Notice

This report was prepared as an account of work sponsored by the United States Government. Neither the United States nor the United States Department of Energy, nor any of their employees, makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness or usefulness of any information, apparatus, product or process disclosed or represents that its use would not infringe privately owned rights.

Abstract

Samples ETTM-01 through ETTM-18 were tested for mutagenicity in Salmonella strain TA1537. Samples previously shown to be non-mutagenic or marginally for TA1538, TA98 and TA100 were not mutagenic for TA1537. Those samples mutagenic for TA1538, TA100 and TA98 were also mutagenic for TA1537 but to a much lesser degree.

This report covers the testing of the following samples for mutagenicity with Salmonella strain 1537:

|         |         |
|---------|---------|
| ETTM-01 | ETTM-10 |
| ETTM-02 | ETTM-11 |
| ETTM-03 | ETTM-12 |
| ETTM-04 | ETTM-13 |
| ETTM-05 | ETTM-14 |
| ETTM-06 | ETTM-15 |
| ETTM-07 | ETTM-16 |
| ETTM-08 | ETTM-17 |
| ETTM-09 | ETTM-18 |

#### 1. Preparation for Mutagenicity Assay

All samples were stored in the dark at 5°C. Samples were prepared for assay by weighing 50-200 mg and adding dimethylsulfoxide (DMSO) so as to obtain a presumptive concentration of 10 mg/ml. Samples ETTM-06, ETTM-07, ETTM-13 and ETTM-14 dispersed completely in the DMSO. None of the other samples (ETTM-01,02, 03,04,05,08,09,10,11,12,15,16,17,18) completely dissolved. The amount of the insoluble sample was subtracted from the total to determine the adjusted concentration used in calculating mutagenic activities. Samples ETTM-05 and ETTM-12 retained the solvent after evaporation to apparent dryness, making it impossible to ascertain the weight of insoluble material. In these two samples, therefore, one ml of the 100% solution was blown down under nitrogen and the remaining residue was taken as the concentration of the solution.

Sample solutions were routinely filter sterilized and applied as 0.1 ml aliquots. Dilutions were made in DMSO so that these percentages of the original solutions were tested: 100%, 50%, 10%, 5%, 1%. Limited mutagenicity (2-4 dose point response with S-9) was done with TA98 to determine if the newly prepared samples were similar in bioactivity to the previous sets of samples for which there are extensive data.

#### 2. Results of Mutagenicity Testing

Samples which have been previously shown to be non-mutagenic or marginally mutagenic (ETTM-03,04,05,06,07,12,13,14) for strains TA1538, TA98 and TA100 were not mutagenic for TA1537 (Tables 1 and 2). Those samples which were mutagenic for TA1538, TA98 and TA100 (ETTM-01,02,08,09,10,11,15,16,17,18) were also mutagenic for TA1537, but to a much lesser degree. None of the samples were mutagenic for any of the strains tested in the absence of 50 µl/plate S-9. The -1 frameshift lesion in TA1538 and TA98 is apparently more susceptible to the mutagenic activity of our samples than the +1 frameshift (TA1537).

Sample ETTM-13, which had been previously reported as very slightly mutagenic for TA1537, in these repeat assays showed no activity. TA98 mutagenicity of this and all other samples (except ETTM-01) was shown to be the same level as that reported in the past.

### 3. Analytical Work

Samples of polycyclic aromatic hydrocarbons, aromatic amines and amino-acridine compounds have been obtained. These will be used to prepare standard mixtures for HPLC analysis method development.

### 4. Publication

The manuscript entitled "Mutagenicity of Products from Coal Gasification and Liquefaction in the Salmonella/Microsome Assay" by Rita Schoeny, David Warshawsky, Lois Hollingsworth, Mary Hund, and George Moore, has been accepted for publication in Environmental Mutagenesis. A second manuscript, "Evaluation of Coal Gasification and Liquefaction Technologies by Salmonella Mutagenesis" by David Warshawsky, Rita Schoeny, and George Moore has been submitted to Science and is under review.

TABLE 2 (Continued)  
 Mutagenicity of ETTM Samples in the Presence of  
 50  $\mu$ l/Plate Aroclor 1254-Induced S-9

| <u>Sample</u> | <u>Amount/Plate</u> | <u>Revertant Colonies/Plate<sup>a</sup></u> |             |
|---------------|---------------------|---|-------------|
|               |                     | <u>TA1537</u>                               | <u>TA98</u> |
| ETTM-18       | 0.9 $\mu$ g         | 9   |             |
|               | 3.7                 | 10  | 36          |
|               | 4.4                 | <u>17</u>                                   | 46          |
|               | 8.9                 | <u>33</u>                                   |             |
|               | 18.7                | <u>18</u>                                   |             |
|               | 37.4                | <u>49</u>                                   | <u>197</u>  |
|               | 44.5                | <u>119</u>                                  | <u>874</u>  |
|               | 89.0                | <u>235</u>                                  |             |
|               | 187.0               | <u>195</u>                                  |             |
|               | 347.0               | <u>278</u>                                  |             |

<sup>a</sup>Numbers are means of colony counts  $n > 2$ . Standard deviations are included for control plates. Underlined numbers are at least 2X the spontaneous rate.

<sup>b</sup>DMSO = dimethylsulfoxide

MNNG = methyl methanesulfonate

9AA = 9-aminoacridine

ACNA = 1-amino-2-carboxy-4-nitroanthraquinone

2AA = 2-aminoanthracene

<sup>c</sup>These and subsequent plates received 50  $\mu$ l/plate Aroclor-induced S-9.
