portion of the specifications.

2938 (NUREG/CR--0789) EVALUATION OF EMPIRICAL ATMOSPHERIC DIFFUSION DATA. Horst, T.W.; Doran, J.C.; Nickola, P.W. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Oct 1979. Contract EY-76-C-06-1830. 151p. (PNL--2599). Dep. NTIS, PC A08/MF A01.

A study has been made of atmospheric diffusion over level, homogeneous terrain of contaminants released from non-buoyant point sources up to 100 m in height. Current theories of diffusion are compared to empirical diffusion data, and specific dispersion estimation techniques are recommended which can be implemented with the on-site meteorological instrumentation required by the Nuclear Regulatory Commission. A comparison of both the recommended diffusion model and the NRC diffusion model with the empirical data demonstrates that the predictions of the recommended model have both smaller scatter and less bias, particularly for groundlevel sources.

2939 (ORNL--5529) RECOMMENDATIONS CONCERNING MODELS AND PARAMETERS BEST SUITED TO BREEDER REACTOR ENVIRONMENTAL RADIOLOGICAL ASSESSMENTS. Miller, C.W.; Baes, C.F. III; Dunning, D.E. Jr. (Oak Ridge National Lab., TN (USA)). May 1980. Contract W-7405-ENG-26. 162p. NTIS, PC A08/MF A01.

Recommendations are presented concerning the models and parameters best suited for assessing the impact of radionuclide releases to the environment by breeder reactor facilities. These recommendations are based on the model and parameter evaluations performed during this project to date. Seven different areas are covered in separate sections.

2940 (P--300-80-006) POTENTIAL IMPACT OF RADIOCARBON RELEASES BY THE NUCLEAR POWER INDUSTRY. CONSULTANT REPORT. Fairhall, A.W. (Washington Univ., Seattle (USA). Dept. of Chemistry). Feb 1980. 40p. California Energy Commission, Sacramento.

Reactors and especially reprocessing plants will potentially release large amounts of $^{14}CO_2$ to the environment. Enhanced levels of ^{14}C in the atmosphere and vegetation surrounding such facilities suggest siting them in nonagricultural areas. The buildup of this manmade ^{14}C in the atmosphere and biosphere is not expected to affect global ^{14}C levels significantly until the turn of the century. Control equipment at reprocessing plants and reactors could be installed to capture the gaseous ^{14}C and solidify and isolate it from the environment. The health consequences of ^{14}C are not fully understood. As a source of β radiation, reactor produced ^{14}C would be a relatively minor contributor to radiation dose compared with natural radiation sources. Because of carbon's key role in our genetic structure, the transmutation of decaying ^{14}C into nitrogen could potentially produce more cellular damage and health risk than ^{14}C would solely as a source of radiation. If such is the case, the hazards of ^{14}C and the need to control it would be greatly increased, but this requires further study.

2941 (PB--290215) RADIATION PROTECTION ACTIVITIES - 1977. ANNUAL REPORT. (Environmental Protection Agency, Washington, DC (USA). Office of Radiation Programs). Aug 1978. 142p. NTIS PC A07/MF A01.

The report is designed to survey in some detail the activities of several Federal agencies involved in radiation protection-such as controlling medical x-ray exposures, managing nuclear power plant effluents, protecting workers exposed to radiation, and monitoring fallout. In addition some of the less obvious activities are referred to, to give readers a sense of scope of Federal involvement. The division of responsibilities within the Federal government is defined, and some relevant congressional and judicial actions are summarized in the introduction. A list of pertinent 1977 Federal publications is provided.

2942 (PB--295054) PUBLIC HEALTH CONSIDERATIONS OF CARBON-14 DISCHARGES FROM THE LIGHT-WATER-COOLED NUCLEAR POWER REACTOR INDUSTRY. TECHNICAL NOTE. Fowler, T.W.; Clark, R.L.; Gruhlke, J.M.; Russell, J.L. (Office of Radiation Programs, Washington, DC (USA). Technology Assessment Div.). Jul 1976. 64p. NTIS PC A04/MF A01.

The paper includes estimates of carbon-14 production in reactors and analyses of carbon-14 behavior in various waste treatment systems at both reactors and spent fuel reprocessing plants. Environmental transport models and carbon-14 dosimetric models are briefly reviewed to ascertain some probably errors in estimating the impact of carbon-14 on man and the environment. To the extent possible, this report provides an analysis of current findings and projects what work must be performed to provide answers to questions concerning the need for the control of nuclear power sources of this environmental contaminant.

2943 (PB--295100) SUMMARY OF RADIOACTIVITY RELEASED IN EFFLUENTS FROM NUCLEAR POWER PLANTS FROM 1973 THRU 1976. Phillips, J.W.; Gruhlke, J. (Office of Radiation Programs, Washington, DC (USA). Technology Assessment Div.). Nov 1977. 129p. NTIS, PC A07/MF A01.

This is the second in a series of annual summaries of radioactive waste being released from, or shipped off-site by, nuclear power plants in the United States. The report provides a consolidated source of data. This report covers only those long lived isotopes which are generally released in sufficient quantities to be environmentally significant over extended periods of time in the biosphere.

2944 (PB--296289) SUMMARY OF RADIOACTIVITY RELEASED IN EFFLUENTS FROM NUCLEAR POWER PLANTS FROM 1972 THRU 1975. Phillips, J.W.; Gruhlke, J.; Gaul, G.A. (Office of Radiation Programs, Washington, DC (USA). Technology Assessment Div.). May 1977. 122p. NTIS, PC A06/MF A01.

This is the first in a series of annual summaries of radioactive waste being released from, or shipped off-site by, nuclear power plants in the United States. The report provides a consolidated source of data. This report covers only those long lived isotopes which are generally released in sufficient quantities to be environmentally significant over extended periods of time in the biosphere. This report includes those plants which reached commercial operation, or had measurable releases prior to commercial operation, as of December 1975, and includes only those isotopes of environmental and radiological significance. All of the information in this report was taken from the individual plant semi-annual or annual operating reports filed by the responsible utility with the Nuclear Regulatory Commission unless otherwise noted.

2945 (PNL--2286(App.)) DESCRIPTIONS OF REFERENCE LWR FACILITIES FOR ANALYSIS OF NUCLEAR FUEL CYCLES. APPENDIXES. Schneider, K.J.; Kabele, T.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Sep 1979. Contract EY-76-C-06-1830. 232p. Dep. NTIS, PC A11/MF A01.

The appendixes present the calculations that were used to derive the release factors discussed for each fuel cycle facility in Volume I. Appendix A presents release factor calculations for a surface mine, underground mine, milling facility, conversion facility, diffusion enrichment facility, fuel fabrication facility, PWR, BWR, and reprocessing facility. Appendix B contains additional release factors calculated for a BWR, PWR, and a reprocessing facility. Appendix C presents release factors for a UO_2 fuel fabrication facility.

2946 (RISO-M--1972) COMPARISON OF NORDIC DOSE MODELS. Thykier-Nielsen, S. (Risoe National Lab., Roskilde (Denmark)). Apr 1978. 199p. Dep. NTIS (US Sales Only), PC A10/MF A01; Also available from Risoe Library, DK-4000 Roskilde, Denmark.

A comparison is made between the models used in the four Nordic countries, Finland, Norway, Sweden and Denmark, for calculation of concentrations and doses from releases of radioactive material to the atmosphere. The comparison is limited to the near-zone models, i.e. the models for calculation of concentrations and doses within 50 km from the release point, and it comprises the following types of calculation: a. Concentrations of airborne material, b. External gamma doses from a plume, c. External gamma doses from radioactive material deposited on the ground. All models are based on the gaussian dispersion model (the gaussian plume model). Unit releases of specific isotopes under specific meteorological conditions are assumed. On the basis of the calculation results from the models, it is concluded that there are no essential differences. The difference between the calculation results only exceeds a factor of 3 in special cases. It thus lies within the known limits of uncertainty for the gaussian plume model.

2947 (SAND--80-0366) OBSERVATIONS ON THE USE OF THE CONSEQUENCE MODEL CRAC FOR SMALL NONREACTOR ATMOSPHERIC RELEASES. Ericson, D.M. Jr. (Sandia National Labs., Albuquerque, NM (USA)). May 1980. Contract AC04-76DP00789. 26p. NTIS, PC A03/MF A01.

As part of the Reactor Safety Study, a consequence model, CRAC, was developed to examine the public consequences of accidental releases of radioactive material from nuclear power plants. Since the development of the model, several studies have been conducted to examine the sensitivity of the model to factors such as plume rise, wind shear, rain, and population evacuation. All of these studies were performed assuming one or more of the potentially large accidental releases from reactor sites. At the same time, CRAC has been used to examine the consequences of sabotage-caused releases from spent fuel during transport. In the most recent study, the consequence estimates obtained with CRAC were compared with those obtained using METRAN, the consequence model developed for the Urban Study.

2948 (STUDSVIK/K2--79/79) REGULAR CONTROL OF MONITORS FOR EFFLUENTS FROM NUCLEAR POWER

PLANT STACKS. Stroem, L. (Studsvik Energiteknik AB, Nykoeping (Sweden)). Jan 1979. 13p. (In Swedish). Dep. NTIS (US Sales Only), PC A02/MF A01.

The report describes a test procedure for emission monitoring devices for nuclear power plants. The following procedures are described, inspection, determination of the air flow through the stack, measurement and adjustment of the flow in the stack loop, measurement and adjustment of flow and density in the measuring loop, calibration of the gas detector, efficiency of sampling of methyliodide and aerosol.

2949 (UCID--18243) ARCHIVING THE PAPER FALLOUT FROM THREE MILE ISLAND. Fisher, H.L.; Caswell, V.D. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 10 Aug 1979. Contract W-7405-ENG-48. 7p. Dep. NTIS, PC A02/MF A01.

During the Three Mile Island incident, the Atmospheric Release Advisory Capability (ARAC) Center at the Lawrence Livermore Laboratory supplied a continuous flow of meteorological and radioactive plume transport and diffusion data to agencies of the Department of Energy and Nuclear Regulatory Commission from March 28 to April 18, 1979. By then a vast amount of data had accumulated in the ARAC Center. This paper describes the scheme devised for archiving this material and suggests how it might be extrapolated to archive responses to future incidents of a more complex nature or longer duration.

2950 (UCID--18783) PRELIMINARY COMPARISONS BETWEEN MEASUREMENTS AND MODEL CALCULATIONS FOR THE TMI VENTING OF ^{85}KR. Dickerson, M.H. (California Univ., Livermore (USA). Lawrence Livermore National Lab.). Aug 1980. Contract W-7405-ENG-48. 21p. NTIS, PC A02/MF A01.

ARAC was on-line calculating hourly concentration values during the TMI-2 venting of ^{85}Kr gas from June 28 to July 11, 1980. During this time hourly isopleths of normalized instantaneous concentration were calculated and transmitted to EPA in Middletown, PA. These isopleths were used to help locate the EPA and Penn State mobile air samplers and they were used for comparison to the EPA fixed 24 hr sampler measurements and the DOE helicopter measurements. This report summarizes preliminary comparisons for the EPA fixed samplers and the DOE helicopters.

2951 (UCRL-Trans--11608) CALCULATION MODEL FOR EVALUATION OF DOSES DUE TO EFFLUENTS FROM THE OPERATION OF NUCLEAR INSTALLATIONS. Boeri, G.C.; Brofferio, C.; Caracciolo, R.; Fiorenza, R. (Comitato Nazionale per l'Energia Nucleare, Rome (Italy)). Jul 1980. Translation source information not available 10p. NTIS, PC A02/MF A01.

A summarizing description is given for a compartment model for the evaluation, under equilibrium conditions, of the effects of operating effluents from nuclear installations. On the basis of this model two calculation codes were developed (DEAR and DELIR) for gaseous and liquid effluents. The methods of use of these codes are described along with possible processing methods. To perform an evaluation of the environmental impact of effluents from nuclear power plants, a mathematical model was developed. This model, based on the interaction between compartments, in particular expresses predictions under equilibrium conditions. The numerical processing is then handed over to two codes written in Fortran IV, DEAR and DELIR, for gaseous and liquid effluents, respectively.

2952 ASSESSMENT OF ENVIRONMENTAL RADIATION HAZARDS FROM THE KOEBERG NUCLEAR POWER STATION. Basson, J.K. (Atomic Energy Board, Pelindaba, Pretoria (South Africa). Isotopes and Radiation Div.); Winkler, B.C. (Atomic Energy Board, Pelindaba, Pretoria (South Africa). Licensing Branch); Walmsley, J. (Electricity Supply Commission, Johannesburg (South Africa)). Civil Engineer in South Africa ; 22: No. 4, 91-95(Apr 1980).

Escom's decision to build the 2 x 922 MW (e) Koeberg nuclear power station on the coastal Duynefontein site, 28 km north of Cape Town is explained. After describing the internationally accepted basis of radiation protection, the philosophy of nuclear-installation licensing, as applied by the AEB Licensing Branch, is outlined. Preoperational environmental investigations that have provided acceptable release rates of radioactive effluent to the sea and the atmosphere are discussed. Accidental releases are described and the sound basis of such studies is compared with normal industrial undertakings.

2953 KOEBERG RADIATION HAZARDS. INVITED REVIEW AND DISCUSSION. Hall, A.V. Civil Engineer in South Africa ; 22: No. 4, 95-96(Apr 1980).

A discussion is presented of the article by J.K. Basson, B.C. Winkler, and J. Walmsley on the assessment of environmental radiation hazards from the Koeberg nuclear power station. The safety of the Koeberg nuclear power station is evaluated and an alternative reactor site is suggested.

2954 TREATMENT OF RADIOACTIVE EFFLUENT WATER IN NUCLEAR POWER STATIONS. Roofthooft, R. (Laboratoire Belge de l'Industrie Electrique (LABORELEC), Rhode-St. Genese). VGB Kraftwerkstechnik ; 60: No. 2, 124-126(Feb 1980). (In German).

The treatment of radioactive effluents can lead to problems because of the presence of detergents. The principal radioactive pollutants are in general Cs-134 and Cs-437. Treatment with copper ferro-cyanide is envisaged. The decontamination factors for various isotopes are quoted and coagulation equipment is planned. The treatment of mixed radioactive effluents is investigated under various conditions. The proposed process is simple and leads to activity concentrations markedly below 5 x 10^{-5} Ci/m^3 at a cost of about DM 1.20/m^3. A total concentration factor of 800 is possible.

2955 RADIOACTIVITY RELEASE TO THE ENVIRONMENT BY THERMAL POWER STATIONS USING COAL AS A FUEL. Mishra, U.C.; Lalit, B.Y.; Ramachandran, T.V. (Bhabha Research Centre, Bombay). Science of the Total Environment ; 14: No. 1, 77-83(Jan 1980).

Radioactive emissions from coal and flyash samples at four thermal power stations that use coal as a fuel in India were measured and compared with radioactive emissions resulting from the operation of BWR's and hot water reactors at nuclear power stations. Experimental samples and methods are described. Although the chemical, physical, and biological properties of radioactive emissions from coal-fired power plants are different from those of emissions from nuclear power plants, exposure of the general population to ionizing radiation originating from thermal power stations burning

coal is as hazardous as exposure to radioactive emissions from nuclear power stations operating with BWR's and HWR's. (14 references, 4 tables)

2956 FORT ST. VRAIN NUCLEAR GENERATING STATION ENVIRONMENTAL SURVEILLANCE PROGRAM. SUMMARY REPORT, JULY 1, 1979-DECEMBER 31, 1979. Fort Collins, CO; Colorado State University (1980). 147p. (NP--24350). Colorado State Univ., Fort Collins.

The environmental sampling and analysis program was essentially identical to that used in the previous reporting period. A few minor changes in sampling locations occurred and these are presented. Essentially all radioactivity data measured on this project are near background levels and more importantly near the minimum detectable activity (MDA) levels for each radionuclide and sample type.

2957 TECHNOLOGY OF TWO-STAGE WASTE WATER EVAPORATION WITH MIXING CONDENSER. Feyerbacher, D.; Schwarz, F. (Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.)); Walter, K.H. (Gemeinschaftskernkraftwerk Neckar G.m.b.H., Neckarwestheim (Germany, F.R.)). pp 509-511 of Jahrestagung Kerntechnik '80 - Reaktortagung 1980. Tagungsbericht. Sektion 4: Brennstoffkreislauf und Spaltstoff-Flusskontrolle. Eggenstein-Leopoldshafen, Germany, F.R.; Fachinformationszentrum Energie, Physik, Mathematik (1980). (In German)

From Annual meeting on nuclear technology; Berlin, F.R. Germany (25 Mar 1980).

2958 AVR'S APPLICATION FOR RELEASE OF TRITIUM AND CARBON-14 APPROVED. GRS (Gesellschaft fuer Reaktorsicherheit) Kurz-Information, Reihe E ; 13: No. 9, 1(1980). (In German).

The relaese limits that have now been approved by the authorities, concerning stack disposal of tritium and carbon-14, are 50 Ci of T per quarter (maximum 100 Ci of T per annum) and 5 Ci of C-14 per quarter (maximum 10 Ci of C-14 per annum). Based upon conservation estimations, the release of 100 Ci/a of T and 10 Ci/a of C-14 will lead to a whole-body radiation exposure of 1.42 mrem/a at the most unfavourable location and taking into account all relevant exposure pathways.

2959 ON-LINE METEOROLOGICAL INFORMATION SYSTEM FOR RESPONSE TO ACCIDENTAL RELEASES OF RADIOACTIVITY INTO THE ATMOSPHERE. Thomas, H.P. (Kernforschungszentrum Karlsruhe, Germany). Nuclear Technology ; 46: No. 2, 241-247(Dec 1979).

A meteorological information system is operated at the Kernforschungszentrum Karlsruhe (KfK). It consists of a tower equipped with instruments and a data processing system. An essential feature of software is the real-time computation of the local and temporal distribution of near-ground activity concentrations in the environment of KfK. After accidental activity releases, the display of concentration distribution serves to initiate concerted intervention.

2960 RADIOLOGICAL CONSEQUENCES OF RADIOACTIVE EFFLUENTS. Clarke, R.H. (National Radiological Protection Board, Harwell (UK)). Radiological Protection Bulletin ; No. 31, 3-5(Nov 1979).

A study of the differential radiological impact of the nuclear fuel cycle with and without plutonium recycle is being undertaken jointly by the National Radiological Protection Board and the Commissariat a l'Energie Atomique (CEA). A summary is given of the development of the methodology detailed in their first report to the Commission of the European Communities (CEC) (NRPB/CEA, A methodology for evaluating the radiological consequences of radioactive effluents released in normal operations. Luxembourg, CEC Doc. V/3011/75 EN (1979)). The Collective Effective Dose Equivalent Commitment was used in an attempt to assess the total health detriment. The application of the methodology within particular member states of the European Community has been discussed at seminars. Sensitivity analysis can identify the more important parameters for improving the accuracy of the assessment.

2961 LIQUID EFFLUENT TREATMENT IN NUCLEAR POWER PLANTS WITH LIGHT WATER REACTORS. Kongsted, T. (Brown, Boveri and Co. Ltd., Baden (Switzerland)). Brown Boveri Review ; 66: No. 8, 526-530(Aug 1979).

In nuclear power plants radioactively contaminated liquid effluents are purified in radioactive waste treatment systems. Efficient purification processes ensure that the major part of the effluent can be re-used in the power plant. The filter residues and evaporator concentrates arising during purification can be solidified with bitumen or cement in the solid radwaste system for final storage.

2962 RADIOACTIVE EFFLUENTS FROM NUCLEAR POWER STATIONS AND FUEL REPROCESSING PLANTS IN EUROPE, 1972 TO 1976. Davis, W. Jr. (Oak Ridge National Lab., TN). Nuclear Safety ; 20: No. 4, 468-475(Jul 1979).

Data on the radioactive gasborne and liquid effluents from 58 nuclear power stations and 7 fuel reprocessing plants in the European Community for the years 1972 to 1976 are presented. There are wide variations in releases from both reactor stations and fuel reprocessing plants because of differences in reactor type, plant size, power levels, and effluent treatment levels. Data covering specific isotopes of particular interest are summarized. In nearly all cases, releases of radioactivity were below maximum applicable values or the treatments used were considered to satisfy the requirement that the best practicable means be used to minimize the amount of radioactivity discharged.

2963 RADIOACTIVE MATERIALS RELEASED FROM NUCLEAR POWER PLANTS IN 1977. Decker, T.R. (Nuclear Regulatory Commission, Washington, DC). Nuclear Safety ; 20: No. 4, 476-482(Jul 1979).

Releases of radioactive materials in airborne and liquid effluents from commercial light-water reactors during 1977, as well as data on solid-waste shipments, have been compiled and reported. This report supplements earlier ones issued by the former Atomic Energy Commission and the Nuclear Regulatory Commission. The 1977 release data are compared with the releases of previous years in tabular form. Data covering specific radionuclides are summarized.

2964 BETA DOSE IN SKIN FROM GASEOUS

RADIOACTIVE REACTOR EFFLUENTS. Schadt, W.W. (Howard Univ., Washington, DC); Thiess, P.E. Transactions of the American Nuclear Society ; 32: 629-631(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
BWR TYPE REACTORS;RADIOACTIVE EFFLUENTS; GASEOUS WASTES;STACK DISPOSAL;KRYPTON 85; RUBIDIUM 88;BETA DOSIMETRY;MAN;SKIN;DEPTH DOSE DISTRIBUTIONS;MATHEMATICAL MODELS

2965 NUCLEAR ENERGY. Lotter, A.C. IMIESA (Institution of Municipal Engineers of Southern Africa) ; 4: No. 6, 5, 7, 9, 12(Jun 1979). (In English and Afrikaans).
The recent, terrifying threat of a major calamity at Pennsylvania's Three Mile Island power plant near Harrisburg reverberated across practically the whole of the civilised world. An almost incredible sequence of human and mechanical failures at this installation had stopped just short of disaster and had brought the unthinkable perilously close to happening. The accident had sprayed radioactive waste into the air and had led to the large scale evacuation of people from the endangered area, disrupted hundreds of thousands of lives and caused a crippling setback to the nuclear industry. In this article the author discusses the impact the Harrisburg incident has had on the nuclear industry.

2966 APPARATUS AND PROCESS FOR HANDLING DANGEROUS FLUENT MATERIAL. Stock, A.J.; Christofer, D.E.; Brinza, J.E. (to Stock Equipment Co., Cleveland, OH (USA)). Canadian Patent 1,045,727/A/. 2 Jan 1979. 68p.
The invention provides apparatus for handling radioactive fluent material capable of emitting radioactivity, comprising a rigid shield wall of material and thickness sufficient to reduce substantially passage of radioactivity through the shield wall to a level that is not harmful to a human operator; operable handling means located at the side of the shield wall that is exposed to radioactivity from the fluent material for handling the fluent material, the handling means including means to introduce the fluent material into a container at the side of the shield wall and means for applying closure means to the container to close it after introduction therein of the fluent material, and means for controlling flow of the fluent material; power means for operating the handling means located on the other side of the shield wall that is not exposed to radioactivity from the fluent material; and movable mechanical means for driving the handling means extending through the shield wall to operate the handling means from the power means without such harmful passage of radioactivity through the shield wall.

2967 SUMMARY AND DISCUSSION OF FINDINGS FROM: POPULATION DOSE AND HEALTH IMPACT OF THE ACCIDENT AT THE THREE MILE ISLAND NUCLEAR STATION (A PRELIMINARY ASSESSMENT FOR THE PERIOD MARCH 28-APRIL 7, 1979). Rockville, MD; Bureau of Radiological Health (1979). 7p. (NP--24440).
This report was prepared by technical staff members of the Nuclear Regulatory Commission (NRC), the Department of Health, Education and Welfare (HEW), and the Environmental Protection Agency (EPA), who constitute an Ad Hoc Population Dose Assessment Group. It is an assessment of the health impact on the approximately 2 million offsite residents within 50 miles of the Three Mile Island Nuclear Station from the dose received by the entire population (collective dose). The Ad Hoc Group has examined in detail the available data for the period up to and including April 7, 1979. The report also addresses several areas of concern about the types of radionuclides released, about the contribution to population exposure due to beta radiation (which does not penetrate the clothing and skin) emitted from the released radionuclides, about the degree of coverage afforded by available radiation measurements, and about the range of health effects that may result from the estimated collective dose.

2968 TREATMENT OF LIQUID AND SOLID WASTE IN THE POWER STATION AREA. Liptak, L.; Takacs, F. (Eroemue es Halozattervezoe Vallalat Eroeterv, Budapest (Hungary)). Eroeterv Koezlemenyek ; 17: 98-100(1979). (In Hungarian).
The types and quantities of liquid radioactive waste of the Paks Nuclear Power Station, the waste water treatment procedures, the waste solidification procedures, the quantities and types of solid radioactive waste, the possible solidification procedures and the use of evaporation below boiling-point are discussed.

2969 DEVELOPMENTS IN THE MANAGEMENT OF LIQUID AND SOLID RADIOACTIVE WASTES FROM THE IRRADIATED FUEL COOLING POND AT TRAWSFYNYDD POWER STATION. Broadbent, D.; Haighton, A.P.; Scanlon, F.B.F.; Smitton, C. (Central Electricity Generating Board, Bristol (UK)). pp 97-112 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
The Central Electricity Generating Board operates a 390 MW(E) twin gas-cooled reactor power station at Trawsfynydd in North Wales. The reactors are fuelled with natural uranium metal clad in a magnesium alloy (Magnox). Spent irradiated fuel is stored underwater in a cooling pond. The cooling pond and its associated pond water and radioactive liquid effluent treatment plants have proved to be the most significant sources of liquid and solid radioactive wastes arising during normal station operation. This paper describes the developments which have taken place in the management and treatment of these radioactive wastes.

2970 SOLIDIFICATION OF LIQUID WASTES FROM NUCLEAR POWER PLANTS BY MOBILE SOLIDIFICATION UNITS. Christ, B.G. (Transnuklear G.m.b.H., Hanau (Germany, F.R.)); Brunner, H.; Kohlpoth, W. (Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.)). pp 349-359 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
According to current regulations liquid nuclear wastes from power plants have to be solidified before being finally stored, preferably in geological salt formations. Solidification is necessary in order to provide a safeguard in addition to the geological barrier. Thus the pollution of the biosphere by radioactive wastes shall be prevented. In the

following the on-site solidification of liquid nuclear wastes in mobile cementation units is presented as an alternative to the transport of liquid wastes to remote conditioning plants or to the solidification of these wastes in a stationary unit of the power plant. Then an account will be rendered on the experiences gained from the operation of the mobile DEWA solidification unit which has been in use for one year.

2971 CEMENT SOLIDIFICATION OF BWR AND PWR RADIOACTIVE WASTE AT THE RINGHALS NUCLEAR POWER PLANT. Christensen, H. (ASEA-ATOM AB, Vaesteraas (Sweden)). pp 333-347 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France: OECD (1979).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
A summary is given of the operational experience gained during four years of cement solidification at the Ringhals nuclear power plant in Sweden. The solidification system was originally designed to handle waste from a BWR only but has been modified to handle also boric acid containing mixed bed resins from a PWR.

2972 ON-SITE MANAGEMENT OF REACTOR WASTES BY A CANADIAN POWER UTILITY. Drolet, T.S. (Ontario Hydro, Toronto (Canada)). pp 53-66 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France: OECD (1979).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
The quantity of Reactor Wastes from the Ontario Hydro Nuclear Program will increase from approximately 1200 m^3 (before processing) in 1978 to 8000 m^3/year in 1990. The principles for management of station radioactive wastes (shorter half-life, low level of radioactivity relative to irradiated fuel/waste) include: process for volume reduction, where appropriate, i.e., incineration, compaction; immobilize by solidification in a low solubility form; use of engineered storage structures with multiple means of confinement; monitoring of the storage containment so that leaks can be detected. Initially, all generating station wastes will be stored retrievably, as solids, in above-ground or in-ground storage facilities. A development program is underway which is intended to establish conditioning techniques for long term storage or disposal.

2973 CHARACTERISATION, HANDLING AND TREATMENT OF WASTE ARISINGS FROM THE WINFRITH SGHWR. Ferrett, D.J.; Symons, W.J. (UKAEA Atomic Energy Establishment, Winfrith). pp 169-184 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France: OECD (1979).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
The waste arisings from the 100 MW(E) SGHWR at Winfrith have been carefully characterised over its 10 year period of operation with special reference to the variation between operational and maintenance periods and the particular effect of the once-yearly circuit decontamination on liquid effluent levels. In addition to determining the pattern of gamma-nuclide discharges, special surveys are reported on discharge levels of beta-emitters, ie, T, ^{32}P, ^{35}S, ^{63}Ni and ^{14}C. A survey of laundry effluents reflects the pattern of operations. The volume of solid waste generated varies with a factor of 3:1 between shut-down and operations. Sludge and resin wastes from coolant clean-up and pond water clean-up plant together with residues from decontamination operations are stored in sludge tanks and techniques for the characterisation of these wastes and their treatment and immobilisation by acid digestion and incorporation in cement/vermiculite matrices are being investigated.

2974 DOW PROCESS FOR THE SOLIDIFICATION OF LOW-LEVEL RADIOACTIVE WASTES FROM NUCLEAR POWER PLANTS. Filter, H.E. (Dow Chemical Co., Midland, MI (USA)). pp 379-393 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France: OECD (1979).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
This report summarizes the laboratory test program, pilot plant runs and field operating experience for solidification of low-level radioactive wastes from nuclear power plants with the Dow solidification process. Simulated wastes and radioactive wastes were converted into homogeneous, liquid-free monoliths. Pilot plant runs and field operating experience demonstrated that data generated in the laboratory could be extrapolated to 210 liter (55-gallon) drums and 1.4 m^3 (50 ft.3) containers. Simulated waste and radioactive wastes produced in the operation of nuclear power plants were solidified and produced homogeneous, liquid-free monoliths which fulfill U.S. regulatory and Dow requirements. The advantages the Dow process offers the nuclear power industry are summarized. Several utilities in the United States have confirmed these advantages and are installing the Dow process in their plants.

2975 PRE-TREATMENT OF EVAPORATOR CONCENTRATES AND SPENT ION-EXCHANGERS BEFORE THEIR SOLIDIFICATION IN ORGANIC BINDERS. Golinski, M.; Cholerzynski, A.; Tomczak, W. (Institute of Nuclear Research, Warsaw (Poland)); Chmielewski, A. (Politechnika Warszawska (Poland)). pp 215-226 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France: OECD (1979).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
The paper presents results of laboratory experiments on the concentration of evaporator concentrates, dewatering and drying of spent ion-exchange resins before their solidification in bitumen or plastic materials. The process of concentration has been based on distillation with tetrachloromethane acting as transporting agent. The fundamental parameters of this process have been established and scheme of pilot installation has been presented. Dewatering of ion-exchangers has been performed by means of vacuum filtration and drying in a stream of heated air. Efficiency of both methods has been established. Also a semi-industrial scale installation is presented.

2976 SOLIDIFICATION OF LOW AND MEDIUM LEVEL WASTES IN BITUMEN AT BARSEBECK NUCLEAR POWER STATION. Harfors, C. (Southern Sweden Power Supply, Barsebeck (Sweden)). pp 449-463 of

Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
Operating experience is presented from 4 years of bitumen solidification of wastes coming from two boiling water reactors. Methods used to sample, analyse and document the wastes are described. Transport and storage methods without remote handling have been adopted. The risk of fire is discussed and a description is given of the measures taken for fire protection.

2977 MEMBRANE FILTER APPLICATIONS FOR CRUD SEPARATION FROM RADIOACTIVE WASTE WATER GENERATED IN LWR POWER PLANTS. Hayashi, M. (Tokyo Electric Power Co., Inc. (Japan)); Yamaguchi, T.; Moriya, Y.; Koshiba, Y. (JGC Corp., Tokyo (Japan)); Ohta, Y. (Nomura Microscience Co., Tokyo). pp 229-239 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
For radioactive waste processing facilities of the BWR type plants in service in Japan, precoat type filters are prevalently used. Meanwhile, the amount of filter sludge produced as a result of their operation is much larger than initially anticipated and this is presenting a serious problem concerning the waste disposal of these solids. In this connection, JGC has been studying the use of the nuclepore Membrane Filter, which does not require precoating material, for reducing the amount of such secondary radioactive solid waste. As a result, it has been proved that this type of filter can be used for long periods without clogging and the prospects of its practical application are very promising. Actually, this filter is already in commercial use in some Radwaste plants in Japan.

2978 RADIOACTIVE WASTE TREATMENT EXPERIENCES AT TARAPUR. Kulkarni, P.C. (Department of Atomic Energy, Tarapur Atomic Station, Maharashtra (India)). pp 199-213 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
This paper describes the experiences of Tarapur Atomic Power Station in treatment of radioactive wastes since plant commissioning in 1969. The station as constructed had certain built in restraints. These restraints were dealt with under two separate categories; by changing the method of processing involved and correcting the deficiencies of the equipment. System modifications and procedural changes helped to tide over the processing difficulties with some indirect saving in liquid discharges. Construction of large capacity delay tanks and chemical treatment of wastes helped in reducing liquid waste discharge.

2979 INCINERATION OF COMBUSTIBLE WASTE AT A REACTOR SITE. Laser, M.; Mallek, H. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Abt. Dekontamination); Metscher, K. (Kraftanlagen A.G., Heidelberg (Germany, F.R.)). pp 439-448 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
For the incineration of combustible reactor waste a 100-kg/h-plant has been developed. The plant is automated to a high degree and is very easy to operate and to control by normal staff of the power reactor station. A 100-kg/h-pilot plant is in operation with very good results at the Nuclear Research Centre in Juelich. Compared with compaction of waste the incineration is economical at a two-block reactor station with about 1,000 m^3 combustible waste per year.

2980 DEVELOPMENT OF INCORPORATION OF EVAPORATOR CONCENTRATE FROM PRESSURIZED WATER NUCLEAR POWER REACTORS INTO ASPHALT. Lee, S.H.; Chun, K.S. (Korea Atomic Energy Research Inst., Seoul (Republic of Korea)). pp 481-493 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
The paper presents a summary of recent progress in the bituminization technique of evaporator concentrate from a pressurized light-water reactor. The research and development work has been carried out for the past three years at Korea Atomic Energy Research Institute. A new approach to incorporation of the concentrate into the mixed asphalt of a straight asphalt and a blown asphalt has been studied. Before feeding the concentrate into a thin-film evaporator, it is neutralized with sodium hydroxide in the range of pH 7.5 to 8.0. Compared with cement and vermiculite process used at Kori unit 1 (600 MWe, PWR), the bituminization process of the concentrate suggests that there is a gain in volume of minimum five.

2981 TREATMENT OF RADIOACTIVE WASTES AT THE CZECHOSLOVAK NUCLEAR POWER STATION. Malasek, E.; Tittlova, E. (Ceskoslovenska Komise pro Atomovou Energii, Prague). pp 185-197 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).
From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).
The paper reviews briefly the system for the treatment of solid, liquid and gaseous radioactive wastes in the Czechoslovak nuclear power station A-1 and the modifications which have been made in the course of the station's operation, and analyses the quantity and the character of the expected and the actual wastes. It also compares the discharge limits for the gaseous and liquid wastes with the actually discharged radioactivity. The solid wastes, and the concentrates produced by the treatment of liquid wastes, are stored temporarily on the power station site, to be transferred, later on, to the regional depository.

2982 CRUD REMOVAL EQUIPMENT USING A CENTRIFUGAL CLARIFIER. Nakao, K.; Kaneda, H. (Chubu Electric Power Co. Inc., Nagoya (Japan)); Nakayama, Y.; Ohigashi, Y.; Nagayama, K.

(Nippon Atomic Industry Group Co. Ltd., Kawasaki, Kanagawa. Nuclear Research Lab.); Kani, J.; Takahara, T. . pp 261-279 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

Centrifugal clarifiers have been applied for the treatment of the radioactive liquid wastes in BWR nuclear power stations to reduce the amount of secondary waste, such as filter aid materials generated by pressure precoat filters. Two steps of the R and D programs have been performed before the full-scale operation of the centrifugal clarifiers installed in the Hamaoka NPS 2 radwaste system: one, a cold test at the laboratory, and the other, a pilot plant test at Hamaoka NPS 1. This paper describes the pilot plant test results and the experience gathered from the actual full-scale equipment operation, that is: concentration of the insoluble impurities of the treated liquid wastes has been kept to less than 0.5 ppm, while that of the fluent increased to approximately 100 ppm; sludge volume reduction by the equipment is approximately one tenth of that made by the pressure precoat filters.

2983 CONTAINERS USED IN PACKAGING REACTOR WASTE. Raemoe, E.G. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). pp 497-511 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

A survey was carried out in order to gather information on the containers used in packaging power reactor wastes. A questionnaire was sent to every operating nuclear power plant in the world and the answering percentage was 38%. In addition some information was gleaned from literature. Both technical and economical aspects are reviewed. The main types of containers are steel drums of different sizes, steel drums with concrete lining, large steel containers, disposable concrete containers and wooden boxes. In addition to technical and cost data the distribution of the container types versus different types of waste and waste treatment methods is presented. No special trends towards certain containers can be ascertained on the basis of this study.

2984 OPERATIVE EXPERIENCE IN RADIOACTIVE WASTE TREATMENT IN ATUCHA NUCLEAR POWER PLANT. Recalde, J.A. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina)). pp 153-167 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

The following report briefly describes the various treatment used in radioactive waste material management in Atucha Nuclear Power Plant, as well as the problems arised during its processing. It also presents the emission values of radionuclides to the environment and the production of solid waste materials.

2985 PROSPECTS FOR LIQUID, GASEOUS AND SOLID WASTE TREATMENT SYSTEMS FOR ENEL'S REFERENCE POWER STATION BWR AND PWR. Russino, G.; Buono, A.; Calabresi, F.; Campolo, D.; Marzullo, T.; Tripputi, I. (Ente Nazionale per l'Energia Elettrica, Rome (Italy)). pp 83-95 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

After a survey of the engineering arrangements chosen by ENEL, in its reference design for the construction of future nuclear power stations, the paper illustrates the choices dictated by the release limits and operating requirements. The evolution of effluent treatment systems in the latest power stations and the increasingly stringent limitations on permissible releases are discussed. The radioactive release during normal operation, evaluated by means of GALE codes, and the doses to the population, estimated on the basis of parameters relating to a coastal site (Montalto) and a fluvial site (Caorso), were found to be very low.

2986 ON-SITE PERMANENT FACILITIES FOR PROCESSING AND DISPOSAL OF RADIOACTIVE WASTE FROM NUCLEAR POWER PLANTS OF KRAFTWERK UNION. Stuenkel, H.; Faust, H.J.; Puthawala, A. (Kraftwerk Union A.G., Erlangen (Germany, F.R.)). pp 465-479 of Compte rendu du colloque sur la gestion des dechets en provenance des reacteurs de puissance sur le site de la centrale. Zurich, 26-30 mars 1979. Paris, France; OECD (1979).

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

This paper describes the development of a screw extruder bituminization plant, which can solidify all low and medium active wastes generating in KWU Nuclear Power Plants. The system meets the final storage requirements for the Asse salt mine. The commissioning and start-up tests of the first KWU plant in the NPP Goesgen/Switzerland showed that the concentrate and resins can be solidified without operational difficulties. The report gives a view to the safety aspects of bituminization and the properties of the products.

2987 NUCLEAR REACTOR GASEOUS RADIOACTIVE WASTES. Sivintsev, Yu.V. Atomnaya Tekhnika za Rubezhom ; No. 8, 9-17(1979). (In Russian).

The data are analysed on continuous radiation monitoring of gaseous radioactive wastes of nuclear power stations depending on reactor type. Taking into consideration the predominant character of water-moderated, water-cooled reactor in present power engineering, the main attention is given to foreign publications on PWR and BWR wastes. The information is given for nuclear power plants with GGR or HWR reactors. Four groups of gaseous radioactive wastes are considered: radioactive noble gases; iodine radioisotopes; long-lived isotopes ^{3}H and ^{14}C; radioactive aerosols. The experimental data (power of the surge of gaseous radioactive substances) and working data (irradiation doze) indicate practical radiation safety of present nuclear power stations for the environment. In the worst cases of the discharge of radioactive noble gases from BWR, the irradiation dose in the neighbouring area does not exceed 1% of the natural radioactivity background dose.

2988 ESTABLISHMENT OF ACTIVITY LIMITS FOR ITEMS TO BE RELEASED FOR UNRESTRICTED USE.

Pettersson, B.G. (Statens Straalskyddsinstitut, Stockholm (Sweden)). pp 251-262 of Decommissioning of nuclear facilities. Vienna, Austria; IAEA (1979).

From International symposium on the decommissioning of nuclear facilities; Vienna, Austria (13 Nov 1978).

Materials, equipment and premises considered for release for unrestricted use in the course of decommissioning operations of nuclear facilities must be cleared from the radiation protection point of view prior to actual release. Activity limits to be applied must be based on characteristics of the future possible uses of the various items and their activity content. The objective of activity limits is to maintain radiation doses resulting from such uses within acceptable limits; i.e. activity limits must be based on appropriately established dose limits. The ICRP recommended System of Dose Limitation provides a suitable framework on which to base decisions on such dose limits. This paper discusses the application of the ICRP System of Dose Limitation on the particular component of decommissioning operations where items are considered for release for unrestricted use. In particular, the principles involved in deriving activity limits based on the System are discussed.

2989 METHODOLOGY FOR DETERMINING ACCEPTABLE RESIDUAL RADIOACTIVE CONTAMINATION LEVELS AT DECOMMISSIONED NUCLEAR FACILITIES/SITES. Watson, E.C.; Kennedy, W.E. Jr.; Hoenes, G.R.; Waite, D.A. (Battelle Pacific Northwest Labs., Richland, WA (USA)). pp 263-282 of Decommissioning of nuclear facilities. Vienna, Austria; IAEA (1979).

From International symposium on the decommissioning of nuclear facilities; Vienna, Austria (13 Nov 1978).

The ultimate disposition of decommissioned nuclear facilities and their surrrounding sites depends upon the degree and type of residual contamination. Examination of existing guidelines and regulations has led to the conclusion that there is a need for a general method to derive residual radioactive contamination levels that are acceptable for public use of any decommissioned nuclear facility or site. This paper describes a methodology for determining acceptable residual radioactive contamination levels based on the concept of limiting the annual dose to members of the public. It is not the purpose of this paper to recommend or even propose dose limits for the exposure of the public to residual radioactive contamination left at decommissioned nuclear facilities or sites.

2990 ANNUAL SURVEY OF RADIOACTIVE DISCHARGES IN GREAT BRITAIN 1977. London; Department of the Environment (Aug 1978). 42p.

Historical and legal aspects of the control over the discharges of radioactive wastes from installations in Great Britain are summarized. The results of the survey then follow, under the headings: UK Atomic Energy Authority establishments, the Radiochemical Centre Limited, British Nuclear Fuels Limited, Central Electricity Generating Board and South of Scotland Electricity Board nuclear power stations, Ministry of Defence. In each case the authorisation is stated, with the actual discharges or disposals, and comments.

2991 NATIONAL AND INTERNATIONAL ACTIVITIES IN THE FIELD OF UNDERGROUND DISPOSAL OF RADIOACTIVE WASTES. Richter, D.K. International Atomic Energy Agency Bulletin ; 20: No. 4, 30-41(Aug 1978).

Technical feature: the underground disposal of nuclear wastes may be done at shallow depths, in rock caverns at various depths, and in deep continental rocks. National activities, waste disposal issues, and international activities and cooperation are discussed. Land burial of low and intermediate level radioactive wastes has been done for decades in many countries, including France, the U.S., the USSR, India, Canada, and Britain. International RandD and deep injection projects are reviewed. The U.S. Dept. of Energy Nat'l Waste Terminal Storage Program is assessed. IAEA plans to issue guidelines on safe underground disposal encompassing five areas: regulations; siting; waste acceptance criteria; design and construction; and operation and shutdown of depositories. (1 drawing, 4 photos)

2992 THE SOLIDIFICATION OF HIGH-LEVEL RADIOACTIVE WASTES. Grover, J.R. International Atomic Energy Agency Bulletin ; 20: No. 4, 23-29(Aug 1978).

Technical feature: an IAEA report on techniques for the solidification of high level radioactive wastes is summarized. The goal of all solidification techniques is to convert the waste solution into a product that is less mobile, requires less surveillance, maintains mechanical integrity, and possesses good irradiative resistance and adequate thermal conductivity. Evaporation, calcination, and denitration are used to form glass or ceramic materials. During the past twenty years, about 30 processes have been developed; these are grouped into four categories: processes that have been demonstrated but are no longer in operation; processes in active operation; processes in advanced stages of development; and processes in the early development stage. Waste solidification processes are reviewed by group classification. (3 diagrams)

2993 Messung und ueberwachung gasfoermiger und aerosolgebundener radioaktiver ableitungen. t. 1. Messung und ueberwachung der ableitungen radioaktiver stoffe mit der kaminabluft bei bestimmungsgemessem betrieb. Entwurf. (MEASUREMENT AND MONITORING OF GASEOUS AND AEROSOL-BOUND RADIOACTIVE DISCHARGES. 1. MEASUREMENT AND MONITORING OF RADIOACTIVE SUBSTANCE RELEASES VIA THE VENT STACK DURING ROUTINE OPERATION. DRAFT). Cologne, Germany; Heymanns (1978). 42p.

The draft rule concerns stationary LWRs and HTRs. The measuring and monitoring methods are to distinguish between noble gases, aerosols, ; sup 129;I and ;sup 131;I, ^{3}H, ;sup 90;Sr, ;sup 14;C, and alpha sources.

2994 MONITORING OF GASEOUS AND LIQUID EFFLUENTS AT FRENCH NUCLEAR POWER PLANTS. Fitoussi, L. pp 81-100 of Monitoring of airborne and liquid radioactive releases from nuclear facilities to the environment. Vienna, Austria; International Atomic Energy Agency (1978).

Uniform sampling and measuring methods are used in monitoring waste at the nuclear power plants operated by Electricite de France. In the following, a brief description of the different power plants is given; diagrams of ventilation and liquid effluent discharge circuits are attached. Some general information is given about the releases from the power plants and also the composition of the liquid effluents. Lastly, the sampling methods and measurement techniques are described.

2995 MONITORING OF RELEASES FROM AN IRRADIATED FUEL REPROCESSING PLANT. Fitoussi, L. pp 101-105 of Monitoring of airborne and liquid radioactive releases from nuclear facilities to the environment. Vienna, Austria; International Atomic Energy Agency (1978).

At its UP 2 plant, the La Hague facility reprocesses irradiated fuel by the PUREX process. The fuel stems from graphite/gas, natural-uranium reactors and pressurized or boiling water enriched-uranium reactors. The gaseous effluents are collected and purified by high-efficiency washing and filtration. After purification the gas stream is discharged into the atmosphere by a single stack, 100m high and 6m in diameter, located at a high point on the site (184m). The radionuclides released into the air are: krypton-85, iodine-129 and -131, and tritium. The liquid effluents are collected by drainage systems, which transfer them to the effluent treatment station in the case of active or suspect solutions. Active solutions undergo treatment by chemical and physical processes. After purification the waste water is released into the sea by an underwater drainage system 5km long, which brings the outlet point into the middle of a tidal current 2km offshore. The radionuclides contained in the purified waste water are fission products originating from irradiated fuels in only slightly variable proportions, in which ruthenium-rhodium-106 predominates. Traces of the transuranium elements are also found in these solutions.

2996 MONITORING EQUIPMENT FOR LIQUID EFFLUENTS. Gans, I. pp 41-45 of Monitoring of airborne and liquid radioactive releases from nuclear facilities to the environment. Vienna, Austria; International Atomic Energy Agency (1978).

Liquid effluents that are possibly contaminated by radioactive substances may only be discharged in batches from discharge tanks designed for this purpose. According to administrative orders, discharge monitoring involves the following five steps: Sampling and measurement before discharge; sampling for storage; composite sampling for specific radionuclide analysis; continuous gamma counting in the discharge pipe from the discharge tank and in the cooling-water outlet; continuous sampling in the cooling-water outlet and inlet and analysis of specific radionuclides in composite samples. The two last monitoring steps are intended to detect unplanned releases.

2997 MONITORING OF RADIOIODINE IN GASEOUS EFFLUENTS AT THE BHABHA ATOMIC RESEARCH CENTRE, INDIA. Krishnamony, S. pp 34-38 of Monitoring of airborne and liquid radioactive releases from nuclear facilities to the environment. Vienna, Austria; International Atomic Energy Agency (1978).

For some time, at Bhabha Atomic Research Centre, radioiodine in the gaseous effluents of nuclear reactors and radiochemical plants has been monitored with cartridges containing activated charcoal. Recently, a modified version of a device which is popularly known as the May Pack has been in use for monitoring radioiodine aerosols which are likely to exist in different chemical and physical forms.

2998 MONITORING METHODS FOR RADIOACTIVE NOBLE GASES IN AIRBORNE EFFLUENTS FROM NUCLEAR POWER PLANTS. Winkelmann, I. pp 29-34 of Monitoring of airborne and liquid radioactive releases from nuclear facilities to the environment. Vienna, Austria; International Atomic Energy Agency (1978).

The following two monitoring and measuring methods which are applicable for radioactive noble gases at the stack of nuclear power plants are described: Continuous measurement of emitted amounts of radioactive noble gases; measurement of individual nuclides of radioactive noble gases, with respect to calculating radiation exposure of the public in the vicinity of nuclear power plants.

2999 ENVIRONMENTAL PROTECTION OF NUCLEAR POWER STATIONS. Deme, S. (Kozponti Fizikai Kutato Intezet, Budapest (Hungary)). Meres es Automatika ; 27: No. 2, 51-55(1978). (In Hungarian).

Nuclear power stations as sources of radioactive pollution of the environment are considered. The principle of technological systems retaining environmental pollution at WWER-440 type power stations being built in Paks is referred to as well. By analysing the potential pathways of radioactive contaminants into the environment and the human body the principles of monitoring and supervising of the nuclear power stations are determined.

3000 INSTANTANEOUS AND CONTINUOUS SAMPLING STATION FOR MONITORING THE RADIOACTIVITY OF SEWAGE. Kovats, M.; Borbely, Gy. (Pollack Mihaly Muszaki Foiskola, Pecs (Hungary)). Acta Acad. Polytech. Pollack Mihaly Pecs.; 105-113(1978). (In Hungarian).

The design and performance of a radiation protection control station for monitoring the radioactivity of sewage are described. The main functions of the station are: continuous measurement and registration of beta and gamma activity, automatic sampling and warning in case of exceeding prescribed levels, continuous measurement of flowing mass and mass proportional sampling.

3001 SUBSTANTIATION OF THE SCOPE OF RADIATION MONITORING IN THE REGION OF ATOMIC POWER STATION LOCATION. Zykova, A.S.; Zhakov, Yu.A.; Yambrovskii, Ya.M. Gigiena i Sanitariya (U.S.S.R.) Issued in English Translation as Hygiene and Sanitation ; No. 12, 48-51(Dec 1977). (In Russian).

Basing on observation on working APS discharges it has been established, that the discharges can be monitored at a distance up to 5-7 km from the station. A number of sample analyses of environment main objects must permit to determine for certain their content of radioactive materials due to global fall-outs and the APS discharges.

3002 PROCESS FOR DECONTAMINATING RADIOACTIVE EFFLUENTS, PRINCIPALLY IN ANTIMONY AND RUTHENIUM. Berton, Y.; Chauvet, P. (to CEA, 75 - Paris (France)). French Patent 2,346,817/A/. 31 Mar 1976. 14p. (In French).

This invention concerns a process for decontaminating radioactive effluents that not only permits a good decontamination of the effluent to be treated as to various radioactive elements but also provides satisfactory elimination of the antimony contained in this effluent as well as improved decontamination of the ruthenium. Under this process a precipitate of a hydroxide of an element in column IVa of the periodic table classification of the elements is formed in the effluent to be processed, and the sludge thus obtained is filtered. To be more precise, the precipitates are formed by the successive addition to the effluent of sulfuric acid, the

salt of an element of column IVa of the periodic classification of the elements, nickel ferrocyanide, soda, ammonium sulfur, cobalt nitrate and baryum nitrate.

Chemical and Thermal Effluents

3003 REVIEW OF THE ENVIRONMENTAL IMPACT OF NUCLEAR ENERGY. El-Hinnawi, E.E. (UN Env Programme, Nairobi). International Atomic Energy Agency Bulletin ; 20: No. 2, 32-42(Apr 1978).

The radioactivity released from the products of nuclear fission is the main focus of public concern about the expansion in the use of nuclear power despite stringent control measures and precautions taken. Environmental impacts associated with all the steps in the nuclear fuel cycle are examined. Discussed are: uranium mining and milling, manufacture of fuel elements for the reactor, transport and reprocessing of irradiated fuel, reactor operation, and management of wastes produced in the cycle. Environmental impacts of a coal-fired power plant are compared with impacts of three nuclear plants with the same generating capacities. Impacts compared are thermal heat waste, effluent radioactivity, air pollution, radioactive and ash waste products, and land used for the plant. The environmental advantages of the nuclear reactors occur in the categories of air pollutant effluents and land used for plants. (45 references, 3 tables)

Research, Test, and Experimental Reactors

3004 (CONF-800607--20) RADIOACTIVE GAS AND HYDROGEN REMOVAL AFTER A LOCE AT THE LOFT FACILITY. McCormick-Barger, J.W.; Sumpter, K.C. (EG and G Idaho, Inc., Idaho Falls (USA)). 17 Dec 1979. Contract EY-76-C-07-1570. 5p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

The use of a silver-zeolite halogen adsorber placed in series with a hydrogen catalytic recombiner and a cryogenic noble gas adsorber assembly constitutes a waste gas processing system (WGPS) capable of handling hydrogen and fission product gases following a Loss-of-Coolant Experiment (LOCE). This paper describes: the types and quantities of gases expected to be found at the facility after a failed-fuel LOCE; the purpose of the WGPS; and the general configuration and expected decontamination factors associated with the LOFT WGPS.

3005 (DOE/ER/01953--T1) OREGON STATE UNIVERSITY TRIGA REACTOR ANNUAL REPORT. Anderson, T.V.; Johnson, A.G.; Bennett, S.L.; Ringle, J.C. (Oregon State Univ., Corvallis (USA). Radiation Center). 31 Aug 1979. Contract EY-76-C-06-1953. 118p. (RLO--1953). Dep. NTIS, PC A06/MF A01.

The use of the Oregon State University TRIGA Reactor during the year ending June 30, 1979, is summarized. Environmental and radiation protection data related to reactor operation and effluents are included.

3006 (EGG--2059) DECONTAMINATION AND DECOMMISSIONING OF THE ORGANIC MODERATED REACTOR EXPERIMENT FACILITY (OMRE). Hine, R.E. (Idaho National Engineering Lab., Idaho Falls (USA)). Sep 1980. Contract AC07-76ID01570. 98p. NTIS, PC A05/MF A01.

This report describes the decontamination and decommissioning (D and D) of the Organic Moderated Reactor Experiment (OMRE) facility performed from October 1977 through September 1979. This D and D project included removal of all the facilities and as much contaminated soil and rock as practical. Removal of the reactor pressure vessel was an unusually difficult problem, and an extraordinary, unexpected amount of activated rock and soil was removed. After removal of all significantly contaminated material, the site consisted of a 20-ft deep excavation surrounded by backfill material. Before this excavation was backfilled, it and the backfill material were radiologically surveyed and detailed records made of these surveys. After the excavation was backfilled and graded, the site surface was surveyed again and found to be essentially uncontaminated.

3007 (EGG/LTR--112-7) OFFSITE EXPOSURE FROM RUPTURE WASTE GAS DECAY TANK. Dinneen, G.A. (Aerojet Nuclear Co., Idaho Falls, ID (USA)). 25 Apr 1972. Contract EY-76-C-07-1570. 6p. Dep. NTIS, PC A02/MF A01.

The offsite exposure resulting in the rupture of the waste gas decay (storage) tank has been calculated. The tank rupture is assumed to occur following a 20% fuel pin perforation blowdown experiment from which the gaseous fission products have been transferred to the waste gas decay tank. Because of the unpredictable nature of the tank rupture, several cases have been considered to scope the rupture situation. The resulting exposures from the cases considered are all within the AEC guidelines (10 CFR-100).

3008 (HEDL-SA--1878-FP) PACKAGING AND SHIPMENT OF U.S. BREEDER REACTOR EXPERIMENTS. Berger, J.D. (Hanford Engineering Development Lab., Richland, WA (USA)). 1980. Contract AC14-76FF02170. 7p. (CONF-800592--1). NTIS, PC A02/MF A01.

From International conference on postirradiation examination; The Lake District, UK (13 May 1980).

Irradiation testing of fuels and materials in the Fast Test Reactor (FTR) required development of a shipping cask (designated T-3) and associated hardware for loading and shipping of these experiments to postirradiation examination facilities. The T-3 shipping-cask program included design, fabrication, and testing of internal cask packages to protect the experiments during loading, shipping, and unloading. The cask was designed for loading in both the vertical and horizontal attitudes.

3009 (LA--7949-MS) NONDESTRUCTIVE VERIFICATION OF RELATIVE BURNUP VALUES AND COOLING TIMES OF IRRADIATED MTR FUEL ELEMENTS. Phillips, J.R.; Bement, T.R.; Kaieda, K.; Medina, E.G. (Los Alamos Scientific Lab., NM (USA)). Aug 1979. Contract W-7405-ENG-36. 39p. Dep. NTIS, PC A03/MF A01.

Sixteen irradiated MTR fuel elements have been examined using nondestructive gamma-ray and neutron techniques. The consistency of declared burnup values and cooling times has been measured. Measured parameters have been identified that best predict the burnup and cooling time values of individual elements and their relative importances have been quantified using established statistical methods of analysis. Various detector systems, including germanium, cadmium telluride, and Be(γ,n) detector, and fission chamber have been used to measure the axial activity profiles.

3010 (RHO-CD--864) FUNCTIONAL DESIGN CRITERIA FOR EBR-II - SPENT FUEL CASK. Moose, J.M. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Mar 1980. Contract AC-06-77RL01030. 9p. NTIS, PC A02/MF A01.

Irradiated Uranium, Plutonium mixed oxide experimental fuel pins from EBR-II have been examined in Hanford Engineering Development Laboratories (HEDL) hot cells and steadily accumulated to the extent that the storage capacity at HEDL is saturated. A large quantity of excess fuel must be transferred from the hot cells for storing at the 200 Area to accommodate handling discharged pins from the Fast Flux Test Facility (FFTF). The spent fuel will be consolidated in six (6) HEDL Spent Fuel Packages. The HEDL Packages are 5.625 in diameter x 41 inches in length and are composed of 28 inner tubes packaged in two welded outer containers.

3011 MEASUREMENT OF AIRBORNE RODON DAUGHTER CONCENTRATIONS IN THE ATMOSPHERE. Ha, C.W.; Lee, J.K.; Moon, P.S. (Korea Atomic Energy Research Inst., Seoul (Republic of Korea)). Radioprotection ; 4: No. 1, vp(Jul 1979).

A simple method for determining the airborne concentration of radon daughter products has been developed, which is based on gross alpha counting of the air filter collections at several time intervals after completion of air sampling. The concentration of each nuclide is then obtained from an equation involving the alpha disintegrations, the sampling time, and the known numerical coefficients. The state of radioactive disequilibrium is also inventigated. The atmosphere sampled in the TRIGA Mark-III reactor room was largely in disequilibrium. The extent of radioactive disequilibrium between radon daughter

3012 FUEL STORAGE AND HANDLING SYSTEM OF 'JOYO' SPENT FUEL FACILITY. Ishiguro, J. (Fuji Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). FAPIG (Tokyo) ; No. 92, 32-36(Jul 1979). (In Japanese).

The fast experimental reactor ''Joyo'' has continued the normal operation at 50 MW-th since July, 1977, while carrying out various tests. The second stage output of 75 MW-th is realized in 1979, and after the new core will be constructed, the Mark-2 project will be carried out, in which the reactor will be used for the irradiation of fuel materials for fast reactors at 100 MW-th output. In order to prepare for the expected increase of spent fuel, it was decided to construct newly the spent fuel storage facility in addition to the existing one. The delivery of the whole installations of this facility was completed in July, 1979. This facility has the storing capacity of 600 assemblies. The plan of transferring spent fuel is shown. It is necessary to store two kinds of cans for Joyo and for reprocessing in storing racks. Accordingly, cell type was adopted for the storing racks, and the cans of different shapes can be stored by exchanging the guide tubes of cells. The storing racks are installed at the bottom of a cooling pool. They are composed of six rack frames, each accommodates 25 cells. The fuel-transferring machine grabs a can in water, lifts, transfers horizontally, and lowers it. The new fuel storage facility is also installed in the spent fuel storage facility, in which new fuel is stored in argon atmosphere.

3013 TRITIUM MONITORING METHODOLOGY USING A DESICCANT AND APPLICATION TO A RESEARCH REACTOR FACILITY. Langhorst, S.M.; Morris, J.S.; Bull, S.R. (Univ. of Missouri, Columbia). Transactions of the American Nuclear Society ; 32: 143-144(Jun 1979). (CONF-790602--(Summ.)).

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

MURR REACTOR;RADIOACTIVE EFFLUENTS;TRITIUM METERS;PERFORMANCE

3014 LABORATORY COMPUTER SYSTEM FOR ROUTINE, PLANT, AND ENVIRONMENTAL RADIATION-MONITORING APPLICATIONS. Myers, W.R.; English, G.O.; Morneau, R.A. (Idaho National Engineering Lab., Idaho Falls, ID). pp 216-222 of Computers in activation analysis and gamma-ray spectroscopy. Carpenter, B.S.; D'Agostino, M.D.; Yule, H.P. (eds.). Washington, DC; Department of Energy (1979).

From Conference on computers in activation analysis and gamma-ray spectroscopy; Mayaguez, Puerto Rico (30 Apr 1978).

This paper describes a PDP-15 computer system used to support the varied activities of the Radiation Measurements Laboratory located in the Test Reactors Area at the Idaho National Engineering Laboratory (INEL). These activities include providing technical assistance to the test reactors and to various groups in counting laboratories, maintaining radiation measurement standards, measuring flux distributions, gamma heating, and other in-pile parameters in the test reactors and associated loop experiments, and developing measurement techniques required in support of test reactor programs. It also describes the implementation of remotely controlled gamma-ray spectrometers and the necessary communications network to provide on a routine basis effluent monitoring for reactor facilities at INEL.

3015 R-5 PROJECT - AN EXAMPLE OF EXPERIENCE FEEDBACK. Sundaram, S.M. (Bhabha Atomic Research Centre, Bombay (India)). pp 95-103 of Operating experience of nuclear reactors and power plants. Bombay, India; Department of Atomic Energy (1979).

From Symposium on operating experience of nuclear reactors and power plants; Bombay, India (7 Feb 1977).

The basic objectives of building R-5 reactor are two-fold, namely, (i) to augment the experimental facilities already available at Trombay in the reactors CIRUS, APSARA, ZERLINA and PURNIMA and (ii) to provide new experimental facilities like large size engineering loop facilities capable of irradiating prototype 500 MW(e) PHWR fuel bundles under near similar power reactor operating conditions, hot and cold neutron sources, horizontal neutron beam tube through the core, provisions for extending the neutron beam into an experimental area outside the containment building etc. Apart from incorporating the latest technological developments and innovations in conventional as well as nuclear fields, the detailed design of the systems and equipment has been influenced greatly by the first hand experience in construction, commissioning and operation of the reactors at Trombay. Also, the commissioning and operating experience of other Indian nuclear power plants has been usefully applied in the design. Spare capacities available in existing facilities have been made use of to the extent possible with suitable modifications, instead of building new facilities, thus resulting in saving in capital cost.

3016 APPLICATION OF ACTIVATION ANALYSIS IN

RADIOECOLOGICAL INVESTIGATIONS. Anovski, T. (Skoplje Univ. (Yugoslavia). Tehnolosko-Metalurski Fakultet); Draskovic, R.; Kirkov, P. (Institut za Nuklearne Nauke Boris Kidric, Belgrade (Yugoslavia)). pp 391-402 of Utilization of nuclear reactors in Yugoslavia. Beograd; Institut za Nuklearne Nauke Boris Kidric (May 1978). (In Serbian)

From Conference on utilization of nuclear reactors in Yugoslavia; Belgrade, Yugoslavia (May 1978).

Intensive building of nuclear power plant ower the world, which also causes increase of radioactive waste materials in the human environment, the problem of radioecology and environmental protection is constantly gaining in importance and scientific attention. Neutron activation analysis was used for observing distribution of metals, such as Sb,Hg,Fe,Zn,etc, in the samples of water, suspended materials of the Vardar river (where the building of nuclear power plant in Macedonia is planned), as well as in the environmental soil samples in the rivers bassin. The samples of water, suspended and bad materials, soils and standards were irradiated for 3 days, after corresponding preparation, by the thermal neutron flux $1{,}5 \times 10^{13}$ n/cm^{2}xsec in the RA - reactor at Vinca. Concentrations of investigated elements were calculated on the basis of relative comparative measurements of irradiated samples and standards. Our preliminary results demonstrate the possibility of utilization of NAA in ecological and radioecological investigations of continental water systems. These data are especially important for determination of distribution of radionuclides in the case of eventual nuclear power plant accidents.

3017 ESTIMATION OF PHOTO AND FISSION NEUTRON SOURCE STRENGTHS IN THE FUEL HANDLING FLASK OF THE R-5 REACTOR CONTAINING AN IRRADIATED FUEL ROD. Kanchhi Singh; Sankaranarayanan, S. (Bhabha Atomic Research Centre, Bombay (India)). pp 334-338 of Reactor physics. Bombay, India; Department of Atomic Energy (1978).

From Symposium on reactor physics; Bombay, India (1 Mar 1976).

Irradiated fuel rods of the R-5 reactor have heavy water cooling while being removed in the fuel handling flask. Consequently the estimation of the source strengths of photo neutrons and fission neutrons from fissions induced by slowed down photo neutrons in the fuel is essential for the neutron shielding design of the flask. The results of certain analyses carried out in this connection are summarised. While the estimation of the photo neutrons is based on available experimental data from ZEEP reactor, a one neutron group calculation is done for the fission neutrons with the photo neutrons slowed down below approximately lev as the source term.

Plutonium and Isotope Production Reactors

3018 (AAEC/PR--44S) NUCLEAR SCIENCE AND TECHNOLOGY BRANCH REPORT 1977. RESEARCH ESTABLISHMENT SITE MANAGEMENT. Cawsey, W.E.T. (Australian Atomic Energy Commission Research Establishment, Lucas Heights). Dec 1977. 77p. Dep. NTIS (US Sales Only), PC A05/MF A01.

This report records the technical service provided in support of research programs at the Research Establishment. Such services include HIFAR reactor operations, engineering services, information services, safety services and services provided research divisions themselves. Radioisotope production and other commercial activities are also included.

3019 (ASO/R--2) GAMMA RAY MEASUREMENT OF SPENT HIFAR FUEL ELEMENTS FOR SAFEGUARDS VERIFICATION. 1. EXPERIMENTAL EVALUATION OF METHOD. Hanna, G.L. (Australian Safeguards Office, Sydney). Jul 1978. 22p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Since 1970, IAEA safeguards inspectors have used gamma ray measurements of fission product activities to verify operator's data on burnup, cooling time, and integrity of fuel elements after irradiation in the HIFAR reactor. Experimental measurements were made in order to assess independently the value of the method as a safeguards technique for verifying burnup and cooling time. Result show that the precision of the method must be improved if useful information is to be obtained but a proper evaluation must include consideration of the theoretical basis of the method. This is presented in Part 2 of the report.

3020 (UNI-SA--77) FIFTEEN YEARS EXPERIENCE FILTERING N REACTOR GASEOUS WASTES. Fowler, K.L. (UNC Nuclear Industries, Inc., Richland, WA (USA)). 14 Jan 1980. Contract EY-76-C-06-1857. 19p. (CONF-800211--1). Dep. NTIS, PC A02/MF A01.

From International symposium on management of gaseous wastes from nuclear facilities; Vienna, Austria (18 Feb 1980).

The N Reactor exhaust gas filtering system consists of roughing filters, particulate filters, and charcoal filters, in that order. The basic particulate and charcoal filters consist of 0.46 m^3/s, 60 cm x 60 cm x 30 cm filter canisters installed four canisters wide by ten canisters high in removable filter frames. The roughing filter canisters are about twice as wide and high as the other canisters but fit into similar frames of the same size. There are two side by side frames of each type of filter in each cell for a total design flow of 37 m^3/s. The reactor and primary pipe space air has two cells for normal operation and one cell reserved for the accident case. One cell without roughing filters is used for the first buffer zone air around the reactor.

3021 EXPERIMENTAL PROGRAMS AT THE HANFORD N REACTOR IN SUPPORT OF SPENT-FUEL STORAGE. Toffer, H. (UNC Nuclear Industries, Inc., Richland, WA). Transactions of the American Nuclear Society ; 33: 366-367(1979). (CONF-791103--).

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

N-REACTOR;SPENT FUEL ELEMENTS;SPENT FUEL STORAGE;CRITICALITY

Propulsion Reactors

3022 (GKSS--79/E/24) RADIOLOGICAL DATA CONCERNING THE NUCLEAR MERCHANTSHIP OTTO HAHN. A REVIEW AFTER TEN YEARS OF OPERATION. Henning, K.D. (Gesellschaft fuer Kernenergieverwertung in Schiffbau und Schiffahrt m.b.H., Geesthacht-Tesperhude (Germany, F.R.). Abt. Strahlenschutz). 1979. 14p. NTIS (US Sales Only), PC A02/MF A01.

A review is given of the data necessary to judge the influence to men and environment resulting from a ten years operation of the German nuclear merchant ship OTTO HAHN. Especially values are reported concerning personal dose during normal operation and maintenance, waste disposal to the sea,

radioactivity levels and radioisotopes involved. The gamma- and neutron dose rates during full power reactor operation on board and outside the ships hull are summarized.

3023 (PB--300378) AN ANALYSIS OF CORROSION PRODUCT ACTIVATION FOR THE PROPOSED NUCLEAR ULTRA-LARGE CRUDE CARRIER. KINGS POINT SCHOLARS SERIES REPORT. Barton, I.L. (National Maritime Research Center, Kings Point, NY (USA)). Dec 1978. 89p. NTIS, PC A05/MF A01.

The purpose of this study was to determine the type of monitoring system which should be installed on the proposed Ultra-Large Crude Carrier (ULCC). To determine the solution to the problem, a broad picture is presented. The ULCC is described in detail, with particular attention given to its monitoring systems. For comparison, the previous experience of the NS Savannah and the present experience of the U.S. Navy are brough forth. Land-based power plants are also discussed. Then, the equipment itself is assessed through actual experimental work on the type of monitoring equipment that is proposed for the nuclear ULCC.

Reactor Safety

3024 (AGNS--35900-1.5-79) SCOPING STUDIES OF THE ALTERNATIVE OPTIONS FOR DEFUELING, PACKAGING, SHIPPING, AND DISPOSING OF THE TMI-2 SPENT FUEL CORE. (Allied-General Nuclear Services, Barnwell, SC (USA)). Sep 1980. Contract AC09-78ET35900. 217p. NTIS, PC A10/MF A01.

A portion of this fuel will be shipped to nuclear facilities to perform detailed physical examinations. Removal of this fuel from the TMI-2 core is also a significant step in the eventual cleanup of this facility. The report presents a scoping study of the technical operations required for defueling and canning. The TMI fuel when canned could be stored in the spent fuel storage pool. After a period of on-site storage, it is expected that the bulk of the fuel will be shipped off-site for either storage or reprocessing. Evaluation is made of the technical, economic, and institutional factors associated with alternate approaches to disposition of this fuel. Recommendations are presented concerning future generic development tasks needed for the defueling, packaging, on-site shipping of this fuel.

3025 (CONF-791049--26) PLENARY LECTURE - A SPECIAL RADIOELEMENT PROBLEM: ORNL ASSISTANCE TO THREE MILE ISLAND IN HANDLING CONTAMINATED AIR AND WATER. Brooksbank, R.E. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 44p. NTIS, PC A03/MF A01.

From 23. conference on analytical chemistry in energy technology; Gatlinburg, TN, USA (9 Oct 1979).

As the investigative work concerning the post-accident period comes to light, it is apparent that ORNL has played a significant role in the recovery of TMI. Work in the area of waste handling, analytical service, flowsheet development, and decontamination are all regarded as significant. Efforts in this specific area of assistance to TMI are really the results of the close working relationship between chemical engineers and analytical chemists. The two major areas of involvement, and the subject of this discussion, are contaminated air and water handling which resulted from the accident.

3026 (CONF-800403--(Vol.2), pp 1266-1272) APPLICATION OF PARTIAL FAILURE ANALYSIS TO AN ACCIDENT INVOLVING LOSS OF COOLING IN A SPENT FUEL STORAGE POOL. Lofgren, E.(Science Applications, Inc., McLean, VA); Denning, R.S.; Cudnik, R.A.; Hall, R.E. Jun 1980.

From ANS thermal reactor safety meeting; Knoxville, TN, USA (8 Apr 1980).

A method is described for extending event tree methodology to the evaluation of systems which are better represented by a spectrum of operational modes than by two discrete modes. The methods are applied to the analysis of the risk to the public from failure of the decay heat removal system in a spent fuel storage pool.

3027 (CONF-800403--(Vol.2), pp 1314-1321) LIQUID PATHWAYS GENERIC STUDIES; RESULTS, INTERPRETATION, AND DESIGN IMPLICATIONS. Walker, D.H.; Nutant, J.A. (Offshore Power Systems, Jacksonville, FL). Jun 1980.

From ANS thermal reactor safety meeting; Knoxville, TN, USA (8 Apr 1980).

Offshore Power Systems and the Nuclear Regulatory Commission have evaluated dose consequences resulting from a release of radioactivity to liquid pathways following a postulated core-melt accident. The objective of these studies was to compare the risks from postulated core-melt accidents for the Floating Nuclear Plant with those for a typical land-based nuclear plant. Offshore Power Systems concluded that the differences in liquid pathway risks between plant types are not significant when compared with the air pathways risks. Air pathways risk is similar to or significantly larger than liquid pathways risk depending on the accident scenario. The Nuclear Regulatory Commission judged the liquid pathways risks from the Floating Nuclear Plant to be significantly greater than the liquid pathway risks for the typical land-based plant. Although OPS disagrees with the NRC judgment, design changes dictated by the NRC are being implemented by OPS.

3028 (CONF-800403--(Vol.2), pp 1328-1335) NATURAL REMOVAL OF PARTICULATE RADIOACTIVITY IN AN LWR-CONTAINMENT DURING CORE MELTDOWN ACCIDENTS. Bunz, H.; Schoeck, W. (Lab. for Aerosol Physics and Filter Tech., Kernforschungszentrum, Karlsruhe, Germany). Jun 1980.

From ANS thermal reactor safety meeting; Knoxville, TN, USA (8 Apr 1980).

During core meltdown accidents in LWRs, large quantities of fission products and core material are vaporized and released to the containment in particulate form. The behavior and the natural removal of this aerosol is calculated with the computer code NAUA. Airborne aerosol mass in the containment and leaked masses are calculated for a typical accident sequence in the German PWR. Additionally, the influence of a containment failure on the total environmental impact is evaluated as a function of time. It is demonstrated that a period of three days of containment integrity is required to minimize the aerosol mass which escapes from the containment.

3029 (CONF-800434--5) APPLICATION OF AEROSOL TECHNOLOGY IN LMFBR DESIGN. Strawbridge, L.E.; Hemmerle, E.H. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1980. Contract AC15-76CL02395. 17p. NTIS, PC A02/MF A01.

From CSNI specialist meeting on nuclear

aerosols in reactor safety; Gatlinburg, TN, USA (15 Apr 1980).

Aerosol technology is applied in several areas in the safety assessment of liquid metal fast breeder reactors. This paper discusses the application of this technology in the assessment of the Clinch River Breeder Reactor Plant. The importance of considering aerosol effects is discussed for sodium fires, the assessment of site suitability and the assessment of the consequences of accidents beyond the design base such as hypothetical core disruptive accidents. Areas in which further development work could have the most impact are indicated.

3030 (CONF-800607--60) EMERGENCY ACTIONS CONCERNED WITH EFFLUENT CONTROL AT TMI. Brooksbank, R.E.; Campbell, D.O.; Snider, J.W.; Yarbro, O.O. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 34p. NTIS, PC A03/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

Information is presented concerning the critical emergency requirements; gaseous effluent status and control; liquid effluent status and control; and water treatment processes.

3031 (CONF-800802--10) RECENT CHEMICAL ENGINEERING REQUIREMENTS AS THE RESULT OF TMI ON-SITE EXPERIENCE. Brooksbank, R.E. Sr. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 24p. NTIS, PC A02/MF A01.

From 89. annual meeting of the American Institute of Chemical Engineers; Portland, OR, USA (17 Aug 1980).

From the experiences gained from the on-site experience at TMI, it is apparent that the role of chemical engineers should increase in order for the nuclear option to proceed in a safe and efficient fashion. It is also obvious that as the results of the reports investigating the causes and effects of the accident come to light and attempts to backfit system designs to prevent a recurrence are studied, more technical demands will be placed on the profession.

3032 (DOE/TIC--11023) POST-ACCIDENT CLEANUP OF RADIOACTIVITY AT THREE MILE ISLAND. Brooksbank, R.E. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 27p. Dep. NTIS, PC A03/MF A01.

Plant schematics, equipment modifications, radioactivity water processing procedures, and radioactivity levels at the Three Mile Island-2 reactor are presented.

3033 (EGG-FM--5078) WATER LOSS IN FAST PROJECT INTERIM FUEL STORAGE RACK. Kelsey, P.V. Jr. (Department of Energy, Idaho Falls, ID (USA). Idaho Operations Office). Jan 1980. Contract EY-76-C-07-1570. 24p. Dep. NTIS, PC A02/MF A01.

Water loss calculations for the concrete FAST interim fuel storage rack were performed at the request of Exxon Nuclear. Because water in concrete, whether chemically combined or in a free state, is a critical component for neutron attenuation and radiation shielding, loss of water within a concrete structure designed to contain various forms of nuclear material could present a criticality problem within the structure. Although a definitive optimum water content has not been presented at this time, it appears that 4 weight % is a minimum content for efficient attenuation. Although other elements in concrete contribute to neutron attenuation, hydrogen with its large cross section is the dominant attenuating element. The results of calculations indicate that the present design of the fuel rack is inadequate for the proposed total fluence and that the minimum safe water content would be reached within one year's operation.

3034 (ESG-DOE--13294) REACTOR SAFETY. ANNUAL TECHNICAL PROGRESS REPORT, GOVERNMENT FISCAL YEAR 1979. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 15 Apr 1980. Contract AT03-76SF74028. 46p. Dep. NTIS, PC A03/MF A01.

Information is presented on LMFBR reactor safety concerning the energetics effects of sodium spray fires; sodium drop and spray burning; core debris accommodation; attenuation in containment; and attenuation in the environment.

3035 (HEDL-SA--2017-FP) EVALUATION MODELS AND THEIR INFLUENCE ON RADIOLOGICAL CONSEQUENCES OF HYPOTHETICAL ACCIDENTS IN FFTF. Stepnewski, D.D.; Hale, J.P.; Martin, H.C.; Peak, R.D.; Franz, G.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1980. Contract AC14-76FF02170. 23p. (CONF-800434--8). NTIS, PC A02/MF A01.

From CSNI specialist meeting on nuclear aerosols in reactor safety; Gatlinburg, TN, USA (15 Apr 1980).

The influence of radiological evaluation models and assumptions on the off-site consequences of hypothetical core disruptive accidents is examined. The effects of initial source term, time of containment venting, meteorology, biological dose model, and aerosol fallout have been included. The analyses were based on two postulated scenarios of a severe hypothetical reactor vessel melt-through accident for 400 MW(t) fast reactor. Within each accident scenario, the results show that, although other variables are significant, radiological consequences are strongly affected by the amount of aerosol fallout computed to occur in the incident.

3036 (INIS-mf--4862) SAFETY STUDY. THE CLINCH RIVER BREEDER REACTOR PLANT. Piper, H.B.; Leaver, D.E.; Wood, P.J. (Project Management Corp., Oak Ridge, TN (USA)). 1978. 9p. (CONF-781022--84). Dep. NTIS (US Sales Only), PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

A risk assessment has been performed to provide a realistic evaluation of the risk to the public from the Clinch River Breeder Reactor Plant (CRBRP), to place that risk in perspective relative to other societal risks, and to provide a basis for assessing the comparability of the risk from the CRBRP with risks associated with previously licensed US reactors. The assessment formally and systematically evaluated the CRBRP risk and showed that the risk associated with postulated accidents of the CRBRP is small when compared with non-nuclear risks to which the local population is already exposed, and that CRBRP risks are comparable to those from light-water reactors (LWR's) of the current generation as characterized in the Rasmussen Study.

3037 (INIS-mf--5181) COMPACT STORAGE OF SPENT FUEL ELEMENTS IN NUCLEAR POWER PLANTS WITH LWR REACTORS. (Kraftwerk Union A.G., Erlangen (Germany, F.R.)). Sep 1978. 13p. (In German). Dep. NTIS (US Sales Only), PC

A02/MF A01.
The storage of burnt fuel elements in NPPs is part of the principle design of such plants. The increasing of the storage capacity of the cooling ponds in the NPPs by replacing normal supports by compact supports is a measure which is technically realizable and represents a positive contribution to the total range of problems of waste management. The technical realisation of compact supports was demonstrated both by the theoretical works carried out up today and the practical carrying out of such compact supports. Furthermore, there are positive comments of experts on the compact supports.

3038 (INIS-mf--5302, pp 41-42) SOME IMPORTANT SAFETY EXPERIENCES MADE DURING OPERATION OF THE AVR REACTOR. Lindackers, K.H. 1979. (In German).
Experience from safety checks of HTR concepts.
AVR REACTOR;ENVIRONMENT;FAILURES;PERFORMANCE; RADIOACTIVE WASTE DISPOSAL;REACTOR OPERATION; REACTOR SAFETY

3039 (LA-UR--79-2946) EVALUATION OF THE THREE MILE ISLAND ACCIDENT IN THE CONTEXT OF WASH-1400. Burns, R.D. III. (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 6p. (CONF-800403--3). Dep. NTIS, PC A02/MF A01.
From ANS thermal reactor safety meeting; Knoxville, TN, USA (8 Apr 1980).
The accident at unit 2 of the Three Mile Island nuclear station (TMI-2) on March 28, 1979, occurred after approximately 400 reactor years (RY) of commercial nuclear reactor operation in the US. The purpose of work summarized here was to evaluate the probability statements in the WASH-1400 reactor safety study (RSS) in view of the TMI-2 event and to estimate the likely public impact of TMI-2. The RSS probability estimate for such a release was found to be consistent with the fact that the TMI-2 accident occurred. The expected health effects are consistent with those for a low-level category of radioactivity release as described in the RSS and they are immeasurably small. However, the public perception of the health effects of the release is likely to be much more severe than the estimated health effects.

3040 (NP--25109) REPORTS OF THE PUBLIC HEALTH AND SAFETY TASK FORCE ON PUBLIC HEALTH AND SAFETY SUMMARY; HEALTH PHYSICS AND DOSIMETRY; RADIATION HEALTH EFFECTS; BEHAVIORAL EFFECTS; AND PUBLIC HEALTH AND EPIDEMIOLOGY. (President's Commission on the Accident at Three Mile Island, Washington, DC (USA)). Oct 1979. 428p. GPO.
The general objectives of the Health Physics and Dosimetry Task Group included: (1) to determine the radiation dose to the people living within the area of 50 miles around the Three Mile Island Nuclear Station during the period of March 28 to April 15, 1979; (2) to determine the radiation dose to the workers at the nuclear power plant during the period of March 28 to June 30, 1979 - the cutoff date necessitated by the deadline of the Commission's report; and (3) to evaluate federal, state, and utility company programs concerned with the protection of human populations and their environment from the possible hazards of ionizing radiation, and the efficacy of these radiation protection programs during the nuclear accident at TMI.

3041 (ORNL/TM--7044) INVOLVEMENT OF THE ORNL CHEMICAL TECHNOLOGY DIVISION IN CONTAMINATED AIR AND WATER HANDLING AT THE THREE MILE ISLAND NUCLEAR POWER STATION. Brooksbank, R.E.; King, L.J. (comps.). (Oak Ridge National Lab., TN (USA)). Aug 1979. Contract W-7405-ENG-26. 61p. NTIS, PC A04/MF A01.
The President's Commission on the Accident at Three Mile Island requested that Oak Ridge National Laboratory (ORNL) generate documents concerning two areas in which ORNL personnel provided on-site assistance following the accident on March 28, 1979. These are: instrumentation diagnostics, and the treatment of radioactive wastes and liquid effluents stemming from the accident. This report describes the involvement of the ORNL Chemical Technology Division (CTD) in contaminated air and water handling at Three Mile Island (TMI).

3042 (PB--296197) POPULATION DOSE AND HEALTH IMPACT OF THE ACCIDENT AT THE THREE MILE ISLAND NUCLEAR STATION. FINAL REPORT, 28 MARCH-7 APRIL 1978. (Ad Hoc Population Dose Assessment Group, Washington, DC (USA)). 10 May 1979. 106p. NTIS, PC A06/MF A01.
The report was prepared by technical staff members of the Nuclear Regulatory Commission (NRC), the Department of Health, Education, and Welfare (HEW), and the Environmental Protection Agency (EPA), who consitute an Ad Hoc Population Dose Assessment Group. It is an assessment of the health impact on the approximately 2 million offsite residents within 50 miles of the Three Mile Island Nuclear Station from the dose received by the entire population (collective dose). The Ad Hoc Group has examined in detail the available data for the period up to and including April 7, 1979. Based on a preliminary review of data from periods beyond April 7, it appears that the collective dose will not be significantly increased by extending the period past April 7.

3043 (PB--801269) ACCIDENT RISKS IN NUCLEAR FACILITIES (A BIBLIOGRAPHY WITH ABSTRACTS). REPORT FOR 1964-NOVEMBER 1979. Kenton, E. (National Technical Information Service, Springfield, VA (USA)). Dec 1979. 337p. NTIS, PC A N01/MF N01.
The bibliography presents risk analysis and hazards evaluation of the design, construction, and operation of nuclear facilities, including the risk and hazards of transporting radioactive materials to and from these facilities. Radiological calculations for environmental effects of nuclear accidents are also included. (This updated bibliography contains 331 abstracts, 69 of which are new entries to the previous edition.)

3044 (PNL-SA--8143) DEMONSTRATION OF ALTERNATIVE DECONTAMINATION TECHNIQUES AT THREE MILE ISLAND. Arrowsmith, H.W.; Allen, R.P. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Nov 1979. Contract AC06-76RL01830. 41p. (CONF-7911104--1). NTIS, PC A03/MF A01.
From DOE/EPRI symposium on Three Mile Island Reactor problems; Harrisburg, PA, USA (11 Nov 1979).
This paper discusses the following decontamination techniques: immersion electropolishing, in-situ electropolishing, barrel electropolishing, vibratory finishing, high-pressure freon spray, centrifugation, acid adsorption, and solidification. (DLC)

3045 (RISLEY-Trans--3352) ORGANISATION OF

NUCLEAR SAFETY IN FRANCE. (UKAEA Risley Nuclear Power Development Labs.). 1978. 46p. British Library Lending Division, Boston Spa.

The subject is covered in sections, as follows: organization of public authorities responsible for nuclear safety in France; the principles of safety (reactors, fuel reprocessing plants, other nuclear installations; the risks - list of accidents and consequences; radioactive wastes, including discharges to the environment; decommissioning of nuclear installations); regulations (including licensing, commissioning, radioactive discharges, monitoring nuclear installations, radiation protection of workers); annexes (position in USA, position in Federal Republic of Germany, list of basic nuclear installations in France, bibliography).

3046 (UCID--18315) ARAC FEASIBILITY STUDY FOR THE NRC PHASE I: FINAL REPORT. Rosen, L.C.; Orphan, R.C. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Nov 1979. Contract W-7405-ENG-48. 56p. Dep. NTIS, PC A04/MF A01.

The feasibility of implementing ARAC (Atmospheric Release Advisory Capability) services in a particular nuclear power plant is examined. The criteria for selecting Rancho Seco are discussed and the physical, meteorological and procedural factors related to the plant are assessed. The potential benefits and limitations of implementing ARAC at Rancho Seco are analyzed. The costs of employing the system at the nuclear power plant are given for alternative plans. A training and familiarization program is outlined.

3047 (UCRL--83489) ATMOSPHERIC RELEASE ADVISORY CAPABILITY (ARAC) RESPONSE TO THE THREE MILE ISLAND ACCIDENT. Dickerson, M.H.; Gudiksen, P.H. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Oct 1979. Contract W-7405-ENG-48. 5p. (CONF-791037--3). Dep. NTIS, PC A02/MF A01.

From IEEE nuclear science/nuclear power systems symposium; San Francisco, CA, USA (17 Oct 1979).

This paper discusses the three general classes of support provided by the Atmospheric Release Advisory Capability (ARAC) and describes the role played by ARAC in support of DOE during the Three Mile Island accident in March and April of 1979.

3048 TMI CLEANUP TO COST MORE, LAST UNTIL 1985. Electric Light and Power ; 58: No. 9, 1-2(Sep 1980).

Cleanup operations at Three Mile island will last two years longer and cost at least $360 million more than the original estimates. The revised plan calls for a $760 million program to be completed by mid-1983. This does not include the cost of restoring the plant to operation, a decision which will be made later. A logical cleanup has been limited by the need to set regulatory criteria, obtain public approval, and resolve waste disposal problems. (DCK)

3049 DECOMMISSIONING OF NUCLEAR POWER PLANTS. Ingenioer-nytt ; 16: No. 24, 18-19,27(21 May 1980). (In Norwegian).

The general aspects of the decommissioning of power reactors are discussed. The three stages of decommissioning, stage 1 (protective storage, or mothballing), stage 2 (entombment) and stage 3 (complete dismantling, or green-field) are each briefly discussed, and practical experience referred to. The amounts and types of waste and their disposal is also touched upon. It is estimated that decommissioning costs will be about 10 percent of the original construction costs.

3050 PHYSICS CONTRIBUTIONS TO RADIATION PROTECTION IN NUCLEAR POWER PLANTS. Krueger, F.W. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). Kernenergie ; 23: No. 3, 97-105(Mar 1980). (In German).

Physical research and physical methods can essentially contribute to radiation protection in nuclear power plants. With their aid, properties of radiation sources can be determined, and calculations of radiation shields can be performed. In the present paper, such tasks are analyzed, the state of the art of their solution is evaluated, and trends of further work are shown. Focal points of the present study are the calculation of properties of radiation sources outside the reactor (fission products, activated corrosion products, decontamination facilities for contaminated media), exact and engineering methods for calculating radiation fields also in inhomogeneous shields, and classification of concretes for gamma-ray shielding. Objectives, possibilities, and problems of standardization of such activities are discussed.

3051 ATMOSPHERIC RELEASE ADVISORY CAPABILITY (ARAC) RESPONSE TO THE THREE MILE ISLAND ACCIDENT. Dickerson, M.H.; Gudiksen, P.H. (Lawrence Livermore Lab, Calif). IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science (Formerly IRE (Institute of Radio Engineers) Transactions on Nuclear Science) ; NS-27: No. 1, 927-930(Feb 1980). (CONF-791037--).

From IEEE nuclear science/nuclear power systems symposium; San Francisco, CA, USA (17 Oct 1979).

A discussion is presented of the three general classes of support provided by the Atmospheric Release Advisory Capability (ARAC) and describes the role played by ARAC in support of DOE during the Three Mile Island accident in March and April of 1979. 6 refs.

3052 EUROPEAN JOINT ENERGY RESEARCH STRESSES NUCLEAR SAFETY. Traill, S. Energy International ; 17: No. 1, 18-20(Jan 1980).

The 1977-1978 European Economic Community's (EEC) annual report outlines a four-year plan to emphasize nuclear safety research, including safety problems associated with each stage of the fuel cycle and waste management. EEC's Joint Research Centre (JRC) has concentrated on refining data for the assessment and licensing requirements of the widely used light water reactors (LWR) and on validation of design concepts for the liquid metal fast breeder reactors (LMFBR), which have a potential for widespread use. Brief summaries are given of major projects: Loop Blowdown investigations; LMFBR work in subassembly thermohydraulics, molten salt-water interactions, post-accident heat removal, thermophysical properties, structural loading and failure detection, and a European accident code; research on plutonium fuels and actinides; and a method for long-term radioactive waste disposal, with the possibility of chemical separation and transmutation of actinides with a long half-life. (DCK)

3053 COMMON SENSE IN NUCLEAR ENERGY. Hoyle, F.; Hoyle, G. London; Heinemann Educational

Books (1980). 88p.
The subject is covered in chapters, entitled: the ultimate price of an energy collapse; desecration of the environment (by activities other than nuclear power); nuclear reactors cannot explode, but other things can (examples of chemical explosions); death sentences (coal mine explosions); radioactivity (activity from all sources compared); how damaging is radioactivity (effects of radiation in various doses); nuclear accidents; the day the dam broke; how stands solar; natural gas; coal; storing one's own nuclear waste; [was there] a nuclear accident in the U.S.S.R.; breeder reactors and the U.S. Non-proliferation Act; who is doing the proliferating; it has all happened before. (U.K.).

3054 WHAT CAN BE DONE WITH OLD NUCLEAR POWER PLANTS. Bild der Wissenschaft ; 16: No. 12, 54-101(Dec 1979). (In German).
Nuclear power plants do not live for ever; at present their life-span is calculated to be about 40 years. What happens then. Are the technological methods already developed for demolishing the radio-active ruins. The technologists are convinced that this is so; an interview with the safety experts of the West German Ministry of the Interior gives rise to doubts, at least when it comes down to details. On-the-spot visits on this subject were made to the two nuclear power stations in the Federal Republic of Germany which have already been closed. This theme is concluded by the President of the German Research Society, Professor Maier-Leibnitz, reviewing 23 years of nuclear engineering and nuclear energy. (orig.) 891 GL/orig. 892 HIS.

3055 NUCLEAR POWER AND SAFETY - SUMMARY AND CONCLUSIONS OF THE REPORT OF THE NUCLEAR POWER COMMISSION. 2. ROUTINE OPERATION. Wethe, P.I. (Institutt for Atomenergi, Kjeller (Norway)). Ingenioer-nytt ; 15: No. 92, 14-15(16 Nov 1979). (In Norwegian).
The radiation hazards to the general public and to occupationally exposed persons due to routine operation of nuclear power plants are discussed. Radiation dose estimates are presented, and discussed. It is stated, quoting data from studies of the Hanford employee statistics, that there is great uncertainty and dispute as to the health effects of these low doses.

3056 NUCLEAR POWER AND SAFETY - SUMMARY AND CONCLUSIONS OF THE REPORT OF THE NUCLEAR POWER COMMISSION. 1. GENERAL VIEWS, ASSUMPTIONS AND MAIN CONCLUSION. Wethe, P.I. (Institutt for Atomenergi, Kjeller (Norway)). Ingenioer-nytt ; 15: No. 90, 16-17,27(9 Nov 1979). (In Norwegian).
In this first of a series of six articles a general discussion of the radiation hazards represented by natural radioactivity, medical irradiation, radioactive substances in everyday articles, fallout, nuclear power plants and radioactive wastes is presented. The assumptions and requirements for safe nuclear power are stated and the main conclusion of the Commission is quoted.

3057 GUIDELINE FOR EMISSION AND IMMISSION MONITORING IN NUCLEAR FACILITIES. Gemeinsames Ministerialblatt, A ; 30: No. 32, 669-683(Nov 1979). (In German).
Emission monitoring according to articles 46, paragraph 1, and 48 of the Radiation Protection Ordinance is necessary to determine emission rates during normal operation and in case of accidents. The necessary measurements must be carried out according to KTA rules no. 1503, part I, and no. 1504. Regulations concerning measurements of the discharge of radioactive substances in the stack air during accidents and measurements of the radioactive substances not discharged with the stack air will be published as soon as the further parts of KTA rule no. 1503 will have been agreed upon. The measurements carried out by the operators of nuclear power plants have to be validated by measurements made by officially authorized experts. (orig./HP).

3058 ECOLOGICAL PROBLEMS OF NUCLEAR POWER DEVELOPMENT. Hermansky, B. Jaderna Energie ; 25: No. 10, 393-399(Oct 1979). (In Czech).
The environmental impacts are assessed of nuclear power plants. The individual safety aspects are discussed of nuclear fuel handling, from uranium ore mining to radioactive waste disposal.

3059 EMERGENCY AND/OR POST-SHUTDOWN COOLING OF A NUCLEAR REACTOR. Boehm, B.; Ritzmann, H. (to Siemens A.G., Berlin (Germany, F.R.); Siemens A.G., Muenchen (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,448,591/B/. 16 Aug 1979. 6p. (In German).
There is a fuel element pond with its own pond pump inside the protective containment of the PWR. The pump for the emergency and/or post-shutdown cooling system is switched in parallel with this pond pump. There is a post-shutdown cooler in the common post shutdown line on the pressure side of both pumps. The suction lines of both pumps can be connected together via a valve in an emergency, and the pressure side of the pond pump can be taken via a shut off valve to the post shutdown cooler.

3060 NUCLEAR REACTOR SAFETY. Head, J.L.; Goddard, A.J.H.; Grant, P.J. Physics Reports. A Review Section of Physics Letters (Section C) ; 53: No. 4, 249-339(Jul 1979).
An account is given of the basic physics and engineering underlying the design of nuclear reactors, descriptions of the types of reactor currently operating, the principles of reactor fault detection and control, safety analysis and hazards assessment. The more serious hypothetical accidents are reviewed for water cooled and gas cooled reactors and for the liquid metal cooled fast breeder reactor. Safety criteria and the siting of nuclear power stations are discussed and illustrated by reference to procedures in the U.K. and a short examination is made of the environmental effects of nuclear power, spent fuel re-processing and the storage of highly radiactive waste.

3061 CONSEQUENCE MODEL OF THE GERMAN REACTOR SAFETY STUDY. Bayer, A.; Aldrich, D.; Burkart, K.; Horsch, F.; Huebschmann, W.; Schueckler, M.; Vogt, S. (Kernforschungszentrum Karlsruhe, Germany). Transactions of the American Nuclear Society ; 32: 478-479(Jun 1979). (CONF-790602--(Summ.)).

3062 WEEK THEY ALMOST LOST PENNSYLVANIA.

Torrey, L. New Scientist ; 82: No. 1151, 174-178(19 Apr 1979).
A tentative sequence of events has been constructed following the failure of a feedwater pump in the secondary cooling system of the Three Mile Island nuclear reactor on 28 March, which tripped the plant's turbine and resulted in a loss-of-coolant accident. The debate surrounding some of the actions taken by the operators at the time of the emergency and come of the conflicting statements made at the time are reported. Measures taken locally to protect the population following the reported venting of high levels of ^{133}Xe and the public reaction to the news that there could be no immediate cold shutdown due to the presence of a non-condensable gas bubble inside the reactor vessel are considered. Present figures however indicate low contamination for both workers and general population. There is mounting criticism following recurrent malfunctions at other similar plants and although the immediate crisis now appears over there are the long term problems of clearing up to be faced.

3063 NUCLEAR ACCIDENT. Mathews, T.; Agrest, S.; Borger, G.; Lord, M.; Marbach, W.D.; Cook, W.J.; Sheils, M. Newsweek ; 93: No. 15, 24-36(9 Apr 1979).
A malfunctioning valve at the Three Mile Island power plant in Pennsylvania was the prelude to the worst nuclear accident in U.S. history. Despite assurances that radiation leaked from the plant posed no immediate threat, the population around the plant dwindled as unforced weekend evacuations grew common. Radiation at the power plant site reached 30 mrem/hr on March 30. While officials of the Metropolitan Edison Co., the plant's operator, consistently downplayed the seriousness of the situation, uncontrolled releases of radioactive steam continued. The planning and previous operation of the three-month-old plant are reviewed, and explanations for the system malfunction are provided. The accident further complicates the tenuous position of the nuclear power industry in the U.S. Because of safety worries and licensing delays, few electric utilities are ordering new nuclear plants. Previous U.S. nuclear accidents are listed. Long-term effects of radiation exposure are assessed.

3064 TORNESS: PROPOSED NUCLEAR POWER STATION. SCRAM (Scottish Campaign to Resist the Atomic Menace) Energy Bulletin ; No. 11, 8-9(Apr-May 1979).
The need for and desirability of nuclear power, and in particular the proposed nuclear power station at Torness in Scotland, are questioned. Questions are asked, and answered, on the following topics: position, appearance and cost of the proposed Torness plant, and whether necessary; present availability of electricity, and forecast of future needs, in Scotland; energy conservation and alternative energy sources; radiation hazards from nuclear power stations (outside, inside, and in case of an accident); transport of spent fuel from Torness to Windscale; radioactive waste management; possibility of terrorists making a bomb with radioactive fuel from a nuclear power station; cost of electricity from nuclear power; how to stop Torness.

3065 REVIEW OF THE AMERICAN NUCLEAR SOCIETY SYMPOSIUM ON THE PROBABILISTIC ANALYSIS OF NUCLEAR REACTOR SAFETY. Shaw, J. (Queen Mary Coll., London (UK). Dept. of Nuclear Engineering). Annals of Nuclear Energy ; 6: No. 1, 19-24(1979).
In this review the conference held at Los Angeles, May 1978, is summarized and the main issues are identified. The application of probabilistic methods in reactor licensing, safety assessment, risk criteria and design, waste disposal, and risk benefit were discussed. Computer codes for evaluation of fault trees, and fault tree probability analysis, and data systems were also considered.

3066 SAFETY ASSESSMENT PRINCIPLES FOR NUCLEAR POWER REACTORS. London; Health and Safety Executive (1979). 46p.
The document is in sections, entitled: introduction; fundamental requirements and policy; basic principles (radiological principles, radioactive waste, principles in the evaluation of fault conditions and protective systems); engineering principles (general principles, reactor core and fuel, primary coolant circuits, reactor heat transport systems, protection systems, essential services, containment systems, fuel and absorber handling, radiological protection engineering; radioactive waste management engineering, the analysis of the plant faults, transients and abnormal conditions, operating conditions, reliability analysis, layout, external hazards, decommissioning, quality assurance).

3067 REPORT OF THE PRESIDENT'S COMMISSION ON THE ACCIDENT AT THREE MILE ISLAND. Washington, DC; President's Commission (1979). 207p. (NP--24200). GPO $5.00.
On March 28, 1979, the United States experienced the worst accident in the history of commercial nuclear power generation. Two weeks later, the President of the United States established a Presidential Commission. The purpose of the Commission was to conduct a comprehensive study and investigation of the recent accident involving the nuclear power facility on Three Mile Island in Pennsylvania. Results and conclusions of the investigation are presented.

3068 NUCLEAR SAFETY AND RADIOACTIVE WASTES. Gey, A. (France AEC). Radioprotection ; 14: No. 3, 161-182(1979).
The fundamental principles and the risk assessment methods of nuclear safety are often unknown to workers in the field. Presented are guidelines to inform workers in the nuclear industry about safety principles and methods that apply to the operations of a nuclear plant; radioactive waste handling; and ways to deal with radioactive releases. The guidelines are presented in the form of simple words and schematic explanations.

3069 ACCIDENT AT THREE MILE ISLAND. COMMENTS BY THE HEALTH AND SAFETY EXECUTIVE. London; Health and Safety Executive (1979). 11p.
Using the report of the President's Commission - the Kemeny Report -as a framework, the principal issues raised by the accident on Nuclear Power Plant No.2 at Three Mile Island, USA which caused considerable damage to the reactor core but minimal release of radioactivity have been reviewed by the Health and Safety Executive. The general conclusions reached are: (1) The accident did not arise from any serious inherent weakness in the concept or design of the PWR. (2) No fundamental revisions of the organisational arrangements for licensing, constructing and operating power reactors in this country are

needed. (3) It is desirable for the Executive to establish and publicise more thoroughly co-ordinated emergency arrangements at the national level. (4) Additional emphasis is needed of detailed points concerning; the performance of instruments in emergency conditions, the presentation of information to operators in reactor control rooms, and communications in general in the period immediately following an accident. The report outlines the accident and presents with comments the following issues raised by the Kemeny report: (1) Regulatory arrangements. (2) The power producing industry and its suppliers. (3) Operator training. (4) Technical assessment. (5) Worker and public health and safety. (6) Emergency planning and response. In an Appendix a commentary on the main recommendations of the Kemeny report prepared by HM Nuclear Installations Inspectorate is presented.

3070 CAN WE FIX NUCLEAR ENERGY. Weinberg, A.M. (Oak Ridge Associated Universities, Inc., TN ;USA). Inst. for Energy Analysis). Annals of Nuclear Energy ; 6: No. 9-10, 473-482(1979).

The status of nuclear energy is examined from the safety aspect. Attitudes to siting and the performance of existing safety barriers for protection against radioactivity released from power stations are discussed. Amongst the problems associated with the operation of a nuclear reactor, mine tailings are considered a greater hazard than either waste disposal or proliferation. The effect of the Three Mile island accident on the estimation of the probability of serious malfunctioning of a reactor is examined. An acceptable nuclear energy system is identified in terms of the following characteristics:-greater isolation of sites, development of a safer reactor type, the separation of nuclear electricity generation from its distribution; more professionlization of staff for nuclear plants, greater security, and education of the public about the hazards of radiation. A brief examination of alternative energy sources suggests that solar energy is worth pursuing. This, however, will be a long-term project and exponents of nuclear energy must provide new and convincing initiatives in order to gain public approval for nuclear power.

3071 RADIOACTIVE RELEASE FOLLOWING A LOCA WITH AN INITIALLY BREACHED CONTAINMENT. Kenigsberg, A. (Israel Atomic Energy Commission, Tel Aviv); Hasan, D.; Elias, E. Transactions of the American Nuclear Society ; 33: 503-504(1979). (CONF-791103--).

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

3072 ASSESSMENT OF THE KOSICE NUCLEAR POWER PLANT PROJECT WITH REGARD TO RADIATION BURDEN OF THE POPULATION IN THE SERVED KOSICE INDUSTRIAL AND DWELLING AREA. Marko, L. (Ustav Radioekologie a Vyuzitia Jadrovej Techniky, Kosice (Czechoslovakia)). Radioaktivita a Zivotne Prostredie ; No. 1, 53-73(1979). (In Slovak).

The theoretical study ''Analysis of the Nuclear Power Plant impact on Kosice'' which has been worked out by Energoprojekt Praha, is evaluated with the aim of determining the possible radiation impact on the inhabitants living in the centre of the Kosice District. The evaluation is based on data of individual dose equivalents and safety coefficients as well as on population dose equivalents to a distance of r=100 km from the nuclear power station with a working reactor of the VORONEZ 2x440 MWe - type with a 100 m high ventilation chimney, having a filter outlet of 100% for inert gases, 0.1% for elementary iodine, 10% for alkyliodide and 0.005% for other substances under different weather conditions.

3073 NUCLEAR SAFETY AND RADIOACTIVE WASTES. Gey, A. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Surete des Matieres Nucleaires). Radioprotection ; 14: No. 3, 161-182(1979). (In French).

From Preventive and social medicine meeting; Dinard, France (14 Sep 1978).

The fundamental principles of nuclear safety and the risk assessment methods are often unknown to people concerned by this field. The following lines have been written to inform them using if possible usual words and simple, sometimes schematic, explanations. Safety principles and methods are applied to nuclear plants of course; but they are also applied to their radioactive releases and wastes. This article is a tentative to give an idea of the importance of solid radioactive wastes and of their fate.

3074 RESULTS OF AN ANALYSIS OF THE QUANTITIES OF RADIOACTIVE WASTES DEVELOPING DURING THE DECOMMISSIONING OF NUCLEAR POWER PLANTS. Gasch, A.; Loercher, G.; Lukacs, G. (Nuklear-Ingenieur Service G.m.b.H., Frankfurt am Main (Germany, F.R.)). pp 299-306 of Decommissioning of nuclear facilities. Proceedings of an international symposium jointly organized by the IAEA and the OECD NEA and held in Vienna, 13-17 November 1978. Vienna; IAEA (1979).

From International symposium on the decommissioning of nuclear facilities; Vienna, Austria (13 Nov 1978).

The Federal Ministry for Research and Technology of the Federal Republic of Germany has issued a contract to NIS, Nuklear-Ingenieur-Service GmbH, to study the radioactive wastes resulting from the decommissioning of light-water reactors currently existing and planned in the FRG. In this study, the existing masses of radioactive waste which must be placed in protective storage, as well as their radioactivity, were estimated for individual reference plants. On the basis of these individual reference plants and probable commissioning dates, the development of the masses of waste and their radioactivity with respect to time was then determined. This study is based on 31 nuclear power plants. It was found that the total mass of waste which must be placed in protective storage is about 290,000Mg with a maximum radioactivity of about 3.7×10^{18}Bq (1×10^{8}Ci) without fuel assemblies, which were not considered in the study.

3075 DEVELOPMENT OF UNITED STATES POLICY AND STANDARDS FOR DECOMMISSIONING NUCLEAR FACILITIES. Bernero, R.M.; Conti, E.F. (Nuclear Regulatory Commission, Washington, DC (USA)). pp 11-27 of Decommissioning of nuclear facilities. Proceedings of an international symposium jointly organized by the IAEA and the OECD NEA and held in Vienna, 13-17 November 1978. Vienna; IAEA (1979).

From International symposium on the decommissioning of nuclear facilities; Vienna, Austria (13 Nov 1978).

The United States Nuclear Regulatory

Commission (NRC), responsible for commercial nuclear licensing, is reevaluating its policy on decommissioning of all types of nuclear facilities. Battelle Pacific Northwest Laboratories (PNL) is being used as a major contractor in this effort. Present NRC regulations and guidance for decommissioning are reviewed. Decommissioning experience in the United States of America is reviewed. Detailed studies are being made of the alternatives and costs for decommissioning of a number of different facilities, including a pressurized water reactor, a boiling water reactor, a fuel reprocessing plant, a mixed-oxide fuel fabrication plant, a uranium oxide fuel fabrication plant, a uranium mill, a UF_6 conversion plant and a low level waste burial ground. Studies are also being made of methods to facilitate decommissioning. The principal issues in decommissioning policy are discussed, including residual radioactivity limits, financial assurance, and generic applicability. The mechanics of policy development, including discussion with the States, are described. Regulation enactment procedures are explained.

3076 CRITERIA FOR THE MANAGEMENT OF REDUNDANT NUCLEAR FACILITIES. Martin, A. (Associated Nuclear Services, Epsom, Surrey, United Kingdom); Tildsley, F.C.J.; Clark, L. (Health and Safety Executive, London (UK). Nuclear Installations Inspectorate). pp 319-335 of Decommissioning of nuclear facilities. Vienna, Austria; IAEA (1979).

From International symposium on the decommissioning of nuclear facilities; Vienna, Austria (13 Nov 1978).

In the paper, various aspects of the management of redundant nuclear facilities are examined, with particular reference to the establishment of criteria. Comparisons are made of the likely residual radioactive inventories in reactors, reprocessing plants and mixed oxide fuel fabrication plants and the implications for decommissioning and dismantling are discussed. Site selection may be influenced by considerations of decommissioning and in turn the approach and timescale of a decommissioning programme will reflect aspects of a site. These are discussed briefly. The need to take account at the design stage of the eventual problems of decommissioning and dismantling are emphasized, and the means by which such a requirement would be met in practice are illustrative. In reactors, features incorporated for the purpose of in-service inspection will ease future dismantling, whilst in fuel plants, many features which are required for the safe and reliable operation and maintenance of the plants would also be advantageous in their decommissioning. Operational practices can have a significant influence on the radiological environment of a plant, and hence on the difficulties of access and on the generation of radioactive wastes. This is particularly true of fuel plants because of the nature of the processes and the process materials. Waste management is a key area of concern, and illustrativecomparisons are made of the waste arising from normal operation and from dismantling of the different types of plants. Disposal routes are still under consideration in most countries and the approaches adopted will greatly affect the cost and the radiological impact of the removal of redundant facilities.

3077 SUMMARY OF A DECOMMISSIONING HANDBOOK FOR NUCLEAR FACILITIES. Manion, W.J. (Nuclear Energy Services, Inc., Danbury, CT, USA). pp 203-216 of Decommissioning of nuclear facilities. Vienna, Austria; IAEA (1979).

From International symposium on the decommissioning of nuclear facilities; Vienna, Austria (13 Nov 1978).

This paper summarizes the information compiled to date for a handbook on decommissioning of surplus nuclear facilities being prepared by Nuclear Energy Services for the United States Department of Energy. Particular attention is focussed on the available technology applicable to those decommissioning activities which have not been accomplished before, such as remote segmenting and handling the highly activated 1100 MW(e) light water reactor vessel internals and thick-walled reactor vessels. Mechanical and torch cutting techniques will be described, including recent developments in 'arc saw' technology. Applicability of the methods as a function of material composition, thickness and configuration is discussed, cutting rates defined, and equipment and procedures described. Other pertinent factors covered include in-air and underwater applications, contamination control and personnel protection. Similar information is presented for the fracturing, segmenting and rebar-cutting of thick concrete sections and for the removal of contaminated piping systems. A summary of available information associated with the planning and estimating of a decommissioning programme is also presented. In particular, the methodologies associated with the calculation and measurement of activated material inventory, distribution and surface dose level; system contamination inventory and distribution; and workarea dose levels are summarized. Cost estimating techniques are also presented and the manner in which to account for variations in labour costs as impacting the labour-intensive work activities is explained.

3078 NEUTRON INDUCED ACTIVATION, WASTE DISPOSAL AND RADIATION LEVELS FOR THE REACTOR ISLAND STRUCTURE OF A DECOMMISSIONED MAGNOX POWER STATION. Woollam, P.B. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.); Pugh, I.G. (Central Electricity Generating Board, Barnwood (UK). Generation Development and Construction Div.). pp 353-377 of Decommissioning of nuclear facilities. Vienna, Austria; IAEA (1979).

From International symposium on the decommissioning of nuclear facilities; Vienna, Austria (13 Nov 1978).

A programme of theoretical and experimental work has been completed with the aim of providing a best estimate of the radioactive inventory in the structure of a Magnox reactor at 10 and 100 years after a planned retirement. The inventory includes up to 13 isotopes in 80 different reactor components; an analysis of all long-lived isotopes shows that no unidentified nuclide could be present in the structure which would significantly affect the results. The inventory is used to assess the major radiological consequences of decommissioning a Magnox reactor: waste disposal and radiation exposure to occupationally exposed personnel during dismantling operations. Calculations of whole-body dose equivalent rates show that, although unlimited access to core areas will not be possible, limited access after a 100 year decay period is likely for times sufficient for setting-up or maintenance of semi-automatic machinery. After a 100 year decay period airborne problems from concrete or graphite dust will be limited by conventional hazards rather than radioactivity control.

3079 DECOMMISSIONING OF THE CANDU-PHW

REACTOR. Unsworth, G.N. (Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). pp 73-86 of Decommissioning of nuclear facilities. Vienna, Austria: IAEA (1979).

From International symposium on the decommissioning of nuclear facilities: Vienna, Austria (13 Nov 1978).

A generic study has been completed in Canada to assess decommissioning of a typical 600 MW(e) CANDU-PHW reactor and to obtain estimates of the costs, environmental impact, quantities of radioactive wastes and man.rem exposure associated with each of the three decommissioning stages. The CANDU reactor is designed to facilitate decommissioning. The vessel and other highly radioactive components are comparatively light weight, provision is made for replacement of the pressure tubes and access is provided into the top of the vault that will facilitate the cutting-up and dismantling of the reactor vessel. In addition to the experience and knowledge gained from decommissioning of one reactor in the United States of America (Elk River), the rehabilitation of the NRX and NRU vessels at Chalk River, and the replacement of some pressure tubes in the Pickering reactor have provided confidence that the proposed decommissioning of a large CANDU-PHW reactor is practical. Also, it is expected that research associated with existing programmes for management of radioactive waste in Canada will provide sufficient data and the methodology for determining permissible Residual Activity Levels for a decommissioned site to be released for unrestricted use. The radioactive waste resulting from decommissioning will be of relatively low specific activity. The disposal facilities and techniques presently being developed in Canada for power reactor wastes will be used to cope with the wastes from decommissioning. Decommissioning costs are not high when compared to the total value of a nuclear generating station and there is little incentive to provide funding now to handle future decommissioning costs.

3080 Genshiryoku anzensei kenkyu no genjo. (PRESENT STATUS OF NUCLEAR POWER SAFETY STUDIES IN JAERI). Tokyo, Japan: Japan Atomic Energy Research Inst. (Dec 1978). 92p. (In Japanese).

The status of nuclear power safety research in 1978 in JAERI is described. Safety research broadly is in two areas of nuclear reactor and environment. The nuclear reactor safety research concerns (1) reliability and integrity of the reactor core and reactor pressure boundary, (2) credible accidents such as loss-of-coolant and reactivity, and (3) evaluation and analysis of the phenomena attendant on the accidents. The environment safety research concerns (1) evaluation and analysis of environmental radioactivities, (2) treatment and disposal of radioactive wastes, and (2) others related. As major facilities in nuclear power safety research, there are ROSA (Rig of Safety Assessment) and NSRR (Nuclear Safety Research Reactor). In the ROSA project, performance of the emergency core cooling system (ECCS) and the influence of cooling system rupture conditions upon the ECCS are studied. NSRR of a TRIGA-ACPR type is used for reactivity accidents research concerning fuel behavior and damage.

3081 AIR CONDITIONING AND VENTILATION IN ATOMIC ENERGY FACILITIES. Amemiya, N. (Shin Nippon Air Conditioning Co. Ltd., Tokyo). Kuki Chowa To Reito (Air Conditioning and Refrigeration) ; 19: No. 1, 103-106(Dec 1978). (In Japanese).

Atomic energy facilities comprise very diverse facilities, and are classified roughly into the facilities concerning a series of nuclear fuel cycle aiming at nuclear power generation, basic research facilities, the demonstration facilities for developing new types of reactors, RI-utilizing facilities, and nuclear powered ships. The air conditioning and ventilation in these facilities aim at the protection of workers in and people around these facilities from radiation exposure, and in addition, heat removal and temperature control. For the protection of workers, the air flow of once-through type is adopted, and reverse flow is prevented. For the protection of people, exhaust air quantity is reduced, sufficient filtration is carried out, and diffusion and dilution are planned by the exhaust from high places. Considerably efficient filters are adopted at the intakes of outside air, and since these facilities are mostly in coastal areas, the countermeasures to salt injury and sand are taken. The equipments for the treatment of outside air and those for exhaust are outlined. As the typical examples, the air conditioning and ventilation in a spent fuel-storing facility, a practical fuel testing facility, an irradiated fuel testing facility, and a spent fuel reprocessing facility are described. Hereafter, materials, method of construction, quality control and aseismatic safety must be studied about the air conditioning and ventilation installations.

3082 STORAGE RACK FOR FUEL ELEMENT SETS. Wachter, W.J.: Robbins, T.R. (to Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,724,301/A/. 30 Nov 1978. 16p. (In German).

The water-filled storage rack for spent fuel elements consists of a modular construction with many storage cells, which contain the fuel element sets as well as many decontamination boxes. These are designed as neutron absorbers because they contain water and their walls are made of B, Al-B, Cd or Gd. The storage cells are arranged in relation to the decontamination boxes in such a way the each decontamination box lies near one storage cell at least. This way the clearances between the fuel element sets become considerably smaller. By means of the narrow arrangement of the storage cells, a friction absorption is generated in case of earthquakes.

3083 ENERGY SOURCES: THE POTENTIAL HAZARDS. PT. 2. Hull, T. Safety Surveyor ; 6: No. 4, 19-23(Nov 1978).

A brief account is presented of nuclear energy and the fission of uranium 235: thermal and fast reactors: the various stages in the production of nuclear power from the mining of uranium to the disposal of radioactive wastes (with special reference to safety considerations): and the protection of workers (including a comparison of the fatal accident rate in the main energy-producing industries).

3084 ALTERATION OF REACTOR INSTALLATION (REACTOR FACILITIES) IN TSURUGA NUCLEAR POWER STATION OF THE JAPAN ATOMIC POWER COMPANY. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 8, 5-6(Nov 1978). (In Japanese).

A report to the Atomic Energy Commission of Japan by the Committee on Examination of Reactor Safety concerning the alteration of the reactor installation in Tsuruga Nuclear Power Station of The Japan Atomic Power Company is presented. Its safety was confirmed. The

alterations are as follows. Alteration of the radioactive solid waste disposal facility: The solid waste storage building B (storage area of about 4,400 m^2) is installed so that the storage capacity is increased to about 35,000 drums from the present capacity of about 15,000. Alteration of the reactor containment facility: An inflammable gas concentration control system was installed, in order to control the concentration of inflammable gases produced in zirconium-water reaction and water radiolysis occurring within the reactor containment vessel following a loss-of-coolant accident.

3085 ALTERATION OF REACTOR INSTALLATION (REACTOR FACILITIES) IN SHIMANE NUCLEAR POWER STATION OF THE CHUGOKU ELECTRIC POWER CO., INC. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 8, 7-10(Nov 1978). (In Japanese).

A report to the Atomic Energy Commission of Japan by the Committee on Examination of Reactor Safety concerning the alteration of reactor installation in Shimane Nuclear Power Station of the Chugoku Electric Power Co., Inc. is presented. Its safety was confirmed. The alterations are as follows. Alteration of the fuel assemblies: In the sixth fuel replacement, together with the conventional 8 x 8 type fuel assemblies (type 1 fuel assembly), altered 8 x 8 type fuel assemblies (type 2 fuel assembly) of up to eight are used. Type 1 and 2 fuel assemblies differ in U^{235} enrichment (2.6 and 2.0 wt%, respectively), outer diameter of fuel rods (1.3 and 1.2 cm) and number of fuel rods per assembly (63 and 62). Alteration of the reactor containment facility: The inflammable gas concentration control system by nitrogen gas injection was installed. Alteration of the spent fuel storage facility: Spent fuel storage capacity is increased to 290% of the amount in the core from 190%.

3086 SAFETY OF NUCLEAR ENERGY. Binner, W. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Vienna). Oesterreichische Ingenieur-Zeitschrift ; 21: No. 10, 302-308(Oct 1978). (In German).

The safety aspects of nuclear power generation are discussed considering the known and possible hazards involved. Based on the available information on the safety record of the nuclear power industry, including analyses of the reported incidents, a conclusion is reached that the nuclear power generation is the safest form of technological activity of today.

3087 PROGRESS REPORT CONCERNING SAFETY RESEARCH FOR NUCLEAR REACTOR FACILITIES. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 22: No. 12, 14-25(Apr 1978). (In Japanese).

Examination and evaluation of safety research results for nuclear reactor facilities have been performed, as more than a year has elapsed since the plan had been initiated in April, 1976, by the special sub-committee for the safety of nuclear reactor facilities. The research is carried out by being divided roughly into 7 items, and seems to be steadily proceeding, though it does not yet reach the target. The above 7 items include researches for (1) criticality accident, (2) loss of coolant accident, (3) safety for light water reactor fuel, (4) construction safety for reactor facilities, (5) reduction of release of radioactive material, (6) safety evaluation based on the probability theory for reactor facilities, and (7) aseismatic measures for reactor facilities. With discussions on the progress and the results of the research this time, research on the behaviour on fuel in abnormal transients including in-core and out-core experiments has been added to the third item, deleting the power-cooling mismatch experiment in Nuclear Safety Research Reactor of JAERI. Also it has been decided to add two research to the seventh item, namely measured data collection, classification and analysis, and probability assessment of failures due to an earthquake. For these 7 items, the report describes the concrete contents of research to be performed in fiscal years of 1977 and 1978, by discussing on most rational and suitable contents conceivable at present.

3088 PROBABILISTIC APPROACH TO DESIGN OF THE SPENT FUEL CASK HANDLING SYSTEM OF A NUCLEAR PLANT. Gachot, B.; Barbet, J.F. (Electricite de France, 75 - Paris). pp 4/10/1-4/10/23 of First national conference on reliability. Part 2. Culcheth, Warrington, England: United Kingdom Atomic Energy Authority (1978).

From National conference on reliability: Nottingham, UK (21 Sep 1977).

The safety in handling containers of spent fuel assemblies, using a travelling bridge crane, during transfer to the deactivation pool and other handling operations within the fuel building, is under consideration. Probability studies of the causes of container falls which are ascribable to cranes were carried out. An analysis of the operation of the various components was followed by a determination of the frequency of such components to failure or breakdown. Available data and data collected from those industries using equipment with the same functions ie overhead travelling bridges carrying heavy loads, were qualified by analysis based on failure trees. Results and conclusions were applied to the design of a new crane and the same type of analysis was undergone. The probability of the containers then dropping proved to be below the safety standard required.

3089 DESIGN FOR SAFETY OF NUCLEAR POWER PLANTS. A CODE OF PRACTICE. Vienna: IAEA (1978). 43p.

This Code of Practice is a compilation of nuclear safety principles aimed at defining minimum requirements for structures, systems and components important to safety in nuclear power plants embodying thermal neutron reactors, with emphasis on what safety requirements shall be met rather than specifying how these requirements can be met. The Code of Practice describes design requirements for structures, systems and components that shall be met in order to prevent or mitigate the consequences of events, considered credible, which could jeopardize safety. The Code of Practice does not deal with non-radiological effects of the nuclear power plant on the environment. It should be recognized that these requirements will continue to evolve and will be subject to revision in the light of future experience.

3090 TIME INTEGRATED SPENT FUEL STORAGE BIOLOGICAL DOSES. Strahl, J.F. (NUS Corp., Rockville, MD (USA)). pp 151-158 of Radiation protection in nuclear power plants and the fuel cycle. Vol. 1. London, England: British Nuclear Energy Society (1978).

From Conference on radiation protection in nuclear power plants and the fuel cycle: Bristol, UK (27 Nov 1978).

Following the President's Energy Message of April, 1977, it became apparent that interim

spent fuel storage may be required for longer periods of time than originally anticipated; either at centralized facilities or in further modification of existing pools. Studies show that, relative to partial increases already achieved at several U.S. facilities (from 4/3 to 7/3 cores), total integrated personnel exposures will double with 35 years of spent fuel accumulation.

3091 INELASTIC RESPONSE OF METALLIC IMPACT LIMITERS. Biffle, J.H.; Sagartz, M.J.; Weingarten, L.I. (Sandia Labs., Albuquerque, NM (USA)). pp J6/10 1-12 of Structural mechanics in reactor technology. Vol. J, Pt. b. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Energy mitigators on some light water reactor (LWR) spent fuel shipping casks and conceptual designs for liquid metal fast breeder reactor (LMFBR) spent fuel shipping casks rely on the inelastic behaviour of metallic plate-like structures. A program was undertaken to investigate the response of mitigators to hypothetical shipping accidents with parallel experimental and theoretical studies. The theoretical studies consist of performing large deformation three dimensional transient dynamic analysis on several metal fin designs and correlating the results with the experimental results. The newly developed computer program WULFF was used. Testing of scale model fin specimens was performed at SLA's drop table facility. The test specimens are mounted on a force transducer and this assembly is bolted to the stationary bottom table. Extra weights are added to the drop table so that the total energy at impact is sufficient to cause large plastic deformation in the specimens. Accelerometers mounted on the drop table and the data from the force transducer are used to compute the energy absorbed during the test. Also framing camera coverage was used to observe the specimen deformation as it develops. The results of the theoretical analysis and experimental program can be used by designers responsible for impact limiters on spent fuel shipping casks. Without data to design impact limiters the integrity of the cask under accident conditions can be questionable.

3092 NUMERICAL ANALYSIS OF IMPACT-PENETRATION PROBLEMS FOR NUCLEAR REACTOR SAFETY. Dubois, J.J.; Chedmail, J.F.; Bianchini, J.C. (Engineering System International S.A., 20 rue Saarinen, F-94150 Rungis-Silic, France). pp J7/1 1-11 of Structural mechanics in reactor technology. Vol. J, Pt. B. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper discusses the Finite Element and Finite Difference analysis of two impact-penetration problems, namely a fuel cask drop on a foundation slab and a missile penetration into a reinforced concrete structure.

Accident Liability

3093 NUCLEAR POWER PLANT SAFETY TODAY. Hartkopf, G. (Bundesministerium des Innern, Bonn (Germany, F.R.)). Atomwritschaft, Atomtechnik ; 25: No. 1, 18-27(Jan 1980). (In German).

From 6. german symposium on nuclear law; Muenster, Germany, F.R. (8 - 9 Oct 1979).

The Undersecretary of State responsible for reactor safety with the Federal Ministry of the Interior read a keynote paper at the 6th German Atomic Energy Law Symposium in which he presented a critical review on the basis of today's atomic energy law and stated priorities, on the part of the federal supervisory agencies, in controlling the peaceful uses of nuclear power as well as the intentions and views of his Ministry with respect to the further development of reactor safety, radiation protection, waste management, liability etc. It is one of the most important requirements that the safety of reactors be further improved and that safety and the necessary radiological protection have absolute priority over economic considerations. Some other aspects covered in the paper are the human factor within the framework of the hazard potential represented by a nuclear power plant, the role of the experts, some first conclusions drawn from the German Risk Study, a comment on the underground construction of nuclear power plants, the role of public action groups, and some key problems of waste management. Also the abolition of limits of liability in reactor accidents is discussed.

ENERGY PLANNING AND POLICY

Energy Analysis and Modeling

3094 (INIS-mf--5244) ANNUAL REPORT 1978. (Stichting Energieonderzoek Centrum Nederland, The Hague). Jun 1979. 80p. (In Dutch). Dep. NTIS (US Sales Only), PC A05/MF A01.

The activities of ECN in 1978 give first the general analysis of the Dutch energy economy carried out by the Energy Study Centre (ESC). Studies on energy modelling and energy conservation in buildings are briefly discussed.

Economics and Sociology

3095 PACIFIC NORTHWEST: PARADISE LOST. Thomas, W.V. Editorial Research Reports (Washington, D.C.) ; 1: No. 15, 287-304(18 Apr 1980).

An influx of new residents to the Pacific Northwest is changing social patterns and is endangering the region's valued wilderness and resources. A growing population and a feeling that the national govenment is more exploitive than conserving of its resources combines with a political tension between progressive populism and conservative Mormon influences to make residents wary of either newcomers or new prosperity. The abundant hydro power is threatened as power demand increases and utilities, industries, and the state and local governments compete for their fair share. A plan to restructure the Bonneville Power Administration (BPA) has been introduced in Congress to give it a single appointed administrator with the authority to decide how power will be distributed and which new power sources to develop. Concern about the two national nuclear waste repositories at Hanford and Idaho Falls led to a six-month moratorium at Hanford to warn the government that the site was not intended to be a permanent solution. A legislative proposal to set up regional nuclear parks will not relieve the Pacific Northwest's problems for some time. Leaders blame the policymakers for looking on the area as too remote and underpopulated to worry about. 18

3096 POLITICS OF ENERGY. O'Keefe, B.J. (EG and G, Boston, MA). Oak Ridge National Laboratory Review ; 12: No. 4, 13-21(Fal 1979).
Bernard J. O'Keefe, president and board chairman of Edgerton Germeshausen, and Grier (EG and G), made several points in a speech concerning the problems of politics and the energy situation. He sees the problems of the nuclear power industry centered around politics and finances - not technology. The difficulties of financing a typical 1000-MW plant by the utilities are briefly discussed. He sees the problems of waste disposal no longer as a technical problem but as a political one. He suggests that a location for disposal should be chosen first and the technology worked out for that site. In the event that alternative sources of energy become meaningful in the overall energy picture, the formidable question of backup energy supplies with their high fixed costs will add another dimension to the economic impact of the alternate sources. Mr. O'Keefe stated that the new energy sources would be expensive, that the public would resist those costs, and the politicians who face the problems squarely will be voted out of office. (SAC)

3097 WINDSCALE INQUIRY AND ITS IMPLICATIONS. Fremlin, J.H. (Birmingham Univ. (UK). Dept. of Physics). Physics Education ; 13: No. 6, 333-336(Sep 1978).
The widely publicised controversy concerning the development of nuclear power for civilian use which the author considers one of the most curious and perhaps the most important of modern times, is discussed. The possible risks incurred in the production of power both by conventional and by nuclear methods are examined. Worries concerning the Windscale plant, storage of radioactive wastes and genetic radiation effects are considered and answered. It is concluded that the most important implication of the controversy is that if we wish to maintain both democracy and a high level of technology, the technologists must make increasing efforts to explain openly, clearly, continuously and effectively what they are doing.

3098 NUCLEAR POWER FOR BEGINNERS. Croall, S.; Sempler, K. London; Beginners Books (1978). 168p.
A 'comic strip' account of nuclear power, covering weapons and weapons proliferation, reactor accidents involving human errors, radiation hazards, radioactive waste management and the fuel cycle, fast breeder reactors and plutonium, security, public relations and sociological aspects, energy consumption patterns, energy conservation and alternative energy sources, environmental aspects and anti-nuclear activities.

Environment, Health, and Safety

3099 (DOE/TIC--10114/1) REGIONAL ENVIRONMENT-ENERGY DATA BOOK: ROCKY MOUNTAIN REGION. (Los Alamos Scientific Lab., NM (USA)). Dec 1978. Contract W-7405-ENG-36. 902p. Dep. NTIS, PC A99/MF A01.
Regional data relating to the energy, environmental, socioeconomic, and institutional characteristics of the Rocky Mountains are compiled. Intended uses are to provide data for policy analysis and generic impact assessments; assist the labs in developing relevant data to be used in analyses and studies; provide a reference book that can be used by local groups and institutions; and identify the gaps in regional data bases so that the Department of Energy (DOE) may be better able to allocate resources for data and program development. The document is divided into four chapters. Chapter I includes current and historic data on energy supply, demand, and production; sector fuel demands, fuel consumption, transmission, and transportation; location of energy production and conversion; and energy prices by sector and state. Chapter II shows a variety of natural and preternatural characteristics including water quality and quantity; air quality and air quality control areas; natural and induced climatic conditions; waste disposal; land and coast conditions, use, and management; managed and endangered species; demographic and socioeconomic conditions; and health and mortality data. Included in Chapter III are a variety of organizational, legislative, and regulatory data. Chapter IV provides energy equivalents, metric conversions, an index, and a glossary.

3100 (LA--8172-MS) OVERVIEW OF SOLID WASTE GENERATION IN THE UNITED STATES. Lacombe, D.M. (Los Alamos Scientific Lab., NM (USA)). Dec 1979. Contract W-7405-ENG-36. 20p. Dep. NTIS, PC A02/MF A01.
Over 5 billion metric tons of solid waste was generated in the United States in 1977. Quantities, composition, and disposal techniques are discussed for the major waste categories: agricultural, mining and milling, industrial, municipal, energy production, and radioactive waste. Continued research and development of adequate disposal methods and resource recovery and recycling processes is needed.

3101 (ORNL--5595, pp 85-89) OFFICE OF INTEGRATED ASSESSMENT AND POLICY ANALYSIS. Parzyck, D.C. Jan 1980.
Health and Safety Research Division progress report, May 1, 1978-September 30, 1979.
The mission of the Office of Integrated Assessments and Policy Analysis (OIAPA) is to examine current and future policies related to the development and use of energy technologies. The principal ongoing research activity to date has focused on the impacts of several energy sources, including coal, oil shale, solar, and geothermal, from the standpoint of the Resource Conservation and Recovery Act. An additional project has recently been initiated on an evaluation of impacts associated with the implementation of the Toxic Substances Control Act. The impacts of the Resource Conservation and Recovery Act and the Toxic Substances Control Act on energy supply constitute the principal research focus of OIAPA for the near term. From these studies a research approach will be developed to identify certain common elements in the regulatory evaluation cycle as a means of evaluating subsequent environmental, health, and socioeconomic impact. It is planned that an integrated assessment team examine studies completed or underway on the following aspects of major regulations: health, risk assessment, testing protocols, environment control cost/benefits, institutional structures, and facility siting. This examination would assess the methodologies used, determine the general applicability of such studies, and present in a logical form information that appears to have broad general application. A suggested action plan for the State of Tennessee on radioactive and hazardous waste management is outlined.

3102 (SAND--80-0021C) WORST-CASE SCENARIO SYNDROME. Wilmot, E.L.; Luna, R.E. (Sandia Labs., Albuquerque, NM (USA)). 1980. Contract EY-76-C-04-0789. 8p. (CONF-800334--10). Dep. NTIS, PC A02/MF A01.
From 2. DOE environmental control symposium; Reston, VA, USA (17 Mar 1980).
Worst-case scenario impacts which must be included in an environmental impact statement (EIS) are discussed. The author presents arguments against their inclusion in the EIS. The low-probability-high-risk scenarios are recalled by the public in far more cases than the realistically expected impacts. The techniques used in creating worst-case scenarios are discussed. An example is given from the EIS of the Waste Isolation Pilot Plant concerning a transportation accident. (DC)

3103 SACRIFICING THE WEST FOR POWER: UTILITIES RISK REGION'S RUIN FOR NUKES AND COAL. Bird, E. Power Line ; 6: No. 2, 5, 7(Sep 1980).
Uranium and coal development in the western states is progressing at a rate which ignores the socio-economic and environmental impacts of desertification of the West in exchange for reducing oil imports. Westerners are organizing to save their homelands by challenging the large utilities, particularly the Tennessee Valley Authority. Water is the central issue, with residents claiming that agriculture replenishes ground water, but mining and energy production do not. Uranium ore tailings are another area of concern for those left to deal and live with the radioactive wastes. Environmentalists oppose the water contamination associated with TVA's in-situ mine projects and its aggressive uranium development. At least 26 energy companies have development plans involving power generation for midwest cities and the West Coast. (DCK)

3104 PUBLIC HEALTH HAZARDS FROM ELECTRICITY-PRODUCING PLANTS. Neyman, J. (Univ. of California, Berkeley). Science ; 195: No. 4280, 754-758(25 Feb 1977).
When a new electricity-producing plant is to be built in a given locality it is natural to take into account the public health consequences of the normal operation of each type of plant contemplated. Here, the fossil-burning plants and nuclear facilities come under consideration. The author attempts to show that, in spite of the many important studies performed, there is currently no reliable methodology to estimate how many more cancer cases, and how many more heart attacks and other diseases have to be anticipated as a consequence of the normal operation of this or that type of electric generator. In part, this is because the currently available estimates of radiation effects on humans are based on extrapolations from studies of two kinds. Those of one kind may be exemplified by studies of atomic bomb casualties in Hiroshima and Nagasaki. The other kind are laboratory experiments with lower animals, frequently mice. The unreliability of both kinds of extrapolations is connected with the following circumstances: (1) The omnipresent troublesome phenomenon of competing risks. (2) The dependence of health effects of a given noxious agent on the preexisting local pollution. (3) The dependence of health effects not only on the dose of an agent, but also on the rate at which the agent is administered. (4) The noted difficulties of making extrapolations from one mammal to another. 17 references.

Natural Resources

3105 OCEAN ENERGY: FORMS AND PROSPECTS. Isaacs, J.D.; Schmitt, W.R. (Scripps Institution of Oceanography, La Jolla, CA). Science ; 207: No. 4428, 265-273(18 Jan 1980).
The nature and distribution of power sources of the sea other than petroleum are discussed. These include waves, tides, currents, salinity and temperature gradients, submarine geothermal sources, salt domes, ice, and other marine-associated concentrations. Opportunities to employ these marine power resources directly rather than for contributions to power grids or power-intensive products are considered.

Research, Development, Demonstration, and Commercialization

3106 (DOE/CR--0010) U.S. DEPARTMENT OF ENERGY PROJECT BOOK. (Department of Energy, Washington, DC (USA)). Jan 1980. 86p. Dep. NTIS, PC A05/MF A01.
This book covers representative projects in each program within the Department of Energy. The projects included were selected to provide an insight into the wide spectrum of projects authorized and under way in the Department. The projects described do not cover all projects authorized - they are merely representative. Descriptions, goals, and status are given for 29 energy projects, 4 scientific projects, and 5 defense projects. (RWR)

3107 (DOE/ER--0035) REVIEW OF THE MANAGEMENT OF MATERIALS RESEARCH AND DEVELOPMENT IN THE DEPARTMENT OF ENERGY. FINAL REPORT. (Department of Energy, Washington, DC (USA). Office of Energy Research). Dec 1979. 134p. Dep. NTIS, PC A07/MF A01.
The Materials Working Group of DOE findings and recommendations of a management nature to improve the handling of materials R and D within DOE are presented. The special role of materials in the development of new energy technologies is provided. (FS)

Nuclear Energy

3108 (CONF-790202--, pp 13-17) NUCLEAR WASTES. Graham, J. (American Nuclear Society, Washington, DC). Jul 1979.
From 6. annual energy conference and exibition energy and the public; Knoxville, TN, USA (21 Feb 1979).
The imprecise terminology used to describe and define nuclear wastes has caused distortions and confusion in the public mind. High-level defense wastes are the major problem, one which many engineers feel has technically feasible solutions and which must be dealt with irrespective of the nuclear power problem. The engineers, however, are unable to reach a consensus on how wastes should be handled because of the varied orientations of their engineering backgrounds. They disagree on whether there is time to explore a range of waste-disposal options and on the cost and risk implications of these options. They question the need for the government to license itself to handle its own defense wastes. Plutonium poisoning from high-level wastes is a myth because the plutonium has been separated from high-level wastes and because, as a heavy metal, it is not readily ingested or digested.

3109 (EMD--79-29) CLEANING UP COMMINGLED URANIUM MILL TAILINGS: IS FEDERAL ASSISTANCE NECESSARY. (General Accounting Office, Washington, DC (USA)). 5 Feb 1979. 29p. General Accounting Office, 441 G St., NW, Washington, DC.

GAO was asked to determine whether Federal assistance should be given to operating mill owners that have processed uranium for sale to both government and industry and, thus, generated residual radioactive wastes. The wastes generated for both government and commercial use are called commingled uranium mill tailings. GAO recommends that the Congress provide assistance to active mill owners to share in the cost of cleaning up that portion of the tailings which were produced under Federal contract. Further, GAO believes that the Congress should also consider having the Federal government assist those mills who acted in good faith in meeting all legal requirements pertaining to controlling the mill tailings that were generated for commercial purposes and for which the Federal government is now requiring retroactive remedial action. At the same time, the Congress should make sure that this action establishes no precedent for the Federal government assuming the financial responsibility of cleaning up other non-Federal nuclear facilities and wastes, including those mill tailings generated after the date when the Federal government notified industry that the failings should be controlled.

3110 (INIS-mf--5514) NUCLEAR ENERGY AND THE NUCLEAR INDUSTRY. NOTES PREPARED TO PROVIDE INFORMATION AND TO ANSWER QUESTIONS. (Department of Energy, London (UK)). 11 Dec 1979. 19 p.p. NTIS (US Sales Only), PC A02/MF A01.

These notes have been prepared by the Department of Energy to provide information and to answer questions often raised about nuclear energy and the nuclear industry and in the hope that they will contribute to the public debate about the future of nuclear energy in the UK. The subject is dealt with under the headings: contribution of nuclear power, energy forecasts, nuclear fuels and reactor types, cost, thermal reactor strategy, planning margin, safety, nuclear licensing, unlike an atomic bomb, radiation, waste disposal, transport of nuclear materials, emergency arrangements at nuclear sites, siting of nuclear stations, security of nuclear installations, world nuclear programmes, international regulation and non-proliferation, IAEA safeguards arrangements in the UK, INFCE, and uranium supplies.

3111 (INIS-mf--5693) POWER GENERATION COSTS. COAL - NUCLEAR POWER. COMPARING INVESTMENT AND OPERATING COSTS OF COAL-FIRED AND NUCLEAR POWER PLANTS. SUPPLEMENT VOLUME. (Battelle-Institut e.V., Frankfurt am Main (Germany, F.R.)). 1979. 224p. (In German). NTIS (US Sales Only), PC A10/MF A01.

This supplement volume contains 17 separate chapters investigating the parameters which determine power generation costs on the basis of coal and nuclear power and a comparison of these. A detailed calculation model is given. The complex nature of this type of cost comparison is shown by a review of selected parameter constellation for coal-fired and nuclear power plants. The most favourable method of power generation can only be determined if all parameters are viewed together. One quite important parameter is the load factor, or rather the hours of operation. (UA) 891 UA/UA 892 AMO.

3112 (KFK--2707) CONSEQUENCES OF LARGE-SCALE IMPLEMENTATION OF NUCLEAR ENERGY IN THE FEDERAL REPUBLIC OF GERMANY. SUMMARY REPORT. Paschen, H.; Coenen, R.; Avenhaus, R.; Conrad, F.; Fischer, P.M.; Frederichs, G.; Halbritter, G.; Wintzer, D. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Abt. fuer Angewandte Systemanalyse). Jun 1979. 172p. (In German). (ASA/ZE--16/78). Dep. NTIS (US Sales Only), PC A09/MF A01.

This report is a summary presentation of the main results of the study on the 'Consequences of Large-scale Implementation of Nuclear Energy in the Federal Republic of Germany' which consists of six separate volumes. The questions dealt with are: - nuclear fuel demand and possible problems of supply, - problems of waste management and reprocessing, - economic aspects of nuclear energy implementation, - environmental impacts of nuclear energy generating plants and plants of the nuclear fuel cycle, - public acceptance of nuclear energy, - nuclear material control. The study is intended as a contribution to an overall assessment of the social, economic, and ecological implications of large-scale implementation of nuclear energy in the Federal Republic of Germany.

3113 NUCLEAR-WASTE PROBLEMS STILL AWAIT SOLUTIONS. Electrical World ; 194: No. 2, 19-21(15 Jul 1980).

Congress and the Administration are trying to resolve the problems of nuclear wastes, but legislators and agency officials disagree on whether enough study has been done. Critics who feel the subject has been over-studied think it is time to build the hardware and get started with permanent disposal sites. The key elements of disagreement about full-scale nuclear waste repositories revolve around the level of Federal, state, and local involvement, site reviews, military wastes, commercial low-level wastes, and inter-agency cooperation. Of the several disposal methods proposed for high-level wastes, storage in salt domes is the most promising. Low-level wastes are felt to be more of a mechnaical than a biological problem. (DCK)

3114 HELPING THE PUBLIC DECIDE: THE CASE OF RADIOACTIVE WASTE MANAGEMENT. Abrams, N.E.; Primack, J.R. Environment ; 22: No. 3, 14-20, 39-40(Apr 1980).

The participation of an educated and informed public in government decisions adds legitimacy to policies and can result in better balanced decisions. Public discussion on the nuclear-waste question may have been frustrated by asking the wrong questions. Public suspicion of the government's ability and intentions in regard to nuclear waste disposal should be addressed by presenting a complete tentative plan for discussion at government-funded forums to which expert comment and analysis can be contributed by interested members of the public. Examples from past hearings illustrate how public confusion has been perpetuated and the big picture has been lost. A set of criteria is set out which must satisfy the public before nuclear waste management will be accepted. Much of the present confusion is due to the separation of issues instead of recognizing the interconnections of decisions. (DCK)

3115 NUCLEAR POWER - THE GRAND ILLUSION. Bunyard, P. Ecologist ; 10: No. 4, 116-129(Apr-May 1980).

The following matters are discussed: the French nuclear programme, uranium availability, the fast breeder reactor, reprocessing, radiation hazards, plutonium, high-level waste, uranium mining, routine emissions of radioactive wastes, accidents at nuclear installations, capital costs, operating costs, public hostility.

3116 NUCLEAR TOWER. THE PROMISE AND THE THREAT. Moss, N. Illustrated London News ; 268: No. 6981, 31-38(Apr 1980).

Reference is made to the planned nuclear power programmes in the UK and other countries. The principles of a nuclear power plant are described, with reference to Magnox, AGR, PWR and fast breeder reactors. Uranium mining, isotope enrichment, fuel reprocessing and disposal of radioactive waste are covered briefly. The opposition to nuclear power is discussed, with particular reference to radiation hazards and to the possibility of diversion of plutonium from civil programmes to weapons. Some information is given on anti-nuclear movements in the UK and elsewhere.

3117 MOVING TO THE NUCLEAR AGE. Donovan, P. Civil Engineering (London) ; 14-15, 19-20(Feb 1980).

The potential of various energy sources is considered, the advantages of nuclear power in this context discussed and the UK Government nuclear energy policies and program examined. Having discussed the underlying principles of nuclear reactor operation, the working parameters of a number of types of power reactors are given. Aspects of safety, security, siting and waste disposal are discussed.

3118 RISK AND FEAR. Lerch, I. New Scientist ; 85: 8-11(3 Jan 1980).

Examples of industrial dangers compound daily but the public attitude remains uniformly indifferent or, at most, is exercised locally for short periods. Basically, quantified risks are far less important on a personal level than perceived risks. Perceived risk is highly personal, impervious to objective measures or external judgment. The long-smoldering debade about nuclear radiation risks from nuclear power flared in the wake of the Three Mile Island accident. The debate over commercial use of nuclear power and fear of radiation effects has spilled over into questioning the medical uses of radiation. This article analyzes the process of fear emotionalism and delineates some of the benefits associated with radiation. (SAC)

3119 WHAT HAPPENED TO NUCLEAR: THE ACTION'S AT THE NRC. Hobart, L. Public Power ; 38: No. 1, 31, 33, 35(Jan 1980).

Little nuclear-energy-related legislation was enacted by Congress during 1979, although both houses rejected constraining proposals and a series of congressional investigations were made of the Three Mile Island (TMI) accident. The Nuclear Regulatory Commission (NRC) toughened regulations by raising the penalty ceiling and was charged by the Senate to issue new safety rules and evacuation requirements, and to stiffen licensing requirements. A number of bills were passed to continue funding the breeder reactor program at a reduced level, with efforts continuing to shift funding from the Clinch River project to a new conceptual study and to nuclear waste management schemes, especially an away-from-reactor (AFR) facility. Responses to TMI included the framework for training utility personnel and assessing safety problems and insurance needs. President Carter emphasized the need for nuclear power as a way to reduce dependence on Middle East oil. Carter also outlined steps to reorganize and strengthen the NRC while urging a rapid conclusion to NRC's studies in order to resume issuing new licenses within six months. (DCK)

3120 TOPICAL PROBLEMS OF NUCLEAR LAW FROM AN INTERNATIONAL VIEW-POINT. Ziegler, E. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Atomwritschaft, Atomtechnik ; 25: No. 1, 38(Jan 1980). (In German).

From Conference: Nuclear inter jura '79; Buenos Aires, Argentina (21 - 25 Oct 1979).

Report on the topical issues discussed at the congress, as e.g. topics relating to nuclear law in general and to legal problems in connection with technology transfer and non-proliferation policy, as well as problems of waste management, insurance, coverage and liability, and questions arising from the licensing of nuclear power plants.

3121 NUCLEAR INTER JURA '79. Energiewirtschaftliche Tagesfragen ; 30: No. 1, 43-44(Jan 1980). (In German).

From Conference: Nuclear inter jura '79; Buenos Aires, Argentina (21 - 25 Oct 1979).

LEGAL ASPECTS;NUCLEAR ENERGY;LIABILITIES; MEETINGS;NON-PROLIFERATION TREATY;NUCLEAR INSURANCE;NUCLEAR TRADE;PROLIFERATION; RADIOACTIVE WASTES;REACTOR LICENSING;REVIEWS; SAFEGUARDS

3122 NUCLEAR WASTE MANAGEMENT. Frankel, D.R. Ecology Law Quarterly ; 8: No. 4, 790-800(1980).

Several recent congressional and executive proposals address the political problem posed by nuclear wastes. The proposals are divided into three categories on the basis of the degree of authority granted to state officials in siting decisions: those granting states a veto power, those providing for consultation with state officials during planning, and those leaving plenary authority in the hands of the Federal goverment. Legislative proposals are discussed under these categories. The most-balanced approach provides a formal role for state officials without granting the states an absolute veto. This solution provides a political outlet for local concern and ensures a wider range of views. It also avoids the problem, inherent in the state veto, of sacrificing the national interest in selecting the safest possible disposal site. 69 references.

3123 URANIUM MILL TAILINGS RADIATION CONTROL ACT OF 1978. Magee, J. Ecology Law Quarterly ; 8: No. 4, 801-809(1980).

The long-term environmental effects of the Uranium Mill Tailings Radiation Control Act of 1978 address the public health hazards of radioactive wastes and recognize the significance of this issue to public acceptance of nuclear energy. Title I of the Act deals with stabilizing and controlling mill tailings at inactive sites and classifies the sites by priority. It represents a major Federal commitment. Title II changes and strengthens Nuclear Regulatory Commission authority, but it will have little overall impact. It is not possible to assess the Act's effect because there is no way to know if current technology will be adequate for the length of time required. 76 references. (DCK)

3124 NUCLEAR POWER: STILL THE ULTIMATE FUEL. Duryee, L.M. Energy International ; 16: No. 12, 30-32(Dec 1979).

Mr. Duryee says the message that nuclear power is safe, economical, and reliable must first penetrate the public's misconception that commercial nuclear power cannot be separated from nuclear warfare. He further states that the media have contributed to the misunderstanding by exploiting bomb fears; this was especially noticeable during the Three Mile Island episode. Irresponsible reporting and overreaction on the part of utilities and government agencies as well as the public have intensified doubts about plant safety and waste disposal. Some nuclear power critics are more confident about disposal after studying the South African site where a spontaneous uranium reaction took place. The hazards of coal-fired power plants and the costs and logistics of coal waste disposal have been shown to be substantially greater than those of nuclear power. The risks are also minor in comparison with possible dam breakage or oil supply disruptions. Mr. Duryee notes that over 40 nations, many with no feasible alternatives, are benefitting from nuclear energy. (DCK)

3125 ENERGY POLICY AND THE PUBLIC HEALTH. THE SAFETY OF NUCLEAR POWER. Wade, B. (UKAEA, Harwell. Atomic Energy Research Establishment. Environmental and Medical Sciences Division). Royal Society of Health Journal ; 99: No. 6, 239-243(Dec 1979).

The various aspects of the nuclear fuel cycle and its effect on public health are described. For the U.K., it is shown that the maximum doses to an individual of the general public are well below the ICRP standards. For nuclear workers, the standard mortality ratio rate for UKAEA and BNFL workers is less than the national average and considerably less than that for miners, quarrymen and other industrial employees. The radiological risk to the general public from nuclear plant accidents is very small compared to the general hazards of life. In conclusion, the hazards involved in nuclear technology are no different in kind or in scale to those of existing technologies and indeed the radiological effects on health are better understood than the health risks associated with other technologies.

3126 PRESIDENTIAL ADDRESS BEFORE THE ANNUAL GENERAL MEETING OF THE VSE OF 31 AUGUST 1979 IN ZOFINGEN. von Schulthess, H. Bulletin de l'Association Suisse des Electricians ; 70: No. 20, 1114-1123(20 Oct 1979). (In German, French).

From Annual general meeting of the Verbandes Schweizerischer Elektrizitaetswerke; Zofingen, Switzerland (31 Aug 1979).

This address dealt on broad lines with the main problems arising out of the present and future supply of energy and electricity in Switzerland. Among the topics discussed were the intervention of the Swiss Federal Government in the affairs of suppliers of electricity and the possibility of a new energy law and taxation of energy consumption, developments in electricity consumption, recent public discussion and referendums on nuclear generation, the price and availability of oil and use of alternative energy sources, the rationale of the choice of nuclear generation for the future and the disposal of radioactive wastes.

3127 NUCLEAR POWER: THE DOUBTS REMAIN. Price, B. (Friends of the Earth, Bristol (UK)). International Environment and Safety ; 27(Oct 1979).

ENERGY CONSERVATION;ENERGY CONSUMPTION; ENERGY POLICY;ENERGY SOURCES;GOVERNMENT POLICIES;HAZARDS;NUCLEAR MATERIALS DIVERSION; NUCLEAR POWER;PLUTONIUM;RADIOACTIVE WASTES; REACTOR SAFETY

3128 TWILIGHT OF NUCLEAR EXPORTS. Gall, N. Ecologist ; 9: No. 7, 230-235(Oct-Nov 1979).

The future of nuclear trade is discussed. In particular, the ability of developing countries to use or pay for imported nuclear power plants is questioned. Contracts and negotiations between United States, German and French suppliers, and Brazil and Iran, are discussed in detail. Economics, environment, public relations, earthquakes, energy demand forecasting, alternative energy sources, litigation, radioactive waste disposal, and general technological problems are among the various aspects examined. (U.K.).

3129 PUBLIC'S CONFUSION ON NUCLEAR SEEN NO SURPRISE; KEY ISSUES REMAIN UNANSWERED: NRC COMMISSIONER. Electric Light and Power ; 57: No. 9, 48, 53(Sep 1979).

John F. Ahearne disagrees with fellow members of the Nuclear Regulatory Commission (NRC) on whether the public's lack of technical understanding and know-how is the deciding factor in nuclear issues. He finds the public's confusion over matters of safety and waste disposal to be legitimate and notes that getting a clear picture of nuclear power or straight answers is almost impossible for the citizen. He cites the lack of agreement about low-level-radiation risks and appropriate waste management and the conflicting statements made after the Three Mile Island (TMI) accident. He criticizes the relationships and the odd management structure of the NRC, especially the lack of a single person in control during a time of crisis. His comments covered the lack of an inflation clause in the Price-Anderson Act, his disbelief that regulators and the Federal regulation process need reform, and the problems of control room technology as demonstrated at TMI.

3130 DEVELOPMENT OF NUCLEAR POWER UTILIZATION IN THE GERMAN DEMOCRATIC REPUBLIC. Mitzinger, W. (Ministerium fuer Kohle und Energie, Berlin (German Democratic Republic)). Kernenergie ; 22: No. 9, 293-298(Sep 1979). (In German).

In the GDR lignite will continue to be the most important primary source of energy up to the year 2000 and beyond. Due to the restricted reserves of lignite, nuclear power utilization was started at an early stage as an integral part of the country's energy policy. This was done in close cooperation with the USSR. Experience gained from operating the Rheinsberg and the Greifswald nuclear power plants has confirmed this policy. Delivery of fresh nuclear fuel and redelivery of spent fuel has been agreed upon by long-term contracts with the USSR, whereas treated low- and intermediate-level wastes are stored in an abandoned rock-salt mine on the territory of the GDR, which has been developed to a final repository of radioactive wastes. The GDR actively participates in scientific research and development works in the field of nuclear power organized between the CMEA member states.

3131 CARTER ANTI-PLUTONIUM POLICY. Power, P.F. (Cincinnati Univ., OH (USA)). Energy Policy ; 7: No. 3, 215-231(Sep 1979).

The US Administration has embarked on an

ambitious effort to rescue civil nuclear energy from perceived dangers, notably the further spread of plutonium separation technology. The Carter policy is focused on the critical activities of spent fuel reprocessing and plutonium fuel recycle, and aims to limit them to as few countries as possible. The Nuclear Non-Proliferation Act of 1978 gives US anti-plutonium policy a comprehensive legislative mandate. It also extends the policy into the field of international diplomacy. This article examines the premises and origins of the US policy, its general intent and direction, the main features of the 1978 Act, the diplomatic record to date, and the implications of the Carter initiatives.

3132 REALITY OF NUCLEAR POWER. Murphy, D. Blackwood's Magazine ; 326: No. 1967, 193-211(Sep 1979).

The following matters are discussed in relation to the nuclear power programes in USA and elsewhere: siting of nuclear power plants in relation to a major geological fault; public attitudes to nuclear power; plutonium, radioactive wastes and transfrontier contamination; radiation and other hazards; economics of nuclear power; uranium supply; fast breeder reactors; insurance of nuclear facilities; diversion of nuclear materials and weapons proliferation; possibility of manufacture of nuclear weapons by developing countries; possibility of accidents on nuclear power plants in developing countries; radiation hazards from use of uranium ore tailings; sociological alternative to use of nuclear power.

3133 NUCLEAR WASTES AND TRAFFIC SAFETY MAIN COMMUNITY HEALTH CONCERNS. Canadian Medical Association Journal, The ; 121: No. 1, 112, 115, 116(7 Jul 1979).

Highlights of a debate at the annual meeting of the Canadian Medical Associaton are reported. Although one or two definitely antinuclear resolutions were rejected or referred back, the General Council of the Association did recommend the following: studies are urgently needed into methods of permanent nuclear waste disposal; reprocessing should be opposed until it is shown to be safe; practising physicians advising the Atomic Energy Control Board should be independent of government and the nuclear industry; the attention of the public should be drawn to health hazards of the production of electrical energy. Traffic safety was also discussed.

3134 TECHNICAL LIMITS OF A CONTROL SYSTEM. van der Meijden, D.; Nienhuys, K. (Rijksuniversiteit Groningen (Netherlands)). Intermediair ; 15: No. 27, 11,13,15,17(6 Jul 1979). (In Dutch).

The most important task for the IAEA at the moment is the security of the nuclear installations and of the fissionable material of the countries who form the Agency. The historical relationship between the Non-Proliferation Treaty and the subjection of the lands under control from the IAEA is described. Within the Treaty (NPT), the IAEA were commissioned with controlling the fulfilment of the NPT. It is expected that the storage of radioactive wastes will generate a discussion over the guarantees which one is bound by and which will expand the ineffectiveness of the IAEA control. The way in which control is executed will bring to light the failures of such a system.

3135 NUCLEAR OPTION: A LONG TERM INVESTMENT. Hoog, H. (Stichting Energieonderzoek Centrum Nederland, Petten). Energiespectrum ; 3: No. 7-8, 182-194(Jul-Aug 1979).

Factors causing delays in the nuclear development are indicated and the extent and certain features of the regression in which nuclear energy appears to find itself are analysed. The most significant elements in international nuclear debate are outlined and the relationship between economic growth and energy demand growth discussed. The author feels that the energy-household in the years after 2000 could not manage without relying on all available energy options including nuclear fission.

3136 FACING THE CHALLENGE OF NUCLEAR WASTE. DeLaughter, J. Tennessee Valley Perspective ; 10: No. 4, 5-9(Sum 1979).

The Tennessee Valley Authority (TVA) is going ahead with plans to safely store hazardous wastes from its nuclear power plants while national policies are developed for permanent storage. TVA had planned to use temporary open pool storage at the plant site and recycle uranium and plutonium until the reprocessing moratorium was imposed. The storage space has since been redesigned to handle larger volumes. TVA now intends to provide on-site storage for the 40-year life of each plant. Low-level wastes have been buried at Barnswell, SC. TVA director, S. David Freeman, sees the Three Mile Island accident as proof that nuclear plants must be treated differently, with safety given first consideration. TVA's new policy of on-site storage will eliminate the transportation hazards until mined geologic repositories are prepared. New technology will improve spent fuel rod storage, making it more compact. (DCK)

3137 FATE OF NUCLEAR HANGS IN THE BALANCE. Energy (Stamford, Connecticut) ; 21-23(Jun 1979).

In the United States, ninety-two reactors have construction permits, 4 have limited work authorizations, and 30 are on order, according to the Atomic Industrial Forum. The 72 with operating permits are capable of generating 52,396 MWe, and in 1978 they accounted for 12.6% of U.S. electric output. If all the additional plants are completed, total nuclear generating capacity will reach 192,738 MWe. In addition to public and Government reaction to the recent Three Mile Island incident, the long-standing and still-unsolved problem of nuclear waste disposal threatens nuclear energy as a major source of electric power in the United States. Although the Department of Energy has plans for a waste-isolation pilot plant in deep salt beds, a number of states have passed legislation barring nuclear waste repositories within their borders. Other states--Maine, Iowa, Wisconsin, and California--enacted laws that would prohibit construction of nuclear facilities until the development of safe nuclear waste disposal technology. Another problem facing the industry is the 12 to 15 years required to bring a nuclear plant from site selection to commercial operation.

3138 PUBLIC COMMUNICATION HIGHLIGHTS KEY ISSUES. Locke, D.H. (UKAEA, Springfields. Nuclear Power Development Labs.). Nuclear Engineering International ; 24: No. 285, 51-52(May 1979).

The experiences in public communication of a group of working scientists at the UKAEA's Springfields Laboratories are described. Areas where there is considerable lack of public

knowledge are discussed and the genuine demand for objective factual information is stressed. Particularly there is a demand for reassurance on ultimate disposal of radioactive waste, the safety of reactors and the hazards of plutonium breeding and proliferation. problems of presentation are discussed. Finally a five point framework is offered as advice to other sections of the industry involved in public acceptability work.

3139 'YES' TO THE PARTIAL REVISION OF THE LAW ON ATOMIC ENERGY. Bulletin de l'Association Suisse des Electricians ; 70: No. 8, 394-396(28 Apr 1979). (In German and French).

The Swiss Atomic Energy Law, dated 23 December 1959, has been reviewed by a National Council and it was agreed on 6 October 1978 that it should be partially revised, with a full revision to be made by the end of 1983. Station construction authorisations previously made for Muehleberg, Beznau I, II, Goesgen and Leibstadt are to be followed in a simplified fashion for Kaiseraugst, Groben and Verbois. Safety precautions, however, must be shown to be met, and this includes storage facilities for spent fuel. Final decision on a new station must be approved by democratic means. The final paragraph of the article states that the economics of nuclear power appear to be favourable and that there is no other apparently acceptable alternative.

3140 SCOTS SEEK SOFT PATH. Webb, T. Undercurrents (London) ; No. 32, 18-19(Feb-Mar 1979).

Energy policy is discussed, with particular reference to Scotland. The plans for nuclear power are analyzed in comparison with developments in coal mining, use of oil and gas and other possible energy sources such as wind and wave power. Arguments against the development of nuclear power are raised on grounds of economics, employment potential, and problems of waste disposal.

3141 US DEFINES NUCLEAR FUEL STORAGE COSTS. Greenhalgh, G. Energy International ; 16: No. 2, 22-23(Feb 1979).

Sticking firmly to its no-reprocessing, non-proliferation policy towards the nuclear fuel cycle, the US DOE has drawn up a scheme for the long-term storage of spent nuclear fuel. Though aimed primarily at satisfying the needs of US utilities, the facility will be offered to foreign utilities who have no urgent need of a fast reactor program that would require them to seek the services of European reprocessing plants. The first stage of the storage and disposal program is for interim storage in AFR (away from reactor) water storage basins. The first of these is planned to be available to receive fuel in 1983. AFR storage will be followed by further storage and ultimately disposal in a deep geological repository. Two potential sites are to be identified, probably in salt formations that have been studied since the late 1950s. Charges for these services are discussed. (MCW)

3142 NUCLEAR CONTROVERSY WITH MANY UNDERCURRENTS. Lingjaerde, R.O. (Norsk Atomenergiforening, Oslo). Ingenioer-nytt ; 15: No. 5, 26,28(16 Jan 1979). (In Norwegian).

The president of the Norwegian Atomic Energy Society presents, in the form of an interview his opinions on the nature of the nuclear controversy in Norway. He is very critical of the emotional and uninformed nature of much of the criticism of nuclear power, and emphasises that nuclear power must be regarded as an alternative to other, less favourable forms of thermal power, as a supplement to hydroelectric power, or to electricity rationing. While a society using less energy is quite feasible, it would hardly be acceptable. The waste disposal controversy is quite artifical, as perfectly safe methods of disposal are available. Finally he regrets that it is the conclusions only in the Nuclear Power Commission's report which have attracted attention, and mainly the comments of the dissident minority.

3143 REFLECTIONS ON NUCLEX '78. Edwards, J. Journal of the Institution of Nuclear Engineers ; 20: No. 1, 18-19(Jan-Feb 1979).

Brief review. AGR TYPE REACTORS;ENVIRONMENT; FBR TYPE REACTORS;INTERNATIONAL COOPERATION; NUCLEAR INDUSTRY;NUCLEAR POWER;NUCLEAR POWER PLANTS;RADIATION PROTECTION;RADIOACTIVE WASTE PROCESSING;REACTOR OPERATION;REPROCESSING; TECHNOLOGY TRANSFER;MEETINGS

3144 NUCLEAR RESEARCH IN THE FEDERAL REPUBLIC OF GERMANY. Paschen, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Abt. fuer Angewandte Systemanalyse); Barnert, H.; Baumgaertel, G.; Coenen, R.; Horsch, F.; Hueper, R.; Klein, S.; Kroebel, R.; Scheer, H.; Zajonc, H. pp 155-209 of Energy/Nuclear Energy. Hamburg, Germany, F.R.; Spiegel-Verl. (Jan 1979). (In German)

After a survey of the targets and extent of nuclear research in West Germany, the 3 project lines are discussed which are the fields of emphasis of nuclear research policy: Fast breeder reactor, HTR reactor, and reprocessing. The states of technology and their development in connection with schedule planning are dealt with. Finally, some economic problems of the industrial application of nuclear power in West Germany are discussed.

3145 LEGAL ASPECTS OF RADIOACTIVE HIGH-LEVEL WASTE MANAGEMENT. Jaksetic, E. (Georgetown Univ., Washington, DC). Environmental Law ; 9: No. 2, 347-406(Win 1979).

The need to dispose of radioactive wastes exits regardless of how the political and legal debates now raging are resolved. The author provides technical background information before discussing current and proposed disposal methods, which he finds to be reasonable and manageable. He examines the statuatory basis for radioactive waste regulation in terms of the administrative responsibilities of the regulating agencies and the conflict which has developed between state and federal agencies over jurisdiction. He concludes that federal regulations have not wholly pre-empted the states in the area of waste disposal and suggests that political and legal factors pose more serious problems than technical factors.

3146 SOCIALLY RESPONSIBLE ENERGY FUTURES. Starr, C. (Electric Power Research Inst., Palo Alto, CA). Electric Perspectives ; No. 3, 1-7(1979).

After examining briefly the usual positions of nuclear critics and nuclear proponents, Dr. Starr says that the proponents (of whom he is one) have a broader case for nuclear power not thus far effectively advanced - a case based chiefly on a visible concern with social values and the future welfare of humanity. Such a broader case for nuclear power has always existed - a case based on motivations that initially spurred development of this energy

resource over the past several decades, but one that has tended to be neglected in the public debate. A concern to avoid worldwide catastrophe is central to this broader case for nuclear power. The threat is perceived as resulting directly from the pending unavailability of petroleum and natural gas at a reasonable cost. This unavailability could lead to global tensions and political instabilities, economic crises, and, ultimately, to military conflicts based on need to obtain and control liquid-fuel resources. It is felt that past history and current events substantiate the threat inherent in the international struggle for raw materials. The broader - and more compelling - case for nuclear power lies in its potential for removing a major threat to the peace, stability, and welfare of the world that is inherent in the growing scarcity of petroleum and natural gas resources and in the limited geographical availability of coal. The catastrophe that could be avoided is at least as threatening as the one projected by those who oppose the use of nuclear power, and, Dr. Starr argues, more realistic in its potential for world-shattering impacts.

3147 UNRAVELING THE NUCLEAR ENERGY DEBATE. Wolfe, B. (General Electric Co., San Jose, CA). Electric Forum ; 5: No. 2, 3-5(1979).

Dr. Wolfe feels that public concerns about the risks of nuclear power tend to lead to meaningless debate because the central core of the nuclear issue is that philosophical differences are being argued in technical terms, many of which are misunderstood. He points out that the debate over nuclear waste, for example, is centered on the benefit, not the risk, of an acceptable disposal method. He identifies three major themes that recur in discussions among the anti-nuclear groups: (1) the harm that society suffers from cheap, abundant energy; (2) the need to force society to reduce its energy use; and (3) a desire to change the social and economic structure of society. Nuclear advocates, on the other hand, generally endorse the development of alternate energy supplies in order to minimize societal changes. They see energy as the key to solving societal problems and recognize the associated risks as necessary tradeoffs.

3148 NUCLEAR POWER PLANT LICENSING PROCEDURES IN THE UNITED KINGDOM. Haire, T.P. (Central Electricity Generating Board, London (UK)); Shaw, J. (Queen Mary Coll., London (UK). Dept. of Nuclear Engineering). Progress in Nuclear Energy ; 4: No. 2, 161-182(1979).

This article summarizes the principle legislation in the UK which controls the design, construction and operation of nuclear reactors, and describes the way in which the requirements of this legislation are met by the two public corporations which own and operate nuclear power plants. The development of siting policies and site selection criteria are described. Reference is also made to the way in which these criteria are used to assess the likely radiological risk to the surrounding population.

3149 Der unsichtbare Tod. Die Angst der Buergers vorm Atom. (INVISIBLE DEATH. CITIZENS' FEARS OF THE ATOM). Barthel, W.; Jaenecke, H.; Thomsen, P. Hamburg, Germany, F.R.; Gruner und Jahr (1979). 254p. (In German).

Contents in key-words: The devils' pact. A story from the a-bomb up to the fast breeder. The bomb/the resistance is being formed/the euphoria in the industry/the resistance of the citizens/the doubts of the scientists/are the lights really being turned off in the industrial society. Drilling Place Gorleben or the radiating giant. Are we living on a time bomb.- The expertises: Reprocession of atomic waste and the final waste management/What is reprocession. What is plutonium. What are the alternatives of reprocession. International group of scientists is discussing the plutonium reactor on the heath. The escape from Harrisburg or when the pile was boiling. Is the FRG going to be an atom country. Do we need nuclear energy at all. How dangerous is radioactivity in the normal case./How dangerous in disturbances : explosions, terror acts, war./ Can radioactivity cause cancer. Who protects the citizens from governmental protective measures or do we need an atom restitution. Annex: Nuclear power plants in the Federal Republic/Nuclear power plant accidents in the Federal Republic/Experts in the Gorleben-hearing in Hannover.

3150 IS NUCLEAR POWER SAFE ENOUGH. Andresen, A.F. (Institutt for Atomenergi, Kjeller (Norway)). Fra Fysikkens Verden ; 41: No. 1, 3-5(1979). (In Norwegian).

The lecture formed a commentary on the report of the Norwegian Government's Commission on Nuclear power Safety which was published in October 1978. It was introductorily pointed out that 'safe' and 'safety' are not in themselves meaningful terms and that the probability of an occurrence is the real measure. The main items in the Commission's report have been core meltdown, releases during reprocessing, waste disposal, plutonium diversion and environmental impacts. The 21 members of the Commission were unanimous in 7 of the 8 chapters. In chapter 2, 'Summary and Conclusions', 3 members dissented from the majority opinion, that, subject to certain conditions, nuclear power was a safe and acceptable source of energy.

3151 ENERGY AND HUMAN NEEDS. Curran, S.C. (Strathclyde Univ., Glasgow (UK)); Curran, J.S. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). Edinburgh: Scottish Academic Press (1979). 340p.

The subject is dealt with in five parts, as follows: energy sources and converted forms; fossil fuels and their depletion; the nuclear option (fission and fusion phenomena; fission reactors; the economics of nuclear power; energy from fusion); the provision of energy (including - energy as electricity, transmission, the hydrogen economy, energy storage, heat pumps, energy conservation and energy from waste, energy analysis); social, environmental and international aspects (the environment - non radioactive pollution; nuclear power and safety, reprocessing and waste disposal; political aspects of the civil uses of nuclear power; proliferation and terrorism, summary and some thoughts for the future).

3152 NUCLEAR POWER AND OTHER THERMAL POWER. A COMPARATIVE EVALUATION OF SAFETY AND ENVIRONMENT. Bakke, J. (Norges Vassdrags- og Elektrisitetsvesen, Oslo). Ingenioer-nytt ; 14: No. 95, 3,9,20(28 Nov 1978). (In Norwegian).

From Nuclear power seminar; Oslo, Norway (23 - 24 Oct 1978).

Some philosophical aspects of mortality statistics are first briefly mentioned, then the environmental problems of, first, nuclear power plants, then fossil fuelled power plants are summarised. The effects of releases of

carbon dioxide, sulphur dioxide and nitrogen oxides are briefly discussed. The possible health effects of radiation from nuclear power plants and those of gaseous and particulate effluents from fossil fuel plants are also discussed. It is pointed out that in choosing between alternative evils the worst course is to make no choice at all, that is, failure to install thermal power plants will lead to isolated domestic burning of fossil fuels which is clearly the worst situation regarding pollution.

3153 NUCLEAR POWER: VERY SIGNIFICANT NORWEGIAN COMPETENCE. Firing, J. (Institutt for Atomenergi, Halden (Norway). OECD Halden Reaktor Prosjekt). Ingenioer-nytt ; 14: No. 94, 2-5,8,21(24 Nov 1978). (In Norwegian).
From Nuclear power seminar; Oslo, Norway (23 - 24 Oct 1978).
The history of nuclear energy research and development in Norway, and the development of the nuclear organizations is briefly presented. Active nuclear R and D mainly takes place now at the Halden Reactor Project, in the form of an international programme in which ten countries participate. This gives the Norwegian Institutt for Atomenergi direct contact with 35 leading nuclear organisations. The way in which Norwegian experience can be utilised in the projecting, design, construction and operation of a nuclear power plant is then discussed at length. Special competence is available in the fields of safety evaluation, reactor operation, fuel cycle administration and fuel technology and process control and instrumentation. It is estimated that about 50% of the construction work could be carried out by Norwegian firms. Experience is also available in the fields of spent fuel handling, reprocessing and waste treatment.

3154 MAIN CONCLUSIONS IN NUCLEAR POWER COMMISSION'S REPORT. Omholt, A. (Norges Almenvitenskapelig Forskningsraad, Oslo). Ingenioer-nytt ; 14: No. 90, 6,8,16-17,39(10 Nov 1978). (In Norwegian).
From Nuclear power seminar; Oslo, Norway (23 - 24 Oct 1978).
This paper is, in effect, a summary of the factual material considered by the Commission. It covers the following aspects:- releases of radioactive substances during routine operation of nuclear power plants and reprocessing facilities; the probability and consequences of major reactor accidents; underground siting of nuclear power plants; radioactive waste disposal, both high level and low and intermediate levels; decommissioning of nuclear power plants; proliferation of nuclear weapons; comparison with other types of thermal power plants. For each of these aspects the majority conclusion is summarised and dissenting opinions are stated. Finally a number of conditions which the majority find require to be fulfilled in order that the safety aspects shall be acceptable are cited, and the reservations of the minority are quoted.

3155 KEY ISSUES OF NUCLEAR POWER R AND D IN JAPAN. An, Shigehiro (Tokyo Univ. (Japan). Faculty of Engineering). Genshiryoku Kogyo (Nuclear Engineering) ; 24: No. 11, 41-46(Nov 1978). (In Japanese).
Nuclear power technology, spreading over a number of specialized areas, is so-to-speak an extreme technology requiring the cooperation of scientists and technologists in respective fields. Its research and development require tremendous amounts of funds and manpower, with long lead times from the basic research up to the practical use. The nuclear power technology exerts thus large influences both socially and economically. The research and development of nuclear power do not remain only in technology. It is a problem spreading over society, economy, politics and diplomacy and compatibility is required in an extensive national system containing nuclear power. On the research and development of nuclear power in Japan, the following matters are described: targets of nuclear power development and the reality; perfection in LWR technology; FBR development; establishment of the nuclear fuel cycle comprising uranium resources, uranium enrichment, downstream and spent fuel storage; and the funding and program of research and development, cooperation of respective orgaizations, etc.

3156 NUCLEAR NON-PROLIFERATION ACT OF 1978 AND THE NUCLEAR FUEL CYCLE REQUIREMENTS OF GERMAN NUCLEAR POWER PLANTS. Strassburg, W. Energiewirtschaftliche Tagesfragen ; 28: No. 11, 692-693(Nov 1978). (In German).
The article tries to show which effects result from the Nuclear-Non-Proliferation Act of 1978 for the solution of waste management in the German nuclear power plants and esp. for the waste management centre near Gorleben, for the fuel-element intermediate store near Ahaus, and for the Stone-I-reprocessing agreements concluded by the German nuclear power plant operators. The author stresses that it is a little early for his article and indicates that the law is in many cases - esp. regarding the criteria of 'timely warning' - very flexible and that this will be seen by applying it very often.

3157 LONG-RANGE PROGRAM OF ATOMIC ENERGY RESEARCH, DEVELOPMENT AND UTILIZATION IN JAPAN. No. 105, 1-33(Nov 1978). (In Japanese).
The research, development and utilization of atomic energy as a big science require tremendous human resources and funds, so it entails a firm administrative policy. On the other hand, the efforts are closely related to the interests of the people, both directly and indirectly. It is thus necessary to disclose the definite views for the future to the people. The long-range program for the next ten years of atomic energy research, development and utilization was presented to replace the previous one, because of the changes in the situation including the rise of importance of nuclear energy, the increase of problems to be overcome, and the international environments around atomic energy. The following matters are described: basic policy concerning the peaceful usage of atomic energy and Japan's own effort; nuclear power generation including LWRs, future reactor types and nuclear fuel cycle; nuclear fusion, etc.; promotion of research/development projects.

3158 NUCLEAR POWER IN 1977. Wethe, P.I. Ingenioer-nytt ; 14: No. 78, 11-13,23(29 Sep 1978). (In Norwegian).
A brief survey is given of the number of nuclear power plants operating, under construction and ordered in the world, and in the leading Western countries. The uncertainties introduced by the controversy on waste disposal and lack of national policies are briefly discussed. The situation regarding uranium reserves is discussed, and it is mentioned that the financing of prospecting by the utilities or national anthorities, with consequent reservation in supplies, will hinder the operation of a natural market in the future. Enrichment services are briefly

surveyed. The availability of reprocessing facilities is discussed rather more fully, especially the French and UK facilities. The vitrification of high-level wastes is briefly described and various projects for final disposal are briefly presented, with special emphasis on Swedish plans. Finally the INFCE is briefly presented.

3159 LONG-TERM ATOMIC ENERGY RESEARCH, DEVELOPMENT AND UTILIZATION PROGRAM FORMULATED. Atoms in Japan ; 22: No. 9, 5-19(Sep 1978).

Japan Atomic Energy Commission has submitted the report on the new "Long-term Atomic Energy Research, Development and Utilization Program" to the Government. It reflects recent severe circumstances represented by the oil crisis, opposition to nuclear power, and the nuclear non-proliferation issue. Although it covers very wide range of atomic energy industry, the basis of this report can be summarized as follows. (1) To improve the reliability and availability of LWRs, and implement standardization. (2) Commercialization of FBR by the year 2000. (3) Practical application of nuclear fusion at the earliest possible date in the 21st Century. Time schedule and necessary funds are estimated for each specific item of research and development projects.

3160 USE OF FISSION REACTORS FOR THE GENERATION OF ELECTRICITY IN THE UK CIVIL PROGRAMME. Journal of the Institution of Nuclear Engineers ; 19: No. 5, 163-165(Sep-Oct 1978).

This is a statement issued by the Institution of Nuclear Engineers, London, U.K., with the object of informing the public of the basic facts concerning nuclear power, including ethics and safety. It concentrates on the use of fission reactors and considers society's needs in the immediate future.

3161 NUCLEAR POWER ACTIVITY IN FRANCE. Wethe, P.I. (Institutt for Atomenergi, Kjeller (Norway)). Ingenioer-nytt ; 14: No. 66, 14-15,30(18 Aug 1978). (In Norwegian).

The overall nuclear power programme in France is surveyed. It is stated that by 1985 it is planned that 70% of the electrical power will be generated at nuclear plants, and that 94% of power plants under construction and planned are nuclear. A brief survey of the previous GCR type, the present PWRs and the future FBR plants is given. The fuel cycle projects, from uranium prospecting to mining, enrichment, fuel fabrication and reprocessing and waste treatment and disposal, are also outlined.

3162 ELECTRONUCLEAR PROGRAM OF THE FEDERAL REPUBLIC OF GERMANY. Mandel, H. (Rheinisch-Westfaelisches Elektrizitaetswerk A.G., Essen (Germany, F.R.)). Annales des Mines ; 184: No. 5-6, 199-206(May-Jun 1978). (In French).

The preoccupation of the Federal Republic is to lessen its energy dependency on petroleum (now 52%) particularly by developing nuclear power which could in the year 2,000 meet 27% of its primary energy needs, equally with oil. At the end of 1977, West Germany had 6 industrial reactors operating representing a total power of 5,500 MW., 12 reactors under construction (of which 8 units of 1,300 MW.) for a total power of 13,000 MW., 9 reactors under investigation (11,300 MW.), and 2 reactors 2,700 M. whose construction had been postponed for political reasons. A centre for fuel reprocessing and waste storage is also being investigated.

3163 CHOOSE NUCLEAR POWER. Breien, B. Polytek. Revy.; No. 1, 2-3(Jan 1978). (In Norwegian).

The opinion is expressed that politicians have shown excessive caution in the nuclear question. Opinion surveys show that only in Sweden, among the principle nuclear power nations, is there a majority opinion against nuclear power. Energy conservation can only delay the demand increase for a few years, and in Norway the possibilities for energy conservation are less than in many other countries. A comparison between coal firing and nuclear power as a supplement to hydroelectric power favours nuclear power, both from reasons of public health and waste disposal. In conclusion a clear recommendation is given - choose nuclear power.

3164 HOW MANY HUMAN LIVES AND HOW MUCH ENVIRONMENTAL DAMAGE WILL BE RISKED TO AVOID NUCLEAR POWER. Doederlein, J.M. (Institutt for Atomenergi, Kjeller (Norway)). Polytek. Revy.; No. 1, 6-7(Jan 1978). (In Norwegian).

In this interview the opinion is expressed that while all forms of electric power production involve health hazards and environmental damage, nuclear power involves less undesireble effects than fossil fuel power. The principle pollutant from fossil fuels is sulphur and present sulphur removing processes are expensive, inefficient and unreliable. It is also stated that newly developed processes for the disposal of radioactive wastes are fully satisfactory while pollutants from fossil fuel plants are spread without coutrol. Diversion of fissile material for nuclear weapon manufacture from nuclear power plants is unlikely as more effective methods are available to those with such ambitions. Finally it is maintained that it is essential that nuclear power be accepted in Norway.

3165 OUTLOOK OF NUCLEAR POWER GENERATION AND INTERNATIONAL SITUATION. Ekulund, S. (International Atomic Energy Agency, Vienna (Austria)). Gensan Nenji Taikai Gijiroku (Proceedings of Japan Atomic Industrial Forum, Incorporated) ; No. 11, 13-23, 91-94(1978). (In Japanese).

Nuclear power generation is advancing at rapid rate over the world, without any major accident. For the base load of electric power, when choice is made between nuclear energy and petroleum, Nuclear energy has larger economic advantages over petroleum as compared with the days before the oil crisis. The costs of its fuel and fuel cycle technology are reasonable. However, nuclear power generation currently has a number of problems. What causes this uncertainty is not technological, but political, i.e. governmental policy changes, and this is based on the apprehension about nuclear proliferation. What is necessary is to strengthen the existing international framework of nuclear nonproliferation. In this respect, IAEA through comprehensive safeguards will make contributions largely to reduction of the political uncertainty. It is important that the new initiatives toward international nuclear cooperation should eliminate the current trends of restraint and denial.

3166 SITUATION OF NUCLEAR POWER GENERATION IN SWEDEN. Sandstroem, S. (Swedish Atomic Forum). Gensan Nenji Taikai Gijiroku (Proceedings of Japan Atomic Industrial Forum, Incorporated) ; No. 11, 249-257, 286-288(1978).

(In Japanese).

In Sweden, nuclear power generation was received initially favorably. In the end of 1960s, however, nuclear power generation got involved in the activities of environment preservation. Then, political parties became opposed to nuclear power generation, and now, the need of nuclear power generation itself is regarded as questionable. In the general election in 1976, the Government opposing the nuclear power generation won. As the result, the conditional nuclear power development law and the energy committee were set up. The committee composed of parliament members, experts, and representatives of enterprises and trade unions is to submit its report so that the parliament can prepare a new energy program in the fall of 1978. Meanwhile, the nuclear fuel safety project formed newly has studied to satisfy the conditions of the law. In Sweden, which has developed nuclear reactors independently from the technology of USA, the oppositions are on the decrease, however. It is awaited what decision will be made by the Government in this fall.

3167 Guide international de l'energie nucleaire. (INTERNATIONAL NUCLEAR ENERGY GUIDE). Paris, France; O. Lesourd (1978). 730p. (In French and English).

The aim of this French-English bilingual Guide is to present a synthesis embracing all the aspects and all the implications of the development of nuclear energy by situating it both within the French administrative and professional framework and in the world context. Special attention has been paid to the protection of man and the environment and to safety and security problems; most of the other questions -technological, economic, industrial- which arise at all points in the nuclear cycle. Teaching and research are outlined and a special appendix is devoted to nuclear information.

3168 NRC ANALYSIS OF THE ENVIRONMENTAL IMPACTS AND LICENSING POLICIES FOR EXPANDED SPENT FUEL STORAGE IN THE UNITED STATES. Smith, C.V. Jr. (Nuclear Regulatory Commission, Washington, DC (USA)). pp 63-73 of Compte rendu du seminaire de l'AEN sur le stockage des elements combustibles irradies. Madrid, 20-23 juin 1978. Paris, France; OECD (1978).

From Seminar on the storage of spent fuel elements; Madrid, Spain (Jun 1978).

This paper reviews the findings of the U.S. environmental impact studies on spent fuel storage to the year 2000, addresses design criteria for independent spent fuel storage installations and expresses the position of the NRC for licensing expanded spent fuel storage capabilities until such time as final solutions are established.

3169 PARADOXES AND POPULAR MISCONCEPTIONS OVER HARNESSED NUCLEAR ENERGY. Lewis, W.B. 15: 327-331(1977).

It is argued that the radioactive wastes generated by nuclear power development are tractable and trivial in scale in relation to natural environmental radioactivity.

3170 ATTITUDES OF NEW MEXICO RESIDENTS TOWARD THE NUCLEAR FUEL INDUSTRY. Bonem, G.; Sievers, J. Albuquerque, NM; Univ. of New Mexico (1977). 18p. (NP--25030).

The survey indicated that New Mexicans favor locating more of the nuclear power industry in the state. Also, New Mexicans approve further national development of the industry. There is widespread disapproval of storing waste materials in the state. A very large segment of the population has not yet formed an opinion on these issues because of lack of information.

Transport and Storage

3171 (PNL--2989) SELECTED LEGAL AND REGULATORY CONCERNS AFFECTING DOMESTIC ENERGY TRANSPORTATION SYSTEMS. Schuller, C.R. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jul 1979. Contract EY-76-C-06-1830. 86p. Dep. NTIS, PC A05/MF A01.

This report provides assessments of eight legal and regulatory concerns that may affect energy material transportation in the US during the rest of the century: state authority to regulate nuclear materials transport, divestiture of petroleum pipelines from major integrated oil companies, problems affecting the natural gas transportation system, capabilities of energy transportation systems during emergencies, Federal coal pipeline legislation, ability of Federal agencies to anticipate railroad difficulties, abandonment of uneconomic railroad lines, and impact of the Panama Canal treaty upon US energy transportation. (DLC)

3172 (PNL--3300(Pt.5), pp 19-20) ENERGY MATERIAL TRANSPORT, NOW THROUGH 2000. Feb 1980.

Pacific Northwest Laboratory annual report for 1979 to the DOE Assistant Secretary for Environment. Part 5. Environmental assessment, control, health, and safety.

The overall objectives of this project are to assess potential problems which may inhibit the safe and environmentally acceptable development of nuclear and fossil energy material transportation systems from now to the year 2000 and to recommend research, development, and other necessary action to mitigate the potential adverse impact of these problems. Effort in FY 1979 addressed the domestic transportation of petroleum, synfuels, nuclear fuel cycle materials, and legal and regulatory concerns. Results of the studies on petroleum, synfuels, and legal and regulatory concerns were published. Research continued on spent fuel cask productivity, coal sludge transportation, the Northern Tier Pipeline, and joint utility corridors.

Supply, Demand, and Forecasting

3173 L'energie. Le compte a rebours. (ENERGY. THE COUNTDOWN). de Montbrial, T. Paris, France; Lattes (1978). 318p. (In French).

After a brief history of the international oil industry the energy crisis (adaptation to oil price), is developed since 1973. Accent is put on the political aspect. Nuclear energy is discussed especially: nuclear controversy, safety, radioactive wastes, proliferation ... The energy problem is situated in the general context of international relations. Then the future is explored: substitution of oil, economical aspects and consequences of energy cost governing all the problems in the world.

Policy, Legislation, and Regulation

3174 (PB--294738) SCIENCE AND TECHNOLOGY ADVICE FOR THE EXECUTIVE THE MICHIGAN EXPERIENCE. Taylor, W.C.; Nern, C.F.;

Kellogg, J.C. (Michigan Office of Science and Technology, Lansing (USA)). Sep 1978. 30p. NTIS, PC A03/MF A01.

The Office of Science and Technology has provided an improved procedure by which information and advice on technical issues is presented to the Governor of Michigan for consideration in making state policy. Issues examined include a proposal to the Department of Defense to locate a massive communication antenna in Michigan, a chemical contaminating incident, a high-level nuclear waste disposal, low-level radioactive waste, and hazardous and toxic waste management. The report includes a description of the program's mode of operation and summaries of the above-mentioned issues. Principal findings center on a number of structural and procedural concepts. Descriptions of five areas in which significant experience was gained which may be transferable to other policy environments utilizing science advisory mechanisms are: a task force approach to substantive issues, participation in task force projects, public participation, output from task force studies, and independence for the science advisory mechanism. It is concluded that the program, as well as the administrative structure of the Office, has proven successful.

3175 (SAND--79-1095) 1979 NEW MEXICO LEGISLATIVE SESSION: ENERGY ISSUES AND LEGISLATION. Barsumian, L.; Vandevender, S.G. (New Mexico Univ., Albuquerque (USA); Sandia Labs., Albuquerque, NM (USA)). Oct 1979. Contract EY-76-C-04-0789. 121p. Dep. NTIS, PC A06/MF A01.

This report is an account of the energy legislation and associated issues considered during the 1979 session of the 34th New Mexico Legislature. The session's major issue was the federal study of a proposed nuclear Waste Isolation Pilot Plant (WIPP) in New Mexico. A large proportion of time and effort was spent on resolving the state's formal position toward the federal project. However, other energy concerns were also significant even though they were neither as controversial nor as visible as the primary issue. The two most important laws enacted were the Radioactive Waste Consultation Act and the Radioactive Waste Transportation Act. The Legislature considered 47 other energy-related bills, of which 17 were enacted.

3176 Roesta nej. En bok om alternativ till kaernkraft och olja. (VOTE NO. A BOOK ABOUT ALTERNATIVES TO NUCLEAR POWER AND OIL). Kjellstroem, B.; Kaageson, P. (Folkkampanjen Nej till kaernkraft, Stockholm (Sweden)). Stockholm, Sweden; LiberFoerlag (1979). 172p. (In Swedish).

This book presents the opinions and programs of the anti-nuclear side in the preparations for the Swedish referendum on nuclear power (to take place on March 23, 1980) It is argued that the nuclear power, now producing more than 20 per cent of the Swedish electricity, can be phased out during a ten years period without severe effects for the economy. The dependence on oil can still be reduced, due to a determined development of alternative energy sources (biomass, peat, wind and solar) and a conseuretion program. The investments for the non-nuclear plan are estimated to become about 21000 MSKR (5000 M) higher than the present, nuclear, program.

3177 Energiepolitik und Gemeinden. (ENERGY POLICY AND THE COMMUNITIES). Goettingen, Germany, F.R.; Otto Schwartz (1978). 139p. (In German).

Papers from this congress are presented which dealt mainly with information on energy policy in the Federal Republic of Germany. Most of the information referred to the state of development, safety and environmental protection in nuclear facilities and in the projected nuclear waste management centre. The statements made at this congress intend to make the communities more ready to contribute to the realisation of measures of the energy programme of the Federal Government.

Electric Power

3178 UNPAID COSTS OF ELECTRICAL ENERGY: HEALTH AND ENVIRONMENTAL IMPACTS FROM COAL AND NUCLEAR POWER. Ramsay, W. Baltimore, MD; Johns Hopkins University Press (1979). 180p. Resources for the Future, Inc., Washington, DC $4.95.

The umpaid costs and the types of uncertainties associated with coal-nuclear technologies are compared. A three-pronged strategy is prepared for the nation: (1) to continue a coal-nuclear mix in new plant construction; (2) to push forward on research in order to advance knowledge of the true magnitude of the impacts; and (3) to place a heavy emphasis on introducing control technologies that will mitigate the impacts which are thought to be dangerous. 20 figures, 2 tables.

Electric Power Generation

3179 (P--300-80-005) ENVIRONMENTAL IMPLICATIONS OF ELECTRIC-UTILITY SUPPLY PLANS, 1978-2000. (California Energy Commission, Sacramento (USA)). May 1980. 104p. California Energy Commission, Sacramento.

California utilities plan to meet their projected demands for electricity during the next 20 years by continuing to rely heavily on existing generation sources along with adding many new facilities. Environmental interest in these plans usually focuses on the effects of building and operating the planned new facilities. However, to get the complete picture of the environmental implications of prospective electric generation, the effects of the total system, including the contributions of existing facilities, must be considered. Of particular importance for air quality is the extent to which generation from older,inefficient power plants is displaced as new, cleaner plants go into operation. The utilities' most-recently-announced plans propose major expansion of their fossil-fuel-fired generating capacity during the next 12 years, including the state's first coal-burning plants. During this period, a significant increase in nuclear generation from plants already in construction or in advanced planning stages is also planned. Whichever supply strategy is selected, the utilities foresee a more than doubling of their installed generating capacity and electricity generated by the year 2000. Assessment of the utilities' generation plans, incorporating the scheduled capacity additions (with long-term emphasis on either coal or nuclear) into total-system operations, reveals major environmental implications associated with the plans' implementation. This report is devoted mostly to these implications (air quality, water resources and quality, land use, nuclear wastes, and coal plant ash and sludge). 43 references, 25 figures, 8 tables, and footnotes.

ENVIRONMENTAL SCIENCES, ATMOSPHERIC

Basic Studies

3180 (SAND--79-7109) METEOROLOGICAL AND AIR QUALITY DATA QUARTERLY REPORT. WIPP SITE: EDDY COUNTY, NEW MEXICO. SPRING QUARTER, MARCH-MAY 1977. Pocalujka, L.P.; Babij, E.; Catizone, P.A.; Church, H.W. (Sandia National Labs., Albuquerque, NM (USA); TRC, Inc., Wethersfield, CT (USA)). Mar 1980. Contract AC04-76DP00789. 244p. NTIS, PC A11/MF A01.

The purpose of the WIPP meteorological, air quality, and radiological measurements program was to support the environmental effort for the evaluation of the site suitability. This data report is the fourth of a series of seasonal quarterly data summaries to be issued for the southeastern New Mexico site.

Chemicals Monitoring and Transport

3181 (INIS-mf--5574, pp 92-96) DETERMINATION OF POLLUTION SPREADING AREAS FROM NUCLEAR POWER PLANTS BY MEANS OF THE POST-IRRADIATION ANALYSIS METHOD. Kalman, L.; Hirling, J. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Method for determination of pollution spreading in the earth atmosphere from a nuclear power plant is stated. The method is that a compound, the main element of which has high value of the neutron activation cross-section, under on the given meteorological conditions, is dispersed in the atmosphere. After this, in the preliminary determined points, samples of air are taken and the labeling substance contained in them is subjected to the neutron irradiation and subsequient determination of its activity is performed. On the basis of the data obtained, migration of the substance, its local concentrations and distribution of the concentrations are determined. The method for modeling of pollution spreading; choice of the labeling substance; method of production and dispersing of the labeling substance in the atmosphere; the methods of samples taking and samples preparation and analysis are given.

3182 (INIS-mf--5574, pp 85-91) ACCURACY ESTIMATION OF THE GAUSS MODEL FOR POLLUTION SPREADING ON DISCHARGE FROM ELEVATED SOURCE AND CLASSIFICATION OF THE ATMOSPHERE STATES FOR MODELING OF IMPURITIES SPREADING. Kaspshitski, A.; Adamska-Tykal, B. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

Comparisons are made of the existing methods for the classification of atmospheric steady-state conditions, and an attempt is made to estimate accuracy of the model of pollution diffusion depending on the classification. The method for estimating the accuracy of the determination is given and comparisons are made of the atmospheric steady-state classifications according to the different authors' criteria. Recommendations are given for application of the average values of the wind direction and speed for pollution spreading from an elevated source by means of the Gaussian model.

3183 (ORNL--5620, pp 21-31) EARTH SCIENCES. Tamura, T. Mar 1980.

Environmental Sciences Division. Annual progress report for period ending September 30, 1979.

Included in this Section are reports on projects which support programs in other divisions, research areas which are unique or are applicable to several programs, and projects which may lead to program status. One of the areas which is of growing interest and need is the development of disposal methods which minimize adverse impacts to the environment. The stored solids study was combined with several other projects and is reported under the Nonnuclear Solid Waste Technology section of this report. Another potential growth area of research is in atmospheric geochemistry. Several proposals were submitted to different agencies; the short report on mercury partitioning is part of a more comprehensive study of trace element biogeochemistry. Another potential growth area is physics-based mathematical model development and validation. The report in this section emphasizes a mathematical technique. Finally, a short report on the biological denitrification of high nitrate waste is provided; the unique aspect is the findings of a microbial culture of estuarine origin which can denitrify waste with much higher nitrate concentrations than previously possible with soil-cultured microbes.

3184 (UCRL--51444-79) PROGRAM REPORT FOR FY 1979: ATMOSPHERIC AND GEOPHYSICAL SCIENCES DIVISION OF THE PHYSICS DEPARTMENT. Knox, J.B.; Orphan, R.C. (eds.). (California Univ., Livermore (USA). Lawrence Livermore Lab.). Dec 1979. Contract W-7405-ENG-48. 81p. NTIS, PC A05/MF A01.

The Atmospheric and Geophysical Sciences (G) Division continues to develop and validate modeling techniques for air quality assessments. The data developed by G Division are used by government officials to help them plan and implement energy programs. Our research includes the following varied areas: regional and local effects of atmospheric releases of toxic or radioactive materials; global climatic effects of accumulated atmospheric carbon dioxide resulting mainly from the increased use of fossil fuels; behavior of pollutants in areas of complex terrain or complex meteorological processes; evaluation of hazards from LNG spills; impact of fossil-fuel emissions, particularly sulfates and acid rain. These studies help the DOE to fulfill its goal of meeting our energy needs while at the same time ensuring public health, safety, and an acceptable environment quality.

3185 USE OF THE INDICATOR ACTIVATION METHOD IN STUDIES OF THE PROPAGATION OF POLLUTANTS IN THE ATMOSPHERE. Alps, W.; Kuehn, W. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Hannover (Germany, F.R.). Inst. fuer Strahlenbotanik). Atomkernenergie/Kerntechnik ; 33: No. 2, 130-133(1979).

The pollution of the atmosphere near ground level with various noxious substances, originating in industrial irradiation centres and in connection with the generation of nuclear power, has recently prompted detailed investigations of the propagation of aerosols, taking into account the roughness of the terrain and the vegetation. For this purpose pyrotechnic aerosols have been developed. Labelled with an easily activated element, they can be released at any point in the atmosphere

in the form of pulsed, linear, or point sources for propagation investigations. The paper reports on experiments over terrain with various types of natural vegetation.

3186 COMPARATIVE BIOLOGICAL HAZARDS OF CHEMICAL POLLUTANTS AND RADIATION. Mukherjee, R.N. (International Atomic Energy Agency, Vienna (Austria). Div. of Life Sciences). International Atomic Energy Agency Bulletin ; 20: No. 3, 31-38(Jun 1978).

Chemical pollutants from conventional energy and industrial sources released to the environment presumably pose a hazard to man's health and environmental resources. Insufficient knowledge of their detailed mechanisms of interaction with the biological systems seems to provide the greatest drawback in current attempts for realistic assessment of the health risks of chemical pollutants in the short and long terms. Nevertheless, their detrimental health consequences are becoming more and more apparent as a result of recent epidemiological surveys of workers in conventional energy installations and of the chronically exposed general public. So far nuclear power has succeeded in achieving a remarkable health safety record. In view of its projected expansion, research on biological effects of low-level radiation and radionuclides should continue to re-evaluate the health safety consequences. However, a projection from past experiences together with continued efforts to improvements of health safety aspects seem to justify an expectation that the proposed expansions in the nuclear power programme should not have an unfavourable impact on the environment. The potential hazards and challenges from the associated radiation in man's environment have proved manageable. More attention now needs to be paid urgently to safeguard human health and environment against the chemical pollutants.

Radioactive Materials Monitoring and Transport

3187 (AECL--6309) EFFAIR: A COMPUTER PROGRAM FOR ESTIMATING THE DISPERSION OF ATMOSPHERIC EMISSIONS FROM A NUCLEAR SITE. Dormuth, K.W.; Lyon, R.B. (Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). Nov 1978. 38p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Analysis of the transport of material through the turbulent atmospheric boundary layer is an important part of environmental impact assessments for nuclear plants. Although this is a complex phenomenon, practical estimates of ground level concentrations downwind of release are usually obtained using a simple Gaussian formula whose coefficients are obtained from empirical correlations. Based on this formula, the computer program EFFAIR has been written to provide a flexible tool for atmospheric dispersion calculations. It is considered appropriate for calculating dilution factors at distances of 10^2 to 10^4 metres from an effluent source if reflection from the inversion lid is negligible in that range.

3188 (AECL--6319) BIBLIOGRAPHY OF AECL PUBLICATIONS ON ENVIRONMENTAL RESEARCH. Hawley, N.J. (Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). Dec 1978. 40p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Publications in the open literature on environmental research performed by AECL personnel are listed chronologically with the first entry dated 1951. It is intended that the bibliography should be brought up to date yearly.

3189 (AIAU--78306) COMPUTERPROGRAM FOR CALCULATING THE RADIOLOGICAL CONSEQUENCES OF SHORTTIME RADIOACTIVE RELEASES FROM NUCLEAR INSTALLATIONS. Boeck, H.; Strubegger, M. (Atominstitut der Oesterreichischen Universitaeten, Vienna). Sep 1978. 38p. (In German). Dep. NTIS (US Sales Only), PC A06/MF A01.

Modular computer program STRISK calculates individual and collective doses as well as expected consequences after release of radioactive nuclides into the atmosphere. The calculation of the individual dose is performed for maximal ten distances from the point of emission in four directions. These 40 points are used to calculate the collective doses in 27 annular space sectors, nine of them in main wind direction and 18 adjacent sectors left and right to the main direction. The method is based on the Pasquill-diffusion model and is modified for the following: duildingwake; plum rise; height dependent diffusionparameter; radioactive decay and build up of daughter nuclides; fallout; washout within any distance from the point of emission; multiple reflexion of the cloud at inversion layers and at the ground; possibility to take into account a change of the stability class and/or the windspeed and/or the height of the inversionlayer during the time of atmospheric transport and height dependent windspeed. The calculation of the doses is done for five types of body tissues: whole body; lungs; gastro-intestinal-tract; thyroid and bone-marrow taking into account the doses from resulting from gammasubmersion (calculated by integration over the actual cloud volume considering the geometry of the cloud, variations in attenuation between the source and the individual and scattering of gammarays from materials outside this direct path); inhalation of radioactive nuclides from the passing gloud; irradiation from contaminated ground (considering radioactive decay, movement of the radionuclides down into the soil and formation of daughter-nuclides); inhalation of resuspended radioactive particles. The calculation of the entire dose is done for short-time-exposure (dose received within one day after the emission) and long-term-exposure (dose received within any longer period).

3190 (BNL--51031) 1978 ENVIRONMENTAL MONITORING REPORT. Naidu, J.R. (ed.). (Brookhaven National Lab., Upton, NY (USA)). Apr 1979. Contract EY-76-C-02-0016. 100p. Dep. NTIS, PC A05/MF A01.

The environmental levels of radioactivity and other pollutants found in the vicinity of Brookhaven National Laboratory (BNL) during 1978 are summarized. As an aid in the interpretation of the data, the amounts of radioactivity and other pollutants released in airborne and liquid effluents from Laboratory facilities to the environment are also indicated. The environmental data includes external radiation levels; radioactive air particulates; tritium and iodine concentrations; the amounts and concentrations of radioactivity in and the water quality of the stream into which liquid effluents are released; the concentrations of radioactivity in sediments and biota from the stream; the concentrations of radioactivity in and the water quality of ground waters underlying the Laboratory; and concentrations of radioactivity in milk samples obtained in the vicinity of the Laboratory.

3191 (CONF-791009--39) POTENTIAL HEALTH EFFECTS OF RADON-222 TO THE GENERAL PUBLIC FROM URANIUM MILLING. Travis, C.C.; McDowell-Boyer, L.M. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 4p. Dep. NTIS, PC A02/MF A01.
From International conference on energy use management; Los Angeles, CA, USA (22 Oct 1979).
This paper presents a discussion of the potential health risk that may result from present and future radon-222 releases at uranium mill tailings piles situated in the United States. These risks are contrasted with the health risk continually present as a consequence of background levels of radon-222 naturally present in the atmosphere. It is estimated that the current risk of lung cancer in the population due to uranium milling is less than 10^{-4} times the natural risk. In addition, it is estimated that future risks due to mill tailings will be approximately a factor of 10^5 lower than the natural radon-222 risk to the general public if stabilization of tailings piles is implemented. Thus, it appears the incremental population risk due to milling is insignificant with respect to the natural risk.

3192 (CONF-791103--107) IODINE-129 DOSE TO THE WORLD POPULATION FROM THE NUCLEAR POWER INDUSTRY. Kocher, D.C.; Till, J.E. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 8p. Dep. NTIS, PC A02/MF A01.
From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).
Because of the 15.7 million-year half life for ^{129}I and the mobility of iodine in the environment, releases of ^{129}I result in potential radiological impacts on the entire world population essentially in perpetuity. This paper presents estimates of dose to the world population from releases of ^{129}I by the world nuclear power industry during the years 1975 to 2020.

3193 (CONF-800607--38) DOSE-RATE CONVERSION FACTORS FOR EXTERNAL EXPOSURE TO PHOTONS AND ELECTRONS. Kocher, D.C. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 5p. NTIS, PC A02/MF A01.
From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).
This paper describes recent modifications of the computer code DOSFACTER, which was developed for the purpose of estimating dose-rate conversion factors for external exposure to photons and electrons emitted by radionuclides dispersed in the environment. The modifications and additions which have been made to the calculations outlined above include the following: (1) calculation of electron dose-rate factors for radiosensitive portions of the skin; (2) incorporation of improved estimates of organ dose-rate factors for photons; and (3) calculation of dose-rate factors for additional radio nuclides and incorporation of updated radioactive decay data for all radionuclides. The revised dose-rate factors described in this paper are available upon request from the Radiation Shielding Information Center at Oak Ridge National Laboratory.

3194 (DOE/EDP--0056) ENVIRONMENTAL DEVELOPMENT PLAN FOR SPECIAL NUCLEAR MATERIALS PRODUCTION. (Department of Energy, Washington, DC (USA). Assistant Secretary for Environment). Jul 1980. 39p. NTIS, PC A03/MF A01.
The scope of this Environmental Development Plan (EDP) follows the Special Nuclear Materials (SNM) Production category of the Department of Energy budget. It includes the process steps and facilities necessary for the production of plutonium and tritium for Government needs and the production of some other radioactive materials that will be used for heat and radiation sources by domestic and international customers. Most of the SNM production is now carried out at the Savannah River Plant, but plutonium is still produced at Hanford. This EDP does not address the mining, milling, or enrichment of the uranium, but it does consider the reactor fuel (and target) fabrication facilities. The production reactors and the spent fuel processing plants and their effluents are discussed here, but the defense wastes from them are treated in a separate EDP. The scope does not include transportation, decontamination and decommissioning, safeguards and security, or use of the SNM products.

3195 (DOE/PNRO--0292-T1) 1978 ANNUAL ENVIRONMENTAL REPORT. VOLUME 2. RADIOLOGICAL. (Duquesne Light Co., Shippingport, PA (USA)). 1978. Contract EY-76-C-11-0292. 120p. Dep. NTIS, PC A06/MF A01.
The Radiological Environmental Monitoring Program conducted during 1978 in the vicinity of the Beaver Valley Power Station and the Shippingport Atomic Power Station is described. The program consists of on-site sampling of water and gaseous effluents and off-site monitoring of water, air, river sediments, food pathway samples, and radiation levels in the vicinity of the site. The results of this monitoring during 1978 are discussed. The environmental program outlined in the Beaver Valley Power Station Technical Specifications was followed throughout 1978. There were no radioactive liquid effluents released from the Shippingport Atomic Power Station, since radioactive liquids are processed and re-cycled within the plant systems. The results of this environmental monitoring program show that Shippingport Atomic Power Station and Beaver Valley Power Station operations have not adversely affected the surrounding environment.

3196 (DOE/TIC--11148) ENVIRONMENTAL REPORT FOR CALENDAR YEAR 1978 ON RADIOLOGICAL AND NONRADIOLOGICAL PARAMETERS. Evans, R.G.; Woodward, J.C. (Battelle Columbus Labs., OH (USA)). 1978. Contract W-7405-ENG-92. 64p. Dep. NTIS, PC A04/MF A01.
Radionuclide releases to the environment from Battelle's West Jefferson Nuclear Sciences and King Avenue Sites were monitored for CY 1978. This included air and water emissions from the West Jefferson and King Avenue Sites and water, grass, fish, food crop, sediment, and soil samples taken from the area surrounding the West Jefferson Site. Nonradioactive effluents in water discharged from the West Jefferson Site were also monitored.

3197 (DP--1551) REAL TIME QUALITY CONTROL OF METEOROLOGICAL DATA USED IN SRP'S EMERGENCY RESPONSE SYSTEM. Pendergast, M.M. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). May 1980. Contract AC09-76SR00001. 18p. NTIS, PC A02/MF A01.
The Savannah River Laboratory's WIND minicomputer system allows quick and accurate assessment of an accidental release at the Savannah River Plant using data from eight meteorological towers. The accuracy of the assessment is largely determined by the

accuracy of the meteorological data; therefore quality control is important in an emergency response system. Real-time quality control of this data will be added to the WIND system to automatically identify inaccurate data. Currently, the system averages the measurements from the towers to minimize the influence of inaccurate data being used in calculations. The computer code used in the real-time quality control has been previously used to identify inaccurate measurements from the archived tower data.

3198 (DP--1552) COMPUTER CODE TO ASSESS ACCIDENTAL POLLUTANT RELEASES. Pendergast, M.M.; Huang, J.C. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Jul 1980. Contract AC09-76SR00001. 22p. NTIS, PC A02/MF A01.

A computer code was developed to calculate the cumulative frequency distributions of relative concentrations of an air pollutant following an accidental release from a stack or from a building penetration such as a vent. The calculations of relative concentration are based on the Gaussian plume equations. The meteorological data used for the calculation are in the form of joint frequency distributions of wind and atmospheric stability.

3199 (EGG--1183-1726) AERIAL RADIOLOGICAL SURVEY OF THE AREA SURROUNDING THE EDWIN I. HATCH NUCLEAR PLANT, BAXLEY, GEORGIA. Hilton, L.K. (EG and G, Inc., Las Vegas, NV (USA). Energy Measurements Group). Nov 1978. Contract EY-76-C-08-1183. 18p. Dep. NTIS, PC A02/MF A01.

An airborne radiological survey of a 2146 km^2 area surrounding the Edwin I. Hatch Nuclear Plant was made 28-31 March 1977. Detected radioisotopes, and their associated gamma ray exposure rates, were consistent with that expected from the normal background emitters. Count rates observed at 152 m altitude are converted to equivalent exposure rates at 1 m above the ground, and are presented in the form of an isopleth map. Exposure rates measured with small portable instruments and soil sample analysis showed agreement with the airborne data.

3200 (EGG--1183-1747) AERIAL RADIOLOGICAL SURVEY OF THE AREA SURROUNDING THE CHEM-NUCLEAR DISPOSAL FACILITY AND ALLIED GENERAL NUCLEAR SERVICES FACILITY, BARNWELL, SOUTH CAROLINA. (EG and G, Inc., Las Vegas, NV (USA). Energy Measurements Group). Jun 1979. Contract AC08-76NV01183. 12p. NTIS, PC A02/MF A01.

An aerial radiological survey to measure terrestrial γ radiation was carried out over the Chem-Nuclear Disposal Facility and the Allied General Nuclear Services Facility located near Barnwell, South Carolina. At the time of the survey (November 1977) the nuclear fuel Facility had not begun operations and no radioactive materials were being processed. Gamma ray data were collected over an 8 km^2 area centered on the Facilities by flying east-west lines spaced 60 m apart. Processed data indicated that detected radioisotopes and their associated gamma ray exposure rates were consistent with those expected from normal background emitters, except at certain locations described in this report. Average exposure rates 1 m above the ground, as calculated from the aerial data, are presented in the form of an isopleth map. No ground sample data were taken at the time of the aerial survey.

3201 (EGG--1183-1759) AERIAL RADIATION SURVEYS. Jobst, J. (EG and G Idaho, Inc., Idaho Falls (USA)). 1980. Contract EY-76-C-08-1183. 11p. (CONF-800334--8). Dep. NTIS, PC A02/MF A01.

From 2. DOE environmental control symposium; Reston, VA, USA (17 Mar 1980).

A recent aerial radiation survey of the surroundings of the Vitro mill in Salt Lake City shows that uranium mill tailings have been removed to many locations outside their original boundary. To date, 52 remote sites have been discovered within a 100 square kilometer aerial survey perimeter surrounding the mill; 9 of these were discovered with the recent aerial survey map. Five additional sites, also discovered by aerial survey, contained uranium ore, milling equipment, or radioactive slag. Because of the success of this survey, plans are being made to extend the aerial survey program to other parts of the Salt Lake valley where diversions of Vitro tailings are also known to exist.

3202 (EGG--1183-1760) GRAPHIC OVERVIEW SYSTEM FOR DOE'S EFFLUENT AND ENVIRONMENTAL MONITORING PROGRAMS. Burson, Z.G.; Elle, D.R. (EG and G, Inc., Las Vegas, NV (USA). Energy Measurements Group). Mar 1980. Contract AC08-76NV01183. 33p. NTIS, PC A03/MF A01.

The Graphic Overview System is a compilation of photos, maps, overlays, and summary information of environmental programs and related data for each DOE site. The information consists of liquid and airborne effluent release points, on-site storage locations, monitoring locations, aerial survey results, population distributions, wind roses, and other related information. The relationships of different environmental programs are visualized through the use of colored overlays. Trends in monitoring data, effluent releases, and on-site storage data are also provided as a corollary to the graphic display of monitoring and release points. The results provide a working tool with which DOE management (headquarters and field offices) can place in proper perspective key aspects of all environmental programs and related data, and the resulting public impact of each DOE site.

3203 (EML--360) CALIBRATION OF A MODIFIED SIERRA MODEL 235 SLOTTED CASCADE IMPACTOR. Knuth, R.H. (Department of Energy, New York (USA). Environmental Measurements Lab.). Jul 1979. 24p. Dep. NTIS, PC A02/MF A01.

For measurements of ore dust in uranium concentrating mills, a Sierra Model 235 slotted cascade impactor was calibrated at a flow rate of .21 m^3/min, using solid monodisperse particles and an impaction surface of Whatman No. 41 filter paper soaked in mineral oil. The reduction from the impactor's design flow rate of 1.13 m^3/min (40 cfm) to 0.21 m^3/min (7.5 cfm) increased the stage cut-off diameters by an average factor of 2.3, a necessary adjustment because of the anticipated large particle sizes of ore dust. The underestimation of mass median diameters, often caused by the rebound and reentrainment of solid particles from dry impaction surfaces, was virtually eliminated by using the oiled Whatman No. 41 impaction surface. Observations of satisfactory performance in the laboratory were verified by tests of the impactor in ore mills.

3204 (EML--373) MEASURED HOURLY AND DAILY AVERAGE ^{85}KR CONCENTRATIONS WITHIN 10 KM OF THE SAVANNAH RIVER PLANT. Gogolak, C.V.; Beck, H.L.; Pendergast, M.M. (Department of Energy,

New York (USA). Environmental Measurements Lab.). Aug 1980. 130p. NTIS, PC A07/MF A01.

Mean hourly ground-level ^{85}Kr concentrations measured at six locations within 10 km of the Savannah River Plant chemical separations facilities during calendar year 1976 are presented in tabular form along with the mean daily concentrations for each site. These data, obtained with arrays of thin window G-M counters especially designed for this purpose, can be used to test point source atmospheric dispersion models.

3205 (EPA--520/1-79-009) AIRDOS-EPA: A COMPUTERIZED METHODOLOGY FOR ESTIMATING ENVIRONMENTAL CONCENTRATIONS AND DOSE TO MAN FROM AIRBORNE RELEASES OF RADIONUCLIDES. Moore, R.E.; Baes, C.F. III; McDowell-Boyer, L.M.; Watson, A.P.; Hoffman, F.O.; Pleasant, J.C.; Miller, C.W. (Environmental Protection Agency, Washington, DC (USA). Office of Radiation Programs). Dec 1979. 265p. Environmental Protection Agency, Washington, DC.

The AIRDOS-EPA computer code is a methodology, designed for use on IBM-360 computers, that estimates radionuclide concentrations in air; rates of deposition on ground surfaces; ground surface concentrations; intake rates via inhalation of air and ingestion of meat, milk, and fresh vegetables; and radiation doses to man from airborne releases of radionuclides. This report describes the atmospheric and terrestrial transport models used in the code, their computer implemetation, and the applicability of the code to the assessment of radiological impacts. A listing of the code and a demonstration run of the code are presented in the appendices.

3206 (EUR--5805) MEASUREMENT OF ENVIRONMENTAL RADIOACTIVITY. ISPRA 1976. Dominici, G. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1977. 50p. (In Italian). Dep. NTIS (US Sales Only), PC A04/MF A01.

In this report there are briefly described the measurements of environmental radioactivity performed during 1976 by the site survey group of the Protection Division of the Euratom Joint Research Centre - Ispra Establisment. Data are given on the concentrations of ^{90}Sr, ^{137}Cs and other radionuclides in precipitation, air, waters, herbage milk and radioactive effluents. The environmental contamination is mainly world-wide fall out.

3207 (EUR--6180) MEASUREMENT OF ENVIRONMENTAL RADIOACTIVITY. ISPRA 1977. Dominici, G. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1979. 50p. (In Italian). Dep. NTIS (US Sales Only), PC A04/MF A01.

The measurements of environmental radioactivity performed during 1977 by the site survey group of the Protection Division of the Euratom Joint Research Centre - Ispra Establishement are described. Data are given on the concentrations of ^{90}Sr, ^{137}Cs and other radionuclides in precipitation, air, waters, herbage, milk and radioactive effluents. The environmental contamination is mainly world-wide fall out.

3208 (IDO--12082(79)) 1979 ENVIRONMENTAL MONITORING PROGRAM REPORT FOR IDAHO NATIONAL ENGINEERING LABORATORY SITE. (Idaho National Engineering Lab., Idaho Falls (USA)). May 1980. Contract W-7405-ENG-82. 44p. Dep. NTIS, PC A03/MF A01.

The results of the 1979 environmental monitoring programs have shown the presence of natural radioactivity and worldwide fallout, but showed no INEL-produced radioactivity detected in the offsite environs. Concentrations and doses from radioactive materials discharged during Site operations were of no health consequence to the surrounding populations. Air, water, and foodstuff samples are routinely collected from around the INEL boundary and from locations distant from the INEL Site. This report describes the analyses and comparison of such samples to determine if there has been any contribution from INEL operations.

3212 (INIS-mf--5574, pp 40-45) UTILIZATION OF THE TEMPERATURE GRADIENTS MEASUREMENTS AND CLIMATOLOGICAL DATA IN DETERMINATION OF PERMISSIBLE LIMITS OF RADIOACTIVE GASES DISCHARGE AT NUCLEAR POWER PLANTS. Tykal, A.; Adamska-Tykal', B. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

On the basis of many years meteorological investigations relationships between the concentrations of discharge and gaseous radioactive substances around a nuclear power plant are determined. The mathematical model of radioactive substances diffusion into the earth atmosphere is given, taking into consideration the meteorological situation in the region of the nuclear power plant and the topography of the district. The meteorological dilution

coefficient of discharges from the nuclear power plant in the atmosphere depending on the azimuth and the distance from the chimney and also depending on the time of the coefficient determination are given.

3213 (INIS-mf--5574, pp 77-84) FORECAST OF AIR POLLUTION AROUND NUCLEAR INSTALLATIONS ON THE BASIS OF METEOROLOGICAL MEASUREMENTS. Tykal, A.; Adamska-Tykal, B. 1978. (In Russian).

From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).

A method is considered for estimation of the radiological hazard in the region of the Central Institute of nuclear research. This method is based on the results of measurements conducted at the nearest to the Institute meteorological station. Factors influencing conditions of gas and dust transport in the atmosphere were investigated. The data are gained on the specific activity distribution of radioactive gases around the Institute and in different seasons. The radius of the territory having maximum pollutions concentration and the maximum season activity have been determined.

3214 (IS--4734) ENVIRONMENTAL MONITORING AT AMES LABORATORY: CALENDAR YEAR 1979. Voss, M.D. (Ames Lab., IA (USA)). Apr 1980. Contract W-7405-ENG-82. 49p. NTIS, PC A03/MF A01.

The results and conclusions from the Ames Laboratory environmental monitoring programs for the Ames Laboratory Research Reactor (ALRR) are presented. The major areas of radiological monitoring were ALRR effluent air, environmental air, effluent water and environmental water. Analysis of air samples collected at the ALRR site showed detectable amounts of ^{60}Co. This isotope was 1.5×10^{-4}% of the concentration guide (1) and was probably due to ALRR operations. The radioisotope of significance in the ALRR stack effluent was tritium. The average yearly individual dose from ^{3}H at the exclusion fence was estimated to 0.0038 mRem and the estimated dose to the entire population within an 80 Km (50 mile) radius of the ALRR was 6.31 man-Rem. These values are 0.00076% and 0.0063%, respectively, of the doses derived from the concentration guides. In the radioactive liquid waste released to the City of Ames sewage system from the ALRR complex, ^{3}H was the predominant isotope. After dilution with other waste water from the ALRR complex, the potential dose was not more than 0.59% of the dose derived from the concentration guide.

3215 (Juel--1577) LIGA - A PROGRAM TO CALCULATE THE LOCAL INDIVIDUAL GAMMA SUBMERSION DOSE DUE TO WASTE AIR PLUMES OF NUCLEAR FACILITIES. Brenk, H.D.; Rohloff, F.; Brunen, E.; Geiss, H.; Vogt, K.J. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Zentralabteilung Strahlenschutz). Jan 1979. 77p. (In German). Dep. NTIS (US Sales Only), PC A05/MF A01.

An improved model to calculate the gamma submersion dose was developed which integrates over the dose contributions of the volume elements of the semi-space and takes absorption and scattering of gamma radiation in the air into consideration. Diffusion parameters were measured for all kinds of weather (diffusion categories) at an emission height of 50 or 100 m for a medium to high surface roughness. From the short-term diffusion factors, long-term diffusion factors have been calculated by superposition of single emissions on the basis of statistics of diffusion meteorology. These long-term diffusion factors describe the environmental burden due to continuously emitting sources in all sectors of a 12-sector wind rose. The contributions of sub-sectors are determined without impermissible neglection for the first time. The influence of important parameters, e.g. the gamma energy of radionuclides in the waste air plume, is investigated in sensitivity analyses. The problem is discussed which error has to be assumed if instead of an exact calculation using the three-dimensional diffusion statistics of a site the gamma submersion factor of a West German standard site is employed which would only have to be multiplied with the local wind direction frequency distribution of the site in the 12 sectors of the wind direction.

3216 (KEK--78-20) RADIOLOGICAL IMPACT OF HIGH-ENERGY ACCELERATORS ON THE ENVIRONMENT. Thomas, R.H. (National Lab. for High Energy Physics, Oho, Ibaraki (Japan)). Nov 1978. 67p. NTIS (US Sales Only), PC A05/MF A01.

The potential radiological impact of high-energy, high-intensity accelerators in the environment is discussed. It is shown that there are three sources of radiation exposure to the general public resulting from the operation of high-energy accelerators. In order of importance these are (a) the prompt radiation field, produced when the accelerator is operating; (b) the release of radionuclides and aerosols into the atmosphere; and (c) the production of radionuclides in the groundwater system around the accelerator. Of these three sources, (a) is dominant and typically exceeds (b) by about an order of magnitude. To date, experience at many accelerator laboratories has shown that the quantity of accelerator-produced radionuclides released to nearby groundwater systems (c) is either extremely small or immeasurable. The population dose equivalent resulting from the operation of several large high-energy facilities is compared.

3217 (KFK--2750, pp 4800-13-4800-21) ANALYTICAL AND EXPERIMENTAL INVESTIGATION OF THE ATMOSPHERIC DISPERSION OF RADIOACTIVE GASES IN THE LOCAL RANGE (UP TO 15 KM DISTANCE, EMISSION HEIGHT =< 100 M). Becker, M.; Hiller, J.; Huebschmann, W.; Nester, K.; Schuettelkopf, H.; Thomas, P.; Vogt, S. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Sicherheit - Bereich 1). Oct 1979. (In German).

Semiannual report 1978/2.

The diffusion parameters evaluated from the single experiments have been combined into parameter sets for sigmasub(y) and sigmasub(z) respectively. The sigma curves depend from the source distance and the diffusion category. The curve families have been smoothened and centered in order to refer to the most frequent turbulence intensity in each diffusion category.

3218 (KFK--2750, pp 4800-28-4800-32) INVESTIGATION OF THE ATMOSPHERIC DISPERSION OF RADIOACTIVE GASES AND AEROSOLS IN THE LOCAL RANGE (UP TO 15 KM DISTANCE) AT EMISSION HEIGHTS ABOVE 100 M. Becker, M.; Hiller, J.; Nester, K.; Schuettelkopf, H.; Thomas, P.; Vater, S.; Vogt, S. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Sicherheit - Bereich 1). Oct 1979. (In German).

Semiannual report 1978/2.

On the basis of the tracer experiments a preliminary curve family of the diffusion parameters sigmasub(y) and sigmasub(z) for emission heights > 130 m has been compiled. Further experiments are necessary to confirm this curve family. The sigmasub(phi) frequency distribution of the Spoeck data has been compared to those of the KfK (100 m height at the meteorological tower). As could be expected, much smaller sigmasub(phi) data have been measured at unstable, somewhat smaller at neutral, and about the same at stable situations.

3219 (KFK--2750, pp 4800-22-4800-28) INVESTIGATION OF THE ATMOSPHERIC DISPERSION OF RADIOACTIVE GASES AND AEROSOLS IN THE MESOSCALE (MORE THAN 15 KM DISTANCE). Thomas, P.; Vogt, S. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Sicherheit - Bereich 1). Oct 1979. (In German).
Semiannual report 1978/2.
The tetroon tracks have been evaluated with respect to atmospheric parameters. It is shown that the time constant of the vertical oscillations as well as the horizontal diffusion parameter sigmasub(y), derived from several consecutive tetroon flights, fall within the expected range.

3220 (LA--8200-ENV) ENVIRONMENTAL SURVEILLANCE AT LOS ALAMOS DURING 1979. (Los Alamos Scientific Lab., NM (USA)). Apr 1980. Contract W-7405-ENG-36. 149p. Dep. NTIS, PC A07/MF A01.
This report documents the environmental surveillance program conducted by the Los Alamos Scientific Laboratory (LASL) in 1979. Routine monitoring for radiation and radioactive or chemical substances was conducted on the Laboratory site and in the surrounding region to determine compliance with appropriate standards and permit early identification of possible undesirable trends. Results and interpretation of the data for 1979 on penetrating radiation, chemical and radiochemical quality of ambient air, surface and ground water, municipal water supply, soils and sediments, food, and airborne and liquid effluents are included. Comparisons with appropriate standards and regulations or with background levels from natural or other non-LASL sources provide a basis for concluding that environmental effects attributable to LASL operations are minor and cannot be considered likely to result in any hazard to the population of the area. Results of several special studies provide documentation of some unique environmental conditions in the LASL environs.

3221 (LBL--1(Vol.3)) SURVEY OF INSTRUMENTATION FOR ENVIRONMENTAL MONITORING: MAJOR UPDATE. VOLUME 3. RADIATION. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Sep 1979. Contract W-7405-ENG-48. 448p. Dep. NTIS, PC A19/MF A01.
This is the third volume of a four-volume (seven-part) series, the culmination of a comprehensive survey of instrumentation for environmental monitoring. Consideration is given to instruments and techniques presently in use and to those developed for other purposes but having possible applications to radiation monitoring. The results of the survey are given as descriptions of the physical and operating characteristics of available instruments, critical comparisons among instrumentation methods, and recommendations of promising methodology and development of new instrumentation. Information is also given regarding the pollutants to be monitored, their characteristics and forms, their sources and pathways, their effects on the ecosystem, and the means of controlling them through process and regulatory controls. The discussion is presented under sections entitled radiation sources; instrumentation: by type of radiation or instrument type; and, instrumentation for specific radionuclides. (JGB)

3222 (MLM--2700) ANNUAL ENVIRONMENTAL MONITORING REPORT: CALENDAR YEAR 1979. Farmer, B.M.; Carfagno, D.G. (Mound Facility, Miamisburg, OH (USA)). 25 Apr 1980. Contract EY-76-C-04-0053. 49p. Dep. NTIS, PC A03/MF A01.
The local environment surrounding Mound Facility was monitored primarily for tritium and plutonium-238. The results are reported for CY-1979. The environmental parameters analyzed included air, water, vegetation, foodstuffs, and sediment. The average concentrations of plutonium-238 and tritium were within the applicable standards for radioactive species.

3223 (MLM--2703(OP)) DEVELOPMENT OF A RADON MONITORING PLAN FOR CANONSBURG, PENNSYLVANIA. Yates, W.G.; Jenkins, P.H. (Mound Facility, Miamisburg, OH (USA)). 1980. Contract EY-76-C-04-0053. 4p. (CONF-800334--9). NTIS, PC A02/MF A01.
From 2. DOE environmental control symposium; Reston, VA, USA (17 Mar 1980).
The site of the former Vitro Rare Metals Plant, now called the Canon Industrial Park, has been found to be contaminated with large quantities of radioactive wastes generated during former radium and uranium recovery operations. This report describes the development of a comprehensive radon monitoring program in the environment surrounding the site. (ACR)

3224 (MLM--2758) RADON MONITORING PROGRAM, FEBRUARY-APRIL 1980. Yates, W.G.; Hagee, G.R.; Jenkins, P.H. (Mound Facility, Miamisburg, OH (USA)). 21 Aug 1980. Contract AC04-76DP00053. 12p. NTIS, PC A02/MF A01.
The radon monitoring plan for Canonsburg, Pa., was implemented on 29 January 1980. Thirty-eight offsite locations were being monitored by the end of the quarter. Additional locations were planned to fulfill DOE Division of Environmental Control Technology requests. Overall distribution of the radon measurements has not yet been determined.

3225 (ND-R--52(W)) ASSESSMENT OF THE ACCEPTABILITY OF PERFORMANCE OF INSTALLED IODINE TRAPPING PLANT. Hyam, E.D.; Manley, A.J. (UKAEA Windscale Nuclear Power Development Labs.). Dec 1978. 18p. Dep. NTIS (US Sales Only), PC A02/MF A01.
Procedures have been developed for estimating, at a stated level of confidence, how long a trapping plant can be relied upon to perform its duties and for determining how this estimate depends on the values of the input parameters and their invariances. Analysis of the relationships involved has shown that the frequency with which plant has to be tested and the charcoal changed is reduced if: (a) the K-value of the charcoal in the as-received condition is high; (b) the bed stay-time is large; (c) provision is made for sampling the charcoal during service and measuring its K-value; and (d) the variances of the K-values for the charcoal of the bed stay-time are small. Attention is drawn to the advantages of continuously recording the gas flows through

the sorbent bed as a function of time and of maintaining by-pass leakage at as low a level as possible. It has been shown that, in order to avoid having to renew the charcoal at the time of the first re-test, the K-value of the fresh charcoal and the value of bed stay-time must exceed definable limits.

3226 (ND-R--53(W)) USER'S GUIDE TO THE PROGRAMS ITRAP-A, ITRAP-B, ITRAP-S AND ITRAP-L. Manley, A.J. (UKAEA Windscale Nuclear Power Development Labs.). Mar 1979. 37p. Dep. NTIS (US Sales Only), PC A03/MF A01.

The four programs ITRAP-A, ITRAP-B, ITRAP-S and ITRAP-L are designed to calculate parameters required for assessing the performance of iodine trapping plant installed in the ventilation systems of enclosures in which radioactive materials are handled. This guide sets out the input to and output from these programs for plant managers and gives sufficient program details to enable the users to assess the accuracy of the methods used.

3227 (NLCO--004EV) REVIEW OF RADON MONITORING AT THE DOE-NIAGARA FALLS STORAGE SITE. Humphrey, H.W. (National Lead Co. of Ohio, Cincinnati (USA)). 31 Mar 1980. Contract AC05-76OR01156. 85p. NTIS, PC A05/MF A01.

Radon-222 monitoring results over the period May 1978 to February 1980 are reviewed and summarized. Radon-222 levels in inhabited areas surrounding the storage site were all found to be no greater than 0.5 pCi/l compared to an average ambient air background for the region of 0.23 +- 0.01 pCi/l. Ambient air radon levels rapidly approach background within 0.5 to 1.0 mile from the storage site. Weekly surveillance information, averaged over a year, indicates that six of the eight fenceline ambient air monitoring stations showed concentrations well within the concentration guide limit of 3.0 pCi/l for uncontrolled areas. The remaining two adjacent stations (along the western boundary fence) showed elevated average radon levels of 4.28 and 5.68 pCi/l, respectively. The higher levels at the western boundary fence are attributed to the Spoil Pile area, which is within a hundred feet of the present boundary fence. Maxima were observed in both soil air and ambient air monthly radon levels, which correlate closely with meteorological parameters. A spoil pile radon flux survey is described which identifies radon source isopleths and quantifies yearly average pile emissions. Average offsite radon flux from soil was found to be 0.14 +- 0.07 pCi/m^2-s. Weighted average (yearly) radon flux from the spoil pile was found to be 407 pCi/m^2-s. The effects of applying asphaltic emulsion, or water, to reduce radon emissions are discussed. Application of asphaltic emulsion to residues in storage buildings resulted in an average reduction in radon emissions of 94%. Variables affecting radon emanation and measurement are discussed, including: instrumentation; meteorological conditions; and source distribution and magnitude. Recommendations are suggested to improve the existing radon monitoring program and future useful innovations are discussed.

3228 (NRPB-R--91) MODEL FOR SHORT AND MEDIUM RANGE DISPERSION OF RADIONUCLIDES RELEASED TO THE ATMOSPHERE. THE FIRST REPORT OF A WORKING GROUP ON ATMOSPHERIC DISPERSION. Clarke, R.H. (National Radiological Protection Board, Harwell (UK)). Sep 1979. 74p. NTIS (US Sales Only), PC A04/MF A01.

A Working Group was established to give practical guidance on the estimation of the dispersion of radioactive releases to the atmosphere. The dispersion is estimated in the short and medium range, that is from about 100 m to a few tens of kilometres from the source, and is based upon a Gaussian plume model. A scheme is presented for categorising atmospheric conditions and values of the associated dispersion parameters are given. Typical results are presented for releases in specific meteorological conditions and a scheme is included to allow for durations of release of up to 24 hours. Consideration has also been given to predicting longer term average concentrations, typically annual averages, and results are presented which facilitate site specific calculations. The results of the models are extended to 100 km from the source, but the increasing uncertainty with which results may be predicted beyond a few tens of kilometres from the source is emphasised. Three technical appendices provide some of the rationale behind the decisions made in adopting the various models in the proposed dispersion scheme.

3229 (ORNL--5452) RADIOLOGICAL SURVEY OF THE INACTIVE URANIUM-MILL TAILINGS AT SLICK ROCK, COLORADO. Haywood, F.F.; Perdue, P.T.; Chou, K.D.; Ellis, B.S. (Oak Ridge National Lab., TN (USA)). Jun 1980. Contract W-7405-ENG-26. 92p. NTIS, PC A05/MF A01.

Results of a radiological survey of two inactive mill sites near Slick Rock, Colorado, in April 1976 are presented. One mill, referred to in this report as North Continent (NC), was operated primarily for recovery of radium and vanadium and, only briefly, uranium. The Union Carbide Corporation (UCC) mill produced a uranium concentrate for processing elsewhere and, although low-level contamination with ^{226}Ra was widespread at this site, the concentration of this nuclide in tailings was much lower than at the NC site. The latter site also has an area with a high above-ground gamma dose rate (2700 μR/hr) and a high-surface ^{226}Ra concentration (5800 pCi/g). This area, which is believed to have been a liquid disposal location during plant operations, is contained within a fence. A solid disposal area outside the present fence contains miscellaneous contaminated debris. The estimated concentration of ^{226}Ra as a function of depth, based on gamma hole-logging data, is presented for 27 holes drilled at the two sites.

3230 (ORNL--5455) RADIOLOGICAL SURVEY OF THE INACTIVE URANIUM-MILL TAILINGS AT RIFLE, COLORADO. Haywood, F.F.; Jacobs, D.J.; Ellis, B.S.; Hubbard, H.M. Jr.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Jun 1980. Contract W-7405-ENG-26. 101p. NTIS, PC A06/MF A01.

Results of radiological surveys of two inactive uranium-mill sites near Rifle, Colorado, in May 1976 are presented. These sites are referred to as Old Rifle and New Rifle. The calculated ^{226}Ra inventory of the latter site is much higher than at the older mill location. Data on above-ground measurements of gamma exposure rates, surface and near-surface concentration of ^{226}Ra in soil and sediment samples, concentration of ^{226}Ra in water, calculated subsurface distribution of ^{226}Ra, and particulate radionuclide concentrations in air samples are given. The data serve to define the extent of contamination in the vicinity of the mill sites and their immediate surrounding areas with tailings particles. Results of these measurements were utilized as technical input for an engineering assessment of these two

sites.

3231 (ORNL--5458) RADIOLOGICAL SURVEY OF THE INACTIVE URANIUM-MILL TAILINGS AT AMBROSIA LAKE, NEW MEXICO. Haywood, F.F.; Christian, D.J.; Ellis, B.S.; Hubbard, H.M. Jr.; Lorenzo, D.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Jun 1980. Contract W-7405-ENG-26. 78p. NTIS, PC A05/MF A01.

The inactive uranium-mill tailings pile at Ambrosia Lake, New Mexico, contains approximately 1520 Ci of ^{226}Ra in 2.4 million metric tons of tailings covering an area of 43 hectares. All of the former mill buildings were intact and, at the time of this survey, several were in use. The tailings have not been stabilized, but the crusty surface is reported to be resistant to wind erosion. The average gamma-ray exposure rate 1 m above the tailings is 720 μR/h while the average rate in the former mill area is 150 μR/h. The adjacent area, between the mill site, ponds, and tailings pile, has an average exposure rate of 230 μR/h. Gamma radiation measurements outside these areas, as well as the results of analyses of surface or near-surface sediment and soil samples, show fairly wide dispersion of contamination around the site. The subsurface distribution of ^{226}Ra in 18 holes drilled at the site, calculated from gamma-ray monitoring data, is presented graphically and compared with measured concentrations in two holes.

3232 (ORNL--5595, pp 59-84) TECHNOLOGY ASSESSMENTS. Rohwer, P.S. Jan 1980.

Health and Safety Research Division progress report, May 1, 1978-September 30, 1979.

The primary objective of the Technology Assessments Section is assessment and interpretation of energy technology impacts on man. Assessment methods are developed and continuously updated and applied to meet this objective. Human impact assessment is a key component of any strategy to optimize the mix of technologies to be developed and deployed to meet the energy requirements of our country. Types of work accomplished in the section may be grouped into three areas: characterization of exposure; estimation of dose; and interpretation of impact. Any specific program may be totally in one of these areas or it may contain tasks representing multiple areas. Characterization of exposure includes off-site survey activities, development of models and concepts to simulate pollutant behavior in man and the environment, and radiation dosimetry intercomparison studies. Estimation of dose encompasses a wide array of applications of the section's expertise in quantifying impacts on man due to environmental releases of nuclear and nonnuclear pollutants. Interpretation of impact is the bottom line on an assessment where dose estimates are compared with applicable limits and guides. Task involvements in the latter area are a part of all assessment application activities, of many off-site survey activities, and of those methodological studies that support assessment criteria development. Varying mixes of work in these three areas constitute the projects highlighted in the descriptions which follow.

3233 (ORNL--5613) ANALYSIS OF THE 1957-58 SOVIET NUCLEAR ACCIDENT. Trabalka, J.R.; Eyman, L.D.; Auerbach, S.I. (Oak Ridge National Lab., TN (USA)). Dec 1979. Contract W-7405-ENG-26. 79p. Dep. NTIS, PC A05/MF A01.

The occurrence of a Soviet accident in the winter of 1957-58, involving the atmospheric release of reprocessed fission wastes (cooling time approximately 1-2 yrs.), appears to have been confirmed, primarily by an analysis of the USSR radioecology literature. Due to the high population density in the affected region (Cheliabinsk Province in the highly industrialized Urals Region) and the reported level of ^{90}Sr contamination, the event probably resulted in the evacuation and/or resettlement of the human population from a significant area (100-1000 km^2). The resulting contamination zone is estimated to have contained approximately 10^8 Ci of ^{90}Sr (reference radionuclide); a relatively small fraction of the total may have been dispersed as an aerosol. Although a plausible explanation for the incident exists (i.e., use of now-obsolete waste storage-^{137}Cs isotope separation techniques), it is not yet possible, based on the limited information presently available, to completely dismiss this phenomenon as a purely historical event. It seems imperative that we have a complete explanation of the causes and consequences of this incident. Soviet experience gained in application of corrective measures would be invaluable to the rest of the world nuclear community.

3234 (ORNL--5663) INDUSTRIAL SAFETY AND APPLIED HEALTH PHYSICS. ANNUAL REPORT, 1979. (Oak Ridge National Lab., TN (USA)). Sep 1980. Contract W-7405-ENG-26. 120p. NTIS, PC A06/MF A01.

In connection with personnel monitoring, there were no external or internal exposures to personnel which exceeded the standards for radiation protection as defined in DOE Manual Chapter 0524. Only 55 employees received whole-body dose equivalent of one rem or greater. The highest whole-body dose equivalent to an employee was 2.8 rem. The highest internal exposure was less than one-half of a maximum permissible dose for any calendar quarter. During 1979, 57 portable health physics instruments were added to the inventory and 75 retired. The total number in service on January 1, 1979, was 977. With regards to environmental monitoring, there were no releases of gaseous waste from the Laboratory which were of a level that required an incident report to DOE. There were no releases of liquid radioactive waste from the Laboratory which were of a level that required an incident report to DOE. Soil samples were collected at all perimeter and remote monitoring stations and analyzed for eleven radionuclides including plutonium and uranium. Plutonium-239 content ranged from 0.01 to 0.06 pCi/g, and the uranium-235 content ranged from 0.01 to 0.05 pCi/g. Grass samples were collected at all perimeter and remote monitoring stations and analyzed for twelve radionuclides including plutonium and uranium. Plutonium-239 content ranged from 0.001 to 0.010 pCi/g, and uranium-235 content ranged from 0.001 to 0.010 pCi/g. Two radiation incidents involving radioactive materials were recorded during 1979. This compares with 14 incidents in 1978. (ERB)

3235 (ORNL/TM--6751) ESTIMATION OF NORTH AMERICAN POPULATION DOSES RESULTING FROM RADON-222 RELEASE IN WESTERN UNITED STATES: METHODOLOGY. Fields, D.E.; Travis, C.C.; Watson, A.P.; McDowell-Boyer, L.M. (Oak Ridge National Lab., TN (USA)). Dec 1979. Contract W-7405-ENG-26. 57p. Dep. NTIS, PC A04/MF A01.

The report represents a compilation of computer codes used to estimate potential human exposures and inhalation doses due to unit releases of ^{222}Rn from uranium milling sites in western United States. The populations considered for potential exposure to risk from

^{222}Rn and associated daughters are the inhabitants of North America between 20° and 60° North latitude. The primary function of these codes is to integrate spatially atmospheric radionuclide concentrations with current population data for the geographic area under consideration. It is expected that these codes will be of assistance to anyone interested in assessing nuclear or nonnuclear population exposures over large geographic areas.

3236 (PB--80-101314) A STUDY OF RADIOACTIVE AIRBORNE EFFLUENTS FROM PARTICLE ACCELERATORS. TECHNICAL REPORT (FINAL). Cehn, J.I. (Teknekron, Inc., McLean, VA (USA)). Aug 1979. Contract EPA-68-01-4997. 115p. NTIS, PC A06/MF A01.

This report discusses radioactive gas production around non-Federally owned particle accelerators, and the release of such gases to the atmosphere. The estimated 1200 non-Federally owned accelerators in the United States are categorized by type and energy, and the potential for radiogas production is discussed for various types. The results of field monitoring around two machines (a cyclotron and a Van de Graaff) are also presented. Estimates of annual radiogas releases from generic accelerator facilities are made. The isotopes of interest are: tritium (target gas) from a generic Van de Graaff; nitrogen-13, oxygen-15, and carbon-11 from a generic cyclotron; and argon-41 from a generic linac. Finally, control technologies to reduce airborne releases of these isotopes are discussed.

3237 (PEL--270) ENVIRONMENTAL RADIOACTIVITY AT THE NATIONAL NUCLEAR RESEARCH CENTRE, PELINDABA. REPORT FOR THE YEAR 1978. Prinsloo, L.; Goodwin, B.; De Jesus, A.S.M. (Atomic Energy Board, Pelindaba, Pretoria (South Africa)). Jul 1979. 14p. NTIS (US Sales Only), PC A02/MF A01.

The revised environmental survey program introduced during 1970 with the emphasis on monitoring of the critical paths of exposure of the general public, was continued in 1978. Results of gamma-spectrometic ^{131}I and ^{90}Sr analyses of milk, the critical material for releases to the atmosphere, are presented. Results of determinations of both gross radioactivity and individual nuclides in samples of fish and water (which are critical materials for liquid-effluent releases) from the Hartbeespoort Dam and from the Crocodile River, are given and discussed. Results are also given of regular investigations of the composition of effluent releases which were below the permissible levels. Levels of deposited and airborne activity from nuclear-bomb tests are reported. No environmental radioactivity resulting from NNRC releases could be detected above the fallout levels.

3238 (PNCT--841-79-03) ATMOSPHERIC DISPERSION CALCULATION FOR POSTURATED ACCIDENT OF NUCLEAR FACILITIES AND THE COMPUTER CODE: PANDA. RELATIVE CONCENTRATION (X/Q) AND RELATIVE CLOUD-GAMMA DOSE (D/Q). Kitahara, Y.; Kishimoto, Y.; Narita, O.; Shinohara, K. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Jan 1979. 65p. (In Japanese). NTIS (US Sales Only), PC A04/MF A01.

Several Calculation methods for relative concentration (X/Q) and relative cloud-gamma dose (D/Q) of the radioactive materials released from nuclear facilities by posturated accident are presented. The procedure has been formulated as a Computer program PANDA and the usage is explained.

3239 (PNL--3128) SUPPLEMENTAL REPORT ON POPULATION ESTIMATES FOR HANFORD HIGH-LEVEL DEFENSE WASTE DRAFT PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT. Yandon, K.E.; Landstrom, D.K. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jun 1980. Contract AC06-76RL01830. 31p. NTIS, PC A03/MF A01.

Current and revised population projections based on those previously published in the document Population Distribution in 90-mile Radius of Hanford Meteorological Station and Projections to Year 2300 by Compass Sector and 10 Mile Radii are presented. In addition, there was a need to extend the population estimates out to 1000 and 10,000 years into the future to permit estimation of population radiation doses from accidents affecting the Hanford Facilities directly related to the defense high-level waste disposal alternatives. The methodology used in making the estimates is presented along with the detailed population matrix data required for performing the dose calculations. Although the near-term overall population projections are probably reasonably correct, no claim is made for the accuracy of the detailed data within each individual sector. Long-term estimates are made using reasonable assumptions about the growth potential and possibilities in the Hanford area. No claim of accuracy of these figures is made since they are so highly dependent on actions and conditions that are not predictable. For example, if a major climate change were to occur, the entire Hanford area might be uninhabited at 10,000 years in the future. To provide conservative dose estimates, it was assumed that the Hanford population will experience reasonable and continuous growth throughout the 10,000 year period.

3240 (PNL--3222) MASTER SCHEDULE FOR CY-1980 HANFORD ENVIRONMENTAL SURVEILLANCE ROUTINE PROGRAM. Blumer, P.J.; Houston, J.R.; Eddy, P.A. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Dec 1979. Contract EY-76-C-06-1830. 41p. Dep. NTIS, PC A03/MF A01.

The current schedule of data collection for the routine environmental surveillance program at the Hanford Site is presented. The enviromental surveillance program objectives are to evaluate the levels of radioactive and nonradioactive pollutants in the Hanford environs, as required in Manual Chapter 0513, and to monitor Hanford operations for compliance with applicable environmental criteria given in Manual Chapter 0524 and Washington State Water Quality Standards. Data are reported on the following topics: air; Columbia River; sanitary water; surface water; ground water; foodstuffs; wildlife; soil and vegetation; external radiation measurement; portable instrument surveys; and surveillance of waste disposal sites;

3241 (PNL--3283) ENVIRONMENTAL SURVEILLANCE AT HANFORD FOR CY-1979. Houston, J.R.; Blumer, P.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Apr 1980. Contract AC06-76RL01830. 72p. NTIS, PC A04/MF A01.

Environmental data were collected for most environmental media including air, Columbia River water, external radiation, foodstuffs (milk, beef, eggs, poultry, and produce) and wildlife (deer, fish, and game birds), as well as soil and vegetation samples. In general, offsite levels of radionuclides attributable to

Hanford operations during 1979 were indistinguishable from background levels. The data are summarized in the following highlights. Air quality measurements of NO_2 in the vicinity of the Hanford Site and releases of SO_2 onsite were well within the applicable federal and state standards. Particulate air concentrations exceed the standards primarily because of agricultural activities in the area. Discharges of waste water from Hanford facilities in the Columbia River under the National Pollution Discharge Elimination System (NPDES) permit were all within the parameter limits on the permit.

3242 (PNL--3284) ENVIRONMENTAL STATUS OF THE HANFORD SITE FOR CY 1979. Houston, J.R.; Blumer, P.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Aug 1980. Contract AC06-76RL01830. 80p. NTIS, PC A05/MF A01.

The Hanford environmental surveillance program provides for the measurement, interpretation, and evaluation of the radiological impact of Hanford operations on its onsite and offsite environs. The program is designed to evaluate all significant potential pathways for the release of radioactivity, especially those that may result in direct exposure of the public and those in which environmental reconcentration of radionuclides is likely to occur. Presented in this report are the results of effluent and environmental monitoring and sampling conducted to determine the onsite impact of ongoing operations.

3243 (PNL--3300(Pt.2), pp 147) WASTE ISOLATION SAFETY ASSESSMENT PROGRAM. Soldat, J.K.; Napier, B.A.; Strenge, D.L.; Watson, E.C. Feb 1980.

Pacific Northwest Laboratory annual report for 1979 to the DOE Assistant Secretary for Environment. Part 2. Ecological sciences.

Several computer codes available for calculation of aerial radiation doses to people were evaluated and those suitable for the WISAP project were modified and converted to the new DOE/RL 1100/44 computer. The codes were used to calculate potential doses from consumption of salt obtained by solution mining of a salt dome. The potential radiation doses were significantly high.

3244 (PNL--3300(Pt.5), pp 71) HANDBOOKS ON EFFLUENT AND ENVIRONMENTAL MONITORING. Feb 1980.

Pacific Northwest Laboratory annual report for 1979 to the DOE Assistant Secretary for Environment. Part 5. Environmental assessment, control, health, and safety.

Issue of the draft Guide for Effluent Monitoring at DOE Installations was postponed pending resolution of further regulatory requirements. Analysis and evaluation of CY-1978 annual environmental surveillance reports from Department of Energy (DOE) nuclear sites were approximately 50% completed. A draft Executive Summary of 1977 environmental impacts from all DOE nuclear sites was completed.

3245 (RHO-CD--79-35-4Q) RADIOACTIVITY IN GASEOUS WASTE DISCHARGED FROM THE SEPARATIONS FACILITIES DURING FOURTH QUARTER OF 1979. Sliger, G.J. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 22 Feb 1980. Contract AC06-76RL01830. 41p. NTIS, PC A03/MF A01.

This document is issued quarterly for the purpose of summarizing the radioactive gaseous wastes that are discharged from the facilities of the Rockwell Hanford Operations (Rockwell). Data on alpha and beta emissions during 1979 are presented where relevant to the gaseous effluent. Emission data are not included on gaseous wastes produced within the 200 areas by other Hanford contractors.

3246 (SAND--80-0342) SANDIA NATIONAL LABORATORIES 1979 ENVIRONMENTAL MONITORING REPORT. Simmons, T.N. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1980. Contract AC04-76DP00789. 28p. NTIS, PC A03/MF A01.

Sandia National Laboratories in Albuquerque is located south of the city on two broad mesas. The local climate is arid continental. Radionuclides are released from five technical areas from the Laboratories' research activities. Sandia's environmental monitoring program searches for cesium-137, tritium, uranium, alpha emitters, and beta emitters in water, soil, air, and vegetation. No activity was found in public areas in excess of local background in 1979. The Albuquerque population receives only 0.076 person-rem (estimated) from airborne radioactive releases. While national security research is the laboratories' major responsibility, energy research is a major area of activity. Both these research areas cause radioactive releases.

3247 (SLAC--228) ANNUAL ENVIRONMENTAL MONITORING REPORT, JANUARY-DECEMBER 1979. (Stanford Linear Accelerator Center, CA (USA)). May 1980. Contract AC03-76SF00515. 30p. NTIS, PC A03/MF A01.

Environmental monitoring results continue to demonstrate that, except for penetrating radiation, environmental radiological impact due to SLAC operation is not distinguishable from natural environmental sources. During 1979, the maximum measured neutron dose near the site boundary was not distinguishable from the cosmic ray neutron background. There have been no measurable increases in radioactivity in ground water attributable to SLAC operations since 1966. Because of major new construction, well water samples were not collected and analyzed during 1979. Construction activities have also temporarily placed our sampling stations for the sanitary and storm sewers out of service. They will be reestablished as soon as construction activities permit (mid 1980). Airborne radioactivity released from SLAC continues to make only a negligible environmental impact, and results in a site boundary annual dose of less than 0.3 mrem; this represents less than 0.3% of the annual dose from the natural radiation environment, and about 0.06% of the technical standard.

3248 (STI/PUB--482) MONITORING OF AIRBORNE AND LIQUID RADIOACTIVE RELEASES FROM NUCLEAR FACILITIES TO THE ENVIRONMENT. SAFETY SERIES NO. 46: RECOMMENDATIONS. (International Atomic Energy Agency, Vienna (Austria)). 1978. 133p. IAEA.

This manual defines the objectives of effluent monitoring programmes, and to provide guidance on the design of adequate systems and on the choice of appropriate monitoring methods and instruments for different types of nuclear fuel cycle facilities. Examples of the methods and equipment used for measuring radioactive airborne and liquid releases and of comprehensive monitoring programmes and requirements, provided by members of the Advisory Group, are included in the manual as annexes to the main text.

3249 (UCRL--50027-79, pp 1-20)
ENVIRONMENTAL MONITORING AT THE LAWRENCE LIVERMORE LABORATORY. 1979 ANNUAL REPORT. 25 Apr 1980.

Environmental monitoring at the Lawrence Livermore Laboratory. 1979 annual report.

In 1979, the annual average airborne gross beta activity in Livermore Valley air samples was 2.6 x 10^{-14} µCi/ml, or less than half the average observed in 1978. There were no atmospheric nuclear shots in 1979; therefore, fission products seen in the January air filters are probably a result of residual activity from the December 14, 1978 nuclear test in China. Airborne ^{238}U concentrations at Site 300 were higher than those at Livermore because of the depleted uranium used in high-explosive tests at the Site. However, these concentrations were well below the standards set by DOE. The average annual beryllium concentrations were less than 1% of the appropriate standard at both the Laboratory perimeter and Site 300. Water samples collected in the Livermore Valley and at Site 300 exhibit gross beta and tritium activities within the ranges previously observed in these areas. Tritium analyses were made on well-water-samples collected near the Livermore Water Reclamation Plant (LWRP). As was found during the 1977 and 1978 surveys, the highest tritium values were detected in wells west of the plant near Arroyo Las Positas; however all concentrations were well below the standards set by DOE. As a means of evaluating the possible impact of Laboratory effluents on locally grown foodstuff, the tritium content of Livermore Valley wines was compared with values from other California and European wines. The tritium levels in Livermore Valley wines were found to be within the range in both European wines and surface waters throughout the world and somewhat higher than those in California wines. Assessments of the calculated radiation dose to an individual from the environmental concentrations listed demonstrates that the dose contribution from Laboratory operations in 1979 was small compared with the dose received locally from natural sources.

3250 (UCRL--52959) UTILIZATION OF THE ATMOSPHERIC RELEASE ADVISORY CAPABILITY (ARAC) SERVICES DURING AND AFTER THE THREE MILE ISLAND ACCIDENT. Knox, J.B.; Dickerson, M.H.; Greenly, G.D.; Gudiksen, P.H.; Sullivan, T.J. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 1 Jul 1980. Contract W-7405-ENG-48. 37p. NTIS, PC A03/MF A01.

At 0820 PST on 28 March 1979, the Department of Energy's Emergency Operations Center advised the Atmospheric Release Advisory Capability (ARAC) that the Three Mile Island nuclear power plant in Harrisburg, Pennsylvania, had experienced an accident some four hours earlier, resulting in the atmospheric release of xenon-133 and krypton-88. This report describes ARAC's response to the Three Mile Island accident, including the role ARAC played throughout the 20 days that real-time assessments were made available to the Department of Energy on-scene commander. It also describes the follow-up population-dose calculations performed for the President's Commission on Three Mile Island. At the request of the Nuclear Regulatory Commission, a questionnaire addressing the usefulness of ARAC products during the accident was sent to ARAC-product users. A summary of the findings from this questionnaire, along with recommendations for improving ARAC service, is also presented. The accident at Mississauga, Ontario, Canada, is discussed in the context of a well-planned emergency response by local and Federal officials.

3251 DOSE-RATE CONVERSION FACTORS FOR EXTERNAL EXPOSURE TO PHOTON AND ELECTRON RADIATION FROM RADIONUCLIDES OCCURRING IN ROUTINE RELEASES FROM NUCLEAR FUEL CYCLE FACILITIES. Kocher, D.C. (Oak Ridge National Lab., TN (USA)). Health Physics ; 38: No. 4, 543-621(Apr 1980).

Dose-rate conversion factors for external exposure to photon and electron radiation are calculated for 240 radionuclides of potential importance in routine releases from nuclear fuel cycle facilities. Exposure modes considered are immersion in contaminated air, immersion in contaminated water, and irradiation from a contaminated ground surface. For each exposure mode, dose-rate conversion factors for photons and electrons are calculated for tissue-equivalent material at the body surface of an exposed individual. Dose-rate conversion factors for photons only are calculated for 22 body organs.

3252 ENVIRONMENTAL RADIATION EXPOSURE DUE TO EXHAUST AIR OF THE REPROCESSING PLANT. Bonka, H. (Technische Hochschule Aachen (Germany, F.R.). Lehrstuhl fuer Reaktortechnik). Atomkernenergie/Kerntechnik ; 35: No. 2, 134-141(1980). (In German).

Nowadays the emissions of radioactive material in nuclear facilities are so low that the radiological impact on the population compared to the effect of the natural radiation exposure is negligibly low. For the planned reprocessing plant for higher emissions have to be taken into account. Due to the increase of the emission height of 100 to 200 m it becomes possible to lower the individual doses so far using conventional retention techniques that the data remain under the limits given by the radiation protection ordinance. The collective doses, however, do not change by this. Due to cost-benefit analysis and taking into account the expected doses in the future due to globally distributed long-lived radionuclides, H3 should be retained to 80-90%, C14 to approx. 90%, Kr 85 to approx. 95% and J129 to approx. 99,5% in the planned large reprocessing plant. For the aerosols a decontamination factor of approx. 10^9 should be aimed at.

3253 MODEL FOR CALCULATING THE MEAN GAMMA DOSE FROM A CONTINUOUSLY EMITTING SOURCE OF AIRBORNE RADIOACTIVITY. Sowa, W.; Krueger, F.W. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). Kernenergie ; 22: No. 12, 429-432(Dec 1979). (In German).

From 11. winter school on radiation protection physics; Gaussig, German Democratic Republic (26 Feb - 2 Mar 1979).

A simple model for calculating the mean gamma dose rate from a continuously emitting source of airborne radioactivity has been developed. In this model the radioactive cloud is approximated by a disk-shaped source, the specific source strength being constant by height and inversely proportional to the distance from the point of emission. A comparison with the program METEOR II recommended for exposure calculations in the GDR shows good agreement for a wide range of distances.

3254 POLLUTION CONTROL IN ENGLAND AND WALES (PART 2). Bennett, G. (Univ of East Anglia, UK). Environmental Policy and Law ; 5: No. 4, 190-193(Oct 1979).

Methods currently used to control pollution in England and Wales are described. Areas of

radioactivity control discussed are wastes, discharges, construction of nuclear installations, nuclear information publication, and occupational exposure. The history of pollution regulation in England and features of the legislation are described. The history of nuclear development planning in England is outlined, and relevant legislation is discussed. The development of statuary regulation of pollution in England has been incremental, with little coordination or integration, resulting in administrative complications, control overlaps, and areas of no defined control.

3255 ENVIRONMENTAL ASPECTS OF TRITIUM. Quisenberry, D.R. (Mercer Univ., Macon, GA (USA). Dept. of Physics). Environmental Pollution (London) ; 20: No. 1, 33-43(Sep 1979).

The potential radiological implications of environmental tritium releases must be determined in order to develop a programme for dealing with the tritium inventory predicted for the nuclear power industry which, though still in its infancy, produces tritium in megacurie quantities annually. Should the development of fusion power generation become a reality, it will create a potential source for large releases of tritium, much of it in the gaseous state. At present about 90% of the tritium produced enters the environment through gaseous and liquid effluents and is deposited in the hydrosphere as tritiated water. Tritium can be assimilated by plants and animals and organically bound, regardless of the exposure pathway. However, there appears to be no concentration factor relative to hydrogen at any level of food chains analysed to date. The body burden, for man, is dependent on the exposure pathway and tissue-bound fractions are primarily the result of organically bound tritium in food.

3256 ANALYSIS OF NRC METHODS FOR ESTIMATING THE EFFECTS OF DRY DEPOSITION IN ENVIRONMENTAL RADIOLOGICAL ASSESSMENTS. Miller, C.W.; Hoffman, F.O. (Oak Ridge National Lab., TN). Nuclear Safety ; 20: No. 4, 458-467(Jul 1979).

The methods contained in Meteorology and Atomic Energy - 1968, which are commonly used for estimating the effects of dry deposition in radiological assessments, have been compared to the methods contained in Nuclear Regulatory Commission (NRC) Regulatory Guide 1.111. Although designed for use when determining compliance with Title 10, Code of Federal Regulations, Part 50, Appendix I for light-water-cooled reactors, the NRC guide has the potential of being used for other types of nuclear reactors and for nuclear facilities as well. This comparison has raised a number of concerns about the NRC approach: (1) deposition rate estimates are independent of the user's calculated air concentration; (2) deposition estimates for elevated releases seem too high close to the source; and (3) the plume depletion curves in the guide do not behave as expected relative to the commonly used plume depletion method. In view of these concerns, it is recommended that other, simpler approaches to these processes be considered for radiological assessment purposes.

3257 COST-EFFECTIVENESS OF THE FENCELINE COW. Eichholz, G.G.; Lando, A.V. (Georgia Inst. of Tech., Atlanta (USA). School of Nuclear Engineering). Health Physics ; 37: No. 1, 174-176(Jul 1979).

The grass-cow-milk pathway for ^{131}I is one of the main contributers to estimated population dose from BWR's and PWR's. Such estimates assume a cow at the fenceline grazing for 12 months of the year. Reductions in the population dose would require a trade-off, based on cost-effectiveness criteria, between additions to the effluent treatment system, expanding the exclusion area, or raising the stack height. It is suggested that a more practical and more cost-effective means may be provided by redistribution of nearby dairy cattle (or goats), and that the plant operator buy these animals and/or contract with the land owner(s) to use the land for alternative crops. Even a subsidy to compensate the farmer for any financial losses entailed in these changes might be less expensive than alternative technical installations to lower iodine effluent levels. Figures are provided to illustrate these points.

3258 ANNUAL REPORT ON RADIOACTIVE DISCHARGES AND MONITORING OF THE ENVIRONMENT 1978. Risley; British Nuclear Fuels Limited (Jul 1979). 64p.

In this annual report, information is given on radioactive discharges and environmental monitoring for all the Works and Sites belonging to British Nuclear Fuels Limited (BNFL) in the provision of nuclear fuel cycle services. The report covers the Windscale and Calder Works and the Drigg Storage and Disposal site; Chapelcross Works; Springfields Works and Ulnes Walton Disposal Site; and Capenhurst Works. The radioactive discharges and environmental monitoring associated with these Works were considered mainly in relation to liquid or airborne radioactive effluent and solid radioactive waste. An assessment of maximum radiological exposures to individual members of the public is given and expressed in terms of limits based on the recommendations of the International Commission on Radiological Protection (ICRP) as advised by the National Radiological Protection Board (NRPB). It is concluded that at no time during 1978 did discharges at any of the Works exceed those laid down in any of the Authorisations. Also, the environmental monitoring studies showed that the radiation exposure in 1978 of the most highly exposed groups of the general population was significantly lower than the limits recommended by the ICRP. (UK).

3259 POTENTIAL IMPORTANCE OF RESUSPENSION DURING CHRONIC RELEASES TO THE ATMOSPHERE. Kocher, D.C. (Oak Ridge National Lab., TN). Transactions of the American Nuclear Society ; 32: 105-106(Jun 1979). (CONF-790602--(Summ.)).

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

Contribution of resuspension of radioisotopes to air concentrations and radiation exposures. NUCLEAR FACILITIES; RADIOACTIVE EFFLUENTS;SURFACE AIR;RADIOACTIVITY; PARTICLE RESUSPENSION;ENVIRONMENTAL TRANSPORT; RADIOISOTOPES;MATHEMATICAL MODELS;RADIATION DOSES

3260 APPLICATION OF THE FINITE ELEMENT METHOD TO THE CALCULATION OF ATMOSPHERIC TRANSPORT FROM LARGE AREA SOURCES. Yuan, Y.C. (Argonne National Lab., IL). Transactions of the American Nuclear Society ; 32: 108-109(Jun 1979). (CONF-790602--(Summ.)).

3262 RADIOACTIVITY OF FLY ASHES FROM COAL POWER PLANTS. Papastefanou, C.; Charalambous, S. (Aristotle Univ. of Thessaloniki (Greece). Dept. of Nuclear Physics). Zeitschrift fuer Naturforschung, Teil A: Physik, Physikalische Chemie, Kosmophysik ; 34: No. 5, 533-537(May 1979).

The radioactivity of Greek lignites and their ashes was studied. It was found that the radionuclides in them belong to the uranium series. Fly ashes are relatively rich in radioactivity. Concentrations up to 7 x 10^{-5}g/g and 12pCi/g were measured for ^{238}U and ^{226}Ra, respectively. The associated hazards from radioactivity escaping from stacks of thermopower plants or when fly ashes are used as subtitutes of cement in concrete are evaluated. (orig.).

3263 ATTENUATION OF RADON FLUX FROM URANIUM MILL TAILINGS BY CONSOLIDATION. Busigin, A.; Nathwani, J.S.; Phillips, C.R. (Toronto Univ., Ontario (Canada). Dept. of Chemical Engineering and Applied Chemistry). Health Physics ; 36: No. 3, 393-399(Mar 1979).

A method is developed for predicting the effectiveness of consolidation of uranium mill tailings in reducing the releases of radon derived from decay of radium. The method is based upon a model of the diffusion process in terms of emanation coefficients and diffusivities, and provides for easy experimental evaluation of these parameters. From the model, the minimum effective depth of consolidated tailings can be predicted.

3264 ENVIRONMENTAL RADIOLOGICAL SURVEILLANCE IN PERSPECTIVE: THE RELATIVE IMPORTANCE OF ENVIRONMENTAL MEDIA AS A FUNCTION OF EFFLUENT PATHWAY AND RADIONUCLIDES. Denham, D.H. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Health Physics ; 36: No. 3, 273-281(Mar 1979).

Most published guides for environmental radiological surveillance emphasize the collection and analysis of specific media (e.g. air, water, milk, direct radiation), without indicating the absolute or relative importance of the media sampled or of the radio analyses performed. To determine the relative importance of medium/nuclide combinations in environmental surveillance, the experience at major DOE sites and at operating nuclear power plants was reviewed. Typical release rates for nuclide groupings (tritium, noble gases, radioiodine, mixed fission or activation products, and transuranics) in those effluent streams were obtained from the literature. Using these release rates, followed through various environmental pathways, radiation doses were calculated for individuals in the local environs of each type of site. Following these calculations, each medium was ranked for a given nuclide/effluent pathway combination providing the relative importance of sampling specific environmental media with emphasis on the radiation dose to a critical population group. Finally, the results of these environmental pathway studies are presented in tabular form to provide ready reference for environmental surveillance program design or evaluation.

3265 ISOLATION AND CHARACTERIZATION OF INDIVIDUAL PLUTONIUM-BEARING PARTICLES IN ATMOSPHERIC EFFLUENTS FROM A NUCLEAR PROCESSING PLANT. Sanders, S.M. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Health Physics ; 36: No. 3, 371-385(Mar 1979).

A method for isolating and characterizing individual particles containing fissionable materials is described. Membrane filters, used to collect the particles from atmospheric effluents from a nuclear processing plant, are cast into films composed of polycarbonate matrix containing the particles. Collected particles containing plutonium or other fissionable materials are identified by fission fragment tracks produced by irradiating the film with thermal neutrons. The nature of the fissionable material is identified by coating the film with nuclear track emulsion and measuring the ratio of alpha particle tracks in the emulsion to the fission fragment tracks in the polycarbonate film. Single particles are isolated by excising small squares from the film and are prepared for sizing and electron microbeam analysis by peeling the emulsion off the film square, placing the square on a beryllium sample-mounting block, and washing the polycarbonate away from the particle.

3266 RADIORUTHENIUM IN THE ENVIRONMENT. Iwashima, K. (Institute of Public Health, Tokyo (Japan)); Morita, S. Radioisotopes (Tokyo) ; 28: No. 3, 184-193(Mar 1979). (In Japanese).

A change in the amount of radioruthenium in the environment (due to nuclear tests and drainage from atomic energy plants) and the exposure dose are discussed. The level of ^{106}Ru in the environment due to radioactive fallout, changes in the level, and the characteristics of these changes are reported. Pollution caused by ^{106}Ru in drainage from atomic energy plants, especially from the Windscale reprocessing factory in the United Kingdom (which release Ru in the greatest amount), changes in the amount of Ru released and in the levels of environmental pollution, and the movement of Ru in the environment are considered. The intake of Ru into the human body by consumption of food produced in polluted areas and by inspiration of Ru present in the air is estimated. (Tsunoda, M.).

3267 RADIOLOGICAL ENVIRONMENTAL IMPACT OF HIGH-ENERGY ACCELERATORS. Thomas, R.H.; Rindi, A. (Univ of California, Berkeley; Univ of Pisa, Italy). CRC Critical Reviews in Environmental Control ; 9: No. 1, 51-95(Feb 1979).

The degree of radiation from high energy accelerators that filters into the environment and its possible effects on humans are discussed. Four possible impacts of radiation from high energy accelerators are: the production of radiation fields in the immediate area of accelerator operation; the production of radionuclides and noxious chemicals in the accelerator vault air and their subsequent release; the production of radionuclides in soil and groundwater near the accelerator; and the induction of long-lived radionuclides in accelerator components, such as copper, brass,

iron, or aluminum, that may eventually be recycled. Studies conducted to date to investigate the problem of radiation contamination from high energy accelerators indicate that no significant population exposure from the accelerators is expected at present energies and intensities. (3 diagrams, 13 graphs, 8 photos, 108 references, 15 tables)

3268 RADIOACTIVITY FROM FOSSIL-FUEL POWER PLANT AND ITS EFFECTS. Okamoto, K. (New South Wales Univ., Kensington (Australia). School of Mathematics). Genshiryoku Kogyo (Nuclear Engineering) ; 25: No. 2, 65-72(Feb 1979). (In Japanese).

Thermal power plants burning fossil fuel are now producing air pollution beyond almost tolerable level. Apart from demand/supply situation of fuels, in this connection, nuclear energy is the foremost one of available sources. Though hardly believable, thermal power plants, especially those burning coal, are emitting the appreciable quantity of radioactivity. This is due to the radioactive impurity elements contained in coal and petroleum, such as U, Th and their daughter nuclides, and these are continuously released to the atmosphere through stacks. The radioactivity from thermal power plants, in comparison with that from nuclear power plants, presents significant problems. That is, several of the radionuclides emitted have high possibility of biological concentration, and also extremely long half-lives. The radioactivity problem of thermal power plants, burning coal in particular, is described in comparison with that of nuclear power plants. (J.P.N.).

3269 RADIOACTIVE WASTE MANAGEMENT AND EXPOSURE SITUATION FOR PEOPLE ENGAGING IN NUCLEAR POWER PLANT FACILITIES. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 9, 188-204(Jan 1979). (In Japanese).

The radiowaste management and the exposure situation for the people employed in nuclear power plant facilities were investigated, and the results were reported by the Nuclear Safety Department of the Science and Technology Agency. As for the radiowaste management, the operational situation of power reactor facilities and the actual state of the radiowaste release from nuclear power plant facilities in 1977 fiscal year are tabulated for each type of GCR, BWR and PWR. These data in each latest fiscal year are also given. The plant utilization factors were about 68%, 4-56% and 0-77% for GCR, BWR and PWR, respectively. The maximum release rates of radioactive rare gas were about 8000 Ci, 7000 Ci (four plants in total) and 400 Ci (three plants in total) during one year for GCR, BWR and PWR, and under the conditions written above, the release rates were about 0 Ci, 10^{-1} Ci and 10^{-3} Ci of radioactive iodine gas, 0.1 Ci, 0.2 Ci and 0.01 Ci of radioactive liquid, and about 600 drums, 10000 drums and 2000 drums of solid wastes. These release rates did not much fluctuated in each latest fiscal year. The release rates of tritium in the liquid waste from PWR were much more than that from BWR. As for the situation of radiation exposure management for the workers, the actual exposure data were compared to the regularly allowable value, three rem in three months. The actual average exposure values were about 0.1 rem, 0-0.7 rem and 0-0.2 rem during 1977 fiscal year for GCR, BWR and PWR, respectively, and no one was exposed to more than three rem in three months. These measured values were sufficiently lower than the allowable value. The data show a tendency that the actual exposure values for the contractor workers were much more than that for the staffs of electric power companies, and these values per year did not much increase during the latest eight years.

3270 ANNUAL RATE OF RELEASE OF RADON TO THE ATMOSPHERE AS A RESULT OF COAL COMBUSTION IN THE UNITED KINGDOM. Blackburn, R.; Gueran, J. (Salford Univ. (UK). Dept. of Chemistry and Applied Chemistry). Radiation Physics and Chemistry ; 13: No. 3-4, 145-147(1979).

Twenty-one samples of fly-ash have been analysed for uranium by a method based on thermal neutron fission of uranium-235 followed by detection of the short-lived delayed-neutron emitting fission products. The ash samples were obtained from power stations deriving their coal from important but widely separated coal-fields and the uranium analyses give a global average of about 10 ppm uranium in ash. This figure has been used to calculate the release of radon-222, a daughter product of uranium-238, assuming secular equilibrium in the (4n + 2) series and complete release of the inert gas on combustion. The uranium content of the total annual U.K. production of coal is estimated as 240 tonnes and the annual associated radon-222 release is therefore about 100 curies.

3271 CALCULATION OF THE DEPLETION OF A RADIOACTIVE PLUME IN THE ATMOSPHERE AND SUBSEQUENT EXPOSURE DUE TO DEPOSITED ACTIVITY. Strachan, S.J.; Goddard, A.J.H. (Imperial College of Science and Technology, London). Annals of Nuclear Energy ; 6: No. 2, 91-101(1979).

Presented is an efficient method for calculating the depletion, by dry deposition and washout to the ground, of a plume of fission products in the atmosphere, and for determining the isotopic composition of resulting gamma and beta activities in the ground deposit at any selected point downwind. By integration over the pattern of material on the ground, gamma and beta exposure rates may be derived as a function of the aging time of the deposit. Calculations performed for a notional Magnox depressurization accident with single channel meltdown illustrate the sensitivity of ground gamma spectra and exposure rate to the use of isotope-dependent deposition velocities. (1 diagram, 9 graphs, 49 references, 7 tables)

3272 IMPACT ON THE ENVIRONMENT OF TRITIUM RELEASES FROM THE KARLSRUHE NUCLEAR RESEARCH CENTER. Koenig, L.A. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Abt. Strahlenschutz und Sicherheit). pp 591-610 of Behaviour of tritium in the environment. Vienna, Austria; International Atomic Energy Agency (1979).

From Symposium on the behavior of tritium in the environment; San Francisco, CA, USA (16 Oct 1978).

Since 1969 tritium activities of $(1.2\text{-}2.1)\times10^{3}$ Ci/a have been released into the atmosphere from the Karlsruhe Nuclear Research Center. These releases have given rise to contamination which can be detected by means of the liquid scintillation measuring technique (detection limit attained about 0.15 pCi/ml) without enrichment. Estimates based on precipitation measurements have shown that a small portion of 5×10^{-4} of the tritium activity released is deposited within an area of 1 km radius around the FR 2 stack. In 1977 the tritium precipitation from fall-out was of the same order of magnitude (213 mCi/km^2). The

contamination of soil by tritium within the fenced area of the Karlsruhe Nuclear Research Center ranges from 10 to 1 pCi/ml of soil humidity, each value averaged over a depth of 0 to 80 cm. The highest values have been measured in the immediate neighbourhood of the sewage clarification plant of the Nuclear Research Center (ground level source) and of the heavy-water-moderated MZFR reactor (200 MW(th), 100-m high exhaust stack). Simultaneous measurements of the air humidity, precipitations, soil humidity and tissue water of plants show that the tritium concentration in plants follows the variation with time of the tritium contamination in the air humidity and of precipitations. These variations are caused by fluctuating release rates and meteorological conditions. The radiation exposure of persons from tritium remains below 1 mrem/a.

3273 FIFTEEN YEARS OF EXPERIENCE IN HANDLING TRITIUM PROBLEMS IN CONNECTION WITH LOW-ENERGY PARTICLE ACCELERATORS. Sauermann, P.F.; Friedrich, W.; Knieper, J.; Printz, H. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Chemie). pp 671-685 of Behaviour of tritium in the environment. Vienna, Austria; International Atomic Energy Agency (1979).

From Symposium on the behavior of tritium in the environment; San Francisco, CA, USA (16 Oct 1978).

The leakage of tritium to the environment in connection with transport, storage and installation of high-activity tritium targets was investigated. The release and distribution of tritium in the environment from target changing and during normal operation of the accelerator were also studied, as well as tritium hazards arising from the contamination of shipping containers, certain sections of the accelerator system, cooling water and pump oil. New procedures suitable for the conditioning of tritium such as those found in pump oils, scintillator solutions, cooling water, absorption cartridges and used targets, are discussed.

3274 LARGE-SCALE DISTRIBUTION OF TRITIUM IN A COMMERCIAL PRODUCT. Combs, F.; Doda, R.J. (Nuclear Regulatory Commission, Washington, DC (USA)). pp 93-99 of Behaviour of tritium in the environment. Vienna, Austria; International Atomic Energy Agency (1979).

From Symposium on the behavior of tritium in the environment; San Francisco, CA, USA (16 Oct 1978).

Tritium enters the environment from various sources including nuclear reactor operations, weapons testing, natural production, and from the manufacture, use and ultimate disposal of commercial products containing tritium. A recent commercial application of tritium in the United States of America involves the backlighting of liquid crystal displays (LCD) in digital electronic watches. These watches are distributed through normal commercial channels to the general public. One million curies (MCi) of tritium were distributed in 1977 in this product. This is a significant quantity of tritium compared with power reactor-produced tritium (3MCi yearly) or with naturally produced tritium (6MCi yearly). This is the single largest commercial application involving tritium to date. The final disposition of tritium from large quantities of this product, after its useful life, must be estimated by considering the means of disposal and the possibility of dispersal of tritium concurrent with disposal. The most likely method of final disposition of this product will be disposal in solid refuse; this includes burial in land fills and incineration. Burial in land fills will probably contain the tritium for its effective lifetime, whereas incineration will release all the tritium gas (as the oxide) to the atmosphere. The use and disposal of this product will be studied as part of an environmental study that is at present being prepared for the U.S. Nuclear Regulatory Commission.

3275 DISCHARGES OF TRITIUM TO THE ENVIRONMENT FROM UNRESTRICTED USE OF CONSUMER PRODUCTS CONTAINING THIS RADIONUCLIDE. Wehner, G. (Bundesministerium des Innern, Bonn (Germany, F.R.)). pp 79-91 of Behaviour of tritium in the environment. Vienna, Austria; International Atomic Energy Agency (1979).

From Symposium on the behavior of tritium in the environment; San Francisco, CA, USA (16 Oct 1978).

Not only nuclear installations but also consumer products containing tritium are an important source of man-made tritium discharge to the environment. In the Federal Republic of Germany about the same tritium activity is annually added to consumer products as is released each year from all nuclear installations. The total tritium activity distributed may rise considerably if devices with Gaseous Tritium Light Sources (GTLS) are permitted for large-scale unrestricted use and consequently also for large-scale uncontrolled disposal. The tritium added to consumer products and, at least partly, finally discharged to the environment is converted to HTO and participates in the normal water cycle of the earth. Therefore it would be very desirable to know how much tritium is used worldwide for such purposes, and it is proposed that the competent national authorities should report to an international organization the amount of tritium in consumer products permitted for unrestricted use and disposal. Finally a review of the normal waste management of tritium in the Federal Republic of Germany is given, and doses that could result from incineration and pyrolysis of waste contaminated with tritium are assessed.

3276 AIRBORNE PLUME DISPERSION FROM TWO-DIMENSIONAL COMPUTATIONAL HYDRODYNAMIC SIMULATIONS. Bennett, R.G.; Golay, M.W. (Massachusetts Inst. of Tech., Cambridge). Transactions of the American Nuclear Society ; 33: 179-180(1979). (CONF-791103--).

3282 REVISED METHOD TO CALCULATE THE CONCENTRATION TIME INTEGRAL OF ATMOSPHERIC POLLUTANTS. Voelz, E. (Preussische Elektrizitaets-A.G. (Preussenelektra), Hannover (Germany, F.R.)); Schultz, H. (Hannover Univ. (Germany, F.R.). Arbeitsgruppe fuer Technischen Strahlenschutz). Atomkernenergie/Kerntechnik ; 34: No. 3, 209-212(1979). (In German).
It is possible to calculate the spreading of a plume in the atmosphere under instationary and inhomogeneous conditions by introducing the 'particle-in-cell'-method. That has a systematical advantage over the steady state Gaussian plume model usually used. Especially the fixed-point concentration time integral is claculated realistically instead of the locally integrated concentration at a constant time as is done in the plume model in this way inaccuracies due to the computational techniques may be avoided for short-time emissions, because both integrals do not lead to the same results. (orig.).

3283 RADIATION SITUATION ON THE PREMISES OF THE INSTITUTE OF NUCLEAR RESEARCH IN REZ. Dlouhy, Z.; Safar, O.; Kropikova, S. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Nukleon ; No. 1, 19-21(1979). (In Czech).
Radiation situation at UJV and the way of measuring and evaluating exposure rates are described. It is shown that the radiation levels are below the limit specified by the Czechoslovak authorities, this even outside the buildings containing the biggest sources of ionizing radiation.

3284 US MEASURES COAL-FIRED RADIOACTIVE HAZARD. New Scientist ; 80: No. 1133, 831(14 Dec 1978).
Radioactive pollution from coal-fired power stations can be more serious than pollution from nuclear power stations if people living nearby eat locally-grown food contaminated with fly ash containing uranium and thorium. In this US study it was assumed that all the food consumed would be grown locally. It is pointed out that the health effects of the doses received are small.

3285 GUIDELINE CONCERNING THE MEASUREMENT OF EMITTED RADIOACTIVE SUBSTANCES IN LIGHT WATER POWER REACTOR FACILITIES. No. 106, 42-49(Dec 1978). (In Japanese).
In this guideline, the standard method is determined, by which the radioactivity of the radioactive substances in gaseous and liquid wastes released into the environment at the time of the normal operation of light water power reactor facilities is measured. The measuring method decided in this guideline is based on the measuring techniques and experiences at present, but it should be revised according to circumstances corresponding to the development of measuring techniques. Moreover, in case of measuring by the other method than that stipulated in this guideline, also that method is approved if the sufficient grounds are found. This guideline is applied to light water power reactor facilities, but it may be the reference for the method of measuring the nuclides in the other reactor facilities. As for the gaseous and liquid radioactive substances released from light water power reactor facilities, the nuclides to be measured, the lower limit of concentration to be measured, and the frequency of measurement are stipulated, considering the condition of release, the physical and chemical properties of the radioactive substances, the method of release control and so on. Sampling must be carried out by the method which can represent the concentration of released radioactive substances. The method of measuring radioactivity, the calculation of the amount of released radioactivity, and recording method are stipulated. (kako, I.).

3286 EXPLANATION OF GUIDELINE CONCERNING THE MEASUREMENT OF EMITTED RADIOACTIVE SUBSTANCES IN LIGHT WATER POWER REACTOR FACILITIES. No. 106, 50-139(Dec 1978). (In Japanese).
The Atomic Energy Commission of Japan established the ''Guideline concerning the target value of dose in the surroundings of light water power reactor facilities'' in May. 1975, and showed the target value of dose as the aim of endeavor for keeping low the exposure dose of public in surroundings by the release of radioactive substances into environment at the time of normal operation. In nuclear power stations, the release control is to be carried out by determining the target value for the release control on the basis of this guideline, and so as not to exceed that value. Based on these situations, in the new guideline, the standard method was decided in order to unify the measuring method concerning the amount of radioactivity of the radioactive substances released from light water power reactor facilities at the time of normal operation, when the measurement is carried out in connection with the target value for release control. Emphasis was placed on the measuring method for the radioactive nuclides determined in the target value for release control, and it is the basic approach to measure each radioactive nuclide corresponding to its

property, bacause released substances are composed of the nuclides with different physical and chemical properties. The nuclides to be measured, the lower limit of concentration to be measured and the frequency of measurement, the measuring method, the sampling method, the calibration of instruments, the calculation of the amount of released radioactivity and others are explained. (Kako, I.).

3287 ESTIMATION OF INHALATION DOSES FROM AIRBORNE RELEASES USING GROSS MONITORS. Goldstein, N.P. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Research and Development Center). Health Physics ; 35: No. 5, 675-683(Nov 1978).

Monitoring programs at most nuclear facilities involve continuous gross measurements supplemented by periodic isotopic analyses of release samples. Isotopic measurements are required to accurately assess the potential dose from the various effluent streams, but in between these measurements, one depends on the gross monitors to provide approximate indications of the dose. The effluent streams release a variety of nuclides, each with its own dose factor. This means that the relationship between the counting rate in a gross monitor and the potential dose of the effluent being monitored will depend on the isotopic composition of this release. If this composition changes, then the dose indicated by the gross monitor (calibrated for the original group of isotopes) may be significantly in error. The problem of indicating inhalation doses from gross monitoring of airborne releases is considered. In order for this type of monitor to accurately indicate dose, regardless of the isotopic makeup of a release, the analysis shows that its response to each isotope should be proportional to the dose factor of that isotope. These ideas are applied to the monitoring of air particulates using gross beta and gross gamma monitors. The study shows that the former more closely satisfies this condition and as a result, satisfactorily indicates the actual dose from reactor effluents, as determined from detailed isotopic data published in the literature. On the other hand, the gross gamma monitor, with its poorer fit to the condition, provided less than satisfactory accuracy in its dose estimates. In addition, a variety of other mathematical response functions were considered but their dose estimation capabilities were not much better than the straight beta response. The study shows that reasonably accurate dose estimates can be made using properly selected gross monitors, but that significant errors can result with improper ones.

3288 DIFFUSION COEFFICIENTS OF AIRBORNE RADIOACTIVE IODINE AND METHYL IODIDE. Krzesniak, J.W.; Porstendoerfer, J. (Centralne Lab. Ochrony Radiologicznej, Warsaw (Poland)). Health Physics ; 35: No. 2, 417-421(Aug 1978).

Airborne ^{131}I from nuclear reactors is a mixture of gaseous elemental I_2, organic iodine compounds and iodine adsorbed on aerosols. A knowledge of the diffusion constants for both I_2 vapour and gaseous methyl iodide is important as they effect the dispersion, adsorption and deposition of radioiodine contamination in the atmosphere. Diffusion constants were determined by measuring the $^{131}I_2$ and $CH_3{}^{131}I$ penetration functions in a cylindrical tube through which air containing $^{131}I_2$ and $CH_3{}^{131}I$ was passed. Values of diffusion constants calculated from the results were Dsub(k) = 8.7 X 10^{-2} cm^2/sec for $CH_3{}^{131}I$ and Dsub(k) = 7.6 X 10^{-2} cm^2/sec for $^{131}I_2$. The size of the diffusion coefficient is close to that of the radon and thoron decay products. Therefore the I_2 activity size distribution, adsorbed by the atmospheric aerosol, is expected to be similar to that of radon progenies, in contrast to the adsorption velocity.

3289 GAS SCRUBBER, INSTALLATION AND PROCESS TO MAKE USE OF IT. (to British Nuclear Fuels Ltd., London). French Patent 2,387,677/A/. 19 Apr 1978. Priority date 21 Apr 1977, United Kingdom of Great Britain and Northern Ireland (UK), 10p. (In French).

Scrubbing of gases containing solids and, in particular, replacement of ventilation filters in dangerous environments, such as toxic or radioactive environments. To this effect, it comprises a containment divided internally into two communicating inlet and outlet compartments by a panel through which one or more holes are drilled, upon which are suitably placed one or more filters that the gas has to cross by passing from the inlet to the outlet compartment. A device enables the replacement filter to be introduced into the containment without the gas contained therein from passing into the surrouding atmosphere.

3290 METHOD AND EQUIPMENT TO EXCHANGE AND REMOVE THE WASTE FROM AEROSOL FILTER ELEMENTS FOR NUCLEAR PLANTS IN A SEALED CASING. Stiehl, H.H. (to Delbag-Luftfilter G.m.b.H., Berlin (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,637,559/A/. 23 Feb 1978. 53p. (In German).

An improvement for filter systems in nuclear plants is proposed consisting in using filter cartridges in cylindrical form as aerosol filter elements. They are arranged vertically in the housing and when exchanged are lowered according to the so-called protection bag technique directly into the waste container below. They are compressed by crushing; the container takes a number of cartridges and is then sealed tight and taken away. 18 claims explain technical details of the system.

3291 MONITORING OF THE DISCHARGE OF RADIOACTIVE MATERIALS IN GASEOUS EFFLUENTS AT THE STACK OF NUCLEAR POWER PLANTS WITH LIGHT-WATER-COOLED REACTORS. Schwibach, J. pp 55-59 of Monitoring of airborne and liquid radioactive releases from nuclear facilities to the environment. Vienna, Austria; International Atomic Energy Agency (1978).

Monitoring of the discharge of radioactive materials in gaseous effluents at the stack of nuclear power plants is done with the following aims: a) Determination of the activity of radioactive materials discharged into the atmosphere during regular operation in accordance with the specifications of the licensing conditions; the measurements have to be carried out in such a way that, if certain levels of activity discharge rate are reached, automatic safety measures can be initiated. b) Possibility of evaluating the environmental exposure and estimating the potential annual population exposure. The requirements of sampling and measuring procedures specified represent a minimum for the monitoring of the discharge of radioactive materials in gaseous effluents at the stack during regular operation.

3292 MONITORING OF AIRBORNE AND LIQUID RADIOACTIVE RELEASES FROM NUCLEAR FACILITIES TO THE ENVIRONMENT. Vienna: IAEA (1978). 121p.

The aim of this manual is to define the objectives of effluent monitoring programmes, and to provide guidance on the design of adequate systems and on the choice of appropriate monitoring methods and instruments for different types of nuclear fuel cycle facilities. Examples of the methods and equipment used for measuring radioactive airborne and liquid releases and of comprehensive monitoring programmes and requirements, provided by members of the Advisory Group, are included in the manual as annexes to the main text.

Site Resource and Use Studies

3293 (PB--291892) ESTIMATED AVERAGE ANNUAL RADON-222 CONCENTRATIONS AROUND THE FORMER URANIUM MILL SITE IN SHIPROCK, NEW MEXICO. FINAL TECHNICAL NOTE. Hans, J.M. Jr.; Horton, T.R.; Prochaska, D. (Environmental Protection Agency, Las Vegas, NV (USA). Office of Radiation Programs). Aug 1978. 42p. NTIS, PC A03/MF A01.

Uranium mills, as a part of the nuclear fuel cycle, produce large volumes of wastes which contain both the long and short-lived radionuclides from the naturally-occurring uranium decay chain. A relatively short-lived member of the chain, radon-222, is a noble gas and can diffuse from the wastes and be transported from its point of origin by prevailing winds. The airborne radon-222 decays into other short-lived radioactive progeny which may result in human inhalation exposures at considerable distances from the point of origin. Since the parent of radon-222 has a half-life of 1620 years, exposure to radon and its progeny will persist for thousands of years. This study was made to estimate the annual average radon-222 concentrations around the former Shiprock, New Mexico uranium mill site in order to identify areas which may require limited or restricted occupancy and to evaluate the effectiveness of the site decontamination activities in reducing the ambient airborne radon-222 concentrations. Using on- and off-site meteorological data and radon source term estimations, average annual radon-222 isoconcentration lines were determined by computer modeling for the mill site area. The lines were determined for both pre- and post-decontamination periods.

3294 (SAND--80-7121) METEOLOGICAL AND AIR QUALITY DATA, QUARTERLY REPORT. WIPP SITE: EDDY COUNTY, NEW MEXICO. AUTUMN QUARTER, SEPTEMBER 1977-NOVEMBER 1977. Pocalujka, L.P.; Babij, E.; Catizone, P.A.; Church, H.W. (TRC Environmental Consultants, Wethersfield, CT (USA); Sandia National Labs., Albuquerque, NM (USA)). Sep 1980. Contract AC04-76DP00789. 30p. NTIS, PC E02/MF $3.50.

Includes 6 sheets of 24X reduction microfiche.

The purpose of the WIPP meteorological, air quality, and radiological measurements program was to support the environmental effort for the evaluation of the site suitability. This data report is the latest in a series of seasonal quarterly data summaries to be issued for the southeastern New Mexico site.

Regulations

3295 (ORNL--5308, pp 305-306) ANALYTIC DOSIMETRY. Turner, J.E.; Holoway, C.F.; Loebl, A.S. Jul 1978.

Health physics division annual progress report for period ending June 30, 1977.

The Analytic Dosimetry Group completed work on the Guide to Radioactive Waste Management, which contains an analysis of 1000 selected documents on various aspects of the subject. Development of a file for health standards for energy production continued. A two-day workshop on dosimetry for radon and radon daughters was held in April and a number of experts from outside ORNL participated. The workshop concentrated on problems associated with the conversion of values measured in air-to-dose estimates and risk assessment. A state-of-the-art summary of the workshop findings is being prepared.

3296 (PB--80-107998) HANDBOOK OF KEY FEDERAL REGULATIONS AND CRITERIA FOR MULTIMEDIA ENVIRONMENTAL CONTROL. FINAL REPORT, SEPTEMBER 1978-JUNE 1979. Greenwood, D.R.; Kingsbury, G.L.; Cleland, J.G. (Research Triangle Inst., Research Triangle Park, NC (USA)). Aug 1979. Contract EPA-68-02-2612. 273p. NTIS, PC A12/MF A01.

The handbook summarizes major Federal environmental regulations and recommendations and the legislative acts that authorize them. It summarizes and tabulates quantitative control limits specified by Federal agencies. It compares the various regulations, standards, and criteria. It includes a selected bibliography addressing Federal environmental control activities.

3297 LIMITS FOR RADIOACTIVE MATERIAL RELEASES FROM NUCLEAR FUEL CYCLE FACILITIES. Ettenhuber, E.; Krueger, F.W.; Rumpf, J.; Zindler, H. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). Kernenergie ; 23: No. 8, 290-296(Aug 1980). (In German).

The actually achieved levels of radioactive material releases from fuel cycle facilities are reviewed. In connection with this, the principles and methods used in various countries for the derivation and establishment of authorized limits are evaluated. Moreover, the trends of limitation practices are outlined.

ENVIRONMENTAL SCIENCES, TERRESTRIAL

Basic Studies

3298 (PNL--3300(Pt.2)) PACIFIC NORTHWEST LABORATORY ANNUAL REPORT FOR 1979 TO THE DOE ASSISTANT SECRETARY FOR ENVIRONMENT. PART 2. ECOLOGICAL SCIENCES. Vaughan, B.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Feb 1980. Contract EY-76-C-06-1830. 238p. Dep. NTIS, PC A11/MF A01.

Research in Environment, Health, and Safety conducted during fiscal year 1979 is reported. This volume consists of project reports from the Ecological Sciences research department. The reports are grouped under the following subject areas: National Environmental Research Park and land use; Alaskan resource research; shale oil; synfuels; nuclear waste; fission; marine research programs; statistical development of field research; nuclear fusion; pumped storage and hydroelectric development; pathways modelling, assessment and Hanford project support; electric field and microwave research; and energy research for other agencies. (ACR)

3299 (SAND--79-0368) REPORT OF BIOLOGICAL

INVESTIGATIONS AT THE LOS MEDANOS WASTE ISOLATION PILOT PLANT (WIPP) AREA OF NEW MEXICO DURING FY 1978. Best, T.L.; Neuhauser, S. (eds.). (Eastern New Mexico Univ., Portales (USA); Texas Tech Univ., Lubbock (USA); New Mexico State Univ., Las Cruces (USA); New Mexico Univ., Albuquerque (USA)). Mar 1980. Contract EY-76-C-04-0789. 524p. Dep. NTIS, PC A22/MF A01.

The US Department of Energy is considering the construction of a Waste Isolation Pilot Plant (WIPP) in Eddy County, NM. This location is approximately 40 km east of Carlsbad, NM. Biological studies during FY 1978 were concentrated within a 5-mi radius of drill hole ERDA 9. Additional study areas have been established at other sites in the vicinity, e.g., the Gnome site, the salt lakes and several stations along the Pecos River southward from Carlsbad, NM, to the dam at Red Bluff Reservoir in Texas. The precise locations of all study areas are presented and their biology discussed.

3300 (UCRL--52889) HAZARD INDEX FOR UNDERGROUND TOXIC MATERIAL. Smith, C.F.; Cohen, J.J.; McKone, T.E. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Jun 1980. Contract W-7405-ENG-48. 151p. NTIS, PC A08/MF A01.

To adequately define the problem of waste management, quantitative measures of hazard must be used. This study reviews past work in the area of hazard indices and proposes a geotoxicity hazard index for use in characterizing the hazard of toxic material buried underground. Factors included in this index are: an intrinsic toxicity factor, formulated as the volume of water required for dilution to public drinking-water levels; a persistence factor to characterize the longevity of the material, ranging from unity for stable materials to smaller values for shorter-lived materials; an availability factor that relates the transport potential for the particular material to a reference value for its naturally occurring analog; and a correction factor to accommodate the buildup of decay progeny, resulting in increased toxicity.

3301 EMERGENCE AND GROWTH OF PLANT SPECIES IN COAL MINE SOIL. Day, A.D.; Mitchell, G.F.; Tucker, T.C.; Thames, J.L. (Univ. of Arizona, Tucson). Journal of Environmental Quality ; 8: No. 1, 110-114(Jan 1979).

Experiments were conducted in the laboratory and greenhouse in Arizona with the following objectives: to evaluate the chemical properties of undisturbed soil, surface-mined coal land (coal mine soil) on the Black Mesa Coal Mine, and Gila loam soil; and to study the emergence of seven plant species in the greenhouse in Gila loam soil and coal mine soil. The pH of coal mine soil (6.2) was lower than the pH of undisturbed soil (7.5) or Gila loam (7.6). The total soluble salts in coal mine soil (3241) and undisturbed soil (4592) were much higher than in Gila loam (378); however, coal mine soil was lower in total soluble salts than undisturbed soil. The nitrogen content of coal mine soil was higher than the nitrogen content of undisturbed soil or gila loam. Emergence percentages for seven plant species grown in coal mine soil were similar to emergence percentages for the same species grown in Gila loam. Alfalfa (Medicago sativa L.), barley (Hordeum vulgare L.), and wheat (Triticum aestivum L. em Thell.) had from 84 to 93% emergence in coal mine soil. Indian ricegrass (Oryzopsis hymenoides Roem. and Shult), fourwing saltbush (Atriplex canescens Pursh), yellow sweetclover (Melilotus officinalis Lam.), and winterfat (Euroti lanata Pursh.) emerged <35% in coal mine soil and Gila loam. Plant growth data from forage species grown in the greenhouse indicate that coal mine soil has a lower fertility level than does Gila loam soil. When supplied with optimum soil moisture and plant nutrients, coal mine soil produced approximately the same yields of forage from alfalfa, barley, and wheat as were produced in Gila loam under the same soil-moisture and fertility conditions.

Chemicals Monitoring and Transport

3302 ASSOCIATION OF TRACE ELEMENTS WITH IRON OXIDES DURING ROCK WEATHERING. Koons, R.D.; Helmke, P.A.; Jackson, M.L. (Univ. of Wisconsin, Madison). Contract EY-76-S-02-1515. Soil Science Society of America Journal ; 44: No. 1, 155-159(Jan 1980).

The association of trace elements with Fe oxides during the early stages of rock weathering was determined by analysis of fresh diabase and granite rocks, their associated whole and size-separated saprolites, and goethite by neutron activation and X-ray fluorescence. The same elements are found to be associated with Fe oxides when the results are interpreted by analysis of correlation, by the distribution of elements in the various size fractions by the effects of removing free Fe oxides, and by direct analysis of geothite from the saprolite. The elements Co, Cr, Mn, Sc, Th, U, Zn, and the heavy rare-earth elements during the weathering of diabase, and As, Co, Cr, Sc, Th, U, Zn, and the heavy rare-earth elements during the weathering of granite are associated with Fe oxides. The concentrations of Mn are too low in this system to separate the effects of Mn oxides from those of Fe oxides.

3303 BOREHOLE ASSAY FOR PLUTONIUM USING DELAYED-NEUTRON ACTIVATION ANALYSIS. Stokes, J. (IRT Corp., San Diego, CA); Steinman, D.K.; Adams, J.; Bruns, L.E.; Kay, M. Transactions of the American Nuclear Society ; 32: 135-136(Jun 1979). (CONF-790602--(Summ.)).

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

DELAYED NEUTRON ANALYSIS;PLUTONIUM;RADIATION MONITORING;RADIONUCLIDE MIGRATION;RADIOACTIVE WASTE DISPOSAL;FEASIBILITY STUDIES;SOILS;ROCKS; BOREHOLES;NEUTRON-NEUTRON LOGGING;RADIOASSAY

Radioactive Materials Monitoring and Transport

3304 (ANL--80-29) ENVIRONMENTAL MONITORING AT ARGONNE NATIONAL LABORATORY. ANNUAL REPORT FOR 1979. Golchert, N.W.; Duffy, T.L.; Sedlet, J. (Argonne National Lab., IL (USA)). Mar 1980. Contract W-31-109-ENG-38. 99p. Dep. NTIS, PC A05/MF A01.

The results of the environmental monitoring program at Argonne National Laboratory for 1979 are presented and discussed. To evaluate the effect of Argonne operations on the environment, measurements were made for a variety of radionuclides in air, surface water, Argonne effluent water, soil, grass, bottom sediment, and foodstuffs; for a variety of chemical constituents in air, surface water, and Argonne effluent water; and of the environemetal penetrating radiation dose. Sample collections and measurements were made at the site boundary and off the Argonne site for comparison purposes. Some on-site measuremenets were made to aid in the interpretation of the boundary and off-site data. The results of the program are

interpreted in terms of the sources and origin of the radioactive and chemical substances and are compared with applicable environmental quality standards. The potential radiation dose to off-site population groups is also estimated.

3305 (INIS-mf--4978, pp 164-165) RADIOECOLOGY IN RESOLVING ENVIRONMENTAL HEALTH PROBLEMS. Kulikov, N.V. (AN SSSR, Sverdlovsk. Inst. Ehkologii Rastenij i Zhivotnykh). Oct 1978. (In Russian).
From 2. radiobiological conference of the socialistic countries; Varna, Bulgaria (9 Oct 1978).
FALLOUT;NUCLEAR POWER PLANTS;RADIATION PROTECTION;RADIOACTIVE WASTES;RADIOECOLOGY

3306 (INIS-mf--5531) EXPOSURE TO RADIATION FROM THE NATURAL RADIOACTIVITY IN BUILDING MATERIALS. (Nuclear Energy Agency, 75 - Paris (France)). May 1979. 34p. NTIS (US Sales Only), PC A03/MF A01.
Radiation exposure of members of the public can be increased appreciably by the use of building materials containing above-normal levels of natural radioactivity. This phenomenon has attracted attention in recent years, and in this review, an attempt is made to quantify exposures incurred under various circumstances. The second section of the review is a general survey of those building materials, mostly industrial wastes, that have aroused interest in Member countries. The probability that environmental pressures may cause such wastes to be used more and more by building industries may lead to similar situations in the future. Other review material of a relevant nature is described in the third section. Primordial radionuclides only are considered here. They are: potassium-40 (K-40); radium-226 (Ra-226) and its decay products; the series headed by thorium-232 (Th-232). The important radiological consequences of the natural radioactivity in building materials are two-fold, irradiation of the body by gamma rays and irradiation of the lung tissues by radon-222 (Rn-222) decay products or daughters. These consequences cannot be explored quantitatively except in relation to the specific activities of the nuclides of interest, and the approach adopted in this review is to assess the consequences in terms of the incremental radiation exposures that would be incurred by occupants of substantial dwellings entirely constructed of materials with various specific activities or combinations thereof. Gamma rays are dealt with in the fourth section and radon daughters in the fifth.

3307 (NUREG/CR--1109) MEASUREMENT OF RADON DIFFUSION FROM URANIUM MILL TAILING PILES. Silker, W.B.; Wogman, N.A.; Thomas, C.W.; Carr, D.B.; Heasler, P.C. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Oct 1979. Contract EY-76-C-06-1830. 16p. (PNL--3187). Dep. NTIS, PC A02/MF A01.
The concentrations of ^{226}Ra and ^{222}Rn (^{214}Pb) were measured as a function of depth within a uranium mill tailings pile by in-situ gamma-ray spectrometry. Radon diffusion and exhalation rates were determined from the concentration gradients by employing an integral solution of the diffusion equation that accommodates a nonuniform depth distribution of the parent radium. Radon diffusion coefficients of 0.0002 and 0.0017 cm^2/sec, and exhalation rates of 60 and 275 atoms/cm^2/sec were determined for two locations with differing soil moisture content.

3308 (PNL-SA--7497) POTENTIAL RADIOLOGICAL IMPACT OF A CONCEPTUAL HANFORD NUCLEAR ENERGY CENTER. Soldat, J.K. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Oct 1978. Contract EY-76-C-06-1830. 32p. (CONF-790728--6). Dep. NTIS, PC A03/MF A01.
From 24. annual meeting of the Health Physics Society; Philadelphia, PA, USA (7 Jul 1979).
The potential radiological impact of the siting of 20 light-water reactors and associated nuclear fuel cycle facilities on the Hanford reservation was evaluated by calculating the potential radiation doses received by individuals and populations in the vicinity of the reservation. The largest contributor to the potential radiation doses, to both the individual and the 50-mile population, were the effluents from the conceptual 1500 MT/yr fuel reprocessing plant. The effluents from the 20 reactors combined was the second largest contributor. The radiation dose contributions from the 300 MT/yr mixed oxide fuel fabrication plant were insignificant. The highest organ dose from all facilities combined was 24 mrem/yr to the child thyroid; followed by 8 mrem/yr to the adult thyroid. The 50-year collective dose commitment to the population within 50 miles was about 50 man-rem for most organs of reference, while the estimate for bone was 70 man-rem. With the exception of ^{85}Kr, the release rates of radionuclides were within the EPA guidelines. Removal of about 90% of the 4×10^5 Ci/yr per gigawatt-year of electricity of ^{85}Kr from the fuel reprocessing plant gaseous effluents would be required for compliance with the EPA guidelines.

3309 ENERGY: WHAT ABOUT WASTE. Goldman, M.I. (NUS Corp, Md). Chemical Engineering Progress ; 75: No. 11, 65-69(Nov 1979).
The toxicity of nuclear high level waste is compared with the toxicity of the waste from burning coal to produce an equivalent amount of energy. The amounts of radon gas emanated from coal ash and from uranium mill tailings are also compared. Experimental methods used to make these comparisons are described. The toxicity associated with coal ash wastes is equal to or greater than the toxicity from the energy equivalent amount of uranium ore. Radon emanations from coal ash piles appear to be of the same order as those from uranium mill tailings. (1 diagram, 2 graphs, 2 tables)

3310 STATISTICAL CONSIDERATIONS AND SURVEY OF PLUTONIUM CONCENTRATION VARIABILITY IN SOME TERRESTRIAL ECOSYSTEM COMPONENTS. White, G.C.; Hakonson, T.E. (Los Alamos Scientific Lab., NM). Contract W-7405-ENG-36. Journal of Environmental Quality ; 8: No. 2, 176-182(Apr 1979).
Statistical aspects of the use of the coefficient of variation (c) in the design of environmental plutonium studies are considered. Small sample properties of the estimate of c were studied for both normal and log-normal populations with Monte Carlo simulations. A minimum sample size of 50 is necessary to estimate c with much precision, and an estimate of c from a sample size of less than 5 is nearly worthless. The difficulty of achieving good estimates of c increases as the true value of c increases. In addition, some of the available data on the variability of plutonium concentrations in terrestrial ecosystem components is summarized. The data were pooled to achieve better estimates of the coefficient of variation than might be available from individual studies. Pooled estimates of c are:

soils, 1.35; vegetation, 0.70; and rodent tissues, 1.10. The estimates of c presented should be useful in designing a field sampling program for plutonium.

3311 DATA ON RADIOACTIVE CONTAMINATION OF THE BIOSPHERE. Szabo, A. (Gyor Megyei Elelmiszerellenorzo es Vegyvizsgalo Intezet, Hungary). Energia es Atomtechnika ; 32: No. 4, 165-168(Apr 1979).

A study was conducted to evaluate the influence of nuclear explosions and nuclear power plant emissions on the biosphere. Data on radioactive contamination of food and surface waters and on the quantity of radioactive emissions released by nuclear power plants are presented. The potential for the utilization of nuclear energy and the health implications of radioactive exposure are also considered. (35 references, 4 tables)

3312 CONTAMINATION OF THE GROUND NEAR BUILDING B 212 AT WINDSCALE WORKS, BNFL. Annals of Nuclear Energy ; 6: No. 9-10, 523-524(1979).

A summary is given of the work in progress to determine the source of the leakage of active liquors contaminating the ground near one of the highly active liquor transfer buildings of the fuel reprocessing plant at Windscale. Circumstances leading to the detection of the leak and subsequent events are outlined and the activities of the Nuclear Installations Inspectorate in the investigation are indicated. (U.K.).

3313 RADIONUCLIDE TRANSFER IN THE ENVIRONMENT AND MODALITY OF MAN CONTAMINATION. Uzzan, G. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Niveaux de Contamination Radioactive du Milieu Ambiant et de la Chaine Alimentaire). Agriculture (Paris) ; No. 416, 52-54(Feb 1978). (In French).

The consequences for man and his environment of nuclear facilities development in the near future are evaluated. Dispersion of radioactive effluents from accidental and routine releases are envisaged. The following topics are emphasized: radionuclide transfer from atmospheric releases and modality of man contamination; radionuclide transfer from releases in surface waters and modality of man contamination; quantitative aspects of radionuclide transfers.

Soil

3314 (DOE/CEA/BMFT--8) CALCULATION OF POLLUTANT TRANSFER IN AN AQUIFER TRIDISOL A1, A2, AND 3 CODES. REPORT DSN NO. 270. Madoz-Escande, C. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Surete Nucleaire). Jan 1979. 37p. (In French). NTIS (US Sales Only), PC A03/MF A01.

This report describes the TRIDISOL A1, A2, and 3 codes which use a 3.D solution of the transfer equation to obtain for a given point the arrival time and the concentration of a radionuclide for a given release in the ground. More exactly, the TRIDISOL A1 and A2 codes are written to search automatically for some physical parameters of the aquifer and groundwater (diffusion coefficients) from results obtained with tracer tests. The TRIDISOL 3 can be used as a previsional calculation model for pollution transfer in the aquifer, the physical parameters of which were previously determined with TRIDISOL A1 and A2 codes. Examples of use of the code for various pollutant releases are given.

3315 (DOE/CEA/BMFT--9) METHOD FOR PREVISIONAL EVALUATION OF POLLUTANT TRANSFERS IN AN AQUIFER. FIRST RESULTS OBTAINED IN A SANDY ENVIRONMENT (AT THE BARP WORKINGS, GIRONDE). REPORT DSN NO. 261. Madoz-Escande, C.; Peyrus, J.C. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Surete Nucleaire). 1979. 17p. (In French). NTIS (US Sales Only), PC A02/MF A01.

The hydrogeological studies undertaken within the frame-work of the radiological safety of nuclear facilities aim, in particular, at quantitatively predicting the consequences of the accidental release of radioactive pollutants into an aquifer. Such a quantitative forecasting is arrived at through a mathematical model based on sequential emission, the use of which requires a knowledge of the physical parameters of the aquifer and an understanding of pollutant behavior in relation to the aquiferous environment. The physical parameters of a saturated porous environment are brought into light by means of radioactive tracer tests on mock-up as well in the field. The first results obtained in a sandy environment (BARP workings) are presented. The difficulty of extrapolating mock-up test results to actual field conditions has, more particularly, made it necessary to commission a mobile laboratory fitted for in situ studies.

3316 (DOE/ET/44206--1) POLLUTION OF GROUND WATER DUE TO INACTIVE URANIUM MILL TAILINGS. SUMMARY OF PROGRESS, OCTOBER 1, 1979-SEPTEMBER 30, 1981. (Colorado Univ., Denver (USA). Center for Environmental Studies). 1980. Contract AC02-76ET44206. 50p. NTIS, PC A03/MF A01.

An extensive program of characterization of several inactive uranium tailings piles has been carried out in the past year. The geotechnical engineering program conducted a drilling program at the Salt Lake City and Grand Junction sites. The locations of slimes and sands in these sites hve been characterized. In general, it was found that slimes exist in the impoundments in lower percentages than normally produced from mill tailings. Permeability tests were conducted yielding values ranging from 10^{-3} cm/sec to 10^{-8}cm/sec. The geochemical studies made considerable progress in the past year. Extensive sampling of several sites was conducted. Sampling programs have been completed for seven sites and are underway for nine other sites. The work to date has indicated the importance of salts in controlling the direction and rate of movement of contaminants. The work has also indicated that a number of non-radioactive elements such as As are of environmental importance. The work also indicates the importance of the fact that the tailings piles are out of chemical equilibrium with their environment. Computer software was developed and implemented for data storage and retrieval. Automation hardware was installed and tested for the Inductively Coupled Plasma Emission Spectrometer. A number of analytical protocols were developed for routine analyses. A comprehensive quality control program was implemented. More than 18,000 chemical analyses were performed.

3317 (DP--1557, pp 21-32) TERRESTRIAL STUDIES. Mar 1980.

Environmental Transport Division: 1979

report.

Tritium in the organic fraction of soil, separated as water by high temperature combustion, was 5 to 50 times higher in activity than water that was freeze-dried from the same samples. The 50-year dose commitment from ingestion of crops is not influenced significantly by the plutonium in the SRP environment. This plutonium is a result of more than 20 years of operating chemical separations facilities. Techniques were developed to detect as little as 0.02 pCi/m^2 of iodine-129 and 0.2 pg of technetium-99 in soil to evaluate environmental effects. A sensitive three-stage mass spectrometer was completed for use in environmental studies of transuranium elements. Results of monitoring particle size distribution of entrapped particles containing Pu-238, and Pu-239,240 are reported.

3318 (EGG--1183-1686) AERIAL RADIOLOGICAL SURVEY OF US DEPARTMENT OF ENERGY SITES IN AMES, IOWA. DATE OF SURVEY: MAY 1977. (EG and G Idaho, Inc., Idaho Falls (USA)). Jul 1979. Contract EY-76-C-08-1183. 14p. Dep. NTIS, PC A02/MF A01.

An aerial radiological survey to measure terrestrial gamma radiation was carried out over five areas totaling 10 km^2 within the town of Ames, Iowa. Gamma ray data were measured over Ames Laboratory, several sections of downtown Ames, and the surrounding area. This was accomplished by flying parallel east-west lines 61 m apart. Processed data indicated that three areas showed increased activity levels of at least twice average background: the reactor, the waste treatment area, and a small area near the airport runway.

3319 (EGG--1183-1751) AERIAL RADIOLOGICAL SURVEYS OF ROCKWELL INTERNATIONAL FACILITIES, CANOGA PARK, CALIFORNIA. DATES OF SURVEYS: JUNE AND JULY 1978. Jobst, J.E. (EG and G, Inc., Las Vegas, NV (USA). Energy Measurements Group). Oct 1979. Contract AC08-76NV01183. 31p. NTIS, PC A03/MF A01.

Aerial radiological surveys were conducted over two facilities. The first survey, conducted on 26 and 27 June 1978 at an altitude of 46 m, was over the Headquarters Facility in urban Canoga Park, California. The second, on 29 and 30 June and 5 to 8 July 1978, was flown at 61 m altitude over the Santa Susana Field Laboratories in the Santa Susana Mountains, about 15 km west-northwest of the Headquarters. Twenty sodium iodide detectors were mounted on a helicopter. Enhanced gamma exposure rate levels were observed during both surveys; these levels could be attributed to industrial operations at the survey sites.

3320 (EGG--2026) SUBSURFACE MIGRATION OF RADIONUCLIDES AT THE RADIOACTIVE WASTE MANAGEMENT COMPLEX: 1978. Humphrey, T.G. (Idaho National Engineering Lab., Idaho Falls (USA)). Jul 1980. Contract AC07-76ID01570. 51p. NTIS, PC A04/MF A01.

This report describes the 1978 core drilling campaign at the Radioactive Waste Management Complex of the Idaho National Engineering Laboratory. The campaign is part of a continuing program to define radionuclide migration from buried waste. Samples of subsurface materials were collected from core drilled wells and from sample trenches excavated beneath buried waste. The sample materials were radiochemically analyzed and results are discussed. It is concluded that radionuclide migration is not now a hazard to the Snake River Plain aquifer.

3321 (ESG--80-7) ENERGY SYSTEMS GROUP ENVIRONMENTAL MONITORING AND FACILITY EFFLUENT. ANNUAL REPORT 1979. Moore, J.D. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 25 Apr 1980. Contract EY-76-C-04-3533. 59p. NTIS, PC A04/MF A01.

Soil, vegetation, and surface water were routinely sampled for radioactivity to a distance of 10 miles from Energy Systems Group (ESG) sites. Continuous ambient air sampling and radiation monitoring by thermoluminescent dosimetry are performed on-site for measuring airborne radioactivity concentrations and site ambient radiation levels. Radioactivity in effluents discharged to the atmosphere from ESG facilities is continuously sampled and monitored to ensure that levels released to unrestricted areas are within appropriate limits, and to identify processes which may require additional engineering safeguards to minimize radioactivity levels in such effluents. In addition, selected nonradioactive constituent concentrations in surface water discharged to unrestrictted areas are determined. Monitoring results for 1979 are summarized and discussed. The random variations observed in the environmental monitoring data indicate that no local source of unnatural radioactive material exists in the environs. Additionally, the similarity between on-site and off-site results further indicat s that the contribution to general environmental radioactivity due to operations at the ESG is essentially nonexistent. The environmental radioactivity reported herein is attributed to natural sources and to fallout of radioactive material from foreign atmospheric testing of nuclear devices.

3322 (INIS-mf--5372, pp 86-87) SOME ASPECTS OF THE ACCUMULATION OF NATURAL RADIONUCLIDES IN AQUATIC PRODUCTS AND VEGETATION AROUND A URANIUM COMPLEX. Markose, P.M.; Eappen, K.P. (Environmental Survey Lab., Jaduguda (India)). 1979.

From 6. Indian Association for Radiation Protection conference; Bombay, India (7 Mar 1979).

BUILDUP;CONTAMINATION;FISHES;GRAMINEAE; NATURAL URANIUM;NUCLEAR FACILITIES;RADIOACTIVE EFFLUENTS;RADIOACTIVITY;RADIUM 226;SOILS; URANIUM MINES;NATURAL RADIOACTIVITY; RADIOECOLOGICAL CONCENTRATION;AQUATIC ECOSYSTEMS;TERRESTRIAL ECOSYSTEMS

3323 (JAERI-M--7642) STUDY ON SAFETY GROUND STORAGE AND DISPOSAL OF RADIOACTIVE WASTES. DISTRIBUTION AND MIGRATION OF ^{60}CO AND ^{137}CS IN A SAND LAYER. Takebe, S.; Matsuzuru, H.; Wadachi, Y. (Japan Atomic Energy Research Inst., Tokyo). Apr 1978. 15p. (In Japanese). Dep. NTIS (US Sales Only), PC A02/MF A01.

In evaluation of radionuclides migration through aerated zone, distribution ratio and migration rate of ^{60}Co and ^{137}Cs in a sand layer were examined under different conditions. Radioactive aqueous solutions ^{60}Co and ^{137}Cs were allowed to flow down to an aerated sand layer in a column. The distribution coefficient of both ^{60}Co and ^{137}Cs is large in acidic, and small in neutral and alkaline condition. Distribution ratios show ^{60}Co and ^{137}Cs deposit mostly at surface of the sand layer independent of the solution acidity. By the equation proposed by Inoue et al., migration rate of ^{60}Co and ^{137}Cs is large in both neutral and alkaline condition, but small compared with that of water.

3324 (LA--8023-PR, pp 43-54) DETERMINATION OF PLUTONIUM IN MAN. Sep 1979.
Biomedical and Environmental Research Program of the LASL Health Division. Progress report, January-December 1978.
Several ongoing research programs which deal with plutonium levels in man are summarized. The following are the topics of research: plutonium in the tissues of the general population, analysis of tissues from occupationally exposed workers, cooperation with the National Bureau of Standards for the preparation of a natural matrix tissue standard, analysis of tissues from an individual exposed during operation ''Big Bang'' (''Smokey''), medical surveillance of 26 early Los Alamos plutonium workers, epidemiologic studies of persons exposed to plutonium, limits for the burial of the Department of Energy transuranic wastes, and a preliminary study of radium contaminated soils.

3325 (LA--8147-MS) DETERMINATION OF HYDRAULIC CONDUCTIVITY IN CRUSHED BANDELIER TUFF. Abeele, W.V. (Los Alamos Scientific Lab., NM (USA)). Nov 1979. Contract W-7405-ENG-36. 7p. Dep. NTIS, PC A02/MF A01.
The unsaturated hydraulic conductivity in a sample of crushed Bandelier Tuff was evaluated using volumetric pressure plate extractors. The total impedance of the tuff sample is determined from the experimental outflow data for each pressure step applied. The determination of the membrane impedance is not compulsory and the varying contact impedances are taken into account at each different pressure step. The results show that predictions of saturation ratios can be made based on knowledge of matric potentials just as predictions of hydraulic conductivities can be made based on knowledge of either matric potentials or saturation ratios. They are highly significant at the equivalent of a matric potential lower than -10 kPa. These results are then compared to those obtained by means of the predictive methods promoted by Campbell and Millington-Quirk using moisture retention data.

3326 (LA--8183-T) RADIUM-226 IN VEGETATION AND SUBSTRATES AT INACTIVE URANIUM MILL SITES. Marple, M.L. (Los Alamos Scientific Lab., NM (USA)). Jan 1980. Contract W-7405-ENG-36. 75p. Dep. NTIS, PC A04/MF A01.
Thesis.
Results of a study of the content of radium-226 in plants growing on inactive uranium mill tailings sites in the Four Corners Region of the southwestern United States and in plants grown under greenhouse conditions with minimal surficial contamination are reported. Field plant samples and associated substrates were analyzed from two carbonate tailings sites in the Grants Mineral Belt of New Mexico. Radium activities in air-cleaned samples ranged from 5 to 368 pCi/g (dry weight) depending on species and location: activities in plants growing on local soils averaged 1.0 pCi/g. The talings and local soils contain 140 to 1400 pCi/g and 2.1 pCi/g, respectively. An evaluation of cleaning methods on selected samples showed that from 17 to 79% of the radium activity measured in air-cleaned samples was due to surficial contamination, which varied with species and location. A survey of 18 inactive uranium mill sites in the Four Corners Region was performed. Radium activity in plant tissues from nine species ranged from 2 to 210 pCi/g on bare tailings and from 0.3 to 30 pCi/g on covered tailings The radium content in most of the soil overburdens on the covered tailings piles was 10 to 17 pCi/g. An experiment was performed to measure radium-226 uptake by two species grown on tailings covered with a shallow (5 cm) soil layer. A grass, Sporobolus airoides (alkali sacaton) and a shrub, Atriplex canescens (four-wing saltbush), were studied. The tailings were a mixture of sands and slimes from a carbonate pile. The tailings treatments were plants grown in a soil cover over tailings; the controls were plants grown only in soil. Three soil types, dune sand, clay loam, and loam, were used. The radium activity of the plant tissue from the tailings treatment compared to that of the appropriate control was 1 to 19 times greater for the grass and 4 to 27 times greater for the shrub.

3327 (LA-UR--80-616) SOIL MONITORING INSTRUMENTATION. Umbarger, C.J. (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 11p. (CONF-791234--1). Dep. NTIS, PC A02/MF A01.
From Environmental decontamination workshop; Oak Ridge, TN, USA (4 Dec 1979).
The Los Alamos Scientific Laboratory (LASL) has an extensive program for the development of nondestructive assay instrumentation for the quantitative analysis of transuranic (TRU) materials found in bulk solid wastes generated by Department of Energy facilities and by the commercial nuclear power industry. Included are wastes generated in decontamination and decommissioning of outdated nuclear facilities as well as wastes from old waste burial ground exhumation programs. The assay instrumentation is designed to have detection limits below 10 nCi/g wherever practicable. Because of the topic of this workshop, only the assay instrumentation applied specifically to soil monitoring will be discussed here. Four types of soil monitors are described.

3328 (NUREG/CR--1155) INTERACTIONS OF RADIOACTIVE WASTES WITH SOILS. A REVIEW, OCTOBER 1976-MAY 1979. Fowler, E.B.; Essington, E.H.; Polzer, W.L. (Los Alamos Scientific Lab., NM (USA)). Dec 1979. Contract EY-76-C-04-0789. 42p. (LA-UR--79-2910). Dep. NTIS, PC A03/MF A01.
Retention of waste radionuclides by four soils of different types was determined using the batch and column methods. Raw and treated liquid wastes from a large laboratory complex were used. Three fractions identified in each waste were (1) insoluble, (2) soluble and sorbable by soil, and (3) soluble but nonsorbable by soil. The soluble fraction (< 0.05 μm) in raw and treated wastes increased with storage time but the increase did not directly relate to the amount retained by the soil. The degree of retention of each radionuclide is influenced by both soil type and waste composition. Ninety-five to one hundred percent of raw waste ^{137}Cs was retained by all soils. Plutonium isotopes and ^{241}Am were least retained by the soils; uranium isotope retention was intermediate. Reaction of a Fuquay soil with the insoluble fraction of the waste resulted in a net dissolution of Pu and Am. Two of the factors investigated that could influence the degree of retention by the soil were (1) charge on the radionuclide in solution, and (2) degree of calcium carbonate saturation. Retention of radionuclides by the soils occurs through ion exchange, occlusion in calcium carbonate precipitates, precipitation of aluminum, and filtration of particulates from the liquid wastes.

3329 (NVO--225) TATUM DOME PROJECT, LAMAR COUNTY, MISSISSIPPI. Fenske, P.R.; Humphrey,

T.M. Jr. (Department of Energy, Las Vegas, NV (USA). Nevada Operations Office). Aug 1980. 413p. NTIS, PC A18/MF A01.

The Tatum Dome site, near Hattiesburg, Mississippi, has been host to two nuclear detonations and two nonnuclear gas detonations. The top of the cavity formed by the detonations was 2660 feet below land surface and 1160 feet below the top of the salt dome. All detonations were totally contained within the salt dome in which they were fired. Activities at the site occurred between 1964 ad 1970. In 1978, NV was asked to provide proof that radiological contamination was not adversely affecting water quality in the aquifers over Tatum Dome. All except the Surficial Aquifer, which was known to be contaminated by tritium, were extensively tested to obtain hydrological data. Sufficient samples were taken to determine if contamination existed in the aquifer around the emplacement casing at surface ground zero (SGZ). Low tritium concentrations were found in the Local Aquifer, approximately 150 to 200 feet below land surface, during this project, but no radioactivity was found in any of the other aquifers above Tatum Dome. The Local Aquifer is the next aquifer below the Surficial Aquifer.

3330 (ORNL--5448) ASSESSMENT OF THE RADIOLOGICAL IMPACT OF THE INACTIVE URANIUM-MILL TAILINGS AT MEXICAN HAT, UTAH. Haywood, F.F.; Goldsmith, W.A.; Ellis, B.S.; Hubbard, H.M. Jr.; Fox, W.F.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Mar 1980. Contract W-7405-ENG-26. 95p. Dep. NTIS, PC A05/MF A01.

High surface soil concentrations of ^{226}Ra and high above-ground measurements of gamma-ray intensity in the vicinity of the inactive uranium-mill tailings at Mexican Hat show both wind and water erosion of the tailings. The former mill area, occupied by a trade school at the time of this survey, shows a comparatively high level of contamination, probably from unprocessed ore on the surface of the ore storage area near the location of the former mill buildings. However, the estimated health effect of exposure to gamma rays during a 2000-hr work year in the area represents an increase of 0.1% in the risk of death from cancer. Exposure of less than 600 persons within 1.6 km of the tailings to radon daughters results in an estimated 0.2%/year increase in risk of lung cancer.

3331 (ORNL--5450) RADIOLOGICAL SURVEY OF THE INACTIVE URANIUM-MILL TAILINGS AT TUBA CITY, ARIZONA. Haywood, F.F.; Jones, T.D.; Hubbard, H.M. Jr.; Ellis, B.S.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Jan 1980. Contract W-7405-ENG-26. 79p. Dep. NTIS, PC A05/MF A01.

Results of a radiological survey of the inactive uranium-mill site at Tuba City, Arizona, conducted in March 1976, are presented. Spread of tailings was detected in all directions by means of direct gamma measurements at 1 m above the ground and by determinations of the ^{226}Ra concentration in surface soil and sediment samples. In the direction toward which prevailing winds blow, the northeast, evidence of transportation of tailings was found at least 3.2 km from the tailings pile. Toward the north, south, and west, the spread was 300 to 400 m. Evidence of movement of tailings by water to offsite locations was also found. The concentration of ^{226}Ra in all water samples was well below the concentration guide for drinking water. The calculated subsoil distribution of ^{226}Ra in 14 holes, based on gamma monitoring data obtained by Ford, Bacon and Davis Utah Inc., is presented graphically and compared with available analytical data.

3332 (ORNL--5451) RADIOLOGICAL SURVEY OF THE INACTIVE URANIUM-MILL TAILINGS AT DURANGO, COLORADO. Haywood, F.F.; Perdue, P.T.; Shinpaugh, W.H.; Ellis, B.S.; Chou, K.D. (Oak Ridge National Lab., TN (USA)). Mar 1980. Contract W-7405-ENG-26. 93p. Dep. NTIS, PC A05/MF A01.

Results of a radiological survey of the inactive uranium-mill site at Durango, Colorado, conducted in April 1976, in cooperation with a team from Ford, Bacon and Davis Utah Inc., are presented together with descriptions of the instruments and techniques used to obtain the data. Direct above-ground gamma measurements and analysis of surface soil and sediment samples indicate movement of tailings from the piles toward Lightner Creek on the north and the Animas River on the east side of the piles. The concentration of ^{226}Ra in the former raffinate pond area is only slightly above the background level. Two structures in Durango were found to contain high concentrations of airborne radon daughters, where tailings are known to have been utilized in construction. Near-background concentrations of radon daughters were found in a well-ventilated building close to the tailings.

3333 (ORNL--5453) RADIOLOGICAL SURVEY OF THE INACTIVE URANIUM-MILL TAILINGS AT GUNNISON, COLORADO. Haywood, F.F.; Jacobs, D.G.; Hubbard, H.M. Jr.; Ellis, B.S.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Mar 1980. Contract W-7405-ENG-26. 79p. Dep. NTIS, PC A05/MF A01.

The findings of a radiological survey of the inactive uranium-mill site at Gunnison, Colorado, conducted in May 1976, are presented. Results of surface soil sample analyses and direct gamma radiation measurements indicate limited spread of tailings off the site. The only significant above background measurements off the site were obtained in an area previously covered by the tailings pile. There was little evidence of contamination of the surface or of unconfined groundwater in the vicinity of the tailings pile; however, the hydrologic conditions at the site indicate a potential for such contamination. The concentration of ^{226}Ra in all water samples except one from the tailings pile was well below the concentration guide for drinking water. The subsurface distribution of ^{226}Ra in 14 bore holes located on and around the tailings pile was calculated from gamma ray monitoring data obtained jointly with Ford, Bacon and Davis Utah Inc.

3334 (ORNL--5454) RADIOLOGICAL SURVEY OF THE INACTIVE URANIUM-MILL TAILINGS AT NATURITA, COLORADO. Haywood, F.F.; Jacobs, D.J.; Hubbard, H.M. Jr.; Ellis, B.S.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Mar 1980. Contract W-7405-ENG-26. 85p. Dep. NTIS, PC A05/MF A01.

Results of a radiological survey of the inactive uranium-mill site a Naturita, Colorado, conducted in May 1976, are presented. The spread of tailings was detected in the area surrounding the site by means of direct above ground gamma measurements and analysis of surface and subsurface soil samples. Radiochemical analyses of water samples in the vicinity of the tailings pile indicate local surface water contamination immediately downstream from the pile, although the ^{226}Ra

concentration in the water at that point as well below the concentration guide for drinking water. The calculated subsoil distribution of ^{226}Ra in onsite holes is presented graphically. The tailings at this site were removed and reprocessed at another location. This operation was completed and reclamation of the site was conducted in 1978. Consequently the information in this report documents radiological conditions that no longer exist.

3335 (ORNL--5456) RADIOLOGICAL SURVEY OF THE INACTIVE URANIUM-MILL TAILINGS AT MAYBELL, COLORADO. Haywood, F.F.; Perdue, P.T.; Ellis, B.S. (Oak Ridge National Lab., TN (USA)). Mar 1980. Contract W-7405-ENG-26. 70p. Dep. NTIS, PC A05/MF A01.

Results of a radiological survey of the inactive uranium-mill tailings near Maybell, Colorado are presented. Measurements of external gamma exposure rate at 1 m above the tailings ranged 16 to 340 μR/hr with an average value of 65 μR/hr. Radionuclide analysis of offsite soil and sediment samples, as well as above-ground gamma exposure rate measurements defined the spread of contamination around the tailings pile. This spread is greatest toward the east, in the direction of surface water runoff. Calculated concentrations of ^{226}Ra in all of the holes drilled in the tailngs, based on gamma monitoring data, showed maximum concentrations in the range 100 to 800 pCi/g.

3336 (ORNL--5457) ASSESSMENT OF THE RADIOLOGICAL IMPACT OF THE INACTIVE URANIUM-MILL TAILINGS AT GRAND JUNCTION, COLORADO. Haywood, F.F.; Goldsmith, W.A.; Jacobs, D.G.; Perdue, P.T.; Ellis, B.S.; Hubbard, H.M. Jr.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Apr 1980. Contract W-7405-ENG-26. 101p. Dep. NTIS, PC A06/MF A01.

Results of a radiological survey of the inactive uranium-mill site at Grand Junction, Colorado, made in May and June 1976, are presented along with descriptions of techniques and equipment used to obtain the data and an assessment of increased risk of health effects attributable to radiation and radionuclides from the tailings. The data obtained indicate that the tailings are adequately stabilized to prevent significant wind and water erosion. The average above-ground gamma-ray exposure rate measured over the tailings pile was 170 μR/hr and that around one of the former mill buildings was 100 μR/hr. Soil samples at a distance of 960 m to the east and west of the center of the tailings pile contained an above-background level of ^{226}Ra. An estimate of potential health effects of exposure to gamma rays around a former mill building and to radon daughters produced by radon dispersed from the tailings has been made for occupants of the site.

3337 (ORNL--5459) RADIOLOGICAL SURVEY OF THE INACTIVE URANIUM-MILL TAILINGS AT GREEN RIVER, UTAH. Haywood, F.F.; Christian, D.J.; Ellis, B.S.; Hubbard, H.M. Jr.; Lorenzo, D.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Mar 1980. Contract W-7405-ENG-26. 71p. Dep. NTIS, PC A04/MF A01.

The uranium-mill tailings at Green River, Utah, are relatively low in ^{226}Ra content and concentration (20 Ci and 140 pCi/g, respectively) because the mill was used to upgrade the uranium ore by separating the sand and slime fractions; most of the radium was transported along with the slimes to another mill site. Spread of tailings was observed in all directions, but near-background gamma exposure rates were reached at distances of 40 to 90 m from the edge of the pile. Water erosion of the tailings is evident and, since a significant fraction of the tailings pile lies in Brown's Wash, the potential exists for repetition of the loss of a large quantity of tailings such as occurred during a flood in 1959. In general, the level of surface contamination was low at this site, but some areas in the mill site, which were being used for nonuranium work, have gamma-ray exposure rates up to 143 μR/hr.

3338 (ORNL--5460) RADIOLOGICAL SURVEY OF THE INACTIVE URANIUM-MILL TAILINGS AT THE SPOOK SITE, CONVERSE COUNTY, WYOMING. Haywood, F.F.; Christian, D.J.; Chou, K.D.; Ellis, B.S.; Lorenzo, D.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). May 1980. Contract W-7405-ENG-26. 74p. NTIS, PC A04/MF A01.

Results of a radiological survey performed at the Spook site in Converse County, Wyoming, in June 1976, are presented. The mill at this site was located a short distance from the open-pit mine where the ore was obtained and where part of the tailings was dumped into the mine. Several piles of overburden or low-grade ore in the vicinity were included in the measurements of above-ground gamma exposure rate. The average exposure rate over these piles varied from 14 μR/hr, the average background exposure rate for the area, to 140 μR/hr. The average exposure rate for the tailings and former mill area was 220 μR/hr. Movement of tailings particles down dry washes was evident. The calculated concentration of ^{226}Ra in ten holes as a function of depth is presented graphically.

3339 (ORNL--5461) RADIOLOGICAL SURVEY OF THE INACTIVE URANIUM-MILL TAILINGS AT RIVERTON, WYOMING. Haywood, F.F.; Lorenzo, D.; Christian, D.J.; Chou, K.D.; Ellis, B.S.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Mar 1980. Contract W-7405-ENG-26. 60p. Dep. NTIS, PC A04/MF A01.

Results of a radiological survey performed at the Riverton, Wyoming site in July 1976, are presented. The average external gamma exposure rate at 1 m over the tailings pile was 56 μR/hr. The corresponding rate for the former mill area was 97 μR/hr. Movement of tailings particles in a dry wash is evident; but it appears that, in general, the earth cover over the tailings pile has been effective in limiting both wind and water erosion of the tailings. The calculated concentration of ^{226}Ra as a function of depth in 15 augered holes is presented graphically. A survey of the Teton Division Lumber Company property in Riverton showed a maximum external gamma exposure rate of 270 μR/hr.

3340 (ORNL--5462) RADIOLOGICAL SURVEY OF THE INACTIVE URANIUM-MILL TAILINGS AT FALLS CITY, TEXAS. Haywood, F.F.; Christian, D.J.; Loy, E.T.; Lorenzo, D.; Ellis, B.S. (Oak Ridge National Lab., TN (USA)). Oct 1980. Contract W-7405-ENG-26. 75p. NTIS, PC A04/MF A01.

Results of a radiological survey conducted at the Falls City, Texas, site in July 1976 are presented. There are seven partial to fully stabilized tailings piles, and an overburden pile from an open-pit mine. Above ground gamma-ray exposure rate measurements show moderate levels of contamination throughout the area with a maximum exposure rate of 500 μR/hr above tailings pile 2. The average exposure rate over the different areas varied from 14 μR/hr over the southwest end of tailings pile 7 to 207 μR/

hr over the northeast end of the same pile. Analyses of surface soil and dry-wash sediment samples, as well as calculations of subsurface ^{226}Ra distribution, serve to define the spread of tailings around the area. Water erosion of the tailings is evident, but, because of abundant growth of vegetation on the tailings piles, wind erosion probably is not a major problem.

3341 (ORNL--5464) RADIOLOGICAL SURVEY OF THE INACTIVE URANIUM-MILL TAILINGS AT LAKEVIEW, OREGON. Haywood, F.F.; Burden, J.E.; Ellis, B.S.; Loy, E.T.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Jun 1980. Contract W-7405-ENG-26. 40p. NTIS, PC A03/MF A01.

The results of the radiological survey of the inactive uranium-mill site at Lakeview, Oregon, show that the average gamma-ray exposure rate 1 m above the tailings pile and the evaporation pond area (now dry) is close to the average background level for the area (11 μR/hr). The ^{226}Ra concentration in most of the surface soil and sediment samples is also at or below the average background value for surface soil samples in the area (0.8 pCi/g). Calculated ^{226}Ra concentrations, based on gamma radiation measurements in shallow (1-m-deep) holes, are in agreement with the results of surface soil and sediment analyses and with gamma-ray exposure rate measurements. The tailings at this site have been stabilized by the addition of 46 to 60 cm (18 to 24 in.) of soil that supports vigorous growth of vegetation. This treatment, coupled with a low-level inventory of ^{226}Ra in the tailings (50 Ci), has resulted in limited spread of tailings by wind and water.

3342 (ORNL--5465) RADIOLOGICAL SURVEY OF THE RADIOACTIVE SANDS AND RESIDUES AT LOWMAN, IDAHO. Haywood, F.F.; Burden, J.E.; Ellis, B.S.; Loy, E.T.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Aug 1980. Contract W-7405-ENG-26. 68p. NTIS, PC A04/MF A01.

No uranium ore milling was performed at the Lowman site, which is located approximately 0.8 km northeast of the town of Lowman, Idaho. Nevertheless, approximately 80,000 metric tons of radioactive sands and residues from upgrading of heavy minerals by physical processing methods remain on the site grounds. Measurements of external gamma radiation 1 m above the surface showed exposure rates up to 2.4 mR/hr on site, but the exposure rate off site quickly dropped to the background level in all directions. Analysis of surface soil and sediment samples for ^{226}Ra and ^{232}Th indicated a limited spread of radioactive material.

3343 (ORNL/MIT--299) ASSESSMENT OF TWO-FILTER TECHNIQUE FOR CORRELATING ACTINIUM-227 CONCENTRATIONS IN SOILS. Fraizer, W.K.; Patch, K.D.; Reynolds, B.A. (Oak Ridge National Lab., TN (USA)). Feb 1980. Contract W-7405-ENG-26. 45p. Dep. NTIS, PC A04/MF A01.

Concentrations of actinium-227 in soil samples from waste-disposal sites for uranium procession plants were successfully correlated with radon-219 measurements obtained by the two-filter technique, thus avoiding time-consuming and difficult radiochemical analyses. A flow-through sampling device and procedure were developed which determined actinium levels with a precision of 2 pCi/g +- 50%. Theoretical relations for the production of radon from actinium, the decay of radon, and the decay and diffusion of radon daughters in the two-filter apparatus were formulated. Measurements indicated that the emanation fraction for radon-219 was about 15%. Sampling filters collected radon daughters with a 93% efficiency while radon could be scrubbed from air samples by use of an activated-charcoal canister.

3344 (ORNL/TM--7004) RESULTS OF GROUND LEVEL RADIATION MEASUREMENTS IN SUPPORT OF THE 1978 AERIAL SURVEY OF THE LAKE ONTARIO ORDNANCE WORKS, LEWISTON, NEW YORK. Berven, B.A.; Doane, R.W.; Haywood, F.F.; Shinpaugh, W.H. (Oak Ridge National Lab., TN (USA)). Sep 1979. Contract W-7405-ENG-26. 86p. Dep. NTIS, PC A05/MF A01.

This report contains the results of a limited series of measurements at the Lake Ontario Ordnance Works site, three miles northeast of Lewiston, New York. The scope of this survey was not extensive, and the survey was conducted to support a concurrent aerial survey conducted by EG and G, Inc. Results of this survey indicate two souces of significant external gamma exposure on the site as well as several locations that retain low to intermediate levels of radioactivity in soil. Off-site soil radionuclide concentrations were well within background levels with one exception. Water radionuclide concentrations on the site in the Central Drainage Ditch are significantly above background levels but decrease with distance from the spoil pile, and are within restrictive concentration guides for off-site locations.

3345 (PNL--3498) POTENTIAL AIRBORNE RELEASE FROM SOIL-WORKING OPERATIONS IN A CONTAMINATED AREA. Sutter, S.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Aug 1980. Contract AC06-76RL01830. 30p. NTIS, PC A03/MF A01.

Experiments were performed to provide an indication of how much material could be made airborne during soil-working operations in a contaminated area. Approximately 50 kg of contaminated soil were collected, dried, and mixed, and particle size distribution and ^{137}Cs content were characterized. In four experiments performed in a 2 ft x 2 ft wind tunnel at the Radioactive Aerosol Release Test Facility, soil was pumped into an airstream moving at 3.2, 10.4, 15.2, and 20 mph. These experiments were designed to maximize airborne releases by fluidizing the soil as it was pumped into the wind tunnel. Thus the airborne releases should represent upper limit values for soil-working operations. Airborne concentration and particle size samples were collected and all of the material deposited downstream was collected to calculate a mass balance. The fraction airborne was calculated using these measurements.

3346 (UCRL--52832) PRELIMINARY STUDY OF THE MIGRATION OF TECHNETIUM IN SOIL UNDER HYDROUS CONDITIONS. Sisson, D.H.; MacLean, S.C.; Schulz, R.K.; Borg, R.J. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 11 Sep 1979. Contract W-7405-ENG-48. 19p. Dep. NTIS, PC A02/MF A01.

The sorption of technetium compared to sodium, cesium, and strontium by a common agricultural soil was measured using a column method. As expected, no sorption of Tc occurred under conditions that substantially removed Na^{+}, Cs^{+}, and Sr^{++}. High radioactivity levels were used to establish absorption profiles over six orders of magnitude of tracer concentration. Behavior of initially dry columns was compared with that of initially water-saturated columns; the results were not quantitatively different although there was a

qualitative difference in the appearance of the profiles. Technetium tracked the moisture content of the column and hence migrated at the veloccity of the aqueous medium.

3347 ADSORPTION OF RADIOSTRONTIUM BY SOIL TREATED WITH ALKALI METAL HYDROXIDES. Spalding, B.P. (Oak Ridge National Lab., TN). Soil Science Society of America Journal ; 44: No. 4, 703-709(Jul 1980).

Twelve soils from areas used for the disposal of low-level radioactive solid waste at the Oak Ridge National Laboratory were examined for their ability to adsorb trace levels of Sr. Radiostrontium adsorption, in the presence of normal soil Ca levels, was determined following the addition of LiOH, NaOH, KOH, NaCl, and Na-polyacrylate. With soils from C horizons, the average thermodynamic equilibrium constant for the Na-Ca(Sr) exchange reaction decreased from 0.063 to 0.00041 after treatment with 0.4 meq/g of NaOH, indicating a large increase in the selectivity for Ca(Sr) adsorption. With samples from A or B horizons, this effect was not observed due to the dissolution of soil organic matter; Na-polyacrylate interfered with the adsorption of Ca(Sr) in the same manner as the NaOH-solubilized soil organic matter. Selectivity differences between trace levels of Sr and the macroamounts of soil Ca were quite small (<5%) in both the treated and untreated soils. A multiple regression analysis indicated that three soil properties (percent organic matter, exchangeable Ca + Mg, and exchangeable acidity) explained 77% of the variation in Sr adsorption by alkali-treated soils. In untreated soils, the exchangeable Ca + Mg and exchangeable acidity explained 70% of the variation in the adsorption of Sr. The response of the soils to alkali treatment generally followed the lyotropic series: Li > Na > K.

3348 (SAND--79-6006) ADSORPTION AND CATION EXCHANGE DURING UNIDIRECTIONAL FLOW IN A SATURATED POROUS MEDIUM. Rochon, J. (B.R.G.M., Orleans, France). (Sandia Labs., Albuquerque, NM (USA)). Nov 1979. Translated from Reunion de travail sur l'utilisation des mineraux argileux pour le confinement des dechets radioactifs, September 10-12, 1979, Paris, France 20p. Dep. NTIS, PC A02/MF A01.

Translated by Cathy Flick.

Several models are proposed to simulate transport of an ionic substance interacting with a homogeneous porous matrix. The types of interaction studied are reversible adsorption, irreversible adsorption, and cation exchange; these are the predominant phenomena in clay media. These models were devised with regard for the simplification necessary for their further use in interpretation of soil data or in predictive calculations.

3354 ENVIRONMENTAL TRITIUM IN TREES. Brown, R.M. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). pp 405-417 of Behaviour of tritium in the environment. Vienna; International Atomic Energy Agency (1979).

From Symposium on the behavior of tritium in the environment; San Francisco, CA, USA (16 Oct 1978).

The distribution of environmental tritium in the free water and organically bound hydrogen of trees growing in the vicinity of the Chalk River Nuclear Laboratories (CRNL) has been studied. The regional dispersal of HTO in the atmosphere has been observed by surveying the tritium content of leaf moisture. Measurement

of the distribution of organically bound tritium in the wood of tree ring sequences has given information on past concentrations of HTO taken up by trees growing in the CRNL Liquid Waste Disposal Area. For samples at background environmental levels, cellulose separation and analysis was done. The pattern of bomb tritium in precipitation of 1955-68 was observed to be preserved in the organically bound tritium of a tree ring sequence. Reactor tritium was discernible in a tree growing at a distance of 10 km from CRNL. These techniques provide convenient means of monitoring dispersal of HTO from nuclear facilities.

3355 ADSORPTION OF CO AND SELECTED ACTINIDES BY MN AND FE OXIDES IN SOILS AND SEDIMENTS. Means, J.L.; Crerar, D.A.; Borcsik, M.P. (Princeton Univ., NJ (USA). Dept. of Geology); Duguid, J.O. Geochimica et Cosmochimica Acta ; 42: No. 12, 1763-1773(Dec 1978).

Iron and Mn oxides and associated radionuclides in soils and sediments from the radioactive waste burial grounds at Oak Ridge National Laboratory have been selectively extracted using wet chemical techniques. Product-moment-correlation analyses have demonstrated that ^{60}Co and various actinides, principally ^{244}Cm, ^{241}AM and ^{239}Pu are dominantly associated with Mn oxides. Correlation coefficients between these radionuclides and Fe oxides and organic C are generally very low. The important role of Mn oxides in radionuclide adsorption is attributed to their unique surface and colloidal properties. The data illustrate the importance of the Mn oxide component of soils and sediments in controlling transition metal and actinide solubility. These results suggest two major implications for the disposal of radioactive waste. First, in order to minimize future ^{60}Co and actinide mobilization from disposal sites, a chemical environment in which Mn oxides are least soluble should be maintained. Second, the liberal use of Mn oxides in waste management operations might improve long-term retention of these radionuclides. Deep-sea Mn nodules, which may in the future be mined for their trace metal contents, could serve as a ready supply of Mn oxide for waste disposal applications.

3356 CONTAINMENT OF GASEOUS FISSION PRODUCTS IN CAVERNS. Takahashi, K.; Tamachi, T. (Kyoto Univ., Uji (Japan). Inst. of Atomic Energy); Kusuki, T. Kyoto Daigaku Genshi Enerugi Kenkyusho Iho (Bulletin of the Institute of Atomic Energy, Kyoto University) ; 2: 76-86(Mar 1978). (In Japanese).

Experimental study and computer code development have been made for the evaluation of the transport of gaseous fission products contained in a cavern into the environment. In the first part, the adsorption and desorption characteristics of iodine and methyl iodide in various samples of soil and sand were reported for various conditions. Descriptions of the test facilities and the variables chosen for the tests are presented together with the experimental results. In the second part, the computational model and the outline of the code for evaluating the transport of gas mixture in soil and sand are described. In the third part, computational evaluation is made for the F.P. containability of a cavern, assuming a loss of coolant accident in an underground LWR. One of the notable features found from this simulation study was that the energy of the high temperature steam from a reactor is quickly absorbed by the large capacity of the ground. Concentration profile of Kr gas, pressure profile in porous media and other typical variables are presented as functions of elapsed time and distance. (Aoki, K.

3357 MANAGEMENT, STABILISATION AND ENVIRONMENTAL IMPACT OF URANIUM MILL TAILINGS. Paris, France; OECD Nuclear Energy Agency (1978). 498p.

These proceedings deal with the sources of radioactivity arising from uranium mill wastes, the environmental aspects, the management and stabilisation of radioactive wastes and the policies and regulatory aspects.

Terrestrial Ecosystems and Food Chains

3358 (BNL--51066, pp 1-16) ENVIRONMENTAL PROTECTION. Hull, A.P. Oct 1979.

Safety and Environmental Protection Division. Progress report, January 1, 1976-December 31, 1978.

Environmental Studies and Internal Dosimetry projects include: Environmental Protection; 1977 Environmental Monitoring Report; Sewage Sludge Disposal on the Sanitary Landfill; Radiological Analyses of Marshall Islands Environmental Samples, 1974 to 1976; External Radiation Survey and Dose Predictions for Rongelap, Utirik, Rongerik, Ailuk, and Wotje Atolls; Marshall Islands - Diet and Life Style Study; Dose Reassessment for Populations on Rongelap and Utirik Following Exposure to Fallout from BRAVO Incident (March 1, 1954); Whole Body Counting Results from 1974 to 1979 for Bikini Island Residents; Dietary Radioactivity Intake from Bioassay Data, a Model Applied to ^{137}Cs Intake by Bikini Island Residents; and External Exposure Measurements at Bikini Atoll.

3359 (CEGB-RD/B/N--4291) PRELIMINARY ASSESSMENT OF THE WASTE DISPOSAL PROBLEM FOR MAGNOX STEELS. Nair, S. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). May 1978. 78p. Dep. NTIS (US Sales Only), PC A05/MF A01.

A methodology has been described which can be used to assess the relative radiological toxicities of activation products over geological timescales. A computer code, STRUMP, was written to assist in this assessment. The methodology was applied to an evaluation of the radiological implications of the waste disposal problem for decommissioned fixed steel components in Magnox reactors. The study concluded that the radiotoxicity of the activated steels was dominated, to a varying extent, by the isotopes ^{63}Ni and ^{59}Ni for timescales up to 400,000 years. An attempt was made to estimate toxicity levels corresponding to the activity limit of $10^{-11}Ci\ gm^{-1}$ below which radioisotopes may be considered stable. The study indicated that steels activated in conditions typical of those encountered by large mass components in the core mid-plane of the core restraint structure became safe for unrestricted disposal only at about a million years.

3360 (CONF-7604154--, pp 18p, Paper 1) DETERMINATION OF SAFE RADIOACTIVE RELEASES TO THE ATMOSPHERE FROM THE NUCLEAR POWER SITE, DUYNEFONTEIN. 1976.

From Conference on air pollution; Pretoria, South Africa (26 Apr 1976).

The capacity of the environment to accept airborne radioactive effluent safely depends on various local factors such as dispersion conditions, the ecology, the habits of the local population and the accumulation, through

critical pathways, of pertinent radionuclides. Long-term average dilution factors at varying distances from a 100 m stack have been calculated from mesometeorological data. On the basis of available data, permissible release rates are derived for radioisotopes of the noble gases (critical pathway: external cloud exposure), ^{131}I (not inhalation but the pathway : atmosphere-deposition-pasture-cow-milk-human), ^{137}Cs (not uptake through milk but exposure from accumulated ground deposition, ^{106}Ru, ^{125}Sb, and ^{144}Ce (ground deposition) and tritium (inhalation). Although final confirmation of these values can only be obtained after operation, such a pre-operational survey - including the nuclear techniques for tracing airborne releases through the biosphere - may serve as an example to conventional industry.

3361 (DOE/EV/10305--1) RADIOECOLOGICAL INVESTIGATIONS OF URANIUM MILL TAILINGS SYSTEMS. PROGRESS REPORT, SEPTEMBER 1, 1979-SEPTEMBER 30, 1980. Whicker, F.W. (Colorado State Univ., Fort Collins (USA). Dept. of Radiology and Radiation Biology). 10 Oct 1980. Contract AC02-79EV10305. 7p. NTIS, PC A02/MF A01.

The initial 13 months of this program have been devoted to staffing, development of a radiochemistry capability, development of a mill tailings reclamation study, studies on hydraulic properties of soils, initiation of plant uptake studies, preparation for metabolic studies with deer and antelope, and sample collections. Through the addition of new personnel and equipment, we are rapidly developing analytical capabilities for ^{238}U, ^{230}Th, ^{226}Ra, ^{210}Pb and ^{210}Po in matrices such as soil, water, plant material, and animal tissues. A 4 acre study site was developed in cooperation with the Pathfinder Mines Corp. at the Shirley Basin Uranium Mine in Wyoming. The study site is designed for investigations on the influence of various kinds and thicknesses of mill tailings soil covers on the integrity of reclaimed tailings and inherent radionuclides. Studies on the hydraulic properties of various soil materials were conducted and data analysis is in progress. Plots and procedures for conducting plant uptake studies on uranium and progeny were established and long-term investigations have been initiated. A colony of tame mule deer and pronghorn antelope has been developed for studies on the uptake and retention of ^{210}Pb and ^{210}Po. Numerous collections of soil, vegetation and water from the Shirley Basin Uranium Mine environs were conducted and radiochemical assay is in progress.

3362 (DOE/SF/00701--T61) DETAILED WORKING PROCEDURE FOR TAKING CORE SAMPLES FROM RMDF LEACH FIELD. Harris, J.; Stelle, A.M. (Rockwell International Corp., Pasadena, CA (USA)). 17 Aug 1976. Contract AM03-76SF00701. 10p. (N--704DWP990020). NTIS, PC A02/MF A01.

This procedure describes the sampling plan for taking cylindrical cores and sampling the cores to determine the extent of radioactive contamination in the RMDF leach field and in the soil and vegetation surrounding the leach field.

3363 (IDO--12088, pp 8-9) RADIATION DOSIMETRY OF SMALL MAMMALS INHABITING A LIQUID RADIOACTIVE WASTE DISPOSAL AREA. Halford, D.K.; Markham, O.D. (Dept. of Energy, Idaho Falls, ID). Apr 1979.

From Symposium on the Idaho National Engineering Laboratory ecology programs; Grand Teton, WY, USA (10 Sep 1978).

Small mammals inhabiting radioactive waste disposal areas may receive chronic radiation exposure. The extent of such radiation exposure needs to be documented so that potential ecological impacts on resident animals can be determined. Therefore, a dosimetry study was conducted on three species of small mammals inhabiting the dry bed of a liquid radioactive waste disposal pond. This paper discusses: (1) the surgical implantation of lithium fluoride thermoluminescent dosimeter chips, and (2) the external chronic gamma radiation doses received by wild rodents residing on or near a liquid radioactive waste disposal area and the possible ecological implications of these doses. Radiation doses received by small mammals inhabiting the TRA leaching pond were estimated by surgically implanting lithium fluoride thermoluminescent dosimeters (TLD) chips subcutaneously.

3364 (IDO--12088, pp 10-11) RADIATION DOSES TO SMALL MAMMALS AT THE IDAHO NATIONAL ENGINEERING LABORATORY RADIOACTIVE WASTE MANAGEMENT COMPLEX. Arthur W.J. (Dept. of Energy, Idaho Falls, ID); Halford, D.K.; Markham, O.D.; Janke, D.H. Apr 1979.

From Symposium on the Idaho National Engineering Laboratory ecology programs; Grand Teton, WY, USA (10 Sep 1978).

A project to estimate radiation doses received by small mammals at the Subsurface Disposal Area of the INEL Radioactive Waste Management Complex (RWMC) was initiated in October 1977. The objectives are: (1) to provide information on radiation doses received by small mammals burrowing into pits and trenches containing radioactive materials and (2) to estimate what proportion of the small mammal population receive doses higher than ambient exposures. The second objective is part of a larger study to model the role of small mammals in radionuclide movement in the RWMC ecosystem. All radiation doses received by small mammals will be compared to area of capture to determine whether any area effects exist. Tissues are being collected from animals receiving higher than background doses in conjunction with a study to discern pathological abnormalities associated with high radiation doses (Evenson et al., this report). Radiation doses received by small mammals will be monitored through time to determine if seasonal differences exist.

3365 (IDO--12088, pp 28-29) ECOLOGY STUDIES AT THE IDAHO NATIONAL ENGINEERING LABORATORY RADIOACTIVE WASTE MANAGEMENT COMPLEX. Arthur, W.J.; Markham, O.D. (Dept. of Energy, Idaho Falls, ID). Apr 1979.

From Symposium on the Idaho National Engineering Laboratory ecology programs; Grand Teton, WY, USA (10 Sep 1978).

From 1954 to present, 7.02 x 10^6 curies of transuranic, mixed fission and mixed activation radioactive waste have been stored below ground in the Subsurface Disposal Area at the Idaho National Engineering Laboratory Radioactive Waste Management Complex (RWMC). In September 1977, studies were initiated to determine the impact of this operation on flora and fauna in the area, and any possible role of these ecosystem components in radionuclide uptake and transport. Animal species utilization of the area is being estimated by tri-weekly driving transects. Tissue samples are being collected from deer mice (Peromyscus maniculatus), Ord's kangaroo rat (Dipodomys ordii), mountain cottontail (Sylvilagus nutallii), pygmy rabbit (Sylvilagus idahoensis), horned lark

(Eremophila alpestris), and sage grouse (Centrocercus urophasianus) inhabiting the area. Samples are analyzed for mixed fission and mixed activation products, ^{210}Po, $^{239,240}Pu$, ^{238}Pu, and ^{241}Am. Data on invertebrate species will be collected with 25 pitfall collectors and samples analyzed for radionuclide concentrations. Searches are being conducted in lava ridges inhabited by predators near the waste storage area, and prey remains and fecal samples collected and analyzed to estimate any radionuclide transport in the food chain. A vegetation sampling program will be conducted to obtain data on floral species present, biomass, percent ground cover, and to determine whether plants play a role in uptake and movement of radionuclides in the ecosystem. Only plants growing within the SDA will be studied as these are the plants most likely contaminated with radionuclides.

3366 (IDO--12088, pp 30-31) SPECIES COMPOSITION AND LOCAL MOVEMENT OF SMALL MAMMALS ON THE RADIOACTIVE WASTE MANAGEMENT COMPLEX, IDAHO NATIONAL ENGINEERING LABORATORY SITE. Groves, C.R.; Keller, B.L. (Idaho State Univ., Pocatello). Apr 1979.

From Symposium on the Idaho National Engineering Laboratory ecology programs; Grand Teton, WY, USA (10 Sep 1978).

Little ecological information is available on small mammals residing on the INEL Site. In May 1978, a major investigation of rodent species composition, local movement, and density was initiated on the Subsurface Disposal Area (SDA) of the INEL Radioactive Waste Management Complex. Arthur et al., are presently investigating radiation doses to small mammals on the SDA. Information obtained on dose rates for individual animals will be related to movement data obtained on small mammals occupying specific areas. Density estimations will be of particular importance in considering the number of rodents which could potentially be affecting the distribution of interred wastes during their burrowing activites. Additionally, information on the surface area over which contamination might be spread by rodents in needed in order to assess the movement of uncontained, radioactive materials. A two week block of data was used to report preliminary movement information for the SDA. Average linear movement was calculated as the average distance between successive captures for rodents occupying the grids and rodents residing on the perimeter. Rodent density was estimated on each internal grid with a modification of the assessment line technique (O'Farrell, M.J., 1977, J. Mammal. 58: 575-582).

3367 (IDO--12088, pp 32-33) THEORETICAL PROBLEMS IN DEFINING DISPERSAL IN SMALL MAMMALS OCCUPYING THE SUBSURFACE DISPOSAL AREA, IDAHO NATIONAL ENGINEERING LABORATORY SITE. Keller, B.L.; Groves, C.R. (Idaho State Univ., Pocatello). Apr 1979.

From Symposium on the Idaho National Engineering Laboratory ecology programs; Grand Teton, WY, USA (10 Sep 1978).

The purpose of this paper is to review several factors which are important in the documentation of dispersal. Enumeration of dispersal is of importance due to the potential for small mammals to serve as a vector for movement of radioactive materials. Such materials may be trapped in the pelt, or enter the gut or lungs of rodents during burrowing. Three main factors of special significance to our research include: (1) The definition of a disperser. Since dispersal constitutes permanent movement from the place of origin, the definition necessitates a knowledge of the location of birth of each individual rodent and any movement away from this area. Such information can never be collected for a large number of animals distributed over a large surface unless a massive marking effort is initiated. We are currently attempting such an effort. The question now becomes, is the SDA prime habitat in which large numbers of demes are present and animals leave in saturation or pre-saturation dispersal during population expansion or is the SDA a mosaic of dispersal sinks. (2) Definition of a dispersal sink. A dispersal sink is an area of suitable to poor habitat where short-term survival is possible. If the SDA is a dispersal sink, we would expect to document, large spring and fall catches on the SDA perimeter, inward movement during winter, and massive loss of colonizers on the SDA during winter. If the SDA is prime habitat, we would expect emigration to the SDA perimeter and outward emigration in fall and spring. (3) Probability of capture. The probability of capturing an emigrating rodent depends on the size of the capturing matrix and the duration of the trapping effort.

3368 (IDO--12088, pp 38-39) ^{129}I DISTRIBUTION IN VEGETATION ON THE IDAHO NATIONAL ENGINEERING LABORATORY SITE. McGiff, T.J. (Colorado State Univ., Fort Collins); Fraley, L. Jr.; Markham, O.D. Apr 1979.

From Symposium on the Idaho National Engineering Laboratory ecology programs; Grand Teton, WY, USA (10 Sep 1978).

A study is in progress to determine the concentration of ^{129}I and the ratio of ^{129}I to ^{127}I (stable iodine) in vegetation at the Idaho National Engineering Laboratory Site and to assess the potential transfer through a food chain to man. Trace amounts of ^{129}I occur ubiquitously in the environment, as a result of natural production and nuclear weapons testing. Levels of 10^{-7} to 10^{-9} atoms ^{129}I/atom ^{127}I are representative of most areas. However, ratios as high as 10^{-4} atoms ^{129}I/atom ^{127}I have been found in iodine extracted from animal thyroids collected on the INEL Site. These increased levels are attributed to the operation of the Idaho Chemical Processing Plant (ICPP) which reprocesses spent nuclear fuel and solidifies the waste for storage. Recent measurements have confirmed that ^{129}I activity is present in the plant's gaseous effluent. During August 1978, samples of big sagebrush (Artemisia tridentata) and mixed grasses were collected for iodine analysis. These vegetation types were considered important in the diets of game and domestic animals in the area.

3369 (IDO--12088, pp 40) ^{129}I IN THYROIDS OF HERBIVORES ON THE IDAHO NATIONAL ENGINEERING LABORATORY SITE. Fraley, L. Jr. (Colorado State Univ., Fort Collins); Bowman, G.C.; Markham, O.D. Apr 1979.

From Symposium on the Idaho National Engineering Laboratory ecology programs; Grand Teton, WY, USA (10 Sep 1978).

The Idaho Chemical Processing Plant (ICPP) on the INEL has been releasing ^{129}I in its gaseous effluent for approximately 25 years. Although stack monitoring for ^{129}I has been conducted only since January 1978, it was estimated that an average of 0.1 Ci (4 GBq) of ^{129}I activity per year was released. Little information is available on the long-term behavior of ^{129}I in the environment and this study was initiated to estimate the ^{129}I concentration in herbivore thyroids and the respective thyroid doses.

3370 (INIS-mf--4978, pp 94-95) RADIOLOGICAL HEALTH AND SAFETY REQUIREMENTS WITH REGARD TO THE POPULATION IN ERECTING DISTRICT-HEATING ATOMIC PLANTS. Gusev, D.I.; Turkin, A.D.; Pavlovskii, O.A.; Stepanova, V.D. (Institut Biofiziki, Moscow (USSR)). Oct 1978. (In Russian).

From 2. radiobiological conference of the socialistic countries; Varna, Bulgaria (9 Oct 1978).

HUMAN POPULATIONS;NUCLEAR POWER PLANTS; RADIATION ACCIDENTS;RADIATION DOSES;RADIATION HAZARDS;RADIATION PROTECTION;RADIOACTIVE WASTE DISPOSAL;SITE SELECTION

3371 (INIS-mf--5349) APPLICATION OF ATOMIC ENERGY IN AGRICULTURE. ANNUAL REPORT 1978. (Association Euratom-ITAL, Wageningen (Netherlands)). 1979. 152p. Dep. NTIS (US Sales Only), PC A08/MF A01.

The work carried out in 1978 is reported as a series of papers. Research has been carried out in the areas of the contamination due to primary radiation effects and due to the behaviour of radioactive and non-radioactive pollutants in soils, sediments and plants, plant nutrition in soils, properties of crop plants, crop protection by genetic control and product treatment by disinfection and disinfestation. Internal matters, publications, lectures and internal reports are detailed.

3372 (JAERI-M--7757) SURVEY OF THE DISTRIBUTIONS OF POPULATION AND AGRICULTURAL PRODUCE, ETC. AND THE APPLICATION FOR POPULATION DOSE EVALUATION. SURVEY FOR ENVIRONMENTAL SAFETY RESEARCH INFORMATION. Iijima, T. (Japan Atomic Energy Research Inst., Tokyo). Jul 1978. 97p. (In Japanese). Dep. NTIS (US Sales Only), PC A06/MF A01.

The computer model CARIEN to calculate the population doses due to all LWRs in Japan needs the distributions of population and agricultural produce around the nuclear installations. These distributions were presumed to be obtainable from national censuses, and a case-study survey was carried out in 1976 for the area up to 1000 km from the JAERI Tokai Research Establishment. The present report describes the survey and its results, and then discusses applicability of the censuses for population dose evaluation. The national censuses of population and foodstuffs were found to be sufficient for determining these distributions and predicting the future population changes. Results indicated the following: a) the population and agricultural produce around little contribute to the population doses, b) the contributions of leafy vegetables and cow's milk are important compared with inhalation, and c) if such as rice, egg and pork concentrate radionuclides to the same extent as leafy vegetables or milk, these are also important.

3373 (KFK--2750, pp 4800-1-4800-9) INVESTIGATION OF THE RADIOECOLOGY OF IODINE 129. Schuettelkopf, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Sicherheit - Bereich 1). Oct 1979. (In German).

Semiannual report 1978/2.

Very sensitive analytical methods for I-129 were developed for different sample materials. - The behaviour of I-129 in the Karlsruhe reprocessing plant and its release was completely investigated. - A longterm risk for the population caused by I-129 is not excpected. An existing environmental contamination with I-129 is reduced by a half-life of 0,3 y. The exposure of the population via the pasture-cow-milk path until now was overstimated at least by a factor 45. - In the environmental air of Kiel, Stade, Karlsruhe, Gundremmingen and Munich elemental iodine and iodine aerosols were measured. In the environmental air of Karlsruhe $CH_3{}^{127}I$ was determined.

3374 (LA-UR--79-3045) UPTAKE OF TRACE ELEMENTS AND RADIONUCLIDES FROM URANIUM MILL TAILINGS BY FOUR-WING SALTBUSH (ATRIPLEX CANESCENS) AND ALKALI SACATON (SPOROBOLUS AIROIDES). Dreesen, D.R.; Marple, M.L. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 18p. (CONF-791140--1). Dep. NTIS, PC A02/MF A01.

From 2. symposium on uranium mill tailings management; Fort Collins, CO, USA (19 Nov 1979).

A greenhouse experiment was performed to determine the uptake of trace elements and radionuclides from uranium mill tailings by native plant species. Four-wing saltbush and alkali sacaton were grown in alkaline tailings covered with soil and in soil alone as controls. The tailings material was highly enriched in Ra-226, Mo, U, Se, V, and As compared with three local soils. The shrub grown in tailings had elevated concentrations of Mo, Se, Ra-226, U, As, and Na compared with the controls. Alkali sacaton contained high concentrations of Mo, Se, Ra-226, and Ni when grown on tailings. Molybdenum and selenium concentrations in plants grown in tailings are above levels reported to be toxic to grazing animals. These results indicate that the bioavailability of Mo and Se in alkaline environments makes these elements among the most hazardous contaminants present in uranium mill wastes.

3375 (NUREG/CR--1004) STATISTICAL ANALYSIS OF SELECTED PARAMETERS FOR PREDICTING FOOD CHAIN TRANSPORT AND INTERNAL DOSE OF RADIONUCLIDES. FINAL REPORT. Hoffman, F.O.; Baes, C.F. III (eds.). (Oak Ridge National Lab., TN (USA)). Oct 1979. Contract W-7405-ENG-26. 201p. (ORNL/NUREG/TM--282). Dep. NTIS, PC A10/MF A01.

Compliance with environmental radiological standards promulgated to limit routine releases from nuclear facilities is usually determined through the use of mathematical models which are subject to considerable uncertainty. One way of estimating the uncertainty associated with model predictions is through an analysis of the statistical properties of their input parameters. Results of such analyses for parameters incorporated in US Nuclear Regulatory Commission (NRC) Regulatory Guide 1.109 are presented. The uncertainty in dose prediction resulting from a given concentration of $^{131}I_2$ in air transported over the pasture-cow-milk pathway is estimated. The NRC recommended generic default values are compared with the statistical distribution of the selected parameters, and the probability of the default values not being exceeded is estimated. The results provide an estimation of actual uncertainties to be expected under real-world conditions in lieu of validation experiments. The relevance of these results to the true uncertainties associated with the parameters and models analyzed in this report is limited because of the qualifying assumptions and the quality of data. However, methods of taking results from these analyses into account when determining compliance with regulatory statutes are discussed.

3376 (PNL--3300(Pt.2), pp 149) HANFORD HIGH-LEVEL WASTE. Soldat, J.K.; Strenge, D.L.; Napier, B.A.; Zimmerman, M.G.; Kennedy, W.E. Jr. Feb 1980.

Pacific Northwest Laboratory annual report for 1979 to the DOE Assistant Secretary for Environment. Part 2. Ecological sciences.

Methodology was developed for estimating the amount of land which might require control or decontamination because of contamination above specified limits following accidental releases of radionuclides at Hanford. Provisional limits were derived by calculating potential doses via food pathways and external exposure. The results of the calculations were published in a preliminary draft report. The report also included the results of calculations of potential doses from onsite and offsite transportation accidents.

3377 (PNL--3315) ENVIRONMENTAL CONSEQUENCES OF POSTULATED PLUTONIUM RELEASES FROM EXXON NUCLEAR MOFP, RICHLAND, WASHINGTON, AS A RESULT OF SEVERE NATURAL PHENOMENA. Jamison, J.D.; Watson, E.C. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Feb 1980. Contract AC06-76RL01830. 69p. NTIS, PC A04/MF A01.

Potential environmental consequences in terms of radiation dose to people are presented for postulated plutonium releases caused by severe natural phenomena at the Exxon Nuclear Company Mixed Oxide Fabrication Plant (MOFP), Richland, Washington. The severe natural phenomena considered are earthquakes, tornadoes, high straight-line winds, and floods. Maximum plutonium deposition values are given for significant locations around the site. All important potential exposure pathways are examined. The most likely 50-year committed dose equivalents are given for the maximum-exposed individual and the population within a 50-mile radius of the plant. The maximum plutonium deposition values most likely to occur offsite are also given.

3378 (RFP--3052) PLUTONIUM/AMERICIUM INVENTORY OF A POND ECOSYSTEM NEAR THE ROCKY FLATS FACILITY. Hurley, J.D.; Winsor, T.F. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 1980. Contract EY-76-C-04-3533. 6p. (CONF-800607--10). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

The data indicate that concentrations of ^{239}Pu exceed fallout background levels in soil and sediment. However, the levels in soil and vegetation indicate substantial dilution at this location downwind from a previously studied area near the source. Radioecological data for ^{241}Am reported herein are the first at Rocky Flats. The measurement accuracy however, for ^{241}Am and ^{238}Pu is not yet well established at such low levels. Calculated inventories reveal that the greatest quantities of the three radioisotopes reside in soil and sediment. This information verifies the pattern of previously obtained data on radionuclide distributions at Rocky Flats in terrestrial and aquatic environments, but at concentration levels lower by one or more orders of magnitude. In the latter sense, the present data are unique and useful.

3379 PLUTONIUM IN THE LUNGS OF PRONGHORN ANTELOPE NEAR A NUCLEAR FUEL REPROCESSING PLANT. Markham, O.D.; Dickson, R.L. (Department of Energy, Idaho Falls, ID (USA). Idaho Operations Office); Autenrieth, R.E. Health Physics ; 37: No. 3, 398-400(Sep 1979).

The lungs of pronghorn antelope which are common on the Idaho National Engineering Laboratory (INEL) site were sampled as a bioindicator of plutonium in the environment near the Idaho Chemical Processing Plant which is located on the INEL site. Lungs were collected from September 1972 to December 1976 and analyzed for Pu. The source of Pu found in the lungs could be determined from a study of the $^{238}Pu/^{239-240}Pu$ ratio as there is a higher proportion of ^{238}Pu in the chemical plant releases than in world-wide fallout in the soils of Southeastern Idaho. Results indicate that ^{238}Pu from the chemical plant is being deposited in lungs and possibly other tissues of pronghorn. Only a proportion of the animals close to the plant had detectable quantities. Concentrations were near the detection limits and do not constitute a health hazard to the pronghorn. Meaningful comparisons can be made to radiation protection standards since pronghorn lungs are similar in size to man's.

3380 RADIOACTIVE MATERIALS AND ENVIRONMENT. Trivedi, R.N. (Fertilizer Association of India, New Delhi); Pandey, G.N. (Harcourt Butler Technological Inst., Kanpur (India)). Chemical Era ; 15: No. 6, 23-38(Jul 1979).

7 tables.

Radioactive materials are very widely used in medicine, industry, agriculture and scientific and industrial research besides their use as nuclear weapons. The radiation energy emitted from radioactive materials into the environment has severe hazards. Because of their unique characteristics, the contamination caused by them is not comparable to other commonly known pollutions. This paper deals with various salient features of the radioactive materials, their numerous applications, the degree of hazards due to contamination in the environment and the essential safety measures to be taken in handling and disposing of the radioactive materials.

3381 COMPARTMENT MODEL FOR ASSESSING CHRONIC RADIOACTIVE RELEASES. Koplik, C.M. (Analytic Sciences Corp., Reading, MA). Transactions of the American Nuclear Society ; 32: 110-111(Jun 1979). (CONF-790602--(Summ.)).

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

3383 BEHAVIOUR OF TRITIUM IN THE ENVIRONMENT. REPORT ON THE INTERNATIONAL SYMPOSIUM HELD IN SAN FRANCISCO FROM 16 TO 20 OCTOBER 1978.

Farges, L. (International Atomic Energy Agency, Vienna (Austria)); Jacobs, D. (Oak Ridge National Lab., TN (USA)). Atomic Energy Review ; 17: No. 1, 213-217(Mar 1979).

Recent advances and the practical aspects of ^{3}H-utilization and monitoring are discussed. A reasonably complete picture exists of the behaviour of tritiated water (HTO) but information on tritiated gas and methane is less certain. The T/H ratio in water vapour over continental areas is about 3.5 to 4 times that over oceanic areas. ^{3}H can be used for developing chronological information in ice caps at the south pole. Watches with liquid crystal display use ^{3}H. Uncontrolled releases from fuel processing plants could contribute 35 to 60% of the maximum total ^{3}H body dose (>30mrem/year for a 100m stack). Global models for ^{3}H-concentration are highly dependent on the surface-water depth considered. T/H in the aquatic medium is discussed. In 1972, the oceanic inventory of ^{3}H was approximately 1640MCi (mostly in the Northern Hemisphere), with most of ^{3}H at a depth of less than 1000m. Terrestrially, rapid ^{3}H-loss is mainly due to evapotranspiration. When HTO penetrates more deeply into soil, the residence time increases. ^{3}H-retention in man can be characterized by a summation of 4 exponential terms, with successively increasing half-times.

3384 ^{90}SR AND ^{137}CS IN COYOTE SCATS FROM THE HANFORD RESERVATION. Springer, J.T. (Washington State Univ., Pullman (USA). Dept. of Zoology). Health Physics ; 36: No. 1, 31-33(Jan 1979).

Sixty scats (faeces) from coyotes (Canis latrans) were collected during the spring of 1976 from locations on the U.S. DOE Hanford Reservation in south central Washington. Only 5 of the 60 scats had detectable ^{137}Cs activity levels. All scats had measurable ^{90}Sr activity levels. Scats collected close to nuclear waste burial sites had the highest levels of radioactivity, and scats collected the greatest distance from the waste burial sites had the lowest levels. Coyotes are potential dispersers of radioactivity, and the data presented here suggest that surveillance of coyote scats can be useful adjunct to radiobiological monitoring procedures.

3385 RADIOCESIUM UPTAKE BY A POPULATION OF COTTON RATS (SIGMODON HISPIDUS) INHABITATING THE BANKS OF A RADIOACTIVE LIQUID WASTE POND. Garten, C.T. Jr. (Oak Ridge National Lab., TN (USA)). Health Physics ; 36: No. 1, 39-45(Jan 1979).

A mean population of 20 cotton rats inhabited the banks of a small radioactive liquid waste pond (approximately 0.39 ha) in Tennessee during the summer of 1977. Radiocesium concentrations in common shoreline plants (Eleocharis, Juncus, Typha, and Polygonum) ranged from 80pCi/dry g in Juncus to 35,800 pCi/dry g in Eleocharis. The mean (+-S.E.) ^{137}Cs concentration in cotton rat GI tracts was 2283 (+-591) pCi/dry g (N=14). The mean (+-S.E.) whole-body burden of ^{137}Cs in 14 rats sampled from June to September was 44467 (+-13,142) pCi. Mean ^{137}Cs body burdens in cotton rats increased from 32 pCi/g live weight in May to 208 pCi/g live weight in August and declined to 3 pCi/g live weight in December. The mean (+-S.D.) percent distribution of the whole-body contents among pelt, GI tract and carcass was 12(+-3), 28(+-12), and 60(+-9), respectively. The calculated mean (+-S.E.) ingestion rate of ^{137}Cs, assuming rats recaptured on the pond's banks for longer than 42 days were at equilibrium, was 1792(+-504) pCi/day. The concentration of ^{137}Cs in shoreline plants, rat GI tracts, and rat bodies indicated that cotton rats, which are herbivores, accumulated their body burdens by foraging along the contamination zone bordering the pond shoreline. A maximum mean estimate of the amount of ^{137}Cs annually exported by cotton rats from the pond is 8719 nCi or approximately 10^{-6}% of the total amount estimated to be present in the pond's sediments.

3386 LONG-TERM ACCUMULATION FACTORS FOR FISH AND SEDIMENTS IN THE BAVARIAN DANUBE AREA. Huebel, K.; Herrmann, H.; Ruf, M. (Bayerische Landesanstalt fuer Wasserforschung, Muenchen (Germany, F.R.)). pp 407-416 of Biological implications of radionuclides released from nuclear industries. Vol. 2. Vienna, Austria; IAEA (1979).

From International symposium on biological implications of radionuclides released from nuclear industries; Vienna, Austria (26 Mar 1979).

The legislation governing radiation protection in a great many countries stipulates the dose limits for human beings thereby restricting the permissible emission of radioactive waste products into the environment. For this purpose mathematical models are formulated which permit the corresponding dose from the emission rates of nuclear systems and facilities to be established. In these models the biological transfer factors are of prime importance. When observing the various exposure routes involved in waste disposal it will be seen that a considerable proportion of the resulting dose stems from eating fish and from exposure to the environment of dried-up river banks. The paper presents the accumulation factors for fish and sediments for a few of the most common elements occuring in nuclear power stations, obtained from many years of investigations in the Bavarian Danube area.

3387 FOODCHAIN TRANSPORT OF ^{210}PB RESULTING FROM URANIUM MILLING ACTIVITIES. McDowell-Boyer, L.M.; Watson, A.P.; Travis, C.C. (Oak Ridge National Lab., TN (USA)). pp 265-276 of Biological implications of radionuclides released from nuclear industries. Vol. 2. Vienna, Austria; IAEA (1979).

From International symposium on biological implications of radionuclides released from nuclear industries; Vienna, Austria (26 Mar 1979).

The milling of uranium ores in western United States has resulted in an enhanced release of ^{222}Rn from the residual tailings produced. The purpose of the present study was to evaluate the potential significance of ^{210}Pb deposited on soil as a result of radioactive decay of the atmospheric ^{222}Rn released. Environmental transport of ^{210}Pb, persisting in soils for 100 years following a unit release of ^{222}Rn from four generic mill sites in the western United States, was evaluated. Resulting dietary exposure and dose commitment for the US population were estimated with the use of derived environmental transport parameters, US dietary and demographic information, and appropriate dose conversion factors for Pb. Soil concentrations of Pb in US crop production areas were determined by the National Oceanic and Atmospheric Administration, using a regional-scale atmospheric dispersion and deposition model applied to the four designated release sites. A comparison between estimated dose commitment from Pb in soil, and that due to inhalation of Rn and short-lived daughters from a unit Rn release from each mill site was made. The results indicate that the Pb in soil is a potentially significant source of

radiation dose from uranium milling activities with respect to the Rn inhalation dose.

3388 BIOLOGICAL RESPONSES OF A TROPICAL COASTAL ECOSYSTEM TO RELEASES FROM ELECTRO-NUCLEAR INSTALLATIONS. Patel, B.; Patel, S.; Balani, M.C. (Bhabha Atomic Research Centre, Bombay (India). Health Physics Div.). pp 335-349 of Biological implications of radionuclides released from nuclear industries. Vol. 2. Vienna, Austria; IAEA (1979).

From International symposium on biological implications of radionuclides released from nuclear industries; Vienna, Austria (26 Mar 1979).

The implications of low-level radioactive waste discharges from electronuclear installations on the biological responses of the arcid clam Anadara granosa have been studied. The rate of feeding, measured in terms of clearance of dye suspension, was not affected by exposure to acute doses of up to 5 R. Exposure to higher doses (up to 40 R) increased the rate by 70%. On further irradiation (100-700 R), however, it dropped significantly. The changes in the feeding rates following bioaccumulation of the fission product nuclides have also been studied. The effect of ionizing radiations at the cellular level was evaluated by studying the electrophoretic mobility of clam erythrocytes. The electrokinetic behaviour of erythrocytes was not affected following irradiation at low doses (0.1 kR), but on exposure to higher doses (1-8 kR) the EPM showed oscillatory behaviour. The paper also discusses the biological half-life of caesium-137, its localization in subcellular fractions of various tissues of A. granosa and the effects of low-level discharges on the intertidal ecosystem.

3389 Umweltradioaktivitaet in Lebensmitteln. (ENVIRONMENTAL RADIOACTIVITY IN FOODS). Fischer, E.; Jakubick, V.; Kalus, W.; Mueller, H. (comps.). Eggenstein-Leopoldshafen, Germany, F.R.; ZAED (Dec 1978). vp. (In German and English).

This new volume of the bibliography series contains 142 citations mainly from the fields 'surveillance of nuclear installations' and 'Terrestrial ecosystems and food chains'.

3390 RADIATION BURDEN FROM RADIOACTIVE GAS EMISSIONS OF THE POPULATION IN THE IMMEDIATE NEIGHBOURHOOD OF THE NUCLEAR RESEARCH INSTITUTE. Horyna, J. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Jaderna Energie ; 24: No. 12, 456-458(Dec 1978). (In Russian).

The method suggested by Pasquill was used in calculating the radiation burden of population in the vicinity of UJV Rez. ^{13}+HlI is most significant from the radiation protection point. It may be directly inhaled and/or become part of the food chain. The calculation showed that the spread of gaseous radioactive wastes depends on the state of the atmosphere. In unfavourable atmospheric conditions the dose from a cloud of volatile fission products may be as much as 10^{-18} J.kg^{-1}.B^{-1}.m.s^{-1} and the dose resulting from iodine inhalation as much as 10^{-14} J.kg^{-1}.B^{-1}.m.s^{-1}. The accuracy of calculations was limited by the fact that literature data rather than experimental data were used.

3391 BIOINDICATION OF NUCLEAR FISSION AEROSOL PRODUCTS BY MEANS OF ORDINARY PINE NEEDLES. Piskunov, L.I.; Treiger, S.I. Atomnaya Energiya ; 45: No. 3, 223-225(Sep 1978). (In Russian).

Site Resource and Use Studies

3392 (DP--1526, pp 223-225) EARTHQUAKE DAMAGE TO UNDERGROUND FACILITIES. Stephenson, D.E.; Pratt, H.R. Nov 1979.

Savannah River Laboratory environmental transport and effects research. Annual report, 1978.

The damage to underground facilities caused by earthquakes was evaluated in order to determine potential seismic risk to an underground nuclear waste repository. Earthquake effects were delineated in terms of both displacements and accelerations. For underground facilities, displacements are considered more damaging than accelerations. An evaluation of the data was made in terms of acceleration, velocity, and displacement as a function of earthquake magnitude, distance, and depth. Damage decreases with distance from the source and with depth below the ground surface. However, extensive damage can occur if the facility is cut by a fault or fault fissure along which a slip can occur during an earthquake. Peak acceleration decreases with depth; however, peak displacements show much less reduction with depth.

3393 (ONWI--16) ENVIRONMENTAL CHARACTERIZATION OF BEDDED SALT FORMATIONS AND OVERLYING AREAS OF THE SALINA BASIN. (Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). Sep 1979. Contract EY-76-C-06-1830. 379p. Dep. NTIS, PC A17/MF A01.

The suitability of the Salina Basin bedded salt region as a repository for underground disposal of radioactive wastes was reported. General information on the need for a repository, the technology development, the assessment process, a preliminary conceptual facility design, and anticipated impacts were included. The geology of the area including: stratigraphy, seismology, energy resources, and mineral resources was studied. The hydrology of the area was also studied as well as the climate. Socioeconomic studies of the area were also performed. Terrestrial and aquatic ecosystems were surveyed. (DMC)

3394 (PB--296712) LANDSAT PROJECT, STATE OF HAWAII. A PRELIMINARY REPORT. (Hawaii Ad Hoc Committee on Remote Sensing, Honolulu (USA)). Dec 1979. 41p. NTIS, PC A03/MF A01.

An inter-agency task force comprised of representatives from the State of Hawaii Departments of Agriculture, Land and Natural Resources, and Planning and Economic Development. The past, present and potential future application of satellite remote sensing technology is examined as a possible means for meeting growing land use and environment-related information needs of the State of Hawaii.

3395 (PB--296947, pp 356-365) ASSESSMENT OF RADON PROGENY INHALATION EXPOSURE FROM LOW-LEVEL WASTES OF PHOSPHATE MINING IN FLORIDA. Fisher, D.R. (Battelle Pacific Northwest Labs., Richland, WA); Roessler, C.E. May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

The redistribution of naturally-occurring uranium series radionuclides as a result of phosphate mining, processing, product use, and waste disposal presents several potential radiation pathways to man. Of particular importance is exposure to radon-222 progeny in structures built on reclaimed lands in Florida. Indoor radon daughter sampling data from Polk County were analyzed, and the data categorized by land and structure type. The average population-weighted concentration in about 4400 homes was determined to be about 0.009 working level (WL) in addition to a background of 0.0003 WL. It was also determined that the average annual cumulative indoor exposure on reclaimed land was approximately 0.02 working level months (WLM). A relatively small number of houses on high-activity overburden accounted for 38% of the total population exposure. A generally applicable model is proposed to relate lund cancer risk to the average annual exposure, the risk coefficient, the expected lung cancer mortality from all other causes, the duration of the exposure and the number of years for observation of the effects. Health risk estimates were performed for present levels and population size, and also for several scenarios anticipating new growth and construction - with and without imposed standards to limit indoor radon progeny levels. The model suggests that for an equilibrium condition, about one additional case of radiogenic lung cancer every two years in the Polk County population might be expected.

3396 (RLO-SA--79-1) PERSPECTIVE ON HANFORD SAFETY AND ENVIRONMENTAL PROTECTION. Fremling, A.G. (Department of Energy, Richland, WA (USA). Richland Operations Office). 25 Jul 1979. 30p. Dep. NTIS, PC A03/MF A01.

Hanford activities and operations past and present are reviewed, with emphasis on those that have potential for adverse safety or environmental impact. Safety and environmental protection requirements and responsibilities are summarized, and the current Hanford environmental surveillance program is outlined. It is concluded that the overall effects of Hanford's operations on people and the environment over the past 36 years have been small. It is perceived that the most difficult challenges are the management and ultimate disposal of the stored wastes. (JGB)

3397 (UCID--18706) SAFETY ANALYSIS (SA) OF THE HAZARDOUS WASTE DISPOSAL FACILITIES (BUILDINGS 514, 612, AND 614) AT THE LAWRENCE LIVERMORE LABORATORY. Odell, B.N.; Toy, A.J. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 13 Dec 1979. Contract W-7405-ENG-48. 64p. NTIS, PC A04/MF A01.

This safety analysis was performed for the Manager of Plant Operations at LLL and fulfills the requirements of DOE Order 5481.1. The analysis was based on field inspections, document review, computer calculations, and extensive input from Waste Management personnel. It was concluded that the quantities of materials handled do not pose undue risks on- or off-site, even in postulated severe accidents. Risks from the various hazards at these facilities vary from low to moderate as specified in DOE Order 5481.1. Recommendations are made for additional management and technical support of waste disposal operations.

3398 CATION EXCHANGE AND SELECTIVITY IN HEATED MINERALS. Komarneni, S. Soil Science Society of America Journal ; 43: No. 4, 790-793(Jul 1979).

Various minerals that are commonly present in shales were heated in air as well as hydrothermally and their cation exchange capacity (CEC) and cation exchange selectivity (CES) values were determined. The CEC values of all the heated minerals decreased because of partial or complete collapse of the layers. The CES (KX/Ca/sub 1/2/X) values of montmorillonites and micaceous vermiculites increased because of wedge site formation by partial collapse after heat treatment to 500 and 750°C in air. The CES values of coarse grained micas, however, decreased by dry heat treatment because of the collapse of frayed edges or wedge zones. Heated illites randomly interstratified with montmorillonite behaved like the specimen montmorillonites, while heated, well crystallized illites behaved similarly to the coarse grained micas. That the wedge zones are enormously selective for potassium was clearly proven here by the collapsed, heated minerals. The CES values of poorly crystalline illites interstratified with montmorillonite increased while those of well crystallized illites with discrete vermiculite impurity decreased upon hydrothermal treatment at 400°C and 500 bar (pressure). The decrease or increase in CES of the hydrothermally heated illite minerals can be explained by the loss or creation respectively of wedge zones just as in the case of air-heated minerals.

3399 UNCLEAR DECISION FOR GERMANY. Barnaby, F. (Stockholm International Peace Research Inst. (Sweden)). New Scientist ; 82: No. 1152, 266-267(26 Apr 1979).

The debate surrounding the proposal by the West German nuclear industry to build a reactor complex comprising a reprocessing plant, a reactor-fuel fabrication plant and a waste disposal facility is examined. Evidence is discussed for and against the nuclear centre on economic, safety, security and nuclear-weapon proliferation grounds.

3400 EFFECT OF SOIL AFFIXANTS ON GERMINATION, EMERGENCE, AND GROWTH OF CHEATGRASS AND RUSSIAN THISTLE. Cline, J.F. (Battelle Pacific Northwest Labs., Richland, WA (USA)); Holter, G. Health Physics ; 35: No. 2, 409-411(Aug 1978).

Shallow burial has been used successfully for the disposal of low-level radioactive wastes at Hanford. Soil affixants are used to control soil erosion by wind and to prevent plant roots or burrowing animals from entering the buried material. Growth chamber experiments were conducted to determine whether the affixants have any adverse effect on seed germination or plant growth. Layers of latex emulsions and asphalt emulsion mixtures applied to soil surfaces did not reduce seed germination significantly. There was no visible evidence of plant toxicity induced by the treatments. Asphalt emulsion and asphalt-neoprene reduced loss of soil water, but water utilization by plants growing in latex treated pots was nearly the same as for controls. Results suggest that these treatments can be used as soil stabilizers, to control the rate of moisture flow from soil and to help control wind erosion.

Regulations

3401 TOXIC AND HAZARDOUS WASTE DISPOSAL. VOLUME 3. IMPACT OF LEGISLATION AND

IMPLEMENTATION ON DISPOSAL MANAGEMENT PRACTICES. Pojasek, R.B. (ed.). Ann Arbor, MI; Ann Arbor Science Publishers, Inc. (1980). 212p. (CONF-790415--P6).
From 177. national meeting of the American Chemical Society; Honolulu, HI, USA (1 Apr 1979).
A continuation of the series Toxic and Hazardous Waste Disposal, Volume 3 is the first of two volumes covering contributions to the international hazardous waste disposal symposium. Volume 3 includes coverage of the United States regulatory program, related European experience, and Japanese technology. Thirteen of the sixteen papers were abstracted and indexed individually for EDB/ERA; no individual items were selected for Energy Abstracts for Policy Analysis (EAPA). (JGB)

3402 INCORPORATION OF PUNISHABLE OFFENCES AGAINST THE LAW ON PROTECTION OF THE ENVIRONMENT INTO THE PENAL CODE.
Moehrenschlager, M. Umwelt ; No. 6, 476-480(Dec 1979). (In German).
The government bill on the sixteenth act amending the penal legislation - act on the prevention of environmental offences - is presented, with comments being given on the most important stipulations. Paragraph 328 of the penal code deals with the unauthorized handling of nuclear fuels and represents an almost complete adoption of Paragraph 45 of the Atomic Energy law. The prohibition of the operation of nuclear facilities laid down in Paragraph 45, par. 1, No.4 of the Atomic Energy law, has been incorporated into the factural characteristics of illegal operation of facilities (Paragraph 327, par. 1,3 No. 1 of the penal code). The illegal handling of other radioactive substances has been dealt with in regard to some important cases: specifically for the case of illegal waste disposal (Paragraph 326, par. 1 No. 2, par. 2 of the penal code), and for the case of irregular transport leading to concrete danger or nuisance (Paragraph 330, par. 1 No. 4 of the penal code), as well as for the case of release of ionizing radiation having any such consequences (Paragraph 330, par. 1 No. 2, item c of the penal code). According to Paragraph 324 of the penal code, radioactive contamination of waters is a punishable offence. The rule of qualification of Paragraph 330 par. 1 of the penal code is to be applied to all these facts. (orig./HP) 891 HP/orig.-892 MB.

ENVIRONMENTAL SCIENCES, AQUATIC

Basic Studies

3403 (PNL--3160-2) ASSESSMENT OF EFFECTIVENESS OF GEOLOGIC ISOLATION SYSTEMS. VARIABLE THICKNESS TRANSIENT GROUND-WATER FLOW MODEL. VOLUME 2. USERS' MANUAL.
Reisenauer, A.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Dec 1979. Contract EY-76-C-06-1830. 157p. Dep. NTIS, PC A08/MF A01.
A system of computer codes to aid in the preparation and evaluation of ground-water model input, as well as in the computer codes and auxillary programs developed and adapted for use in modeling major ground-water aquifers is described. The ground-water model is interactive, rather than a batch-type model. Interactive models have been demonstrated to be superior to batch in the ground-water field. For example, looking through reams of numerical lists can be avoided with the much superior graphical output forms or summary type numerical output. The system of computer codes permits the flexibility to develop rapidly the model-required data files from engineering data and geologic maps, as well as efficiently manipulating the voluminous data generated. Central to these codes is the Ground-water Model, which given the boundary value problem, produces either the steady-state or transient time plane solutions. A sizeable part of the codes available provide rapid evaluation of the results. Besides contouring the new water potentials, the model allows graphical review of streamlines of flow, travel times, and detailed comparisons of surfaces or points at designated wells. Use of the graphics scopes provide immediate, but temporary displays which can be used for evaluation of input and output and which can be reproduced easily on hard copy devices, such as a line printer, Calcomp plotter and image photographs.

3404 (SKBF/KBS-TR--79-08) CALCULATION OF GROUND WATER MOVEMENTS IN THE STERNOE AREA IN BLEKINGE, SWEDEN. Stokes, J. (Kaernbraenslesaekerhet, Stockholm (Sweden); Svensk Kaernbraenslefoersoerjning AB, Stockholm). Feb 1979. 13p. (In Swedish). NTIS (US Sales Only), PC A02/MF A01.
The groundwater flow in the Sternoe region in Blekinge, Sweden was studied with the 2-D-analytical potential flow model which is presented in KBS report 47. Due to the topography, the cylinder-symmetrical alternative was used. Flowlines, gradients and flowtimes were computed for four different profiles representing typical examples of boundary conditions. The flowlines, gradients and flowtimes are presented in figures. (Author).

3405 (SKBF/KBS-TR--79-17) WATER PERCOLATION EFFECTS ON CLAY-POOR BENTONITE/QUARTZ BUFFER MATERIAL AT HIGH HYDRAULIC GRADIENTS. Pusch, R. (Svensk Kaernbraenslefoersoerjning AB, Stockholm; Kaernbraenslesaekerhet, Stockholm (Sweden)). May 1979. 13p. NTIS (US Sales Only), PC A02/MF A01.
A test senes was made in the laboratory to investigate the clay-transporting power of percolating water. Two buffer mass compositions were studied, one containing 4 percent Na bentonite and 96 percent quartz particles the other 8 percent bentonite and 92 percent quartz.

3406 (UCRL--15162) ESTIMATING LONG-TERM STATISTICS FOR ANNUAL PRECIPITATION FOR SIX REGIONS OF THE UNITED STATES FROM TREE-RING DATA. Fritts, H.C.; DeWitt, E.; Gordon, G.A.; Hunt, J.H.; Lofgren, G.R. (Arizona Univ., Tucson (USA). Lab. of Tree-Ring Research). Dec 1979. Contract W-7405-ENG-48. 99p. Dep. NTIS, PC A05/MF A01.
Spatial anomalies of seasonal precipitation for the United States and southwestern Canada have been reconstructed from 1602 through 1961 using dendrochronological and multivariate techniques on 65 arid-site tree-ring chronologies from western North America. Seasonal reconstructions are averaged to obtain mean annual precipitation values for six regions of importance to the Nuclear Regulatory Commission (NRC) Nuclear Waste Management Program (NWMP). Statistics calculated from the regionally averaged annual values for 25-year and longer intervals show annual precipitation in the seventeenth through nineteenth centuries to be lower than in the twentieth century for three regions in the American Southwest and higher for one region in the Northwest and two

regions in the East. The variability of precipitation generally was higher in the past three centuries than in the present century. Twenty-five-year intervals with noteworthy statistics are identified and important results are summarized and tabulated for use in the hydrologic modeling of the NWMP. Additional research is recommended to incorporate temperature and precipitation into a single hydrologic parameter.

3407 OCEAN MINING TECHNOLOGY AND ENVIRONMENTAL STUDIES. Halkyard, J.E. (Kennecott Copper Corp). Mining Congress Journal ; 65: No. 8, 25-28(Aug 1979).

A resource exists and numerous mines have been identified using sampling techniques developed over the past few decades. Mining systems have been demonstrated and unique technology developed. Ore transfer and transport have some problems that appear solvable. At least one economic process has been developed and demonstrated at a pilot scale. Mining effects on the ocean environment look minimal, while the question of process tailings disposal remains to be studied.

Chemicals Monitoring and Transport

3408 (COO--2185-12) TRANSPORT AND TRANSFER RATES IN THE WATERS OF THE CONTINENTAL SHELF. Biscaye, P.E. (Columbia Univ., Palisades, NY (USA). Lamont-Doherty Geological Observatory). Aug 1979. Contract EY-76-S-02-2185. 160p. Dep. NTIS, PC A08/MF A01.

Samples and data from previous cruises were analyzed with a view to understanding those biological, chemical, and physical processes which affect energy-related pollutants in the marine environment of the continental margin. Two cruises designed to expand the sample base, measure the time variability of several transfer processes, and to test specific hypotheses on the mechanisms for processes which effect exchange of continental margin with open ocean waters were carried out. Progress was made in understanding the relative roles of nutrients and light in controlling the productivity of important primary biomass (and hence, particle) producers. Progress was also made in understanding the influences of phytoplankton populations on distribution of inorganic nutrients, dissolved oxygen and particulate organic matter. In addition, preliminary results from field work support the hypothesis that most diatom production on the shelf sinks to the bottom where it enters benthic food chains or provides seed populations for subsequent blooms. Radionuclides were studied in water columns and in sediments to develop an understanding of processes associated with suspended solids and with sediments as sinks for radionuclides and other pollutants. Major progress was made on the analysis of hydrographic data from all previous cruises and to evolve a comprehensive picture of the stratification of the waters of the New York Bight. The Co_2-H_2O equilibration system required for the preparation of samples for oxygen isotope analysis was completed. Work has continued in the use of radon as a tracer of small scale water motions and mixing in the definition of the source function needed for modelling the data, in actual modelling of the data, and in defining the range of variability of the radon distributions. (JGB)

3409 (ORNL/TM--6328/V1, pp 187-260) BIOPROCESS DEVELOPMENT AND DEMONSTRATION. Pitt, W.W. Jr. Jun 1980.

Advanced Technology Section semiannual progress report, April 1-September 30, 1977. Volume 1. Biotechnology and environmental programs.

Bioprocess development and demonstration activites during this report period included the operation of bench-scale and pilot-plant ANFLOW (anaerobic upflow system for treatment of wastewater) units and long-term operation of a large fluidized-bed denitrification bioreactor. The ANFLOW demonstration pilot plant was operated essentially continuously at feed rates up to 15.1 m^3/day (4000 gal/day) with steadily improving performance. The bench-scale unit was also operated under conditions similar to the pilot plant, using raw sewage as feed. Results for the smaller unit compared closely with those from the large unit except for a much greater rate of methane production by the smaller unit. A preliminary cost estimate comparing ANFLOW with conventional waste treatment indicated that for waste treatment plants, 1 million gallon per day or less in size, the capital costs of ANFLOW would be less and consume much less energy than would conventional methods. Progress is also reported on research on the biological denitrification of various nitrate-containing waste streams associated with the nuclear industry, namely, evaluating the influence of radiation and the concentrations of sodium, calcium, nitrate, ammonium, and nickel on denitrification rates.

3410 (UCRL--83664) ON-LINE MONITORING OF TOXIC MATERIALS IN SEWAGE AT THE LAWRENCE LIVERMORE LABORATORY. Auyong, M.; Cate, J.L. Jr.; Rueppel, D.W. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 21 Feb 1980. Contract W-7405-ENG-48. 9p. (CONF-800223--1). Dep. NTIS, PC A02/MF A01.

From 2. symposium on process measurements for environmental assessment; Atlanta, GA, USA (25 Feb 1980).

It is becoming increasingly important for industry to prevent releases of potentially toxic material to the environment. The Lawrence Livermore Laboratory has developed a system to monitor its sewage effluent on a continuous basis. A representative fraction of the total waste stream leaving the Plant is passed through a detection assembly consisting of an x-ray fluorescence unit which detects high levels of metals, sodium iodide crystal detectors that scan the sewage for the presence of elevated levels of radiation, and an industrial probe for pH monitoring. With the aid of a microprocessor, the data collected is reduced and analyzed to determine whether levels are approaching established environmental limits. Currently, if preset pH or radiation levels are exceeded, a sample of the suspect sewage is automatically collected for further analysis, and an alarm is sent to a station where personnel can be alerted to respond on a 24-hour basis. In the same manner, spectral data from the x-ray fluorescence unit will be routed through the 24-hour alarm system as soon as evaluation of the unit is complete. The design of the system and operational experience is discussed.

3411 INTERLABORATORY COMPARISON OF ARSENIC, MOLYBDENUM, AND SELENIUM ANALYSES FROM URANIUM MILL TAILINGS. Dreesen, D.R.; Gladney, E.S.; Owens, J.W. (Los Alamos Scientific Lab., NM). Journal of the Water Pollution Control Federation ; 51: No. 10, 2447-2456(Oct 1979).

An inter-laboratory analytical comparison was conducted to investigate analytical laboratories and techniques and to establish whether intensive analytical development is necessary to determine arsenic, molybdenum, and

selenium in complex groundwater collected at an inactive uranium mill tailings pile. A disparity in results indicates problems of trace analyses in complex matrixes. Regulations regarding wastewater discharge assume that accurate analysis can be achieved with standard techniques; such an assumption is suspect. 5 tables.

3412 MARINE POLLUTION - FACTS AND FICTION, THE SITUATION IN BRITAIN. Cole, H.A. Ocean Management ; 5: No. 3, 263-278(Oct 1979).
The widely-held impression that serious biological damage has been done to the marine environment and its resources by pollutants is not soundly based. There is no evidence that any offshore stock of fish or shellfish has suffered a reduction in annual recruitment to the exploitable stock as the result of pollution. The most damaging effects of pollution are reduction in available oxygen, increased turbidity due to suspended material and discolouration, and deposition of organic material on the bottom. Sewage and other organic effluents (such as food-processing wastes) with a high biological oxygen demand are the prime causes of these conditions. Potentially harmful metals and synthetic organic substances resistant to breakdown may accumulate in estuarine and coastal sediments, particularly muddy sands, silts and muds containing a high proportion of organic matter, and will continue to release potential pollutants long after shore discharge are controlled. There is no evidence that radioactive waste disposal by the UK in the sea has created any public health hazard or has had any discernible effect on organic production.

Radioactive Materials Monitoring and Transport

3413 (AECL--6586) PROGRESS REPORT, BIOLOGY AND HEALTH PHYSICS DIVISION, 1 APRIL TO 30 JUNE 1979. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Aug 1979. 67p. (PR-B--122). NTIS (US Sales Only), PC A04/MF A01.
Results are reported for research into the areas of dosimetry, monitoring, environmental radiation effects, waste management and tumour induction in mammals. (L.L.).

3414 (COO--3563-78) DETECTION AND MEASUREMENT OF CURIUM IN THE MARINE ENVIRONMENT. Schneider, D.L.; Livingston, H.D. (Woods Hole Oceanographic Institution, MA (USA)). 27 Oct 1978. Contract EY-76-C-02-3563. 36p. (CONF-7806174--1). Dep. NTIS, PC A03/MF A01.
From American Chemical Society symposium on analytical methods in oceanography; Boston, MA, USA (Jun 1978).
Transuranium elements have been introduced to the environment by a variety of ways including fallout from weapons testing, leakage from nuclear power reactors, waste effluent from nuclear fuel processing and leakage of radioactive waste from ocean dump sites. Several methods of curium detection and analysis in samples from marine ecosystems are contrasted and discussed in this paper.

3415 (FERMILAB--80/29) ENVIRONMENTAL MONITORING REPORT FOR CALENDAR YEAR 1979. Baker, S.I. (Fermi National Accelerator Lab., Batavia, IL (USA)). 1 May 1980. Contract AI08-76DP00474. 38p. NTIS, PC A03/MF A01.
The accelerator operated routinely at 400 GeV during CY-1979 with about the same number of protons accelerated during CY-1979 as in CY-1978. The total number of protons accelerated in 1979 was 2.5×10^{19}. Typical operation was at about 40 percent of the design intensity of 5×10^{13} protons per acceleration cycle. During CY-1979 there were no abnormal ocurrences. The perforated tile field at B0 was sealed off and a new resin regeneration system became operational. Precipitates from the effluent are disposed of as radioactive waste. There is no evidence for any off-site impact from previous releases of any pollutant. Operation of the Central Laboratory Sewage Treatment Plant was discontinued in June 1979, and sewage was diverted to the City of Batavia Sewage Treatment Plant. The maximum potential radiation exposure at the site boundary during CY-1979 was 2 mrem compared to 11 mrem last year. This dose rate was lower because the experimental areas produced fewer off-site muons this year. The total potential radiation exposure to the general off-site population from Fermilab operations during CY-1979 was 3 man-rem compared to 5 man-rem last year. Airborne radioactivity was released across the site boundary in small amounts throughout the year. The radioactive gas was primarily ^{11}C, total quantity released was 4 kCi, and the maximum dose at the site boundary was 1.0 mrem for 1979. The average concentration at site boundary based on measurements at the stack was 0.2% of the Concentration Guide. There was also a controlled release of tritium; the total amount released was 280 mCi. Tritium was released continuously from about June 1, 1979 (when the Meson Area resumed operations after a long shutdown) until the end of the year. The average concentration at the site boundary was about 0.00001% of the Concentration Guide, resulting in a negligible off-site exposure.

3416 (INIS-mf--5574) RESEARCH ON DEACTIVATION OF LIQUID, SOLID AND GASEOUS RADIOACTIVE WASTES AND DECONTAMINATION OF SURFACES. PART 5. INVESTIGATIONS ON METHODS AND MEANS FOR REMOVAL OF RADIOACTIVE AEROSOLS AND GASES FROM AIR DISCHARGES. (Sovet Ehkonomicheskoj Vzaimopomoshchi, Moscow (USSR). Postoyanniya Komissiya po Ispol'zovaniyu Atomnoj Ehnergii v Mirnykh Tselyakh). 1978. 119p. (In Russian). (CONF-761260--(Pt.5)). NTIS (US Sales Only), PC A06/MF A01.
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
Selected papers are processed separately.

3417 (INIS-mf--5574, pp 97-114) INVESTIGATION OF RADIATION SUBSTANCES MIGRATION IN THE SURFACE WATERS OF LAND, SEAS AND OCEANS FOR THE PURPOSE OF STUDY OF RADIATION SITUATION CHANGES IN THE FRESH AND SEA-WATERS IN CONNECTION WITH NUCLEAR POWER PLANTS AND NUCLEAR INDUSTRY ENTERPRISES ACTIVITY. Gedeonov, L.I.; Ivanova, L.M.; Rakov, N.A.; Blinov, B.A. 1978. (In Russian).
From 4. conference on processing and disposal of radioactive wastes and on decontamination of surfaces; Moscow, USSR (20 Dec 1976).
Review of the main results is given in research on the radioactive substances migration in the surface waters of the land, seas and oceans. The problem is considered of the methodology preparation for investigations and choice of the common criterias for the methods of radionuclides determination in environment. General problems are stated of accumulation and migration of strontium-90 and cesium-137 in the water medium. The data is given on radioactive contamination of the

Danube river; Baltic and North seas.

3418 (ORNL/TM--6893) RADIOACTIVE WASTE DISPOSAL AREAS AND ASSOCIATED ENVIRONMENTAL SURVEILLANCE DATA AT OAK RIDGE NATIONAL LABORATORY. Oakes, T.W.; Shank, K.E. (Oak Ridge National Lab., TN (USA)). Dec 1979. Contract W-7405-ENG-26. 34p. Dep. NTIS, PC A03/MF A01.

Environmental surveillance data have been collected around radioactive waste disposal areas for the past thirty years at Oak Ridge National Laboratory (ORNL). The wealth of data collected around the ORNL radioactive waste burial grounds is presented in this review. The purpose of this paper is to describe the solid waste burial grounds in detail along with the environmental monitoring data. The various monitoring systems are reviewed, and the liquid discharge trends are discussed. Monitoring at White Oak Dam, the last liquid control point for the Laboratory, was started in the late 1940's and is continuing. Presently, a network of five environmental monitoring stations is in operation to monitor the radionuclide content of surface waters in the White Oak Creek watershed. Facts observed during the lifetime of the disposal sites include: (1) a large amount of ^{106}Ru released during 1959 to 1964 due to the fact that Conasauga shale did not retain this element as well as it retained other radionuclides. (2) Large quantities of tritiated water have been released to the Clinch River in recent years, but, from a practical standpoint, little can be done to inhibit or control these releases. (3) A general downward trend in the number of curies released has been observed for all other radionuclides. A number of corrective measures that have been initiated at ORNL to reduce the radioactive liquid discharges are outlined in the paper.

3419 (PB--80-101959) EFFECT OF NUCLEAR POWER GENERATION ON WATER QUALITY IN THE GREAT LAKES. TECHNICAL REPORT. Sullivan, R.E.; Ellet, W.H. (Office of Radiation Programs, Washington, DC (USA). Div. of Criteria and Standards). Jul 1977. 82p. NTIS, PC A05/MF A01.

The 1972 Great Lakes Water Quality Agreement between the United States and Canada concerning improvement of the water quality of the Great Lakes has led to a study of the probable effects of nuclear power generation on radioactivity levels in the lakes. A simplified physical model of the Great Lakes system has been employed which assumes thorough annual mixing but allows for the perturbations in dilution volume required by the periodic establishment of thermoclines. Corrections are made, where necessary, for removal of radionuclides by sedimentation and equilibration. The results are given in terms of the concentration of radionuclides in each lake and the dose rates resulting from continuous, long-term ingestion of system waters. Dose calculations are performed using equations promulgated by the ICRP in Report 10. Using the model described, it is possible to obtain analytical solutions for the coupled differential equations describing these quantities. A Fortran computer program, GLA-1, has been employed to reduce calculational effort.

3420 RADIOACTIVE WASTE MANAGEMENT AND ITS IMPLICATIONS FOR ENVIRONMENTAL RESEARCH. Murray, C.N.; Girardi, F.; Bertozzi, G.; Myttenaere, C. (Commission of the European Communities Joint Research Centre, Varsese, Italy). pp 125-133 of Management of environment. Patel, B. (ed.). New Delhi, India; Wiley Eastern Ltd. (1980).

The methodology proposal in this article is based on the identification and mathematical modeling of barriers, natural and artifical, interposed between radioactive wastes and man. The development of terrestrial and aquatic ecological models is described. Management mechanisms established to assure a successful information transfer and proper coordination among different organizations will be briefly outlined. (DAD)

3421 DUMPING OF SOLID PACKAGED RADIOACTIVITY IN THE DEEP OCENAS. Forster, W.O.; Van As, D. (International Atomic Energy Agency, Vienna, Austria). pp 134-141 of Management of environment. Patel, B. (ed.). New Delhi, India; Wiley Eastern Ltd. (1980).

A discussion of radioactive wastes from industrial origins is presented. Provisions for deep sea dumping are listed. Requirements for dumping sites are given. IAEA recommendations are discussed. (DAD)

3422 WINDSCALE RADIOCAESIUM IN THE CLYDE SEA AREA. Baxter, M.S.; McKinley, I.G. (Glasgow Univ. (UK). Dept. of Chemistry); Mackenzie, A.B.; Jack, W. Marine Pollution Bulletin ; 10: No. 4, 116-120(Apr 1979).

Radiocaesium, introduced into coastal waters in the effluent from the B.N.F.L. nuclear fuel reprocessing plant at Windscale, is present at significant levels throughout the Clyde Sea Area. Concentrations reached maximum in April, 1977, and have recently declined. Around 30 % of Windscale radiocaesium output passes through the Clyde Sea Area but less than 0.3 % remains in sediments. There appears to be no major radiological safety hazard. The radiocaesium is, however, an excellent tracer species for both waters and sediments. The Irish Sea-derived component comprises over 90 % of Clyde seawater and may well introduce major inventories of pollutants. The average water residence time in the Clyde system is 4.5 months, although significantly longer entrainment is evident in northern sea lochs. Study of radiocaesium variations has enabled improved assessment of the Clyde's response to marine pollution.

3423 COMPARISON OF CALCULATED AND MEASURED RADIATION DOSES FROM CHRONIC AQUEOUS RELEASES. Watts, J.R. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Health Physics ; 36: No. 4, 519-521(Apr 1979).

This paper compares 70-yr dose commitment values for drinking water and fish consumption from environmental monitoring data at the Savannah River Plant (SRP) with predicted values obtained with the computer code CARDOCC (Chronic Aqueous Release Dose Commitment Code).

3424 METHODS OF RADIOACTIVE WASTEWATER TREATMENT. Schaaf, R. (Wolfatit Alkalmazasi Osztaly). Energia es Atomtechnika ; 32: No. 4, 169-171(Apr 1979).

Problems associated with radioactive waste disposal at high capacity nuclear power plants are considered. In particular, radioactive liquid waste disposal is described. Various ion exchange methods for concentrating and precipitating radioactive isotopes in water are discussed. Successful experiments that evaluated the performance of pulver form ion exchangers in decontaminating radioactive wastewater are reported. (11 references)

3425 GEOLOGIC MIGRATION POTENTIALS OF TECHNIUM-99 AND NEPTUNIUM-237. Bondietti, E.A.; Francis, C.W. (Oak Ridge National Lab., TN). Science ; 203: 1337-1340(30 Mar 1979).
Relatively mobile TcO_4^- and NpO_2^+ can be chemically reduced to less soluble oxidation states in the presence of igneous rocks, as predicted by oxidation-reduction measurements. Current risk assessments, which consider technetium and neptunium as potentially capable of migrating from high-level radioactive waste repositories, may be overestimating their potential hazard to the public since the Fe(II) content of many subsurface waters may maintain these elements in less soluble oxidation states.

3426 NUCLEAR WASTE DISPOSAL. Costello, J.M. (Australia AEC). Atomic Energy in Australia ; 22: No. 1, 11-19(Jan 1979).
For nuclear energy to become a viable means of meeting future world energy requirements, a method for the safe disposal of radioactive wastes must be developed. Three principles currently employed in radioactive waste disposal are: the concentration and containment of long-lived radioactive wastes; the dilution and dispersion of short-lived radioactive wastes; and the delay storage of short-lived radioactive wastes to permit their decay into nonradioactive species. The current status of each method in the various countries in which it is utilized is examined. The risk of death from radiation exposure was compared with the risk of death from other human activities, such as smoking, driving, and traveling by air. (2 diagrams, 2 graphs, 1 photo, 30 references)

3427 ELIMINATION OF RADIOACTIVE LIQUID WASTES IN HOSPITALS: A MATHEMATICAL MODEL FOR DESIGNING DECAY PONDS. Magrini, A. (Univ of Rome). Energia Nucleare (Milan) ; 25: No. 12, 573-578(Dec 1978).
Presented is a mathematical model that can be used to design decay pond systems for the elimination of liquid wastes contaminated with short half-life radioisotopes as found in hospitals. The operation of a decay pond system, with reference to an average flow of radioactive effluents assumed to be constant with time, is analyzed. Criteria for an optimal choice of design parameters characterizing system dimensions and discharge modalities are chosen. The suitability of the model for studying possible operation transients is briefly reviewed. (in Italian) (1 diagram, 2 graphs, 4 references)

3428 NEW OPPORTUNITIES FOR STATE PARTICIPATION IN THE CONTROL OF RADIOACTIVE POLLUTION. Fabrizio, J.F. Chicago-Kent Law Review; 52: No. 1, 157-168(1975).
State governments have expressed a strong desire to regulate the environmental aspects of atomic energy production, but have been prevented from assuming any role by the belief that the Atomic Energy Act of 1954 pre-empted the states' power in this area. Even though Congress has the power to preclude the states from exercising any control over atomic waste disposal, it has never expressly done so; rather, the courts have imputed this intent to Congress. Two developments which may open the door to state regulation are reviewed. The first is the passage of the 1972 Amendments to the Federal Water Pollution Control Act (FWPCA), which seemingly takes from the Atomic Energy Commission (AEC) and gives to the Environmental Protection Agency (EPA) the responsibility for control of certain radioactive materials; also under the FWPCA, the states are expressly authorized to impose stricter performance standards than the EPA. The second development is the court decision upholding the interpretation that the FWPCA conferred jurisdiction on the EPA to regulate the discharge of radioactive waste materials into navigable waters.It is concluded that there is a small possibility that the states may be allowed to play a role in atomic energy pollution control, but their role will depend upon further court and Congressional action.

3429 ARTIFICIAL RADIOACTIVITY IN THE SEA. CHAPTER 22. Preston, A. pp 817-836 of Sea. Ideas and observations on progress in the study of the sea. Vol. 5. Marine Chemistry. Goldberg, E.D. (ed.). London; Wiley (1974).
The subject is covered in sections, entitled: global inventory of artificially produced radionuclides (including fallout and controlled disposal of radioactive wastes from nuclear power production); radioactivity as a potential pollutant (including public health implications of discharges from selected sites); radiation dose commitment to marine organisms; spectrum of artificially-produced radionuclides in marine environments and their overall distribution; distribution of radionuclides in seawater; distribution of radionuclides in sediment; bioaccumulation.

3430 RADIOACTIVITY IN THE MARINE ENVIRONMENT. CHAPTER 15. Preston, A. pp 305-329 of Sea fisheries research. Harden Jones, F.R. (ed.). London; Elek Science (1974).
The subject is covered in sections, entitled: introduction; sources of radioactivity in the marine environment; control of radioactive waste discharges; human radiation exposure due to radionuclides introduced to United Kingdom coastal waters in effluents; radiological consequences of major accidents in coastal waters; field research and radioecology (distribution of radionuclides in (a) the water, (b) sediments, (c) biological materials; nuclear weapon test fallout); radiation dosimetry of plaice; experimental work in aquaria; the future.

Water

3431 (CEA-R--4952) SORPTION-DESORPTION PROCESSES OF RADIOISOTOPES WITH SOLID MATERIALS FROM LIQUID RELEASES AND ATMOSPHERE DEPOSITS. THE DISTRIBUTION COEFFICIENT (KSUB(D)), ITS USES, LIMITATIONS, AND PRACTICAL APPLICATIONS. Saas, A. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). Mar 1979. 80p. (In French). NTIS (US Sales Only), PC A05/MF A01.
The various sorption-desorption processes of radionuclides with environmental materials are presented. The parameters governing the distribution coefficient are reviewed in the light of various examples. The factors affecting equilibria between the different phases are: reaction time, concentration of the solid phase, water quality, salinity, competition between ions, concentration of radioisotopes or stable isotopes, pH of the mobile phase, particle diameter, chemical form of the radioisotopes, nature of the solid phase, temperature. The effects of the biological parameters on the distribution coefficient are discussed. Biological processes affect the main chemical transformations: mineralization, insolubilization, oxidation-reduction, complexation, ... The importance of these processes is demonstrated by a number of

examples in various media. Finally, the practical use of Ksub(d) in the assessment of the environmental impact of radioactive releases is developed, with special emphasis on the limits of its use in siting studies and its essential interest in specifying pathways and capacity of a river system.

3432 (CONF-800433--4) AUTORADIOGRAPHIC STUDIES OF ACTINIDE SORPTION IN GROUNDWATER SYSTEMS. O'Kelley, G.D.; Beall, G.W.; Allard, B. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 9p. NTIS, PC A02/MF A01.

From 4. international conference on nuclear methods in environment and energy research; Columbia, MO, USA (14 Apr 1980).

Autoradiography is a convenient and sensitive technique for the study of spacial distributions of alpha radioactive nuclides on slabs of rock or on other planar surfaces. The autoradiographic camera contains an arrangement for placing in firm contact Polaroid sheet film, a plastic scintillator screen, and the radioactive face of the specimen. As an example of the use of the autoradiographic method, a series of sorption experiments were carried out in which synthetic groundwater solutions of americium, neptunium, uranium, and plutonium were contacted with Climax Stock granite under aerated and anoxic conditions at pH 8 to 9. The sorption observed at specific mineral sites was correlated with data on sorption of these actinides on pure minerals.

3433 (CS-INIS--258, pp 99-118) STUDY OF RADIUM STATE AND BEHAVIOUR IN SURFACE AND WASTE WATERS. Benes, P.; Sedlacek, J.; Sebesta, F. (Ceske Vysoke Uceni Technicke, Prague (Czechoslovakia). Fakulta Jaderna a Fysikalne Inzenyrska); Havlik, B. (Institut Hygieny a Epidemiologie, Prague (Czechoslovakia)). Sep 1978. (In Czech).

From 9. national conference on radionuclides and ionizing radiation in water management; Liberec, Czechoslovakia (28 Sep 1978).

A survey is given of the current state of research into the behaviour of radium in surface and waste waters. The methods are discussed for analyzing the state of radium in natural and waste waters. Attention was focused on the observation of the effects of the season, water acidity, amount of suspended matter, distance from source of pollution, barium concentration, concentration of sulphate anions which are the principal factors affecting the behaviour of radium in surface waters. Also observed were the interactions of radium with sediments. The problems are briefly outlined of the radium intake of aquatic organisms on which future research should be focused.

3434 (EUR--5636) MONITORING OF PLUTONIUM CONTAMINATED SOLID WASTE STREAMS. CHAPTER II: PRINCIPLES AND THEORY OF RADIOMETRIC ASSAY. Birkhoff, G.; Bondar, L.; Notea, A.; Segal, Y. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1977. 70p. Dep. NTIS (US Sales Only), PC A04/MF A01.

The interpretation of a count rate distribution obtained from radiometric assay of a given waste items population in terms of source strength distribution is discussed. A model for the evaluation of errors, arising from non uniform source density distribution (Pu) within the item volume and heterogeneity of matrix materials, is presented. Points concerning calibration procedures and representativity of reference materials are dealt with. Qualification procedures for possible monitoring systems are outlined on the basis of comparison with reference systems. The latter are composed of reference monitors based on high resolution gamma spectrometry and passive and active neutron techniques. The importance of information upon the elemental composition and density distribution of matrix materials for the interpretation of radiometric assay of solid wastes is stressed.

3435 (FRL--14) RADIOACTIVITY IN SURFACE AND COASTAL WATERS OF THE BRITISH ISLES, 1976. PART 2. AREAS OTHER THAN THE IRISH SEA AND ITS ENVIRONS. Mitchell, N.T. (Ministry of Agriculture, Fisheries and Food, Lowestoft (UK). Fisheries Radiobiological Lab.). 1978. 21p. Dep. NTIS (US Sales Only), PC A03/MF A01.

The establishments from which discharges are made are listed: they comprise sites of the United Kingdom Atomic Energy Authority, the Radiochemical Centre and the Ministry of Defence, as well as nuclear power stations operated by the Central Electricity Generating Board and the South of Scotland Electricity Board. Much of the environmental data in this report is the direct result of the Fisheries Radiobiological Laboratory's (FRL) control monitoring activities in relation to these discharges - that is monitoring to show whether public radiation exposure from them remains within the prescribed limits laid down within national policy. As such it is independent of the often similar environmental monitoring done by the operators as a condition of their authorizations. It is supplemented by some of the results of the Laboratory's extensive programme of environmental research where summaries of those results can be useful in providing a more comprehensive account of the situations being described. Tables are presented showing the radioactivity in environmental materials around each site.

3436 (IDO--12088, pp 67) LIQUID WASTE DISPOSAL AT THE IDAHO NATIONAL ENGINEERING LABORATORY AND RESULTANT WASTE PLUMES IN THE SNAKE RIVER PLAIN AQUIFER. Barraclough, J.T. Apr 1979.

From Symposium on the Idaho National Engineering Laboratory ecology programs; Grand Teton, WY, USA (10 Sep 1978).

Plumes of several waste components in the aquifer have been monitored and mapped periodically from as early as 1958. Tritium has been dispersed over an area of about 72 km^2 of the aquifer and has migrated about 12 km downgradient. The ^{90}Sr plume is about 4 km^2 in area and extends about 2.5 km from the discharge site. ^{137}Cs has not been detected in the aquifer, and is believed to have been immobilized in sediments by ion exchange. A thermal plume covers about 5 km^2 of the aquifer, and Cl and Na plumes cover about 39 km^2 of the aquifer. ^{129}I has only recently been discovered and mapped as a waste fission product at INEL. Because of its very long half-life (1.6 x 10^{7}y), it is significant in long-range studies of radioactive waste management. ^{129}I is dispersed over about 8 km^2 of the aquifer and has migrated about 4 km downgradient from the discharge site.

3440 (KFK--2892) PLUTONIUM CONTAMINATION OF THE 'ALTRHEIN'. THE CONTAMINATION OF THE SEDIMENTS. Pimpl, M.; Schuettelkopf, H.; Afsar, M. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Nukleare Sicherheit). Dec 1979. 51p. (In German). NTIS (US Sales Only), PC A04/MF A01.
The distribution of Pu-238 and Pu-239+240 in the sediments of the 'Altrhein', a former branch of the river Rhine which serves as a main canal for liquid effluents from the Nuclear Research Center, was measured. Transverse, longitudinal and depth profiles were taken. The transverse profiles are different: either the 'Altrhein' moves in a bend or he moves on a straight line in the middle of the river-bed. The sediments are homogeneously contaminated with plutonium up to the lowest layer which is in about 70 cm depth. The contamination of the longitudinal profiles depends on the straitening of the 'Altrhein', on the width of the river, and on the distance from the location of discharge of the waste water. In the 'Altrhein' 94% of plutonium, in total, emitted with the waste water, were refound.

3441 (PNL--3160-1) VARIABLE THICKNESS TRANSIENT GROUND-WATER FLOW MODEL. VOLUME 1. FORMULATION. Reisenauer, A.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Dec 1979. Contract EY-76-C-06-1830. 35p. Dep. NTIS, PC A03/MF A01.
Mathematical formulation for the variable thickness transient (VTT) model of an aquifer system is presented. The basic assumptions are described. Specific data requirements for the physical parameters are discussed. The boundary definitions and solution techniques of the numerical formulation of the system of equations are presented.

3442 (PNL--3346) RADIOLOGICAL STATUS OF THE GROUND WATER BENEATH THE HANFORD PROJECT, JANUARY-DECEMBER 1979. Eddy, P.A.; Wilbur, J.S. (Battelle Columbus Labs., OH (USA)). Apr 1980. Contract AC06-76RL01830. 114p. NTIS, PC A06/MF A01.
Operations on the Hanford Site since 1944 have resulted in discharge of large volumes of process cooling water and low-level liquid radioactive waste to the ground. Radioactivity and chemical substances have been carried with these discharges and have reached the Hanford ground water. For may years wells have been used as groundwater sampling structures to gather data on the distribution and movement of these discharges as they interact with the unconfined ground water beneath the site. During 1979, 317 wells were sampled on various frequencies from weekly to annually. This report is one of a series prepared annually to document the evaluation of the status of ground water on the Hanford Site. Data collected during 1979 describe the movement of radionuclide (Tritium and Beta) and nitrate plumes that respond to the influence of groundwater flow, ionic dispersion and radioactive decay.

3443 (UCID--18652) BIODOSE: A CODE FOR PREDICTING THE DOSE TO MAN FROM RADIONUCLIDES RELEASED FROM UNDERGROUND NUCLEAR WASTE REPOSITORIES. Bonner, N.A.; Ng, Y.C. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Mar 1980. Contract W-7405-ENG-26. 127p. NTIS, PC A07/MF A01.
The BIODOSE computer program simulates the environmental transport of radionuclides released to surface water and predicts the resulting dosage to humans. This report describes the program and discusses its use in the evaluation of nuclear waste repositories. The methods used to estimate dose are examined critically, and the most important parameters in each stage of the calculations are identified as an aid in planning for measurements in the field. Dose predictions from releases of nuclear waste to a large northwestern river (the baseline river) are presented to point out the nuclides, compartments and pathways that contribute most to the hazard as a function of waste storage time. Predictions for five other water systems are presented to identify the most important system parameters that determine the concentrations of individual nuclides in compartments and the resultant dose. The uncertainties in the biological parameters for dose prediction are identified, and changes in current values are suggested. Various ways of reporting dose estimates for radiological safety assessments are discussed. Additional work needed to improve the dose predictions from BIODOSE and specific areas and steps to improve our capabilities to assess the environmental transport of nuclides released from nuclear waste repositories and the resultant dose to man are suggested.

3444 (UCRL--52000-80-10, pp 8-13) PLUTONIUM IN THE MARINE ENVIRONMENT OF THE MARSHALL ISLANDS. Oct 1980.
Energy and technology review.
Between 1946 and 1958, the United States conducted 66 nuclear tests in the Pacific atolls of Eniwetok and Bikini in the Marshall Islands. Since 1972, LLNL has conducted a variety of studies related to the cycling and transport of longer lived residual radionuclides in the marine environments of these atolls. The primary concern is to collect sufficient data to develop recommendations to minimize the transfer of man-made radionuclides to people returning to the atolls. However, an attempt has also been made to relate analytical findings to much wider fields of scientific endeavor and to develop models that are useful, first locally, and secondly in another aquatic environments receiving inputs from different

source terms. One such program deals with the behavior of plutonium radionuclides in the marine environment of Eniwetok and Bikini, the findings of which are reported. A summary of the concentration of ^{239}Pu plus ^{240}Pu in the Eniwetok and Bikini lagoons and in the North Equatorial Pacific Ocean is presented.

3445 SOLUTION SPECIES OF PLUTONIUM IN THE ENVIRONMENT. Rai, D.; Serne, R.J.; Swanson, J.L. (Batelle Pacific Northwest Lab., Richland, WA). Journal of Environmental Quality ; 9: No. 3, 417-420(Jul 1980).
Information regarding the oxidation states of Pu in environmental samples is needed for estimating its migration through the geologic media. Predictions based upon thermodynamic data indicate that in the Eh-pH range of natural aqueous environments, the dominant species of Pu is likely to be Pu[V] in relatively oxidizing environments and Pu[III] in reducing environments. Because of the lack of methods of determining Pu[V] in environmental samples containing trace concentrations of Pu, Pu[V] has not been previously identified in these samples. Plutonium [VI] has generally been assumed to be the dominant species in relatively oxidizing environments. However, the results presented show that solutions in equilibrium with $^{239}Pu[IV]$ hydroxide contain Pu[V]. The presence of Pu[V] in solutions contacting $^{239}PuO_2(s)$ is also inferred from the data.

3446 (SAND--79-6002) REPRESENTATION OF RADIOELEMENT MIGRATION IN FISSURED ROCKS BY A MATHEMATICAL MODEL. Goblet, P.; Ledoux, E.; de Marsily, G.; Barbreau, A. (Ecole des Mines de Paris, 75 (France). Centre d'Information Geologique Fontainebleau; CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire). Sep 1979. Translation of paper presented at the symposium on radionuclide migration, Brussels, January 29-31, 1979 (CONF-790161--1(Trans.)). 14p. Dep. NTIS, PC A02/MF A01.
From Symposium on radionuclide migration; Brussels, Belgium (29 Jan 1979).
The migration of elements in solution in fissured rocks is approached by a method in which the fissured medium is described by way of the equivalent continuous, heterogeneous, anisotropic medium. The retention of the substances is represented by limited adsorption mechanisms within the fissure planes. After an explanation of the principle on which this model is built, a sample interpretation is given for tracing experiments performed with a fissured granitic massif by the Bureau de Recherches Geologiques et Minieres (BRGM; Bureau of Geological and Mining Research) and by the Centre d'Etudes Nucleaires de Grenoble (CENG; Grenoble Center for Nuclear Studies). This work was carried out for the Commission of the European Economic Communities and the French Atomic Energy Commission under a cost-sharing contract regarding the indirect action program on Management and Storage of Radioactive Waste.

3453 TRANSFER OF ACTINIDES FROM THE ENGLISH CHANNEL INTO THE SOUTHERN NORTH SEA. Murray, C.N.; Kautsky, H.; Eicke, H.F. (Deutsches Hydrographisches Inst. (DHI), Hamburg (Germany, F.R.)). Nature (London) ; 278: No. 5705, 617-620(12 Apr 1979).

Results are presented for ^{238}Pu, sup(239+240)Pu, ^{241}Pu, ^{241}Am, ^{242}Cm and ^{244}Cm in waters of the English Channel and southern North Sea. Based on actinide concentration ratios in these waters compared with expected fallout values, the activities measured are considered to be mainly due to releases of low-level waste from the La Hague fuel reprocessing plant. Measurements made on ^{242}Cm indicate that any support by ^{242}Am would be minimal.

3454 PROCESS AND INSTALLATION FOR THE DISPOSAL OF LIQUID RADIOACTIVE WASTE. Stuenkel, H. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,736,256/A/. 15 Feb 1979. 6p. (In German).

It is proposed to evaporate liquid radioactive waste from nuclear power plants in their cooling towers. Evaporation may be carried out intermittently, with washings with an inactive liquid (e.g. water, if necessary with cleaning additives) in between. (UWI) 891 HP/UWI 892 MBE.

3455 ASSESSMENT OF THE RADIOLOGICAL IMPACT OF TRITIUM RELEASED TO SEA FROM THE WINDSCALE FUEL ELEMENT REPROCESSING PLANT. Hetherington, J.A.; Robson, J.C. (Ministry of Agriculture, Fisheries and Food, Lowestoft (UK). Fisheries Radiobiological Lab.). pp 283-299 of Behaviour of tritium in the environment. Vienna; International Atomic Energy Agency (1979).

From Symposium on the behavior of tritium in the environment; San Francisco, CA, USA (16 Oct 1978).

Tritium is discharged routinely to the Irish Sea in low-level liquid wastes from the nuclear fuel reprocessing plant at Windscale, Cumbria. In the course of a programme of environmental research utilizing the tritium discharges, samples of sea-water have been collected regularly from the northern area of the Irish Sea during the period 1968-74. Electrolysis has been used to concentrate the tritium to achieve a limit of detection in sea-water of about 10 pCi/l. Results have been corrected for the background concentrations of tritium from both naturally occurring sources and nuclear weapons' testing. The corrected results show that under conditions of constant discharge there is a fairly uniform concentration of tritium in the vicinity of the discharge point which in numerical terms corresponds to about 5 pCi/l per Ci/d. The shape of the contours of concentration both close to Windscale and over the wider area of the northern area of the Irish Sea is discussed in relation to dispersal mechanisms and water turn-over times. Evidence is presented of marked reversals in the paths taken by activity after discharge from Windscale. Finally the radiological safety aspects of tritium discharges are discussed in terms of both dose to critical groups and collective dose. It is shown that the limiting discharge rate in terms of the need to keep individual doses within ICRP limits is something like $9x10^8$ Ci yearly. A simple, although conservative, assessment of collective dose shows that this is likely to be less restrictive than the dose to individuals.

3456 Radioecologie marine. Etude du devenir des radionucleides rejetes en milieu marin et applications a la radioprotection. (MARINE RADIOECOLOGY. A STUDY OF THE FATE OF RADIONUCLIDES RELEASED INTO THE MARINE ENVIRONMENT AND APPLICATIONS TO RADIATION PROTECTION). Ancellin, J.; Guegueniat, P.; Germain, P. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). Paris, France; Eyrolles (1979). 256p. (In French).

This book presents the state-of-the art of the knowledge gained in France and in foreign countries for some 20 years on the points concerning man from the sanitary point of view and radionuclides transfers in the ocean environment especially. The various data of physico-chemistry (viz. behaviour of trace elements), geochemistry, physiology, physical and biological oceanography are included. In situ data are included on various sites of radioactive releases after several years of monitoring. Particular attention is devoted to the problem of concentration factors necessary for impact assessment studies and regulatory provisions governing effluents.

3457 TESTS OF POROUS PERMEABLE MEDIUM HYPOTHESIS FOR FLOW OVER LONG DISTANCES IN FRACTURED DEEP HARD ROCK. Bourke, P.J.; Hodgkinson, D.P. (UKAEA Atomic Energy Research Establishment, Harwell); Gale, J.E. (Waterloo Univ., Ontario (Canada)); Witherspoon, P.A. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). pp 157-171 of Low flow, low-permeability measurements in largely impermeable rocks. Paris, France; OECD (1979).

From Workshop on Low-Flow Low permeability measurements in Langley Impermeable rocks; Paris, France (19 Mar 1979).

Experiments are proposed to test the hypothesis that water movement over long distance through fractures in deep, hard rock can be treated as flow through an effectively porous, permeable medium. Water flow rate into the rock from various lengths of an injection hole and pressure rises at various distances from this hole will be measured to determine the effective permeability and to test if it is constant. The movement of tracers with the water flow will be studied to determine the average and any variation of the porosity and will simulate accelerated leakage over appreciable distances from radioactive waste depositories. An experiment to measure the in-situ compressibility of the rock is also suggested. Existing data are analyzed to quantify the ranges of conditions in which these experiments may be practical.

3458 ASSESSMENT OF PLUTONIUM CHEMICAL FORMS IN GROUNDWATER. Saltelli, A.; Avogadro, A.; Bertozzi, G. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). pp 147-164 of La migration des radionucleides a vie longue dans la geosphere. Compte rendu. Paris, France; OECD (1979).

From Symposium on radionuclide migration; Brussels, Belgium (29 Jan 1979).

The leaching of plutonium from vitrified high-level waste can result in very low plutonium concentrations, of the order of 10^{-8}M, in the groundwater, where plutonium is shared among different complexes of the ions Pu^{4+}, Pu^{3+}, PuO_2^+, PuO_2^{++} with the anionic components of the medium. Thermodynamic information is available in literature on some equilibrium constants, so that it is possible to describe quantitavely the plutonium distribution among different chemical forms,

for a given water composition. Pu (IV) complexes with carbonate ions are known to be very stable; however, the numerical value of 10^{47} which has been attributed to the stability constant appears to be too large by many orders of magnitude; a parametric study of that constant has been performed.

3459 ENGINEERING SAFEGUARD FOR ACCIDENTAL RELEASE OF RADIONUCLIDES FROM RADIOACTIVE WASTE GROUND DISPOSAL SITE, (1). FEASIBILITY OF CONTAMINATED GROUNDWATER ZONE CONTROL BY UNDERGROUND IMPERMEABLE WALL. Morisawa, S.; Inoue, Y. (Kyoto Univ. (Japan). Faculty of Engineering). Nippon Genshiryoku Gakkaishi (Journal of the Atomic Energy Society of Japan) ; 20: No. 9, 662-670(Sep 1978). (In Japanese).

Feasibility of an underground impermeable wall was discussed for controlling radioactively contaminated groundwater zone around a radioactive waste ground disposal site. Fundamental equations, which describe variation of groundwater table and a radionuclide (^{90}Sr) migration in the saturated zone, were analyzed and distribution of ^{90}Sr was estimated in case with and/or without an impermeable underground wall. The results obtained in this paper are as follows: (1) Underground impermeable wall might be feasible as an engineering safeguard for controlling radioactively contaminated groundwater. (2) Underground impermeable wall might be used more effectively when the geologic stratum is heterogeneous than when the stratum is uniform around a waste disposal site. (3) Underground impermeable wall of type E is most promising under considered conditions. The wall of type E is assumed to be built across the zone with higher flow rate of groundwater.

3460 METHOD TO DECONTAMINATE RADIOACTIVE WATER IN THE PRESENCE OF IMPURITY SUBSTANCES. Krause, H.; Hepp, H.; Kluger, W.; Geisel, R. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 1,517,664/C/. 24 Aug 1978. 1p. (In German).

The method ensures the removal of radioactive substances from hard-to-decontaminate water. Before decontamination proper, ozone or chlorine is added to the water for demasking. The daughter products (oxidized radionuclides) of ozone are gaseous while the decay products of the chlorine remain in the water in the form of salts. In both cases, complex or chelate formation during the subsequent decontamination process is avoided.

3461 MEDICALLY USED RADIONUCLIDES IN SEWAGE SLUDGE. Erlandsson, B.; Mattsson, S. (Technical Department, Personnel Health Care, City of Malmoe, Malmoe, Sweden). Water, Air, and Soil Pollution ; 9: No. 2, 199-206(Feb 1978).

The concentration of medically used radionuclides has been studied in sludge from the sewage treatment plant serving the borough of Malmoe. In this area all nuclear medicine procedures are carried out in one hospital and almost all patients live in the borough. Therefore, the input of medically used radionuclides into the sewage system can be estimated with good accuracy. Samples of digested sludge have been taken once or twice a week during half a year. Iodine-131 (physical half life (T) = 8.05 d) was detected in all samples. The ^{131}I-activity concentration due to medical use varied between (0.03 +- 0.01) and (0.12 +- 0.02) nCi kg^{-1}. The ratio between the total output of ^{131}I via the sludge and an adherent input of the radionuclide into the sewage system was determined to (2.6 +- 0.6) X 10^{-3}, which is equivalent to a ratio of (2 +- 1) X 10^{-2} for stable I. Occasionally measurable activities of ^{198}Au (T = 2.7 d) and ^{201}Tl (T = 3.1 d) have been found. The radioactivity concentration of medically used radionuclides in the sludge is low and constitutes no health problems for the persons involved. The sludge however has proved to be a very sensitive and suitable integrator of radioactive material released from a large urban area.

3462 ASSESSMENT OF TECHNICAL RISKS. Jaeger, T.A. (Bundesanstalt fuer Materialpruefung, Berlin (Germany, F.R.)). Amts- und Mitteilungsblatt der Bundesanstalt fuer Materialpruefung ; 8: No. 3, 123-127(1978). (In German).

The safety of technical systems is so difficult to assess because the concept 'risk' contains technical-scientific factors as well as components of individual and social psychology. Immediate or short-term hazards of human life as i.e. caused by the operation of industrial plants and mediate and thus long-term hazards have to be distinguished. Characteristic for the second hazard groups is the great time-lag before the effect takes place. Thus a causal relationship can be recognized only late and not definitely. Even when the causes have been obviated the effects still show. The development of a systems-analytical model as a basis of decisive processes for the introduction of highly endangered large-scale technologies seems particularly difficult. A starting point for the quantification of the risk can still be seen in the product of the probability of realization and the extent of the damage. Public opinion, however, does not base its evaluations on an objective concept of risk but tends to have an attitude of aversion against great and disastrous accidents. On the other hand, plenty of slight accidents are accepted much more easily, even when the amount of deadly victims from accidents reaches dimensions beyond those of the rare large-scale accidents. Here, mostly the damage possible but not the probability of its occurence is seen, let alone the general use of the new technology. The value of the mathematical models for estimating risks is mainly due to the fact that they are able to clear up decisions.

3463 CONDITIONING HIGHLY RADIOACTIVE SOLIDIFIED WASTE. Hild, W.; Krause, H.; Scheffler, K.; Gusten, H.; Gilbert, E. (to Gesellschaft fuer Kernforschung m.b.H.). US Patent 3,971,717. [ndl. 7p.

Highly radioactive wastes, such as fisson-product solutions resulting from processing irradiated nuclear fuels, are converted to solid, stable and substantially water-insoluble products before they are transported to a final storage location in conformance with environmental protection requirements. Highly radioactive solidified waste, incorporated in molded bodies of glass, ceramic or a basaltic mass, is introduced into waste water and/or settling or precipitated sludge from community or industrial systems (in order to sterilize, improve the filterability of and condition (a) the waste water before it is introduced into a receiving stream and (b) the sludge before it is composted) and is left to remain there until the heat energy produced by the radioactive radiation has been reduced in its order of magnitude to one tenth of the amount available in the molded bodies upon their completion. The

molded bodies, which may be sheathed or coated, are alternatively introduced into raw water used for preparing drinking water in order to sterilize it and are left to remain therein until heat energy produced by the radioactive radiation has been reduced in its order of magnitude to one tenth of the amount available in the freshly prepared molded bodies. An object of the invention is to find a better way to utilize available ultimate storage locations in salt stocks and to reduce the cost of noncontaminating removal or final storage of highly radioactive waste.

Aquatic Ecosystems and Food Chains

3464 (ANL--78-65(Pt.3), pp 55-57) SOURCES OF PLUTONIUM TO THE GREAT MIAMI RIVER. Bartelt, G.E.; Kennedy, C.W.; Bobula, C.M. III. 1978.

Radiological and Environmental Research Division: ecology. Annual report, January-December 1978.

Progress is reported in the study of ^{238}Pu, in the Great Miami River watershed the contribution of various sources to the total ^{238}Pu transported by the river. Periodic discharges of industrial wastewater from Mound Laboratory from 1973 to 1975 have released approximately 20 mCi of ^{238}Pu each year to the Great Miami River. Changes in the wastewater treatment system in 1976 have reduced the annual discharge to less than 3 mCi/year. However, despite this sevenfold reduction of plutonium in the wastewater discharge, the annual flux of ^{238}Pu down the river has remained relatively constant and is approximately 10 times greater than can be accounted for by the reported effluent discharges. Therefore, other sources of the ^{238}Pu in the Great Miami River exist. A second possible source of plutonium is the resuspension of sediments enriched by earlier waste water releases and deposited in the river. However, since there appear to be few areas where large accumulations of sediment could occur, it seems improbable that resuspension of earlier sediment deposits would continue to be a significant contributor to the annual flux of plutonium. A much more likely source is the continuing erosion of soil from a canal and stream system contaminated with approx. 5 Ci of ^{238}Pu, ^{7} which connects directly to the river 6.9 km upstream from Franklin. Results from samples analyzed in 1978 show the average concentration of ^{238}Pu in suspended sediments from the canal to be approximately 10^3 times greater than suspended sediment concentrations in the river and waste water effluent.Thus the main contributor to the total amount of plutonium transported by the Great Miami River appears to be highly enriched sediment from the canal, which is eroded into the river where it is then diluted by uncontaminated sediments.

3465 (CONF-790562--2) EFFECTS OF CHRONIC LOW-LEVEL IRRADIATION ON GAMBUSIA AFFINIS. Blaylock, B.G.; Frank, M.L. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 22p. Dep. NTIS, PC A02/MF A01.

From Radiation effects on aquatic organisms; Tokyo, Japan (May 1979).

Since 1944, White Oak Lake (WOL), located on the Oak Ridge Reservation, has served as a final settling basin for low-level radioactive effluents from the Oak Ridge National Laboratory. Organisms inhabiting the lake have been exposed for many generations to chronic low-level radiation significantly higher than background. During the past decade, studies on Gambusia affinis from WOL have been carried out to relate estimated radiation doses to effects on the fitness of the Gambusia population. Results of studies on fecundity, temperature tolerance, and embryonic mortality have led to the conclusion that the Gambusia population in White Oak Lake has an increased frequency of deleterious and recessive lethal genes which may be attributed to the radiation exposure history. The frequency of nonviable embryos from WOL Gambusia did not change significantly from 1966 to 1978; however, it was still significantly greater than that of a control population. In July 1977, Gambusia from a control population were stocked into a 0.45-ha pond which had served as a low-level waste settling basin. The beta and gamma dose rate in this pond averaged from 37 rad/yr at the water surface, 394 rad/yr at mid-depth, and 1150 rad/yr at the surface of the sediments. Preliminary results from samples taken in August 1978 showed that although the frequency of nonviable embryos increased, the frequency was not significantly greater than that of the control parent population. Additional sampling of future generations of Gambusia in this pond will determine whether the frequency of nonviable embryos increases as succeeding generations are exposed to dose rates that are higher than the dose rates in WOL.

3466 (CS-INIS--258, pp 92-98) EFFECT OF EMERGENCY DISCHARGE OF NUCLEAR FACILITIES EFFLUENTS ON HYDROSPHERE. Chytil, I. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Sep 1978. (In Czech).

From 9. national conference on radionuclides and ionizing radiation in water management; Liberec, Czechoslovakia (28 Sep 1978).

The EXPER and WATER mathematical models are described which have been developed at UJV, Rez for finding the effects of the discharge of radioactive wastes into the hydrosphere during accidents of nuclear installations. The EXPER model describes the pulse discharge of material at a certain point of the water course where the complete depth mixing of the discharged material with the water is assumed. The parameters of the water course are considered as being constant in the whole observed stretch. The WATER model is designed for observing the effect of a number of nuclear installations on the whole basin. The dose equivalent for set points may be determined which will affect the population consuming contaminated water. The population is divided into four age groups.

3467 (DOE/EV/70024--31) CHEMICAL AND GEOCHEMICAL STUDIES OFF THE COAST OF WASHINGTON. PROGRESS REPORT, SEPTEMBER 1978-AUGUST 1979. Carpenter, R. (comp.). (Washington Univ., Seattle (USA). Dept. of Oceanography). Aug 1979. Contract EY-76-S-06-2225-024. 11p. (RLO--2225-T24-31). Dep. NTIS, PC A02/MF A01.

Progress on a series of marine chemical and geochemical investigations involving both laboratory studies and field studies off the coast of Washington are summarized. Most of the field work has been on the Washington continental shelf, slope, and the submarine canyons indenting the shelf north of the Columbia River. The aim is to provide basic data required to characterize underlying chemical and physical processes and their rates which control the distributions, concentrations, and ultimate fate of some of the potentially hazardous agents associated with fossil fuel and nuclear power production or transportation. The studies have followed several main lines of investigation which are

in various stages of completion: (1) field studies of the uptake and transport by zooplankton fecal pellets of ^{210}Po, ^{210}Pb, and other trace inorganic and organic constituents in a well-studied part of Puget Sound; (2) studies of the behavior of ^{210}Po and ^{210}Pb in sediments off the coast of Washington and the application of the ^{210}Pb determinations in sediment cores to determine sediment accumulation rates for the past 100 years, the depth of the surface mixed layer, and a mixing coefficient for the surface sediments; and (3) investigations of aliphatic and aromatic hydrocarbons in some of the same samples of organisms and sediment cores whose accumulation histories for the past 100 years we have determined with the ^{210}Pb technique.

3468 (IDO--12088, pp 6-7) DOSIMETRY DEVELOPMENTS AND THEIR APPLICATION TO RADIOECOLOGY STUDIES AT THE IDAHO NATIONAL ENGINEERING LABORATORY SITE. Aoki, I.; Jones, D.E. (Dept. of Energy, Idaho Falls, ID). Apr 1979.

From Symposium on the Idaho National Engineering Laboratory ecology programs; Grand Teton, WY, USA (10 Sep 1978).

In order to determine the environmental impact of nuclear activities and waste, accurate measurements of radiation exposures at specific locations and radiation dose to wildlife species must be determined. Because of the varied studies at the INEL Site, radiation exposures and dose rate estimates must be available for both terrestrial and aquatic ecosystems. The purpose of this paper is to briefly introduce the various applications of dosimetry (the measurement of radiation doses and exposures) in INEL ecological studies and to present background information on thermoluminescent dosimeters used in these studies.

3469 (IDO--12088, pp 34-35) RADIONUCLIDE CONCENTRATIONS IN A BARN SWALLOW POPULATION NESTING NEAR RADIOACTIVE LEACHING PONDS. Millard, J.B. (Colorado State Univ., Fort Collins); Whicker, F.W.; Markham, O.D. Apr 1979.

From Symposium on the Idaho National Engineering Laboratory ecology programs; Grand Teton, WY, USA (10 Sep 1978).

Seasonal populations of barn swallows (Hirundo rustica) use a radioactive leaching pond adjacent to the Test Reactor Area (TRA) on the Idaho National Engineering Laboratory (INEL) Site. Most swallows nest at a sewage treatment facility building 200 m north of the ponds, and some birds nest within the TRA facility. Adults fly to the ponds where they feed on terrestrial and aquatic arthropods and, therefore, are capable of radionuclide uptake. Average concentrations for predominant radionuclides showed adults having the highest concentrations followed by > 10 g immatures and 0 to 10 g immatures. Chromium-51 exhibited the highest value detected for any nuclide with 520 pCi/g whole body. Sodium-24 had relatively high concentrations despite its 15 h physical half-life. Cesium-137 and K-40 were the only detectable nuclides in off site control swallows. Mean concentrations were assumed to be uniformly distributed and at equilibrium in swallow tissues and used to calculate internal whole body dose rates for the three developmental stages of birds. Internal dose rates increased by a factor of four from immatures to adults. Sodium-24 with its 1.4 MeV beta was the main dose rate contributor comprising 72% of the total. Cesium-137 and I-131 were the next major contributors. The beta component contributed 90% of the total internal dose rate for adult swallows. It was not possible to isolate exposure to radioactive materials as the causitive factor responsible for the observed difference in mean growth rates.

3470 (IDO--12088, pp 36-37) ACTIVATION AND FISSION RADIONUCLIDE CONCENTRATIONS AND RETENTION BY DUCKS USING RADIOACTIVE LEACHING PONDS. Halford, D.K. (Dept. of Energy, Idaho Falls, ID); Markham, O.D.; Millard, J.B. Apr 1979.

From Symposium on the Idaho National Engineering Laboratory ecology programs; Grand Teton, WY, USA (10 Sep 1978).

Several species of waterfowl use the Test Reactor Area (TRA) radioactive leaching pond as a resting area. Since the pond is used for liquid radioactive waste disposal, waterfowl could carry radioactive contamination from the area. Ducks are consumed by man who could receive an internal radiation dose commitment from waterfowl that previously used the TRA pond. Also, the radiation doses to waterfowl at the pond are needed to determine the environmental effects of disposal of low level liquid radioactive waste into leaching ponds. A study of waterfowl at the TRA radioactive leaching pond began in February 1974. The purposes of this study are to determine: (1) species and numbers of waterfowl using the TRA pond, (2) concentrations of gamma and transuranic radionuclides present in waterfowl tissues and body burdens that waterfowl can obtain and subsequently carry from the TRA environs, (3) effective and biological half-lives of activation and fission products in waterfowl, (4) radiation doses from gamma emitters concentrated by waterfowl while on the TRA pond, and (5) potential internal dose commitment to man from consuming contaminated waterfowl tissues. This paper discusses the experimental design and some preliminary data.

3471 (IDO--12088, pp 63-64) DISTRIBUTION AND AVIAN EXPORT OF GAMMA EMITTING RADIONUCLIDES AT THE TEST REACTOR AREA LEACHING PONDS. Millard, J.B. (Colorado State Univ., Fort Collins); Whicker, F.W.; Markham, O.D. Apr 1979.

From Symposium on the Idaho National Engineering Laboratory ecology programs; Grand Teton, WY, USA (10 Sep 1978).

The purpose of this study was to determine the seasonal distribution and ecological behavior of gamma emitting radionuclides and to estimate amounts of radioactive materials exported by the principle avian species utilizing the TRA ponds. The large number of detectable fission and activation products in the TRA pond ecosystem make this project unique. Ecological behavior of these radionuclides, such as ^{75}Se, have not been discussed in the literature. In addition, bioaccumulation data are currently needed for a number of radionuclides in order to help assess environmental impacts resulting from the discharge of radioactive liquid effluents.

3472 (IDO--12088, pp 65-66) CONCENTRATIONS OF THE TRANSURANIC RADIONUCLIDES ^{238}PU, ^{239} ^{240}PU, ^{241}AM, ^{242}CM, AND ^{244}CM IN ABIOTIC AND BIOTIC COMPONENTS OF THE TEST REACTOR AREA RADIOACTIVE LEACHING PONDS. Kuzo, G.B. (Colorado State Univ., Fort Collins); Fraley, L. Jr.; Markham, O.D. Apr 1979.

From Symposium on the Idaho National Engineering Laboratory ecology programs; Grand Teton, WY, USA (10 Sep 1978).

Sampling of the leaching pond environs was initiated to determine the concentration of

five transuranic nuclides, (^{238}Pu, ^{239,240}Pu, ^{241}Am, ^{242}Cm, ^{244}Cm), in selected components of this freshwater ecosystem. Greatest concentrations of all transuranic nuclides investigated were found in sediment, periphytic and planktonic components. The data obtained for arthropod species and waterfowl suggest an inverse relationship between concentrations of these nuclides in an organism and its trophic level. More samples are being gathered to provide information to calculate an inventory of these five transuranic nuclides within the TRA pond ecosystem.

3473 (IDO--12088, pp 12-14) SYSTEMIC EFFECTS OF RADIATION EXPOSURE ON RODENTS INHABITING LIQUID AND SOLID RADIOACTIVE WASTE STORAGE AREAS. Evenson, L.M. (Univ. of Idaho, Moscow); Olson, D.P.; Halford, D.K.; Markham, O.D. Apr 1979.

From Symposium on the Idaho National Engineering Laboratory ecology programs; Grand Teton, WY, USA (10 Sep 1978).

A study was begun in 1977 to investigate the potential effect of chronic radiation exposure on small mammals inhabiting a dry radioactive leaching pond at the Test Reactor Area (TRA) of the Idaho National Engineering Laboratory (INEL). The white-footed deer mouse (Peromyscus maniculatus), was studied since thermoluminescent dosimeter (TLD) data obtained in 1976 by Halford and Markham indicated that this species received significantly larger doses of radiation per day than other species present in the pond vicinity. In 1978, the study was expanded to include the effects of radiation on mice inhabiting a solid radioactive waste burial site located at the Radioactive Waste Management Complex (RWMC). The objectives of this study are: (1) to determine whether radiation exposure at the TRA and the RWMC study sites results in pathological changes in the hematopoietic systems of deer mice, (2) to examine vital and reproductive organs of mice for the presence of tumors and other pathologic lesions resulting from radiation exposure, and (3) to identify possible damage due to radiation exposure to chromosomes of mice lymphocytes. Hematological studies of animals from the TRA site, control site, and laboratory control colony revealed no significant differences between populations and, therefore, there were no pathologic changes to the hematopoietic system attributable to radiation exposure. Further, there were no significant differences in histopathologic lesions in the tissues between populations. Preliminary hematological studies on the mice from the RWMC indicated pathologic changes to the hematopoietic system due to radiation exposure. Significant differences were observed in all the hematologic parameters measured in 51 of the 109 samples examined when compared to the controls.

3474 (INIS-mf--4637, pp 12) ^{137}CS - CONTAMINATION INDICATOR OF WASTE WATER DISCHARGED FROM A-1 NUCLEAR POWER PLANT. Csupka, S.; Petrasova, M. (Krajska Hygienicka Stanica, Bratislava (Czechoslovakia)). Jun 1976. (In Slovak).

3475 (PB--296947, pp 471-484) USE OF HANFORD WASTE WATER PONDS BY WATERFOWL. Price, K.R.; Fitzner, R.E. (Battelle Pacific Northwest Labs., Richland, WA). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

Census and environmental surveillance information on waterfowl that use the Hanford Site 200 Area waste water ponds are described and evaluated. Physical features of the ponds are discussed in relation to their use and suitability for waterfowl. Seasonal distributions observed for the years 1971 through 1974 indicate that the highest use by waterfowl occurs during the spring and fall migratory periods. Base population estimates are 300 to 400 resident waterfowl with a few tens of pairs nesting during the summer. Environmental surveillance data on ^{137}Cs in muscle tissue are presented for the years 1971 through 1977. Comparisons are made between Columbia River and waste water pond waterfowl, between waterfowl groups, and among ponds. Waterfowl collected from ponds frequently have easily detected levels of ^{137}Cs in muscle tissue. However, those waterfowl collected from the Columbia River seldom show a ^{137}Cs level above that expected from worldwide fallout. Waterfowl collected from the pond with the smallest ^{137}Cs inventory and the poorest waterfowl habitat contained the lowest levels of ^{137}Cs in muscle tissue.

3476 (PNL--3127) RADIOLOGICAL SURVEY OF EXPOSED SHORELINES AND ISLANDS OF THE COLUMBIA RIVER BETWEEN VERNITA AND THE SNAKE RIVER CONFLUENCE. Sula, M.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Apr 1980. Contract AC06-76RL01830. 163p. NTIS, PC A08/MF A01.

This document describes a radiological survey which was performed to evaluate the magnitude and distribution of radioactive contamination on the exposed shorelines of the Columbia River along and downstream of the Hanford Site. The area encompassed by the survey includes the low-lying exposed land on both sides of the river from the uppermost point of production reactor discharge into the river at 100-B Area to the confluence of the Snake and Columbia Rivers, almost 60 miles downstream of the starting point. External exposure rate measurements were made at nearly 30,000 locations during the survey - accounting for approximately 60% of the land in the study area. Measurable radioactive contamination, resulting from past Hanford operations was found to be present on the shorelines of the Columbia River along the study area. The absence of short-lived radionuclides in the shore sediments and the presence of contamination several meters above recent maximum river levels indicate that the material was deposited some years ago.

3477 (PNL--3300(Pt.2), pp 71-78) RADIOECOLOGY OF NUCLEAR FUEL CYCLES. Schreckhise, R.G.; Cadwell, L.L.; Emery, R.M. Feb 1980.

Pacific Northwest Laboratory annual report for 1979 to the DOE Assistant Secretary for Environment. Part 2. Ecological sciences.

Sites where radioactive wastes are found are solid waste burial grounds, soils below liquid stoage areas, surface ditches and ponds, and the terrestrial environment around chemical processing facilities that discharge airborne radioactive debris from stacks. This study provides information to help assess the environmental impacts and certain potentiall human hazards associated with nuclear fuel cycles. A data base is being developed to

define and quantify biological transport routes which will permit credible predictions and assessment of routine and potential large-scale releases of radionuclides and other toxic materials. These data, used in assessment models, will increase the accuracy of estimating radiation doses to man and other life forms. Information obtained from existing storage and disposal sites will provide a meaningful radioecological perspective with which to improve the effectiveness of waste management practices. Results will provide information to determine if waste management procedures on the Hanford Site have caused ecological perturbations, and if so, to determine the source, nature, and magnitude of such disturbances.

3478 (UCID--18267) PRELIMINARY EVALUATION OF THE BIODOSE COMPUTER PROGRAM. Bonner, N.A.; Ng, Y.C. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Sep 1979. Contract W-7405-ENG-48. 14p. Dep. NTIS, PC A02/MF A01.

The BIODOSE computer program simulates the environmental transport of radionuclides released to surface water and predicts the dosage to humans. We have evaluated the program for its suitability to the needs of the Nuclear Regulatory Commission Waste Management Program. In particular, it is an evaluation to determine whether BIODOSE models account for the significant pathways and mechanisms resulting in radiological doses to man. In general, BIODOSE is a satisfactory code for converting radionuclide releases to the aqueous environment into doses to man.

3479 (UJV--4508-D,CH,A,E) WATER - A MATHEMATICAL MODEL FOR COMPUTING POPULATION DOSES IN A WATERSHED DUE TO CONTINUOUS RADIOACTIVE EFFLUENTS INTO WATER FLOWS. Chytil, I. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Apr 1978. 27p. (In Czech). Available from Ustav jaderneho vyzkumu CSKAE, Rez, Czechoslovakia.

A mathematical model is described for computing the spread of radioactive and other substances in a watershed from any arbitrary number of sources at continuous discharge. It is used for the computation of population doses from drinking water, water food, irrigation, recreation and water sports for individual profiles.

3480 NUCLEAR WASTE PONDS AND STREAMS ON THE HANFORD SITE: AN ECOLOGICAL SEARCH FOR RADIATION EFFECTS. Emery, R.M.; McShane, M.C. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Health Physics ; 38: No. 5, 787-809(May 1980).

Limnological and radiological parameters were investigated in ponds and streams on the Hanford Site to develop general radioecological profiles. All but one aquatic system receive low-level aqueous radioactive wastes from nuclear facilities. The remaining system is a pond formed by surfacing groundwater and contains radioactivity as a result of evaporative concentration of naturally occurring nuclides. Attempts were made to determine whether the amounts of radioactivity present in each aquatic system could be related to ecological variation occurring among them. Maximum dose from the sediments and nuclide concentrations in the water were used to differentiate these systems radiologically. These aquatic environments support populations of commonly occurring algae, macrophytes, invertebrates and in some cases, fish. Since these ponds and streams cannot be clearly differentiated from offsite systems or among themselves on the basis of a general ecological profile, this survey provides no conclusive evidence that the nuclear wastes discharged into Hanford ponds and streams have affected the colonization, diversity and activity of biota that appear in them.

3481 DISTRIBUTION OF ACTIVATION PRODUCTS FROM BARSEBAECK NUCLEAR POWER PLANT (SWEDEN) IN THE MARINE ENVIRONMENT. TEMPORAL AND SPATIAL VARIATIONS AS ESTABLISHED BY SEAWEED. Mattsson, S.; Finck, R.; Nilsson, M. (Lund Univ. (Sweden). Radiofysiska Institutionen). Environmental Pollution (Series B: Chemical and Physical) ; 1: No. 2, 105-115(Apr-Jun 1980).

The biophysical behaviour of the radioactive corrosion products ^{51}Cr, ^{54}Mn, ^{58}Co, ^{60}Co, ^{65}Zn and $^{110}Agsup(m)$ has been studied in the marine environment up to 150 km from a nuclear power station using the brown seaweeds Fucus vesiculosus and F. serratus as bioindicators. The activity concentration in Fucus per unit activity released from the nuclear power station is about equal for ^{54}Mn, ^{58}Co, ^{60}Co and ^{65}Zn but lower by a factor of 3 for $^{110}Agsup(m)$ and by a factor of 10 for ^{51}Cr. The biological half-time of radioactive cobalt in naturally growing F. vesiculosus was 60 +- 15 days during the summer. Approximately the same value was found for ^{54}Mn and ^{65}Zn. The results show that 85 to 90% of the activity released from the nuclear power plant follows the dominating north-bound water stream and 10 to 15% is transported southwards. For ^{54}Mn, ^{58}Co, ^{60}Co and ^{65}Zn the decrease in activity concentration C(z) with distance, z(km) north of the power plant can be described by a power function, $C(z) = \alpha.zsup(-1.4)$, where α is a constant.

3482 ENVIRONMENTAL MONITORING PROGRAMME TO ASSESS AND CONTROL THE EFFECTS OF LIQUID EFFLUENT DISCHARGES OF LOW RADIO-ACTIVITY TO AN INLAND LAKE. Smitton, C. (Central Electricity Generating Board, Manchester (UK). Scientific Services Dept.); Williams, W.M. (Central Electricity Generating Board, Gwynedd (UK). Trawsfynydd Power Station). Nuclear Energy (Formerly Nuclear Energy Engineer) ; 19: No. 2, 111-115(Apr 1980).

The 400 MW(e) twin gas-cooled reactor power station at Trawsfynydd in North Wales is unique in the UK in that it uses water extracted from an inland lake, Lake Trawsfynydd, for cooling the turbine-generator steam condensers. The radio-active liquid effluent is discharged into this lake with the returning cooling water flow. The lake is 200m above sea level and is fed from mountain streams in an area of relatively high rainfall. The principal outflow of lake water is to a small hydroelectric power plant which discharges its water into the sea. Consumption of trout taken from this lake provides the critical radiological pathway for exposure to the public. The critical radionuclide is caesium-137 which is concentrated in the flesh of the fish. The monitoring programme used to assess the impact of the low-level liquid effluent discharges on the lake environment is described. This involves sampling water, bed sediments, flora and fauna, not only from the lake but also from the outfall stream. The methods of sampling, sample preparation and counting for assay of the radionuclides of interest are described. The results from this programme are described and they demonstrate that the lake bed provides a varying adsorption term in the balance equation for radionuclides discharged into this environment. Furthermore, it is found that the effects of these discharges are critically dependent on

meteorological conditions and the management of the lake water volume.

3483 DISTRIBUTION OF COBALT 60 IN A MOLLUSC, A CRUSTACEAN AND A FRESHWATER TELEOST: VARIATIONS AS A FUNCTION OF THE SOURCE OF POLLUTION AND DURING ELIMINATION. Amiard, J.C.; Amiard-Triquet, C. (CEA, Saint-Paul-lez-Durance, Fr). Environmental Pollution (London) ; 20: No. 3, 199-213(Nov 1979).

Three experiments were carried out: starved animals were immersed in ^{60}CO-contaminated water; animals were immersed in contaminated water and received radioactive food; and animals were placed in fresh water without any pollutant but received contaminated food. Radiation doses were calculated for contamination via both food and water. 25 refs.

3484 EFFECT OF A LONG-TERM RELEASE OF PLUTONIUM AND AMERICIUM INTO AN ESTUARINE-COASTAL SEA ECOSYSTEM. 1. DEVELOPMENT OF AN ASSESSMENT METHODOLOGY. Murray, C.N.; Avogadro, A. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). Health Physics ; 36: No. 5, 573-585(May 1979).

A method is developed for the assessment of the distribution and the associated hazard due to a long-term release of long-lived alpha-emitting radionuclides into surface waters of a marine ecosystem. The methodology is designed to identify various environmental compartments and the processes occurring within them, which are of importance in affecting the behaviour and thus the distribution of actinide elements in such systems. The compartment model system (box model) chosen is applied to an imaginary coastal area. Various processes in the environmental compartments are considered separately and then assembled to show their combined interactions. Using the concept of critical nuclide-pathway-group analysis, an attempt has been made to define a number of the most important pathways by which actinides released into the aquatic environment could return to man, and especially those related to the exploitation of aquatic food resources. The concentration levels for the example considered produce rather low dose rates to man of less than 3% of the maximum permissible intake. The low dose levels strongly depend upon the concentration factors of the various biological species, as well as upon source-term activities. The concentration factors used for the biological transfer of actinides relate to the water activity only. In the case where highly radioactive sediments or sedimentary-associated material were closely involved in the uptake pathway, actinide transfer to man could become more relevant. This study shows that sedimentation and bottom sediment absorption represent the major reconcentration processes for actinides released into surface waters.

3485 EVOLUTION OF GAMMA ARTIFICIAL RADIOACTIVITY IN COASTAL SEDIMENTS OF THE ENGLISH CHANNEL DURING THE YEARS 1976, 1977 AND 1978. Gueguéniat, P. (CEA Centre de la Hague, 50 - Cherbourg (France). Lab. de Radioecologie Marine); Auffret, J.-P.; Baron, Y. Oceanologica Acta ; 2: No. 2, 165-180(Apr 1979). (In French).

During 1976-1977, a state of equilibrium was found to prevail for ^{106}Ru and ^{144}Ce, especially in the North-West Cotentin and the Norman-Breton gulf, where reconcentration of both radionuclides was observed with preferential enrichment of the latter over the former. Levels of ^{125}Sb and ^{137}Cs were found to be low but were difficult to interpret, because of the particular physico-chemical behavior of ^{125}Sb and the long half-life of ^{137}Cs. The results obtained for ^{103}Ru, ^{141}Ce, ^{95}Zr may be explained entirely by the contribution of atmospheric fallout. ^{144}Ce and ^{106}Ru levels in the Norman-Breton gulf may be for the most part ascribed to La Hague disposals, radionuclide dispersal from the emissary being characterized by an eastward transfer of the soluble fraction and a westward transfer of the particulate fraction, with transit times which may last up to 2 years. The boundary between the areas submitted respectively to the twofold impact of fallout and industrial waste, and to fallout alone would appear to lie between the mouth of the Trieux river and Morlaix Bay. From a graphic representation of the relationship between radionuclides, empiric distribution laws for ^{106}Ru and ^{137}Cs were established from ^{144}Ce level parameters characteristic of the areas considered (years 1976-1977).

3486 EXCRETION OF ^{131}I BY FRESHWATER CATFISH (ICTALURUS PUNCTATUS) AND BLUEGILL (LEPOMIS MACROCHIRUS). Lyon, R.J.; Blanchard, R.L.; Moore, J.B. (Environmental Protection Agency, Montgomery, AL (USA). Eastern Environmental Radiation Lab.). Health Physics ; 36: No. 3, 444-447(Mar 1979).

Fish in waters to which wastes from nuclear power stations are discharged accumulate radionuclides for a short time during batch discharges and then eliminate them during the longer intervals between discharges. Hence, the elimination rates of radionuclides are of importance in computing radiation doses to humans who eat fish caught in these waters. The excretion rates of ^{131}I in two freshwater fish species were studied. Findings show that ^{131}I is excreted quite rapidly by both species. ^{131}I loss from fish muscle during deep frying was also measured and found to be 20 +- 4%. It is concluded that the practice of simply applying a concentration factor to convert the concentration in water to that in fish, without considering excretion, grossly overestimates the dose to the consumer, and that further studies should be made to identify other nuclides that behave similarly.

3487 TRITIATED WATER TREATMENT PROCESS. O'Brien, C.J. (to Aerojet-General Corp., El Monte, CA (USA)). Canadian Patent 1,046,242/A/ 16 Jan 1979. 7p.

The invention provides a method for removing tritium from water comprising the steps of: bringing the water into contact with a water insoluble hydrophilic material that is more basic than the water and contains labile hydrogen atoms to provide an isotope exchange of tritium from the water to said water insoluble material; bringing said water insoluble hydrophilic material into contact with a liquid that contains labile hydrogen atoms and is more basic than said water insoluble material to provide an isotope exchange of tritium from said water insoluble material to said liquid, said more basic property of said liquid causing a tritium concentration to form in said liquid that is greater than the tritium concentration in the water; and separating the tritium from said liquid.

3488 PANEL SUMMARY REPORT. pp 7-35 of Methodology for assessing impacts of radioactivity on aquatic ecosystems. Vienna, Austria; International Atomic Energy Authority (1979).

From Advisory group on methodology of

radiation effects experiments on aquatic organisms and ecosystems for evaluation; Vienna, Austria (21 Nov 1977).

Previous Advisory Group Meetings have led to IAEA Technical Reports No.15=5 (1974) on thermal discharge, 118 (1970) and 169 (1975) on sampling, storage and analysis methods for marine radioactivity studies, 167 (1975) on design of marine biological studies permitting comparative evaluation, and 172 (1976) on the effects of ionizing radiation on aquative organisms and eco-systems. The aim of the present report was a bringing into perspective not only problems designing radioecological experiments but to describe reliable experimental methodology suitable for a successful evaluation of radioactivity cycling, and of the effects of such radioactive additions to aquatic environments, as a result of nuclear activities. Specific examples are described. Individual studies presented to the Panel have been treated in detail, and constitute 19 separate INIS entries.

3489 ALPHA-EMITTING NUCLIDES IN COMMERCIAL FISH SPECIES CAUGHT IN THE VICINITY OF WINDSCALE, UNITED KINGDOM, AND THEIR RADIOLOGICAL SIGNIFICANCE TO MAN. Pentreath, R.J.; Lovett, M.B.; Harvey, B.R.; Ibbett, R.D. (Ministry of Agriculture, Fisheries and Food, Lowestoft (UK). Fisheries Radiobiological Lab.). pp 227-242 of Biological implications of radionuclides released from nuclear industries. Vol. 2. Vienna, Austria; IAEA (1979).

From International symposium on biological implications of radionuclides released from nuclear industries; Vienna, Austria (26 Mar 1979).

The concentrations of a number of alpha-emitting nuclides have been determined in the tissues of several commercial fish species caught in the vicinity of the fuel reprocessing plant at Windscale. All tissues analysed were found to contain ^{238}Pu, sup(239+240)Pu and ^{241}Am, but ^{242}Cm and ^{244}Cm could only be reliably detected in the liver samples of some fish. Fish of the same species, but taken from the North Sea, have also been analysed for some naturally occurring alpha-emitting nuclides. Whereas uranium (^{238}U) and thorium (^{232}Th) could be detected in bone samples of fish, neither could be reliably detected in samples of muscle: in contrast, ^{210}Po was readily detected in samples of liver, muscle and bone. Commercial fish fillets from the Irish Sea, including the Windscale area, are also routinely monitored for alpha-emitting nuclides, and their radiological significance to man is briefly discussed. Comments are also made on the significance of the naturally occurring nuclides.

3490 RADIOCESIUM EXCHANGE AMONG COMPONENTS OF A COASTAL PLAIN BOTTOMLAND STREAM ECOSYSTEM. Gladden, J.B. Atlanta, GA; Emory Univ. (1979). 205p. University Microfilms Order No. 79-16,053.

Thesis (Ph. D.).

The cycling of reactor effluent radiocesium was studied in a Coastal Plain bottomland stream ecosystem from 1972 to 1976. Changes in radiocesium burdens in major components of the stream margin community were examined to establish the patterns of variation both within and among years. The magnitudes and directions of radiocesium movement among stream channel, emergent vegetation zone and floodplain forest communities were also examined.

3491 POLLUTIONS ASSOCIATED WITH RADIOACTIVITY. Bittel, R. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). Agriculture (Paris) ; No. 416, 55-57(Feb 1978). (In French).

Excluding the thermal effluents of nuclear power plants, two types of effluents are envisaged: chemical and microbiological effluents; effluents with radiomimetic effects on environment organisms and on man. Correlations between the various types of pollutions are emphasized.

3492 PRELIMINARY RESULTS ON ACCUMULATION AND LOSS OF ARTIFICIAL RADIONUCLIDES IN MARINE BENTHIC ALGAE. Santos, P.L. dos; Santos Gouvea, R.C. (Universidade Federal Fluminense, Niteroi (Brazil). Inst. Biomedico); Gusmao Pedrini, A. (Universidade Santa Ursula, Rio de Janeiro). Rodriguesia ; 29: No. 44, 263-268(1978). (In Portuguese).

The acummulation and the loss of artificial radionuclides in three species of marine benthic algae of the state of Rio de Janeiro were studied under laboratory conditions, so that a selection of biological indicators for radioctive contamination of the marine environment could be made. Medium concentration factors were calculated, the most significant figures being those obtained for the algae Pterocladia Capillacea (Gmelin) Bornet et Thuret (132+-40) p/ sub(131) I and Sargassum vulgares J. Agardh (19+-5) p/ ^{51}Cr.

3493 FLUX OF CERTAIN RADIONUCLIDES IN THE BLOOD-CLAM ANADARA GRANOSA LINNAEUS UNDER ENVIRONMENTAL CONDITIONS. Patel, B.; Patel, S.; Balani, M.C.; Pawar, S. (Bhabha Atomic Research Center, India). Journal of Experimental Marine Biology and Ecology ; 35: No. 2, 177-195(1978).

The bioaccumulation of the radionuclides cesium-137, cerium-144, and ruthenium-106, and of the product nuclide cobalt-60, by arcid clams (Anadara granosa L.) in the Bombay, India, harbor was monitored from 1970-76. During the study period, the input of low level radioactive waste decreased by more than 20 times. The arcid clam showed an affinity for all three radionuclides and cobalt-60. On reaching maximum accumulation, the levels of the radionuclides decreased exponentially with time although the radioactivity was still present in sediments. The ecological half-life for cerium-144 and ruthenium-106 was 3-6 times longer, and that of cesium-137 significantly shorter, than their biological half-lives. Data on tissue distribution and rates of loss of radionuclides are presented. The bioaccumulation of the activation product cobalt-60 was independent of ambient concentration and temperature, unlike that of the three radionuclides. (7 graphs, 28 references, 7 tables)

3494 Iode-129. Compte rendu d'une reunion de specialistes de l'AEN. Paris, 13-16 juin 1977. (IODINE-129. PROCEEDINGS OF AN NEA SPECIALIST MEETING. PARIS, 13-16 JUNE 1977). Paris, France; OECD (1977). 113p. (In English, French).

From NEA specialist meeting on Iodine-129; Paris, France (13 - 16 Jun 1977).

In the framework of its programme on effluent releases from the nuclear fuel cycle and its radiological significance, the Committee on Radiation Protection and Public Health decided to organise meetings of specialists directly involved with research or regulatory aspects of effluent releases in order to note the status of present knowledge

in this field. A first meeting of this type on iodine 129 was organised by the OECD Nuclear Energy Agency. This publication reproduces papers presented at this meeting.

Site Resource and Use Studies

3495 (DP-MS--79-95) PRELIMINARY ASSESSMENT OF THE AQUATIC IMPACTS OF A PROPOSED DEFENSE WASTE PROCESSING FACILITY AT THE SAVANNAH RIVER PLANT. Mackey, H.E. Jr. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1979. Contract EY-76-C-09-0001. 138p. Dep. NTIS, PC A07/MF A01.

A review of the literature indicates that a significant body of descriptive information exists concerning the aquatic ecology of Upper Three Runs Creek and Four Mile Creek of the Savannah River Plant south of Aiken, South Carolina. This information is adequate for preparation of an environmental document evaluating these streams. These streams will be impacted by construction and operation of a proposed Defense Waste Processing Facility for solidification of high level defense waste. Potential impacts include (1) construction runoff, erosion, and siltation, (2) effluents from a chemical and industrial waste treatment facility, and (3) radionuclide releases. In order to better evaluate potential impacts, recommend mitigation methods, and comply with NEPA requirements, additional quantitative biological information should be obtained through implementation of an aquatic baseline program.

3496 (RHO-BWI-ST--6) SURFACE HYDROLOGIC INVESTIGATIONS OF THE COLUMBIA PLATEAU REGION, WASHINGTON. Leonhart, L.S. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Jul 1979. Contract EY-77-C-06-1030. 206p. Dep. NTIS, PC A10/MF A01.

The Washington State portion of the Columbia Plateau is divided into six hydrologic sub-basins on the basis of the principal surface drainage systems present, structural and topographic relationships, and political and other considerations. Baseline descriptions of the surface water systems and resources are presented for the Columbia Plateau with emphasis on the Pasco Sub-basin. A preliminary evaluation of the hydrologic budget for each sub-basin is derived. For each sub-basin, recharge/discharge relationships arising from precipitation/evapotranspiration/runoff, stream losses and gains, and artificial mechanisms are determined on the basis of available data. The net exchange between surface and groundwater systems is evaluated and relative estimates of the net groundwater flow into or out of the sub-basin are obtained. An evaluation is made of hydrologic risk factors arising from: (1) tributary flooding in eastern Washington; and, (2) major flooding of the Columbia River within the Pasco Sub-basin. Scenarios are presented for credible natural and man-generated catastrophic events.

HEALTH AND SAFETY

3497 (ORNL--5543) INDUSTRIAL SAFETY AND APPLIED HEALTH PHYSICS. ANNUAL REPORT FOR 1978. Auxier, J.A. (Oak Ridge National Lab., TN (USA)). Sep 1979. Contract W-7405-ENG-26. 104p. Dep. NTIS, PC A06/MF A01.

There were no external or internal exposures to personnel which exceeded the standards for radiation protection as defined in DOE Manual Chapter 0524. Only 39 employees received whole body dose equivalents of one rem or greater. The highest whole body dose equivalent to an employee was 3.3 rem. The highest internal exposure was less than 25% of a maximum permissible dose for any calendar quarter. During 1978, 23 portable instruments were added to the inventory and 228 retired. The total number in service on January 1, 1979, was 1023. There were no releases of gaseous waste or liquid radioactive waste from the laboratory which were of a level that required an incident report to DOE. The average background level at the PAM stations during 1978 was 9.3 μR/hr, or 81 mR/yr. Soil samples were collected at all perimeter and remote monitoring stations and analyzed for eleven radionuclides including plutonium and uranium. Grass samples were collected and analyzed for twelve radionuclides including plutonium and uranium. During 1978, the Radiation and Safety Surveys personnel continued to assist the operating groups in keeping contamination, air concentrations, and personnel exposure levels below the established maximum permissible levels. Fourteen radiation incidents involving radioactive materials were recorded during 1978. Of the 582,000 articles of wearing apparel and 192,000 articles, such as mops, laundry bags, towels, etc., monitored during 1978 about four percent were found to be contaminated. Three lost workday cases occurred at ORNL in 1978, a frequency rate of 0.07. The Serious Injury frequency rate for 1978 was 1.40, as based on the new OSHA system for recording injuries and illness (RII). A total of 55 days were lost or charged for the three lost workday cases in 1978.

3498 REACTOR SAFETY, SAFETY OF OTHER NUCLEAR FACILITY, RADIATION PROTECTION. INTERPRETATION OF ARTICLE 4, PARAGRAPH 4, 1ST SENTENCE, NO. 2E OF THE RADIATION PROTECTION ORDINANCE. Gemeinsames Ministerialblatt, A ; 30: No. 30, 631(Nov 1979). (In German).

Standard criteria for the disposal of radioactive waste in the handling of radioactive waste exempt from approval and subject to approval (waste with a specific activity of more than four times the maximum permissible activity per gramme).

3499 GENERAL CALCULATION BASIS FOR ASSESSING THE RADIATION EXPOSURE FROM RADIOACTIVE DISCHARGES VIA EXHAUST AIR OR INTO SURFACE WATER (REG. GUIDE RELATED TO PARAGRAPH 45 OF THE GERMAN RADIATION PROTECTION REGULATION). Gemeinsames Ministerialblatt, A ; 30: No. 21, 371-436(Aug 1979). (In German).

The present mathematical models and data tables are primarily reference data that are required for the design of facilities in order to judge if the dose limits given in paragraph 45 of the German Radiation Protection Regulation are met. Furthermore this mathematical model helps to establish the most important locations and programs for immission measurements in the individual case within the scope of monitoring the environment. The presentation distinctly shows the expert doing the analysis the complexity and the manifold parameters; it is a reference for assessing immission if emission is known. The calculation basis does not dispense the expert from examining and judging the individual case according to the relevant local characteristics and circumstances. (orig.).

3500 RADIOACTIVE MATERIALS AND ENVIRONMENT. Trivedi, R.N. (Fertilizer Association of India, New Delhi); Pandey, G.N. (Harcourt Butler Technological Inst., Kanpur (India)). Metals

and Minerals Review ; 18: No. 9, 28-38(Aug 1979).

Radioactive materials are very widely used in medicine, industry, agriculture and scientific and industrial research besides their use as nuclear weapons. The radiation energy emitted from radioactive materials into the environment has severe hazards. Because of their unique characteristics, the contamination caused by them is not comparable to other commonly known pollutions. This paper deals with various salient features of the radioactive materials, their frequent applications, the degree of hazards due to contamination in the environment and the essential safety measures to be taken in handling and disposing of the radioactive materials.

3501 Bericht und Analyse der bisher geheimgehaltenen Atomkatastrophe in der UdSSR. (REPORT AND ANALYSIS OF THE CONCEALED NUCLEAR CATASTROPHE IN THE USSR). Medwedjew, Z. Hamburg, Germany, F.R.: Hoffmann und Campe (1979). 270p. (In German).

Rumour has it that there was a nuclear catastrophe in the Tchelyabinsk district in the southern Ural mountains in late 1975 or early 1958. When a radioactive waste deposit exploded, hundreds of persons died; thousand had to be evacuated or treated in isolated hospital wards. Eye witnesses gave news of a ghost landscape without any vegetation. Even years later, vehicles could only pass with closed windows and at high speed. On the basis of radioactivity data of widely known Soviet publications, Medvedyev gives exact details of the extent and consequences of the nuclear contamination. His report is published in book form for the first time. Documents released for publication by the CIA - although some 'purified' -, with detailed witnesses' reports on the accident were given to the editors by the authors. They are printed in facsimile.

3502 Nuklearmedizinische Betriebe. Regeln fuer die Errichtung und Ausstattung. (INSTALLATIONS FOR NUCLEAR MEDICINE. REGULATIONS FOR CONSTRUCTION AND EQUIPMENT). Berlin, Germany, F.R.: Beuth (Dec 1978). 12p. (In German). (DIN--6844).

The rules are valid for medical installations using unsealed radioactive material in diagnostics, therapy, and research: Classification of rooms and sub-areas; General rules for design and construction; Condition of groups of rooms and functional units; Calculation of radiation shields and constructional drawings for radiation protection; General equipment of rooms and installation; Special equipment and condition of individual rooms; Disposal or radioactive wastes.

3503 THE TRANSPORT OF RADIOACTIVE MATERIALS. Swindell, G.E. (IAEA). International Atomic Energy Agency Bulletin ; 20: No. 5, 17-24(Oct 1978).

From 1971-75, 144 nuclear accidents involved packages of radioactive materials, and, in 36 cases, some release of contents was reported. In no case has any release been observed from a Type B package as result of an accident. Type B packages contain: sealed radioactive material for medical and industrial purposes; spent nuclear fuel; high level wastes; or highly radiotoxic materials. Spent fuel is probably most vulnerable to attack or theft during transport. The following measures can be taken to lessen risk during transit: minimize the total time nuclear materials are in transit; minimize the number of transfers; avoid regular movement schedules; predetermine the trustworthiness of all handlers; and give advance warning to receivers. (4 photos, 15 references, 5 tables)

3504 SAFETY CONCERNING THE ALTERATION IN FUEL MATERIAL USAGE (NEW INSTALLATION OF THE HIGH-LEVEL RADIOACTIVE MATERIAL RESEARCH FACILITY) IN TOKAI WORKS OF POWER REACTOR AND NUCLEAR FUEL DEVELOPMENT CORP. Genshiryoku Iinkai Geppo (Journal of Atomic Energy Commission) ; 23: No. 2, 20-27(Jul 1978). (In Japanese).

A report of the Committee on Examination of Nuclear Fuel Safety was presented to the Atomic Energy Commission of Japan, which is concerned with the safety in the alteration of fuel material usage (new installation of the high-level radioactive material research facility) at Tokai Works. Its safety was confirmed. The alteration, i.e. installation of the high-level radioactive material research facility, is as follows. Intended for research of the reprocessing technology for high burnup plutonium-enriched spent fuel and of the glassification treatment for high-level liquid waste from fuel-reprocessing, the high-level radioactive material research facility includes a research building of about 6,200 m^2 floor space, an administrative building of about 1,200 m^2 floor space, cells, glove boxes and hoods, storages and waste facilities. The contents of the examination are safety of the facilities, fire/ explosion prevention, criticality control, radiation control, waste treatment, effects on the surrounding environment, and accident evaluation.

3505 INTERNATIONAL GUIDELINES FOR FIRE PROTECTION AT NUCLEAR INSTALLATIONS INCLUDING NUCLEAR FUEL PLANTS, NUCLEAR FUEL STORES, TEACHING REACTORS, RESEARCH ESTABLISHMENTS. London: British Insurance (Atomic Energy) Committee ([nd]). 40p.

The guidelines are recommended to designers, constructors, operators and insurors of nuclear fuel plants and other facilities using significant quantities of radioactive materials including research and teaching reactor installations where the reactors generally operate at less than approximately 10 MW(th). Recommendations for elementary precautions against fire risk at nuclear installations are followed by appendices on more specific topics. These cover: fire protection management and organization; precautions against loss during construction alterations and maintenance; basic fire protection for nuclear fuel plants; storage and nuclear fuel; and basic fire protection for research and training establishments. There are numerous illustrations of facilities referred to in the text.

3506 (CONF-7906121--1) TWO-DIMENSIONAL FINITE ELEMENT SOLUTION FOR THE SIMULTANEOUS TRANSPORT OF WATER AND SOLUTES THROUGH A NONHOMOGENEOUS AQUIFER UNDER TRANSIENT SATURATED UNSATURATED FLOW CONDITIONS. Gureghian, A.B. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 33p. Dep. NTIS, PC A03/MF A01.

From Permiability and groundwater containment transport symposium; Philadelphia, PA, USA (17 Jun 1979).

A mathematical model of ground water transport through an aquifer is presented. The solute of interest is a metal tracer or radioactive material which may undergo decay through a sorbing unconfined aquifer. The subject is developed under the following headings: flow equation, solute equation, boundary conditions, finite element formulation, element formulation, solution scheme (flow equation, solute equation), results and discussions, water movement in a ditch drained aquifer under transient state, water and solute movement in a homogeneous and unsaturated soil, transport of ^{226}Ra in nonhomogeneous aquifer, tailings pond lined, and tailings pond unlined. It is concluded that this mathematical model may have a wide variety of applications. The uranium milling industry may find it useful to evaluate the hydrogeological suitability of their disposal sites. It may prove suited for the design of clay disposal ponds destined to hold hazardous liquids. It may also provide a means of estimating the long-term impact of radionuclides or other pollutants on the quality of ground water. 31 references, 9 figures, 3 tables.

3507 (DP--1522) DEVELOPMENT AND VALIDATION OF GWHEAD, A THREE-DIMENSIONAL GROUNDWATER HEAD COMPUTER CODE. Beckmeyer, R.R.; Root, R.W.; Routt, K.R. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Mar 1980. Contract AC09-76SR00001. 26p. NTIS, PC A03/MF A01.

A computer code has been developed to solve the groundwater flow equation in three dimensions. The code has finite-difference approximations solved by the strongly implicit solution procedure. Input parameters to the code include hydraulic conductivity, specific storage, porosity, accretion (recharge), and initial hydralic head. These parameters may be input as varying spatially. The hydraulic conductivity may be input as isotropic or anisotropic. The boundaries either may permit flow across them or may be impermeable. The code has been used to model leaky confined groundwater conditions and spherical flow to a continuous point sink, both of which have exact analytical solutions. The results generated by the computer code compare well with those of the analytical solutions. The code was designed to be used to model groundwater flow beneath fuel reprocessing and waste storage areas at the Savannah River Plant.

3508 (KBS-TR--47, pp 1-61) GROUNDWATER FLOW DUE TO TOPOGRAPHICAL AND GEOLOGICAL EFFECTS. Stokes, J. (Tekniska Hoegskolan, Stockholm (Sweden)). May 1978.

Investigations of groundwater flow in rock around repositories for nuclear waste.

A first investigation of the principal aspects of groundwater flow when varying topography, hydraulic conductivity and geometry is presented. The groundwater table was assumed coincident with topography. The conductivity was assumed constant or exponentially decreasing with depth. The bottom was either fixed or infinite. Numerical examples containing equipotentials, streamlines, lines of equal flux and travel times are presented. Several profiles in the Forsmark area were analysed to show the effects of regional flow.

3509 (LBL--8764(Vol.1)) GEOHYDROLOGICAL STUDIES FOR NUCLEAR WASTE ISOLATION AT THE HANFORD RESERVATION. VOLUME I. EXECUTIVE SUMMARY. Apps, J.; Doe, T.; Doty, B. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Aug 1979. Contract W-7405-ENG-48. 31p. Dep. NTIS, PC A03/MF A01.

A study of the hydrology of the Pasco Basin near Richland, Washington, was initiated during FY 1978 as part of a long-term study on the feasibility of nuclear waste disposal in the Columbia River Basalt underlying the Hanford Reservation. This report summarizes the hydrology field program, Pasco Basin modeling, and groundwater chemistry program. Hanford well logs are also reviewed. (DLC)

3510 (LBL--8764(Vol.2)) GEOHYDROLOGICAL STUDIES FOR NUCLEAR WASTE ISOLATION AT THE HANFORD RESERVATION. VOLUME II. FINAL REPORT. Apps, J.; Doe, T.; Doty, B. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Aug 1979. Contract W-7405-ENG-48. 279p. Dep. NTIS, PC A13/MF A01.

A field testing program to provide data for mathematical modeling of ground water flow in the deep basalts of the Pasco Basin was initiated in FY 1978. Tests performed in DC-2 and water level responses in neighboring DC-1 suggest possible leakage between the three lower piezometers in DC-1 and indicate a downward gradient in the upper basalt layers down to 4000 ft, beneath which there may be an upward gradient. A sharp steepening of the downward gradient near the Umtanum Unit suggest that Umtanum may be acting as a barrier to vertical flow. Pressure testing in well DC-8 in the basalts above the Vantage sandstone at 1700 to 2700 ft indicate a downward gradient. Water level elevations were higher and downward gradients steeper than in wells DC-1/DC-2. Well DC-6 was artesian, with a production rate of about 17 gpm, with 75% of this flow coming from the depth interval 3650 to 3800 ft. Pressure tests between 2200 and 4300 ft indicate artesian conditions in every zone. Water level elevations in the Grande Ronde basalts in DC-6 were higher than in the same zones in DC-1/DC-2. As in DC-1/DC-2, there appears to be a local heat minimum within 600 ft below the bottom of the Umtanum with higher heads at greater depth. The Gable Mountain anticline may be a flow barrier separating Cold Creek Valley from the Columbia River Valley to the north and east. Recharge to the deep basalts in Cold Creek Valley appears small, with drainage occurring to the southeast, parallel to the Cold Creek syncline. The lowest head elevation in DC-2 was 360 ft, which indicates that the deep flow systems in this area may be discharging to the Columbia River, probably at or below the Tri-Cities area. Presence of tritium in DC-2 at 20% of the Columbia River value was still present after swabbing 64,000 gal of water from the packed-off zone. Recommendations are presented for a continued well drilling and testing program. (DLC)

3511 (LBL--9677-2/2) STUDY OF ROCK-WATER-NUCLEAR WASTE INTERACTIONS IN THE PASCO BASIN, WASHINGTON: PART II. PRELIMINARY EQUILIBRIUM-STEP SIMULATIONS OF BASALT DIAGENESIS. Benson, L.V.; Carnahan, C.L.; Che, M. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Aug 1980. Contract W-7405-ENG-48. 31p. NTIS, PC A03/MF A01.

Interactions between a large number of complex chemical and physical processes have resulted in significant changes in the Pasco Basin hydrochemical system since emplacement of the first basalt flow. In order to perform preliminary simulations of the chemical evolution of this system, certain simplifying assumptions and procedures were adopted and a computer model which operates on the principal of local equilibrium was used for the mass transfer calculations. Significant

uncertainties exist in both the thermodynamic and reaction rate data which were input to the computer model. In addition, the compositional characteristics of the evolving hydrochemical system remain largely unknown, especially as a function of distance along the flow path. Given these uncertainties, it remains difficult to assess the applicability of the equilibrium-step approach even though reasonable matches between observed and simulated hydrochemical data were obtained. Given the uncertainties mentioned, the predictive abilities of EQ6 are difficult, if not impossible to evaluate; our simulations produced, at best, only qualitative agreement with observed product mineral assemblages and sequences, and fluid compositions.

3512 (LBL--10686) EARTH SCIENCES DIVISION. ANNUAL REPORT 1979. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Jul 1980. Contract W-7405-ENG-48. 239p. NTIS, PC A11/MF A01.

This annual report contains articles describing the research programs conducted during the year. Major areas of interest include geothermal exploration technology, geothermal energy conversion technology, reservoir engineering, geothermal environmental research, basic geosciences studies, applied geosciences studies, nuclear waste isolation, and marine sciences. (ACR)

3513 (ONWI--21) GEOTHERMAL ALTERATION OF CLAY MINERALS AND SHALES: DIAGENESIS. Weaver, C.E. (Georgia Inst. of Tech., Atlanta (USA)). Jul 1979. Contract EY-76-C-06-1830. 192p. Dep. NTIS, PC A09/MF A01.

The objective of this report is to perform a critical review of the data on the mineral and chemical alterations that occur during diagenesis and low-grade metamorphism of shale and other clay-rich rocks - conditions similar to those expected from emplacement of heat-producing radioactive waste in a geologic repository. The conclusions drawn in this document are that the following type of alterations could occur: smectite alteration, ion mobilization, illitic shales, kaolinite reactions, chlorite reactions, organic reactions, paleotemperatures, low temperature shales, high temperature shales, and phase equilibrium changes.

3514 (PNL--2851, pp VII.1-VII.8) PRELIMINARY SUBSURFACE HYDROLOGIC CONSIDERATIONS: COLUMBIA RIVER PLATEAU PHYSIOGRAPHIC PROVINCE. Veatch, M.D. (Shannon and Wilson, Inc., Seattle, WA). Nov 1979.

Summary of FY-1978 consultation input for Scenario Methodology Development.

Subsurface hydrologic conditions in the Pacific Northwest are strongly controlled by the structural and stratigraphic framework of subregions. A significant portion of the Pacific Northwest is underlain by the Columbia River Plateau basalt sequence. This discussion is limited to hydrologic conditions as they relate to the Columbia River Plateau physiographic province and specifically to the Pasco Basin in the central part of the province.

3515 (PNL--2851, pp VIII.1-VIII.9) GENERAL SUBSURFACE GEOLOGY OF SOUTHEASTERN NEW MEXICO WITH SPECIAL REFERENCE TO ITS STRUCTURAL STABILITY. Hills, J. (Univ. of Texas, El Paso). Nov 1979.

Summary of FY-1978 consultation input for Scenario Methodology Development.

Southeastern New Mexico east of the Pecos River is a tectonically stable area with no major fault movements for the past 250 million years. No major tectonic adjustments are expected in the next million years. Minor tectonic adjustments during Triassic time (200 to 180 million years ago) and early Tertiary time (70 million years ago) have resulted in deepening and eastward tilting of the Delaware basin. These tectonic adjustments have resulted in the opening of joints and consequent solution of the upper part of the Salado salt. Compaction of Pennsylvanian and Lower Permian sediments has also contributed to the basin subsidence. This effect has been most severe on the west edge of the basin near the Pecos River and in the southeast edge of the basin adjoining Winkler County, Texas. Recent minor seismic activity is probably the result of petroleum secondary recovery operations. This seismic activity may result in the release of strain and may contribute to the long term tectonic stability of the area.

3516 (PNL--3198) DURABILITY OF METALS FROM ARCHAEOLOGICAL OBJECTS, METAL METEORITES, AND NATIVE METALS. Johnson, A.B. Jr.; Francis, B. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jan 1980. Contract EY-76-C-06-1830. 117p. Dep. NTIS, PC A06/MF A01.

Metal durability is an important consideration in the multi-barrier nuclear waste storage concept. This study summarizes the ancient metals, the environments, and factors which appear to have contributed to metal longevity. Archaeological and radiochemical dating suggest that human use of metals began in the period 6000 to 7000 BC. Gold is clearly the most durable, but many objects fashioned from silver, copper, bronze, iron, lead, and tin have survived for several thousand years. Dry environments, such as tombs, appear to be optimum for metal preservation, but some metals have survived in shipwrecks for over a thousand years. The metal meteorites are Fe-base alloys with 5 to 60 wt% Ni and minor amounts of Co, I, and S. Some meteoritic masses with ages estimated to be 5,000 to 20,000 years have weathered very little, while other masses from the same meteorites are in advanced stages of weathering. Native metals are natural metallic ores. Approximately five million tonnes were mined from native copper deposits in Michigan. Copper masses from the Michigan deposits were transported by the Pleistocene glaciers. Areas on the copper surfaces which appear to represent glacial abrasion show minimal corrosion. Dry cooling tower technology has demonstrated that in pollution-free moist environments, metals fare better at temperatures above than below the dewpoint. Thus, in moderate temperature regimes, elevated temperatures may be useful rather than detrimental for exposures of metal to air. In liquid environments, relatively complex radiolysis reactions can occur, particularly where multiple species are present. A dry environment largely obviates radiolysis effects.

3517 (RHO-BWI-C--25) GEOLOGY OF THE SOUTHWESTERN PASCO BASIN. (Geoscience Research Consultants, Moscow, ID (USA)). Sep 1978. Contract EY-77-C-06-1030. 892p. Dep. NTIS, PC A99/MF A01.

The objective of this study was to define those aspects of the stratigraphic, structural, and tectonic setting which are important to the integrity of a deep-mined waste-isolation cavern in the Columbia River basalts. Three

principal structural features received the focus of the field effort in the 1,485-square-kilometer area. These are the northern end of the Horse Heaven uplift, the linear ridges of the Badger Mountain-Red Mountain trend, and the Rattlesnake uplift. The thickest sequence of basalt exposed in the study area is on the steep, northeastern slope of Rattlesnake Mountain; about 485 meters of stratigraphic section can be examined in the field area. Subsidence and weak deformation of the southwestern Pasco Basin area during Yakima time can be recognized in the disposition of flows and interbeds. In the southwestern Pasco Basin, most of the topographically expressed basalt bedrock mountains, ridges, hills, and knolls have developed since spreading of the Saddle Mountains flows. Deformation since Ice Harbor time (about 8 million years ago) has been by folding, faulting, and in some structures, by a combination of both. The doubly plunging anticlinal folds of Badger Mountain, Red Mountain, and easternmost Rattlesnake Hills have vertical structural amplitudes in the 80 to 200-meter range. The high-angle, possibly reverse Badger Mountain fault has offset up to 60 meters; offset is downward on the northeast. Rattlesnake Mountain is, in part, a tilted fault-block structure. The western end of the Rattlesnake uplift, Rattlesnake Hills, is principally a broad anticline with numerous minor folds and faults. Geomorphic relations suggest that the post-Ice Harbor structural movement in the study area is of one episode. 65 figures, 8 tables.

3518 (RHO-BWI-C--82) BIBLIOGRAPHY OF THE GEOLOGY OF THE COLUMBIA PLATEAU AND ADJACENT AREAS OF WASHINGTON. (Shannon and Wilson, Inc., Portland, OR (USA)). Aug 1980. Contract AC06-77RL01030. 30p. NTIS, PC A03/MF A01.

This bibliography is a supplement to Rockwell Hanford Operations Report RHO-BWI-C-59, July 1979, prepared by the Washington State Division of Geology and Earth Resources which is a compilation of all known published, unpublished, and open-file references dealing with geology and geophysics of the Columbia Basin of eastern Washington. This supplement covers 1979 and early 1980 publications, as well as some items published prior to 1979. Every effort was made, where possible, to avoid duplicating citations already listed in the basic bibliography. The principal sources for the citations in this bibliographic supplement were the GeoRef database (1979 through mid-1980) and the NTIS database (1977 through mid-1980). In addition, Conference Papers Index, Tulsa, Geoarchive, and Comprehensive Dissertations Index databases have been used selectively. To make this supplement as up-to-date as possible, the latest issues of New Publications of the Geological Survey, Washington Geologic Newsletter, GSA Abstracts with Programs, and other current listings of publications have also been scanned. (ACR)

3519 (RHO-BWI-SA--26) BASALT STRATIGRAPHY - PASCO BASIN. Waters, A.C.; Myers, C.W.; Brown, D.J.; Ledgerwood, R.K. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Oct 1979. Contract EY-77-C-06-1030. 11p. (CONF-791155--1). Dep. NTIS, PC A02/MF A01.

From Deccan volcanism and related basalt provinces in other parts of the world; Bombay, India (Nov 1979).

The geologic history of the Pasco Basin is sketched. Study of the stratigraphy of the area involved a number of techniques including major-element chemistry, paleomagnetic investigations, borehole logging, and other geophysical survey methods. Grande Ronde basalt accumulation in the Pasco Basin is described. An illustrative log response is shown. 1 figure. (RWR)

3520 (RHO-BWI-ST--6) SURFACE HYDROLOGIC INVESTIGATIONS OF THE COLUMBIA PLATEAU REGION, WASHINGTON. Leonhart, L.S. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 23 Jul 1979. Contract EY-77-C-06-1030. 242p. Dep. NTIS, PC A11/MF A01.

The Washington State portion of the Columbia Plateau is divided into six hydrologic sub-basins on the basis of the principal surface drainage systems present, structural and topographic relationships, and political and other considerations. Baseline descriptions of the surface water systems and resources are presented for the Columbia Plateau with emphasis on the Pasco Sub-basin. A preliminary evaluation of the hydrologic budget for each sub-basin is derived. For each sub-basin, recharge/discharge relationships arising from precipitation/evapotranspiration/runoff, stream losses and gains, and artificial mechanisms are determined on the basis of available data. The net exchange between surface and ground-water systems is evaluated and relative estimates of the net ground-water flow into or out of the sub-basin are obtained. An evaluation is made of hydrologic risk factors arising from: (1) tributary flooding in eastern Washington; and (2) major flooding of the Columbia River within the Pasco Sub-basin. Scenarios are presented for credible natural and man-generated catastrophic events.

3521 (SAND--79-0276) BASIC DATA REPORT FOR DRILLHOLE WIPP 19 (WASTE ISOLATION PILOT PLANT-WIPP). (Sandia National Labs., Albuquerque, NM (USA); Geological Survey, Denver, CO (USA)). Mar 1980. Contract AC04-76DP00789. 76p. NTIS, PC A05/MF A01.

WIPP 19 is an exploratory borehole whose objective was to determine the nature of the near-surface formations after seismic information indicated a possible fault. The borehole is located in section 20, T.22S., R.31E., in eastern Eddy County, New Mexico, and was drilled between April 6 and May 4, 1978. The hole was drilled to a depth of 1038.2 feet and encountered, from top to bottom, surficial Holocene deposits (7'), including artificial fill for drill pad), the Mescalero caliche (7'), the Santa Rosa Sandstone (82'), the Dewey Lake Red Beds (494'), the Rustler Formation (315'), and the upper portion of the Salado Formation (143'). Cuttings were collected at 10-foot intervals. A suite of geophysical logs was run to measure acoustic velocities, density, and radioactivity. On the basis of comparison with other geologic sections drilled in the area, the WIPP 19 section is a normal stratigraphic sequence and it does not show structural disruption. The WIPP is to demonstrate (through limited operations) disposal technology for transuranic defense wastes. The WIPP will also provide facilities to research interactions between high-level waste and salt.

3522 (SAND--79-1519) LABORATORY STUDIES OF WATER TRANSPORT IN ROCK SALT. Hohlfelder, J.J.; Hadley, G.R. (Sandia Labs., Albuquerque, NM (USA)). Nov 1979. Contract EY-76-C-04-0789. 19p. Dep. NTIS, PC A02/MF A01.

The transport of water through rock salt as a result of heating is examined experimentally

and a new model proposed to explain the data. The experiment consists of the measurement of water loss rate as a function of time for three 1 kg blocks of Southeastern New Mexico rock salt. Each block was heated for approximately three days with maximum temperatures ranging from 165 to 250°C. The resulting data is qualitatively explained by a continuum model of Darcian flow of water vapor from a receding evaporation front. The model includes the prediction of thermal stresses which are calculated to crack the specimens during heater shutdown giving an anomalously high water loss spike in agreement with the data.

3523 (SKBF/KBS--79-05) COMPLEMENTARY INVESTIGATIONS OF THE BEDROCK IN THE FINNSJOE AND KARLSHAMN AREAS, SWEDEN. Olkiewicz, A.; Scherman, S.; Kornfaelt, K.A. (Kaernbraenslesaekerhet, Stockholm (Sweden); Svensk Kaernbraenslefoersoerjning AB, Stockholm). Feb 1979. 158p. (In Swedish). Dep. NTIS (US Sales Only), PC A08/MF A01.

In its statement of the 1978-10-05 the government decided that the KBS' reports I and II did not prove the existance of a''sufficiently large'' geological formation with the qualities which were required in the KBS risk analysis. The government therefore demanded further investigations. Complementary investigations were carried out in two areas, Finnsjoen in northwestern Uppland and Sternoe in southwestern Blekinge, Sweden. This report comprises mapping of the drillcores and extended geological mapping of the actual investigated areas. Measurements of borehole-deviation as well as surface-geophysical investigations from the Finnsjoen area are enclosed. The mapping of the four drill-cores in the Finnsjoe area shows that the cores are dominated by a slightly gneissic granodiorite. Of secondary importance occurs a young red homogenous granite. The frequency of fractures and fracture sets is high and evenly distributed. The tectonized parts are very often red coloured, foliated and containing many calcite healed fractures. The mapping also shows that mylonites and breccias are common in connection with more disturbed zones. Fractures are usually lined with calcite and chlorite. The mapping of these five new boreholes at Sternoe (one of the holes an extension of Ka 1 from earlier investigations) shows quite a complex picture of the bedrock. This is probably an effect of granitization of the coastal gneiss. Close to the surface coastal gneiss is dominating, in the deeper sections granitic material, gneissgranite and granite, are dominating. Pegmatites are common in the shallow sections of the area investigated. The frequency of fractures and fracture sets are very low. The only exception is one core, Ka 4, drilled in close connection with a thrust-zone in ''Munkahusviken''. Coatings of fracture surfaces are dominated by calcite and gypsum.

3524 (SKBF-KBS-TR--79-02) BEDROCK AND THE SOIL TYPES IN THE FINNSJOEAREA, SWEDEN. Almen, K.-E.; Ekman, L.; Olkiewicz, A. (Svensk Kaernbraenslefoersoerjning AB, Stockholm; Kaernbraenslesaekerhet, Stockholm (Sweden)). Nov 1978. 46p. (In Swedish). Dep. NTIS (US Sales Only), PC A04/MF A01.

This report is a part of a long-term project, started at the request of the Nuclear Fuel Safety Project, Sweden. The aim of the project is to claryfy the geohydrological situation of a drainage area close to Finnsjoen in northern Uppland, Sweden. The work comprised bedrock- and soil mapping as well as an investigation of existing literature about the geology of northern Uppland. The area is about 25 km² and is limited by its water-shed. The area is relatively flat, rich in outcrops - expecially in the western parts - and often swampy. Big areas of forests and agriculture have been drained by ditches.

3525 (SKBF/KBS-TR--79-06) COMPLEMENTARY MEASUREMENTS OF THE PERMEABILITY IN THE AREA AROUND KARLSHAMN, SWEDEN. Gidlund, G.; Hansson, K.; Thoregren, U. (Kaernbraenslesaekerhet, Stockholm (Sweden); Svensk Kaernbraenslefoersoerjning AB, Stockholm). Feb 1979. 29p. (In Swedish). Dep. NTIS (US Sales Only), PC A03/MF A01.

Water loss measurements have been carried out in four boreholes in the Karlshamn area, in the southeast parts of Sweden. All of the boreholes are inclined and drilled down to a vertical deep about 550 m, except one (Ka 1) which has a vertical depth of 780 m. Measurements have been carried out with double- and single packer tests. By the doublepacker tests a section of 3 meter have been used. Totally some 800 permeability tests have been brought out in the area. The major part the doublepacker testings shows sections with a permeability less than 10^{-9} m/s. The single-packer testings shows, especially towards the depth, large sections with permeabilities less than 10^{-11} m/s. Borehole Ka 1, which is situated in the central part of the investigation area presents many sections with a very low permeability. The surrounding boreholes in the area generally show higher permeabilities, and in these individual fracture zones have also been identified. Two of the boreholes (Ka 4 and Ka 5) are also measured by geophysical logging. The geophysical borehole measurements in Ka 5 shows a very low degree of fracturing and a concentration of fractures to a few zones with an almost non-fractured rock-mass in between. The borehole diameter are constant along the borehole indicating closed fractures. An exception from this general picture are results from borehole Ka 4 which is drilled close to a major fracture zone located in the northern part of the investigated area. The resistivity measurements from this borehole shows a high frequency of fractures and a high water content in the fractures. (author) Karlshamn, Sweden.

3526 (UCRL--15270) STATE-OF-THE-ART FOR EVALUATING THE POTENTIAL IMPACT OF FLOODING ON A RADIOACTIVE WASTE REPOSITORY. (Geotechnical Engineers, Inc., Winchester, MA (USA)). 16 Jul 1980. Contract W-7405-ENG-48. 68p. NTIS, PC A04/MF A01.

This report is a review of the state-of-the-art for evaluating the potential impact of flooding on a deep radioactive-waste repository, namely, for predicting the future occurrence of catastrophic flooding and for estimating the effect of such flooding on waste containment characteristics. Several detrimental effects are identified: flooding can increase groundwater seepage velocities through a repository within the framework of the existing hydrologic system and thus increase the rate of radioactive-waste leakage to the biosphere; flooding may alter repository hydrology by reversing flow gradients, relocating sources of groundwater recharge and discharge, or shortening seepage paths, thereby producing unpredictable leakage; saturation of a vadose-zone repository during flooding can increase groundwater seepage velocities by several orders of magnitude; and flooding can damage repository-media containment properties by inducing seismic or chemical instability or increasing fracture permeability in relatively shallow repository rock as a result of

redistributing in-situ stresses. Short-term flooding frequency and magnitude can be predicted statistically by analyzing historical records of flooding. However, long-term flooding events that could damage a permanent repository cannot be predicted with confidence because the geologic record is neither unique nor sufficienly complete for statistical analysis. It is more important to identify parameters characterizing containment properties (such as permeability, groundwater gradient, and shortest seepage path length to the biosphere) that could be affected by future flooding, estimate the maximum magnitude of flooding that could occur within the life of the repository by examining the geologic record, and determine the impact such flooding could have on the parameter values.

3527 (UCRL--82649) SIMPLIFIED GROUNDWATER FLOW MODELING: AN APPLICATION OF KALMAN FILTER BASED IDENTIFICATION. Pimentel, K.D.; Candy, J.V.; Azevedo, S.G.; Doerr, T.A. (California Univ., Livermore (USA). Lawrence Livermore Lab.). May 1980. Contract W-7405-ENG-48. 13p. (CONF-7909138--1). NTIS, PC A02/MF A01.

From International Federation of Information Processing working conference on simulation and the environment; Bangor, UK (18 Sep 1979).

The need exists for methods to simplify groundwater contaminant transport models. Reduced-order models are needed in risk assessments for licensing and regulating long-term nuclear waste repositories. Such models will be used in Monte Carlo simulations to generate probabilities of nuclear waste migration in aquifers at candidate repository sites in the United States. In this feasibility study we focused on groundwater flow rather than contaminant transport because the flow problem is more simple. A pump-drawdown test is modeled with a reduced-order set of ordinary differential equations obtained by differencing the partial differential equation. We determined the accuracy of the reduced model by comparing it with the analytic solution for the drawdown test. We established an accuracy requirement of 2% error at the single observation well and found that a model with only 21 states satisfied that criterion. That model was used in an extended Kalman filter with synthesized measurement data from one observation well to identify transmissivity within 1% error and storage coefficient within 10% error. We used several statistical tests to assess the performance of the estimator/identifier and found it to be satisfactory for this application.

3528 RECHARGE AND POLLUTION OF THE ENGLISH CHALK: SOME POSSIBLE MECHANISMS. Reeves, M.J. (Univ of Durham, Engl). Engineering Geology (Amsterdam) ; 14: No. 4, 231-240(Oct 1979).

The Chalk aquifer is currently the most important source of groundwater in the United Kingdom. Pore water in the Chalk is likely to remain essentially static under the influence of environmental forces with the exception of evapotranspiration. A process of piston displacement of water through networks of microfissures provides a possible mechanism for downward percolation through the unsaturated Chalk. Maintenance of continuous diffusion equilibrium between fissure and pore water throughout downward migration allows the explanation of the observed rates of movement for thermonuclear tritium in the unsaturated zone. Activation of increasingly large fissures with increasing infiltration rates explains observed rapid water-table response quality parameters in the saturated aquifer.

3529 LABORATORY STUDIES OF WATER TRANSPORT IN ROCK SALT. Hohlfelder, J.J.; Hadley, G.R. (Sandia Labs., Albuquerque, NM). Contract DE-AC04-76DP00789. Letters in Heat and Mass Transfer ; 6: No. 4, 271-279(Jul 1979).

The transport of water through rock salt as a result of heating is examined experimentally and a new model proposed to explain the data. The experiment consists of the measurement of water loss rate as a fuction of time for three 1 kg blocks of Southeastern New Mexico rock salt. Each block was heated for approximately three days with maximum temperatures ranging from 165 to 250°C. The resulting data are qualitatively explained by a continuum model of Darcian flow of water vapor from a receding evaporation front. The model includes the prediction of thermal stresses which are calculated to crack the specimens during heater shutdown giving an anomalously high water loss spike in agreement with the data.

3530 COMMENTS ON CARBON-14 DATING OF GROUNDWATERS IN CRYSTALLINE ENVIRONMENTS. Fritz, P.; Gale, J.E.; Reardon, E.J. (Waterloo Univ., Ontario (Canada)). Geoscience Canada ; 6: No. 1, 10-15(Mar 1979).

Groundwater age determinations based on carbon-14 are discussed on the basis of a definition of the age of a water and its significance in terms of groundwater flow. Such investigations are useful in evaluating potential subsurface disposal sites suitable for the long-term containment of toxic materials such as wastes from the nuclear fuel cycle. The geochemical inferences which may influence the carbon geochemistry and the carbon-14 budget in crystalline environments are discussed. It is concluded that carbon-14 dating of groundwaters is not easy to use unless the geochemical evolution of a groundwater follows processes whose influence on the carbon budget may be assessed.

3531 RESULTS OF A MULTIPLE BOREHOLE PUMPING TEST IN LOW PERMEABILITY GRANITE. Black, J.H. (Institute of Geological Sciences, Harwell (UK). Environmental Pollution Section). pp 183-197 of Low flow, low-permeability measurements in largely impermeable rocks. Paris, France; OECD (1979).

From Workshop on Low-Flow Low permeability measurements in Langley Impermeable rocks; Paris, France (19 Mar 1979).

A 21 day pumping test was carried out using four 300 m deep boreholes in granite. An average abstraction rate of 0.36 m^3/day was achieved by pumping periodically. The results of this test were compared with single borehole injection and slug tests. Both types of single borehole tests yielded values of hydraulic conductivity between 2 and 13 x 10^{-5} m/day with two boreholes giving values at the lower end of this range. The multiple borehole test yielded values ranging from 18 to 49 x 10^{-5} m/day for time-drawdown relationships, and 7 to 25 x 10^{-5} m/day for distance-drawdown relationships. Values of storativity from the multiple test varied between 3.5 and 25 x 10^{-4} compared to 0.5 to 5 x 10^{-4} for single borehole tests. Borehole logging indicated a total porosity of about 10^{-2} and an evenly distributed porosity taking part in flow of about 10^{-5}. The tests showed that a radial flow model was applicable in this particular granite environment and that inflow of water was virtually independent of depth.

3532 ANALYSIS OF GROUNDWATER FLOW AROUND A

HIGH-LEVEL WASTE REPOSITORY IN CRYSTALLINE ROCK. Burgess, A.S.; Charlwood, R.G.; Skiba, E.L. (Acres Consulting Services Ltd., Niagara Falls, Ontario (Canada)); Ratigan, J.L.; Gnirk, P.F. (RE/SPEC, Inc., Rapid City, SD (USA)); Stille, H.; Lindblom, P.F. (Hägconsult AB, Goteborg (Sweden)). pp 199-220 of Low flow, low-permeability measurements in largely impermeable rocks. Paris, France; OECD (1979).

From Workshop on Low-Flow Low permeability measurements in Langley Impermeable rocks; Paris, France (19 Mar 1979).

The paper discusses the geohydrological data base, conceptual models for fractured rock flow and limitations of existing field and laboratory techniques. The results of analyses of the groundwater regime expected during the various phases of a repository at a crystalline rock site are presented. These include. - Initial conditions: regional and local flows and assessments of effects of topographic variations, faults and anisotropy. - Construction emplacement and thermal periods: the effects of stress are assessed and convective flow analyses coupled with regional flows are shown to identify effects on transport paths and magnitudes of advective heat transfer. - Long-term flow: flow modifications following repository construction and sealing are shown. Flow paths and potential leakage plumes and velocities are suggested. These analyses used a set of rock mechanics, heat transfer and flow finite-element models in which significant coupling is identified and included.

3533 ESTIMATION OF HYDRAULIC CONDUCTIVITY IN SWEDISH PRECAMBRIAN CRYSTALLINE BEDROCK. Carlsson, L.; Gidlund, G.; Hansson, K.; Klockars, C.-E. (Geological Survey of Sweden, Uppsala). pp 97-115 of Low flow, low-permeability measurements in largely impermeable rocks. Paris, France; OECD (1979).

From Workshop on Low-Flow Low permeability measurements in Langley Impermeable rocks; Paris, France (19 Mar 1979).

The hydraulic conductivity of rock mass was determined from water pressure and flow measurements. Special equipment was constructed which made it possible to determine conductivity values of less than 10^{-11} m/s depending on the length of the investigated sections. The hydraulic conductivity of fissures was estimated from tracer tests. The combination of the two techniques, where transient formulas were used made it possible also to estimate the effective porosity and the storage coefficient.

3534 HYDROGEOLOGIC PROPERTIES AND PORE WATER ORIGIN AND AGE: CLAYEY TILL AND CLAY IN SOUTH CENTRAL CANADA. Cherry, J.A.; Desaulniers, D.E.; Frind, E.O.; Fritz, P.; Gevaert, D.M.; Gillham, R.W.; Lelievre, B. (Waterloo Univ., Ontario (Canada)). pp 31-47 of Low flow, low-permeability measurements in largely impermeable rocks. Paris, France; OECD (1979).

From Workshop on Low-Flow Low permeability measurements in Langley Impermeable rocks; Paris, France (19 Mar 1979).

This paper describes the hydrogeologic properties and origin of pore water in clayey glacial till and glaciolacustrine clay in six areas in south-central Canada, including four in southern Ontario, one in southern Manitoba, and one in south-central Saskatchewan. At each of the sites the water table is within the depth range of one to four metres. The results are appraised in light of a concept for long-term isolation of solid low-level radioactive wastes in large-diameter holes augered to depths of tens of metres below the water table. With the exception of one of the study sites, the sites are only research sites and are not under consideration for radioactive waste management. One of the sites is highly fractured, but at all other sites fractures were detected only in the surficial weathered zone. At all of the sites except one, a major component of Pleistocene-age groundwater was identified at depth. Mathematical analysis and the isotope data indicates that groundwater flow in these deposits is so slow that molecular diffusion rather than groundwater advection is the dominant process of solute migration below the weathering zone, even in zones where fractures are known to occur. Diffusion controlled subsurface regimes are the most favorable for waste disposal.

3535 FIELD PERMEABILITY AND HYDRAULIC POTENTIAL MEASUREMENTS IN CRYSTALLINE ROCK AND SOLUTE TRANSPORT THROUGH FINELY FRACTURED MEDIA. Davison, C.C.; Grisak, G.E. (Environment Canada Ground Water Division, National Hydrological Research Institute, Ottawa, Ontario); Williams, D.W. (Chicago Univ., IL (USA)). pp 139-155 of Low flow, low-permeability measurements in largely impermeable rocks. Paris, France; OECD (1979).

From Workshop on Low-Flow Low permeability measurements in Langley Impermeable rocks; Paris, France (19 Mar 1979).

Drill stem tests were performed to depths of 500 metres during borehole advancement in crystalline rock using a single packer system. Apparent equilibrium shut-in pressures were obtained to provide an estimate of the vertical hydraulic potentials. A downhole pneumatic piston was used to create an instantaneous pressure pulse in the isolated test section and the transient pressure decay was monitored. Equivalent single-fracture apertures and equivalent rock mass hydraulic conductivities, Kerm, were calculated from the transient pressure decay data. Equivalent single-fracture apertures are presented which range between 1 and 125 microns for tests performed in a 150 m deep borehole into a granitic rock mass. It can be shown from modeling studies that diffusion from a fracture into the adjacent matrix, fracture aperture and grounwater velocity through the fractures are the controlling transport parameters for non reactive solute transport through fractured media. Finite difference model results for a constant porosity system illustrating solute breakthrough curves and profiles along the length of a fracture indicate the importance of matrix diffusion in particular. If the average water velocity in a 300 μm fracture in a fractured clay or shale is 3m/d, the average velocity of a conservative solute under the simulated conditions is approximately 08m/d.

3536 PERMEABILITY OF GENERIC REPOSITORY ROCKS AT SIMULATED IN SITU CONDITIONS. Heard, H.C.; Trimmer, D.; Duba, A.; Bonner, B. (California Univ., Livermore (USA). Lawrence Livermore Lab.). pp 69-83 of Low flow, low-permeability measurements in largely impermeable rocks. Paris, France; OECD (1979).

From Workshop on Low-Flow Low permeability measurements in Langley Impermeable rocks; Paris, France (19 Mar 1979).

New laboratory data are reported on the effect of confining (lithostatic) pressure, pore-water pressure, and principal stress difference on permeability of Westerly granite and White Lake gneissic granite. Permeabilities

as low as 10^{-19} cm^2 (10^{-11} D) have been measured successfully, using a transient technique. Principal strains, electrical conductivity, and compressional velocity are determined simultaneously. Applied loads on the 15-cm diameter by 28-cm long test sample are controlled automatically and all data are taken by a micro-computer. Results on the gneissic indicate permeabilities of 10^{-18} to 10^{-19} cm^2 that appear to be unaffected either by effective pressure or by stress. The granite yields permeabilities of 4.10^{-18} cm^2 that decrease by a factor of two with pressure and vary by a factor of two with stress. When compared to the initial value, compressional velocities increase by 4% and conductivity decreases by 50% as pressure is increased to 50 MPa in the gneissic granite. In granite, these become 3% and 58%, respectively. At pressure, loading of the granite to 0.5 of failure stress increases conductivity by about 20%.

3537 GEOHYDROLOGIC INVESTIGATIONS OF BURIED METAMORPHIC ROCK AND MUDSTONE FOR THE STORAGE OF RADIOACTIVE WASTE. Marine, I.W. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). pp 49-56 of Low flow, low-permeability measurements in largely impermeable rocks. Paris, France; OECD (1979).

From Workshop on Low-Flow Low permeability measurements in Langley Impermeable rocks; Paris, France (19 Mar 1979).

From 1961 to 1972 a geohydrologic investigation of crystalline metamorphic rock and Triassic mudstone was carried on at the Savannah River Plant near Aiken, south Carolina, U.S.A., operated by the U. S. Department of Energy, for the purpose of evaluating the feasibility of storing radioactive waste in these host rocks. Although this investigation is no longer active, many of the concepts, testing methods, and results developed in this investigation are applicable to investigations currently being conducted at other locations fo geologic storage of radioactive waste.

Geophysics

Seismology and Tectonics

3538 (PNL--2851, pp XII.1-X11.13) EVIDENCE AND THEORY FOR THE PREDICTION OF TECTONIC ACTIVITY IN THE BASIN AND RANGE PROVINCE OF NEVADA AND UTAH FOR THE NEXT ONE MILLION YEARS. Lovejoy, E.M.P. Nov 1979.

Summary of FY-1978 consultation input for Scenario Methodology Development.

Major conclusions of the report are: Important seismic activity in the next one million years will be restricted to the Intermountain Seismic Belt. Minor seismic activity in the same period will be restricted to the Nevada Seismic Belt, Sierra Nevada front, and Reno-Yellowstone lineament. There will be seismic inactivity in the same period in the rest of the Basin and Range Province except locally along high mountain frontal fault zones. In these zones, isostatic unloading will produce slow, secular, mild seismic activity for many millions of years to come.

3539 (PNL--2851, pp XIV.1-XIV.10) ASSESSMENT OF TECTONIC HAZARDS TO WASTE STORAGE IN INTERIOR-BASIN SALT DOMES. Kehle, R. Nov 1979.

Summary of FY-1978 consultation input for Scenario Methodology Development.

Salt domes in the northern Gulf of Mexico may make ideal sites for storage of radioactive waste because the area is tectonically quiet. The stability of such salt domes and the tectonic activity are discussed. (DLC)

3540 (UCRL--15260) SEISMIC HAZARD ANALYSIS FOR THE NTS SPENT REACTOR FUEL TEST SITE. Campbell, K.W. (TERA Corp., Berkeley, CA (USA)). 2 May 1980. Contract W-7405-ENG-48. 63p. NTIS, PC A04/MF A01.

An experiment is being directed at the Nevada Test Site to test the feasibility for storage of spent fuel from nuclear reactors in geologic media. As part of this project, an analysis of the earthquake hazard was prepared. This report presents the results of this seismic hazard assessment. Two distinct components of the seismic hazard were addressed: vibratory ground motion and surface displacement. (ACR)

3541 (UCRL--15269) STATE-OF-THE-ART FOR EVALUATING THE POTENTIAL IMPACT OF TECTONISM AND VOLCANISM ON A RADIOACTIVE WASTE REPOSITORY. (Geotechnical Engineers, Inc., Winchester, MA (USA)). 16 Jul 1980. Contract W-7405-ENG-48. 83p. NTIS, PC A05/MF A01.

Most estimates of the time required for safe isolation of radioactive wastes from the biosphere range from 100,000 to 1,000,000 years. For such long time spans, it is necessary to assess the potential effects of geologic processes such as volcanism and tectonic activity on the integrity of geologic repositories. Predictions of geologic phenomena can be based on probabilistic models, which assume a random distribution of events. The necessary historic and geologic records are rarely available to provide an adequate data base for such predictions. The observed distribution of volcanic and tectonic activity is not random, and appears to be controlled by extremely complex deterministic processes. The advent of global plate tectonic theory in the past two decades has been a giant step toward understanding these processes. At each potential repository site, volcanic and tectonic processes should be evaluated to provide the most thorough possible understanding of those deterministic processes. Based on this knowledge, judgements will have to be made as to whether or not the volcanic and tectonic processes pose unacceptable risk to the integrity of the repository. This report describes the potential hazards associated with volcanism and tectonism, and the means for evaluating these processes.

Volcanology

3542 (LASL--80-42(Mini-Review)) VOLCANOLOGY AT THE LOS ALAMOS SCIENTIFIC LABORATORY. Heiken, G. (Los Alamos Scientific Lab., NM (USA)). Oct 1980. Contract W-7405-ENG-36. 4p. NTIS, PC A02/MF A01.

This mini-review briefly describes the research conducted at Los Alamos Scientific Laboratory (LASL) on various areas in volcanology. Areas of research include volcanic hazard analysis, the climatic effects of volcanic eruptions, young volcanic fields as heat sources, volcanic ash deposits and nuclear waste isolation, and basic research on the origin of volcanism. (ACR)

3543 (PNL--2882) DISRUPTIVE EVENT ANALYSIS:

VOLCANISM AND IGNEOUS INTRUSION. Crowe, B.M. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Aug 1980. Contract AC06-76RL01830. 46p. NTIS, PC A03/MF A01.

An evaluation is made of the disruptive effects of volcanic activity with respect to long term isolation of radioactive waste through deep geologic storage. Three major questions are considered. First, what is the range of disruption effects of a radioactive waste repository by volcanic activity. Second, is it possible, by selective siting of a repository, to reduce the risk of disruption by future volcanic activity. And third, can the probability of repository disruption by volcanic activity be quantified. The main variables involved in the evaluation of the consequences of repository disruption by volcanic activity are the geometry of the magma-repository intersection (partly controlled by depth of burial) and the nature of volcanism. Potential radionuclide dispersal by volcanic transport within the biosphere ranges in distance from several kilometers to global. Risk from the most catastrophic types of eruptions can be reduced by careful site selection to maximize lag time prior to the onset of activity. Certain areas or volcanic provinces within the western United States have been sites of significant volcanism and should be avoided as potential sites for a radioactive waste repository. Examples of projection of future sites of active volcanism are discussed for three areas of the western United States. Probability calculations require two types of data: a numerical rate or frequency of volcanic activity and a numerical evaluation of the areal extent of volcanic disruption for a designated region. The former is clearly beyond the current state of art in volcanology. The latter can be approximated with a reasonable degree of satisfaction. In this report, simplified probability calculations are attempted for areas of past volcanic activity.

Geophysical Survey Methods

3544 (UCRL--52961) GEOTOMOGRAPHY APPLIED AT THE STRIPA MINE IN SWEDEN. Okada, J.T.; Laine, E.F.; Lytle, R.J.; Daily,W.D. (California Univ., Livermore (USA). Lawrence Livermore National Lab.). 7 Apr 1980. Contract W-7405-ENG-48. 27p. NTIS, PC A03/MF A01.

LLNL made ultrahigh-frequency (450-MHz) electromagnetic borehole-to-borehole transmissions in the Stripa Mine near Guldsmedshyttan, Sweden, in April 1979. Transmission loss measurements were made between four sets of 76-mm boreholes 30 m long, located at the end of a drift. Distances between the boreholes varied from 2 to 22 m. More than 25,000 data points were taken. A geotomograph was constructed to show the variation of attenuation between boreholes. The observed spatial variation of electromagnetic attenuation may be related to the expected stress relief created by the mine. Transmission loss measurements were also made between two converging boreholes drilled from the surface to points near the mine. Data taken at 21 MHz show a nearly uniform attenuation within this sampled region. These experiments demonstrate that geotomographic data collection/interpretation provides high-resolution images of the underground environment and can provide useful input to those charged with providing the detailed site characterizations needed for both short- and long-term monitoring of underground nuclear waste repositories.

Mineralogy, Petrology, and Rock Mechanics

3545 (AECL--6423) STUDY OF SLOW CRACK GROWTH IN GRANITE AND ITS APPLICATON TO NUCLEAR WASTE DISPOSAL IN HARD ROCK. Wilkins, B.J.S. (Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). Jun 1979. 27p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Pathways analysis models are being developed and applied to estimate the possible rate of escape of nuclides from the vault to the biosphere. These models require as input details of the rock crack population, i.e., number, dimensions and spatial distribution of cracks. For the estimates of waste movement to be valid, the long-term parameters of the rock crack population must be known. The vault and the heat generated by the waste will disturb the stress pattern in the rock. This report discusses an approach to estimating how that stress disturbance will influence rock crack propagation in the long term. It shows how slow crack growth in rock may be quantified statistically by linear elastic fracture mechanics, and how the results can be used to define a volume surrounding the vault outside of which no significant crack growth will occur in the time of interest.

3546 (DP-MS--80-16) STUDIES OF THE SUBSURFACE EFFECTS OF EARTHQUAKES. Marine, I.W. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1980. Contract AC09-76SR00001. 37p. (CONF-800245--1). NTIS, PC A03/MF A01.

From Workshop on subsurface seismic studies; Seattle, WA, USA (20 Feb 1980).

As part of the National Terminal Waste Storage Program, the Savannah River Laboratory is conducting a series of studies on the subsurface effects of earthquakes. This report summarizes three subcontracted studies. (1) Earthquake damage to underground facilities: the purpose of this study was to document damage and nondamage caused by earthquakes to tunnels and shallow underground openings; to mines and other deep openings; and to wells, shafts, and other vertical facilities. (2) Earthquake related displacement fields near underground facilities: the study included an analysis of block motion, an analysis of the dependence of displacement on the orientation and distance of joints from the earthquake source, and displacement related to distance and depth near a causative fault as a result of various shapes, depths, and senses of movement on the causative fault. (3) Numerical simulation of earthquake effects on tunnels for generic nuclear waste repositories: the objective of this study was to use numerical modeling to determine under what conditions seismic waves might cause instability of an underground opening or create fracturing that would increase the permeability of the rock mass.

3547 (DS--1972-11) ANALYSIS OF THE STATE OF STRAIN AROUND DIFFERENT GEOMETRIES WITH RADIAL CRACKS IN AN INDEFINITE MEDIUM DUE TO EXPANSIVE FORCES. Duchterlony, F. (Stiftelsen Svensk Detonikforksning, Stockholm (Sweden)). Aug 1972. 149p. (In Swedish). Dep. NTIS (US Sales Only), PC A08/MF A01.

The break up of fragile materials due to internal expansive forces for instance at rock blasting is going on by the growth of radial cracks. This process has been studied in this report by an analysis of the state of strain around different geometries with radial cracks in an indefinite medium. Fracture properties

such as stress intensity factors, probable growing direction for the crack as well as the crack volume have been calculated. The results are given in graphs and tables.

3548 (LA--8139-MS) MINERALOGY AND PETROLOGY OF TUFF UNITS FROM A UE25A-1 DRILL SITE, YUCCA MOUNTAIN, NEVADA. Sykes, M.L.; Heiken, G.H.; Smyth, J.R. (Los Alamos Scientific Lab., NM (USA)). Nov 1979. Contract W-7405-ENG-36. 78p. Dep. NTIS, PC A05/MF A01.

Drill hole UE25a-1 has penetrated tuffs of Tertiary age which contain two major zeolitized horizons at depths below 380 m. These horizons are restricted to low-density, high-porosity nonwelded tuffs below the basal vitrophyre of the Topopah Springs Member of the Paintbrush Tuff (approximately 70 m above the current water table), and interfinger with more-densely-welded devitrified tuffs of granophyric mineralogy. Zeolites occur as glass pyroclast replacement, vug linings, and fracture fillings. Nonwelded units above the welded portion of the Topopah Springs Member are essentially unaltered, indicating that they have never been ground water-saturated for any significant length of time. Zeolite mineral assemblages appear to be characteristic of low temperature (<100°C) ground water alteration of glass in an open hydrologic system. The principal zeolite phase is high-Si clinoptilolite with Si/Al ratios of 4.7 to 6.0. Ca tends to be the dominant large-radius cation, but grains with dominant K or Na are not uncommon, particularly with increasing depth. Compositional variations in clinoptilolite may be due to ground water composition or original pyroclast composition. Minor amounts of mordenite, characterized by lower silica content (<55 wt %) and high alkali content (>10 wt % $Na_2O + K_2O$), occur as vug fillings at depths below 500 m. Presence of mordenite may indicate slightly elevated alteration temperatures, but more likely reflects enrichment of ground water in alkalis with depth. Mineralogical, compositional, and textural similarities of the zeolitized tuffs from UE25a-1 and J-13 are compatible with a single episode of crystallization. 16 figures.

3549 (LBL--8648) EARTH SCIENCES DIVISION. ANNUAL REPORT 1978. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). 1978. Contract W-7405-ENG-48. 258p. NTIS, PC A12/MF A01.

Progress is reported on geothermal energy development, geosciences, and underground nuclear waste management. Fifty-one energy-related projects are listed by title for EDB. (MHR)

3550 (LBL--8648, pp 229-231) NATURE AND DISTRIBUTION OF SECONDARY MINERALS IN THE BASALTS OF THE PASCO BASIN, WASHINGTON, AND THEIR RELATION TO THE DISPOSAL OF NUCLEAR WASTES. Benson, L.V.; Carnahan, C.L.; Apps, J.A.; Corrigan, D.J.; Frisch, C.J.; Mouton, C.A.; Teague, L.K. 1978.

3552 (LBL--9425) FIELD MEASUREMENT TECHNIQUES: STATUS AND NEEDS. Cook, N.G.W. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Jun 1979. Contract W-7405-ENG-48. 11p. Dep. NTIS, PC A02/MF A01.

This paper discusses those field measurements which must be taken to enable the response of a rock mass to thermomechanical experiments to be determined. Measurements as a function of time are needed of: (1) rock temperatures including the initial values, (2) rock movements, (3) the state of strain or stress in the rock, including the initial values, and (4) fluid pressures in the rock, including initial values.

3553 (LBL--9557) VALIDITY OF CUBIC LAW FOR FLUID FLOW IN A DEFORMABLE ROCK FRACTURE. TECHNICAL INFORMATION REPORT NO. 23. Witherspoon, P.A.; Wang, J.S.Y.; Iwai, K.; Gale, J.E. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Oct 1979. Contract W-7405-ENG-48. 34p. Dep. NTIS, PC A03/MF A01.

The validity of the cubic law for laminar flow of fluids through open fractures consisting of parallel planar plates has been established by others over a wide range of conditions with apertures ranging down to a minimum of 0.2 μm. The law may be given in simplified form by $Q/\Delta h = C(2b)^3$, where Q is the flow rate, Δh is the difference in hydraulic head, C is a constant that depends on the flow geometry and fluid properties, and 2b is the fracture aperture. The validity of this law for flow in a closed fracture where the surfaces are in contact and the aperture is being decreased under stress has been investigated at room temperature using homogeneous samples of granite, basalt, and marble. Tension fractures were artificially induced and the laboratory setup used radial as well as straight flow geometries. Apertures ranged from 250 μm down to 4 μm. The cubic law was found to be valid whether the fracture surfaces were held open or were being closed under stress, and the results are not dependent on rock type. Permeability was uniquely defined by fracture aperture and was independent of the stress history used in these investigations. The effects of deviations from the ideal parallel plate concept only cause an apparent reduction in flow and may be incorporated into the cubic law by replacing C by C/f. The factor f varied from 1.04 to 1.65 in these investigations. The model of a fracture that is being closed under normal stress is visualized as being controlled by the strength of the asperities that are in contact. These contact areas are able to withstand significant stresses while maintaining space for fluids to continue to flow as the fracture aperture decreases. The controlling factor is the magnitude of the aperture and since flow depends on $(2b)^3$, a slight change in aperture evidently can easily dominate any other change in the geometry of the flow field.

3554 (LBL--9884) CHARACTERIZATION OF DISCONTINUITIES IN THE STRIPA GRANITE. Thorpe, R.K. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Oct 1979.

Contract W-7405-ENG-48. 11p. (CONF-791112--27). Dep. NTIS, PC A02/MF A01.
From Materials Research Society annual meeting; Boston, MA, USA (26 Nov 1979).
Characterization of the fracture system in a repository is important, and its purpose should dictate the scale over which measurements must be made. The results discussed pertain to nearfield behavior of a rock mass and represent a practical limit to the degree to which discrete subsurface discontinuities can be defined by surface mapping and cross-correlation of observational borehole data. Discontinuities on the scale of the rock mass being studied can dominate its response, and should therefore be described according to their influence on the stability of the opening and local groundwater regime. Alternatively, if the size or continuity of a feature is much less than the scale of the rock mass in question, there will be insufficient data with which to validate a discrete characterization, hence a statistical approach is required.

3555 (ONWI--95) REVIEW OF CURRENT CAPABILITIES FOR THE MEASUREMENT OF STRESS, DISPLACEMENT, AND IN SITU DEFORMATION MODULUS. Schrauf, T.W.; Pratt, H.R. (Terra Tek, Inc., Salt Lake City, UT (USA)). Dec 1979. Contract AC06-76RL01830. 88p. NTIS, PC A05/MF A01.
Current capabilities for the measurement of stress, displacement, and in situ deformation modulus in rock masses are reviewed as to their accuracy, sensitivity, advantages, and limitations. Consideration is given to both the instruments themselves and the measurement technique. Recommendations concerning adaptation of existing measurement techniques to repository monitoring are also discussed. These recommendations include: (1) development of a modified borehole deformation gage with improved long-term stability and reliability and reduced thermal sensitivity; (2) development of a downhole transducer type of extensometer; (3) development of a rigid inclusion type gage; (4) development of an improved vibrating wire stressmeter with greater accuracy and simplified calibration and installation requirements; and (5) modification of standard rod extensometers to improve their sensitivity.

3556 (ONWI--100) MECHANICAL BEHAVIOR OF AVERY ISLAND HALITE: A PRELIMINARY ANALYSIS. Carter, N.L.; Hansen, F.D. (RE/SPEC, Inc., Rapid City, SD (USA)). Jan 1980. Contract AC06-76RL01830. 37p. NTIS, PC A03/MF A01.
Nine specimens of dome salt from Avery Island were studied to obtain preliminary fabric, deformation mechanism, and mechanical data. The fabric study showed that this salt is comprised primarily of small strain-free halite grains. The salt is unusually clean. The fabric patterns are typical of dome salts. They have moderate a - axes concentrations parallel to the core axis that spread into girdles. Deformation mechanisms were studied using optical microscopy. At low temperatures (24°C to 70°C), cataclasis dominates the deformation while at higher temperatures (to 200°C), plastic flow is predominant. Results of constant stress-rate experiments show that strength increases with increasing stress rate and decreasing temperature. Data from creep tests are fit to several constitutive laws that prescribe deformation during transient and steady-state creep as functions of stress, temperature, and time.

3557 (ORNL/TM--7052) THERMAL CONDUCTIVITY OF THE ROCKS IN THE BUREAU OF MINES STANDARD ROCK SUITE. Morgan, M.T.; West, G.A. (Oak Ridge National Lab., TN (USA)). Jan 1980. Contract W-7405-ENG-26. 60p. Dep. NTIS, PC A04/MF A01.
Thermal conductivities of eight rocks from the Bureau of Mines Standard Rock Suite were measured in air over the temperature range 373 to 533°K (100 to 260°C). The thermal conductivities of these rocks were measured to furnish standards for future comparisons with host rock from prospective nuclear waste repository sites. The thermal conductivity at a given temperature decreased by as much as 9% after a specimen had been heated to the maximum temperature (533°K), but additional heating cycles had no further effect. This decrease was smallest in the igneous rocks and largest in the sedimentary types. Variations due to orientation were within the precision of measurements (+- 5%). In most cases the thermal conductivities were linear with the reciprocal of the temperature and were within 14% of published data obtained by other methods. Measurements were made by a cut-bar comparison method in which the sample was sandwiched between two reference or metering bars made of Pyroceram 9606 glass-ceramic. The apparatus consisted of a Dynatech Model TCFCM-N20 comparative thermal conductivity analyzer controlled by a Hewlett Packard Model 3052A data acquisition system. A program was written to increment and cycle the temperature in steps between predetermined initial and maximum values. At each step the thermal conductivity was measured after steady-state conditions were established. The rocks furnished by the Bureau of Mines were quarried in large and fairly homogeneous lots for use by researchers at various laboratories. To investigate any anisotropy, cores were taken from each rock cube perpendicular to each of the cube faces. Samples 2 in. in diameter and approx. 0.75 in. thick were prepared from the cores and were dried in a vacuum oven for at least one month prior to taking measurements.

3558 (PNL--2864) IDENTIFYING SUITABLE PIERCEMENT SALT DOMES FOR NUCLEAR WASTE STORAGE SITES. Kehle, R.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Aug 1980. Contract AC06-76RL01830. 46p. NTIS, PC A03/MF A01.
Piercement salt domes of the northern interior salt basins of the Gulf of Mexico are being considered as permanent storage sites for both nuclear and chemically toxic wastes. The suitable domes are stable and inactive, having reached their final evolutionary configuration at least 30 million years ago. They are buried to depths far below the level to which erosion will penetrate during the prescribed storage period and are not subject to possible future reactivation. The salt cores of these domes are themselves impermeable, permitting neither the entry nor exit of ground water or other unwanted materials. In part, a stable dome may be recognized by its present geometric configuration, but conclusive proof depends on establishing its evolutionary state. The evolutionary state of a dome is obtained by reconstructing the growth history of the dome as revealed by the configuration of sedimentary strata in a large area (commonly 3,000 square miles or more) surrounding the dome. A high quality, multifold CDP reflection seismic profile across a candidate dome will provide much of the necessary information when integrated with available subsurface control. Additional seismic profiles may be required to confirm an apparent configuration of the surrounding strata and an interpreted evolutionary history. High frequency seismic

data collected in the near vicinity of a dome are also needed as a supplement to the CDP data to permit accurate depiction of the configuration of shallow strata. Such data must be tied to shallow drill hole control to confirm the geologic age at which dome growth ceased. If it is determined that a dome reached a terminal configuration many millions of years ago, such a dome is incapable of reactivation and thus constitutes a stable storage site for nuclear wastes.

3559 (RHO-BWI-C--50) DETERMINATION OF BASALT PHYSICAL AND THERMAL PROPERTIES AT VARYING TEMPERATURES, PRESSURES, AND MOISTURE CONTENTS. FIRST PROGRESS REPORT, FISCAL YEAR 1979. Miller, R.J.; Bishop, R.C. (Colorado School of Mines, Golden (USA). Evacuation Engineering and Earth Mechanics Inst.). 26 Mar 1979. Contract EY-77-C-06-1030. 83p. Dep. NTIS, PC A05/MF A01.

This report is a summary of the rock mechanics testing done at the Earth Mechanics Institute of the Colorado School of Mines for Rockwell Hanford Operations under Subcontract SA-917. Cores were supplied from drill hole DC-6 on the Hanford Site, characterized geologically, and tested for thermal and physical properties for designing long-term underground storage of radioactive waste materials. This report presents the approved test procedures, results, and data analysis for this test series. Results indicated thermophysical properties similar to those of previously tested basalt cores from the Hanford area, but showed no significant trends; thus, generalizations are risky at this time. However, density was found to be a good guide to thermal and physical properties--higher density basalt cores showed significant improvements in physical and thermal properties.

3560 (RHO-BWI-C--54) DETERMINATION OF BASALT PHYSICAL AND THERMAL PROPERTIES AT VARYING TEMPERATURES, PRESSURES, AND MOISTURE CONTENTS. SECOND PROGRESS REPORT, FISCAL YEAR 1979. Miller, R.J. (Colorado School of Mines, Golden (USA). Evacuation Engineering and Earth Mechanics Inst.). 13 Aug 1979. Contract EY-77-C-06-1030. 80p. Dep. NTIS, PC A05/MF A01.

The rock mechanics testing performed at the Earth Mechanics Institute of the Colorado School of Mines for Rockwell Hanford Operations under Subcontract SA-917 is summarized. Cores were supplied from drill hole DC-8 on the Hanford Site, characterized geologically, and tested for thermal and physical properties for designing long-term underground storage of radioactive waste materials. This report presents the approved test procedures, results, and data analysis for this test series. Results indicate significantly lower strengths for drill hole DC-8 than determined for drill hole DC-6 or for the drill holes reported on in our fiscal year 1978 (FY 78) tests. Trends, however, were found to be similar between drill holes DC-6 and DC-8, and it is hoped more definitive conclusions can be found following completion of the final series of tests.

3561 (RHO-BWI-C--55) DETERMINATION OF BASALT PHYSICAL AND THERMAL PROPERTIES AT VARYING TEMPERATURES, PRESSURES, AND MOISTURE CONTENTS. THIRD PROGRESS REPORT, FISCAL YEAR 1979. Miller, R.J. (Colorado School of Mines, Golden (USA). Evacuation Engineering and Earth Mechanics Inst.). 31 Aug 1979. Contract EY-77-C-06-1030. 82p. Dep. NTIS, PC A05/MF A01.

The rock mechanics testing performed at the Earth Mechanics Institute of the Colorado School of Mines for Rockwell Hanford Operations under subcontract SA-917 is summarized. Cores were supplied from drill hole DC-4 on the Hanford Site, characterized geologically, and tested for thermal and physical properties for designing long-term underground storage of radioactive waste materials. The approved test procedures, results, and data analysis for this test series are presented. Uniaxial and triaxial results indicate strengths similar to drill hole DC-6, but significantly higher than drill hole DC-8. Trends with density, depth, confining pressure, and temperature, however, were similar for the three drill hole locations tested.

3562 (RHO-SA--93) COLUMBIA RIVER BASALT REFERENCE SAMPLE. Additon, M.K.; Seil, R.O. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Apr 1979. Contract EY-77-C-06-1030. 32p. (CONF-7904116--1). Dep. NTIS, PC A03/MF A01.

From Geological Society of America cordilleran section meeting; San Jose, CA, USA (10 Apr 1979).

A Columbia River Basalt reference sample, ARHCO-1, has been prepared for use as a standard in basalt research projects. Approximately 112 kg of basalt was collected from the Umatilla flow of the Columbia River Basalt Group at Finley Quarry, Washington (46°07'N, 119°02'W). The basalt sample was powdered, split, and randomly ordered. Analyses of major and minor oxides and trace elements were performed. Analysis of variance of the data shows that with few exceptions the sample is homogeneous at $F_{0.95}$.

3563 (SAND--79-1119) COMPRESSIBILITY OF GRANULATED ROCK SALT. Stinebaugh, R.E. (Sandia Labs., Albuquerque, NM (USA)). Aug 1979. Contract EY-76-C-04-0789. 75p. Dep. NTIS, PC A04/MF A01.

Crushed rock salt will be used extensively at the Waste Isolation Pilot Plant as a material for backfilling underground openings. This document addresses one of the characteristics of crushed salt which must be known to assess the consequences of its usage, namely, compressibility.

3564 (SAND--79-1546C) MATERIAL PROPERTIES OF ELEANA ARGILLITE: EXTRAPOLATION TO OTHER ARGILLACEOUS ROCKS, AND IMPLICATIONS FOR WASTE MANAGEMENT. Lappin, A.R.; Olsson, W.A. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 36p. Dep. NTIS, PC A03/MF A01.

Results of a near-surface heater test in the Eleana argillite suggest the possibility that the high-temperature (> 100°C) thermomechanical response of argillaceous rocks to waste emplacement may be dominated by behavior of expandable clays. Enough expandable clay is probably present in most argillaceous rocks to cause a similar response. In situ thermal conductivities may be markedly reduced by even small amounts of clay contraction, compensated by opening of pre-existing joints. A simple model predicts that such opening behavior may continue to operate for disposal at considerable depths, though several factors affecting this depth remain poorly defined at present.

3565 (SAND--79-1773) PREDICTED TEMPERATURE/TIME HISTORIES RESULTING FROM THE BURIAL OF NUCLEAR WASTE CANISTERS IN BEDDED SALT.

George, O.L. Jr. (Sandia National Labs., Albuquerque, NM (USA)). Jul 1980. Contract AC04-76DP00789. 61p. NTIS, PC A04/MF A01.

This report provides computed thermal mappings for bedded salt surrounding canisters containing nuclear waste. This information can be used to study the possible migration of fluids within bedded salt under the influence of thermal gradients created by the heat-generating nuclear waste. The results presented were obtained from CINDA thermal models. Three different drift/canister configurations were modeled. The thermal conductivity of the salt was assumed to be temperature dependent while both the density and specific heat were assumed to be constant. Thermal power densities of 30, 75, and 150 kW/acre were examined with canister powers of 0.581 kW (51.6 canisters/acre), 3.5 kW (21.4 canisters/acre), and 3.5 kW (42.9 canisters/acre) at emplacement, respectively. These three cases resulted in maximum salt temperatures of 55°C, 117°C, and 176°C, respectively; and maximum thermal gradients of 15°C/m, -63°C/m, and -101°C/m, respectively. Computer-generated plots of temperature versus distance in horizontal planes at the top, midpoint, and bottom of the canister were made for several times after emplacement. Logarithmic or linear equations (whichever provided the better fit) were used to describe these curves. Derivatives of temperature with respect to distance were then taken and results of the form x(dT/dx) and dT/dx for the logarithmic and linear equations, respectively, were plotted against time. For the two cases where the waste thermal outputs decayed exponentially, it was found that x(dT/dx) and dT/dx were linear functions of time over a large period of years.

3566 (SAND--79-1853) CONSTITUTIVE MODEL FOR THE LOW TEMPERATURE CREEP OF SALT (WITH APPLICATION TO WIPP). Munson, D.E.; Dawson, P.R. (Sandia Labs., Albuquerque, NM (USA)). Oct 1979. Contract EY-76-C-04-0789. 47p. Dep. NTIS, PC A03/MF A01.

While numerous constitutive models have been proposed for the low temperature creep of salt, this work is the first to develop such a model within the framework of rate controlling mechanisms and the deformation-mechanism map. Use of this framework permitted unfolding of the rather complicated low temperature steady-state creep behavior into three simpler responses involving separate regimes with individual controlling mechanisms. The observed total creep rate obeys the rules of additive processes. The creep model incorporates primary (transient) creep as a simple two parameter modificaton to the steady-state creep equations. Application of the model is through a formulation into proper stress and strain measures for use in a large strain finite element code. Extensive analysis of available low-temperature triaxial creep data produced the appropriate material parameters, including activation energies and stress dependencies for the separate regimes. Material variations were observed to produce changes in absolute creep rate, without change in controlling mechanism. Numerous calculations demonstrate the adequacy of the model and numerical method to simulate the results of triaxial creep experiments on Southeastern New Mexico salt from the horizons proposed for the Waste Isolation Pilot Plant (WIPP).

3567 (SAND--79-2230) FAR-FIELD THERMOMECHANICAL RESPONSE OF ARGILLACEOUS ROCK TO EMPLACEMENT OF A NUCLEAR-WASTE REPOSITORY. McVey, D.F.; Thomas, R.K.; Lappin, A.R. (Sandia National Labs., Albuquerque, NM (USA)). Aug 1980. Contract AC04-76DP00789. 49p. NTIS, PC A03/MF A01.

Before heat-producing wastes can be emplaced safely in any argillaceous rock, it will be necessary to understand the far-field thermal and thermomechanical response of this rock to waste emplacement. This report presents the results of a first series of calculations aimed at estimating the far-field response of argillite to waste emplacement. Because the thermal and mechanical properties of argillite are affected by its content of expandable clay, its behavior is briefly compared and contrasted with that of a shale having the same matrix thermal properties, but containing no expandable clay. Under this assumption, modeled temperatures are the same for the two rock types at equivalent power densities and reflect the large dependence of in-situ temperatures on both initial power density and waste type. Thermomechanical calculations indicate that inclusion of contraction behavior of expandable clays in the assumed argillite thermal expansion behavior results, in some cases, in generation of a large zone in and near the repository that has undergone volumetric contraction but is surrounded by uniformly compressive stresses. Information available to date indicates that this contraction would likely result in locally increased fluid permeability and decreased in-situ thermal conductivity, but might well be advantageous as regards radionuclide retention, because of the increased surface area within the contracted zone. Assumption of continuous and positive expansion behavior for the shale eliminates the near-repository contraction and tensional zones, but results in near-surface tensional zones directly above the repository.

3568 (SAND--79-7030) CREEP BEHAVIOR OF BEDDED SALT FROM SOUTHEASTERN NEW MEXICO AT ELEVATED TEMPERATURE. Hansen, F.D.; Mellegard, K.D. (RE/SPEC, Inc., Rapid City, SD (USA)). Nov 1979. Contract EY-76-C-04-0789. 126p. Dep. NTIS, PC A07/MF A01.

Results of a series of triaxial creep experiments conducted on bedded salt specimens from ERDA Hole 9 in southeastern New Mexico are presented. The purpose of the experiments was to measure creep response of salt at temperatures of 24, 70, and 100°C under confinement pressures of 0, 1500, 2000, 2500, and 3000 psi and differential axial stress levles of 1500, 3000, 4500, and 6000 psi. Test durations ranged from 15 minutes to over 500 hours. The specimens, obtained by recording 4-in.-dia cores in the axial direction, were nominally two inches in diameter and four inches in length. The crystal size ranged from very small to one-half inch diameter; the specimens contained various amounts of clay impurities. A total of 19 specimens were prepared of which 14 were tested. The collected data included axial and lateral strain, axial and confinement stresses, time and temperature. Periodically, axial stress was adjusted to account for specimen strain in order to maintain a constant differential stress. Frequency of the stress correction was dependent on the rate of deformation; two or more corrections in a 24-hour period were typical. Data were automatically recorded with a printer, manually recoded from the print-out to punched cards and reduced by means of a computer. A preponderance of the data was collected in the transient creep regime. In some tests specimen rupture occurred, while in others an accelerating creep rate brought the specimen in contact with the pressure vessel wall. Aslo, a considerable amount of data was collected during stress application to creep stress level.

3569 (SAND--79-7045) TRIAXIAL QUASI-STATIC COMPRESSION AND CREEP BEHAVIOR OF BEDDED SALT FROM SOUTHEASTERN NEW MEXICO. Hansen, F.D. (RE/SPEC, Inc., Rapid City, SD (USA)). Nov 1979. Contract EY-76-C-04-0789. 131p. Dep. NTIS, PC A07/MF A01.

This report summarizes the results obtained from a series of triaxial quasi-static compression and creep tests on specimens of bedded salt recovered at depth intervals of 1953 to 1954 and 2711 to 2722 feet in AEC Hole No. 7 in southeastern New Mexico. The primary objective was the determination of the deformational characteristics of the salt for prescribed stress and temperature states under quasi-static and time-dependent conditions. The test conditions encompassed confining pressures of 500 and 2000 psi, differential axial stresses of 1500, 3000 and 4500 psi, temperatures of 23 and 100°C, and time durations of several hours to ten days. The data analysis was confined primarily to power law fits to the creep strain-time measurements and to an evaluation of the principal strain ratio behavior for the various test conditions and axial strain magnitudes.

3570 (SAND--80-0769) THERMAL CONDUCTIVITY OF SILICIC TUFFS: PREDICTIVE FORMALISM AND COMPARISON WITH PRELIMINARY EXPERIMENTAL RESULTS. Lappin, A. R. (Sandia Labs., Albuquerque, NM (USA)). Jul 1980. Contract AC04-76DP00789. 50p. NTIS, PC A04/MF A01.

Performance of both near- and far-field thermomechanical calculations to assess the feasibility of waste disposal in silicic tuffs requires a formalism for predicting thermal conductivity of a broad range of tuffs. This report summarizes the available thermal conductivity data for silicate phases that occur in tuffs and describes several grain-density and conductivity trends which may be expected to result from post-emplacement alteration. A bounding curve is drawn that predicts the minimum theoretical matrix (zero-porosity) conductivity for most tuffs as a function of grain density. Comparison of experimental results with this curve shows that experimental conductivities are consistently lower at any given grain density. Use of the lowered bounding curve and an effective gas conductivity of 0.12 W/m°C allows conservative prediction of conductivity for a broad range of tuff types. For the samples measured here, use of the predictive curve allows estimation of conductivity to within 15% or better, with one exception. Application and possible improvement of the formalism are also discussed.

3571 (UCRL--15117) GEOMECHANICS OF BEDDED SALT. Serata, S.; Milnor, S.W. (Serata Geomechanics, Inc., Berkeley, CA (USA)). 8 Jun 1979. Contract W-7405-ENG-48. 103p. Dep. NTIS, PC A06/MF A01.

Creep data from the literature search is reinterpreted by SGI, resulting in a better understanding of the temperature and stress state dependence of the octahedral creep rate and the octahedral shear strength. The concept of a transition strength between the elastic and the plastic states is in agreement with the data. The elastic and rheological properties of salt are described, and a set of constitutive equations is presented. The dependence of material properties on parameters such as temperature is considered. Findings on the permeability of salt are summarized, and the in-situ behavior of openings in bedded salt is described based on extensive engineering experience. A stress measuring system utilizing a finite element computer code is discussed. Geological factors affecting the stability of salt openings are considered, and the Stress Control Technique for designing stable openings in bedded salt formations is explained.

3572 (UCRL--15149) HYDROLOGIC PROPERTIES OF SHALE AND RELATED ARGILLACEOUS ROCKS. Moiseyev, A.N. (California State Univ., Hayward (USA). Dept. of Geological Sciences). 15 Nov 1979. Contract W-7405-ENG-48. 175p. Dep. NTIS, PC A08/MF A01.

This report is the result of a bibliographic study designed primarily to collect hydrologic data on American clay-rich rocks. The following information was also sought: stratigraphy, environment of deposition, mineralogic composition, and diagenetic changes. The collected numerical data are presented in tables which contain densities, porosities, and/or hydraulic conductivities of approximately 360 samples. Additional data include hydraulic diffusivities, resistivities, flow rates, and rock strengths. Geologic information suggests that large deposits of shale which may be suited for waste repository belong to all ages and were formed in both marine and continental environments. Of the studied units, the most promising are Paleozoic in the eastern half of the country, Mesozoic in the central part, and Cenozoic in the Gulf Coast area and the West. Less widespread units locally present some additional possibilities. Mineralogic investigations suggest that the smectite content in rocks shows a decrease in time (70% in Recent rocks; 35% in pre-Mesozoic rocks). Because of this predominance of smectite in younger rocks, the modeling of repositories in post-Paleozoic formations might require knowledge of additional and poorly known parameters. Results of investigations into the mathematical relationships between porosity and permeability (or hydralic conductivity) suggest that in situ permeabilities could be estimated from sonic logs and fluid pressure changes at depth. 16 figures, 8 tables.

3573 MECHANICAL BEHAVIOR OF NEW MEXICO ROCK SALT IN TRIAXIAL COMPRESSION UP TO 200 °C. Wawersik, W.R.; Hannum, D.W. (Sandia Laboratories, Albuquerque, New Mexico 87185). Journal of Geophysical Research ; 85: No. B2, 891-900(10 Feb 1980).

Experiments were conducted to determine the 'quasi-static' mechanical behavior of rock salt in support of the structural design of a waste isolation pilot plant. The salt studied was from the Salado formation in the Delaware Basin, southeastern New Mexico. Three groups of tests are discussed to identify the relative and site-specific importance of deviator stress, confining pressure (mean stress), temperature, time (loading rate), and stress path. The three groups of experiments consist of (1) hydrostatic loading, (2) triaxial compression tests ($\sigma_1 > \sigma_2 = \sigma_3 = \text{const}$), and (3) variables stress path tests including experients at approximately constant σ_1 and at constant mean stress. The range of parameters considered was $0 < p$ (hydrostatic pressure) ≤ 34.5 MPa, $0 < \sigma_2 = \sigma_3 \leq 20.7$ MPa, $0 < (\sigma_1 - \sigma_3) \leq 62$ MPa, $23 < T$ (temperature) ≤ 200 °C, and $1.7 < d(\sigma_1 - \sigma_3)/dt \leq 3.5$ kPa/s. All data were generated on 100-mm-diameter specimens. The rock salt exhibited nonlinear response under all loading conditions, a low initial elastic limit ($\sigma_1 - \sigma_3 \leq 0.7$ MPa, and an apparent inseparability of permanent deformations into time-independent and time-dependent components. Pressure and temperature did not alter the elastic constants

over the range 29.6< or =E< or =36.5 GPa and 0.17< or =ν< or =0.26, depending on core lithology. Pressure and temperature affected the principal strain ratio, the ratio of volumetric to shear strain, rock salt ductility, and the ultimate stress. In particular, low pressure and temperature permitted pronounced dilatancy and loss in load bearing ability. Under such conditions the volumetric strains reached sizeable fractions of the shear strains, vertical-barepsilon/ (epsilon$_1$-epsilon$_3$) vertical-bar> or =0.2.

3574 PROPOSED APPLICATIONS OF NQR TECHNIQUES TO THE GEOSCIENCES. Marino, R.A. (Hunter Coll., New York (USA). Dept. of Physics); Wenk, H.R. (California Univ., Berkeley (USA). Dept. of Geology and Geophysics); Apps, J.A.; Klainer, S.M. (California Univ., Berkely (USA). Geosciences Group). Journal of Molecular Structure ; 58: 445-457(Jan 1980).

Many energy-related areas such as nuclear waste isolation, continental drilling, fossil fuel recovery, and geothermal energy are directly associated with an in-depth understanding of the earth sciences. Of particular interest is the development of analytical techniques which can augment existing ones in developing a better understanding of mineralogy. Nuclear quadrupole resonance (NQR) spectroscopy offers the potential for being able to obtain accurate high resolution spectra. These can then be interpreted to give structural information which can be related to local electronic structure, atomic arrangement, order/disorder phenomena, and crystal phase transformation. In addition, molecular dynamics in the solid state can be studied. Furthermmore, since NQR data are sensitive to changes in temperature and pressure, there is the possibility of obtaining stress/ strain information. Given the role of aluminum in the architecture of the rock-forming minerals in the earth's crust, aluminum-27 (100% abundance, I = 5/2) is easily shown to be the most generally useful NQR probe nucleus. Initial studies will be performed on the plagioclase mineral suite, already well characterized by x-ray and by single crystal NMR studies. The anticipated instrumental difficulties and likely solutions to the problem of efficient detection of aluminum-27 NQR will be discussed.

3575 DETERMINATION OF THE LOCATION OF FRACTURES IN METAMORPHIC ROCK WITH IN-HOLE TRACERS. Marine, I.W. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). pp 85-96 of Low flow, low-permeability measurements in largely impermeable rocks. Paris, France; OECD (1979).

From Workshop on Low-Flow Low permeability measurements in Langley Impermeable rocks; Paris, France (19 Mar 1979).

A detailed investigation of the geohydrology of slightly fractured metamorphic rock by means of exploratory boreholes involves three steps; first, determining the exact location and character of the fractures penetrated by exploratory boreholes; second, determinating the nature and connectivity of fractures between boreholes; third, determining the hydraulic parameters. This paper describes methods of determining the first of these, including core inspection, geophysical logs, packer tests, in-hole tracer tests, and dry drilling. Emphasis is given to the in-hole tacer tests by using an example from an investigation of slightly fractured metamorphic rock at the Savannah River Plant near Aiken, South Carolina, U.S.A.

3576 PERMEABILITY CHRACTERIZATION OF NEARLY IMPERMEABLE ROCK MASSES FOR NUCLEAR WASTE REPOSITORY SITING. Wilson, C.R.; Doe, T.W.; Long, J.C.S.; Witherspoon, P.A. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). pp 13-29 of Low flow, low-permeability measurements in largely impermeable rocks. Paris, France; OECD (1979).

From Workshop on Low-Flow Low permeability measurements in Langley Impermeable rocks; Paris, France (19 Mar 1979).

Characterization of the deep geologic formations now being considered for disposal of long lived radioactive waste requires the development of a wide range of tools for measurement and interpretation of very low permeabilities. A methodology is presented in this paper for measuring such low permeabilities and interpreting the results in terms of the regional hydrology. Small-scale tests on single fractures are proposed to statistically identify the geometrical parameters required for risk analysis of repository safety. Large-scale tests over large volumes of rock containing many fractures should also be conducted to provide direct information on regional permeabilities and to provide a verification of permeabilities inferred from the small-scale tests.

3577 CRITICAL REVIEW OF THE METHODS OF DETERMINING THE THERMAL CONDUCTIVITY OF ROCKS. Patnaik, N.K.; Singh, R.D. (Indian Sch of Mines, Dhanbad). Journal of Mines, Metals and Fuels ; 26: No. 8, 274-282(Aug 1978).

This concluding part critically examines two field (in situ) methods of determining the thermal conductivity of rocks. These probe methods were developed by Hopper and Lepper and the U.S. Bureau of Mines. Associated equipment and instruments are also discussed. It is concluded that, although the field in situ methods give results which very closely correspond to the conductivity values of rocks in their in situ condition, there still remains a pressing need for laboratory determinations. This is particularly true in the case of unworked and virgin mining areas.

3578 NATURAL ZEOLITES: OCCURRENCE, PROPERTIES, AND USE. Sand, L.B.; Mumpton, F.A. (eds.). Elmsford, NY; Pergamon Press, Inc. (1978). 557p. (CONF-760626--(Exc.)).

From Zeolite conference; Tucson, AZ, USA (6 Jun 1976).

This volume consists of papers selected from those presented at ZEOLITE '76, an international conference on the occurrence, properties, and utilization of natural zeolites. The objective is to serve as a useful, basic reference in the field of natural zeolites. Topics covered include crystal structure and mineralogy, geology and occurrences, physical and chemical properties, and applications. (ACR)

Geochemistry

3579 ION-EXCHANGE EQUILIBRIA BETWEEN MONTMORILLONITE AND SOLUTIONS OF MODERATE-TO-HIGH IONIC STRENGTH. Shiao, S.Y. (Oak Ridge National Lab., TN); Rafferty, P.; Meyer, R.E.; Rogers, W.J. ACS (American Chemical Society) Symposium Series ; No. 100, 297-324(1979).

Prediction of the migration rates of ions in geologic formations is of extreme importance in the fields of nuclear waste disposal and enhanced oil recovery. In order to accumulate a systematic body of information pertinent to

interest on minerals typical of classes, from a wide range of aqueous solution compositions. Initially, montmorillonite was selected for attention because its high adsorptive capacity for ions may cause it to dominate the adsorptive proportion of the formation in which it is present. Reported here are distribution coefficients of alkali metal and alkaline earth ions, and of one rare earth, between montmorillonite predominantly in the sodium and calcium forms and aqueous solutions of controlled pH, at moderate to high salinities (> 0.01 M NaCl).

Oceanography

3580 (IOS-Rep--77) OCEANOGRAPHY RELATED TO DEEP SEA WASTE DISPOSAL. A SURVEY COMMISSIONED BY THE DEPARTMENT OF THE ENVIRONMENT. (Institute of Oceanograhic Sciences, Godalming (UK)). Sep 1978. 254p. NTIS (US Sales Only), PC A12/MF A01/ Available on loan from the British Library Lending Div., Boston Spa.

In connection with studies on the feasibility of the safe disposal of radioactive waste, from a large scale nuclear power programme, either on the bed of the deep ocean or within the deep ocean bed, preparation of the present document was commissioned by the (United Kingdom) Department of the Environment. It attempts (a) to summarize the present state of knowledge of the deep ocean environment relevant to the disposal options and assess the processes which could aid or hinder dispersal of material released from its container; (b) to identify areas of research in which more work is needed before the safety of disposal on, or beneath, the ocean bed can be assessed; and (c) to indicate which areas of research can or should be undertaken by British scientists. The programmes of international cooperation in this field are discussed. The report is divided into four chapters dealing respectively with geology and geophysics, geochemistry, physical oceanography and marine biology.

3581 (PNL--2851, pp IX.1-IX.8) SEA LEVEL REPORT. Schwartz, M.L. (Western Washington Univ., Bellingham). Nov 1979.

Summary of FY-1978 consultation input for Scenario Methodology Development.

Study of Cenozoic Era sea levels shows a continual lowering of sea level through the Tertiary Period. This overall drop in sea level accompanied the Pleistocene Epoch glacio-eustatic fluctuations. The considerable change of Pleistocene Epoch sea level is most directly attributable to the glacio-eustatic factor, with a time span of 10^5 years and an amplitude or range of approximately 200 m. The lowering of sea level since the end of the Cretaceous Period is attributed to subsidence and mid-ocean ridges. The maximum rate for sea level change is 4 cm/y. At present, mean sea level is rising at about 3 to 4 mm/y. Glacio-eustacy and tectono-eustacy are the parameters for predicting sea level changes in the next 1 my. Glacio-eustatic sea level changes may be projected on the basis of the Milankovitch Theory. Predictions about tectono-eustatic sea level changes, however, involve predictions about future tectonic activity and are therefore somewhat difficult to make. Coastal erosion and sedimentation are affected by changes in sea level. Erosion rates for soft sediments may be as much as 50 m/y. The maximum sedimentation accumulation rate is 20 m/100 y.

FUSION ENERGY

3582 (ASA-ZE--09/78) NUCLEAR PRIMARY ENERGY CARRIERS. PT. 2. ENERGY FROM NUCLEAR FUSION. (Arbeitsgemeinschaft der Grossforschungseinrichtungen, Koeln (Germany, F.R.). Programmleitung Angewandte Systemanalyse; Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). Apr 1978. 269p. (In German). Dep. NTIS (US Sales Only), PC A13/MF A01.

A very brief presentation of the elementary fusion reactions, the energies delivered by them and the most basic energy balances leading to Lawson-type diagrams are given. The report estimates reserves and cost of lithium and deuterium, gives estimates of the total available for DT fusion and comments on production technology, availability and handling of the fuels. A survey is given of the different concepts of magnetic confinement (stellarators, tokamaks, toroidal pinches, mirror machines, two-component plasmas), of confinement by walls, gas blankets, and imploding liners and, finally, of the concepts of inertial confinement (laser fusion, beam fusion). The reactors designed or outlined on the basis of the tokamak, high-β, mirror, and laser fusion concepts are presented, which is followed by a discussion of the key problems of fusion power plants. The main requirements on superconducting magnet system for possible fusion reactors, particularly tokamak reactors, are discussed and compared with the present state of the superconducting magent technology. The present-day knowledge of the cost structure of fusion power plants and the sensitivity of this structure with respect to the physical and technical assumptions made is analyzed. Finally the aspects of safety and environment are treated. The problems discussed include the hazard potentials of different designs (radiological, toxicological, and with respect to stored energies), release of radioactivity, possible kinds of malfunctioning, and the environmental impact of waste heat, radiation and radioactive waste.

3583 (INIS-mf--5173) NUCLEAR FUSION. ANOTHER CHOICE FOR SOLVING THE ENERGY PROBLEM IN THE LONG RUN. AN ANALYSIS OF THERMONUCLEAR REACTOR CONCEPTS AND A NUMBER OF SELECTED FUSION EXPERIMENTS. Huber, H. (Mannheim Univ. (Germany, F.R.). Inst. fuer Physikalische and Chemische Technologie). 1978. 383p. (In German). Dep. NTIS (US Sales Only), PC A18/MF A01.

Diploma thesis.

A comprehensive survey is presented of the present state of knowledge in nuclear fusion research. In the first part, potential thermonuclear reactions, basic energy balances of the plasma (Lawson criterion), and the main criteria to be observed in the selection of appropriate thermonuclear reactions are dealt with. This is followed by a discussion of the problems encountered in plasma physics (plasma confinement and heating, transport processes, plasma impurities, plasma instabilities and plasma diagnostics) and by a consideration of the materials problems involved, such as material of the first wall, fuel inlet and outlet, magnetic field generation, as well as repair work and in-service inspections. Two main methods have been developed to tackle these problems: reactor concepts using the magnetic pinch (stellarator, Tokamak, High-Beta reactors, mirror machines) on the one hand, and the other concept using the inertial confinement (laser fusion reactor). These two approaches and their specific problems as well as past, present and future fusion experiments are treated in detail. The last part of the

work is devoted to safety and environmental aspects of the potential thermonuclear aspects of the potential thermonuclear reactor, discussing such problems as fusion-specific hazards, normal operation and potential hazards, reactor incidents, environmental pollution by thermal effluents, radiological pollution, radioactive wastes and their disposal, and siting problems.

Fusion Power Plant Technology

Tritium Processing, Environment and Safety

3584 (JAERI-M--7582) INDUCED ACTIVITIES OF FUSION REACTOR STRUCTURAL MATERIALS. Iida, H.; Seki, Y. (Japan Atomic Energy Research Inst., Tokyo). Mar 1978. 32p. (In Japanese). Dep. NTIS (US Sales Only), PC A03/MF A01.

Induced activity, biological hazard potential and decay heat of the JAERI Demonstration Fusion Reactor (JDFR) with molybdenum alloy as a blanket structural material and gamma-ray dose rates in and around the reactor after shutdown are calculated. Induced activities of other blanket materials, tantalum and tungsten used in molybdenum alloy, other fusion-reactor structural materials and impurities are also calculated to examine effects of the gamma-ray dose rates in reactor design. The quantities of radioactive wastes from JDFR and JAERI Experimental Fusion Reactor (JXFR) are estimated.

3585 REDUCTION IN THE TOXICITY OF FISSION PRODUCT WASTES THROUGH TRANSMUTATION WITH DEUTERIUM-TRITIUM FUSION NEUTRONS. Parish, T.A. (Texas A and M Univ., College, Station); Davidson, J.W. Nuclear Technology ; 47: No. 2, 324-342(Feb 1980).

A waste management concept that employs irradiation of fission products in fusion reactor blankets is evaluated. The purpose of the irradiation is to reduce the toxicity of the material to be committed to geologic disposal. Target isotopes included ^{90}Sr, ^{137}Cs, ^{129}I, ^{99}Tc, ^{135}Cs, and ^{93}Zr. The n,γ), n,2n), (n,3n), (n,p), (nα), (n,d), (n,t), and (n,nα) reactions were all considered to contribute to the transmutation process. Extensive chains were employed in the depletion calculations performed to quantify the toxicity of the products. A sharp reduction in the short-term toxicity by a factor of 100 or more appears achievable, but should not be pursued unless the toxicity of the actinide wastes can also be substantially reduced.

3586 THERMONUCLEAR REACTORS AND THEIR ENVIRONMENTAL IMPACT. Petr, I. (Ceske Vysoke Uceni Technicke, Prague (Czechoslovakia). Fakulta Jaderna a Fysikalne Inzenyrska). Radioisotopy ; 20: No. 3, 343-377(Jun 1979). (In Czech).

Some of the existing principles of fusion reaction control and their comparison, technical problems connected with the development of fusion reactors and estimated environmental impact of fusion reactors are discussed. Attention is paid to possible tritium leakage, the activation of structural materials and emergency situations in fusion reactors. Non-radiation effects due to the operation of fusion reactors are also discussed. A comparison of operation and environmental impacts of light-water reactors, fast breeder reactors and fusion reactors to the environment is given.

Inertial Confinement Technology

3587 (BNL--27118) HYPER FUSE: A NOVEL INERTIAL CONFINEMENT SYSTEM UTILIZING HYPERVELOCITY PROJECTILES FOR FUSION ENERGY PRODUCTION AND FISSION WASTE TRANSMUTATION. Makowitz, H.; Powell, J.R.; Wiswall, R. (Brookhaven National Lab., Upton, NY (USA)). 1979. Contract EY-76-C-02-0016. 16p. (CONF-791204--22). Dep. NTIS, PC A02/MF A01.

From 2. Miami international conference on alternative energy sources; Miami Beach, FL, USA (10 Dec 1979).

Parametric system studies of an inertial confinement fusion (ICF) reactor system to transmute fission products from an LWR economy have been carried out. The ICF reactors would produce net power in addition to transmuting fission products. The particular ICF concept examined is an impact fusion approach termed HYPERFUSE, in which hypervelocity pellets, traveling on the order of 100 to 300 km/sec, collide with a target in a reactor chamber and initiate a thermonuclear reaction. The DT fusion fuel is contained in a shell of the material to be transmuted, e.g., ^{137}Cs or ^{90}Sr. The 14 MeV fusion neutrons released during the pellet burn cause transmutation reactions [e.g., (n, 2n), (n, α), etc.] that convert the long lived fission products (FP's) either to stable products or to species that decay with a short half-life to a stable product.

OTHER

3588 (AAEC/PR--44D) NUCLEAR SCIENCE AND TECHNOLOGY BRANCH REPORT 1977. DIVISIONAL RESEARCH. (Australian Atomic Energy Commission Research Establishment, Lucas Heights). Dec 1977. 28p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Research programs are reported for the following divisions: Physics, Chemical Technology, Materials, Engineering Research, Isotopes, Instrumentation and Control, Health Physics Research and Applied Maths and Computing. Staff responsible for each project are indicated.

3589 (AD-A--076168) THE U.S. ARMY RADON TEAM: ORGANIZATION, CAPABILITIES AND RESOURCES. FINAL REPORT. Rigotti, D.L. (Army Armament Research and Development Command, Aberdeen Proving Ground, MD (USA). Ballistics Research Lab.). Sep 1979. 131p. NTIS, PC A07/MF A01.

This report is intended to acquaint the reader with what the RADCON Teams are, how they operate, how they are presently constituted and their overall capabilities. Information on how the teams maintain the required readiness posture is also presented. Finally the various emergencies in which the RADCON Team has been involved over the past twenty years are described and the unique capabilities that the team possesses beyond that required by pertinent regulations are highlighted.

3590 (AERE-M--3063) ENHANCED DIFFUSION AND RELATED PHENOMENA IN SOLIDS CONTAINING ACTIVE SPECIES. Stoneham, A.M. (UKAEA Atomic Energy Research Establishment, Harwell. Theoretical Physics Div.). Jan 1980. 13p. NTIS (US Sales Only), PC A02/MF A01.

Much recent work on semiconductors has shown that diffusion and related processes can be vastly enhanced by the presence of free carriers (i.e. electrons and holes). In some

cases quite different mechanisms take over. This note discusses two possible effects of ionisation in waste-disposal glasses, namely (1) the enhanced motion of alkalis by changes of charge state and (2) enhanced segregation through ionisation-induced electric fields near surfaces and interfaces. Both appear to be unimportant for the activity levels expected for HARVEST glasses.

3591 (CEA-CONF--4493) CALCULATION OF GAMMA-RAYS AND FAST NEUTRONS FLUXES WITH THE PROGRAM MERCURE-4. Baur, A.; Dupont, C.; Totth, B. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Eau). 1978. 37p. (CONF-7811158--1). NTIS (US Sales Only), PC A03/MF A01.

From Ispra courses on radiation shielding methods; Varese, Italy (20 Nov 1978).

The program MERCURE-4 evaluates gamma ray or fast neutron attenuation, through laminated or bulky three-dimensionnal shields. The method used is that of line of sight point attenuation kernel, the scattered rays being taken into account by means of build-up factors for γ and removal cross sections for fast neutrons. The integration of the point kernel over the range of sources distributed in space and energy, is performed by the Monte-Carlo method, with an automatic adjustment of the importance functions. Since it is operationnal the program MERCURE-4 has been intensively used for many various problems, for example: - the calculation of gamma heating in reactor cores, control rods and shielding screens, as well as in experimental devices and irradiation loops; - the evaluation of fast neutron fluxes and corresponding damage in structural materials of reactors (vessel steels...); - the estimation of gamma dose rates on nuclear instrumentation in the reactors, around the reactor circuits and around spent fuel shipping casks.

3592 (CEGB-RD/B/N--4668) METHOD FOR ASSESSING THE ANNUAL DOSE TO THE MOST EXPOSED INDIVIDUAL FROM TRITIUM AND ^{14}C REACTOR DISCHARGES TO ATMOSPHERE. Nair, S. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Oct 1979. 67p. NTIS (US Sales Only), PC A04/MF A01.

A method is described for assessing the annual dose to the most exposed individual from routine releases of tritium and ^{14}C to the atmosphere during normal reactor operations. A detailed assessment has been made of the resulting equilibrium contamination levels in a range of foodstuffs typical of an average UK diet and of the annual doses resulting from a chronic intake of tritium and ^{14}C via inhalation, ingestion and, additionally, in the case of tritium, via skin absorption. Equilibrium annual doses from the global circulation of tritium and ^{14}C have also been calculated. Upper limits to the effective annual dose-equivalents to the most exposed individual were found to be 0.6 rem.yr^{-1} and 100 rem.yr^{-1} per Ci.yr^{-1} release of tritium and ^{14}C respectively, with the ingestion pathway contributing significantly to the overall exposure. The most exposed individual was found to be a Reference 10 year old child. The methods outlined for calculating the ingestion dose from tritium and ^{14}C releases hav been incorporated into the more generally applicable code FOODDOSE. The code may be used to make more realistic dose calculations to the individuals based on site-specific surveys of variables such as local meteorology, local diet and local land use for agriculture, which may lead to doses smaller than the upper limit values quoted by factors of 20 and 200 for tritium and ^{14}C respectively.

3593 (CEGB-RD/B/N--4686) USER'S GUIDE TO THE POPDOS2 PROGRAM FOR EVALUATING COLLECTIVE DOSES. Merlin, J.H.; Henning, M.J. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Aug 1979. 49p. NTIS (US Sales Only), PC A03/MF A01.

This report contains details for using the computer program POPDOS2, which will calculate collective doses to any specified area of England, Scotland and Wales, either to the total population or to any one of six age groups, due to an atmospheric release of radioactivity. Details are given of all the input data and job control language required for running POPDOS2, and also the program CONTOUR, which when run in conjunction with POPDOS2, produces a collective dose surface using the graph plotting facility. A complete test case is included, together with listings of the POPDOS2 subroutines and of the major variables used. POPDOS2 and CONTOUR are written in Fortran IV (level H) and compiled under OPT=2 using the IBM 370/168 compiler.

3594 (CONF-780110--, pp 329-362) THE MONITORING SYSTEM OF THE TRITIUM RESEARCH LABORATORY, SANDIA LABORATORIES, LIVERMORE, CALIFORNIA. Hafner, R.S.; Westfall, D.L.; Ristau, R.D. 1978.

From 11. symposium on radiation instrumentation; San Diego, CA, USA (17 Jan 1978).

Computerized tritium monitoring is now in use at the Tritium Research Laboratory (TRL). Betatec 100 tritium monitors, along with several Sandia designed accessories, have been combined with a PDP 11/40 computer to provide maximum personnel and environmental protection. Each individual monitoring system, in addition to a local display in the area of interest, has a visual/audible display in the control room. Each system is then channeled into the PDP 11/40 computer, providing immediate assessment of the status of the entire laboratory from a central location. Measurement capability ranges from uCi/m^3 levels for room air monitoring to KCi/m^3 levels for glove box and process system monitoring. The overall monitoring system and its capabilities will be presented.

3595 (CONF-780110--, pp 203-215) ATOMIC ENERGY OF CANADA LIMITED MONITORING TRITIATED WATER IN AIR AND WATER EFFLUENTS. Osborne, R.V.; Tepley, N.W. (Chalk River Nuclear Lab., Ontario). 1978.

From 11. symposium on radiation instrumentation; San Diego, CA, USA (17 Jan 1978).

Current on-line methods of monitoring effluents for tritium (as tritiated water, HTO) measure concentrations in air above 250 nCi/m^3 (approx. 10 kBq/m^3) and in water above 1 uCi/kg (approx. 40 kBq/kg). Some of the problems encountered in such monitoring are the presence of fission and activation products in the effluents and, particularly in water monitoring, the often dirty quality of the sample. In a new design of monitor, HTO is collected directly from air by a flow of liquid scintillator (LS). For water monitoring a flow of air continuously samples the water and transports HTO to the LS. The key features of the new design are that the high detection efficiency of LS is realizable, that the rate of use of LS is only approx. 2 mm^3/s, that the controlled evaporation and metering of air provides the low flow of HTO needed for mixing with LS, and that accurate metering of a dirty effluent is not needed. The sensitivities for

detecing tritium on-line are improved by at least an order of magnitude.

3596 (CONF-790923--8) DECOMMISIONING PLAN FOR PARTICLE ACCELERATORS. Opelka, J.H.; Kikta, M.J.; Marmer, G.J.; Mundis, R.L.; Peterson, J.M.; Siskind, B. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 16p. Dep. NTIS, PC A02/MF A01.
From Decontamination and decommissioning of nuclear facilities conference; Sun Valley, ID, USA (16 Sep 1979).
An assessment of the magnitude of the problem presented by the decommissioning of particle accelerator facilities is given. The history of past decommissionings is reviewed with regard to technological, environmental, health, and economic aspects. Development of a generalized plan for accelerator decommissioning is discussed. (GHT)

3597 (CONF-790977--1) GENETIC RISKS FROM RADIATION: RECENT ASSESSMENTS BY THE BEIR AND UNSCEAR COMMITTEES AND SUGGESTIONS AS TO HOW FUTURE RESEARCH CAN IMPROVE SUCH ESTIMATES. Selby, P.B. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 11p. Dep. NTIS, PC A02/MF A01.
From Conference on health effects of energy production; Ontario, Canada (12 Sep 1979).
Recently two widely-recognized committees, namely the UNSCEAR and BEIR Committees, have reevaluated their estimates of genetic risks from radiation. Their estimates for gene mutations are based on two different approaches, one being the doubling-dose approach and the other being a new direct approach based on an empirical determination of the amount of dominant induced damage in the skeletons of mice in the first generation following irradiation. The estimates made by these committees are in reasonably good agreement and suggest that the genetic risks from present exposures resulting from nuclear power production are small. There is room for much improvement in the reliability of the risk estimates. The relatively new approach of measuring the amount of induced damage to the mouse skeleton shows great promise of improving knowledge about how changes in the mutation frequency affect the incidence of genetic disorders. Such findings may have considerable influence on genetic risk estimates for radiation and on the development of risk estimates for other less-well-understood environmental mutagens.

3598 (CONF-800392--1) RADIOACTIVITY IN MAN: LEVELS, EFFECTS AND UNKNOWNS. Rundo, J. (Argonne National Lab., IL (USA)). 1980. Contract W-31-109-ENG-38. 16p. NTIS, PC A02/MF A01.
From Public meeting on federal research into biological effects of ionizing radiation; Bethesda, MD, USA (10 Mar 1980).
The report discusses the potential for significant human exposure to internal radiation. Sources of radiation considered include background radiation, fallout, reactor accidents, radioactive waste, and occupational exposure to various radioisotopes. (ACR)

3599 (CS-INIS--258, pp 119-124) TOXICITY OF WASTE WATER FROM URANIUM ORE MINING AND PROCESSING. Justyn, J. (Vyzkumny Ustav Vodohospodarsky, Prague (Czechoslovakia)). Sep 1978. (In Czech).
From 9. national conference on radionuclides and ionizing radiation in water management; Liberec, Czechoslovakia (28 Sep 1978).
Some results are given of the observations made of waste waters from uranium ore mining and processing. Cu, Fe, Pb, Al, Ni, Ba, Zn, NH_3 were found in decontaminated waste waters discharged into surface waters in concentrations toxic for various species of aquatic organisms. The maximum permissible concentration or uranium for surface waters in Czechoslovakia is 0.1 mg/l which practically excludes toxic effects on aquatic organisms. The radiation effects of uranium in such concentrations are negligible. The concentration was also studied of ^{226}Ra and ^{210}Po which in association with natural radionuclides in the water may accumulate radiation doses dangerous for aquatic organisms. This value was determined for both radioisotopes at 0.5 Bq/l. The obtained results are discussed against data published in foreign literature.

3600 (CS-INIS--258, pp 1-7) ASSESSMENT OF RADIONUCLIDES IN WATERS WITH RESPECT TO RADIATION PROTECTION OF POPULATION. Kunz, E. (Institut Hygieny a Epidemiologie, Prague (Czechoslovakia)). Sep 1978. (In Czech).
From 9. national conference on radionuclides and ionizing radiation in water management; Liberec, Czechoslovakia (28 Sep 1978).
Factors affecting dose reduction are discussed with respect to the ICRP 1977 recommendation on population radiation protection. The dose reduction system uses two principles, viz., all necessary exposures should be as low as is reasonably attainable from the economic and social points of view, and the dose equivalent in individuals should not exceed the limits set for the given exposure type. Attention is devoted to the assessment of radionuclides in waters. Two methods are pursued, ie., measures aimed at reducing radioactive material content in water, ie., waste water control prior to discharge, and measures aimed at radioactive material trapping or at choosing alternative sources with a lower radioactive material content.

3601 (DOE/EIS--0018) FINAL ENVIRONMENTAL IMPACT STATEMENT. LOS ALAMOS SCIENTIFIC LABORATORY SITE, LOS ALAMOS, NEW MEXICO. (Department of Energy, Washington, DC (USA)). Dec 1979. 627p. Dep. NTIS, PC A99/MF A01.
The statement assesses the potential cumulative environmental impacts associated with current, known future, and continuing activities at the Los Alamos Scientific Laboratory (LASL) site. This includes the adverse impacts from postulated accidents associated with the activities. Various effluents including radioactive ones are released to the environment. However, a continuing, comprehensive, monitoring program is carried out to assist in the control of hazardous effluents. Alternatives considered to current operation of LASL include: cessation or relocation of programs; continue activities as presently constituted; further limitation of adverse impacts by institutional or other improvements in various operations; and expansion of current activities.

3602 (DOE/EV--0046(Vol.2), pp 547-562) SCALE MODEL EXPERIMENTS OF ENERGY MATERIAL SHIPPING CONTAINERS. Burian, R.J. (Battelle's Columbus Labs., OH). Sep 1979.
From Environmental control symposium; Washington, DC, USA (28 Nov 1978).
An ongoing program is being conducted by Battelle's Columbus Laboratories as an integral part of an overall ECT program to overview and assess the adequacy of the public safety and

environmental protection provided by containers used in the shipment of spent fuel, high-level wastes, and other DOE energy materials. The efforts of this program are directed toward development of improved techniques for assessment of cask response to specific dynamic impact conditions. Initial phases of the program were directed to verify the applicability of scale modeling techniques utilizing lead shielded/stainless steel cask models. Cask models 1/8, 1/4, and 1/2 linear scale of a typical truck cask were tested. The results indicated that the elastic and plastic response of lead shielded casks can be predicted by tests of replica cask models. Tests conducted to produce only elastic strains in 1/8- and 1/4-scale models revealed that axial strains at four different locations agree with predictions from scaling theory within 20%; circumferential strains agreed within 40%. For tests of 1/8, 1/4, and 1/2 scale models in which plastic strains were produced, strains generally agreed with scaling theory. These tests also revealed the influence of other conditions such as impact angle, temperature, material properties, and impact target on the response of the cask models. These data are being used by LASL in computer code development for analytically predicting cask response.

3603 (DP--1536) RAIL TIEDOWN TESTS WITH HEAVY CASKS FOR RADIOACTIVE SHIPMENTS. Petry, S.F. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Aug 1980. Contract AC09-76SR00001. 56p. NTIS, PC A04/MF A01.

A rail tiedown test program was conducted at the Savannah River Plant in July and August 1978. For each test, a 40- or 70-ton cask was secured on a railcar. The railcar was pushed to speeds up to 11 mph and allowed to couple to parked railcars simulating ordinary railyard operations. The test car carrying the cask was heavily instrumented to measure the accelerations and forces generated at strategically selected places. Eighteen test runs were made with different combinations of railcars, couplers, casks, speeds, and tiedown configurations. The major objectives of the test program were to (1) provide test data as a basis to develop a tiedown standard for rail cask shipments of radioactive materials and (2) collect dynamic data to support analytical models of the railcar cask tiedown system. The optimum tiedown configuration demonstrated for heavy casks was a combination of welded, fixed stops to secure the cask longitudinally and flexible cables to restrain vertical and lateral cask movement. Cables alone were inadequate to secure a heavy cask to a standard railcar, and bolting was found disadvantageous in several respects. The use of cushioning coupler mechanisms dramatically reduced the tiedown requirements for the rail coupling operation. The test program and general conclusions are discussed.

3604 (DPSPU--79-30-14) COMPLETELY CONTAINED AND REMOTELY OPERATED DIGITAL DENSITY METER. Goergen, C.R. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). Oct 1979. Contract EY-76-C-09-0001. 13p. (CONF-791103--34; CONF-791049--11). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

A completely contained and remotely operated density determination system having unique features was designed, fabricated, and installed at the Savannah River Plant. The system, based on a Mettler calculating digital density meter, provides more precise and accurate results than the falling drop technique for measuring densities. The system is fast, simple, easy to operate, and has demonstrated both reliability and durability.

3605 (FDA--78-8054) NINTH ANNUAL NATIONAL CONFERENCE ON RADIATION CONTROL. (Conference of Radiation Control Program Directors, Inc. (USA); Utah State Government, Salt Lake City (USA); Nuclear Regulatory Commission, Washington, DC (USA); Bureau of Radiological Health, Rockville, MD (USA)). Apr 1978. 426p. GPO.

This publication contains the proceedings of the Ninth Annual National Conference on Radiation Control - Meeting Today's Challenges, held June 19-23, 1977, in Seattle, Washington, Sponsors were the Conference of the Radiation Control Program Directors, Inc.; the Bureau of Radiological Health, FDA; the US Environmental Protection AGency; and the US Nuclear Regulatory Commission. Participants representing State and major local radiation control programs, as well as Federal agencies, discussed mutual radiation control programs. The formal presentations and the reports of the various task forces and workshops are included in these proceedings.

3606 (GEFR-SP--204) CONSIDERATIONS FOR DESIGNING A SPENT-FUEL SHIPPING SYSTEM FOR COMMERCIAL LMFBR PLANTS. Davis, C.R. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 31 Jul 1980. Contract AT03-76SF70030. 28p. (CONF-801115--1). NTIS, PC A03/MF A01.

From 6. international symposium on packaging and transporting radioactive material; Berlin, F.R. Germany (10 Nov 1980).

Thesis.

This paper identifies many factors which influence the design of a spent-fuel shipping system for commercial Liquid Metal Fast Breeder Reactors (LMFBR's). Appropriate consideration of these factors will result in a cost effective shipping system that maximizes safety and reliability and minimizes shipping time and radiation exposure to personnel. Existing spent-fuel shipping equipment is not appropriate for servicing future commercial LMFBR's. This is due primarily to two present-day conditions: first, without reprocessing and recycle in the US, there are presently no economic incentives for rapid low-cost spent-fuel shipping; and second, the early LWR's and LMFBR's were designed, and many built, without a spent-fuel shipping system design. LMFBR facilities can be designed to eliminate the removal of a 100 ton shipping cask from its railroad transporter for loading and the contamination of the cask's exterior surfaces and the subsequent cleaning. Loading of the shipping cask can be accomplished remotely, which eliminates almost all personnel exposure to radiation. Shipping spent-fuel in sodium eliminates a sodium cleaning operation at the reactor, saves time in preparing spent-fuel for shipment and reduces the accumulation of radioactive liquid waste at the reactor. A cask and canister design that provides double containment of spent-fuel during transit enhances safety and satisfies regulatory requirements. Sealed sodium-filled canisters for individual fuel assemblies provide primary containment. The sealed shipping cask closure provides secondary containment and heat dissipation. Criteria for minimizing fuel inventory costs require that spent-fuel shipping be integrated into the overall refueling and fuel recycle schedules. Cost savings are obtained by rapid cash turn-around and shipping fuel and radial blanket assemblies together in the same cask.

3607 (HMI--296) SCIENTIFIC PROGRESS REPORT 1978. NUCLEAR CHEMISTRY AND REACTORS. (Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.). Bereich Kernchemie und Reaktor). 1978. 106p. (In German). NTIS (US Sales Only), PC A06/MF A01.

This is a short description of the research work of the working groups on neutron scattering, radiation damage in solids, reactor chemistry, trace element research in biomedicine, and geochemistry as well as of the available infrastructure for the fields of reactors and radionuclide production. The description is followed by a bibliography of 1978 publications (some of them with abstracts) and papers read by HMI members. Also listed are papers by HMI guest scientists, lectures at Berlin universities, and dissertations and theses written at HMI.

3608 (INIS-mf--5598) ENERGY, HEALTH AND ENVIRONMENT. Hoegberg, L. (Energi-och miljoe kommitten, Jordbruksdepartementet, Stockholm (Sweden)). 1978. 30p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01.

The results of a study performed by the Energy and Environment Committee of the Dept. of Agriculture in Sweden are presented. The health and environmental effects during routine operation of hydroelectric power, coal-firing, oil-firing, natural gas and nuclear power are discussed in turn. The risk of major accidents for all these energy sources is considered in one section, while the final section discusses briefly these aspects of alternative energy sources.

3609 (JAERI-M--7979) HEALTH PHYSICS AND SAFETY IN JAERI, NO.20 (APRIL 1, 1977 - MARCH 31, 1978). (Japan Atomic Energy Research Inst., Tokyo). Jan 1979. 277p. (In Japanese). NTIS (US Sales Only), PC A14/MF A01.

In the annual report No. 20 (fiscal 1977) are described the activities of health physics and safety in the Tokyo Office, Tokai Research Establishment, Takasaki Radiation Chemistry Research Establishment, and Oarai Research Establishment.

3610 (LA-UR--80-1460) DECONTAMINATION OF CONCRETE SURFACES AT THE LOS ALAMOS SCIENTIFIC LABORATORY. Cox, E.J.; Garde, R. (Los Alamos Scientific Lab., NM (USA)). 1980. Contract W-7405-ENG-36. 17p. (CONF-800542--3). NTIS, PC A02/MF A01.

From Concrete decontamination workshop; Seattle, WA, USA (28 May 1980).

For the past two years the Los Alamos Scientific Laboratory has been engaged in decontaminating its former plutonium facility. The facility was in use for over 30 years for plutonium operations varying from dry metallurgical processes to wet (solution) recovery processes. To date approximately 3400 square meters of floor surface have been decontaminated to permit re-use for nonplutonium work. Approximately 330 square meters of concrete surfaces required scarifying the contamination after all other attempts such as detergents and acid solutions had proven ineffective. The uses of hand-held and floor type pneumatic scarifiers are described as well as an inexpensive but effective contamination containment chamber built at Los Alamos for use with the hand-held model. Contamination control, waste handling, manpower requirements, and cost are documented for the techniques used at LASL.

3611 (NTIS/PS--79/0080) COAL MINE WASTE (A BIBLIOGRAPHY WITH ABSTRACTS). REPORT FOR 1964-JANUARY 1979. Hundemann, A.S. (National Technical Information Service, Springfield, VA (USA)). Mar 1979. 163p. NTIS PC N01/MF N01.

Research topics cover coal mining refuse, refuse dumps, and spoil. Studies on disposal, utilization, environmental impacts, and testing of these wastes are included, as are reports on land reclamation and spoil bank safety. (This updated bibliography contains 157 abstracts, 19 of which are new entries to the previous edition.)

3612 (ORNL--5685, pp 1-30) MOLECULAR AND CELLULAR SCIENCES SECTION. Oct 1980.

Biology Division progress report, October 1, 1978-May 31, 1980.

A wide variety of scientific disciplines are represented within the Section. One central theme of much of the research is the study of gene structure and function. The reason for this is that the principal consequences of exposure of biological systems to radiation (from nuclear energy production) and to organic and inorganic chemicals (from natural and synthetic fuel production) result from their interactions with the cellular genome. Within this central theme are studies on the structure of DNA and chromatin, the interaction of nucleic acids with heavy metals and certain carcinogenic and mutagenic chemicals, replication and transcription of DNA and their regulation, mechanisms of repair of DNA damaged by radiation or chemicals, and molecular genetics. Some of the Section's major recent contributions in these fields that have also, but not coincidentally, contributed to a more comprehensive understanding of carcinogenesis and mutagenesis are described. Other disciplines within the Section are cryobiology, developmental biology, enzymology, membrane biology, protein biosynthesis, protein chemistry, and x-ray diffraction. Because of their diversity, research in these areas cannot be so easily categorized as having a central theme. However, the relationships of these activities to the Division's general mission to study adverse health and environmental effects of energy production are described. Notable recent achievements in these disciplines are discussed. (ERB)

3613 (PB--296947, pp 385-399) DOSIMETRIC AND RISK/BENEFIT IMPLICATIONS OF AM-241 IN SMOKE DETECTORS DISPOSED OF IN NORMAL WASTES. Wrenn, M.E.; Cohen, N. (New York Univ., NY). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

The risks associated with ^{241}Am in residential-type smoke detectors have been assessed (using a linear dose-response model) by evaluating collective dose commitments (70 years) to the public delivered during normal detector use and disposal. The risk of radiation induced harm results mainly from external exposure, with only a small contribution from waste management practices. A reference case of 100 million detectors distributed in residences at a rate of 10 million per year leads to an external dose of 340 man-rems per year to the US population and a cancer risk of 0.07 cases per year. Collective background is 20 million man-rems per year. Lives saved by detectors from fires are estimated at 2400 cases per year, for a benefit (lives saved) per risk (potential

cancers induced) ratio of 34,000.

3614 (PB--296947, pp 485-491) CESIUM-137 IN COOTS (FULICA AMERICANA) ON HANFORD WASTE PONDS: CONTRIBUTION TO POPULATION DOSE AND OFFSITE TRANSPORT ESTIMATES. Cadwell, L.L.; Schreckhise, R.G.; Fitzner, R.E. (Battelle Pacific Northwest Labs., Richland, WA). May 1979.

From 12. Health Physics Society midyear topical symposium; Williamsburg, VA, USA (12 Feb 1979).

American coots (Fulica americana) were periodically collected from ponds receiving low-level radioactive waste on the Hanford Site and from ponds on a control area. Gut contents and selected tissues were removed and analyzed for ^{137}Cs, ^{90}Sr and gross Pu. The concentration of ^{137}Cs in coot flesh was the highest of the radioelements measured. Coots from the pond receiving the greatest quantity of fission products had the highest ^{137}Cs concentrations. One- and fifty-year ^{137}Cs total-body dose commitments to an individual from ingesting all edible tissues of one Gable Mountain Pond coot were calculated at 1.9 and 2.1 mrem, respectively. The 50-year population dose from the projected harvest of Gable Mountain Pond coots during one year was estimated to be 0.13 person-rem, which is likely high because the coots must leave the Site to be harvested. Total ^{137}Cs export from Hanford Site ponds via coots, having an average body burden of 0.092 μCi, was estimated to be 46 μCi per year.

3615 (PB--298585) NATIONAL ENVIRONMENTAL/ ENERGY WORKFORCE ASSESSMENT. RADIATION PROGRAMS. FINAL REPORT ON PHASE 3. (National Field Research Center, Inc., Iowa City, IA (USA)). Aug 1979. 40p. NTIS, PC A03/MF A01.

The report describes radiation education/ training programs which are currently being conducted in 23 states and one territory. In total there are 39 program entries included in this volume. Although the report attempts to concentrate mainly on radiation protection programs, aspects of technologies, engineering, and public health are included. The criteria for selection of a program included at least three (preferably more) radiation courses required for program completion. Overall, the following types of programs were included: health physics; radiation health and safety; radiological health; nuclear or radiological waste management; and, radiological technician.

3616 (PB--301163) ON BOARD CORROSION ANALYSIS OF A RECOVERED NUCLEAR WASTE CONTAINER. TECHNICAL NOTE. Dexter, S.C. (Delaware Univ., Newark (USA). Coll. of Marine Studies). Aug 1979. 29p. NTIS, PC A03/MF A01.

This report represents initial observations on extent of corrosion of an 80-gallon low-level radiactive waste container after immersion for more than fourteen years. This container was recovered during the 1976 survey of a deepsea radioactive waste dumpsite located at a depth of 2800 m in the Atlantic. During the two hour interval between the time the container first emerged from the ocean until it was encapsulated, the exterior condition of the metal drum, including the appearance of corrosion product films and attached biological organisms, was photographically documented. Representative photographs as well as results of limited chemical and biological analyses are presented. These results are then discussed with respect to previously published deep ocean corrosion data, and recommendations are given for improving shipboard sampling and analytical procedures.

3617 (PNL--1845-44) QUARTERLY REPORT ON THE STRONTIUM HEAT SOURCE DEVELOPMENT PROGRAM, ADVANCED NUCLEAR SYSTEMS AND PROJECTS DIVISION FOR JULY-SEPTEMBER 1979. Fullam, H.T. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Oct 1979. Contract EY-76-C-06-1830. 17p. Dep. NTIS, PC A02/MF A01.

Metallographic examination of the metal specimens exposed to $^{90}SrF_2$ for 20,000 h was completed, as was the examination of the specimens exposed to nonradioactive SrF_2 for 30,000 hours. Fabrication and welding of the prototype capsules to be used in the qualification testing program was completed.

3618 (RHO-SA--81) FACILITY FOR THE ANALYSIS OF RADIOACTIVE SAMPLES BY INDUCTIVELY COUPLED PLASMA SPECTROSCOPY. Homi, C.S.; Manabe, R.M. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). Oct 1979. Contract EY-77-C-06-1030. 18p. (CONF-791049--21). Dep. NTIS, PC A02/MF A01.

From 23. conference on analytical chemistry in energy technology; Gatlinburg, TN, USA (9 Oct 1979).

A 29-channel polychromator and a scanning monochromator are used to determine over 60 elements by inductively coupled plasma (ICP) spectroscopy. The addition of a sample hood, special torch containment box, and an off-gas scrubber system will allow the analysis of low- to intermediate-level radioactive samples. The simultaneous multi-element analysis capabilities of the ICP reduces sample handling and total analysis time. Consequently, the potential for radiation exposure to personnel will be reduced.

3619 (SAND--78-1951) BENEFICIAL USES PROGRAM. PROGRESS REPORT FOR PERIOD ENDING JUNE 30, 1978. (Sandia Labs., Albuquerque, NM (USA)). Jan 1979. Contract EY-76-C-04-0789. 53p. Dep. NTIS, PC A04/MF A01.

The Beneficial Uses Program is a comprehensive program to develop the necessary technologies for cost-beneficial uses of existing and future surplus radioactive materials. The major portion of the work at Sandia is concentrated in two sub-programs: the Waste Resources Utilization Program and the Separation Technology and Source Development Program. Progress is reported on: (1) the Sandia Irradiator for Dried Sewage Solids; (2) bacteriology; (3) mycology; (4) virology; (5) animal feeds containing irradiated sewage solids; (6) use of irradiated sewage sludge as fertilizer; and (7) development of ^{137}Cs radiation sources obtained from radioactive wastes. (TFD)

3620 (SAND--79-2354C) EXPERIMENTAL STUDY OF THE STEADY NATURAL CONVECTION IN A HORIZONTAL ANNULUS WITH IRREGULAR BOUNDARIES. Boyd, R.D. (Sandia Labs., Livermore, CA (USA)). 1980. Contract EY-766-C-04-0789. 66p. (CONF-800723--1). NTIS, PC A04/MF A01.

From 19. national heat transfer conference; Orlando, FL, USA (27 Jul 1980).

The natural convective heat transfer across an annulus with irregular boundaries was studied using a Mach-Zehnder interferometer. The annulus was formed by an inner hexagonal cylinder and an outer concentric circular cylinder. This configuration models, in two dimensions, a liquid metal fast breeder reactor spent fuel subassembly inside a shipping container. During the test, the annulus was

filled with a single gas, either neon, air, argon, krypton, or xenon, at a pressure of about 0.5 MPa. From temperature measurements, both local and mean Nusselt numbers (Nu/sub Δ/) at the surface of the inner cylinder were evaluated, with the mean Rayleigh number (anti Ra/sub Δ/) varying from 4.54 x 10^4 to 0.915 x 10^6 (Δ is the local gas width). The data correlation for the mean Nusselt and Rayleigh numbers is given by anti Nu/sub Δ/ = 0.183 anti Ra/sub Δ/$^{0.310}$.

3621 (SAND--80-0543C) OVERVIEW OF BENEFICIAL USES OF NUCLEAR FISSION PRODUCTS. Sivinski, J.S. (Sandia Labs., Albuquerque, NM (USA)). 1980. Contract EY-76-C-04-0789. 6p. (CONF-800607--21). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

Recoverable or reprocessed nuclear wastes as conservable resources with significant potential benefits for use as heat sources, or as radiation sources for industrial, agricultural, and medical applications are reviewed. (LCL)

3622 (TID--3319-S8-P1) NUCLEAR MEDICINE: A BIBLIOGRAPHY. (Department of Energy, Oak Ridge, TN (USA). Technical Information Center). Sep 1978. 677p. NTIS, PC A99/MF A01.

References to 6208 publications related to nuclear medicine that have been added to the Department of Energy's information data base since July 1976 are contained in this bibliography. Documents dealing with therapeutic irradiation are included in the data base only if there is new information on the technique, if there is significant information on the effects on normal tissues, if evaluations are made of new radiation sources, e.g., pion beams, or if dose or dose distribution measurements are made. Information on uses of isotope tracers in medicine is included if a contribution is made to the technology of tracer usage. References to instrumentation used in nuclear medicine, such as that for detection of radiation or measurement of doses, are included. Extensive bibliographies or reviews are also included.

3623 (TID--3319-S8-P2) NUCLEAR MEDICINE: A BIBLIOGRAPHY. (Department of Energy, Oak Ridge, TN (USA). Technical Information Center). Sep 1978. 665p. NTIS, PC A99/MF A01.

References to 6208 publications related to nuclear medicine that have been added to the Department of Energy's information data base since July 1976 are contained in this bibliography. Documents dealing with therapeutic irradiation are included in the data base only if there is new information on the technique, if there is significant information on the effects on normal tissues, if evaluations are made of new radiation sources, e.g., pion beams, or if dose of dose distribution measurements are made. 3624 METHOD FOR MANUFACTURE OF NEUTRON ABSORBING ARTICLES. Owens, D. (to Carborundum Co The). US Patent 4,213,883. 22 Jul 1980. Filed date 30 Dec 1977. vp.

A one-step curing method for the manufacture of a neutron absorbing article which comprises irreversibly curing, in desired article form, a form-retaining mixture of boron carbide particles, curable phenolic resin in solid state and in particula te form and a minor proportion of a liquid medium, which boils at a temperature below 200*c., at an elevated temperature so as to obtain bonding of the irreversibly cured phenolic polymer resulting to the boron carbide particles and production of the neutron absorbing article in desired form.

3625 PARAMETRIC DEFINITION OF RADIOCESIUM SOURCES. Kenna, B.T. (Sandia Labs., Albuquerque, NM (USA)). International Journal of Applied Radiation and Isotopes ; 31: No. 4, 233-239(Apr 1980).

The use of fissiogenic ^{137}Cs for beneficial uses is a real possibility, although its present availability only as the relatively soluble CsCl form could present difficulties. Other cesium-containing materials are known to posses solubilities much lower than CsCl, but their effectiveness as radiation sources are unknown. A means was developed to compare sources in terms of their radiation efficiencies utilizing absorption coefficients, source radius, and material characteristics. It is shown that cesium-containing sources such as aluminosilicates and glass could be used in place of CsCl. In some cases, these sources would require less ^{137}Cs to provide the same external energy per unit time as does a $^{137}CsCl$ source. This technique should be applicable for intercomparison of sources other than ^{137}Cs, e.g. neither spent fuel rods nor compressed calcined waste can be used in lieu of the previously mentioned ^{137}Cs sources.

3626 EPA SAYS COAL A HAZARD. Agres, T. Industrial Research/Development ; 22: No. 3, 47-48(Mar 1980).

Coal-fired power generating plants are up to 80 times riskier than nuclear power generating plants in terms of danger from radionuclides (certain radioactive atoms) emitted during normal operation, according to a preliminary government report. The figures derive from a study conducted by the Environmental Protection Agency. The report, "Radiological Impact Caused by Emissions of Radionuclides into Air in the United States," was prepared as a result of recent legislation that requires radionuclides to be included among other sources of air pollution. The findings suggest that there are greater risks to the public of developing cancer from radionuclides emitted by coal-fired power plants than by normally-operating nuclear plants.

3627 SOCIETY'S VALUATION OF LIFE SAVING IN RADIATION PROTECTION AND OTHER CONTEXTS. Cohen, B.L. (Pittsburgh Univ., PA (USA); Argonne National Lab., IL (USA)). Health Physics ; 38: No. 1, 33-51(Jan 1980).

Various situations are described in which societal action may be interpreted as a dollar value placed on averting a human fatality, and numerical values are derived in each case. Situations included are a variety of medical screening and medical care programs and of automobile and highway safety measures, food for overseas relief, air pollution control, fire prevention, industrial safety, and several radiation-related activities including standards for radium in drinking water, radwaste systems in nuclear plants, and defence and civilian high-level waste management. Values varying from a few thousand dollars to hundreds of million of dollars per fatality

averted are obtained. An attempt to derive data of this type from polling is described. The problem of discounting when money is spent now to save lives far in the future (as with nuclear waste) is discussed. It is concluded that nearly all of the vast variation in the results is unjustified and represents a need for educating the public, especially in the area of radiation protection.

3628 HYDROGEN PRODUCTION FROM NUCLEAR FISSION PRODUCT WASTE HEAT AND USE IN GAS TURBINES. Nelson, M.E.; Keating, E.L.; Govan, D.R.; Banchak, R.J.; Corpus, J.R. (Naval Academy, Annapolis, MD). International Journal of Hydrogen Energy ; 5: No. 4, 383-399(1980).

An analysis has been made on the feasibility of producing hydrogen using fission product waste heat and its subsequent combustion in gas turbines. The work has been performed in three distinct phases. In the first phase, a system using heat generated from radioactive wastes has been designed which produces saturated steam. This steam is sent through a turbogenerator to produce electricity. The electrical power output of this system has been calculated as a function of fission product decay time, solidified form of fission products, as well as numerous other parameters. In the second phase, the electrical energy produced is used to electrolyze water, which in turn produces hydrogen. The amount of hydrogen produced (lb/h) has been calculated for varying electrical inputs, electrolyzer efficiencies, and feedwater temperatures. This hydrogen is then assumed to be liquified and stored. Finally, the third phase considers the burning of this hydrogen in a standard marine gas turbine.

3629 COMPARISON OF GAMMA-SPECTROMETRIC TECHNIQUES FOR ENVIRONMENTAL MONITORING OF NUCLEAR INSTALLATIONS. Fietz, J.; Knobus, B. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Kernenergie ; 22: No. 12, 424-429(Dec 1979). (In German).

From 11. winter school on radiation protection physics; Gaussig, German Democratic Republic (26 Feb - 2 Mar 1979).

In environmental monitoring of nuclear installations gamma-spectrometric methods make use of both scintillation probes of large volume and Ge(Li) detectors of high resolution. Both types of detectors are compared with respect to their nuclide-specific lower limit of detection. On the basis of measured spectra their use for various measuring problems in environmental monitoring is discussed. Finally, the relationship between the lower limit of detection of a simple Ge(Li) spectrometer and the measurable discharges into the environment is studied for ^{131}J.

3630 NUCLEAR RESEARCH AND DEVELOPMENT IN THE EUROPEAN COMMUNITY. Atom (London) ; No. 278, 328-329(Dec 1979).

Research programmes undertaken by the European Atomic Energy Community and the European Economic Community are discussed. These programmes are carried out both at the Communities own Joint Research Centres (at Ispra, Karlsruhe, Geel and Petten) and also, although centrally managed by the Commission, at research organizations in the Member States. Such research projects include radioactive waste management and storage, decommissioning of nuclear power stations and nuclear fusion. Culham Laboratory is not only the centre for the UKAEA's research into controlled thermonuclear fusion but is also host to the Joint European Torus Joint Undertaking.

3631 IMPLEMENTATION OF THE RADIATION PROTECTION ORDINANCE. HERE: RADIATION PROTECTION GUIDELINES FOR THE USE OF RADIOACTIVE SUBSTANCES AND THE OPERATION OF APPARATUS FOR THE GENERATION OF IONIZING RADIATION AND OF IRRADIATION DEVICES WITH RADIOACTIVE SOURCES IN MEDICAL THERAPY (RADIATION PROTECTION GUIDELINE IN NUCLEAR MEDICINE). Gemeinsames Ministerialblatt, A ; 30: No. 31, 637-662(Nov 1979). (In German).

This guideline is meant to serve both the competent highest land authorities as well as the physician or other medical personnel involved in the application of radioactive substances for medical purposes as a means of explaining the licensing procedure and of defining the rights and duties to be observed, as one of the main goals being to improve coordination in the licensing procedure and to guarantee uniform application of the regulations given, and to facilitate supervision by land authorities in the field of nuclear medicine.

3632 PROGRAMMABLE TEMPERATURE REGULATOR OF VAO-1 FURNACE. Zahalka, F. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Nukleon ; No. 3, 15-21(Nov 1979). (In Czech).

A programmable temperature controller is described for a furnace for high-level waste processing. Furnace temperature is controlled by a program compiled from a combination of 3 parts with different linear increments or decrements of time dependent temperature and 2 parts with isothermal control for over a preset period. The equipment consists essentially of a programming unit, a programmed digital-to-analog converter and a power unit. The design is described in detail and its specifications are given. The maximum operating temperature of 1500 degC may be reached in the furnace charge section.

3633 CONTINUOUS DETECTION OF RADIOACTIVE EFFLUENTS IN LIQUID CHROMATOGRAPHY BY MEANS OF A HIGH EFFICIENCY TOROIDAL TYPE PROPORTIONAL COUNTER. Parker, W.C.; Perez-Alarcon, J.; Flores, D. (Instituto Venezolano de Investigaciones Cientificas, Caracas. Dept. de Quimica). Radiochemical and Radioanalytical Letters ; 40: No. 6, 365-372(17 Oct 1979).

A toroidal, or doughnut-type gas-flow proportional counter specially designed for scanning liquid chromatograph columns is described. The principal features include a well-defined annular window, a large radiation sensitive volume and a series of interchangeable split cores that permit the use of the detector with chromatograph column diameters of 1/8-3/4 inch. The minimum detectable activity for β- and γ-ray emitters was found to be 0.02 μCi for ^{36}Cl, E=0.7 MeV and 3.0 μCi for ^{110}Cd, E=0.08 MeV, respectively. The special geometry of the described detector results in the elimination of dead volume and affords excellent resolution of separating radioactive fractions.

3634 NUCLEAR FUEL TRANSPORTATION CONTAINERS. Smith, A.J. (to British Nuclear Fuels Ltd.). US Patent 4,171,002. 16 Oct 1979. Filed date 20 Oct 1977. 6p.

The invention discloses an inner container for a nuclear fuel transportation flask for irradiated fuel elements comprising a cylindrical shell having a dished end closure with a drainage sump and means for flushing out solid matter by way of the sump prior to

removing a cover.

3635 THEORETICAL COMPARISON OF THE ENHANCED VARIANCE AND TWIN-GATE METHODS FOR MONITORING PLUTONIUM IN WASTE. Deighton, M.O. (UKAEA Atomic Energy Research Establishment, Harwell). Nuclear Instruments amp Methods ; 165: No. 3, 589-605(15 Oct 1979).

Certain plutonium-monitoring systems, especially those used for checking and classifying drums of mixed waste, depend on detecting paired neutrons originating from spontaneous fissions of ^{240}Pu. Such neutrons can be detected with reasonable efficiency by suitable counters but, as they are usually accompanied by a high random background of other neutrons, the problem arises of separating the 'signal', i.e. pairs, from the 'noise' or random pulses. Various ways of doing this have been devised, e.g. variable dead-time counters, arrangements of coincidence gates for measurement of the pulse interval distribution. A recent suggestion for doing this was to look for deviation from a true Poisson distribution in the actual numbers of counts registered in a large number of equal time intervals. This paper is a theoretical analysis of the counting statistics to determine the nature and amount of the deviation and thus estimate the accuracy of fission-pair rate determinations in a few typical cases. As a yardstick for comparison, the authors have also analysed a simple form of twin-gate method, in which total counts accumulated via a time-gate triggered by some of the pulses, are compared with counts in another gate triggered after a suitable delay.

3636 LEUKAEMIA AND RADIATION. Schofield, G.G. (British Nuclear Fuels Ltd., Sellafield). Lancet, The ; 2: No. 8146, 802-803(13 Oct 1979).

CONTAMINATION;DOSE-RESPONSE RELATIONSHIPS; HUMAN POPULATIONS;LEUKEMOGENESIS;MORTALITY; RADIOACTIVE EFFLUENTS;RADIOSENSITIVITY;SEAFOOD; UNITED KINGDOM

3637 DESIGN AND EVALUATION OF CUSTOM ^{133}XE TRAPPING AND HOLDING SYSTEM FOR ANIMAL RESEARCH STUDIES. Miller, K.L.; Pennock, R.E.; Bowman, G.; Hernandez, M.J. (Pennsylvania State Univ., Hershey (USA). Milton S. Hershey Medical Center). Health Physics ; 37: No. 3, 414-417(Sep 1979).

A cell for the trapping and holding of ^{133}Xe by activated charcoal was designed and tested for use in animal experiments. The cell was made from copper tubing with end caps and nipples for attachment of tubing and valves. Results of test indicated that up to 4 animals per day could be studied with complete trapping of all activity in a single cell. 16 of such cells allow continuous studies to be made on 4 animals a day using a different cell each day. By the time each cell is re-used the trapped ^{132}Xe has decayed for at least 23 days thus greatly reducing any exhausted activity. The cells were arranged in a wall-mounted filter bank inside a shielded cabinet. The outlet of the filter bank was connected into the exhaust stream of a fume hood.

3638 LIMITS OF THE CONCEPT OF RADIATION MINIMISATION. Schattke, H. Deutsches Verwaltungsblatt mit Verwaltungsarchiv ; 94: No. 17/18, 652-658(Sep 1979). (In German).

The author discusses at length the basic concept of the Radiation Protection Ordinance, i.e. to keep population exposure and environmental radiation exposure as low as possible. To his opinion, this concept is limited by technical and economic aspects. If too much emphasis were laid on protection, the promotion of nuclear power as stated in the Atomic Energy Act would be hindered. The order in which the two legal goals are to be considered depends on the degree to which one of these goals is endangered.

3639 EXPERIMENTAL STUDY OF THE TRAPPING AND RELEASE OF KRYPTON IN NICKEL. Donnelly, S.E.; Ingram, D.C.; Armour, D.G. (Salford Univ. (UK). Dept. of Electrical Engineering). Radiation Effects ; 42: No. 3-4, 179-184(Sep 1979).

An experimental study is reported of the trapping and release of krypton implanted into nickel at low energies (< 3 keV). The experimental technique used was Thermal Evolution Mass Spectrometry. Various peaks have been observed in the release rate spectra at temperatures similar to those for the inert gases helium, neon and argon, indicating that the trapping and release behaviour of krypton in nickel is not significantly different from that of the other gases. In common with the other gases an important parameter which defines the overall form of the evolution spectrum was found to be implanted gas distribution. Saturation curves for Kr incident on Ni(111) and Ni (110) have been obtained and indicate that gas retention is greatest for higher energy implantation into the more transparent (110) surface. For 3 keV Kr^+ incident on Ni (110) the maximum quantity of gas retained in the target was found to be approximately 2.5×10^{15} ions cm^{-2}.

3640 IMPROVED ASSEMBLY FOR THE TRANSPORT OF FUEL ELEMENTS. Myers, G. (to UKAEA Headquarters, London). British Patent 1,554,605/A/. 25 Aug 1979. 6p.

An improved assembly is described for the transport and storage of radioactive fuel elements. The system consists of a transport flask in which the fuel element holder is placed in such a way that the elements may be submerged in liquid within the flask and the assembly used in one orientation for loading the fuel elements and in another orientation for transporting them. The assembly has a self-regulating loading system comprising reservoirs for containing liquid and pressurising gas, the arrangement for the reservoirs being such that in either orientation of the assembly liquid is maintained in all the reservoirs to prevent egress of the pressurised gas and to compensate for volume changes arising from temperature variations within the flask.

3641 STEEL CONTAINER FOR ACCOMMODATING SPENT FUEL ELEMENTS. Elbinger, H.; Klein, D.; Kroll, H.; Luthardt, G. (to Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,804,828/A/. 9 Aug 1979. 5p. (In German).

The steel containers which are used for intermediate storage of fuel elements are provided with an aluminium layer 0.5 to 2mm thick to connect T permeations on the outer and inner surface. The same thing applies for the lid of the container.

3642 SLUDGE DEWATERING BY BELT PROCESS. Soderberg, R.L.; Dorman, K.R. (USBM). Mining Congress Journal ; 65: No. 8, 29-32(Aug 1979).

The belt process is proposed as a possible disposal method for mill tailings, floatation tailings, and coal and phosphate wash plant

effluents. Test results from a belt process run on coal sludge at the Washington Irrigation and Development Co., Centralia, Wash., and from a series of tests performed on various mill minings by USBM at the Spokane Mining Research Center, Wash., are presented. Because the belt process produces a relatively dry solid cake and has low maintenance and operating costs, it shows good potential for eliminating tailings. (1 diagram, 3 graphs, 2 photos, 4 tables)

3643 ELECTRICITY GENERATOR OPERATED BY RADIATION ENERGY. Gravisse, P. (to Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,802,089/A/. 19 Jul 1979. 9p. (In German).

Kr 85, for example, or solid radioactive waste products are used as a radiation source in a steel cylinder which is surrounded by a spherical plastic matrix. The radiation emitted is absorbed by the PMMA, PVC, silicon, or an aromatic hydrocarbon of the plastic matrix. The thus produced long-wave secondary radiation in the range of 7000 to 8000 A is absorbed by photoelements which are arranged around the sphere and are connected in parallel or in series.

3644 DRY CONTAINMENT OF RADIOACTIVE MATERIALS. Williams, C.E. (to NL Industries, Inc., Hightstown NJ (USA)). British Patent 2,010,164/A/. 27 Jun 1979. 11p.

A cask for the dry containment of radioactive material, e.g. irradiated nuclear fuel elements has a cover which contains purge and drain passageways having valve connections. These passageways are sealed by after-purge cover seals which are clamped over them and to the outer surface of the cover. The cover seals are tested by providing them with a pair of concentric ring seal elements squeezed between the cover seal and the outer surface of the cover and by forcing a gas under pressure into the annular region between the seal elements via a T-connection and monitoring the pressure between the seal elements by means of a pressure gauge.

3645 THOUGHTS ON THE APPLICATION OF FISSION PRODUCT NUCLIDES FROM RADIOACTIVE WASTE. Chemiker-Zeitung ; 103: No. 6, 207-210(Jun 1979). (In German).

The utilization of the fission products of the fission of heavy atom nuclei, preferably of xenon, palladium and rhodium isotopes, as well as tritium, and the use of possible nuclides Pm 147, Cs137, Kr 85 and Sr90 as radiation sources are considered.

3646 TRANSPORT CONTAINER FOR SPENT NUCLEAR REACTOR FUEL ELEMENTS. Sieber, R.; Naumann, K.H. (to Gesellschaft zur Auslegung von Nuklear-Komponenten m.b.H. (GANUK), Goslar (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,749,690/A/. 10 May 1979. 11p. (In German).

The transport container consists of a hollow cylinder with container closures and outside cooling ribs. The main container is made in the form of a double steel jacket. The intermediate space is filled by radiation shielding material, which also favours of heat. It consists of individual cast steel rings laid on top of each other, whose contact surfaces are stepped. All gaps are filled with a lead-tin alloy so that there are no empty spaces.

3647 METHOD TO TRANSPORT AND STORE RADIOACTIVE RADIATING ARTICLES OR SUBSTANCES. SYSTEM TO PERFORM THIS METHOD AND TRANSPORTABLE TRANSPORT OR STORAGE CONTAINERS TO CARRY OUT THE METHOD AND FOR USE IN CONNECTION WITH SUCH A SYSTEM. Vox, A. (to Vox Lumatic G.m.b.H., Ostfildern (Germany, F.R.); Amtrust A.G., Luzern (Switzerland); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,747,080/A/. 26 Apr 1979. 33p. (In German).

A suggestion is made to fill radioactive articles, e.g. fuel elements, into transport containers and then to cover these with a salt melt (at least 41% salt) which solidifies at temperatures > 98°C, so that by hardening of the melt, one may transport or store these as solid blocks. If desired, one can remelt the salt melt by heating slightly and extract the articles. Insulating materials (such as, e.g., glass fibres) can be added to the salt mixture, the hardened melt can also be covered by bitumen, concrete etc. Apparatus to carry out this proposed method is presented in detail.

3648 FACILITY FOR THE DECONTAMINATION OF FUEL ELEMENT TRANSPORT CASKS. Gottwald, K. (to Kraftanlagen A.G., Heidelberg (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,745,626/A/. 19 Apr 1979. 11p. (In German).

Before transporting them to the reprocessing plant the transport casks containing fuel assemblies are cleaned on the outside. This is achieved by means of a tank which can be closed and into which the transport cask is inserted. Within the tank the cask is standing on a roller drive mechanism with the aid of which it can be revolved. In the bottom, shell, and cover region there are adjustable nozzles by means of which the transport cask can be sprayed with washing water all-round. After cleaning, drying is performed at subatmospheric pressure by means of stationary hot-air nozzles also arranged in the tank.

3649 FIRE RESISTANT NUCLEAR FUEL CASK. Heckman, R.C.; Moss, M. (to Dept. of Energy). US Patent 4,147,938. 3 Apr 1979. Filed date 7 Feb 1978. 6p.

PAT-APPL-875,821.

The disclosure is directed to a fire resistant nuclear fuel cask employing reversibly thermally expansible bands between adjacent cooling fins such that normal outward flow of heat is not interfered with, but abnormal inward flow of heat is impeded or blocked.

3650 METHOD FOR COOLING A FUEL ELEMENT TRANSPORT CASK. Fechner, B.; Hahn, H.; Mackert, P. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,747,601/B/. 15 Feb 1979. 4p. (In German).

The internal space of the transport cash is part of a cooling circuit with water as a coolant. The coolant injection rate is limited by the pressure within the transport cask. While being injected the water is evaporating. Subsequently the steam produced is removed by means of a condensation device in the form of a water jet pump and supplied to a gas plenum that is partly filled with coolant and has got a tangential separator. This one is connected with the water jet pump. During the cooling process the pressure in the transport cask lies below 10 bar. By means of controlled steam cooling cladding damages, e.g. by quenching effects, are avoided.

3651 FUEL ELEMENT TRANSPORT CONTAINER. Schaaf, W. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,732,791/A/. 15 Feb 1979. 6p. (In German).

The proposal concerns the configuration of the lid of a fuel element transport container which is characterised by the fact that a circular protective lid penetrating into the loading opening covers the sealing surfaces when the transport container is open.

3652 DESIGNING INSTRUMENTS FOR MEASURING ACTIVITY OF LIQUIDS. Gilar, O.; Kula, J.; Novakova, O.; Slezak, V. (Tesla, Premysleni (Czechoslovakia). Vyzkumny Ustav Pristroju Jaderne Techniky). Jaderna Energie ; 25: No. 2, 60-64(Feb 1979). (In Czech).

The requirements are briefly outlined for equipment for radionuclide concentration measurement in liquids in different fields, such as checks of potable and service water for the population, utility water in uranium ore mining, in the operation of nuclear power facilities and radioisotope laboratories, in the application of tracer techniques in monitoring technological processes in industries. The analysis of the requirements offered possible configurations for continuous and discontinuous signal evaluation, mainly for scintillation detectors. Basic characteristics are compared of four selected detection units and the evaluation units are briefly described for continuous and discontinuous measurements.

3653 APPLICATION STATE OF RADIOISOTOPES FOR MEDICAL USE. Nakajima, T. (Japan Radioisotope Association, Tokyo). Eizo Joho, Medikaru ; 11: No. 2, 127-133(Feb 1979). (In Japanese).

Application of unsealed radioisotopes as radiopharmaceuticals has been increasing year by year with the development of nuclear medicine. As for the radioisotopes for in vivo use which are internally administered and are detected by external scanning, the consumption of Tc-99 m drugs has increased rapidly. The sales of radiopharmaceuticals for in vivo use including ^{131}I, etc. amounted to four billion Yen in 1977. The consumption of the isotopes used in vitro for radioimmunoassay has made more rapid increase, and the sales of radiopharmaceuticals for in vitro use amounted to seven billion Yen in 1977. Radiopharmaceuticals have been used in 1,134 institutes all over Japan in 1978. 534 among them have applied radiopharmaceuticals to both in vivo and in vitro uses. Radioactive wastes have been increasing with the application of these unsealed radiopharmaceuticals, and their disposal method should be examined as there is a limit in their storage.

3654 RADIOISOTOPE HEATING BLOCK. Wenk, E. (to Dornier-System G.m.b.H., Friedrichshafen (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,447,176/C/. 18 Jan 1979. 3p. (In German).

The waste decay heat that emanates from calcinated and glazed radioactive wastes is used with the help of heat transfer pipes for seawater-distillation in desalination plants. Therefore, the fission products and the heat transfer pipes are alternatively piled up to a homogeneous radioisotope heating block. The fission products arranged at the periphery are covered by heat transfer-pipes or -plates. Their dissipation side is connected with evaporators or with heat exchangers which are flowed about by seawater.

3655 NUCLEAR POWER AND THE ENVIRONMENT. Hill, J. (UKAEA). British Journal of Radiology ; 52: No. 613, 2-13(Jan 1979).

The lecture concentrated on the problems of harmful effects of low levels of radiation, and radioactive waste management. Doses to the U.K. population from natural background and from man-made environmental radiation from the use of radioactive materials and X-rays in industry and medicine, from fallout from nuclear weapons tests, and from the nuclear industry are compared, and the regulations which apply to radioactive wastes and emissions are described. The hazard from small doses of radiation, particularly the probability of carcinogenesis, is discussed in the light of statistics of mortality from different causes and in different occupations. Finally, the treatment and disposal of long-lived fission product wastes is reviewed. It is concluded that nuclear power can provide the U.K. with all the energy it requires with less impact upon the environment than that of alternative energy sources.

3656 RADIATION EXPOSURE IN THE VICINITY OF NUCLEAR POWER PLANTS. GRS (Ges. Reaktorsicherheit) Kurz-Inf., Reihe K.; 13: No. 1, 1(1979). (In German).

3657 RADIOLOGICAL SAFETY ASPECTS OF THE OPERATION OF ELECTRON LINEAR ACCELERATORS. Swanson, W.P. (Stanford Linear Accelerator Center, CA (USA)). Vienna; IAEA (1979). 327p.

This manual is intended as a guide for the planning and implementation of radiation protection programmes for all types of electron linear accelerators. Material is provided for guidance in the planning and installation stages, as well as for the implementation of radiation protection for continuing operations. Because of their rapidly growing importance, the problems of installation and radiation safety of standard medical and industrial accelerators are discussed in separate sections. Special discussions are devoted to the radiation protection problems unique to electron accelerators: thick-target bremsstrahlung, the electromagnetic cascade, the estimation of secondary-radiation yields from thick targets, and instrumental corrections for accelerator duty factor. In addition, an extensive review of neutron production is given which includes new calculations of neutron production in various materials. A recalculation of activation in a variety of materials has been done for this manual, and specific gamma-ray constants have been recalculated for a number of nuclides to take into account the contribution of K X-rays. The subjects of air and water activation, as well as toxic gas production in air have been specially reviewed. Betatrons and electron microtrons operating at the same energy produce essentially the same kind of secondary radiation as electron linacs and the material given in this manual is directly applicable to them.

3658 LABORATORY TRAINING MANUAL ON THE USE OF

NUCLEAR TECHNIQUES IN ANIMAL RESEARCH. Vienna; IAEA (1979). 299p.

The manual is designed to give the animal science researcher the basic terms and principles necessary for understanding radiation, its detection and measurement, its associated hazards, and some of the more common applications. Basic laboratory exercises to illustrate this purpose are included.

3659 DECONTAMINATION OF WASTE RADIOACTIVE POLLUTED SOLUTIONS IN RADIATION TREATMENT. Simova, G.; Boyadzhiev, A.; Mikhailov, M.G.; Shopov, N. (Meditsinska Akademiya, Sofia (Bulgaria). Nauchen Inst. po Rentgenologiya i Radiobiologiya). Rentgenologiya i Radiologiya ; 18: No. 1, 25-28(1979). (In Bulgarian).

The decontamination capacity of solutions of the trivial cleaning Bulgarian preparations ''Mipro'', ''Sana'', ''Synthek'' and ''Univer'' for different surfaces (steel, glass, PVC and linoleum) contaminated with cesium-134, strontium-85 or cerium-144 chlorides, was studied. Concentrations from 5 to 15 g/l of the solutions used in this study displayed a degree of cleaning over 90%. Higher concentration of the solution does not improve its cleaning capacity. For evaluation of foam formation by the solutions, the so called ''foam column stability coefficient'' has been adopted. This coefficient represents the ratio between the height of the foam column and the time of its half life, referred to the time for the foam column formation when blown through with a constant air current. On the basis of this index, solutions of the preparation ''Mipro'' proved to be the best ones for decontamination in the whole investigated concentration span, the foam column stability coefficient for the solutions of this preparation is with two orders lower than the respective coefficient of the other preparations. It was experimentally established that radiation treatment of radio-contaminated solutions reduces the foam column stability coefficient. Radiation treatment should be carried out in a gamma field, realizing at least one megarad within an acceptable for the liquid wastes time period.

3660 ADSORPTION OF TETRANITRONITROSYLRUTHENATE ON ACTIVATED CHARCOAL. Akatsu, E.; Yonezawa, C.; Motojima, K. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Annals of Nuclear Energy ; 6: No. 7-8, 399-404(1979).

Sodium tetranitronitrosylruthenate $Na_2[RuNO(NO_2)OH]2H_2O$, labelled with ^{106}Ru, was prepared and its properties and adsorption behavior on activated charcoal were studied. The ruthenate was well adsorbed on activated charcoal of Tsurumicoal HC-30 (8-28 mesh). The adsorbability was increased by addition of the organic cation of zephiramine or methylene blue at pH4-8. The adsorbability was lowered by the introduction of dodecylbenzenesulfonate or Emulgen 220, but raised by further addition of zephiramine. The adsorbed ruthenate was not easily desorbed with water.

3661 NUCLEAR POWER AND ENVIRONMENTAL RADIOACTIVITY. REGULATIONS. Medrano, G. (INTESCA, Madrid (Spain)). Energia Nuclear (Madrid) ; 23: No. 121, 329-338(1979). (In Spanish).

Regulations from different european countries and from USA are presented, defining limits for doses and radioactive effluents produced in the operation of nuclear installations.

3662 PREPARATION AND CONTROL OF RADIOPHARMACEUTICALS IN HOSPITALS. A GUIDEBOOK. Kristensen, K. (National Health Service, Copenhagen (Denmark)). Vienna; IAEA (1979). 119p.

This guidebook covers the work commonly organized as part of the work in the hospital. It does not cover the manufacture of radiopharmaceuticals on an industrial scale. The work is characterized by the small scale on which manufacture and preparation of radiopharmaceuticals take place.

3663 Radioaktive 'Niedrig'-Strahlung. Strahlenschaeden bei Kindern und Ungeborenen. (LOW LEVEL RADIATION. RADIATION INJURIES OF CHILDREN UND FETUSES). Sternglass, E.J. Berlin, Germany, F.R.; Oberbaum (1979). 163p. (In German).

In this book, Sternglass compiles data and facts to prove his hypothesis that even very small radiation doses can be of great danger for the human organism - especially for infants and fetuses -, and that there is no treshold value for the danger of radioactivity. He starts with the detection of radioactive fallout following nuclear weapons tests and its effects and then proceeds to the environmental pollution in the neighbourhood of nuclear power plants. (MG).

3664 DATA ON THE ACTIVATION AND DISMANTLING OF THE 155MEV SYNCHROCYCLOTRON OF THE INSTITUTE OF NUCLEAR PHYSICS AT ORSAY. Choquet, R. (Institut National de Physique Nucleaire et de Physique des Particules, 75 - Paris (France)); Clapier, F. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). Radioprotection ; 14: No. 2, 81-87(1979). (In French).

From Information session on the decommissioning and the dismantling of nuclear installations; Paris, France (31 Mar 1977).

After twenty years of operation, the dismantling of a 155 MeV proton Synchrocyclotron led to define working conditions and to examine the final destination of materials affected by radioactivation by direct or indirect ionizing radiation. The dismantling operation and the separation of radioactive material after consideration of activation analysis data and indirect measuring methods adopted are described. Arising from this experience suggestions are made, for if personnel dose limitation is attained, it appears that solutions must still be found to process important amounts of metals of rather small specific activity; it should be possible to handle the treatment of waste much more satisfactorily in terms of cost and ecology.

3665 Offene radioaktive Stoffe. Umgang, Lagerung, Verwendung und Beseitigung in Krankenhaeusern und medizinischen Forschungseinrichtungen. (UNSEALED RADIOACTIVE MATERIALS. HANDLING, STORAGE, USE, AND DISPOSAL IN HOSPITALS AND MEDICAL RESEARCH INSTITUTIONS). Stuttgart, Germany, F.R.; Gustav Fischer Verl. (1979). 76p. (In German).

To supplement its general recommendations, the ICRP has also elaborated specific recommendations for the handling of unsealed radioactive substances in medicine and medical research. Although these recommendations are mainly addressed to authorities granting licenses for the handling of radioactive materials, they contain many practical hints which makes them indispensible to those working in nuclear medicine or doing medical research

with nuclear materials, i.e. physicians and researchers.

3666 INCIDENCE OF MYELOID LEUKAEMIA IN LANCASHIRE. Baverstock, K.F.; Papworth, D.G.; Vennart, J. (Medical Research Council, Harwell (UK). Radiobiological Research Unit). Lancet, The ; 2: No. 8156-7, 1362-1363(1979).
Calculations are made of the radiation dose required to produce the doubling of incidence of myeloid leukaemia reported in Lancashire during 1971-76. In order for radiation from the eating of fish contaminated with radioactive Cs to produce such a doubling, each member of the population would need to receive an average dose of about 2 rem per year between 1957 and 1968. Such doses are shown to be highly unlikely; indeed, it is shown that the average dose rate is likely to be 1000 times less than this dose. In conclusion, it is unlikely than any case of leukaemia registered in Lancashire has been the result of discharges of radioactive waste to the Irish Sea.

3667 SIGNIFICANCE OF IODINE RADIOACTIVE ISOTOPES IN THE PROBLEM OF RADIATION SAFETY OF NUCLEAR FUEL CYCLE. Malenchenko, A.F.; Mironov, V.P. Vestsi Akademii Navuk Belaruskai SSR, Seryya Fizika-Energetychnykh Navuk ; No. 4, 28-36(1979). (In Russian).
The data on actual wastes of nuclear-power plants, environmental distribution and biological effects of iodine radioactive isotopes have been analyzed. Dose-response relationship is estimated as well as its significance for struma maligna development under ionizing radiation and the contribution of iodine radionuclides resulted from nuclear power engineering to this process.

3668 SOLID NEUTRON SHIELD MATERIAL TESTS. Allen, G.C. Jr.; Pope, R.B.; Rack H.J. (Sandia Labs., Albuquerque, NM). Transactions of the American Nuclear Society ; 33: 456-457(1979). (CONF-791103--).

3672 RADIOLOGICAL SURVEILLANCE OF AIRBORNE CONTAMINANTS IN THE WORKING ENVIRONMENT. Vienna, Austria; IAEA (1979). 149p.
Contamination of the air of the working environment may result from incidental or accidental releases during the handling of radioactive materials. Representative sampling and measurement are complicated by a variety of factors, arising mainly from the physical and chemical properties of radioactive aerosols. The following topics are presented in detail: sources and types of airborne contaminants, sampling techniques and instruments, measurement techniques and instruments, interpretation of measurements, examples of air monitoring programmes.

3673 USAGE OF RADIOACTIVE WASTES FOR DISTRICT HEATING. Galaktionov, I.V.; Chernyaev, V.A.; Ivanov, G.V.; Turchin, A.V. (comp.). Atomnaya Tekhnika za Rubezhom ; No. 6, 20-23(1979). (In Russian).
Technical and economic problems of using radioactive waste heat of nuclear power industry for production of low pressure steam in nuclear waste boiler (NWB) are considered. The NWB design which provides safe and reliable storage of radioactive waste, besides heat generation is described. The NWB consists of: I. concrete zone of storing fresh fuel elements which arrived after waste processing, and spent fuel elements, which are transported for disposal later on; 2. water circulating cooling loop with heat exchangers. The comparison between organic fuel boiler and NWB shows the advantages of the latter when the fuel element cost is no more than 11 dollar/kg.

3674 DEVICE FOR FILTERING GASEOUS MEDIA. Benzel, M. (to Krantz (H.) Lufttechnik, Aachen (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,721,588/A/. 16 Nov 1978. 11p. (In German).
The air filter system for gaseous radioactive substances consists of a vertical chamber with filter material (charcoal, e.g. impregnated). On one side of the chamber there is an inlet compartment and an outlet compartment. On the other side a guiding compartment turns the gas flow coming from the natural-air side through the lower part of filter chamber to the upper part of the filter. The gas flow leaves the upper part through the outlet conpartment as cleaned-air flow. The filter material may be filled into the chamber from above and drawn off below. For better utilization of the filter material the filter chamber is separated by means of a wall between the inlet and outlet compartment. This partition wall consist of two sheets arranged one above the other provided with slots which may be superposed in alignment. In this case filter material is tickling from the upper part of the chamber into the lower part avoiding to form a crater in the filter bed.

3675 IMPROVEMENTS IN NUCLEAR FUEL TRANSPORTATION CONTAINERS. Smith, A.J. (to British Nuclear Fuels Ltd., Risley). British Patent 1,532,425/A/. 15 Nov 1978. 6p.

An inner container for use inside a transport flask for irradiated nuclear reactor fuel elements is described. The container comprises a cylindrical shell having a dished closure at one end and a detachable lid at the other end and a partitioning structure defining compartments in the shell each for receiving an elongated nuclear reactor fuel element disposed with axis parallel to the axis of the shell. Sealable ducts extend through the lid for injecting streams of flushing liquid along the axis of each compartment to the dished closure, the dished closure having a drainage sump and ducts arranged for discharging matter through the other end of the inner container.

3676 CALCULATION OF DISTRIBUTION RATIOS OF RARE EARTH ELEMENTS IN MULTISTAGE COUNTER CURRENT EXTRACTION WITH HDEHP. Nakamura, H.; Tachimori, S.; Sato, A. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Journal of Nuclear Science and Technology (Tokyo) ; 15: No. 11, 829-834(Nov 1978).

Extraction of rare earth elements with di(2-ethylhexyl)phosphoric acid (HDEHP)-tributyl-phosphate (TBP)-n-paraffin system was studied as functions of concentrations of the quantity of H^+ released into aqueous phase. The ratio of rare earth elements extracted into organic phase was found to depend on the initial composition of the aqueous solution. The ratios determined for various concentrations of rare earth elements and acid were shown as a linear function of the concentrations of acid in aqueous phase and that of rare earth elements in organic phase after extraction. The acid concentration in aqueous phase after extraction can be estimated from any initial concentrations of acid and rare earth elements in aqueous solution by this equation. Also a graphic process of experimental results could give approximate values of distribution ratio for various initial concentrations of rare earth elements and nitric acid. For calculation of the distribution ratio of each stage in multi-stage counter current extraction, a computation code was programmed on the basis of the graphical process. The calculated values agreed well with those obtained experimentally in multistage extraction.

3677 CONTROLLING THE USE OF HAZARDOUS MATERIALS IN RESEARCH AND DEVELOPMENT LABORATORIES. Reynolds, J.M. (General Electric Co., Schenectady, NY (USA). Research and Development Center). Journal of Hazardous Materials ; 2: No. 4, 299-308(Nov 1978).

A systematic approach for controlling the use of hazardous materials in a large industrial research and development complex is described. The basic concepts, although fundamental, require the pooling of several technical disciplines. Although, a system may be in place and is functioning effectively, new governmental restraints are constantly occurring, hence, the program is continually expanding.

3678 ECOLOGICAL PROBLEMS OF NUCLEAR POWER. Babaev, N.S.; Demin, V.F.; Kuz'min, I.I.; Stepanchikov, V.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). Priroda (Moscow) ; No. 10, 3-16(Oct 1978). (In Russian).

Modern power sources including nuclear one are characterized. Basic information on radiation protection of man and biosphere is presented. Problems of radiation effect of nuclear fuel cycle enterprises on population and environment are discussed. Comparative evaluation of nuclear and thermal power effect on biosphere is made. It is shown that nuclear power is the safest power source at the present development state. The conclusion is drawn that the use of nuclear energy controlled and limited by scientifically founded norms does not present radiation hazard for population and environment.

3679 DESIGN OF A MINIATURE DIRECTIONAL ANTENNA FOR GEOPHYSICAL PROBING FROM BOREHOLES. Lytle, R.J.; Laine, E.F. (Univ. of California, Livermore). Contract W-7405-ENG-48. IEEE (Institute of Electrical and Electronics Engineers) Transactions on Geoscience Electronics ; GE-16: No. 4, 304-307(Oct 1978).

A design for a miniaturized directional antenna for use in geophysical exploration from boreholes is described. Mathematical results are given which indicate the antenna characteristics. The concept involves an antenna eccentrically located within a high-dielectric-constant of high-permeability sheath.

3680 HEALTH PHYSICS CONSIDERATIONS IN INTRAINSTITUTIONAL MOBILE NUCLEAR MEDICINE. Murphy, P.H. (Baylor Univ., Houston, TX (USA). Coll. of Medicine). Health Physics ; 35: No. 4, 565-568(Oct 1978).

The use of a mobile scintillation camera within a hospital enables imaging procedures to be used on patients such as those in critical care units, who cannot be transported to the central nuclear medicine laboratory. Transport throughout the hospital of the radiopharmaceuticals for use with the mobile system and the associated radiation safety precautions are discussed. The nuclides most frequently used are sup(99m)Tc and ^{133}Xe. It is shown that radiation exposure to hospital personnel can be kept well below recognised guidelines when using sizeable quantities of radionuclides remote from the controlled environment of the central laboratory. Special care is needed in disposing of radioactive waste, particularly ^{133}Xe gas, which must be collected and returned to the laboratory. There is a need for education and reassurance of nurses concerning the use of ionizing radiation and hazards to them from patients containing radioactive material.

3681 SYSTEM FOR VENTILATING AIR CONTAMINATED WITH RADIOACTIVITY. Moriyama, N.; Sakairi, T. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1953-10,7598/A/. 19 Sep 1978. 4p. (In Japanese).

The purpose of the study was to provide a system wherein when the radioactive concentration of indoor air which has been contaminated with water vapor having radioactivity reaches a predetermined value, radioactive iodine in the exhaust air is removed, and thereafter the air is exhausted thereby to effectively reduce radioactive iodine contained in the air. The radioactive concentration of indoor air is detected from the temperature difference between air introduced in the chamber through an air supply duct and exhaust air exhausted through an exhaust duct. Only when the detected value exceeds a predetermined value, exhaust air is passed through a device for removing radioactive iodine, and exhausted through the exhaust duct. In any case other than the above described case exhaust air is exhausted directly through the duct.

3682 METHOD AND ARRANGEMENT FOR LOADING AND UNLOADING SPENT FUEL SHIPPING CASKS. Sieber, R. (to Gesellschaft zur Auslegung von Nuklear-Komponenten m.b.H. (GANUK), Goslar (Germany, F.R.)). German(FRG) Patent 2,706,042/A/. 17 Aug 1978. 15p. (In German).

The LWR fuel assemblies are loaded and unloaded from their shipping casks into a water pool without contamination of the surface of shipping cask. For this purpose it is deposited with sufficient safety clearance above the water level on an additional tube-shaped shield. This additional shield is standing on a storage rack. Within the shipping cask there is a cylindrical charging cage which together with the bottom of the shipping cask can be moved down through the additional shield by means of a crane hoist.

3683 EFFECTS OF THERMAL EFFLUENT ON BODY CONDITION OF LARGEMOUTH BASS. Gibbons, J.W. (Savannah River Ecology Lab., Aiken, SC (USA)); Bennett, D.H.; Esch, G.W.; Hazen, T.C. Nature (London) ; 274: No. 5670, 470-471(3 Aug 1978).

3684 CORROSION RESISTANCE OF MAGNESIUM-BERYLLIUM ALLOYS IN POTASSIUM BICHROMATE AND CARBON DIOXIDE AQUEOUS SOLUTIONS AT DIFFERENT TEMPERATURES AND PRESSURES. Petlitsa, A.P.; Ermolaev, M.I.; Kapitanov, V.F.; Dugin, N.A. Atomnaya Energiya ; 45: No. 2, 136-137(Aug 1978). (In Russian).

AQUEOUS SOLUTIONS;BERYLLIUM ALLOYS;CARBON DIOXIDE;CHEMICAL REACTION KINETICS;CHROMATES; CORROSION;CORROSION RESISTANCE;FUEL CANS; MAGNESIUM ALLOYS;MEDIUM PRESSURE;MEDIUM TEMPERATURE;POTASSIUM COMPOUNDS;PRESSURE DEPENDENCE;SPENT FUEL STORAGE;TEMPERATURE DEPENDENCE

3685 DEVELOPMENT OF A RADON BARRIER. Culot, M.V.J. (Westinghouse Electric Corp., Monroeville, PA (USA). Nuclear Energy Systems); Schiager, K.J.; Olson, H.G. Health Physics ; 35: No. 2, 375-380(Aug 1978).

High radon progeny exposures exist in structures where uranium mill tailings have been improperly used as a concrete aggregate constituent and as a leveling or backfill material. The application of a radon barrier on the indoor face of these structures' foundations is considered a potential means to reduce the radon progeny exposure to the occupants. The methods used and the results obtained in the search for a material capable of inhibiting or entirely blocking diffusion of a noble radioactive gas such as radon are presented; a material which would simultaneously offer good durability and be practical. Demonstration of the method's applicability is shown by successful reduction of radon concentrations to subbackground levels in an experimental building built atop uranium mill tailings.

3686 ION-EXCHANGE PROPERTIES OF CESIUM AND STRONTIUM INTO ZEOLITES FROM SODIUM SALT SOLUTIONS. Kanno, T.; Hashimoto, H. (Tohoku Univ., Sendai (Japan). Research Inst. of Mineral Dressing and Metallurgy); Ohtani, T. Tohoku Daigaku Senko Seiren Kenkyusho Iho (Bulletin of the Research Inst. of Mineral Dressing and Metallurgy, Tohoku University) ; 34: No. 1, 53-57(Jun 1978). (In Japanese).

The ion-exchange properties of cesium and strontium into zeolite from sodium salt solution has been studied in zeolite A, zeolite X, zeolite Y, mordenite and clinoptilolite. The distribution of cesium into mordenite from about 1 -- 2 M sodium chloride and sodium hydroxide solutions is considerably larger than that into zeolite A. The distribution coefficient for 2 M solution of sodium salts was about 300. Therefore, the separation of cesium from sodium salt solution is possible by using mordenite. The distribution of strontium into zeolites form 1 -- 2 M solutions of sodium chloride and sodium nitrate were in the order of zeolite A>zeolite X>zeolite Y asymptoticaly equals mordenite. The distribution coefficient of 230 was obtained for 1 M solutions of sodium salts. The anion in solutions had no effect on the distribution of cesium and strontium into zeolite from sodium salt solution.

3687 DISTRIBUTION OF CO, CR AND FE INTO NA- AND H-TYPE ZEOLITES. Mimura, H.; Kanno, T. (Tohoku Univ., Sendai (Japan). Research Inst. of Mineral Dressing and Metallurgy). Tohoku Daigaku Senko Seiren Kenkyusho Iho (Bulletin of the Research Inst. of Mineral Dressing and Metallurgy, Tohoku University) ; 34: No. 1, 58-66(Jun 1978). (In Japanese).

The effect of pH on the distribution has been studied by the use of radioisotopes, ^{60}Co, ^{51}Cr and ^{59}Fe, with Na- and H-type zeolites, i.e., synthetic zeolites A, X and Y, synthetic mordenite, natural mordenite, and clinoptilolite. At tracer-level concentrations, distribution coefficients (K) into Na-type zeolites indicated curves with a maximum at a different equilibrium pH corresponding to the kind of zeolites. Lowering of K values in the acidic region is due to the selective adsorption of hydrogen ions. In the presence of carrier (10 ppm), the distribution coefficients into the zeolites showed similar curves with a maximum at the pH of about 7 and 6.2 for Co and Cr, respectively. The values of K were 10^4 or above for zeolite Y with the largest channel. For H-type zeolites, the values of K were less than 10^2 at pH 3 and decreased with increasing acidity.

3688 POSSIBILITIES OF PURIFICATION OF CHEMONUCLEAR SYNTHESIS PRODUCTS AND ESTIMATING COSTS OF SUCH OPERATIONS. Bessonov, V.A.; Borisov, E.A. Atomnaya Energiya ; 44: No. 4, 351(Apr 1978). (In Russian).

CHEMICAL PREPARATION;CHEMONUCLEAR REACTORS; COST BENEFIT ANALYSIS;DECONTAMINATION; DISTILLATION;FILTRATION;GLYCOLS;PURIFICATION; RADIOACTIVE WASTES

3689 MEASUREMENT OF CARBON-14 IN GASEOUS EFFLUENTS. Riedel, H. pp 38-41 of Monitoring of airborne and liquid radioactive releases from nuclear facilities to the environment. Vienna, Austria; International Atomic Energy Agency (1978).

Carbon-14 is a pure beta emitter with a maximum energy of 148keV. In general, the stack monitors will not detect the presence of gaseous ^{14}C compounds. For this, special sampling and measuring methods which are necessary for this are described.

3690 LATE RADIOBIOLOGICAL EFFECTS OF A-BOMBING IN JAPAN. A REPORT ON THE INTERNATIONAL INVESTIGATION CARRIED OUT IN JULY 1977. Sztanyik, L.B. (Orszagos Frederic Joliot-Curie Sugarbiologiai es Sugaregeszsegugyi Kutato Intezet, Budapest (Hungary)). pp 61-68 of Late biological effects of ionizing radiation. Vol. 1. Proceedings of the symposium held by

the IAEA in Vienna, 13-17 March 1978. Vienna, Austria; International Atomic Energy Authority (1978).

On the occasion of the 32nd anniversary of the A-bombing in Japan, an international investigation was held in Hiroshima and Nagasaki to review existing knowledge on the damage and the after-effects of atomic bombing. The investigation was carried out by an international team made up of Japanese and foreign scientists. A brief summary is given of the most important statements and conclusions of the natural science group of the international team with regard to the late biological effects of radiation on man. Particular attention is paid to the effects of residual radiation which were somewhat disregarded in previous surveys. The most carefully analysed late consequences are induction of leukaemia and other malignancies, but cataract formation cannot be neglected either. Some of the possible explanations why established long-term effects of radiation, such as increased mortality, malignancies after exposure in utero, and genetic defects are absent among survivors, are also mentioned.

3691 INTERNAL RECEPTACLE FOR A RADIOACTIVE MATERIAL TRANSPORT CASK AND DISCHARGE PROCESS OF THIS CASK. (to British Nuclear Fuels Ltd., London). French Patent 2,406,871/A/. 24 Oct 1977. 12p. (In French).

Internal receptacle for use inside a flask for transporting irradiated nuclear reactor fuel elements, comprising a generally cylindrical casing with an integral closure component at one end and a removable cover at the other, partitioning dividing the casing into compartments, each of which houses a long nuclear fuel element, so that its centre line is parallel with that of the casing, and pipes that can be hermetically shut intended for introducing jets of washing liquid into the internal receptacle, the characteristics being that the inside surface of the integral closure component of one end is convex and forms a drain-off collector, pipes being provided to discharge a material from this collector through the cover of the internal receptacle.

3692 CONTROL CONNECTION, PRIMARILY FOR RADIOACTIVE PRODUCTS FILTRATION EQUIPMENT. Svandelik, J.; Zajic, J. Czech Patent 169,493/B/. 15 May 1977. 3p. (In Czech).

The principle is described of a control circuit for an apparatus for filtering radioactive products, consisting of a scrubber circuit for the control and final treatment of the gas discharged into the environment. Connected to the circuit is a detection unit for generating a discrete signal whose pulse rate is proportional to the radioactivity of the medium flowing through the detection unit. The output of the detection unit is fed to the pulse ratemeter block whose output is connected to one of the two inputs of the comparator block. The other input is connected to the preselector of the measured intensity limit. The comparator block output is fed to the control block.

3693 IMPROVEMENTS IN PARTICLE-IN-GAS FILTERING. Catlin, J.R.; Strong, R.E.; Guest, W.R. (to British Nuclear Fuels Ltd., Risley). British Patent 1,557,857/A/. 21 Apr 1977. 6p.

An improved method of changing a filter assembly used for particle-in-gas filtration is described with especial reference to hazardous, toxic or radioactive environments.

3694 RADIATION HAZARD MONITORING IN ^{131}I THERAPY IN AND OUT CLINIC. Chomicki, O.; Gorowski, T. Postepy Fizyki ; 12: No. 2, 81-85(Apr-Jun 1977). (In Polish).

The work presents a statistical analysis of a technique of preparing ^{131}I doses used in the treatment of thyroid diseases (between 1965 and 1976). Radiation hazard to the personnel and that to the patients as well as the radioactive waste disposal are also discussed. The authors emphasize the need for a wider use of out clinic therapy and the application of ^{131}I capsules in therapy.

3695 CONTAINER FOR TRANSPORTING SPENT FUEL ELEMENTS. Blum, P. (to Transnucleaire, 75 - Paris (France)). French Patent 2,384,327/A/. 14 Mar 1977. 11p. (In French).

The description is given of a container for transporting fuel elements, in which the elimination of heat between the fuel elements and the gamma shielding is effected by thermal conduction and by radiation without the help of a liquid. It is so designed that the housing for a given fuel element or a given group of housings is separated from at least one neighbouring housing or from a group of neighbouring housings by a normally empty compartment of chosen thickness so that the neutrons are thermalized enough for criticality control when the container is filled with water. Neutron poison is provided between the given housing or group of housings and the empty compartment which, otherwise, communicates with the housing or group of housings.

3696 Strahlenschutzkurs fuer Aerzte. T. 3. Umgang mit offenen radioaktiven Stoffen. (RADIATION PROTECTION COURSE FOR PHYSICIANS. PT. 3. HANDLING OF UNSEALED RADIOACTIVE SOURCES). Kaul, A.; Stieve, F.E. (eds.). Berlin, Germany, F.R.; H. Hoffmann (1977). 255p. (In German).

This radiation protection course for nuclear diagnosis and therapy consists of a basic course for physicians on the basis of the present state of knowledge. The following subjects are treated by several authors who have held courses in radiation protection for more than 10 years: Application of radioactive materials in medicine; radiopharmaceuticals; patient exposure during diagnosis; technical radiation protection and radiation protection surveillance; contamination and incorporation monitoring; external personnel exposure during diagnosis and therapy; storage, transport and removal of radioactive substances; instruction and information; laws, ordinances, regulations, technical rules; measures in cases of accident; procedures and inspections by the responsible authorities; practical courses and calculation training.

3697 METHOD OF PREPARING A SORBENT. Rais, J.; Selucky, P. Czech Patent 165,751/B/. 15 Nov 1976. 2p. (In Czech).

The molybdophosphoric acid (0.001% w.w. to saturated) or tungstophosphoric acid solution in diluted HNO_3 and/or in a $NaNO_3$ aqueous solution is precipitated by a solution of the polyethylene glycol type polymer in water or an organic solvent (0.001% w.w. to saturated). The polymer of a molecular weight of 180 to 600 contains the -R-O- structural unit where R is methyl, ethyl, propyl or aryl with 6 carbon atoms. The precipitate is filtered and dried, preferably at room temperature. The sorbent is mainly selective to Ba, Ce, Cs and Sr.

3698 CLOSABLE CONTAINER WITH A SELF-LOCKING LID. Paressant, M.; Faucond, J.; Tellier, C. (to Ateliers et Chantiers de Bretagne (ACB), 44 - Nantes (France)). French Patent 2,350,279/A/ . 4 May 1976. 10p. (In French).

This invention concerns a closable container with a self-locking lid. The invention applies in particular in automated installations, for instance for the transport of dangerous substances and notably in the nuclear area for removing radioactive waste. The purpose of the invention is therefore to propose a closable container with a lid that can close and lock automatically on the receptacle whilst allowing for easy unlocking and opening by remote means. Under the invention the container comprises a receptacle and a self-locking lid closing it, the said container being such that the edge of the lid is shut down so as to cover that of the receptacle, these two edges cooperating by means of a hooking ramp and catch fitted respectively to each of them, this gear retracting when moving over the ramp in the lid closing direction and butting against it in the reverse direction. The container has unlocking gear to clear the catch from the ramp to free its passage in the lid opening direction.

3699 HYGIENE OF IONIZING RADIATIONS. Legare, I.M. (Servico de Radioprotecao e Higiene do Meio, Quebec); da Rocha, A.F.G. (Centro de Medicina Nuclear da Guanabara (Brazil)); da Conceicao Cunha, M. (Rio de Janeiro Univ. (Brazil). Inst. de Biologia). pp 91-107 of Medicina nuclear. da Rocha, A.F.G. (Centro de Medicina Nuclear da Guanabara (Brazil)). Rio de Janeiro, Brazil; Guanabara Koogan S.A. (1976). (In Portuguese)

The concepts of quality factor and rem are introduced and a table of biological effects of external ionizing radiation sources is presented. Natural exposures, with tables of background radiation sources and of doses due to cosmic rays on high altitude areas and their populations are treated, as well as medical exposures; artificial background; fallout; scientific, industrial and other sources. The maximum and limit doses for man are given and tables of maximum admissible doses of ionizing radiations for 16-18 year old workers professionaly exposed, for professionals eventually subjected to radiation in their work and for people eventually exposed. Professional protection is discussed and tables are given of half-value layer of water, concrete, iron and lead for radiations of different energies, as well as the classification of exposure zones to the radiations and of maximum acceptable contamination for surfaces. The basic safety standards for radiation protection are summarized; tables are given also with emergency references for internal irradiation. Procedures with patients which received radioisotopes are discussed. At last, consideration is given to the problem of radioactive wastes in connection with the medical use of radionuclides.

3700 METABOLISM AND BIOLOGICAL EFFECTS OF THE TRANSPLUTONIUM ELEMENTS. Durbin, P.W. Contract W-7405-ENG-48. pp 739-896 of Handbook of experimental pharmacology. Eichler, O.; Farah, A.; Herken, H.; Welch, A.D. (eds.). New York, NY; Springer-Verlag (1973).

The metabolism and toxicity of the transplutonium elements (americium, curium) are discussed with emphasis upon radionuclide kinetics within mice, dogs, and humans.

CORPORATE INDEX

In the Corporate Index, report literature is indexed using the name of the organization or institution responsible for issuing the report. Headings are provided for all report literature and for published literature for which a corporate approach is especially desirable, e.g., symposium and conference proceedings.

Each entry under a corporate heading gives the report title and the volume and abstract numbers. Report numbers, if applicable, are given in parentheses at the end of the entry.

DOE Energy Information Data Base: Corporate Author Entries (TID-4585) is used in the standardization of corporate entries. TID-4585 is available for purchase from the National Technical Information Service (NTIS), U. S. Department of Commerce, Springfield, Virginia 22161.

Krypton-85 storage in solid matrices, 71 (PNL-SA--7752)
LANDSAT data as a basis for regional environmental assessment within the Columbia Plateau, 1837 (RHO-BWI-SA--43)
Leach test methodology for the Waste/Rock Interactions Technology Program, 1757 (PNL--3326)
Leaching characteristics of actinides from simulated reactor waste, 2071 (UCRL--81147(Pt.2)(Rev.1))
Leaching of actinides and technetium from simulated high-level waste glass, 513 (PNL--3152)
Long-term leaching of irradiated spent fuel, 247 (PNL-SA--7734)
Management of high-level nuclear wastes, 519 (PNL-SA--7072/T1)
Master schedule for CY-1980 Hanford Environmental Surveillance Routine Program, 3240 (PNL--3222)
Materials Characterization Center program plan, 515 (PNL--3254)
Materials Characterization Center workshop on leaching of radioactive waste forms. Summary report, 1756 (PNL--3318)
Mathematical simulation for safety assessment of nuclear waste repositories, 1780 (PNL-SA--7897)
Measurement of radon diffusion from uranium mill tailing piles, 3307 (NUREG/CR--1109)
Methodology for assessing the long-term safety of radioactive waste storage in geologic formations, 1763 (PNL-SA--7184)
Methods for determining radionuclide retardation factors: status report, 1759 (PNL--3349)
Monitoring and physical characterization of unsaturated zone transport. Laboratory analysis, 2457 (PNL--3304)
Multibarrier waste forms. Part III: Process considerations, 931 (PNL--2668-3)
Multicomponent mass transport model: a model for simulating migration of radionuclides in ground water, 1752 (PNL--3179)
Naturally occurring glasses: analogues for radioactive waste forms, 1729 (PNL--2776)
Nature of glass leaching, 1781 (PNL-SA--7953)
Near surface spent fuel storage: environmental issues, 246 (PNL-SA--7344)
Nuclear waste management. Quarterly progress report, April-June 1979, 507 (PNL--3000-2)
Nuclear waste management. Quarterly progress report, July-September 1979, 508 (PNL--3000-3)
Nuclear waste management. Quarterly progress report, January-March 1980, 510 (PNL--3000-5)
Nuclear waste management. Quarterly progress report, October-December 1979, 509 (PNL--3000-4)
Numerical analysis of radionuclide movement from a hypothetical nuclear waste repository, 2461 (PNL-SA--7875)
Numerical modeling of liquid feeding in the liquid-fed ceramic melter, 942 (PNL--3137)
Opportunities to increase the productivity of spent fuel shipping casks in the United States, 237 (PNL--3017)
Organic components of nuclear wastes and their potential for altering radionuclide distribution when released to soil, 1728 (PNL--2563)
Pacific Northwest Laboratory annual report for 1979 to the DOE Assistant Secretary for Environment. Part 2. Ecological sciences, 3298 (PNL--3300(Pt.2))
Pacific Northwest Laboratory (PNL) spent fuel transportation and handling facility models, 238 (PNL--3105)
PATHS groundwater hydrologic model, 1750 (PNL--3162)
Placing the special trains issue in perspective, 242 (PNL-SA--6519)
Potential airborne release from soil-working operations in a contaminated area, 3345 (PNL--3498)
Potential radiological impact of a conceptual Hanford Nuclear Energy Center, 3308 (PNL-SA--7497)
Preliminary evaluation of alternative waste form solidification processes. Volume I. Identification of the processes, 946 (PNL--3244)
Preliminary results on comparison of adsorption-desorption methods and statistical techniques to generate Kd predictor equations, 2458 (PNL-SA--7245)
Preliminary subsurface hydrologic considerations: Columbia River Plateau Physiographic Province. Assessment of effectiveness of geologic isolation systems, 1736 (PNL--2859)
Proceedings of the Task 4 Waste Isolation Safety Assessment Program second contractor information meeting, 1767 (PNL-SA--7352(Vol.1))
Proceedings of the Task 4 Waste Isolation Safety Assessment Program second contractor information meeting, 1773 (PNL-SA--7352(Vol.2))
Proceedings of the Task 2 workshop Waste Isolation Safety Assessment Program, 1782 (PNL-SA--7992)
Processes for production of alternative waste forms, 956 (PNL-SA--7414)
Processing of waste solutions from electrochemical decontamination, 932 (PNL--2786)
Quarterly report on the strontium heat source development program, Advanced Nuclear Systems and Projects Division for July-September 1979, 3617 (PNL--1845-44)
Radiological aspects of sea bed dumping in the deep oceans, 1798 (PNL-SA--8011)
Radiological survey of exposed shorelines and islands of the Columbia River between Vernita and the Snake River confluence, 3476 (PNL--3127)
Removal of radionuclides from the water-soluble fraction of Hanford Nuclear Defense Wastes, 988 (RHO-SA--145)
Research and development activities: High-Level Waste Immobilization Program. Quarterly progress reports, January-December 1978, 935 (PNL--2999(Pts.1-4))
Research and development activities: high-level waste immobilization program. Quarterly progress report, January-March 1979, 937 (PNL--3050-1)
Research and development activities: high-level waste immobilization program. Quarterly progress report, April-June 1979, 938 (PNL--3050-2)
Risk of transporting spent nuclear fuel by truck, 243 (PNL-SA--6520)
Safety assessment of the liquid-fed ceramic melter process, 953 (PNL--3493)
Selected legal and regulatory concerns affecting domestic energy transportation systems, 3171 (PNL--2989)
Simulation of atmospheric turbulence, 2896 (PNL--3276)
Spent fuel and fuel pool component integrity. Annual report, FY 1979, 239 (PNL--3171)
Spent LWR fuel leach tests: Waste Isolation Safety Assessment program, 236 (PNL--2982)
Spray calcination/in-can melting: effluent characterization and treatment, 941 (PNL--3109)
Statement by Dr. Ernst Albrecht on the provincial government's position regarding the planned nuclear waste disposal facility (NEZ) in Gorleben. Part II. Position taken by the Federal government regarding the policy statement by the Niedersachsen provincial government on the planned nuclear waste disposal facility in Gorleben, 2131 (PNL-TR--378)
Status of sorption information retrieval system, 1744 (PNL--3139)
Status report on LWR spent fuel IAEA leach tests, 1751 (PNL--3173)
Stress analysis of high-level waste canisters: methods, applications, and design data, 511 (PNL--3036)
Summary of FY-1978 consultant input for scenario methodology development, 1731 (PNL--2851)
Summary of FY-1978 consultation input for Scenario Methodology Development, 1732 (PNL--2851)
Summary of non-US national and international radioactive waste management programs 1980, 1758 (PNL--3333)
Supplemental report on population estimates for Hanford high-level defense waste draft programmatic environmental impact statement, 3239 (PNL--3128)
Survey of LWR environmental control technology

performance and cost, 2450 (PNL--2287)
Technical requirements for the control of ^{129}I in a nuclear fuels reprocessing plant, 945 (PNL--3186)
Tests for determining impact resistance and strength of glass used for nuclear waste disposal, 1742 (PNL--2954)
Uranium mill tailings stabilization, 960 (PNL-SA--8414)

Abstracts: NRC Waste Management Program reports, 2023 (UCID--18133(Rev.1))
Advanced three-dimensional thermal modeling of a baseline spent fuel repository, 272 (UCID--18660)
Annular air space effects on nuclear waste canister temperatures in a deep geologic waste repository, 2028 (UCID--18662)
Application of FRAMIS to K/sub D/ data, 2027 (UCID--18651)
ARAC feasibility study for the NRC Phase I: final report, 3046 (UCID--18315)
Archiving the paper fallout from Three Mile Island, 2949 (UCID--18243)
Atmospheric Release Advisory capability (ARAC) response to the Three Mile Island accident, 3047 (UCRL--83489)
BIODOSE: a code for predicting the dose to man from radionuclides released from underground nuclear waste repositories, 3443 (UCID--18652)
Brine: a computer program to compute brine migration adjacent to a nuclear waste canister in a salt repository, 2031 (UCID--18666)
Burning nuclear wastes in fusion reactors, 2661 (UCRL--82969)
Characteristics of defense high-level waste, 480 (NUREG/CR--0685)
Climax granite test results, 2024 (UCID--18502)
Computer modeling of nuclear waste storage canister corrosion, 2076 (UCRL--83488)
Determination of performance criteria for high-level solidified nuclear waste, 534 (UCID--18121)
Development and utilization of a two-dimensional model of transient fluid flow in a generic repository (OGRE), 2026 (UCID--18650)
Disruptive event uncertainties in a perturbation approach to nuclear waste repository risk analysis, 2020 (UCID--17893)
Early identification of technical issues: a sensitivity study to check LISTRA1A internal consistency and structure, 2649 (UCID--18709)
Effects of dimensionality and boundary conditions on thermal calculations, 2033 (UCID--18681)
Geoscience data base handbook for modeling a nuclear waste repository. Volume 1, 1608 (NUREG/CR--0912(Vol.1))
Geoscience data base handbook for modeling a nuclear waste repository, 1609 (NUREG/CR--0912(Vol.2))
Hazard index for underground toxic material, 3300 (UCRL--52889)
Investigations of the performance of solidified high-level nuclear waste forms, 1602 (NUREG/CR--0612)
Leaching characteristics of actinides from simulated reactor waste, 2071 (UCRL--81147(Pt.2)(Rev.1))
Leaching characteristics of actinides from simulated reactor waste, Part 2, 2483 (UCRL--81147(Pt.2))
MACRO1: a code to test a methodology for analyzing nuclear-waste management systems, 2068 (UCRL--52736)
Meteorology and demography models for risk assessments of accidental atmospheric releases of nuclear waste. Phase 2 methodology, 2558 (UCID--17930)
Method for calculating internal radiation and ventilation with the ADINAT heat-flow code, 273 (UCRL--52918)
Methods for evaluating the leak tightness of spent fuel container closures, 228 (NUREG/CR--1312)
Modeling of brine migration in halite, 2072 (UCRL--82228(Rev.1))
Modeling of brine migration in halite, 2484 (UCRL--82228)
New developments in measurement technology relevant to the studies of deep geological repositories in domed salt and basalt, 2069 (UCRL--52747)
Nuclear waste immobilization. Progress report, 1007 (UCRL--15147)
Nuclear waste management: storage and disposal aspects, 2084 (UCRL--84918)
Numerical calculation of thermal convection in porous media in two dimensions with applications to nuclear repository design, 2034 (UCID--18700)
On-line monitoring of toxic materials in sewage at the Lawrence Livermore Laboratory, 3410 (UCRL--83664)
Parameter identification in groundwater flow: a feasibility study, 2025 (UCID--18575)
Preliminary evaluation of the BIODOSE computer program, 3478 (UCID--18267)
Preliminary study of the migration of technetium in soil under hydrous conditions, 3346 (UCRL--52832)
Proceedings of a workshop on thermomechanical modeling for a hardrock waste repository, 1658 (ONWI--98)
Program report for FY 1979: Atmospheric and Geophysical Sciences Division of the Physics Department, 3184 (UCRL--51444-79)
Radiation safety and health effects related to low-level radioactive wastes, 2075 (UCRL--83328)
Radiochemical separation of neptunium and plutonium from leaching of reactor waste glass in brine solutions, 2073 (UCRL--82798)
Regulatable elements in the high-level waste management program, 535 (UCID--18150)
Remarks on the assessment, representation, aggregation and utilization of expert opinion, 2030 (UCID--18665)
Repository post-sealing risk analysis using MACRO, 2560 (UCRL--82236)
Retrieval system for emplaced spent unreprocessed fuel (SURF) in salt bed depository: accident event analysis and mechanical failure probabilities. Final report, 2037 (UCRL--15111)
Review of geochemical measurement techniques for a nuclear waste repository in bedded salt, 2029 (UCID--18664)
Rock salt constitutive modeling, 2053 (UCRL--15204)
Safety Analysis (SA) of the Hazardous Waste Disposal Facilities (Buildings 514, 612, and 614) at the Lawrence Livermore Laboratory, 3397 (UCID--18706)
Seismic safety in nuclear-waste disposal, 2022 (UCID--18125)
Simplified groundwater flow modeling: an application of Kalman filter based identification, 3527 (UCRL--82649)
Solving the geologic issues in nuclear waste disposal, 2074 (UCRL--83285)
Sources of data for biodose simulations used in bedded salt repository analysis, 2055 (UCRL--15208)
Spent fuel handling system for a geologic storage test at the Nevada Test Site, 2077 (UCRL--83728)
Stressmeter placement at spent fuel test in climax granite, 271 (UCID--18629)
Technical concept for rock mechanics tests, Climax Granite, NTS, 2021 (UCID--18009)
Test storage of spent reactor fuel in the Climax granite at the Nevada Test Site, 274 (UCRL--83976)
Thermal analysis for a spent reactor fuel storage test in granite, 2079 (UCRL--83995)
Thermal conductivity, diffusivity and expansion of Avery Island salt at pressure and temperature, 2078 (UCRL--83789)
Three-dimensional thermal analysis of a baseline spent fuel repository, 2081 (UCRL--84153)

Utilization of the atmospheric release advisory capability (ARAC) services during and after the Three Mile Island accident, 3250 (UCRL--52959)
Waste form dissolution in bedded salt, 2032 (UCID--18678)
Waste Isolation Program Evaluation Assistance. Quarterly technical progress report, 2035 (UCID--18796-80-1)
Waste pipe calculus extensions, 2480 (UCID--18136)
CALIFORNIA UNIV., LIVERMORE (USA). LAWRENCE LIVERMORE NATIONAL LAB.
Critique of rationale for transmutation of nuclear waste, 1009 (UCRL--84356)
Effects of annular air gaps surrounding an emplaced nuclear waste canister in deep geologic storage, 2080 (UCRL--84152)
Geotomography applied at the Stripa Mine in Sweden, 3544 (UCRL--52961)
Potential of pyroprocessing for partitioning purex wastes, 1010 (UCRL--84405)
Preliminary comparisons between measurements and model calculations for the TMI venting of ^{85}Kr, 2950 (UCID--18783)
Recommended new criteria for the selection of nuclear waste repository sites in Columbia River basalt and US Gulf Coast domed salt, 2070 (UCRL--52749)
Review of the 1979 workshop on thermomechanical modeling for a hard rock waste repository, 2083 (UCRL--84643)
Status of LLNL granite projects, 2082 (UCRL--84613)
