TYPE OF FUNDING: Contract No.-68-02-2148
77 FUNDING: Environmental Protection Agency FY77:$284,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS (50%);PARTICULATES/Dust (50%)
CHARACTER OF STUDY: FULL SCALE DEMONSTRATION (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Examine technical and economic aspects of small, full scale, reverse air baghouse operated at filtration velocities up to 9 fpm on a stoker fired industrial boiler.
APPROACH: (a) Operate baghouse for a minimum period of 10 months using Nomex, Gore-Tex, Teflon, and Dralon T fabrics. (b) Determine fabric performance and life. (c) Determine system performance and costs. (d) Record all pertinent boiler and filter system operating parameters. (e) Characterize flue gas streams and fly ash.
RESULTS: System scheduled to start 12/76. Options include testing additional fabrics and testing SO2 removal capabilities.
PROJECT MILESTONES: (1) 3/76 Contract award. (2) 12/76 Baghouses on line. (3) 12/77 Report on first year's operation. (4) 12/77 Report on second year's operation.

77 FUNDING: Environmental Protection Agency FY77:$65,500
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: EXTRACTION (33%);PROCESSING, CONVERSION (33%);WASTE MANAGEMENT (34%)
POLLUTANTS: PARTICULATES/Dust (100%)
CHARACTER OF STUDY: DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: Improvements in fabric filter performance obtained by control of elemental fiber geometry, fabric construction, or applied electric fields are believed to depend on differences in the structure of the deposited dust layer or cake. The object of the proposed research is to identify those features of the different dust cakes which can account for differences in filter performance.
APPROACH: The objective will be accomplished by scanning electron microscopical studies using known techniques and possibly new techniques to be developed in the course of the project.
RESULTS: On the basis of the information acquired, improved fabric constructions will be developed in which the tendency to deposit dust cakes with desirable features will be maximized.
PROJECT MILESTONES: (1) 12/76 Grant awarded. (2) 1/78 Yearly report. (3) 1/79 Yearly report. (4) 1/80 Final report.
KEYWORDS: AIR FILTERS;PERFORMANCE TESTING;DUSTS;FILTRATION;FIBERS;REMOVAL

TITLE: High Velocity Fabric Filtration
PROJECT NUMBER: P-624-A-62
PRINCIPAL INVESTIGATOR: First, M.W.;Leith, D.
ADDRESS: 665 Huntington Ave., Boston, MA 02115
AFFILIATION: Harvard School of Public Health, Boston, Mass. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Turner, J.H.
TELEPHONE: F629-2925
TYPE OF FUNDING: Grant No.-R804700-02
77 FUNDING: Environmental Protection Agency FY77:$41,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: EXTRACTION (33%);PROCESSING, CONVERSION (33%);WASTE MANAGEMENT (34%)
POLLUTANTS: PARTICULATES/Dust (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale;DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The objectives of this project are: (1) to study the practicality of high velocity fabric filtration, (2) to investigate phenomena which limit effective high velocity operation, and (3) to develop mathematical models to interpret and predict fabric filter performance.
APPROACH: These objectives will be met using experimental work with a three bag pilot scale filter cleaned by the pulse-jet principle, and theoretical work to describe filter performance mathematically.
RESULTS: If fabric filters can be made to operate at higher than conventional velocity, a proportional reduction in filter size and initial cost will be possible, making these efficient collectors attractive for many applications where they are not currently used. For example, a high velocity filter operating at a superficial filtration velocity of 25 cm/s (air to cloth ratio of 50 cfm/square feet) need be only 10 to 25 percent as large as a unit operating at conventional velocities.
PROJECT MILESTONES: (1) 8/76 Grant awarded. (2) 9/77 Yearly report. (3) 9/78 Yearly report. (4) 9/79 Final report.
KEYWORDS: AIR FILTERS;PERFORMANCE TESTING;MATHEMATICAL MODELS;FIBERS;TEXTILES

CHARACTER OF STUDY: DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Demonstrate the effectiveness of the University of Washington Electrostatic Scrubber for controlling the emissions of fine particles from power plants and industrial plants.
APPROACH: Construct a mobile electrostatic scrubber and test the device on 3 or 4 sources in the field.
RESULTS: The unit has been completed and testing on an electric arc furnace in a steel mill has been completed. Testing on a coal-fired power plant is scheduled.
PROJECT MILESTONES: (1) 3/76 Grant funded. (2) 6/77 Complete test on electric arc furnace. (3) 10/77 Complete test on coal-fired power plant. (4) 1/78 Complete 3rd test. (5) 3/78 Final report.

TITLE: Fine Particulate Control by High Gradient Magnetic Separation (HGMS)
PROJECT NUMBER: P-624A-70
PRINCIPAL INVESTIGATOR: Mixon, F.O.
ADDRESS: P.O. Box 12194, Research Triangle Park, NC 27709
AFFILIATION: Research Triangle Inst., Research Triangle Park, N.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
TYPE OF FUNDING: Contract No.-68-02-1879
77 FUNDING: Environmental Protection Agency FY77:$200,000
TECHNOLOGY: CONSERVATION/Improved conversion efficiency (100%)
POLLUTANTS: PARTICULATES/Dust (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale;DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To demonstrate the feasibility of using a high gradient magnetic separation (HGMS) system as an effective and economic technique for control of fine particulate emissions.
APPROACH: Phase I of the project will include a review of the theoretical concepts of HGMS as applied to fine particle collection with emphasis on collection efficiency, collector regeneration, and power and residence time requirements. Bench scale experiments will follow to varify or disprove the theoretical predictions. A preliminary analysis of capital and operating costs will be performed to compare the system to conventional equipment, i.e., scrubbers, electrostatic precipitators or fabric filters. If the results obtained in Phase I are technically and economically attractive, Phase II will consist of the design, construction and operation of an experimental model of at least 500 cfm capacity to obtain additional information on the performance of the HGMS system with respect to power input, residence time, temperature, particulate type, and particulate size distribution. Phase III will consist of a 3000 cfm pilot demonstration at a plant site.
RESULTS: Demonstrated control technology for potential particulate air pollutants which are ferromagnetic or highly paramagnetic, users would include the ferroalloy and iron and steel industries.

PROJECT MILESTONES: (1) 6/75 Award Contract. (2) 7/77 Complete Feasibility Tests at Small Scale. (3) 8/79 Complete Field Pilot Demonstration.
KEYWORDS: PARTICLES;AEROSOLS;AIR POLLUTION CONTROL;POLLUTION CONTROL EQUIPMENT;PARTICLE SIZE;DUSTS;ENVIRONMENTAL TRANSPORT;FEASIBILITY STUDIES;SEPARATION PROCESSES;AIR CLEANING SYSTEMS;MAGNETIC FIELDS;DESIGN;METAL INDUSTRY;IRON COMPOUNDS

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Provide current information on advances in scrubber technology to potential users.
APPROACH: This project is to conduct a technology transfer conference dealing with novel device and scrubber control technology. In addition, the symposium proceedings will be compiled and printed, three special reports will be written, and six executive summaries will be prepared and compiled into a report.
RESULTS: The first conference was held in the eastern U.S. during the Spring of 1977.
PROJECT MILESTONES: (1) 9/76 Contract award. (2) 5/77 Conduct scrubber conference. (3) 9/77 Report on scrubber programs. (4) 11/77 Report on application areas for dry scrubbing. (5) 1/78 Executive summaries of current research. (6) 3/78 Report on scrubber performance models.

CHARACTER OF STUDY: DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To design, fabricate, install and test in the IERL Laboratory in Research Triangle Park, N.C., a versatile, high temperature (to 1500 degrees F) fabric filter test unit which can control the gas composition, particulate leading and humidity of the inlet stream.
APPROACH: A fabric filter test unit will be designed, fabricated and installed which will allow for the testing of four tubular (35 1/2'' x 5'' diameter) fabric filters in independent test chambers. Inlet particulate loading, temperature, gas composition, filter face velocity and humidity will be controlled by the unit. Additional instrumentation will be designed which will measure and log other parameters affecting filter life.
RESULTS: A design will be generated during the initial 4 months of the contract. This design will be reviewed before parts procurement and fabrication begin. Partial fabrication of the test unit will be accomplished at Aerotherm (Mountain View, California) prior to the shipment of the device to the EPA in December 1976. Installation in the IERL Laboratory is scheduled to begin in January 1977. Unit demonstration tests will be conducted in September 1977.
PROJECT MILESTONES: (1) 3/76 Contract signed. (2) 6/76 Design drawings of versatile fabric filter test unit. (3) 8/76 Procurement of all parts. (4) 10/76 Assembly of unit at contractor's location. (5) 2/77 Shipment. (6) 5/77 Installation at RTP. (7) 11/77 Shakedown and demonstration tests.

ENERGY CYCLE: COMBUSTION OR END USE (50%);WASTE MANAGEMENT (50%)
POLLUTANTS: PARTICULATES/Dust (100%)
CHARACTER OF STUDY: DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of the project is to provide a pilot-scale electrostatic precipitator (ESP) at the research EPA facility in Research Triangle Park, N.C. The ESP will provide maximum flexibility, and accuracy consistent with the basic requirement that its general configuration be similar to that of full-scale electrostatic precipitators. A burner, humidifier, and a specially designed aerosol generator will be included in order to provide a wide variety of atmospheres in the precipitator unit.
APPROACH: Phase 1: Prior to designing the precipitator, a survey of existing pilot-scale installations will be made and experts in the field of ESP design and application will be interviewed. With these background data, the features and parameters of the pilot scale ESP will be established and the design will be undertaken. Phase 2: The second part of the effort will be to fabricate and assemble the precipitator at the Cherry Creek Field Site Facility of the University of Denver for checkout. Having proven the unit, it will be partially dismantled, shipped to Research Triangle Park, N.C., and re-assembled.
RESULTS: The ESP a system has been installed at Research Triangle Park, N.C.
PROJECT MILESTONES: (1) 11/75 Contract signed. (2) 3/76 Technical Survey report of ESP experts. (3) 5/76 Design drawings of ESP system. (4) 11/76 Fabrication of ESP at contractor's site. (5) 2/77 Shipping of unit to RTP, N.C. (6) 4/77 Installation and checkout.

PROJECT DESCRIPTION: To establish a computerized data base concerning the manufacture, use, storage, processing, formation, release, disposal and repackaging in NJ of a group of carcinogenic substances selected on the basis of their large volume of production and/or their carcinogenicity.
APPROACH: To identify the area of the state and population group that are subject to an increased cancer risk due to exposure to cancer causing substances and other toxic agents in the environment.
RESULTS: The data base will permit determinations of the following: a comprehensive inventory of the selected carcinogens in New Jersey; the industrial locations where the selected carcinogens are used, manufactured, stored, released, formed, repackaged, etc. and the quantity of the carcinogen handled at each location; the products which are manufactured from the selected carcinogens, the quantity of the substances emitted and/or released to the atmosphere, water and solid waste stream, the potential occupational and community exposure to the selected materials.

REGIONS OF INTEREST:
BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: An EPA contracting officer will issue specific tasks of work which will fall into one of the following categories: (1) Assessment of the environmental and economic impact of pollution control systems. (2) Process analysis of early stage research results. (3) Cost estimates for the pollution control systems being developed by the EPA. (4) Engaging in process research. (5) Evaluation of the energy conservation potential of new pollution control technologies. (6) Determine the environmental impacts that result from air pollution control processes and systems. (7) Assessment of R and D programs in coal liquefaction; low-, medium-, and high-Btu gasification; advanced combustion research; and improved coal extraction and reclamation techniques. (8) Survey process emissions and control technology of designated industrial sources to define research development, and demonstration requirements. (9) Identify new environmentally acceptable fossil fuel power systems. (10) Provide technical services in the areas of site planning, configuration of power plant process layouts, process equipment design, preparation of engineering reports such as computation of emission by process and source, and other engineering studies. (11) Assist regional EPA offices and state pollution control agencies in control implementation planning. The majority of work assignments will be completed by Pullman
OJECT MILESTONES: (1) 3/77 Contract award. (2) 3/79 Estimated contract completion date.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: As part of its efforts in promoting both improved environmental assessments and pollution control technologies for industrial processes and energy production, IERL-RTP carries out five basic activities: (1) the assessment of areas where control technologies are likely to have significant environmental impact, (2) the translation of such assessments into specific R and D work units and the allocation of funds needed to carry out this work, (3) the identification of projects and funding of contractors to accomplish the work units planned, (4) the monitoring and evaluation of the progress and performance on various R and D projects, and (5) the dissemination of results from R and D projects to potential users. The primary goal of the proposed research is to support these basic activities at IERL-RTP by providing effective methods to: (1) identify the technological, environmental, and related goals needed to determine high impact areas for R and D planning, (2) establish priorities among sub-objectives and work units so that rational budget allocation decisions can be made, (3) help improve the decision/budgeting process at various organizational levels at IERL-RTP and at different points in the planning cycle, and (4) investigate the end-uses of R and D work and establish a system for information dissemination outside the laboratory consistent with the mission and resources of IERL-RTP.
PROJECT MILESTONES: 6/78 Phase I Final Report: recommendations on measurement and evaluation procedures for environment R and D.

TITLE: Project Definition Phase Study for an Integrated Assessment of Coal-Based Energy Technology
PROJECT NUMBER: P624A-74
PRINCIPAL INVESTIGATOR: Davidson, R.S.
AFFILIATION: Battelle Columbus Labs., Ohio (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Hansen, R.
77 FUNDING: Environmental Protection Agency FY77:$50,000
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)

PROJECT DESCRIPTION: This Project, Phase I--Definition Phase, will include the following objectives: (1) a methodology for integrating the results ot completed and ongoing EPA/IERL ''environmental assessments'' of coal based energy and environmental quality control technologies; (2) a methodology for conducting a comparative assessment of the environmental, social, economic, and energy impacts of coal based energy technologies, supply systems, and end uses; (3) a methodology for assessing national impacts for all components of coal energy supply systems, extraction, fuel stock transportation, processing, conversion, energy product transportation, and end use; (4) approaches to identifying, analyzing, and comparing technological and institutional methods of avoiding, or mitigating undesirable consequences of coal energy development; (5) propose ways of identifying and comparing the effects of alternative energy related environmental policies and policy implementation strategies.
APPROACH: Battelle's Columbus laboratories will prepare a workplan for conducting a full scale assessment of coal-based technology and develop a cost proposal. The subject area of the workplan will have as its scope: coal production, preparation, transportation, conversion, and utilization. The boundaries for the full assessment are to be chosen in the Project Definition Phase. Forecasting of the total coal demand as well as the demand for other fuels will be included in the analysis. For any level of coal demand impacts will be forecast, and tradeoffs between different coal utilization systems will be covered.
PROJECT MILESTONES: (1) 01/77 Contract award--competitive. (2) 07/77 Phase I (work plan and proposal for Phase II)--completed.
KEYWORDS: COAL INDUSTRY;ENVIRONMENTAL IMPACTS;TECHNOLOGY ASSESSMENT;QUALITY CONTROL;SOCIAL IMPACT;ECONOMIC IMPACT;ENERGY MODELS;SOCIO-ECONOMIC FACTORS;ENVIRONMENTAL POLICY;IMPLEMENTATION;DECISION MAKING;ENERGY DEMAND;FORECASTING;TECHNOLOGY UTILIZATION

TITLE: Activated Carbon for Control of Service Station Gasoline Emissions
PROJECT NUMBER: P604B-3
PRINCIPAL INVESTIGATOR: Kelly, W.C.;Manos, M.J.
AFFILIATION: Scott Environmental Technology, Inc., San Bernardino, Calif. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
TYPE OF FUNDING: Contract No.-68-02-2655
77 FUNDING: Environmental Protection Agency FY77:$50,000
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (50%);CONSERVATION/General (50%)
PROJECT DESCRIPTION: To complete the laboratory work and conduct field trials; high surface area carbon meets the need for a practical adsorbent bed in the control of gasoline vapor emission in service stations.
APPROACH: Work will be based on the recently completed laboratory study showing activated carbon has

excellent promise for use in control of gasoline vapor emissions from service stations, especially as applicable to emissions caused in filling automobile gasoline tanks. The preliminary study will be extended to quantification of variables determining carbon performance and engineering design for use under conditions to be encountered in service stations. Field tests will be conducted to confirm laboratory results and demonstrate in-use utility.
RESULTS: A technical report will be issued covering the performance and engineering design parameters determining the utility of activated carbon in adsorption-desorption control of gasoline vapor emissions at service stations. The report will include results of in-use tests to demonstrate performance under actual service conditions. A literature search will be conducted and issued to assist in application of developed technology to the general problem of solvent emissions control.
PROJECT MILESTONES: (1) 09/77 Develop test matrix. (2) 09/77 Issue program work plan. (3) 10/77 Reassemble and calibrate apparatus. (4) 01/78 Conduct parameter effects tests. (5) 01/78 Analyze data. (6) 02/78 Project results to service stations. (7) 02/78 Complete field working capacity tests. (8) 03/78 Complete information search on applicability of technology. (9) 03/78 Issue assessment report. (10) 04/78 Final report draft.

TITLE: Guidelines for Application of Coke Oven Pollution Control Systems
PROJECT NUMBER: F604C-10
PRINCIPAL INVESTIGATOR: Bee, R.W.
AFFILIATION: Mitre Corp., McLean, Va. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: McCrillis, R.C.
77 FUNDING: Environmental Protection Agency FY77:$15,200
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
PROJECT DESCRIPTION: Develop guidelines for application of demonstrated coke battery air pollution control technology to existing and new coke batteries.
APPROACH: Specific control technologies to be examined are the AISI/EPA Smokeless Coke Oven Charging System, the Enclosed Coke Pushing and Quenching System, the Smokeless Coke Pushing System, staged charging (industrial development), Koppers Co. Erie car, Bethlehem Steel Corp. one-spot traveling hood, U.S. Steel Corp. ''silver streak'', and the Osterfeld system installed at Armco Steel-Middletown. The guidelines will examine characteristics of the control system that are important in design, construction, and operation and relate these characteristics to application of the control systems to U.S. coke batteries based upon examination of their characteristics and requirements.
RESULTS: The Final Report will be used by coke producers in planning the application of control technology and by regulatory officials in specifying air pollution control strategies and enforcement actions.
PROJECT MILESTONES: (1) 07/76 Project start. (2) 02/78 Publish final report.

TITLE: Sampling and Analysis of Emissions from Coke Oven Doors
PROJECT NUMBER: F604C-3
PRINCIPAL INVESTIGATOR: Barrett, R.;Jones, P.;Strupp, P.
AFFILIATION: Mitre Corp., McLean, Va. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
TYPE OF FUNDING: Contract No.-68-02-1409
77 FUNDING: Environmental Protection Agency FY77:$10,100
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ROJECT DESCRIPTION: Evaluate the performance of the coke oven door emission sampling system by executing a complete sampling program over the coking cycles on one oven. Perform detailed elemental, organic, and bioassay analyses on the samples thus obtained.
APPROACH: All emissions are contained within an enclosure around the door. Purging this enclosure maintains the door at its natural conditions. Samples were taken throughout the cycle of the exiting purge stream. The collected emission samples will be subjected to rigorous analysis utilizing various techniques such as GC-MS, high resolution MS and biological evaluations. These samples, as well as coal and coke samples, will also be subjected to spark source MS for element identification.

RESULTS: The final result will be published in a public report. It will provide detailed information concerning the sampling equipment, procedures, and analyses.
PROJECT MILESTONES: (1) 08/75 Project start. (2) 09/77 Publish final report.
KEYWORDS: COKE OVENS;ENVIRONMENTAL IMPACTS;AIR POLLUTION;SAMPLING;CHEMICAL ANALYSIS;BIOASSAY;ELEMENTS;ORGANIC COMPOUNDS;MONITORING;COAL;COKE;AIR POLLUTION MONITORS;MEASURING METHODS;AIR SAMPLERS

TITLE: Blast Furnace Cast House Emission Control Technology
PROJECT NUMBER: P604C-4
PRINCIPAL INVESTIGATOR: Lindsay, D.;May, W.P.
AFFILIATION: Betz Environmental Engineers, Inc., Plymouth Meeting, Pa. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: McCrillis, R.C.
77 FUNDING: Environmental Protection Agency FY77:$31,200
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
PROJECT DESCRIPTION: Develop feasible emission controls for new and existing blast furnace cast houses, considering capital costs, potential emission reductions, operating costs, impact on cast house operating procedures and total energy requirements.
APPROACH: Conduct a world-wide survey of state-of-the-art emission controls; investigating design details of installation and compatibility with, and impact upon, each producer's operating procedures and practices. Review literature and design technology of proposed foreign and domestic installations. Categorize the significant parameters and factors to determine model classifications of cast houses to be considered. For each model category, perform total cost analysis including cost or effects on hot metal production. Define benefits and detrimental effects faced by implementing each system and determine criteria to be considered in optimizing both retrofitted and integrated cast house emission control system.
RESULTS: A formal report will be published detailing the findings, analyses, and conclusions. Cast house emission control system combinations will be suggested for each major category of cast house for both retrofit and new furnaces. Areas of technological uncertainty will be identified and suggest development programs outlined.
PROJECT MILESTONES: (1) 09/75 Project start. (2) 09/77 Publish final report.
KEYWORDS: BLAST FURNACES;EMISSION;POLLUTION CONTROL EQUIPMENT;AIR POLLUTION CONTROL;ECONOMICS;ENERGY CONSUMPTION;TECHNOLOGY ASSESSMENT

TYPE OF FUNDING: Contract No.-68-02-2173
77 FUNDING: Environmental Protection Agency FY77:$62,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
PROJECT DESCRIPTION: Advance the state of the art of coke oven end door sealing significantly beyond that which is currently available.
APPROACH: Conduct a scientific and engineering program based on the recommendations and findings of Contract 68-02-1439, ''A Study of Concepts for Minimizing Emissions from Coke Oven Door Seals'', to design and develop at least one new system that will be proven in the field (in an optional project) to be retrofitable to existing coke ovens as well as applicable to new construction, mechanically and physically suitable for commercial use in steel plants, and highly effective in containing and controlling emissions from the ends of ovens. Mathematical modelling, physical modelling and field data collection tasks will be completed concurrently. Analysis and recommendations will be completed subsequently. Development and evaluation of the selected design(s) will culminate in the decisions required to initiate the demonstration work in the Optional Scope of Work. If this option is exercised the contract will be extended an additional 16 months to December 1979.
RESULTS: Complete, detailed design and manufacturing data for the demonstrated system backed up by the full scale field tests. Manuals will also be prepared describing in detail construction, installation, operation, and maintenance procedures.
PROJECT MILESTONES: (1) 08/76 Project start. (2) 02/78 Interim report--full scale design recommendations. (3) 08/78 Decision point to proceed with full scale demonstrations. (4) 02/80 Issue final report.

TITLE: Treatment of Gaseous Emissions from Steel Plants Containing Small Concentrations of Hydrocarbon Vapors
PROJECT NUMBER: P604C-8
PRINCIPAL INVESTIGATOR: Szekely, J.
AFFILIATION: Massachusetts Inst. of Tech., Cambridge (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Plaks, N.
TYPE OF FUNDING: Grant No.-R805311
77 FUNDING: Environmental Protection Agency FY77:$10,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
PROJECT DESCRIPTION: Develop technology for the selective adsorption of steelmaking processes such as sinter plants, cokemaking, etc.
APPROACH: The project proceeds in a logical manner by first developing adsorption equilibrium for several adsorbents and hydrocarbons and then by systematically trying to increase the specificity of adsorption for hydrocarbons. Simultaneously, data will be developed on regeneration of the adsorbents. The controlling mechanisms for the process, mass transfer, pore diffusion, or adsorption kinetics, will be determined for use in scale-up purposes.
RESULTS: The output will be a final report.

TITLE: Kinetics of Evolution of Sulfur-Bearing Gases from Blast Furnace Slags
PROJECT NUMBER: P610B-1
PRINCIPAL INVESTIGATOR: Elliott, J.F.
AFFILIATION: Massachusetts Inst. of Tech., Cambridge (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Plaks, N.
TYPE OF FUNDING: Grant No.-R805338-01
77 FUNDING: Environmental Protection Agency FY77:$12,100
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
PROJECT DESCRIPTION: Investigate the fundamental physico-chemical factors affecting the formation of SO2 and/or H2S from a reaction with hot blast furnace slag and desulfurization residues.
APPROACH: Investigate the fundamental factors affecting the formation of SO2 and H2S from reaction with hot blast furnace slags and desulfurization residues. If these reactions are better understood, one can develop means to control the evolution of sulfur bearing gases into the atmosphere from this source. Included is the study of the effects of the composition of the slag on the kinetic processes. If the study is successful, the practicality of process control as a means of eliminating sulfur emissions from hot slag can be ascertained.
RESULTS: The output of this grant will be a final report.
PROJECT MILESTONES: (1) 07/77 Start grant. (2) 07/78 Complete grant.

TITLE: Source Assessment Program
PROJECT NUMBER: P610B-9
PRINCIPAL INVESTIGATOR: Binning, R.
AFFILIATION: Monsanto Co., St. Louis, Mo. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Denny, D.A.
TYPE OF FUNDING: Contract No.-68-02-1874
77 FUNDING: Environmental Protection Agency FY77:$989,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The project objectives are to quantify and verify discharges to the environment from a variety of industrial sources. The discharge concentrations are compared to estimated risk levels in the environment. Source Assessment is a problem definition activity. Stationary sources in this category have been ranked in order of priority based on their potential for environmental damage. This potential is tested for validity for each of the source types in order of priority. For any given source a representative facility is defined in terms of process parameters. Discharge data are confirmed within known limits of error by the most appropriate means available. Actual field sampling is a last resort because of expense. Once discharge levels are known for the representative facility, statistical projections are made for the rest of the sources of the given type. The discharge levels are compared to quantitative measures of risk, either by biological testing or by extrapolation from known adverse effects levels. When the discharge levels exceed the estimated risk levels the problem is qualitatively identified. The extent to which the discharges exceed the estimated risk levels provides a quantitative measure of the degree of control needed and is a basis for objectives in the control program. Industry participation is encouraged. They provide effluent and process data and review reports. Interested parties in Government as well as industry are invited to participate in the program to ensure the results will be of use to all parties. Products are emissions reports which can be used by various groups. Emissions-Environmental risk comparisons can be used to judge the need to reduce the emissions to acceptable levels.
PROJECT MILESTONES: (1) 07/77 Assessment reports--Beef feed lots--Harvesting of grain. (2) 08/77 Assessment reports--Harvesting of cotton--Agricultural open burn. TITLE: Multi-Media Environmental Assessment of Ferrous Metallurgical Processes-Related Pollution Control Technologies
PROJECT NUMBER: P604C-06
PRINCIPAL INVESTIGATOR: Carpenter, B.H.
AFFILIATION: Research Triangle Inst., Research Triangle Park, N.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Hendriks, R.V.
77 FUNDING: Environmental Protection Agency FY77:$138,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The Research Triangle Institute proposes to conduct its best level of effort multi-media environmental assessment of eight major processes: (1) Coke By-Product Recovery Plant; (2) Blast Furnaces; (3) Iron Foundries; (4) Sinter Plants; (5) Basic Oxygen Steelmaking; (6) Electric Arc Steelmaking; (7) Hot Forming; and (8) Ferroalloy Production.
APPROACH: The Institute will collect existing data relevant to evaluation of pollutant sources, control efficiency, and environmental acceptability of these processes. RTI will then identify any needs for further information and design a program to obtain it. Acting either alone or through other EPA contractors, RTI will apply the plans to develop the information to the extent the scope of work permits and then complete the environmental assessment.
RESULTS: The results to be expected for each process assessment are: (1) A symposium to discuss the results and on-going effort; (2) A capsule report highlighting exemplary technology; (3) A delineation of information needed to conduct a complete assessment; (4) An informal briefing conference to present and review the assessment; (5) A final report documenting the work of assessment, the recommendations and conclusions.
PROJECT MILESTONES: (1) 03/77 Project start. (2) 11/77 Report on by-product recovery. (3) 12/77 Report on iron foundries.

PROJECT DESCRIPTION: Aerosol size distributions have been measured in the St. Louis area as part of EPA's Project MISST using aircraft and ground based self contained mobile laboratories.
APPROACH: These measurements were made with a group of collaborators such that a complete array of chemical, physical, and meteorological measurements were obtained on a coal fired power plant plume. The University of Minnesota's portion of the project included aerosol measurements aboard an aircraft and the operation of a mobile van on the ground under the plumes. This mobile van was also operated on freeways in the Los

Angeles area during October 1976 as part of an EPA sponsored project to study sulfur aerosols on roadways.
RESULTS: Much of the work during the next project year will be analysis and reporting of the large amount of data obtained during the past several years. Analysis is being directed toward obtaining aerosol growth rates in the plumes, aerosol nucleation rates in the plumes and surrounding atmosphere, and toward better descriptions of the aerosol size distributions. Laboratory work toward the development of a continuous instrument for the measurement of aerosol sulfur is also being partially supported by this project.
PROJECT MILESTONES: 3/77 Data Report.

PROJECT DESCRIPTION: The objective of this program is to develop and evaluate a prototype device for the selective analysis of sulfuric acid in the range of 0.25 to 50 mu g/m3.
APPROACH: The success of this program necessitates the development of a satisfactory method for collecting and fixing sulfuric acid aerosol from ambient air. The fixed sulfuric acid aerosol (adduct) will be chemically more stable than the unfixed acid aerosol and thus will eliminate negative interferences due to surface reactions during the collection procedure. However, the acid aerosol must be stabilized in a form capable of quantitatively releasing the original acid or some stoichiometrically related reagent, derivative or byproduct for measurement. It is anticipated that positive interferences can be eliminated by forming an adduct that exhibits selective decomposition or selective solubility in the presence of interfering sulfates. Additional analytical specificity will be accomplished by use of a sulfur measuring flame photometric detector.
RESULTS: Current plans are to examine the compounds diethylamine, diethylhydroxylamine and acetaldoxime for use as potential sulfuric acid fixing reagents. These and chemically similar compounds will be used to form sulfuric acid adducts which will be evaluated, utilizing the techniques and methodology discussed above, for interferences, accuracy and precision.

PROJECT DESCRIPTION: A continuous SO2 monitor for mobile sources is to be designed, constructed, tested and delivered to the Environmental Protection Agency.
APPROACH: The monitor makes use of the ultraviolet absorption by SO2 for its sensitivity and discrimination against other gas species normally present in the exhaust of internal combustion engines.
RESULTS: The minimum detectable concentration of SO2 is to be less than 0.1 parts per million; the maximum measurable concentration is to be greater than 1000 ppm. Included with the instrument are the pumps, filters, valves and other gas-handling equipment required to transfer continuously the exhaust gas to the sampling chamber.

PROJECT DESCRIPTION: To make a detailed study of the use of a flame photometric detector for the continuous, in situ measurement of total particulate sulfur and the selective measurement of individual sulfur compounds.
APPROACH: The technique is based on coupling a ''diffusion tube'' scrubber to a very sensitive flame photometric detector. The diffusion tube scrubber serves two purposes: First, all gaseous sulfur compounds are reacted out to permit measurement of particulate sulfur only in the flame photometric detector. Second, by heating the aerosol upstream of the diffusion tube, individual sulfur compounds can be vaporized or decomposed to gases which are subsequently removed by the diffusion tube. This results in a decrease in the flame photometer output over a temperature range which is specific to the sulfur compound being vaporized or decomposed. A detection limit of approximately 2 mu g/m/sup 3/ sulfur is achieved by electronic signal averaging the detector output.
RESULTS: Preliminary studies on flash volatilization at several sulfate compounds are nearing completion. It is expected that these studies will show the feasibility at measuring volatile sulfate concentrations by heating droplets quickly with a platinum wire and monitoring resultant SO2 with an FPD. Several diffusion scrubbers have been fabricated and are now being evaluated for their ability to remove SO2, H2S, CH3SH, and CH3SSCH3. The final aspect of this work is the design, fabrication and testing of prototype monitors for both total and individual particulate sulfur compounds.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Fabricate, test and deliver automated sulfuric acid samplers, sampler-calibrators and analyzers to EPA.
APPROACH: The samplers are designed to collect sulfuric acid with a minimum of acid neutralization from coarse basic particles and gaseous ammonia. The acid aerosol is run through a diffusion scrubber for removal of NH3 and then a dichotomous sampler so only the fine aerosol fraction is collected on 1/2 mu m unbacked fluoropore filters. Built in calibrators on same samplers allow for internal quality control of sampler and filter transport procedures. The analyzer is designed to separate H_2SO_4 from other sulfur compounds on the filter by low temperature volatilization and to detect the sulfur with a sensitive FPD.
RESULTS: The first three samplers calibrators have been fabricated and are being tested and delivered to the branches which requested them. Preliminary tests in our laboratory indicate the manufacturer has met design specifications. Problems with the analyzer have thrown all production behind schedule. We have decided to go ahead with delivery of the samplers and calibrators waiting on fabrication of the analyzers until technical problems are worked out. We are confident that moderate design changes in the volatilization vapor transfer assembly will minimize current problems and allow delivery of acceptable analyzers by mid summer.
PROJECT MILESTONES: 9/77 Complete delivery of units.

PROJECT DESCRIPTION: The objective of this project was to determine background measurement, their capabilities of recently developed monitors for SO2, NO2, and NH3 and to determine if background measurements could be made using a moving van traveling across the United States equipped with these monitors and a special data logging system.
APPROACH: The Contractor using a mobile van equipped with a mapping and data acquisition system, measurement instrumentation for SO2, NO2, NH3 and H2S and calibration system would leave Los Angeles, California in early November 1976 and proceed across the Southern United States measuring background concentrations in rural areas and urban data in 5 cities along the route. Rural measurements would also be made at fixed sites along the route. Data from the measurement instrumentation would be plotted as a function of location and concentration.
RESULTS: The study was performed as planned using the described instrumentation. Considerable data were gathered as to background concentrations of the gases of interest as well as the pollution islands formed by the urban areas. Performance characteristics of measurement and instrumentation and data system were also obtained. The data being reduced and a final report written at this time.
PROJECT MILESTONES: 6/77 Final Report.

PROJECT DESCRIPTION: Develop generator for sulfuric acid particles in the 0.02 to 0.5 mu m size range. The aerosol generator is to be designed for use in animal test chamber studies to simulate exposures to sulfuric acid from catalyst equipped vehicles.
APPROACH: Introduce sulfuric acid into an air flow stream using a syringe pump. The air stream is heated and then cooled to cause evaporation of the original droplets and condensation into smaller ones. Particle size is controlled by adjusting the amount of dilution and the residence time.
RESULTS: The sulfuric acid is being installed in a 0.33 m/sup 3/ animal exposure chamber, where its performance will be evaluated. Particular care will be taken to limit the concentration and residence time for particles in the 0.02--0.05 mu m range to prevent change of particle size by coagulation.
PROJECT MILESTONES: 6/78 Delivery of Generator.

PROJECT DESCRIPTION: Our smog chamber and laboratory studies continue to provide data necessary for the development of experimentally validated kinetic computer models of chemical and physical transformations in polluted atmospheres, which can be incorporated into urban airshed models. The latter are used in developing and evaluating emission control strategies and health warning systems for photochemical air pollution.
APPROACH: Specifically, the SAPRC smog chamber facility continues to be used in an experimental program designed to provide accurate and extensive data for computer model validation. Thus, the photochemistry program conducted in the 5800-liter evacuable chamber includes irradiations, under simulated atmospheric conditions, of NO/sub x/-hydrocarbon systems in the ppb-ppm concentration range beginning with a single hydrocarbon and building through systems of six-component hydrocarbon mixtures of alkenes, alkanes, and aromatics. Studies of the effects on these systems of aldehydes and species such as HONO are included. In addition to extensive gas chromatographic analyses of hydrocarbons at the ppb detection level, a Fourier interferometer long-path infrared (LPIR) system and an off-line combined gas chromatograph-mass spectrometer system will be used for the characterization of additional trace products.
RESULTS: The laboratory program will continue to provide detailed product, mechanistic, and kinetic data that will support the chamber experiments and lead to the development of more accurate computer models. The laboratory studies this year will be (a) a quantitative investigation of the products formed in the reactions of OH radicals with benzene, toluene and possibly other selected aromatics in the presence of oxygen, and at atmospheric pressure, and (b) the determination of relative quantum yields for the formation of H atoms from formaldehyde over the wavelength region 270-350 nm.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objective of this project is to develop, demonstrate, and use methods and procedures for clarifying the relationship between oxidant precursors (specifically hydrocarbon and oxides of nitrogen) and oxidant (ozone) based on studies of ambient air. Understanding of this relationship is vital to sound development of control strategy, air quality standards, and emission standards. In photochemical smog the major health hazard (ozone) is a secondary product of a very complex reaction of primary pollutants (hydrocarbons and nitric oxide) which are not themselves highly toxic.
APPROACH: A new gas chromatographic procedure has been devised which permits direct measurement of ambient concentrations of methane, ethane, ethene, acetylene and total C3/sup +/ hydrocarbons. This procedure is automated to provide repetitive samples around the clock. These data will be compared with NO/sub x/ data and oxidant levels to better define the relationship between oxidant and its precursors, hydrocarbon and nitrogen oxides. The intensive data collection phase of the project is just beginning.
PROJECT MILESTONES: 6/77 Final Report.

PROJECT DESCRIPTION: Our smog chamber and laboratory studies continue to provide data necessary for the development of experimentally validated kinetic computer models of chemical and physical transformations in polluted atmospheres, which can be incorporated into urban airshed models. The latter are used in developing and evaluating emission control strategies and health warning systems for photochemical air pollution.
APPROACH: Specifically, the SAPRC smog chamber facility continues to be used in an experimental program designed to provide accurate and extensive data for computer model validation. Thus, the photochemistry program conducted in the 5800-liter evacuable chamber includes irradiations, under simulated atmospheric conditions, of NO/sub x/-hydrocarbon systems in the ppB-ppM concentration range beginning with a single hydrocarbon and building through systems of six-component hydrocarbon mixtures of alkenes, alkanes, and aromatics. Studies of the effects on these systems of aldehydes and species such as HONO are included. In addition to extensive gas chromatographic analyses of hydrocarbons at the ppB detection level, a Fourier interferometer long-path infrared (LPIR) system and an off-line combined gas chromatograph-mass spectrometer system will be used for the characterization of additional trace products.

PROJECT DESCRIPTION: A numerical model is being developed to define the parameters controlling the dry deposition of gaseous pollutants, particularly SO2, on vegetative canopies.
APPROACH: This model is one dimensional and divides the transfer from the free atmosphere to the ultimate sink into four processes: turbulent transfer above the canopy, within the canopy, molecular diffusion near the leaf surface, and finally diffusion through stomata to the interior of the leaf.
RESULTS: The basic model has been tested against wind tunnel data with considerable success. Investigations are now proceeding to model canopies typical of deciduous and coniferous forests and grasslands.

APPROACH: Aerosol size distributions have been measured in the St. Louis area as part of EPA's Project MISST using aircraft and ground based self contained mobile laboratories. These measurements were made with a group of collaborators such that a complete array of chemical, physical, and meteorological measurements were obtained on a coal fired power plant plume. The University of Minnesota's portion of the project included aerosol measurements aboard an aircraft and the operation of a mobile van on the ground under the plumes. This mobile van was also operated on freeways in the Los Angeles area during October 1976 as part of an EPA sponsored project to study sulfur aerosols on roadways.
RESULTS: Much of the work during the next project year will be analysis and reporting of the large amount of data obtained during the past several years. Analysis is being directed toward obtaining aerosol growth rates in the plumes, aerosol nucleation rates in the plumes and surrounding atmosphere, and toward better descriptions of the aerosol size distributions. Laboratory work toward the development of a continuous instrument for the measurement of aerosol sulfur is also being partially supported by this project.
PROJECT MILESTONES: 4/79 Final report.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: It is our hope that current and continued refinements in our photochemical model will make it possible to better quantify the most important regions of hydrocarbon NO/sub x/-oxidant control strategy diagrams.
APPROACH: Some of the major improvements in the model will come from the results of our proposed smog experiments which will isolate the influence of nitric and nitrous acid, aldehyde, PAN, carbon monoxide, aeromatics and less reactive hydrocarbon materials on smog systems. Since most of this work will be done on static smog chamber systems, continued effort will be made to simulate real atmospheric smog conditions by using sophisticated patterns of continued injection and dilution in the chamber.
RESULTS: Static analog experiments will be conducted with these very complex experiments. This information will then be used to reconstruct modeling results so that the derived control strategy relationships will have implicit atmospheric relevance.

PROJECT DESCRIPTION: The goal of this research effort is to measure dry deposition rates for pollutants related to photochemical air pollution in typical field situations.
APPROACH: A field measurement facility for monitoring the deposition velocity of such pollutants as SO2, O3, and NO/sub x/ will be assembled. A portable tower with pollutant sampling and meteorological sensors at four levels between the top of the underlying vegetation and a height of 10 m above this surface vegetation will be used to obtain profile measurements in the boundary layer. The results of these experiments should lead to a better understanding of the factors affecting dry deposition and to improved modeling procedures.

PROJECT DESCRIPTION: Using the technique of computer modeling in a previous contract with EPA (No.

68-02-0580) Systems Applications, Inc. developed chemical oxidation mechanisms for the hydrocarbons propylene and butane based on elementary chemical reactions to simulate smog chamber experiments performed at the University of California at Riverside (UCR). A new condensed photochemical smog mechanism was proposed at the end of that work based on the propylene/butane airshed models.
APPROACH: The present contract (No. 68-02-2428) extends both the explicit and condensed chemistry by computer modeling of recent smog chamber experiments using groups of various hydrocarbons. Also an addendem to the new contract has been granted to model similar propylene experiments performed in 10 different smog chambers in order to elucidate and eliminate any systematic errors present in the mechanisms caused by the walls of smog chambers.
PROJECT MILESTONES: (1) 9/77 Interim Report. (2) 9/78 Final Report.

PROJECT DESCRIPTION: Kinetic and mechanistic studies are undertaken in order to characterize several reactions that are important in polluted atmospheres. These include alkyl peroxy and hydroperoxy radical reactions with SO2, NO, and NO2.
APPROACH: Kinetic flash spectroscopy, steady state photochemical systems, and flow systems are employed to follow the kinetics of RO2 reactions. Identification and characterization of the initial reactants and reactive products will be attempted by the use of infrared, visible and U.V. spectroscopy, mass spectroscopy, and the conventional wet chemical methods.
RESULTS: The kinetic information obtained in this study will be applied directly to the development of a realistic computer model for simulating SO2, NO/sub x/, and HC removal in the atmosphere.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: It is proposed to study the oxidation of sulfur dioxide in the atmosphere using the techniques of matrix-isolation and molecular fragmentation.
APPROACH: Reactions of olefins and ozone and the subsequent oxidation of SO2 will be monitored with a Model 12-A Fourier Transform Interferometer. Spectra of mixture of ethylene and ozone suggest the formation of at least two reaction intermediates. Argon diluted samples of sulfur dioxide and isotopic ozone revealed appreciable 18 oxygen exchange only after the sample was allowed to stand for two days. Detection of the reactive species provides the kinetic and structural data necessary to elucidate the oxidative mechanism of SO2 and other pollutants such as the nitrogen oxides and vinyl chlorides.
PROJECT MILESTONES: 11/77 Report on SO2 oxidation.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The purpose of this research is the understanding of the various atmospheric chemical and photochemical reactions involving halogenated species. These include the halocarbon compounds in current technology, the intermediate halogenated radicals released during their atmospheric decomposition, and compounds formed in situ by atmospheric reactions.
APPROACH: The ultraviolet absorption spectra of brominated molecules often extend into the 2900-3100A region near the atmospheric cut-off of stratospheric ozone. Long-path u.v. absorption spectra will be measured for various brominated species (e.g., CBr2F2) to determine which molecules can undergo appreciable tropospheric solar photodecomposition. The chemical reaction mechanisms of important ''semi-stable'' molecules formed in the atmosphere will be studied. Flash photolysis will be used to determine whether the halogenated species released in the photodecomposition of chlorine nitrate is ClO, ClONO, Cl or ClNO. Flash photolysis will be used to determine whether ClONO2 is the sole product from the reaction of ClO with NO2. Peroxynitric acid (HO2NO2) will be synthesized and its u.v. absorption spectrum will be measured. Radioactive tracer techniques will be applied to the determination of the chemical fate of halogenated radicals reacting with air. These tracer radicals can effectively simulate the very low concentrations of organic species in the actual atmosphere. The possible formation of aldehydes from the oxidation of halo radicals will be investigated, e.g., for CH3CCl3, the formation 14-CH3CClO from 14-CH3CCl2 + O2. The reactions of the residual radicals from CH3Br decomposition will be traced using radioactively-labeled CH2-82-Br.
PROJECT MILESTONES: (1) 10/77 Annual Report. (2) 10/78 Annual Report. (3) 10/79 Final Report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: As a result of transport of ozone and its precursors over long distances, elevated oxidant concentrations have been observed in many rural areas in the continental United States. In order to assess the impact of long-range transport on regional control strategies, a meso-scale photochemical air quality model is being developed under this project.
APPROACH: The modeling region will be approximately 1000 km by 1000 km. The major component of this model will be a multiple-layer grid model that invokes the atmospheric diffusion equation. Other key components include a kinetic model and a pollutant-depletion model. The kinetic model will follow photochemical reactions between hydrocarbons, oxides of nitrogen and sulfur, ozone, and other species. The pollutant-depletion model will treat the removal of gaseous and particulate pollutants due to dry or wet deposition processes.
RESULTS: Emissions from both anthropogenic and natural sources will be considered in this model.
PROJECT MILESTONES: 9/79 Final Report.

PROJECT DESCRIPTION: The purpose of this research study is to investigate the source of high oxidant levels in rural areas. Specific goals include monitoring individual hydrocarbons in the C2 to C10 molecular weight range, NOx and ozone in non-urban areas of the western and midwestern United States.
APPROACH: The study will involve both ground based and aircraft monitoring. We also plan to conduct a number of natural sunlight irradiation experiments designed to provide information about how fresh inputs of NOx affect photochemical behavior of rural air masses. The field portion of this study is scheduled for July and August of 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The research effort includes the continuing development, evaluation, and validation of air quality simulation models, both for inert and reactive pollutants.
ROACH: Users will be provided access to these models through the EPA User's Network for the Applied Modeling of Air Pollution (UNAMAP). New concepts and technologies will be developed and adapted for improving the weakest components of existing models, with emphasis on the effects of topography, pollutant removal and conversion processes, and complex sources. Other activities will be directed toward the determination and definition of the effects of pollutant emissions on visibility, weather, and climate. Further studies will be conducted in air pollution potential climatology.
RESULTS: Participation will continue in the Regional Air Pollution Study (RAPS). The field portion of the

study will terminate in Spring, 1977, and analysis and use of the data for model evaluation and verification will be initiated.
PROJECT MILESTONES: (1) 10/76 Begin fall studies. (2) 11/76 End fall studies.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Investigation of the dependence of ambient NO2 on precursor emissions.
APPROACH: EPA is considering establishing a short-term (one-hour) standard for NO2 to complement the existing annual mean standard. To support regulations concerning NO2 standards, empirical analyses will be conducted by TSC on ambient monitoring data. A statistical analysis will be performed with nationwide ambient NO2 data to characterize the relationship between yearly one-hour maximum and annual mean NO2 concentrations. This analysis will identify regions that may exceed the annual standard. It will also be determined if the annual standard or a proposed one hour standard is the binding constraint for control strategy formulation in various areas. An empirical modeling project will also be carried out to provide a better understanding of the relationship of NO2 concentrations to precursors. Although it is generally agreed that NO2 concentrations should be proportional to NOx concentrations with all other factors held constant, there is substantial uncertainty concerning the impact of hydrocarbon and oxidant reductions on NO2 levels. Empirical models will be applied to ambient NO2 and precursor data from Los Angeles, Texas, and CAMP sites in order to determine the dependence of max one hour NO2 and annual mean NO2 on precursors.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
APPROACH: Dispersion from sources upwind of two- and three-dimensional rounded hills will be performed in the stably-stratified towing tank. For conditions of mild stability, where turbulence is not completely

damped, the effect of stability on flow separation and turbulence over the model hill will be investigated. The position of separation determines much of the flow over a hill and, therefore, the dispersion. For strongly stratified conditions, it will be of interest to study how an initially turbulent plume is converted into a laminar plume. Previous experimental data indicated that the turbulence decays but the plume remains well-mixed by means of internal shearing motions in the plume caused by its initial bending over. This study is highly relevant to the current dilemma over the ''EPA Topographical Model.''

PROJECT DESCRIPTION: The purpose of this model development is the simulation of the transport, dispersion, and chemical transformation of species over large time and distance scales.
APPROACH: The winds, temperature, eddy diffusion coefficients and other meteorological parameters will be furnish by a boundary layer model being developed by NOAA. Emissions will be calculated from the NEDS data base and will include plume rise. The model will calculate transport of pollutants using a flux-corrected advection scheme (SHASTA), while diffusion will be calculated using an implicit approximation. The model will also include deposition at the surface via boundary conditions.
RESULTS: The program has been tested using fictitious data to test the advection and diffusion schemes used. It is expected that testing of sulfur chemistry using fictitious meteorology and real emissions will be completed by June '77.
PROJECT MILESTONES: 6/78 Report on model evaluation.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: A comprehensive study is being conducted to characterize the occurrence of sulfur in aerosol particles at sampling stations in 14 locations between the mid-continent and eastern seaboard of continental U.S.A. Additional remote stations in marine and continental areas are also being operated to provide important background information. Emphasis is being placed on the concentrations of sulfur in relation to other elements present in the aerosol and on the time variability of these concentrations with a time resolution of 2 hours.
APPROACH: Sampling is being carried out continuously at heights from ground level to 30 meters by a unique time sequence filter sampler which has been developed at Florida State University. Additional samples are planned to be taken during intensive periods during the year by cascade impactors at about five of the filter sampling sites, using cascade impactors for determination of the particle size distribution of sulfur and related elements. Elemental analysis is performed using proton induced X-ray emission, a highly sensitive technique permitting both the extremely short 2-hour time resolution on a continuous basis for filter samples as well as the size resolution of particles as small as 0.25 mu m diameter by cascade impactors. By means of the combination of sampling techniques, the impact of fossil fuel combustion and other anthropogenic sources of sulfur on the natural characteristics of the atmosphere may be precisely determined.
PROJECT MILESTONES: 12/80 Final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: This program has designed and built an outdoor chamber facility for the investigation of aerosol formation processes similar to those occurring in the ambient atmosphere. During the second budget period, experimental methods and procedures were developed or adapted for this project and an experimental program is now in progress. The overall objectives of this budget period will be to investigate gas to particle conversion processes.
APPROACH: This will be accomplished by conducting chamber experiments in three areas: sulfate aerosol formation in hydrocarbon-NO/sub x/ systems, SO2-NO/sub x/ plume systems and systems containing metallic seed nuclei. During this coming period, additional experiments will be conducted on this system. Aerosol parameters to be obtained include condensation nuclei count, size distributions by electric aerosol analyzer and filter samples for sulfate analysis by x-ray fluorescence and flash vaporization flame photometric detection. The hydrocarbon-NO/sub x/-SO2 system is an analog of aerosol formation in urban areas with multiple sources of pollution, stationary and mobile. the second area of research involves the SO2-NO/sub x/ system as an analog of the processes occurring in a power plant plume. A series of experiments with various initial concentrations of SO2, NO, NO2 and water vapor will be conducted. The third major area of research will be generation of aerosols in the presence of seed nuclei. Existing aerosols provide an alternate oxidation process for conversion of SO2 to sulfate. Metallic nuclei will be introduced into the chamber and the size distribution will be determined, then SO2 will be introduced and evolution of the aerosol will be measured.
PROJECT MILESTONES: 6/78 Laboratory data for test of integrated chemical and physical model of aerosol dynamics.

PROJECT DESCRIPTION: During the contract period the contractor will provide technical services as directed by the Project Officer through task orders.

APPROACH: Such services will include but are not limited to: (1) prediction of size, shape and direction of power plant and urban plumes, (2) planning assistance (site selection and experimental design), (3) surface and vertical profile measurements (pilot balloons, radiosondes, helicopter flights, tower measurements), (4) measurement of vertical fluxes of pollutants, (5) calculation of wind fields and trajectories, and (6) preparation of appropriate data and interpretive reports.
RESULTS: These services are expected to require approximately 700 man-hours during the contract period, but the contract should provide for the purchase of additional services in increments of 235 man-hours if they are needed. The contractor shall provide equipment, materials, and travel that may be required to perform assigned tasks.

PROJECT DESCRIPTION: To modify current models for maximum user utility, to document these models and make them available through the Users Network for Applied Modeling of Air Pollution (UNAMAP).
APPROACH: Current models (to date of the Gaussian type) are modified to be of practical use to the greatest number of users. Such modification is primarily aimed at arrangement of additional output useful for air quality management, although input modifications may also be accomplished to accept routinely available information.
RESULTS: Two models: RAM, a short term (1-hour to 24-hour) urban model and PAL, a point, area, and line source model, are being documented in the form of users guides. Additional models, such as MX24SP, a single plant model to estimate maximum 24-hour concentrations, and CDM(36), a climatological model accepting wind input for 36 points, as well as products from the Atmospheric Modeling and Assessment Branch will be modified, documented, and made available.
PROJECT MILESTONES: 5/77 User's guide for MX24SP. Model users.

PROJECT DESCRIPTION: The objectives of the proposed research are to determine mechanisms and rate of sulfuric acid and sulfates formation from catalytic oxidation of sulfur dioxide, to investigate the effects of catalytic iron salts and organic compounds on conversion of sulfur dioxide in aqueous solutions and to assess the role of liquid phase oxidation in the formation of sulfates aerosols in ambient and polluted atmosphere.
APPROACH: Kinetic experiments will be carried out in liquid phase using stopped-flow technique. Mechanisms and rate of oxidation of sulfur dioxide by oxygen and ozone in aqueous solutions will be determined utilizing the kinetic data. Catalytic effects of iron salts and influences of organic compounds on the reactions will be investigated.
RESULTS: The proposed research will be divided into several subsystems to study the kinetics of oxidation with or without catalytic agents and organic compounds. The experiments will be conducted at temperatures ranging from 10 to 30 degrees C in aqueous solutions with pH ranging from 2 to 11. Absorbances and, in turn, concentrations of the solutions during reactions will be measured and analyzed to determine the reaction kinetics.
PROJECT MILESTONES: 7/78 Final report.

PROJECT DESCRIPTION: To test Air Quality Simulation Models against available data bases and determine accuracy.
APPROACH: The Environmental Applications Branch has been participating in the Practical Demonstration of Urban Air Quality Simulation Models as part of activities of the NATO/CCMS Panel on Modeling.
RESULTS: Two models, CDM(36) and SCAM (Sampled Chronological Air-Quality Model), have been described and applied to the NATO Common Data Base for Frankfurt. This has resulted in four short reports. (Two describing the models and two giving the resulting calculations.) Additional calculations and an additional report describing the calculations have been made using additional meteorological data. Upon receipt of the measured concentrations for Frankfurt, comparisons will be made with model estimates. A final report on using the Frankfurt data will be completed.
PROJECT MILESTONES: 9/77 Report on participation in NATO/CCMS evaluations. Model users.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Our objectives in this study are: (1) Refinement of the Lagrangian trajectory model, including chemical transformation terms and improving precipitation scavenging terms based on a cloud-modeling study; (2) cloud-modeling study to investigate the vertical transport of pollutants by convective clouds and the distribution of pollutants in cloud air and cloud water droplets; (3) incorporation into our model of pollution transport by ''dry'' convection into the layers above the mean mixing layer height.
APPROACH: A long-range transport model suitable to keep track of pollutants at distances from 100 to 1000 km downstream of large industrial complexes is under development. It is the purpose of this research proposal to make our transport model more comprehensive and to study vertical transport processes of pollutants.
PROJECT MILESTONES: (1) 5/78 Progress report. (2) 5/79 Final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The three main objectives of this study are: (1) establish and document by field easurements the sulfur budget in large single plumes, (2) identify the major physical and chemical echanisms and parameters which govern the sulfur budget, (3) formulate and test a ispersion-transformation-removal model for SO2 and aerosol.
APPROACH: Instrumented aircraft and surface vehicles will be used for the detailed plume mapping of fixed distances from the source outward to 100 km. Using wind field data from pilot balloon measurements, the horizontal sulfur flux will be measured in the gas and aerosol phase. The aerosol mass and sulfur content will be measured by a high resolution beta-gauge and vaporization-flame photometric method, respectively.
RESULTS: These data will be utilized to establish the amounts of SO2 converted to aerosol and its rate and

the amount of sulfur removed by dry deposition. The data will be used for the improvements and extension of dispersion-transformation-removal models.
PROJECT MILESTONES: 9/78 Report on statistical relationship between visibility and pollutant concentration.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objective of this program is to refine and update existing kinetic mechanisms that describe the formation of photochemical smog.
APPROACH: To meet this objective, we will test and modify these mechanisms by comparing computed concentration-time dependence of various reactants and products with those observed experimentally in the smog chamber facility at the Statewide Air Pollution Research Center (SAPRC), Riverside, California. Individual kinetic models will be developed in conjunction with data for the hydrocarbons, ethylene, propene, butene-1, trans-2-butene, n-butane, 2,3-dimethyl-butane, and toluene.
RESULTS: The models will be combined and tested in conjunction with smog chamber data for mixtures of hydrocarbons that mimick hydrocarbon reactivity in various urban atmospheres.
PROJECT MILESTONES: 9/78 Final report.

POLLUTANTS: NOXIOUS GAS/SO/sub x/;NOXIOUS GAS/Nitrates (50%);PARTICULATES/Smog (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The purpose of this contract activity is to obtain experimental evidence on the effects of various controllable factors, such as concentrations of reactant hydrocarbon, NO/sub x/, and SO2, under various ambient conditions, and in the presence of other atmospheric constituents. This contract effort focusses on the area-wide atmospheric process; other contract effort is addressed to the process prevailing in roadway atmospheres.
APPROACH: The experimental work includes measurement of rate of SO2 oxidation under conditions that approach as closely as possible those prevailing in the real atmosphere above an urban center. Such conditions can be approximated to some degree in the laboratory and to a much greater degree in smog chambers filled with real atmosphere air and irradiated by natural sunlight. This contract activity is intended to provide the requisite experimental data following both approaches, namely, the in-laboratory simulation approach.
RESULTS: Results will be used by EPA to estimate the degree to which SO2 is converted (into SO4/super -2/) in the atmosphere through the homogeneous gas-phase photooxidation process, and to assess the relative effects of the SO2, HC, and NO/sub x/ reactants on this process.
PROJECT MILESTONES: 9/77 Final report.

PROJECT DESCRIPTION: The objective of this task is to develop performance specifications which will provide a technical base in support of regulations that require monitoring of particulate emissions from selected industries.
APPROACH: Performance specifications and test procedures will be considered for commercially available monitors that operate on specific physical principles, namely, optical, electrical and nuclear. Development of performance specifications will be contingent upon demonstrated capability of monitors commercially implemented to perform adequately in applications to selected industrial emissions.
RESULTS: Current evaluation of commercially available monitors applied to coal-fired power plants is underway for optical, nuclear and electrical type systems. Optical monitors, to date, offer adequate performance. Performance specifications for these optical monitors will be developed.
PROJECT MILESTONES: 6/78 Proposal specifications applied to smelters and steel industry.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: (1) To assess and document the current precision and accuracy of both air quality and meteorological data presently obtained from the 25 RAMS stations. (2) To identify sensors/analyzers not satisfying acceptable performance criteria to allow for timely corrective action by RAMS. (3) To define and evaluate the capabilities of the RAMS/RAPS data acquisition system and data validation procedures. (4) To develop, demonstrate, and recommend statistical edit/validation procedures specific to each measured parameter, both air quality and meteorological.
APPROACH: Performance audits of the air quality analyzers for NO, NOx, NO2, SO2, CO, CH4 and THC will be made using compressed gas cylinders of each pollutant at the levels to be audited. For example, cylinders of SO2 at or near 50 ppB and 180 ppB will be used to audit the TS analyzers on the 0 to 200 ppB range. All audit standards/devices are built around NBS SRMs or their traceability to NBS SRMs or other accepted standard established prior to the audit. Statistical data validation procedures will be developed by personnel experienced in making air quality and meteorological measurements, air chemists, and meteorologists.
RESULTS: Two performance audits are scheduled for June and September, 1976. Recommendations for data validation procedures will be completed 2 months after requested RAMS data becomes available to RTI.
PROJECT MILESTONES: 10/77 Final report.

PROJECT DESCRIPTION: Kinetic and mechanistic studies will be made to recognize and to quantitatively characterize the several reaction pathways which result in the chemical transformation and removal of SO2, NO, and NO2 in the polluted atmosphere.
APPROACH: In one phase of the work the seemingly important reactions of the alkyl peroxy and hydroperoxy radicals with SO2, NO, and NO2 are being investigated. Kinetic flash spectroscopy, steady state photochemical systems, and studies in flow systems are employed to follow the kinetics of the RO2 reactions. The identification and kinetic characterization of the initial reactive products of these reactions will be attempted using infrared, visible, ultraviolet spectroscopy, mass spectroscopy, and more conventional chemical methods. In other phases of this work we plan to study the reaction pathways which involve the reactions of the electronically excited SO2 with atmospheric components and the reactions of the HO-radical with SO2, NO, NO2, and other atmospheric pollutants of special interest.
RESULTS: The mechanism and kinetic information obtained in the study will be applied directly to the development of a more realistic computer simulation scheme for the prediction of traces of SO2 and NO/sub x/ removal reactions and the nature of the initial ''sulfate'' and other unidentified and recognized products of the sunlight-irradiated, NO/sub x/, SO2, RH-polluted atmospheres.

PROJECT DESCRIPTION: The investigator proposes to perform calculations using a recently developed theory to estimate the effect of particle size and refractive index on the Raman scattering cross-sections for molecules comprising all or a constituent part of small particles.

APPROACH: These calculations will be coordinated with experimental work at the National Bureau of Standards directed towards the analysis of molecular species contained in small particles. The NBS work is being supported by EPA through an Interagency Agreement. The investigator will undertake theoretical studies to extend the present theory to nonspherical particles and to nonuniform light sources. The numerical studie will permit extension of the present technique for qualitative analysis for particulates to a more quantitative basis. To this time no theory has been available to predict the dependence of the total Rama.. signal in particle size, shape, refractive index and orientation with respect to the directions of illumination and collection. Calculations to elucidate these dependencies may also lead to estimates of the distribution of the molecular species within the particle (i.e., uniform distribution throughout the particle or concentration in a surface layer). If the theory can be extended to nonspherical particles, then computations can be made to include more real world particles other than simply spherical particles. The theoretical computations and the experimental study will be complementary and will provide a more complete assessment of Raman scattering as a nondestructive analytical technique for determining molecular composition of small particles.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The immediate objective of this study is to provide a new and more comprehensive body of data useful in evaluating current theories for the gas-phase oxidation of SO2 in polluted air. The ultimate goal of the program is to develop and validate a model which will be useful in predicting SO2 oxidation rates for a variety of atmospheric conditions, including those for plumes from combustion sources, urban core smog and urban plumes, and long-range transport of large air masses.
APPROACH: Experiments of SO2 oxidation will be conducted with three smog systems: propylene, a surrogate mixture of urban hydrocarbons, and early-morning air in Columbus, Ohio. Comparative data from these three systems will be used to assess the adequacy of existing kinetic models for SO2 oxidation and to formulate more unique models where necessary.
PROJECT MILESTONES: 6/78 Final Report.

PROJECT DESCRIPTION: Determine the rates of formation and removal of secondary pollutants, such as sulfates, nitrates, and organic aerosols, during transport distances from ten to hundreds of kilometers. Determine which parameters influence the rates of formation and removal and their frequency of occurrence.
APPROACH: Use aircraft at mobile ground units to measure pertinent parameters in plumes from point and area sources and stagnant air masses (hazy blobs). Determine mass flow rates of pollutants under various conditions and infer reaction rates and mechanisms.
RESULTS: Measurements were made in coal-fired power plant plumes and urban plumes during the summer of 1974, 1975, and 1976, in a hazy blob in August 1976, and in an oil-fired power plant plume in February 1977. Preliminary reports have been made at APCA and ACS meetings. The use of SF6 tracers and continuous sulfate instruments will be tested in spring 1977. In FY78 and later, measurements will be made in additional areas of the U.S. Data analyses and interpretations are continuing wth data presentations planned for RTP (June or July 1977), Dubrovnik (September 1977) and a regional meeting early in 1978. Rates of conversion of SO2 to sulfate and rates of removal of SO2 have been measured under summer conditions. Background air composition, background ozone and water vapor concentrations, and extent of plume mixing are parameters

influencing reaction rates. Conversion is observed both during daylight and nighttime hours.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objective of this program as a part of project MISTT (Midwest Interstate Sulfur Transformation and Transport) is the quantitative determination of the fate of atmospheric sulfur, i.e., the rate of sulfate formation and the rate of SO2 removal to the ground.
APPROACH: Large plumes emitted from the elevated (power plant) and low level sources (urban) were studied on the regional scale. Airborne measurements in the plumes and background air outside the plume were carried out for SO2 O3 NO/sub x/, b/sub scat/, aerosol charge, particulate sulfur concentration and supported by extensive meteorological measurements.
RESULTS: Sulfur budgets of well defined plumes were assessed. Transport of pollutants in plumes was characterized in terms of horizontal ''long range transport'' and vertical transport. The importance of dry removal for different types of plumes and meteorological conditions was assessed. SO2 to particulate sulfate conversion rates were determined for the coal-fired Labadie power plant plume and the diurnal variability (1 to 4 percent per hour for noon hours and 0.5 percent per hour for night hours) was determined.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The purpose of the 1976 MISTT study is to extend the results of previous studies to cover larger distances from the sources and obtain more detailed knowledge of the chemical processes occurring in polluted air. The aerosol formation processes as well as gaseous plume chemistry will be the subject of continued study.
APPROACH: Conversion rates and mechanisms identified earlier need to be verified under a variety of meteorological conditions. The aerosol chemistry of the urban and power plant plumes will be examined using new techniques which will yield information on substances other than sulfate. In addition to refining our understanding of the chemical processes, the 1976 program will attempt to better define the regional transport and accumulation mechanisms at work in the Eastern United States.
RESULTS: The project will be expanded from the immediate St. Louis area to include the study of pollutant accumulation and transport in synoptic scale, slow moving, stable air masses.

PROJECT DESCRIPTION: Aerosol size distributions have been measured in the St. Louis area as part of EPA's Project MISST using aircraft and ground based self contained mobile laboratories. These measurements were made with a group of collaborators such that a complete array of chemical, physical, and meteorological measurements were obtained on a coal fired power plant plume. The University of Minnesota's portion of the project included aerosol measurements aboard an aircraft and the operation of a mobile van on the ground under the plumes.
APPROACH: Much of the work during the next project year will be analysis and reporting of the large amount of data obtained during the past several years. Analysis is being directed toward obtaining aerosol growth rates in the plumes, aerosol nucleation rates in the plumes and surrounding atmosphere, and toward better descriptions of the aerosol size distributions. Laboratory work toward the development of a continuous instrument for the measurement of aerosol sulfur is also being partially supported by this project.
RESULTS: This mobile van was also operated on freeways in the Los Angeles area during October 1976 as part of an EPA sponsored project to study sulfur aerosols on roadways.

POLLUTANTS: NOXIOUS GAS/SO/sub x/ (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To pursue work in three distinct areas of aerosol instrumentation and characterization. These include development of (a) a shape sensitive aerosol particle size spectrometer, (b) a nuclear gamma-ray Lethod to measure the concentrations of light elements such as carbon, nitrogen, oxygen and sulfur and (c) a particulate sulfur analyzer.
RESULTS: During the current period the device and techniques to measure particle size have been documented with laboratory aerosols. Additional measurements on atmospheric aerosols will be made in the upcoming period. In this period the nuclear gamma-ray method was brought into routine operation for all elements except oxygen, and this analytical technique will be developed in the next period. Some work has also been done on the in-situ analysis of sulfate aerosols using thermal analysis techniques. A Malloy FPD Sulfur Analyzer was obtained and laboratory tested and calibrated and will be field tested under a variety of conditions in the next year.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The goals of this current proposed study is to trace the sources of aerosol particles collected by the EPA and other agencies at a network of sampling stations, by identifying the types of particles and comparing them to reference samples.
APPROACH: The particles will be characterized and identified by polarized light microscopy supplemented with scanning electron microscopy and mass spectrometry. The data from these analyses will be correlated with meteorological and aerosol data to discover the impact of individual sources in producing haze.
RESULTS: The City of Denver experiences over 200 atmospheric inversions each year which produce haze and decreased visibility over significant portions of Denver. In 1973, the U.S. EPA began a research study to determine the cause and sources of this pollution problem. One important aspect of the study involves the

identification of aerosols collected from the atmosphere. In a previous preliminary study (1972), polarized light microscopy was used successfully to identify many of the aerosol particles.

PROJECT DESCRIPTION: A comprehensive study is being conducted to characterize the occurrence of sulfur in aerosol particles at sampling stations in 14 locations between the mid-continent and eastern seaboard of continental U.S.A. Additional remote stations in marine and continental areas are also being operated to provide important background information.
APPROACH: Emphasis is being placed on the concentrations of sulfur in relation to other elements present in the aerosol and on the time variability of these concentrations with a time resolution of 2 hours. Sampling is being carried out continuously at heights from ground level to 30 meters by a unique time sequence filter sampler which has been developed at Florida State University. Additional samples are planned to be taken during intensive periods during the year by cascade impactors at about five of the filter sampling sites, using cascade impactors for determination of the particle size distribution of sulfur and related elements. Elemental analysis is performed using proton induced X-ray emission, a highly sensitive technique permitting both the extremely short 2-hour time resolution on a continuous basis for filter samples as well as the size resolution of particles as small as 0.25 micron diameter by cascade impactors.
RESULTS: By means of the combination of sampling techniques, the impact of fossil fuel combustion and ther anthropogenic sources of sulfur on the natural characteristics of the atmosphere may be precisely determined.
PROJECT MILESTONES: 12/78 Final report.

ECT DESCRIPTION: The research program has two objectives: (1) To analyze the halocarbons and hydrocarbons n air samples collected by the field studies in the St. Louis area. Particular emphasis will be placed on detailed C2 to C12 hydrocarbons measurements from both aircraft and ground sampling stations. In addition a complete analysis of the halocarbons will be accomplished especially the fluorocarbons 11 and 12 and the chlorocarbon cleaning solvents. (2) To provide future field support via an instrumented field laboratory, meteorological support for coordinating aircraft studies and interpreting stagnating anticlone weather situations.
RESULTS: The installation of specially programmed automated halocarbon instrumentation, and/or manually operated high resolution hydrocarbon instrumentation in government owned mobile aerosol laboratory will be accomplished at the request of the government.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: This study will support the further development and application of multiple atmospheric tracer techniques.
APPROACH: The analytical approach is to extend the use of electron capture gas chromatography. Recently, with the helpful suggestions given to us by Ray Dixon, we have developed systems which separate SF6, CBrF3, CCl2F2, O2, and CBr2F2 into sharp distinct peaks, the last of which elutes within 200 seconds from the time of injection. The rest of the system development is to develop the capability to accurately analyze at least 1000 air samples per day.
RESULTS: The first extended application of this multiple tracer technique would be to determine the transport and extent of dispersion associated with: (1) urban sources (emitted at low levels) and (2) rural power plant plumes emitted at high levels. Specific experiments are planned to accurately determine the extent of vertical dispersion associated with plumes traveling over rural regions and over urban regions.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This Symposium should bring together American, European and other participants to report and discuss the current issues on the atmospheric sulfur problem.
APPROACH: It is estimated that the global emission from anthropogenic sources are of the same order of magnitude as emissions from natural sources. However, more than 90 percent of anthropogenic SO2 emissions are in the northern atmosphere. It has been recognized that the anthropogenic sulfur problem is a regional one on the spatial scale of thousands of kilometers. The horizontal and vertical dispersion mechanisms, removal rates by dry and wet deposition, SO2 oxidation rates and mechanisms, the particulate sulfur size distribution, spatio-temporal distribution and chemistry of aerosol sulfur compounds and associated measurement techniques will be discussed.

PROJECT DESCRIPTION: The overall objective of this research is to determine the structure and reactivity of adsorbed oxides of sulfur. Results from such a study will be useful in identifying the photochemical and thermal reactions which take place on atmospheric aerosols. The specific goals during the current year were (a) to develop photoelectron infrared spectroscopy as a technique for studying oxides of sulfur on aerosols, (b) to determine the mechanism for the oxidation of SO2 to SO4 on surfaces, (c) to identify ions such as S2O- and H2S- which may be produced during the photochemical reaction of H2S with SO2 on magnesium oxide.

APPROACH: Emphasis in future work will be placed on the catalytic oxidation of SO2 in films of absorbed water.

PROJECT DESCRIPTION: The objective of this field measurement program is to collect a set of reliable aerometric measurements in the vicinity of the Clinch River Power Plant in Russell County of southwestern Virginia.
APPROACH: Continuous measurements of SO2, NO, wind, and temperature are made at 8 fixed sites out to 30 km from the plant. An instrumented van routinely monitors air quality at likely receptor locations SO2 and NO are monitored continuously at the plant and pibal and temperature soundings are made daily.
RESULTS: After the field data are archived they will be analyzed to determine effects of complex terrain on transport and diffusion, and the aerometric data will be made available to others, analysts, modelers, etc.
PROJECT MILESTONES: 8/78 Report on field study of a power plant for complex terrain.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Environmental Measurements, Inc. (EMI) will organize and execute field programs for the measurement of power plant plume transport, using aircraft platforms and a variety of air quality instruments. The purposes of these field programs are to: (1) Obtain measurements of changes in plume chemistry of the same air parcel during its long-range transport away from a power plant; (2) Develop an EPA data base parallel and complementary to that obtained by others as part of such programs as the Sulfate Regional Experiment (SURE); (3) Test fly a new and innovative instrumentation.
APPROACH: An initial project will be in cooperation with the activities of the Atmospheric Dynamics and Chemistry Section of Battelle-Pacific Northwest Laboratories (BNW), as supported by the Electric Power Research Institute (EPRI). The work will take place in the vicinity of two power plants located in Michigan and Indiana in May 1977.
RESULTS: Measurements for the following parameters will be included: sulfates, SO2, submicron aerosols, SF6, b(scat). This work will be coordinated with other contractors to provide broad field measurements, data analyses and a final report.

PROJECT MILESTONES: 4/80 Final report.
KEYWORDS: THERMAL POWER PLANTS;GASEOUS WASTES;PLUMES;AERIAL MONITORING;CHEMICAL COMPOSITION;AIR POLLUTION;MONITORING;AEROSOLS;PARTICLE SIZE;SULFUR COMPOUNDS;QUANTITATIVE CHEMICAL ANALYSIS;SULFATES;SULFUR DIOXIDE;SULFUR FLUORIDES;AIR POLLUTION MONITORS;PERFORMANCE TESTING;SAMPLING;ORGANIC COMPOUNDS

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: (1) A thorough study of sampling procedures for atmospheric nitrate and of factors and conditions affecting their collection efficiency, especially of those which may lead to the conversion of NO/sub x/ to nitrite and nitrate on the collection medium and consequently to the formation of artifacts and pseudoparticles. (2) Development of an efficient and dependable procedure for the accurate collection of nitrate from ambient air with particular emphasis on preventing the oxidation of nitrate precursors to nitrate on the collection medium. (3) Development of a dependable laboratory method for the determination of atmospheric nitrate. The method must be sufficiently sensitive to allow analysis of ambient air levels of nitrate in the submicrogram and low microgram range and should be potentially suited for eventual automation.
PROJECT MILESTONES: 12/77 Final report.

ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: PARTICULATES/Dust (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (50%);FULL SCALE DEMONSTRATION (50%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of the program is to construct an optical instrument that is capable of making measurements of mass concentration in times approaching real time.
APPROACH: The technique makes use of the fact that the wavelength dependence of opacity varies with the size of the particles in the effluent. The instrument makes transmission measurements at several wavelengths free of absorption bands in the visible and IR. The data is fed into a computer that has been programmed for a particular type of site. The program contains information on the optical indices of the particulate as a function of wavelength, the form of the particle size distribution function, typical size ranges, etc. The computer makes a best fit of the optical data by adjusting the parameters of the size distribution function and computes the mass concentration. Since the computations occur very rapidly, the results are available in almost real time. The current system uses time share but future units will use an on-board minicomputer.
RESULTS: The program will be accomplished in two phases. The first phase will involve the construction of a breadboard unit that will be checked out in the laboratory with controlled dust chambers and cells. The second phase involves the packaging of a field worthy unit which will be tested at a coal burning power plant and at a Portland cement plant. Concurrent probe measurements will also be made.
PROJECT MILESTONES: 2/77 Final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;ECT
ECT DESCRIPTION: A comprehensive study is being conducted to characterize the occurrence of sulfur in aerosol particles at sampling stations in 14 locations between the mid-continent and eastern seaboard of continental U.S.A. Additional remote stations in marine and continental areas are also being operated to provide important background information.
APPROACH: Emphasis is being placed on the concentrations of sulfur in relation to other elements present in the aerosol and on the time variability of these concentrations with a time resolution of 2 hours. Sampling is being carried out continuously at heights from ground level to 30 meters by a unique time sequence filter sampler which has been developed at Florida State University. Additional samples are planned to be taken during intensive periods during the year by cascade impactors at about five of the filter sampling sites, using cascade impactors for determination of the particle size distribution of sulfur and related elements. Elemental analysis is performed using proton induced X-ray emission, a highly sensitive technique permitting both the extremely short 2-hour time resolution on a continuous basis for filter samples as well as the size resolution of particles as small as 0.25 mu m diameter by cascade impactors.
RESULTS: By means of the combination of sampling techniques, the impact of fossil fuel combustion and other anthropogenic sources of sulfur on the natural characteristics of the atmosphere may be precisely determined.
PROJECT MILESTONES: 12/77 Final Report.

TITLE: Instrumentation to Measure Particle Size in Source Emissions
PROJECT NUMBER: G-712B-BD-03
PRINCIPAL INVESTIGATOR: Wertheimer, A.
ADDRESS: Dickerson Road, North Wales, PA 19454
AFFILIATION: Leeds and Northrup Co., North Wales, Pa. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Nader, J.S.
TYPE OF FUNDING: Contract No.-68-02-2447
77 FUNDING: Environmental Protection Agency FY77:$50,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: PARTICULATES/Dust (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The purpose of this project is to develop a method for the real-time measurement of the size of particulate in source emissions. The method developed will be applicable to measuring the size of the particulates both in-stack by on-stack instrumentation and in-plumes of sources by remote instrumentation.
APPROACH: The particle size range of interest is 0.2 to 10 microns. The method of measurement of these particles is based on Rayleigh scattering produced by illuminating the particles with source(s) having wavelength(s) greater than the diameter of the particles. By measuring the scatter flux intensity at 90 degrees relative to the incident beam for two orthogonal polarizations and having qualitative information about the refractive index of the scattering material, the sizes of particles can be computed.
RESULTS: The project plan includes demonstration of the method in the laboratory, followed by design and construction of a prototype on-stack instrument. The latter instrument will then be evaluated in stationary stack facilities.
PROJECT MILESTONES: 6/78 Final Report.
KEYWORDS: CHEMICAL EFFLUENTS;AIR POLLUTION;MONITORING;GASEOUS WASTES;AEROSOLS;ENVIRONMENTAL TRANSPORT;STACK DISPOSAL;PLUMES;PARTICLE SIZE;STACKS;MONITORING;MEASURING METHODS;AIR POLLUTION MONITORS;DESIGN;DUSTS;PARTICLES

TITLE: Investigation of Particulate Matter Monitoring Using Contact Electricity
PROJECT NUMBER: G-712-B-BB-04
PRINCIPAL INVESTIGATOR: Wesolowski, J.J.
ADDRESS: 714 P Street, Sacramento, CA 94704
AFFILIATION: California Dept. of Public Health, Sacramento (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Nader
TYPE OF FUNDING: Grant No.-R803719-01
77 FUNDING: Environmental Protection Agency FY77:$27,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: PARTICULATES/Dust (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (50%);FULL SCALE DEMONSTRATION (50%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objective is to critically examine the basis for the indirect measurement of particulate matter mass concentration by the use of contact electricity as the detection mechanism.
APPROACH: A study of the literature has been made and a contact-electricity type of monitoring instrument has been tested in the laboratory. The total charge has been found to correlate well with gravimetric mass. The response of the instrument depends mainly on the electrical resistivity of the material. The condition of the surface of the probe has a major effect on the sensitivity.
SULTS: Further tests will be made to investigate the effect on the instrument performance of the condition of the probe surface, particle size, and other relevant parameters.
PROJECT MILESTONES: 6/78 Final Report.
KEYWORDS: AIR POLLUTION;MONITORING;AEROSOLS;AIR POLLUTION MONITORS;PERFORMANCE TESTING;ELECTRIC DISCHARGES;PARTICLE SIZE;SENSITIVITY

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: Determine morphologies of collected aerosols and infer source types.
APPROACH: Polarizing light microscopy is used for collected aerosols that have diameters greater than 5 micrometers. Reflected color, polarization colors, and index of refraction are used to establish morphology. Smaller particles are investigated with scanning and transmission electron microscopes equipped with X-ray fluorescence detectors.
RESULTS: This effort supports the field and laboratory studies of ESRL.
PROJECT MILESTONES: 9/77 Report on Microscopy of Aerosol Samples.
KEYWORDS: AIR POLLUTION;MONITORING;AEROSOLS;MICROSCOPY;PARTICLE SIZE;AIR;SAMPLING;ELECTRON MICROSCOPY;X-RAY FLUORESCENCE ANALYSIS

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Air pollution is composed of a very complex mixture of gaseous and particulate matter originating from both natural and man-made sources. One class of atmospheric particulate pollution includes polynuclear aromatic hydrocarbons (PNA's) which have been shown to be carcinogenic in experimental animals.
APPROACH: Because PNA compounds are formed in combustion processes with hydrocarbon fuels, almost all PNA's in the atmosphere arise from man-made sources. Currently, important investigations of mobile source emissions contribution to PNA levels in the atmosphere are under study by the Environmental Protection Agency. Results of these investigations will qualitatively and quantitatively demonstrate which PNA's are found in mobile source exhaust emissions. A strong correlation between PNA levels in automobile exhaust and pre-existent PNA's in fuel has been demonstrated in previous work.
RESULTS: The purpose of this project is to quantitatively determine 12 individual polynuclear aromatic hydrocarbons present in various aircraft turbine, diesel, and gasoline test fuels. The results of these determinations are necessary to correlate the amount of PNA present in fuel with PNA exhaust emission levels.
PROJECT MILESTONES: 76/11 Contract awarded.
KEYWORDS: CONDENSED AROMATICS;QUANTITATIVE CHEMICAL ANALYSIS;EXHAUST GASES;CHEMICAL ANALYSIS;AVIATION FUELS;DIESEL FUELS;AUTOMOTIVE FUELS;AIR POLLUTION;CARCINOGENS;HYDROCARBONS

PROJECT DESCRIPTION: To determine composition and sources of atmospheric aerosols.
APPROACH: Collect and analyze atmospheric aerosol samples. Develop improved collection and analysis techniques. Participate in cooperative aerosol characterization studies. Interpret data in terms of aerosol sources.
RESULTS: (1) New York City Aerosol Experiment: collect two weeks of samples in cooperation with the New York University Medical Center, Institute of Environmental Medicine. Compare reduced data and publish joint reports where warranted. Samples were collected between January 31 and February 13, 1977. (2) Natural Organic Aerosol Program: collect particulate and gas-phase organic in a controlled Loblolly Pine Forest, for gravimetric, GC-MS, and Particulate profile analysis. Preliminary samples have been collected and are being evaluated.
PROJECT MILESTONES: 09/77 Report on relationship between ambient aerosol loading and aerosol sources.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The object of this program is to provide an instrument which can be mounted on a stack and continuously monitor the mass concentration of particulate emissions.
APPROACH: The basis for this instrument is the measurement of the depolarization of backscattered polarized radiation. Such a monitor can be used for regulatory purposes, to evaluate the efficiency of abatement equipment, and to record for control purposes the particulate emissions under different plant operating conditions. Such information can be used to define the optimum plant and abatement equipment operating conditions required to meet acceptable particulate emissions standards for different types of fuels. Optimization of the operation of the abatement equipment under different conditions would advance the state of the art of pollution abatement and lead to improve air quality.

PROJECT DESCRIPTION: NBS, with its micro-Raman capability in facilities and expertise will perform the following tasks: (1) Generate preliminary reference spectra of various major types of stationary source particulates of interest to EPA, including sulfates, nitrates, and carbonates. Analyze several representative particulate samples to be provided by EPA. These samples will have been previously characterized for elemental composition by EPA or their contractors to provide a basis for comparison with micro-Raman results. (2) Cooperate with and advise EPA in the development of stack sampling methods compatible with micro-Raman analysis. (3) Develop and install rapid automated sample holding systems for the NBS micro-Raman instrument in order to reduce data acquisition time, and to permit unattended operation in the analysis of multi-particle samples.

PROJECT DESCRIPTION: The objectives of this task are to study various particle sizing devices for measurement of size and for measurement of particle size composition.
APPROACH: Both extractive and in-stack sizing devices are being tested in the laboratory at a stationary source simulator and in the field at various sources. Optical and inertial type sampling methods will be studied and various types of impaction surfaces are being tested for their applicability to the impactors, to the source conditions (temperature, humidity, loading, velocity, etc.) and to the analytical method of analyses.
RESULTS: Currently, two in-stack impactors, an extractive impactor and a series cyclone are being tested at oil-fired and coal-fired power plants, portland cement plants and municipal incinerators. A two wavelength transmissometer is being tested at oil-fired power plants and a four wavelength transmissometer is to be tested at the source simulator and in the field for particle size measurement.
PROJECT MILESTONES: (1) 9/77 Report-Comparison/In-Situ Extractive inertial size classification techniques. (2) 12/77 Report-Size Correction/Quantitative Analysis. (3) 6/78 Report of the size distribution of emissions from incinerators.

PROJECT DESCRIPTION: The objectives of this task are to characterize sulfur emissions from coal and oil-fired combustion sources and to assess the adequacy of present emission factors and to study the characteristics of SO3/H2SO4 formation and emission relative to operating parameters.
APPROACH: Selected emission sources will be sampled which represent a cross-section of boiler size, combustion operating conditions, emissions controls and fuel type. Samples will be collected and analyzed for SO2, total water soluble sulfates, CO, CO2, and oxygen. In addition, research measurements will be carried out to evaluate the adequacy of advanced methods and monitors for the characterization of emissions.
RESULTS: Currently, data has been obtained from three coal-fired sources and light oil-fired boilers which indicate a significant difference in emissions of SO4/sup 2-/ between coal and oil fuels.
PROJECT MILESTONES: 6/77 Final Report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: To determine the contribution of naturally occurring bacterial sources to the total atmospheric sulfur load. Select monitoring sites showing good promise of biogenic sulfur production with a clean reference site nearby. Monitor atmospheric sulfur levels at selected sites along with meteorological data. (Wind speed, wind direction and temperature.) Correlation of sulfur levels with natural cycles (tides, day/night and seasonal). Design a simple and inexpensive method of measuring ambient NO2 levels in the atmosphere.
APPROACH: Development of specially treated filters to selectively absorb different volatile sulfur and NOx compounds. Collect laboratory data on efficiencies of collection, effects of temperature, humidity, various volatile sulfur selectivities, ease and accuracy of analysis at low levels. Development of a field collection system with high portability.
RESULTS: (a) A method of collection of volatile sulfur compounds using selective filters treated with various silver salts and (OH-) anions were tested in regard to effect of temperature and humidity on collection efficiency. AgNO3 treated filters were selected for H2S absorption and LiOH treated filters for SO2 absorption. X-ray fluorescence is used for analysis. (b) Further laboratory testing will be done on these filters to determine performance limits regarding air temperature, humidity, flow rate, selectivity, and sulfur load extremes and to compare XRF non-destructive analysis with other destructive wet methods of higher accuracy but greater costs. (D.F. Natusch Method) (c) Design instruments and interface circuitry to support environmental studies anticipated in the near future.
PROJECT MILESTONES: 9/80 Final Report.

PROJECT DESCRIPTION: The objective of this task is to develop technology for plume opacity measurement both in-stack and remote and to evaluate the application to various industrial sources.
APPROACH: Simultaneous plume opacity measurements are made at a selected site by in-stack transmissometers, remote methods such as lidar, visual observers, sun photometer, and telephotometers. Particulate loadings are determined by EPA Reference Method 5 to provide information on possible correlation between mass and opacity for various types of emissions.
RESULTS: Studies have been conducted on a series of sources including coal and oil-fired power plants, portland cement plants, kraft recovery furnace and a phosphate fertilizer plant. Reports on tests and technology are available or are being prepared. Additional measurement method development and evaluation will continue.
PROJECT MILESTONES: 7/77 Report on effect of weather on plume opacity measurement.

PROJECT DESCRIPTION: To collect aerosols in a variety of geographic locations in the United States. Aerosols are collected with dichotomous samplers and analyzed for elemental content by x-ray fluorescence.
'ROACH: The sulfur measurements are compared with sulfate measurements made by wet chemical procedures to determine (1) ratio of sulfates in the fine and coarse aerosols and (2) whether XRF sulfur measurements are directly correlated with ion-chromatographic measurements for sulfates.
RESULTS: Samples are being collected in a variety of locations, and are being analyzed for elemental sulfate, H+ and NH4/sup +/ content. As a result of these studies it is concluded that sulfur in the fine particle fraction is in the form of ammonium sulfate. A procedure has been developed which permits quantitative extraction of sulfate and sulfite from Fluoropore filters without converting the sulfite to sulfate. Studies are continuing to collect aerosol samples at a large number of urban and rural sites across the United States to determine the ratio of elements in the fine and coarse fractions with particular emphasis on the sulfate distribution.
PROJECT MILESTONES: 2/77 Final Report.

PROJECT DESCRIPTION: The objective of this task is to evaluate the viability of a prototype remote SO2 sensor for surveillance and enforcement applications.
APPROACH: A performance data base will be obtained through studies at the stationary source simulator facility and field tests at a coal-fired power plant.
RESULTS: Currently, a preliminary laboratory evaluation was performed to verify those performance specifications claimed by the manufacturer. Results of those studies were reported, indicating the design of the JRB prototype system was unacceptable due to several malfunctions including gas cell leakage, lack of sensitivity, and electronic drift. At this time, no further effort will be pursued with the JRB system. Future efforts will be contingent upon the success of evaluations by the Special Techniques Group on a more recent prototype development by SAI.

PROJECT DESCRIPTION: Investigations are being conducted on the utility of ion selective electrodes for measurement of atmospheric particulate nitrate concentrations. This program which has been conducted for the past 18 months has provided substantial information regarding nitrate electrode chemistry.
APPROACH: Over 100 particulate samples have been measured with various types of selective electrodes and the obtained results compared with other nitrate measurement techniques. This work will be extended to include organic carbon measurement and characterization on similar samples.
RESULTS: The methodology which will be developed to meet these objectives includes various oxidation techniques and selective solvent extraction coupled with high performance liquid chromatography. Included in these efforts will be a detailed evaluation and comparison of the results obtained from the different oxidation techniques using a variety of sample types.
PROJECT MILESTONES: 78/1 Final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objectives of this task are to evaluate the utility of measuring the sulfuric acid dewpoint temperature as an indirect measurement of the sulfuric acid concentration in combustion source emissions.
APPROACH: A laboratory study will investigate the adequacy of existing empirical relationships between acid dewpoint and concentration. A commercially available dewpoint monitor will be used in conjunction with a gas phase H_2SO_4 generator in the laboratory. The monitor will then be used in the field and results will be compared with the isopropanol absorption and controlled condensation methods for SO_3/H_2SO_4 determinations.
RESULTS: Currently, a laboratory evaluation of the system has been completed. Comparative field data have also been obtained at residual oil-fired sources which indicate the applicability of calibrated dewpoint probe. Future studies will be made to determine the viability of the method as applied to coal, gas turbine, and advanced power generation combustion processes.

PROJECT DESCRIPTION: To sustain an active and forward-looking development and testing activity related to the monitoring of nitrogen containing compounds in ambient air.
APPROACH: To set up laboratory experiments in which new detection techniques can be evaluated and in which advanced techniques can be improved. Specifically, physical techniques involving the creation of light due to molecular interaction (chemiluminescence) has proved a sensitive, simple and low cost approach to monitoring certain nitrogen containing compounds. With previous work as a basis, different aspects of the chemiluminescence technique are being improved. The feasibility of other techniques, which provide advantages in some aspect of measurement, is being investigated.
RESULTS: Current plans include: (1) the investigation of new NO2 to NO converter designs in chemiluminescence monitors; (2) investigation of water vapor effects in commercial chemiluminescence monitors; (3) feasibility studies of NH3 detection by chemiluminescence and opto-acoustic techniques; (4) feasibility studies of long paths systems for NO measurements. Progress during the past year includes: (1) the evolution of an ambient NH3 monitor using chemiluminescence techniques; (2) the evolution of a design for an opto-acoustic for sensitive NH3 detection; (3) characterization studies of the detection of PAN by chemiluminescence techniques.
PROJECT MILESTONES: 78 Testing of GC detector for nitrogen containing compounds complete.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND

MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Develop technique for performing complete elemental analysis of aerosol particles.
APPROACH: Collect aerosols on thin Nuclepore filters. Use existing x-ray techniques to determine elements with atomic numbers above 12. Develop new proton scattering technique, to determine the concentrations of elements with atomic numbers between 1 and 16. Use tandem Van de Graaff accelerator to accelerate protons to an energy of 16 MeV. Pass the proton beam through the sample, and observe the spectrum of scattered protons using a solid state detector. Deduce the amount of each element from analysis of the spectrum.
RESULTS: All facets of the method have been developed, and initial field testing has begun. Limited tests show that only about 70 percent of the gravimetric mass can be accounted for by the sum of the elemental components. Tests are to be conducted to determine if the remaining 30 percent is a volatile water component.
PROJECT MILESTONES: 77/2 Final report.

PROJECT DESCRIPTION: Develop an aerosol sampling technique consisting of Nuclepore filters in series that enables respirable and nonrespirable particles to be separately collected.
APPROACH: Use 12 mu m Nuclepore filters to collect particles in the nonrespirable fraction, and use an appropriate high efficiency polycarbonate or Teflon filter to collect the respirable particles, which penetrate the first filter. Develop theoretical model to predict the efficiency curve for the 12 mu m Nuclepore filter, and use this model to predict the operating conditions that allow a best match to the ACGIH curve for respirable sampling. Test model using monodisperse aerosols produced in a vibrating orifice generator.
RESULTS: Measure collection efficiency curves using both solid and liquid particles to determine any dependence on particle type. Investigate the extent to which particle loading might affect the collection efficiency. Work to date indicates that there is no change for modest particle loadings.
PROJECT MILESTONES: 78 Final report.

CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
SEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
OJECT DESCRIPTION: To sustain an active and forward-looking development and testing activity related to the monitoring of carbon monoxide, hydrocarbons and halogenated hydrocarbons.
APPROACH: To set up laboratory experiments in which new detection techniques can be evaluated and in which advanced techniques can be improved. Optical techniques based on the absorption of radiation at characteristic wavelengths are currently receiving attention as an alternative to the more established techniques involving flame ionization detection.
RESULTS: Current plans include: (1) continued evaluation of the gas filter technique for carbon monoxide and various hydrocarbons; (2) feasibility studies on the use of an opto-acoustic detector for ambient gases; (3) improvement of the flame ionization approach to non-methane hydrocarbon measurement. Progress during the past year includes: (1) field testing (successful) of the prototype CO monitor based on gas filter correlation; (2) feasibility testing of a combination gas chromatograph and opto-acoustic detector to demonstrate the separation and detection of typical infrared absorbing compounds.
PROJECT MILESTONES: 5/77 Measure ambient freons with opto-acoustic detector.

PROJECT DESCRIPTION: The objectives of this task are to coordinate activities involving test programs, maintenance and operation of the Stationary Source Simulator Facility, upgrade source reference instrumentation and install an ambient air monitoring system for personnel safety.
APPROACH: The SSSF will be modified to incorporate an in-situ monitoring system for SO2, NO, CO and CO2. Ambient air monitors for SO2, NO and CO will be installed to allow for continuous monitoring of ambient air in the testing area. This monitoring system will include an alarm feature to alert personnel of potential hazardous conditions.
RESULTS: Currently, required monitors have been procured and are scheduled to be installed in the near future.
PROJECT MILESTONES: 03/77 Installation of EDC Source Monitoring System.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To evaluate and improve the performance of the Dichotomous Virtual Impactor Aerosol Sampler.
APPROACH: A Dichotomous Sampler is a device for collecting ambient aerosol samples in two size ranges, consisting of particles whose aerodynamic diameter is less than, and greater than, 3.5 mu m. A crucial factor in obtaining quantitative results with such samplers is the knowledge of sampling efficiency, as it depends on both particle size and wind speed. Both mathematical modelling and wind tunnel tests are being used to obtain this information.
RESULTS: A long series of wind tunnel tests of alternative aerosol inlet heads has resulted in a head design which exhibits the generally favorable characteristics of high sampling efficiency up to about 20 mu m, and minimal wind speed dependence. A mathematical modelling study will next be performed to better understand the results so far obtained largely by empirical means, and which will make possible the design of future instruments employing the dichotomous principle at other flow rates and cut-points. In particular an experimental investigation will be made of a virtual impactor with a 0.1 mu m cut-point.
PROJECT MILESTONES: 78 Final report.

PROJECT DESCRIPTION: The primary objective of this program is to study air sampling filter media and to evaluate the available commerical filter media in terms of their sampling efficiency, resistance to flow, dust holding capacities, moisture retention characteristics, and other physical properties of interest.
APPROACH: All major commercial filter media will be studied.
RESULTS: The end result of the project will be the preparation of a ''Filter Handbook'' in which the major filter characteristics are described. In addition, a concurrent study will be undertaken to relate the sampling efficiency and flow resistance of flters to those predicted by theory. Also, the ''series filter'' method will be studied as a possible alternative to the dichotomous sampler for separating atmospheric particles into a fine and a course fraction with a cut point near 2.0 mu m.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To develop an ambient aerosol particle size spectrometer capable of measuring in real-time the aerodynamic size distribution in the range 0.05 to 25 mu m diameter.
APPROACH: The measurement method consists of (1) causing individual aerosol particles to oscillate in a sinuscidally varying acoustical field, and (2) measuring by means of a laser Doppler technique the phase lag of each particle's motion relative to the acoustical excitation, with the phase lag being directly related to the aerodynamic size of the particle.
RESULTS: At the end of the first year's work a first prototype spectrometer has been built which is able to measure aerodynamic size distributions in the 0.3 to 5 mu m range. During the second year the prototype's performance will be evaluated, and basic research will be performed to investigate the most feasible method for extending the size range. During the third year a second prototype will be built which should meet the original objective.
PROJECT MILESTONES: 79 Final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To design, fabricate, field test and reduce the data for two infrared Gas Filter Correlation instruments for measurement of extended area stationary source gaseous pollutant emissions. One instrument will operate in the up-looking mode (single-ended, passive) to sense ambient temperature sulfur dioxide against the cold sky background. The second will operate in the open-path mode (double-ended, active) to sense sulfur dioxide, hydrogen sulfide, and vinyl chloride monomer at ground level. The design goals for each instrument are: sensitivity: 50 ppM-meters (nominal), dynamic range: two orders of magnitude, time constant: variable from 1 to 60 seconds.
APPROACH: To measure the infrared radiation emitted or absorbed by the pollutants and correlating this radiation by alternately passing it through a gas cell containing a sample of the specific pollutant to be detected and a reference cell which is transparent. This is the GFC technique which provides a highly specific measurement in the presence of interfering species. The passive, up-looking instrument will measure SO2 at 4.0 mu m. The active instrument will measure SO2 at 8.6 mu m, H2S at 7.9 mu m, and VCM at 10.9 mu m using an infrared source and a retroreflector.
RESULTS: To build and calibrate the two instruments over the next nine months and then to field test them in the vicinity of a coal-burning power plant.
PROJECT MILESTONES: 9/77 Final report.

PROJECT DESCRIPTION: Develop a pulsed fluorescence monitor for NO2. The instrument should have a sensitivity of 2 ppb and should be suitable for airborne measurements.
APPROACH: Under EPA contract No. 68-02-2246 the Aerospace Corp. developed a laboratory prototype monitor with a sensitivity of 5 ppb of NO2.
RESULTS: The sensitivity of the prototype developed under EPA contract No. 68-02-2246 is to be improved to 2 ppb and the instrument is to be re-engineered into a package suitable for airborne measurements. Two instruments are to be delivered to EPA/RTP (ESRL-AIB). The contractors will also extend studies of the instruments response to possible interferents. To date no significant interferences with the measurement technique have been found.
PROJECT MILESTONES: 78 Delivery of 2 improved units.

PROJECT DESCRIPTION: To sponsor the development of a research effort directed at the identification and quantification of gaseous and particulate absorbers in the infrared, particularly in the spectral region near 9 microns.
APPROACH: To fund a grant effort in which the optical technique of opto-acoustic detection is used to measure absorption coefficients of gaseous and particulate absorbers in the infrared and to quantify ambient concentrations of these absorbers. The approach is sufficiently new so that several feasibility experiments will be tried initially in order to determine the most effective research plan.
RESULTS: Current plans include: (1) initiate experiments to determine feasibility to begin in the summer of 1977; (2) finalization of first year research objectives as based on initial feasibility studies in the fall of 1977. Progress during the immediate past has consisted of the processing of a grant proposal.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: To develop an instrument for real-time measurement of ambient aerosol mass associated with respirable aerosol particles.
APPROACH: A newly developed device, tapered element oscillating microbalance (TEOM), similar to a classical quartz crystal microbalance, but without many of the latter's problems, will be mated to a dichotomous virtual impactor. The impactor segregates particles whose aerodynamic diameter is less than 3.5 microns, and whose accumulated mass is subsequently measured with the TEOM.
RESULTS: Work is expected to begin by August 1977. During the first year of work a TEOM especially suited to incorporation in a dichotomous impactor will be developed. A completed TEOM-impactor system is expected to be available and laboratory tested by the end of the second year.
PROJECT MILESTONES: 9/77 Phototype completed.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To investigate the feasibility of measuring ambient aerosol size and shape distributions in the range 1-100 mu m by means of holographic recording and image analysis.
APPROACH: Holographic recording has previously been demonstrated as a method of measuring aerosol particle size and shape distributions in the super-micron size regime. Its chief advantage is that it is a true in situ method, not depending on intake of the aerosol into the measuring instrument, and thus avoids the severe sampling efficiency problems which plague super-micron measurements. Analysis of the resulting holograms is very tedious however, and limits the usefulness of the method. This study investigates the degree to which the holographic analysis can be automated by use of a commercial image analyzer (IMANCO Quantimet).
RESULTS: Work is expected to begin in May 1977. Holograms will be made of a series of laboratory generated aerosols and field acquired aerosols. The holograms will be analyzed on a Quantimet image analyzer which has been modified to accept a holographically generated image.
PROJECT MILESTONES: 2/77 Final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The project objective is to determine the relative accuracy of remotely measured SO2 mass emission rates from a power generating station with respect to standard reference methods.
APPROACH: Under a preceding contract, two types of remote sensing air quality instruments (spectrometers) were used to measure fence-line vertically integrated burdens of SO2. Concurrent wind velocity

measurements were made by means of a laser Doppler velocimeter, a tethersonde and pilot balloon. The current contract will provide two stages of data evaluation: data processing and data analysis. The SO2 mass emission rates will be calculated from the SO2 and wind data. Comparisons of these results will be made with in-stack and cross-stack results.
RESULTS: An analysis will be made of the effect on accuracy made by each wind measuring system.
PROJECT MILESTONES: 9/77 Final report.

PROJECT DESCRIPTION: This contract is for continuation of the development of the CW lidar method into a portable instrument for remote measurement of plume opacities suitable for use by Air Pollution Control Agencies.
APPROACH: The visibility of plumes and particulate emissions are regulated by plume opacity standards. It is probably the oldest and most used method for regulating particulate emissions to the atmosphere from stationary sources. Compliance with these standards is usually determined by the subjective evaluation of plume opacities by trained visible emissions observers. To improve the accuracy and objectivity of the opacity determination, an instrumental method is needed. Pulsed lidar has been used as an effective instrumental method for remote measurement of plume opacity; however, its application has been restricted to opacity measurement research due to its cost, size and complexity. A recent study on the feasibility of developing a new lidar method that uses a low powered CW laser showed promise for developing the method into a small portable opacity measuring instrument for surveillance work by control agencies.

PROJECT DESCRIPTION: Provides for continuing support in methods evaluation and standardization for measurement of mobile source sulfur oxide emissions.
APPROACH: Analytical methods for sulfate and SO2 measurement from mobile sources have been well-developed over the last few years. Present approach involves refinement efforts in analytical finished, identification of diesel sulfates, standardization and sampling methods.
RESULTS: Recent work in ion-chromatography has permitted segregation of sulfate, sulfide, and sulfite in solution and has provided a routine means for cross-check of BCA color procedures. Evaluation of photometric and BCA methods in MSERB laboratories has shown that the methods give essentially identical results. The last series of collaborative testing (the 8th round-robin so far conducted) showed that all participating laboratories have worked out calibration biases; consequently, effective means now exist for measuring vehicular sulfuric acid emissions throughout the industry and government. Current plans include identification of the source of diesel sulfate emissions in experiments with pure hydrocarbons and further study of sampling methods.
PROJECT MILESTONES: 1977 Annual Report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Update emissions factors for H_2SO_4 from production catalyst cars.
APPROACH: Historically, this project has been aimed at developing data on catalyst-sulfate emissions from low-mileage cars. Continuing efforts are concentrating on improved factors for new technology vehicles at a lower level. Vehicles obtained for characterization studies are routinely examined for SO_4 emissions.
RESULTS: Work on 1977 foreign cars has been completed and awaits only release of certified data for publication. Production car data has been reported in several recent SAE papers. Numerous vehicles were studied in the EPA baseline program at RTP and these data were published by OAWM in SAE paper 770166. Future work on characterization will continue to produce sulfate data on current-year technologies.
PROJECT MILESTONES: 1977 Supplement Records.

PROJECT DESCRIPTION: To analyze sunphotometer and nephelometer data which are a measure of air quality with the objective of establishing the relationship between visibility and air quality.
APPROACH: Approximately four years of sunphotometer and nephelometer data have been collected at the Research Triangle Park. These data and the daily weather observations taken at Raleigh-Durham airport will be used in attempting to establish a relationship between visibility and air quality.
RESULTS: Preliminary examination of 1975 and 1976 sunphotometer and nephelometer data has been completed. While both sets of data will be useful, it is clear that the nephelometer data will be of greatest benefit to the investigation. The preliminary examination of the data indicates that relative humidity has a key role in the relationship between visibility and air quality. It is planned to examine the available sunphotometer, nephelometer and weather data in detail and attempt to derive definite conclusions on the relationship between visibility and air quality.
PROJECT MILESTONES: (1) 5/78 Report on visibility trends in U.S. (2) 9/79 Report on the relationship between air quality and visibility trends in the U.S.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Long range transport of ozone and other pollutants has been the objective of other studies. The studies, however, were limited to the investigation of either transported ozone from a very complex urban area such as New York or short distance transport of ozone from a simpler urban plume such as Columbus. What is generally missing from these studies is detailed information concerning precurser-ozone and other product relationships for short time periods over long downwind distances. Since this type of information is necessary for air pollution modeling, this study will be designed to obtain these type of data.
APPROACH: The in-house effort will be coordinated with Washington State University (EPA contract number 68-02-2298) and Battelle (EPA contract number 68-02-2439) to perform aircraft and ground level sampling downwind of an urban area (not chosen as yet). Our effort will be to provide primarily detailed hydrocarbon compositional analyses of collected air samples.
RESULTS: The study is scheduled to commence in June 1977. Tentative discussions concerning a generalized study approach have been discussed; however, a detailed plan has not yet been decided. The study area has not yet been selected.
PROJECT MILESTONES: 9/78 Final Report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Determine, using smog chamber experiments, the reactivities of various hydrocarbons emitted by natural as well as anthropogenic sources. Determine product formation, NO/sub x/ conversion, ozone formation as well as reactant depletion.
APPROACH: Using established smog chamber techniques, hydrocarbons and oxides of nitrogen in air at near ambient concentrations are irradiated with UV light. Reactant decay and product formation are monitored using gas chromatographic or long path infrared techniques. Ozone and oxides of nitrogen are measured using chemiluminescence or long path infrared.
RESULTS: UV irradiations of selected naturally emitted hydrocarbons (terpenes) and anthropogenic hydrocarbons observed in auto exhaust have been studied at various initial hydrocarbon/NO/sub x/ ratios. Products of the reactions are followed throughout the UV irradiation. The reaction rate for most terpenes is fast. Formed in these reactions as a product are peroxyacylnitrate type compounds. Gas phase products do not account for all of the systems reacted carbon and nitrogen. The reaction of ozone with many terpenes is rapid. Future plans include smog chamber studies of naturally emitted hydrocarbons observed in field studies. Particular attention will be directed toward determining the reactivity and ozone forming potential of the compound. To obtain good carbon and nitrogen balances for the photochemical systems, investigation will include aerosols formed in the UV irradiations of naturally emitted hydrocarbons.
PROJECT MILESTONES: 9/79 Final Report.

PROJECT DESCRIPTION: To thoroughly characterize organic vapors and the organic fraction of ambient aerosols in terms of different types of carbon and composition.
APPROACH: This characterization of ambient aerosols will consist of selective solvent extraction, removal of the solvent by sublimation or freezedrying followed by high pressure liquid chromatographic and total organic carbon analyses. Organic vapors will be collected on cartridges and the total carbon and the different types of carbon will be determined. Eventually we hope to determine the relative amounts of gaseous, vapor and particulate carbons.
RESULTS: The instrumentation has been received and is in the process of being set up and tested.

PROJECT DESCRIPTION: Test newly developed dichotomous samplers for the following performance properties: stability of flow rate, uniformity of deposit, performance during adverse weather conditions, intercomparability with high volume samplers.
APPROACH: Install differential flow control with electrical cutoff switch to insure that the flow is constant up to the maximum practical particle load. Investigate the use of new filter media and new types of filter seal gaskets.
RESULTS: Conduct 8 day intercomparison of method to sample and analyze aerosol moss, sulfate, and lead. The sampling is to be conducted in Charleston, West Virginia, during the second week in May 1977. The results are to be reported by September 1, 1977 to the Lawrence Livermore Laboratory which will tabulate the results.
PROJECT MILESTONES: 1977 Results of intercomparison published.

PROJECT DESCRIPTION: Develop an ultrasensitive method to measure carbon concentration in ambient aerosols collected with dichotomous samplers.
APPROACH: Aerosols collected on Fluoropore filters are extracted with organic solvents. A fraction of the extract is deposited on a platinum strip, the solvent evaporated and the pt. strip to 100 degrees C with N2 flowing over the strip to a flame ionization detector. The signal from the FID is proportional to organic content of the extract. A second aliquot is deposited onto MnO2 catalyst and heated to 800 degrees C. The products of this treatment are also directed to an FID. The signal produced by the FID is proportional to the carbon content of the extract.
RESULTS: Both instruments have been calibrated and give response proportional to carbon content for standards. Aerosol samples are being collected for analysis and comparison with the gamma emission analysis method.
PROJECT MILESTONES: 8/79 Complete analytical method prepared for publication.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Improve the reliability, accuracy and precision of methods used for calibration of ozone and NOx monitors. Develop new methods if old ones are inadequate.
APPROACH: Critically evaluate current methods to determine weaknesses. Study feasibility of alternate methods. Develop and characterize hardware for the most promising methods.
RESULTS: Have developed a unitized piece of gas phase titration glassware for ozone and NOx calibration. Have studied a new potassium iodide procedure for ozone calibration. Have designed and constructed a photometer for ozone calibration. This photometer is the most accurate and precise piece of hardware available of ozone calibration work and is the standard against which other methods will be compared. Further work will be in area of designing additional photometer circuits to provide operator with additional information on the performance of the photometer, further examination of gas phase titration as a NOx calibration technique, and participation in the EPA task force formed to choose a new Federal Reference method for ozone calibration.
PROJECT MILESTONES: 6/77 Fabricate and evaluate new ozone generator and calibration systems.

TITLE: In Vitro Assay of Relative Toxicity of Diesel-Engine Exhausts
PROJECT NUMBER: G712B-BC-05
PRINCIPAL INVESTIGATOR: Meltz, M.L.;Greene, N.;Gause, E.
AFFILIATION: Southwest Foundation for Research and Education, San Antonio, Tex. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Bradow, R.L.
77 FUNDING: Environmental Protection Agency FY77:$130,000
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
PROJECT DESCRIPTION: The two main objectives of this proposal are (1) the direct assessment of the relative toxicity of combustion products of 4 different diesel fuels as emitted from a diesel engine and diluted and cooled to gas concentrations and temperatures compatible with biological test systems; and (2) the measurement of the relative biochemical toxicity of 6 or 7 chemically separable fractions from the collected combustion products of one of the fuels. A secondary objective is to utilize and compare the biochemical alterations resulting when in vitro cell culture systems of human, baboon, and rodent blood and lung origin are directly exposed and utilized as the biological test system.
APPROACH: The biochemical indices to be used upon exposure of baboon macrophages include macrophage migration and response to MIF, phagocytic ability, aryl hydrocarbon hydroxylase (AHH) activity, ATP concentration, and RNA precursor incorporation rate. Upon exposure of other cell types, the following parameters will be measured: collagen synthesis in WI-38 cells, response of baboon lymphocytes to mitogens, RNA and DNA precursor incorporation rates, AHH activity and inducibility, proliferative capacity, viability, and colony forming ability. For each cell type the induction of repair replication, indicative of damage to the cell DNA, will be measured.
PROJECT MILESTONES: 11/77 Final report.

PROJECT DESCRIPTION: The objective of this study was to investigate the ozone forming potential of hydrocarbons with multi-day irradiations. This was done in four 27 cubic meter outdoor chambers. The chambers were constructed of 5 mil FEP Teflon on aluminum frames. The initial charge of non-methane hydrocarbon (NMHC) ranged from 1.0 to 10.0 ppmC; nitrogen oxides (NOx) from 0.100 to 1.00 ppm. This makes initial NMHC/NOx ratios between 7 and 20. On second and third day irradiations the NMHC/NOx ranged from 16 to 610. High levels of ozone were generated on second and third days.

PROJECT DESCRIPTION: Objectives of this project during the third budget period: This program has designed and built an outdoor chamber facility for the investigation of aerosol formation processes similar to those occurring in the ambient atmosphere. During the second budget period, experimental methods and procedures were developed or adapted for this project and an experimental program is now in progress. The overall objectives of this budget period will be to investigate gas to particle conversion processes.
APPROACH: This will be accomplished by conducting chamber experiments in three areas: sulfate aerosol formation in hydrocarbon-NOx systems, SO2-NOx plume systems and systems containing metallic seed nuclei. During this coming period additional experiments will be conducted on this system. Aerosol parameters to be obtained include condensation nuclei count, size distributions by electric aerosol analyzer and filter samples for sulfate analysis by x-ray fluorescence and flash vaporization flame photometric detection. The hydrocarbon-NOx-SO2 system is an analog of aerosol formation in urban areas with multiple sources of pollution, stationary and mobile. The second area of research involves the SO2-NOx system as an analog of the processes occurring in a power plant plume. A series of experiments with various initial concentrations of SO2, NO, NO2 and water vapor will be conducted. The third major area of research will be generation of aerosols in the presence of seed nuclei. Existing aerosols provide an alternate oxidation process for conversion of SO2 to sulfate. Metallic nuclei will be introduced into the chamber and the size distribution will be determined, then SO2 will be introduced and evolution of the aerosol will be measured.

TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$25,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of this program is to develop chemical kinetics mechanisms that describe the formation of photochemical smog.
APPROACH: The mechanisms under development are tested and modified by comparing the computed concentration-time profiles of various reactants and products with those observed experimentally in smog chamber studies of irradiated hydrocarbon and NOx mixtures.
RESULTS: A method is under development for deriving ozone-precursor relationships based on the combined results of photochemical modeling techniques and smog chamber data. A model has been developed to fit O3 yields obtained in smog chamber studies of auto exhaust and NOx mixtures. This model is being used to construct O3 isopleths as a function of hydrocarbon and NOx levels. These isopleths can be used to estimate O3 control requirements for urban areas. Currently, the effect of selected parameters on the predictions of this model is being investigated.
PROJECT MILESTONES: 09/79 Final report.

77 FUNDING: Environmental Protection Agency FY77:$16,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: Examine air quality data, mainly ozone, and determine whether there is a greater potential for high concentrations with flows from urban than from non-urban areas. Examine prolonged (three or more days) periods when widely-separated urban areas (cities more than 200 kilometers apart) simultaneously had high concentrations and determine the meteorological conditions which contributed to the high concentrations.
APPROACH: Trajectory analyses for the surface-to-700 meters or surface-to-1000 meters layer of air are used to estimate the source-receptor relationships. In the second part it will be determined whether phenomena previously associated with high ozone concentrations (that is, intense solar radiation, low wind speeds, high temperatures) occurred with the high concentrations found in this study.
RESULTS: Ozone data for the Hampton Roads, Virginia, area have been analyzed and summarized. Ozone data for the Richmond-Washington-Baltimore corridor are being analyzed and evaluated.

TYPE OF FUNDING: Grant No.-R804860-01
77 FUNDING: Environmental Protection Agency FY77:$20,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
APPROACH: The research proposed for this study would utilize a micrometeorological approach to obtain improved estimates of the total amount and the time course of the natural emissions of hydrocarbons from the forest vegetation. Micrometeorological measurements, including vertical profiles of various hydrocarbons, will be made in a forested area near Durham, N.C. at the Triangle Site for the International Biological Program (IBP) Project. These measurements will enable us to calculate the vertical flux of these hydrocarbons and then their emission rate from the forest vegetation. The proposed research will be a cooperative effort involving personnel and instrumetation from both the IBP project and the Gas Kinetics Photochemistry Branch (GKPB) of the EPA Environmental Sciences Research Laboratory. The measurements will be made for selected sampling days over a six month period beginning in July, 1976. They will provide daily and seasonal time course estimates of the emission of natural hydrocarbons which can be related to both the physiological activity and water status of the forest vegetation and general climatic conditions. They will give us a better understanding of the importance of vegetation in the production of photochemical smog.

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: Determine emissions of natural hydrocarbons over several differing areas of vegetation in the United States. Determine the contribution of natural to anthropogenic hydrocarbon emissions as oxidant precursors. Determine ozone formation attributed to natural hydrocarbon emissions and its effects on urban and rural areas.
APPROACH: Cryogenic concentrating of sample and gas chromatographic techniques are used in measuring natural hydrocarbons at extremely low concentrations in the ambient atmosphere. The emissions of flux of natural hydrocarbons are obtained by mathematically combining data of natural hydrocarbon measurements taken concurrently with micrometeorological data. Chemiluminescence techniques are employed to measure ozone and oxides of nitrogen.
RESULTS: Measurements of natural hydrocarbons (terpenes) and anthropogenic hydrocarbons are being made at a rural pine forest site to determine emissions of terpenes from the trees. The forest, part of an International Biological Project (IBP) is operated by Duke University. Through an EPA grant, Duke provides micrometeorological data (energy balances of CO, H2O, temperature) obtained simultaneously with natural hydrocarbon measurements which are combined to calculate the natural hydrocarbon flux. Ozone measurements are being made to determine the effects natural terpenes have on rural oxidant. Continued measurements at the IBP site of natural and anthropogenic hydrocarbons, ozone and NOx will provide a data base from which

seasonal variations and effects on rural oxidant due to natural emissions can be established. Future studies will be directed toward emissions of leafy trees, grasslands, and swamplands.
PROJECT MILESTONES: 09/77 Report on contribution of natural emissions of ozone oxidation.

PROJECT DESCRIPTION: Measure trace gases in the ambient air.
APPROACH: Collect air samples at various locations in the Research Triangle Area and bring them to the laboratory for analysis in the several available long path infrared cells. Develop techniques of freeze-drying the samples and of compressing them to increase pollutant detection sensitivity. Record the spectra by FTS techniques. Process the spectra by computer manipulation techniques to minimize interferences between pollutants.
RESULTS: The freeze-dry technique is being perfected. Multiple pass cell innovations have been adopted. Background pollutants not detectable by any other technique are being measured, including COS, and CHClF2. Cell miniaturization has progressed to the point where 10 nanograms of a pollutant can be detected.

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: A systematic development of numerical models capable of examining the effects of halogenated gases on stratospheric photochemistry and the earth's ozone balance will be undertaken. Because the industrial halogenated gases have their origin at the surface, this research will also be concerned with the fate of these gasses in the troposphere. To accomplish this goal, it is important to simulate atmospheric processes as realistically as possible. Therefore, the model should be designed such that exchange mechanisms in the planetary boundary layer, as well as between the troposphere and stratosphere, can be properly simulated. The first step of this modeling effort will be the design and examination of the results of a one-dimensional, time-dependent model. Eventually two- and three-dimensional models incorporating realistic boundary conditions will be developed. Using the best available chemical kinetic data, a detailed examination of the formation of intermediate halogenated gases which may or may not be removed from the troposphere by heterogeneous processes will be conducted. To obtain a measure of the efficiency of these processes, the numerical simulations will be compared to measurements of the various halogenated gases in the atmosphere.
PROJECT MILESTONES: 06/79 Final report.

77 FUNDING: Environmental Protection Agency FY77:$21,500
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
PROJECT DESCRIPTION: A two-dimensional, finite-difference model simulating a highway is being developed which is able to handle linear and nonlinear chemical reactions. The model currently only includes reactions of sulfuric acid and ammonia, but will be expanded to include more complex reactions.
APPROACH: Transport of the pollutants is accomplished by use and upstream-flux-corrected algorithm developed at the Naval Research Laboratories. This algorithm insures positive concentrations and reduces numerical diffusion. The model develops background eddy diffusion coefficients which are then perturbed by the mechanical turbulence introducd by vehicular motion. The model calculations are currently being compared to the SF6 experiments carried out by General Motors in the GM sulfate diffusion experiment. Model development is complete with only final comparisons of the predictions and observations to be completed. A paper is presently being prepared that will present the findings of this work.

77 FUNDING: Environmental Protection Agency FY77:$74,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: This study is designed to characterize the behavior of plumes in calm, stably stratified surroundings. Pure jets (non-buoyant) and buoyancy-dominated plumes will be emitted into the salt-water-stratified water channel. Photographs will be analyzed to determine the maximum penetration height, the angle of spread, the equilibrium height and the thickness and growth rate of the equilibrium layer. A secondary goal will be to determine the sensitivity to these effects to variations in jet Reynolds number, i.e., to establish criteria for modeling of plumes in the laboratory. Knowledge of the growth rate and thickness of the equilibrium layer is essential in order to predict ground-level concentrations resulting from morning inversion break-up. As time permits, this project will be extended to include plume rise in a crosswind and the merger of multiple buoyant plumes, for which little experimental data are available.
PROJECT MILESTONES: 01/78 Final report (Modelers).

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: This is a basic, systematic study of the diffusion in the vicinity of buildings. Three reports have been prepared within the scope of this study to date and the project will be continued in FY77. Previous work includes (1) determination of a necessary height for stack near a tall thin building, (2) a mathematical model constructed from diffusion tests in the vicinity of a rectangular-shaped building, and (3) dispersion measurements downstream of a cubical building with roof-top emissions. During FY77, it is proposed to study the effect of the ratio of building height to roughness length on the shape of and the turbulence intensity and resulting concentrations in the building cavity and wake regions. This would be done for a number of simple building shapes. As time permits, this study will be extended to include other parameters such as effluent to wind speed ratio, stack height to building height ratio, effluent buoyancy, etc. The overall goal is to develop and verify a ''cookbook'' of approximate effects of basic building shapes on diffusion in the area of building influence.
PROJECT MILESTONES: (1) 09/78 Progress report. (2) 09/79 Final report.

TECHNOLOGY: GENERAL SCIENCE (100%)
OJECT DESCRIPTION: This study involves the determination of the effect of grass blades on the evaporation rate from a liquid surface. A grass-like surface will be formed by fixing aluminum strips on a base plate, which is then immersed in a pan of water in the wind tunnel. Measurements of velocity profiles and turbulence statistics will be made to determine the zero-plane displacement and roughness lengths as functions of blade spacing and height. Evaporation rates will be determined by directly monitoring the liquid level. This problem is mathematically equivalent to finding the rate of dry deposition of gaseous pollutants on surfaces. This project will provide data for verification of a mathematical model which has

recently been developed in the Model Development and Assessment Branch.

TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The Fluid Modeling Facility wind tunnel will be used to study characteristics of turbulent shear flow over a fibrous canopy.
APPROACH: A grass-like canopy of aluminum strips set into a plexiglas substrate has been constructed. The canopy is set in a pan of liquid on the floor of the wind tunnel, and, by adjusting the depth of submersion, the effective height of the blades may be changed from 0 to 10 cm. The experiment is conducted in two phases. In the first phase, measurements of mean speed, turbulent intensities and Reynolds stress are taken over the canopy. The objective is to determine the changes of these properties and the deduced roughness and zero-plane with free stream speed and blade height. The second phase deals with vertical exchange within and above the canopy. For this phase, the liquid at the tunnel floor is isopropyl alcohol. The evaporation rate is measured directly and a profile of vapor concentration is measured within and above the canopy. Objectives are to determine the eddy diffusivity within the canopy and the reliability of the profile method above the canopy, both as a function of canopy height and wind speed.
RESULTS: The first phase measurements have been made. Analysis of the data is in progress.
PROJECT MILESTONES: (1) 09/77 Progress report. (2) 09/78 Final report.

APPROACH: A large amount of field data is being collected on contract to EPA on the dispersion of pollutants from the Clinch River Power Station in West Virginia, which is located in complex terrain. In the current study a terrain model will be run in the EPA Meteorological Wind Tunnel to provide preliminary data for the development of mathematical models, and by comparison of wind tunnel data with field data, to determine the validity of wind tunnel modeling of flow and diffusion in complex terrain.

TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: Determine the variation of stability with height for six layers between 26 and 444 meters over Oklahoma City.
APPROACH: Determine the stability variations using the split-sigma technique (that is, vertical stability is determined by temperature differences between heights and horizontal stability is determined by the standard deviation of wind direction near the middle of the layer) with 10-second readings for half-hour periods. These are data for approximately 600 half-hour periods.
RESULTS: The data are analyzed and summarized. An original draft, completed in December 1976, is being revised. Major emphasis is given to the marked decrease in standard deviation of wind direction with height.
PROJECT MILESTONES: 12/76 Final report on stability variations with weight.

PROJECT DESCRIPTION: To develop climatological information that contributes to our understanding of atmosphere transport and diffusion processes, and to our ability to assess the environmental impact of air pollutants.
APPROACH: Routine ground-level and free-air observations/measurements, made throughout the United States by the National Weather Service, are specially processed and summarized in terms of their impact on transport and diffusion.
RESULTS: (1) A very comprehensive summary of lapse rate and temperature inversion characteristics (base height, thickness, intensity) is being prepared for more than 60 locations, 2 soundings/day, 5 years of observations. An EPA report will be published during 1977. (2) A climatology of effective chimney heights, based on vertical profiles of temperature and wind speed and for hypothesized chimney heights of 50, 100, 200, 300 and 400 meters throughout the United States, is in progress. Results will be published in 1977. (3) Studies of the trends of stagnating anticyclones in the eastern U.S. and of limited mixing episodes will be prepared for comparison to trends in air quality. (4) Statistics on wind direction persistence over periods of hours will be developed for applications in receptor-oriented diffusion models. A report will be issued in 1978.
PROJECT MILESTONES: (1) 05/77 Report on effective stack height climatology for the U.S. (2) 06/77 Report on trends of stagnating anticyclones in eastern N.C. (3) 09/77 Report on trends of limited mixing episodes. (4) 10/78 Report on wind direction persistence climatology of the U.S.

PROJECT DESCRIPTION: To develop procedures for identifying and measuring virus particles utilizing laser-excited fluorescence (LAF) with a tunable acousto-optical filter (TAOF).
APPROACH: (1) To develop procedures for staining T-2, bacteriophage with ethidium bromide. (2) To adapt the LAF/TAOF available at JPL to measure the fluorescence of various virus particles in water. (3) To measure the fluorescence intensity of a single T-2 bacteriophage particle using the adapted LAF/TAOF system.
RESULTS: Future activities should the system look promising: (1) to utilize this technique to measure viruses in aerosols generated in sewage treatment plants; (2) to develop and combine the use of immunological specificity and virus monitoring of surface waters to provide a means of indicating the disease potential of surface water by identifying a specific marker virus (i.e., hepatitis); (3) to investigate the potential use of multiple staining of nucleic acid and protein in developing classification capabilities.

PROJECT DESCRIPTION: The research effort includes the continuing development, evaluation, and validation of air quality simulation models, both for inert and reactive pollutants. Users will be provided access to these models through the EPA User's Network for the Applied Modeling of Air Pollution (UNAMAP). New concepts and technologies will be developed and adapted for improving the weakest components of existing models, with emphasis on the effects of topography, pollutant removal and conversion processes, and complex sources. Other activities will be directed toward the determination and definition of the effects of pollutant emissions on visibility, weather, and climate. Further studies will be conducted in air pollution potential climatology. Participation will continue in the Regional Air Pollution Study (RAPS). The field portion of the study will terminate in Spring, 1977, and analysis and use of the data for model evaluation and verification will be initiated.

TECHNOLOGY: FOSSIL FUEL/Coal (100%)
PROJECT DESCRIPTION: Aerosol size distributions have been measured in the St. Louis area as part of EPA's Project MISST using aircraft and ground based self contained mobile laboratories. These measurements were made with a group of collaborators such that a complete array of chemical, physical, and meteorological measurements were obtained on a coal fired power plant plume. The University of Minnesota's portion of the project included aerosol measurements aboard an aircraft and the operation of a mobile van on the ground under the plumes. This mobile van was also operated on freeways in the Los Angeles area during October 1976 as part of an EPA sponsored project to study sulfur aerosols on roadways. Much of the work during the next project year will be analysis and reporting of the large amount of data obtained during the past several years. Analysis is being directed toward obtaining aerosol growth rates in the plumes, aerosol nucleation rates in the plumes and surrounding atmosphere, and toward better descriptions of the aerosol size distributions. Laboratory work toward the development of a continuous instrument for the measurement of aerosol sulfur is also being partially supported by this project.

TYPE OF FUNDING: Grant No.-R803399-03
77 FUNDING: Environmental Protection Agency FY77:$45,000
TECHNOLOGY: FOSSIL FUEL/General (50%);NUCLEAR/General (50%)
PROJECT DESCRIPTION: To evaluate the performance of prototype air pollution monitors and to effect engineering solutions to problem areas. Emphasis has been on the evaluation of long path monitors and of monitors based on gas filled correlation.
APPROACH: To conduct laboratory and field tests in which various prototype monitors can be evaluated. Long path systems have been evaluated in regional studies in which their capabilities for area monitoring, as distinct from point monitoring, can provide useful information on the representativeness of stationary monitoring sites. Point monitors have been used in new types of applications.
RESULTS: Current plans include: (1) To develop a better design for a diode laser-based, long path system and in so doing to enhance stability and reliability of the present system; (2) To test two long path systems, one based on a diode laser and one based on a CO2 laser. Progress during the past year includes: (1) redesign of a wavelength selection system for the diode laser, long path monitor; (2) evaluation of a carbon monoxide monitor based on the optical technique of gas filter correlation (GFC); (3) participation in a field study to determine the diffusion of CO from automobile traffic on the San Diego freeway; (4)

evaluation of data pertinent to the site representativeness of sites in the Regional Air Monitoring System in St. Louis.
PROJECT MILESTONES: 06/77-ILAMS field tested; 06/79-Long path absorption spectroscopy implemented.

MONITOR: Dimitrides
TYPE OF FUNDING: Contract No.-68-02-1720
77 FUNDING: Environmental Protection Agency FY77:$11,200
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
PROJECT DESCRIPTION: The purpose of this contract activity is to obtain experimental evidence on the effects of various controllable factors, such as concentrations of reactant hydrocarbon, NO/sub x/, and SO2, under various ambient conditions, and in the presence of other atmospheric constituents. This contract effort focusses on the area-wide atmospheric process: other contract effort is addressed to the process prevailing in roadway atmospheres. The experimental work includes measurement of rate of SO2 oxidation under conditions that approach as closely as possible those prevailing in the real atmosphere above an urban center. Such conditions can be approximated to some degree in the laboratory and to a much greater degree in smog chambers filled with real atmosphere air and irradiated by natural sunlight. This contract activity is intended to provide the requisite experimental data following both approaches, namely, the in-laboratory simulation approach. Results will be used by EPA to estimate the degree to which SO2 is converted (into SO4 ions) in the atmosphere through the homogeneous gas-phase photooxidation process, and to assess the relative effects of the SO2, HC, and NO/sub x/ reactants on this process.

AFFILIATION: Pennsylvania State Univ., University Park (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Niemeyer, L.E.
TYPE OF FUNDING: Grant No.-R800397
77 FUNDING: Environmental Protection Agency FY77:$220,000
APPROACH: Previous work in the continuing program was focused toward development of a comprehensive, meteorological model suitable for application to urban and synoptic scale problems. The resulting model is now undergoing extensive testing and validation case studies. Several of the 1, 2 and 3-d versions are also being applied to selected air pollution transport and diffusion situations such as east coast air stagnation episodes. Research also continues into improved planetary boundary layer (PBL) parameterization schemes. Simplified 11-nd order close schemes have been verified against sodar and aircraft measurements using observational system developed earlier in the program. Several 1-d PBL models have been integrated with commonly used diffusion prediction models and adapted for general use on desk calculators. Testing of surface boundary condition parameterization schemes is proceeding using satellite observations of the Los Angeles basin. Selected pollutant deposition velocities are being derived on the basis of airborne measurements made in Pennsylvania and New York. Air borne measurements made during the St. Louis RAPS experiment will be prepared for use in urban scale modeling studies.
PROJECT MILESTONES: 03/78-Final report.

MONITOR: Niemeyer, L.F.
TYPE OF FUNDING: Interagency agreement
77 FUNDING: Environmental Protection Agency FY77:$182,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The research effort includes the continuing development, evaluation, and validation of air quality simulation models, both for inert and reactive pollutants. Users will be provided access to these models through the EPA User's Network for the Applied Modeling of Air Pollution (UNAMAP). New concepts and technologies will be developed and adapted for improving the weakest components of existing models, with emphasis on the effects of topography, pollutant removal and conversion processes, and complex sources. Other activities will be directed toward the determination and definition of the effects of pollutant emissions on visibility, weather, and climate. Further studies will be conducted in air pollution potential climatology. Participation will continue in the Regional Air Pollution Study (RAPS). The field portion of the study will terminate in Spring, 1977, and analysis and use of the data for model evaluation and verification will be initiated.

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: To derive the stability functions for calculating the fluxes of momentum and heat using large and mesoscale flow parameters in the St. Louis metropolitan area. The computed values of the momentum, heat fluxes and roughness length values determined from RAPS (Regional Air Pollution Study) special field study periods will be used along with the radiosonde, pibal data and LIDAR information to determine the stability functions for estimating heat and momentum fluxes. These results will be compared against results of other studies conducted over much less complex surface conditions.
RESULTS: The turbulence data from four (4) 30 meter towers are being processed. LIDAR, radiosonde and pibal data are presently available. Current plans: The depth of the mixed layer and the average wind within the mixed layer, geostrophic wind, horizontal temperature gradients, momentum and heat fluxes and roughness and stability lengths will be calculated from the various data sets gathered as part of the RAPS boundary layer intensive field study. Extensive analyses will be conducted to determine the stability function from this data set.

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: This project will evaluate the capability of state-of-the-art air quality models to predict pollutants concentrations in an urban region. Models from a broad span of complexity, including photochemical and inert species models, will be tested against the Regional Air Pollution Study (RAPS) data from St. Louis
APPROACH: A set of approximately 50 days will be selected on which to base comparisons. Three of these days will be randomly chosen to adjust the models to try peculiarities of the St. Louis region. Once adjusted, the models will be run on the remaining days of the set. Comparison of predicted and observed pollutant concentrations will be made in terms of spatial and temporal correlations as well as relative differences in hourly averages at individual points.
RESULTS: This project is presently in the stage of adapting seven models to simulate the St. Louis region.
PROJECT MILESTONES: 09/78 Progress report. 09/79 Final report.

TYPE OF FUNDING: Agency in-house effort-In-house
77 FUNDING: Environmental Protection Agency FY77:$35,000
TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: To describe and to model the temporal and spatial variation of the turbulence structure over the St. Louis metropolitan area for purposes of improving urban dispersion parameterization in air quality simulation modeling.
APPROACH: Three to five 30 m towers were instrumented to obtain high frequency observations of the horizonal and vertical wind components, temperature and moisture. These towers were situated in various urban rural locations in metropolitan St. Louis. From this data set, turbulent moments, derived scaling parameters, and spectra and cospectra will be computed for various land uses. These results will be tested against current similarity theories.
RESULTS: Approximately one month of summer and one month of fall data has been collected. These data are presently being processed to compute the various essential parameters and spectra. The specific topics to be addressed are: (1) in depth study of the temporal and spatial variability of the turbulent quantities; (2) applicability of current similarity theory based on horizontal homogeneity to urban areas; and (3) relating the above results to pollutant dispersion in urban areas.
PROJECT MILESTONES: 06/79 Final report.

MONITOR: Demerjian, K.L.
TYPE OF FUNDING: Agency in-house effort-In-house
77 FUNDING: Environmental Protection Agency FY77:$11,000
TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: To evaluate the representativeness of the upper heat island temperature distribution obtained from a moving vehicle. Also to determine the representativeness of point wind measurements for a larger (0.3 to 3 km) adjacent area of similar land area.
APPROACH: Temperature collected as part of the RAPS (Regional Air Pollution Study) in St. Louis from the RAMS network will be compared with the data from an instrumented mobile van to determine possible roadway biases. Also, wind measurements for two locations, an urban and rural site, will be compared with optical wind sensor data that provides an average wind across a path 0.3 to 3 km.
RESULTS: Mobile van temperature data for selected routes are currently being compared to the subjectively analyzed RAMS temperature fields. (1) Statistics of the temperature difference obtained from the two systems as a function of time and land use will be evaluated. (2) Data from the optical wind system are not yet available. Plans call for obtaining statistics of the difference between a point measurement and space average values for a rural and an urban site.

TYPE OF FUNDING: Agency in-house effort-In-house
77 FUNDING: Environmental Protection Agency FY77:$24,000
TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: The algorithm developed by this project generates two-dimensional, non-divergent wind fields using 15-minute averaged wind data from 21 stations of the Regional Air Pollution Study in St. Louis, Missouri. In most Eulerian-type air pollution models, divergent-free wind fields are required,

since divergence can influence the calculated concentrations of the pollutants. The algorithm is based upon modified techniques developed by Hovland, et al. (Control Data Corporation, 1976) and Liu and Goodin (Mon. Wea. Rev., June 1976). The Hovland technique generates a two-dimensional wind field which is not divergent-free via a weighted scan-radius procedure. The Liu and Goodin technique adjusts the wind field produced by the Hovland technique to minimize the divergence. A technical paper describing the algorithm and the modifications made to each and illustrating resultant wind fields has been finalized. The paper also contains a listing of the computer program and a users' guide.

77 FUNDING: Environmental Protection Agency FY77:$14,000
TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: To obtain a climatology and a model of energy fluxes at the surface for concrete, simulated blacktop and soil. The surface energy balance will be calculated for idealized cities composed of various fractions of these materials.
APPROACH: In depth analyses of the data set collected at and along a deserted airport runway in a rural area 25 miles NW of St. Louis area will be conducted. The data set includes net radiation fluxes and subsurface temperature profiles for at least one year and sensible heat flux during a 3 week summer period.
RESULTS: Data are presently being processed and edited under Task Order contract with Rockwell International as part of the RAPS (Regional Air Pollution Study) program. The field collection phase covers the period February 1976 through May 1977. (1) Compute, compare, and model the ground heat fluxes from the subsurface temperature profiles for the three surface types. (2) The surface energy budget will be calculated for St. Louis based on estimated percentage of these three materials in the metropolitan area.

TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$20,000
TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: To describe and to model the temporal and spatial variability of the vertical wind and temperature profiles over an urban area and to relate these to the vertical fields of SO2 and light scattering. These studies will provide a basis for improving air quality simulation modeling.
APPROACH: Data from eight RAPS (Regional Air Pollution Study) intensity boundary layer field studies obtained by instrumented helicopter and mobile van, by a LIDAR and an acoustic sounder, from fixed wind aircrafts and from the RAMS surface and upper air network will be subjected to in-depth analyses on the spatial and temporal behavior of the mixed layer and associated air quality field as a function of land use and season.
RESULTS: 75 percent of helicopter/mobile van data has been processed. Current Plans: Remaining helicopter data will be processed along with LIDAR, acoustic sounder and fixed-wing aircraft data. Mixed layer depths derived for these periods will be made available. Further analyses will include: (1) intercomparison of the mixed layer depths observed using LIDAR, radiosondes, SODAR and helicopter soundings; (2) statistics of the morning and evening transition period, i.e., the rate of rise strength, duration and onset of the inversion over St. Louis for different seasons and land uses; (3) tests of current inversion rise parameterization formulas against the observations in the St. Louis urban/rural areas; (4) case studies of the urban heat island.

DIVISION: Environmental Sciences Research Laboratory
MONITOR: Demerjian, K.L.
TYPE OF FUNDING: Agency in-house effort-In-house
77 FUNDING: Environmental Protection Agency FY77:$25,000
TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: To obtain the best estimate of the energy budget for metropolitan St. Louis as function of land use with particular emphases on the surface and vertical distribution of the sensible heat flux. These studies will lead to a model of the energy budget and subsequently to an improved understanding of dispersion in the urban boundary layer.
APPROACH: Evaluate derived and measured values of the sensible heat flux as a function of time and land use from data obtained during several RAPS (Regional Air Pollution Study) intensive field investigations

involving an instrumented helicopter and mobile van, a fixed-wing aircraft, pibals, radiosondes and specially instrumented 30 m towers.
RESULTS: Analyses of several case studies involving helicopter temperature profiles and pibal winds have been made. These involve deriving the vertical profile of sensible heat flux for different land uses as the residual term of the enthalpy equation given the closure assumption that the heat flux at the top of the inversion is proportional to the surface value. Primary emphasis is on the morning transition period. The direct measurement by the eddy correlation technique is being processed for the instrumented towers. (1) Several additional case studies using the enthalpy approach will be made. (2) Vertical profiles of heat flux will be computed from measurements of the turbulent temperature and vertical velocity obtained by fixed-wing aircraft equipped with inertial navigation system. (3) Surface sensible and latent heat fluxes as a function of time and land use will be obtained via the eddy correlation technique from the 30 m tower data. (4) Construct a model of the heat flux for St. Louis from the results of the above 3 tasks.

MONITOR: Durham
TYPE OF FUNDING: Contract No.-68-02-2411
77 FUNDING: Environmental Protection Agency FY77:$20,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The purpose of the 1976 MISTT study is to extend the results of previous studies to cover larger distances from the sources and obtain more detailed knowledge of the chemical processes occurring in polluted air. The aerosol formation processes as well as gaseous plume chemistry will be the subject of continued study. Conversion rates and mechanisms identified earlier need to be verified under a variety of meteorological conditions. The aerosol chemistry of the urban and power plants plumes will be examined using new techniques which will yield information on substances other than sulfate. In addition to refining our understanding of the chemical processes, the 1976 program will attempt to better define the regional transport and accumulation mechanisms at work in the Eastern United States. The project will be expanded from the immediate St. Louis area to include the study of pollutant accumulation and transport in synoptic scale, slow moving, stable air masses.
PROJECT MILESTONES: 12/77 Final report.

TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: Currently, the electron microscope is the only instrument capable of measuring the morphology, chemistry, and crystal structure of asbestos fibers. Several laboratories perform the analysis for airborne asbestos fibers, and while they have reasonable internal self consistency, the results obtained by the separate laboratories are often widely different. The objective of this program is to evaluate the various methods currently in use in the various laboratories, statistically evaluate the sub-procedure used, and arrive at an optimum composite procedure. The optimum procedures will be tested and statistically evaluated.
RESULTS: A handbook on the optimum procedure will be written in which detailed instructions on the method

will be given without any ambiguity. Samples will be sent out to other laboratories for analysis using the optimum procedure as described in the manual. The inter-laboratory results will then be evaluated.
PROJECT MILESTONES: 04/77 Draft final report.

77 FUNDING: Environmental Protection Agency FY77:$9,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: Due to the requirements by EPA for the continuous monitoring of certain pollutants, and the consequent obligation to develop continuous monitoring methods, a contract has been awarded to Rockwell International Corporation for the fabrication of one prototype sulfuric acid mist monitor. As the instrument is nearing completion of fabrication by Rockwell and will soon be lab tested at their facility, it becomes necessary to test the performance of the instrument under field conditions. Since the instrument is a prototype, there is no previous data to indicate whether the measurement methodology involved will successfully monitor acid mist. The decision has been made to select a contractor to field evaluate and modify if necessary the prototype sulfuric acid mist monitor.
RESULTS: If successful, this instrumental design and technique can be used to continuously monitor acid mist emissions and make possible the compliance with EPA regulations.

TITLE: Design and Construction of a Prototype X-ray Diffraction Instrument for Analysis of Asbestos Fibers in Air and Water
PROJECT NUMBER: G712B-BA-25
PRINCIPAL INVESTIGATOR: Birks, L.S.;Fatemi, M.;Johnson, E.T.;Whitlock, R.R.;Gilfrich, J.V.
AFFILIATION: Department of the Navy, Washington, D.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Wagman, J.
77 FUNDING: Environmental Protection Agency FY77:$35,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: This is a follow-up to an earlier study that demonstrated the feasibility of an x-ray diffraction measurement technique for asbestos involving prealignment of fibers and direct measurement of mass concentrations.
APPROACH: Additional effort will be devoted to optimizing the sample preparation procedure, including the following steps: (1) Separation of the sample from the collection substrate, (2) Removal of non-asbestos material, (3) Fiber pretreatment to facilitate alignment, and (4) The alignment procedure itself, e.g., alignment medium, grid voltage, etc. Finally, a specially-designed x-ray diffraction analyzer will be fabricated for use by ESRL/RTP.
KEYWORDS: DESIGN;FABRICATION;AIR POLLUTION MONITORS;X-RAY DIFFRACTOMETERS;X-RAY DIFFRACTION;ASBESTOS;AIR;WATER;FEASIBILITY STUDIES;FIBERS

TITLE: Development of Low Speed Gas Flow Measurement by Optical Convolution Velocimetry
PROJECT NUMBER: G712B-BA-29
PRINCIPAL INVESTIGATOR: Rudd, M.;Dubro, G.
AFFILIATION: Department of the Air Force, Washington, D.C. (USA); Bolt, Beranek, and Newman, Inc., Cambridge, Mass. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Nader, J.
77 FUNDING: Environmental Protection Agency FY77:$15,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The purpose of this project is to design and fabricate a prototype device based on optical convolution principles for the measurement of gas stream velocities in emission sources and to test its applicability at the Simulated Stationary Source Facility (SSSF), at the Environmental Protection Agency (EPA), Research Triangle Park (RTP), N.C. Air Force Flight Dynamics Laboratory (AFFDL) with its expertise will accomplish the design and fabrication of the prototype device by amending an AFFDL contract with Bolt, Beranek and Newman of Cambridge, Mass (B.B. and N.) to include the necessary effort.
APPROACH: AFFDL will evaluate the applicability of the prototype device to source emissions with tests

conducted at the Simulated Stationary Source Facility at EPA, N.C. and will provide consultative expertise, as appropriate, to EPA in the area of gas flow measurement technology using OCV principles.
PROJECT MILESTONES: 12/78 Final report.
KEYWORDS: EARTH ATMOSPHERE;MEASURING METHODS;AIR POLLUTION;STATIONARY POLLUTANT SOURCES;GASES;OPTICAL PROPERTIES;AIR POLLUTION MONITORS;DESIGN;FABRICATION

<071920>
TITLE: Dye Laser Lidar System for Remote Monitoring of Air Pollution Produced by Stationary Sources, Area Sources, and Present in Ambient Conditions
PROJECT NUMBER: G712B-BA-37
PRINCIPAL INVESTIGATOR: Ahmed, S.A.
AFFILIATION: City Univ. of New York, N.Y. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Herget, W.F.
77 FUNDING: Environmental Protection Agency FY77:$20,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: A development program is proposed to define the working parameters for a practical lidar system for remote monitoring and tracking of specific air pollutants.
APPROACH: A multifrequency dye laser will be used to detect pollutants by measuring the differential absorption of atmospheric elastic backscatter on and off resonance absorption peaks. The proposed scheme therefore combines the sensitivity of resonance absorption measurements with range information to provide an accurate method of determining accurately pollutant concentration and its spatial distribution.
RESULTS: The system is designed to be of particular use in the monitoring and tracking of molecular pollutants produced by stationary and area sources as well as for measuring ambient pollution conditions.
PROJECT MILESTONES: 07/78 Final report.
KEYWORDS: LASERS;REMOTE SENSING;MONITORING;AIR POLLUTION;STATIONARY POLLUTANT SOURCES;REGIONAL ANALYSIS;OPTIMIZATION

<071922>
TITLE: Development of Hydrogen Cyanide Monitors for Vehicle Emission
PROJECT NUMBER: G712B-BA-60
PRINCIPAL INVESTIGATOR: Burch, D.E.
AFFILIATION: Ford Motor Co., Dearborn, Mich. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Stump, F.
77 FUNDING: Environmental Protection Agency FY77:$75,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective is to develop instruments for the real-time monitoring of hydrogen cyanide (HCN) in the exhaust of automotive engines.
APPROACH: The instrument is to make use of the unique infrared absorption properties of HCN and will employ a gas-filter cell filled with this gas species. This CTC will be the key component responsible for the sensitivity of the instrument to HCN as well as the discrimination against other gas species that occur in auto exhaust. An existing ETA instrument will be converted for use as an HCN monitor.
RESULTS: During this first phase of the contract, the instrument will be used to determine the optimum spectral bandpass, sample cell length, and other important parameters. This design information will then be used in the second phase to design, assemble, evaluate and deliver three (3) additional monitors for the same gas.
PROJECT MILESTONES: 09/77 Delivery of three instruments.
KEYWORDS: HYDROCYANIC ACID;AIR POLLUTION MONITORS;EXHAUST GASES;AUTOMOBILES;MONITORING;INFRARED SPECTRA;ABSORPTION SPECTROSCOPY;DESIGN;FABRICATION;PERFORMANCE TESTING

<071923>
TITLE: Measurement of Halogenated Pollutants and Other Trace Gases in the Troposphere In Situ by Long-Path Infrared Absorption Spectroscopy
PROJECT NUMBER: G712B-BB-02
PRINCIPAL INVESTIGATOR: Pitts, J.N.;Winer, A.M.;Graham, R.A.;Tuazon, E.C.
AFFILIATION: California Univ., Riverside (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Hanst, P.
77 FUNDING: Environmental Protection Agency FY77:$77,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: A quantitative characterization of ambient primary and secondary trace pollutant as a function of time (both diurnally and seasonally) and location (including urban areas and downwind receptor sites) is being conducted using in situ, long-path, high resolution Fourier transform infrared spectroscopy in conjunction with conventional state-of-the-art analytical methods for ambient gas phase and particulate pollutants.
APPROACH: Emphasis is being placed on the quantitative determination of products, labile intermediates, and primary pollutants for which little, if any, reliable ambient air data are currently available. These non-criteria pollutants include nitric acid, nitrous acid, halocarbons, halogenated acids, hydrogen peroxide, nitrosamines, alcohols, epoxides and organic acids, aldehydes, and other carbonyl compounds. These are of interest per se, may be toxic, and are also important for validating computerized kinetic smog models for control strategies.
RESULTS: Results of the first year of this program at Riverside include the first positive identification by spectroscopic techniques of formaldehyde and nitric acid in ambient photochemical smog, the measurement of low levels of formic acid, ammonia and a variety of halocarbons, and determination of upper limits for the possible presence of other trace contaminants. Studies will continue at Riverside and at a mid-basin site, approximately four to six hours upwind of Riverside, using the part-per-billion sensitivity afforded by a kilometer optical pathlength multiple reflection cell, and an FTS-14 Fourier transform infrared spectrometer (both of which are the property of the EPA and are on loan to SAPRC for this three-year project). Portable instrumentation currently employed in gas phase and particulate ambient air monitoring studies at SAPRC are operated in conjunction with the LPIR during selected smog episodes at the monitoring locations. This program is coordinated with ambient air monitoring studies at SAPRC supported by the California Air Resources Board and the development of an experimentally validated model for photochemical smog, funded through NSF-RANN.
PROJECT MILESTONES: 06/78 Final report.

MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Nader, J.S.
FUNDING: Environmental Protection Agency FY77:$12,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of this task is to quantitatively and qualitatively determine the gaseous organic emissions from various petrochemical sources, principally those involving chemical processing.
APPROACH: Initial investigations involve studies at stationary sources emitting halocarbon compounds. The two sources examined thus far include a solvent degreaser using trichloroethylene and one using methylene chloride. Sequential samples are collected both at the point emission sources and at downwind fenceline locations and analyzed for halocarbons using GC/MS techniques.

RESULTS: Currently, a preliminary report on hydrocarbon characterization data available in the literature as well as a discussion of on-going programs within EPA was issued in 8/76. A halocarbon emissions measurement report will be issued in 7/77.
PROJECT MILESTONES: 07/78 Annual report.

TITLE: Laboratory and Field Evaluation of Hydrocarbon Classifier System
PROJECT NUMBER: G712B-BD-15
PRINCIPAL INVESTIGATOR: Homolya, J.B.
AFFILIATION: Environmental Protection Agency, Research Triangle Park, N.C. (USA). Environmental Sciences Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Nader, J.S.
77 FUNDING: Environmental Protection Agency FY77:$6,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of this task is to evaluate a prototype system for the determination of hydrocarbon emissions by class; i.e., paraffins, olefins, aromatics and oxygenates.
APPROACH: A laboratory study will be carried out using mixtures of known concentrations of hydrocarbons representative of each class fraction of interest. Upon demonstration of successful separation and quantification by sequential column chromatographic elution and FID analysis, a limited series of field experiments will be carried out.
RESULTS: Currently, the preliminary laboratory studies have been completed. The results indicate potential separation but not quantification of various classes of organics. The system is currently undergoing modification.
PROJECT MILESTONES: 10/77 Final field evaluation and emissions characterization.

TITLE: Characterization of Gaseous Emissions from Stationary Sources by Remote Sensing
PROJECT NUMBER: G712B-BD-17
PRINCIPAL INVESTIGATOR: Herget, W.F.
AFFILIATION: Environmental Protection Agency, Research Triangle Park, N.C. (USA). Environmental Sciences Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Herget, W.F.
77 FUNDING: Environmental Protection Agency FY77:$18,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: Use ground-based remote sensing methods to determine species identity and concentration of gaseous pollutants emitted by point and extended area stationary sources; determine optimum spectral regions for monitoring specific pollutants.
APPROACH: Longpath high resolution infrared spectroscopy will be used in absorption and emission to determine the spectral characteristics of gaseous pollutants emitted by a variety of sources. Laboratory spectra of various species will be obtained to assist in species identification and concentration determinations. Longpath gas-filter correlation methods will also be used.
RESULTS: Measurements using a grating spectrometer have been made at coal-burning power plants, incinerators, gas purification plants and carbon black plants. The grating spectrometer has been replaced with a Fourier transform spectrometer to greatly increase spectral resolution and sensitivity. A variety of sources will be studied in future years.

TITLE: Polynuclear Aromatic Compounds--Synthesis and Purification
PROJECT NUMBER: G712B-BE-04
PRINCIPAL INVESTIGATOR: Eisenbraun, E.J.
AFFILIATION: Oklahoma State Univ., Stillwater (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Meeker, J.
77 FUNDING: Environmental Protection Agency FY77:$40,000

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The synthesis and/or purification of high-purity (99.9 percent goal) polynuclear -romatic compounds, chiefly hydrocarbons, are of the types found in the products of incomplete combustion automobile exhaust gases, stack gases, coking operations), still bottoms, and heavy fuel oil from spills, nd hence appear as environmental pollutants.
APPROACH: In general, known synthesis routes will be used, but their improvement will be sought through use of new reagents and techniques. High-pressure liquid chromatography and/or zone refining will be included in the purification procedures. Modern analytical techniques (glc, lc, tlc, nmr, mass, and other spectrometric techniques) will be used for identifying compounds and establishing the purity of the synthesis products.

77 FUNDING: Environmental Protection Agency FY77:$32,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: Modify a new method developed by the NCI for the analysis of PAH's using liquid crystals. Develop some capillary columns for the better separation and determination of organic pollutants. Improve HPLC separations of organic pollutants.
APPROACH: The liquid crystal GC column used by NCI was found to have excessive bleed. An attempt will be made to find or synthesize a liquid crystal that is much more stable and still has the resolution necessary for PAH analysis. GC capillary and HPLC columns will also be developed and tested.
RESULTS: Several new liquid crystals have been purchased and a few synthesized. Testing has been started on several of the new liquid crystals but thus far none have been found satisfactory.
PROJECT MILESTONES: 12/78 Sampling and analysis of PAH associated particulates.
KEYWORDS: POLYCYCLIC AROMATIC HYDROCARBONS;QUANTITATIVE CHEMICAL ANALYSIS;ECOLOGICAL CONCENTRATION;SEPARATION PROCESSES;GAS CHROMATOGRAPHY;LIQUID CRYSTALS;PERFORMANCE TESTING;FEASIBILITY STUDIES

TITLE: Engineering and Development of Dichotomous Sampler
PROJECT NUMBER: G712B-BE-26
PRINCIPAL INVESTIGATOR: Greene, M.;Morgan, J.L.;McFarland, A.
AFFILIATION: Beckman Instruments, Inc., Anaheim, Calif. (USA); Texas A and M Univ., College Station (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Stevens, R.K.
77 FUNDING: Environmental Protection Agency FY77:$70,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: To design and fabricate two low-cost manual dichotomous samplers and two low-cost automated dichotomous samplers.
APPROACH: To develop complete engineering drawings and design concepts to simplify the systems, reduce production cost by using molded parts, improve reliability and compatibility, with operation at

unprotected sites under full range of weather conditions.
RESULTS: Contract awarded to Beckman (4-20-77) to initiate development of manual sampler. Delivery due Jan. 15, 1977. Automated system to be funded FY-78 or sooner if resources available.
ECT MILESTONES: 06/78 First phototype delivered.

TITLE: Developed Polymer Standards for Calibrating X-Ray Fluorescence Spectrometers
PROJECT NUMBER: G712B-DE-27
PRINCIPAL INVESTIGATOR: Yasuda, H.
AFFILIATION: Research Triangle Inst., Research Triangle Park, N.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Dzubay, T.G.
77 FUNDING: Environmental Protection Agency FY77:$15,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: Develop thin films of known mass per unit area for calibrating x-ray fluorescence spectrometers.
APPROACH: Prepare thin films of cellulose acetate propionate that contain known amounts of organometallic compounds. Each film will contain 1 or 2 calibration elements. Using acetylacetonate compounds that are uniformly dissolved in the polymer film standards are to be made that contain Ti, V, Cr, Mn, Fe, Co, Ni, Cu, Zn, Ag, Cd, Zn, and Pb. Other compounds are to be selected for Rb, Sr, Mo, Ba, Hg, and W.
RESULTS: Initial work has demonstrated that uniform films containing V, Cu, Ni and Pb can be prepared. The same techniques are to be used to produce the complete set of standards.
PROJECT MILESTONES: 09/77 Report.

TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The objective of this contract is to provide electronics engineering, prototype design and instrument fabrication on a task order basis to the Atmospheric Instrumentation Branch of ESRL.
APPROACH: The mechanism for this contract, task orders, allows RTI to respond to the needs of EPA personnel within the branch rapidly to minimize the delays usually inherent in procurring support from outside the agency. RTI has the personnel and facilities to provide the services upon request.
RESULTS: Typical of the tasks initiated under this contract are (a) design and fabrication of filter collection device for SO2; (b) modification of existing electronic hardware; (c) design and fabrication of a thermal converter for NH3 measurement; and (d) interfacing of hardware on existing data processing systems.
PROJECT MILESTONES: 10/76 Fabrication of 2 different ultra-ion concentration calibration systems.

<0719044>
TITLE: Develop Optical Method for Monitoring Nonmethane Hydrocarbons
PROJECT NUMBER: G712B-BE-44
PRINCIPAL INVESTIGATOR: Burch, D.E.
AFFILIATION: Ford Motor Co., Dearborn, Mich. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: McClenny, W.A.
77 FUNDING: Environmental Protection Agency FY77:$20,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: To develop reliable optical techniques for measurement of nonmethane hydrocarbons.
APPROACH: To sponsor a contractual effort in which the optical detection technique of gas filter correlation (GFC) is used to monitor ambient levels of methane. This type of methane measurement along with a measurement of total hydrocarbons by flame ionization detection (FID) would then be combined to provide a nonmethane hydrocarbon (NMHC) measurement.
RESULTS: Current plans include: (1) the testing of the GFC-FID monitor for detection of NMHC; (2) the extension of optical detection techniques to other hydrocarbons. Progress during the immediate past has involved the initiation of the contractual process.
PROJECT MILESTONES: 01/79 Testing and comparison with existing instrumentation.
KEYWORDS: HYDROCARBONS;OPTICAL PROPERTIES;MONITORING;AIR POLLUTION MONITORS;DESIGN;AIR SAMPLERS

TITLE: Development of Automated Sampler-Concentration System for Halocarbons
PROJECT NUMBER: G712B-BE-49
PRINCIPAL INVESTIGATOR: Singh, H.B.
AFFILIATION: Stanford Research Inst., Menlo Park, Calif. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Coleman, A.I.
77 FUNDING: Environmental Protection Agency FY77:$25,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: To develop automated sampling and preconcentration techniques for selected halocarbons to permit accurate determination of their atmospheric concentrations.
APPROACH: A preconcentration step is needed for those halocarbons in the atmosphere in concentrations more dilute than can be accurately determined by up-to-date gas chromatographic--electron capture technique. Methyl chloride, methylene chloride, chloroform, and Freon 22 have been selected for this study. In this work, the approach will be to employ sorption on glass surfaces at liquid nitrogen or oxygen temperatures. The procedure will be designed to produce a concentrated sample ready for injection into an analytical column. Probable interferences, especially water, will be studied. Means to eliminate the interferences will be devised.
RESULTS: The project will require eight months. The sampler--concentrator will be coupled in-house to a G.C. system to provide a complete analytical facility for the designated halocarbons.
PROJECT MILESTONES: 09/78 Final report.
KEYWORDS: AIR SAMPLERS;AUTOMATION;ORGANIC HALOGEN COMPOUNDS;ELECTRON CAPTURE;CHLOROFORM;FREONS;DESIGN

MONITOR: Browning
77 FUNDING: Environmental Protection Agency FY77:$18,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The purpose of this understanding is to provide ADP technical analysis and programming services in support of data management projects involving both the Meteorology and Assessment Division (MD) and the Regional Air Pollution Study (RAPS). The agencies involved are the General Services Administration, Federal Data Processing Center, Post Office Box 1900, West Station, Huntsville, Alabama 35807, and the Environmental Protection Agency, Environmental Sciences Research Laboratory, Environmental Research Center, Research Triangle Park, North Carolina 27711. In the performance of work under this understanding, the GSA shall provide a supervisory systems analyst, a staff systems analyst, a senior programmer, and an assistant programmer. The estimated staffing date is 13 October 1975; an estimated 4160 hours is required for each position.
KEYWORDS: METEOROLOGY;AIR POLLUTION;REGIONAL ANALYSIS;DATA ANALYSIS;DATA PROCESSING;PERSONNEL

<072001>
TITLE: Development of Bioindicators to Nitrogen Dioxide and Sulfur Dioxide Exposures
PROJECT NUMBER: H601B-5104
PRINCIPAL INVESTIGATOR: Geller, I.;Greene, N.D.;Rowlands, C.J.
AFFILIATION: Southwest Foundation for Research and Education, San Antonio, Tex. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Bruce, R.M.
77 FUNDING: Environmental Protection Agency FY77:$100
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The intention of this research effort is to examine the biochemical action of NO2 and SO2 on both lung metabolism and metabolism in general and develop alterations that occur into a type of dose-response bioindicator.
APPROACH: The first phase of this study will concentrate heavily on the effects of sulfur dioxide exposures on circulating lipids, proteins and immunological functions. The second phase, which combines years two and three, will be devoted to an in-depth study of the effect of SO2 and NO2 exposures upon altered immunological function and circulating hormone and biogenic amine levels. Starting with acute and chronic exposures, a specific detectable change or a series of detectable changes will be investigated in regard to its or their usefulness, over varying periods of exposure time and bracketing 0.14 ppM SO2 and 0.13 ppM NO2, as blood/urine bioindicator tests. The initial phase of this study was utilized in the development of methodology and in investigating the effects of SO2 on immunological functions and circulating lipids and proteins. The areas that demonstrated the most promise in the development of bioindicators following exposure include immunology, protein, hormones and biogenic amines. It is believed that SO2 stress does produce subtle changes in lipid metabolism; whether a bioindicator can be developed at this time, is open to question.
PROJECT MILESTONES: (1) 02/77 Screening of bioindicators responsive to SO2 exposure in animals. (2) 02/78 Effects of SO2 on selected bioindicators in rats.
KEYWORDS: BIOLOGICAL INDICATORS;NITROGEN DIOXIDE;SULFUR DIOXIDE;BIOLOGICAL EFFECTS;HEALTH HAZARDS;LUNGS;BIOLOGICAL EFFECTS;METABOLISM;BIOLOGICAL STRESS;TRANSPORTATION SYSTEMS;EXHAUST GASES;AIR POLLUTION;BIOCHEMICAL REACTION KINETICS

TITLE: Effect of Controlled Exposure to H2SO4 Aerosol on Immune Response
PROJECT NUMBER: H601B-7102
PRINCIPAL INVESTIGATOR: Graham, J.A.
AFFILIATION: Environmental Protection Agency, Research Triangle Park, N.C. (USA). Health Effects Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Graham, J.A.
77 FUNDING: Environmental Protection Agency FY77:$50,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The objective of this research is to determine what effects aerosols of H2SO4 have on the immune system. Since alternate energy sources are likely to liberate sulfur-bearing compounds that are easily converted to H2SO4, it becomes increasingly important to see what effect this pollutant has on one of the most important host defense systems.
APPROACH: The humoral immune system will be examined using the following parameters: (1) antibody production by spleen cells; (2) serum immunoglobulin titers; (3) nasal lga titers; and (4) ability of B lymphocytes to respond to mitogens. The cell mediated immune system will be examined by testing the ability of B lymphocytes to respond to mitogens.
PROJECT MILESTONES: (1) 06/77 Complete H2SO4 (0.3 micromole) exposure for immunology. (2) 11/77 Complete H2SO4 (0.3 micromole) exposure for hematology. (3) 11/79 Complete H2SO4 (ultrafine) exposure. (4) 11/80 Complete sulfate exposure.
KEYWORDS: SULFURIC ACID;AEROSOLS;IMMUNOLOGY;HEMATOLOGY;SULFATES;BIOLOGICAL EFFECTS;SULFUR;SPLEEN;ANTIBODIES;BLOOD SERUM;MITOSIS;AIR POLLUTION;BIOCHEMICAL REACTION KINETICS;TRANSPORTATION SYSTEMS

TITLE: Toxicological Effects of Small Particle Sulfuric Acid Aerosol
PROJECT NUMBER: H601B-7103
PRINCIPAL INVESTIGATOR: O'Neil, J.J.;Stultz, S.
AFFILIATION: Environmental Protection Agency, Research Triangle Park, N.C. (USA). Health Effects Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: O'Neil, J.J.
77 FUNDING: Environmental Protection Agency FY77:$60,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The respiratory effect of sulfuric acid aerosol will be determined in small animals. These studies will concentrate on the direct respiratory physiologic response to H_2SO_4 in normal animals and in animals with pre-existing pulmonary lesions (e.g., animals with chemically induced emphysema-like lesions) to determine the sensitivity of high risk groups to sulfur oxides.
APPROACH: Appropriate pulmonary function measurements will be made, such as: spirometry (lung volumes and capacities), mechanics (flow-volume relationships, dynamic and static compliance, pulmonary resistance), distribution of ventilation (N_2 washout, single breath oxygen test) and perfusion with greater sensitivity.
RESULTS: The role of H_2SO_4 aerosol size and mass concentration on these responses will be determined. Dose-response relationships will be investigated.
PROJECT MILESTONES: (1) 05/77 Hire a new principal investigator. (2) 06/78 Set up a pulmonary function laboratory for use with small animals.
KEYWORDS: TRANSPORTATION SYSTEMS;AIR POLLUTION;SULFURIC ACID;AEROSOLS;TOXICITY;PARTICLES;PARTICLE SIZE;PHYSIOLOGY;RESPIRATION;PATHOLOGY;LUNGS;BIOLOGICAL MODELS;DOSE-RESPONSE RELATIONSHIPS;ANIMALS;METABOLISM;BIOLOGICAL EFFECTS

DIVISION: Health Effects Research Laboratory
MONITOR: Gardner, D.E.
77 FUNDING: Environmental Protection Agency FY77:$80,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The objective of this project is to provide insights into how metallic sulfates, sulfur dioxide and sulfuric acid affect respiratory defense mechanisms, particularly the alveolar macrophage. With the current and proposed use of alternate energy sources, many of which contain sulfur compounds, this research becomes increasingly important, especially when one considers the current state of health effects information on these pollutants.

APPROACH: Hamsters, guinea pigs and rabbits will be exposed to aerosols of various sulfur-bearing materials, and the pulmonary deposition of these toxicants will be determined. The alveolar macrophages from these animals will then be examined in detail. The following parameters will be investigated: (1) morphology using histochemical and light and electron microscopic techniques; (2) total number and viability of cells lavagable from the lung; (3) biochemical alterations, particularly of intra- and extra-cellular enzymes and respiration; and (4) physiological functioning using both in vitro and in vivo phagocytic techniques and macrophage migration measurements.
PROJECT MILESTONES: 02/77 Contract started. 02/77 Installation and calibration of exposure chambers. 07/77 Developing and modifying specific techniques. 10/77 Begin initial testing of metallic sulfates.

TECHNOLOGY: FOSSIL FUEL/Oil and Gas (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The objective of this contract is to determine the biologic activity of platinum, specifically the metallic oxide on the induction of pulmonary neoplasia by a known hydrocarbon carcinogen, benzo(a)pyrene.
APPROACH: It is the purpose of the contract to examine the action of a lead compound in this same role. This investigation will thereby serve to compare the possible role as a cofactor in carcinogenesis of one of the presently emitted substances, lead, with a substance which might be added de novo to the exhaust stream as a consequence of mandated modifications in the automotive engine. This comparison will be augmented by an exposure group receiving ferric oxide plus Pb to serve as both a positive control in the system and as an index of the ability of either platinum or lead to replace Fe2O3 as a cofactor in the carcinogenesis model. This study is in its second year. The work is progressing on schedule.
RESULTS: The data derived from this investigation are to be used in evaluating the potential human health hazard associated with the use of an automotive engine employing a platinum catalytic muffler.
PROJECT MILESTONES: 12/77 Estimate final date for necropsy. 03/78 Final report available.

TITLE: Mucus Glycoproteins Secreted by Tracheal Explants from Rats Exposed to Pollutants
PROJECT NUMBER: H601B-7124
PRINCIPAL INVESTIGATOR: Last, J.A.
AFFILIATION: California Univ., Berkeley (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Graham, J.A.
77 FUNDING: Environmental Protection Agency FY77:$36,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The effects of exposure of rats of ozone and sulfuric acid aerosols, pollutant gases that cause irritation to the airways, are being evaluated. Preliminary data suggest that there are qualitative and quantitative changes in glycoproteins secreted by cultured trachea from animals exposed to ozone or to mixtures of ozone and sulfuric acid. Interestingly, sulfuric acid and ozone appear to act synergistically.
APPROACH: To perform an experiment, we incubate excised trachea in organ culture in the presence of isotopically labeled precursor sugars or amino acids. The radioactive label allows to quantitate secreted glycoproteins, and relate those quantitative data to the pollutant regimen to which the rats had been exposed.
RESULTS: It is anticipated that these studies will add to our basic knowledge concerning reactions of the respiratory system with air pollutants, and of tracheal metabolism, with a focus on the most important secretory products of this organ, the mucus glycoproteins. Such knowledge is relevant to a better understanding of several human diseases, including chronic bronchitis, and a rational evaluation of the role(s), if nay, that exposure to air pollutants play(s) in the development of these diseases of the conducting airways.
PROJECT MILESTONES: 11/77 Award grant. 01/78 Begin exposures. 04/79 Complete initial in vivo exposures to O3 and H2SO4. 08/80 Complete exposures to combinations of O3 and H2SO4. 10/80 Final report.

TITLE: Estimating Population at Risk to Various Air Pollution Exposures
PROJECT NUMBER: H601C-7213
PRINCIPAL INVESTIGATOR: Hollowell, C.D.;Merrill, D.W.;Austin, D.M.
AFFILIATION: Environmental Protection Agency, Research Triangle Park, N.C. (USA). Health Effects Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Nelson, W.C.
77 FUNDING: Environmental Protection Agency FY77:$100,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: To provide population-at-risk estimates on a county basis for the United States population and selected demographic subsets for specified concentrations of the major air pollutants.
APPROACH: To obtain and combine existing population and air quality data sets to form a data base covering all counties in the contiguous U.S. and to utilize this data base to make population-at-risk estimates. Effort will be made to fill in gaps in the area coverage of the air monitoring data by investigating alternative data sources and by utilizing estimation procedures.
RESULTS: Appropriate data bases for population, air pollution, meteorology, socio-economic data, and mortality have been identified and obtained on the LBL computer. A data base management system has been developed to facilitate analysis.
PROJECT MILESTONES: 09/77 Acquire necessary data at LBL. 09/77 Provide planned county maps. 12/77 Develop estimation methodology required by missing data. 06/78 Perform statistical analyses. 10/78 Final report.
KEYWORDS: AIR POLLUTION;HEALTH HAZARDS;HUMAN POPULATIONS;ECOLOGICAL CONCENTRATION;INFORMATION SYSTEMS;TOXICITY;METEOROLOGY;SOCIO-ECONOMIC FACTORS;MORTALITY;DATA PROCESSING;RISK ASSESSMENT;DATA ACQUISITION SYSTEMS;DATA COMPILATION;EPIDEMIOLOGY

TITLE: SIMS Three Year Study on Statistics and Environmental Factors in Health
PROJECT NUMBER: H601C-7214
PRINCIPAL INVESTIGATOR: Thomsen, D.L.;Fleiss, J.L.;Goldstein, I.F.
AFFILIATION: Columbia Univ., New York (USA); Society for Industrial and Applied Mathematics, Philadelphia, Pa. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Nelson, W.C.
77 FUNDING: Environmental Protection Agency FY77:$100,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: During 1976 SIMS will continue to coordinate the Study as outlined in the Proposal (February 1976).
APPROACH: This coordination will in part consist of ensuring communication between the Review Panel and the centers at Columbia and Stanford; it will also consist of ensuring direct communication between the two centers in the form of both personal visitations by members of the Study and seminars as appropriate. As soon as any technical reports and papers are produced as a result of the Study, SIMS will see that there is suitable distribution. COLUMBIA: The first steps will be taken towards the construction of a doubly stochastic Poisson process as a model for mortality and morbidity data in which the rate parameter is itself a random variable depending on time, weather, and pollution. Research will begin to develop sounder statistical methods than so far employed for detecting geographic areas in which there is nonrandom clustering of cases of a certain disorder, with proper control for such factors as size of population, proximity to treatment facilities, and utilization of those facilities. Principal components analysis for individual pollutants will begin of correlations, covariances, and raw cross-products between readings from the 40 monitoring stations in the New York City aerometric network. STANFORD: During the first year, research will include the following: The effects of time averaging on the distribution of pollutant concentration maxima; the relevance of probabilistic assumptions to the estimation of spatial pollutant distributions; the relation between spatial air pollution patterns and spatial health and mortality statistics; a retrospective look at the effects of the 1974 fuel crisis on air pollution and mortality statistics.
PROJECT MILESTONES: 07/77 SIMS technical progress report. 07/78 SIMS technical progress report.

TITLE: ST Segment Analysis of Electrocardiogram in Subject Testing
PROJECT NUMBER: H601C-7215
PRINCIPAL INVESTIGATOR: Stacy, R.W.
AFFILIATION: Environmental Protection Agency, Research Triangle Park, N.C. (USA). Health Effects Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Stacy, R.W.
77 FUNDING: Environmental Protection Agency FY77:$75,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The objective of this study is to provide a non-invasive index, based on the conventional electrocardiogram and automatically derived by computer techniques, for evaluating ischemic changes to the myocardium resulting from exposure to environmental contaminants.
APPROACH: A computer program will be developed to analyze the 12-lead electrocardiogram of humans. This program will provide information regarding (a) S-T segment changes before, during, and after exercise stress testing, separately and in combination with exposure to environmental contaminants, and (b) arrhythmias occurring in a single lead electrocardiogram during such testing. The latter will identify unusual or abnormal cardiac rhythms.
RESULTS: The analytical program will provide for the quantitative measurement of the S-T segment voltage depression, the slope of the S-T segment, and the area under the S-T segment of the ECG. These quantities, along with the heart rate, will be continuously available to the investigator, so that he may intervene if cancerous conditions occur. The programs so developed will be implemented on the CLEANS Physiological Data Acquisition System computer. A parallel development will implement the same programs on microprocessors, which will tie up the PDAS computer for only a very small fraction of its time. The ultimate purpose of this project is to provide the capability of using the electrocardiogram (as easy parameter to measure) as a non-invasive indicator of insufficient myocardial blood flow brought on by toxicologic effects of atmospheric pollutants in combination with exercise stress testing.
PROJECT MILESTONES: 06/76 Acquisition and testing of analog measuring equipment. 12/76 Development and testing of programs on free standing computer. 07/77 Demonstration of use of programs on dogs exposed to CO and hypoxigenation. 12/77 Debugging and evaluation of exercise stress testing in CLEANS. 12/77 Acquisition of microprocessing equipment. 06/78 Incorporation of existing programs into CLEANS PDAS system. 12/78 Development and evaluation of microprocessors for ECG analysis.

TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The objective is to outline major human health effects associated with inhalation of known air pollutants.
APPROACH: Subject volunteers will be exposed to levels of ozone, NO2 and aerosols approximating safe maximal daily concentrations in polluted areas. Measurements will be made of changes in pulmonary function and on

the efficiency of exercise performance. Changes in airway resistance, spirometry function, oxygen uptake and cardiac performance will be determined. In addition, studies will be performed on circulating white blood cells and the possible adverse health effects of these pollutants on the infection-fighting role of these blood elements. Measurements will include those of lymphocyte transformation and phagocytic and chemotactic ability of polymorphs.
RESULTS: Information from this study will assist in assessing the physiologic and cellular impact of these pollutants on humans.
PROJECT MILESTONES: 02/78 Publication of health effects of 0.6 ppm ozone inhalation for 2 hours.

TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The purpose of this investigation will be further assessment of the role of carbon monoxide (CO) as an aggravating factor in the pathophysiology of ischemic heart disease and acute myocardial infarction.
APPROACH: Animal studies assessing the effect of graded exposure to low levels of CO on regional myocardial blood flow, tissue oxygenation, and left ventricular function are planned. Further studies on ventricular fibrillation threshold and the genesis of arrhythmias will be performed. Human studies include assessment of CO as a factor limiting exercise performance, aggravating arrhythmias and compromising left ventricular function will be carried out. A long-term study of the relationship of carboxyhemoglobin level to myocardial infarction size, morbidity, and mortality from acute myocardial infarction is being undertaken in conjunction with the area emergency medical services and the Office of the State Medical Examiner.
PROJECT MILESTONES: 05/76 Grant award; obtain supplies and equipment. 10/76 Initiate pilot experiments. 07/77

Submit report of pilot studies. 07/77 Initiate dog studies. 01/78 Preliminary report on dog data. 07/78 Initiate human studies. 01/79 Final report on dog data. 04/79 Final report on human exposures.

TITLE: Adaptation Effects of Low Level O3 Exposure on Normal Humans
PROJECT NUMBER: H601C-7225
PRINCIPAL INVESTIGATOR: Horvath, S.M.
AFFILIATION: California Univ., Berkeley (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Ketcham, B.T.
77 FUNDING: Environmental Protection Agency FY77:$100
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The objective of this program is to provide information concerning the influence of two environmental contaminants (specifically, O3 and NO2 separately and in combination) with heat stress before and during moderate exercise, on cardiac, pulmonary and peripheral circulatory function. The combination effect of environmental contaminants and heat stress is not known at this time. Information regarding the pathophysiological interaction of these three factors will assist in assessing their precise effects on human health. In the first year of the research program, the effect of O3 (0.3-0.5 ppm, 2-4 hours/day) and heat stress (25 degree C-40 degree C) on cardiac, pulmonary and peripheral circulatory function will be studied on human subjects before and during moderate exercise. These responses will be compared with an identical schedule with the same subjects breathing clean air.
APPROACH: In the second year of the research program, the effect of NO2 (0.5-1.0 ppm for two hours daily) and heat stress (25 degree C-40 degree C) on cardiac, pulmonary and peripheral circulatory function will be studied on human subjects before, during and after moderate exercise. These responses will, in turn, be compared with an identical schedule with the same subjects breathing clean air. In the third and final year of the research program, the effects of O3 and NO2, in combination (levels dependent upon the outcome of the Year I (O3) study and Year II (NO2) study) and heat stress on cardiac, pulmonary and peripheral circulatory function will be studied on human subjects before and during moderate exercise. These responses will be compared with an identical schedule with the same subject breathing clean air.
RESULTS: Final report describing ozone effects in man.
PROJECT MILESTONES: 06/78 Report on ozone adaptation in humans.

TITLE: Operation and Maintenance of the Community Health Air Monitoring Program (CHAMP) Including Mobile Units
PROJECT NUMBER: H601C-7226
PRINCIPAL INVESTIGATOR: Sullivan, R.J.
AFFILIATION: Xonics, Inc., Los Angeles, Calif. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Hinton, D.O.
77 FUNDING: Environmental Protection Agency FY77:$905,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: To quantitatively characterize air pollutants in selected health study communities.
APPROACH: A CHAMP monitoring site (fixed or mobile) is located within each study community to obtain measurements representative of the air pollutant exposure of residents within the community.
RESULTS: The present status involves contract 68-02-2493 with Xonic, Inc. to operate stations, validate data and perform Quality Assurance to determine accuracy of data produced. This system utilizes automatic continuous air quality measurement instruments and real time data retrieval at 28 CHAMP sites. This contract provides for continuing operation and maintenance of the CHAMP system consisting of 23 semi-fixed stations and 5 mobile vans.
PROJECT MILESTONES: (1) Progress report due monthly; (2) quality control reports due periodically, not to exceed six month intervals; (3) determination of award fee semi-annually.

TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The objective is to define precisely the accuracy of aerometric data obtained from the CHAMP network. Interferences, measurement difficulties, etc. shall be investigated and their impact upon collected data shall be known.
APPROACH: The approach of this task is to determine the optimal characteristics of the CHAMP system aerometric sensors and to provide evaluation of instrumentation for new CHAMP pollutant measurements.
RESULTS: Both laboratory and field projects will be carried out to determine operational parameter characteristics of the various sensors used in CHAMP. Specific sensors will be laboratory tested and all associated parameter values will be tested. In concert with the laboratory tests, the parameters will be field tested at existing CHAMP locations. From the test data obtained, recommendations will be made for setting operational parameters. In addition, feasibility studies will be performed to evaluate new sensors and methods.
PROJECT MILESTONES: 02/77 Parameter testing, field data collection. 03/77 SO2 sensor evaluation report. 02/77 Massive volume particulate sampler evaluation. 02/77 CHAMP aerosol instrument evaluation. 06/77 APCA presentation on parameter testing results and Massive volume sampler. 07/77 Hydrocarbon sensor evaluation. 09/77 Final report on hydrocarbon sensor evaluation. 10/77 Final report on CHAMP aerosol instrumentation operation. 12/77 Final report on massive volume sampler development and evaluation

TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: This contract is an extension of a previous EPA contract which will utilize an experimental animal model system for studying the interaction between a variety of interacting atmospheric pollutants and infectious agents (bacterial and viral).
APPROACH: Animal (mice) will be exposed to either SO2, NO2, O3 and particulates alone and in combination for various periods of time. Temperature and relative humidity will be varied. When a minimum effective dose is found for each of the above individual exposures, the pollutants will then be combined and longer, lower levels of exposure will commence. The parameters for measuring the development and severity of the disease will be mortality rate, mean survival time, lung lesion scores, pulmonary clearance of labelled microorganisms, total number of alveolar macrophages, as well as phagocytic and bactericidal capability. Various tissues and cells of the lungs will be examined by scanning electron microscopy and/or transmission electron microscopy. On long-term exposures, additional parameters will be measured. They include: serum neutralization or hemoagglutination-inhibition titration, cell mediated immunity, and immunoglobulin levels (IgA, IgM, IgG, IgG2). This contract will supply us with information concerning the health effects resulting from inhalation of complex, interacting atmospheres that closely resemble that found in a community.
PROJECT MILESTONES: 11/77 Short-term exposure to complex mixtures-NO2-O3-SO/sub x/. 11/77 Begin long-term exposure to NO2 + O3. 12/77 Annual report

TITLE: Incidence of Chromosomal Aberrations in the Peripheral Lymphocytes of College Students as a Function of Photochemical Air Pollution
PROJECT NUMBER: G601C-7245
PRINCIPAL INVESTIGATOR: Nagie, A.R.
AFFILIATION: Loma Linda Univ., Calif. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Calafiore, D.
77 FUNDING: Environmental Protection Agency FY77:$133,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: To compare whether the experience, as determined by the incidence of peripheral chromoscmal aberrations, of young adults emigrating from and immigrating to an area with perpetually high levels of photochemical air pollutants differs significantly from students already living in the respective areas. Secondary objectives include the influence of a change in residence on the incidence of chromosomal aberrations, the persistence of chromosomal aberrations already present at the time of immigration, and the effect of other environmental and lifestyle factors.
APPROACH: 400 non-smoking, non-imbiding, non-drug-using new students (ages 17 to 22) at two Seventh-day Adventist colleges were pre-selected for this study. Objectivity in preparation of blood culture and evaluation for chromosomal aberration is assured since neither collaborating laboratory knows the origin of the samples. Chromosomes of each student are evaluated for the frequency of breaks, gaps, isogaps, hypo- and hyper-diploidy, undoreduplications, terminal blebs, and stable changes such as dicentrics, quadriradials, inversion, and translocation.
RESULTS: Lifestyle and demographic characteristics of the subjects have been analyzed. Three blood sampling periods have been completed. The frequency of chromosomal aberrations from the first blood samples are being statistically evaluated. Chromosome scoring of the other samples is currently in progress. It is

planned to follow this group of students into their child-bearing years to determine if observed chromosomal aberrations have any correlation with the outcome of pregnancies.
PROJECT MILESTONES: 07/76 Award grant. 07/77 Progress report and continuation. 11/78 Final report

PROJECT DESCRIPTION: The objectives of this project are to develop and compare two or more strategies to examine the possible relationship between community air pollution and acute bronchitis. The project includes a pilot field study in which the strategies would be compared with respect to willingness of subjects to participate and effectiveness in measuring incidence or prevalence of acute bronchitis. Analysis of data would include testing, on a demonstration basis, the null hypothesis based upon whether exposure to air pollution in the South Coast Air Basin affects the incidence or prevalence of chronic bronchitis.
APPROACH: (1) An interview survey asking about episodes during a defined period, such as the preceding six or twelve months. This would be timed so as to follow closely the season of heaviest pollution and might be repeated one or more times; and (2) enrollment of a panel of subjects who would be asked to record symptoms on a daily basis or who might be contacted periodically by telephone, mail, or in person to elicit symptoms.
RESULTS: Geographic areas and population samples will be selected. A questionnaire and diary will be designed and pre-tested. A pilot study will be conducted.
PROJECT MILESTONES: 11/77 Award grant. 06/78 Final report.

TITLE: Effects of Pollutants on Immunological Functioning at the Primary Site of Oxidant Impact--Pulmonary Cells
PROJECT NUMBER: H601C-7259
PRINCIPAL INVESTIGATOR: Graham, J.A.
AFFILIATION: Environmental Protection Agency, Research Triangle Park, N.C. (USA). Health Effects Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Graham, J.A.
77 FUNDING: Environmental Protection Agency FY77:$30,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The effects of oxidants on pulmonary immunological mechanisms will be investigated. A number of air pollutants (Ni, Cd, Pb, O3, NO2, and SO2) have been shown to have adverse effects on systemic immune systems; however, little research has been directed at pulmonary systems.
APPROACH: Since the lung is the primary site of pollutant impact, it is probable that more profound immunosuppression occurs at this site. Due to the importance of the pulmonary immune system, any alteration of this mechanism would be ominous to the host.
RESULTS: Sensitive models will be developed and used to determine the influence of oxidants on: (1) pulmonary inflammatory responses, using chemotaxis of alveolar macrophages and polymorphonuclear leukocytes as the principal technical approach; and (2) immunological functioning of alveolar macrophages, using the ability of these cells to process antigen and produce factors which stimulate lymphocyte functioning.
PROJECT MILESTONES: 11/77 Complete development of 3 models. 12/77 Complete O3 dose-response studies for 1st model. 03/78 Complete development of the 3rd model. 03/78 Complete O3 dose-response on the 2nd model. 06/78 Complete development of the 4th model. 11/78 Complete O3 dose-response on 3rd and 4th model.

TITLE: Nasal-Pharyngeal Uptake of O3 and NO2
PROJECT NUMBER: H601C-7260
PRINCIPAL INVESTIGATOR: Miller, F.J.
AFFILIATION: Environmental Protection Agency, Research Triangle Park, N.C. (USA). Health Effects Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Miller, F.J.
77 FUNDING: Environmental Protection Agency FY77:$40,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: Since nasal-pharyngeal uptake of gaseous pollutants may be experimentally determined and must be accounted for in a complete modeling approach to the problem of evaluating pulmonary effects of gaseous pollutants, this study has as its objective the empirical determination of the nasal-pharyngeal uptake of O3 and NO2 in various laboratory animals (rabbits, guinea pigs and rats).
APPROACH: The pollutant gas is drawn through the nares and exhausted through a tracheal cannula of an anesthetized and surgically prepared animal. The chamber and tracheal concentrations are monitored continuously by the chemiluminescent method. From the resulting data, the relationship between the tracheal and inhaled concentration of pollutant may be obtained.
RESULTS: The data obtained from experiments using these animals can be compared with already existing data on other species to better assess the role the nasal-pharyngeal area plays in pollutant exposures. Also, the data will serve as a building block in the development of a complete lung moel for the uptake of O3 and other gaseous pollutants.
PROJECT MILESTONES: 10/76 Complete rabbit and guinea pig upper airway exposures. 01/77 Final analysis of

results. 05/77 Final manuscript on nasopharyngeal removal of O3 in guinea pigs. 10/77 Begin upper airway exposures at elevated flow of O3. 05/78 Complete exposures begun 10/77. 06/78 Begin NO2 nasopharyngeal exposures. 09/78 Final manuscript on nasopharyngeal removal of O3 with elevated flow rates. 01/79 Begin NO2 nasopharyngeal studies with elevated flow rates

TITLE: Effects of Controlled Ozone Exposure on Human Immunity
PROJECT NUMBER: H601C-7262
PRINCIPAL INVESTIGATOR: Peterson, M.L.
AFFILIATION: Environmental Protection Agency, Research Triangle Park, N.C. (USA). Health Effects Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Peterson, M.L.
77 FUNDING: Environmental Protection Agency FY77:$120,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: Clinical tests will be made to assess the effects of ozone on cellular defense mechanisms in exposed human volunteers. In vitro blood tests will identify changes in lymphocyte and neutrophile populations in peripheral blood based on cellular properties such as DNA and RNA synthesis, membrane receptor quality, lymphokinase activity, cytotoxicity and phagocytosis.
RESULTS: Data from this study will provide quantitative information on the immunologic effects of ozone for humans and aid in criteria development and evaluation of air quality standards for photochemical oxidants.
PROJECT MILESTONES: 12/76 Immunologic effects of one 4-hour exposure to 0.4 ppm ozone. 12/77 Immunologic effects of one 2-hour exposure to 0.6 ppm ozone. 12/78 Immunologic effects of multiple exposure to 0.4 ppm ozone. 12/80 Immunologic effects of multiple exposure to 0.4 ppm ozone

TITLE: Development of Chronoepidemiologic Methods with Reference to Cardiopulmonary Conditions
PROJECT NUMBER: H601C-7280
PRINCIPAL INVESTIGATOR: Halberg, F.;Reinberg, A.;Halberg, E.;Tong, L.;Cornelissen, G.;Lee, J.
AFFILIATION: Minnesota Univ., Minneapolis (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
77 FUNDING: Environmental Protection Agency FY77:$53,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: Existing data from selected studies of cardiopulmonary conditions (e.g., panel studies of air pollution effects) will be analyzed by methods acknowledging the existence of biological as well as environmental periodicities. Recommendations will be developed for the design and analysis of future

epidemiologic studies so that predictable biologic variability (rhythms and trends) can be separated from effects of environmental factors.
APPROACH: Statistical methods (including the least-squares fitting of cosine models) will be used to quantitatively define characteristics of resolvable rhythms, preferably circadian, about-weekly (circaseptan), circannual rhythms as well as rhythms with other periods in circulatory and respiratory function of healthy subjects living in relatively pollution-free environments. Extensive time series (e.g., measurements of heart rate, blood pressure and peak expiratory flow 5 or more times daily for several years) are already available for this purpose. Morbidity data (e.g., from appropriate panel studies sponsored by the Environmental Protection Agency) will be analyzed against this background, using rhythmometric and other statistical procedures (e.g., cross spectral analysis).
RESULTS: On the basis of this experience, a flow chart will be developed integrating old and new computer programs and providing indications for the design and analysis of epidemiologic time series in general. Primary emphasis will be placed on chronoepidemiologic studies permitting the inferential statistical isolation of rhythms. Such chronoepidemiologic criteria should be particularly pertinent and sensitive for air pollution monitoring with a view of health and disease.
PROJECT MILESTONES: 06/76 Grant awarded. 06/77 Progress report and grant continuation. 06/78 Progress report and grant continuation application. 06/79 Final report.

DIVISION: Health Effects Research Laboratory
77 FUNDING: Environmental Protection Agency FY77:$82,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The major objective of this study is to determine if prolonged exposure to high levels of air pollutants in urban areas of California is associated with increased risk of chronic diseases. This study objective arose out of the need to document in a scientific manner, the disease effects associated with air pollution in urban areas of California. The high pollution areas will be defined by the ambient levels of SO2, ozone, particulate matter, and NO2.
APPROACH: The population group to be studied (Seventh-Day Adventists) has inherent controlled parameters as a result of its lifestyle. In this study a smog questionnaire is being mailed to the study subjects. It includes questions designed to determine the prevalence of Chronic Obstructive Pulmonary Disease (COPD) in the polluted areas of the South Coast Air Basin and to estimate the prevalence of COPD in the rest of California, as well as estimate the relative exposure to air pollutants based on differing lifestyle habits.
PROJECT MILESTONES: 05/77 Grant award. 05/78 Final report due.

TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The objective of this task is to determine the influence of environmental pollutants on cells and organ cultures in vitro and when obtained from exposed animals.
APPROACH: Animal, human and microbial cells or organ fragments will be cultured in vitro and subsequently exposed to a wide range of pollutants. Gross morphological, subcellular and molecular changes in the exposed preparations will be monitored using the following parameters: cell viability, total cell number, morphology, physiological function, growth kinetics, macromolecular biosynthetic activity, intracellular and extracellular release of enzymes, cations, etc. In order to relate cytotoxicity evaluations to potential carcinogenic and mutagenic effects of environmental pollutants, the assesssment of the following parameters will be developed: microsomal enzyme activity and induction (e.g., aryl hydrocarbon hydroxylase, epoxide hydrase, p-nitroanisole demethylase), induction of unscheduled DNA synthesis, induction of membrane damage and alterations of transport, effects on DNA, RNA and protein synthesis, etc.

These parameters will be assessed in the pulmonary cell types (rabbit alveolar macrophages and WI-38 cells) currently in use as in vitro screening systems. Several epithelial cell systems including primary rat liver hepatocytes will be developed as in vitro screening systems. Initially a series of potentially carcinogenic metals (e.g., As, Cr, Cd, etc.) and polycyclic aromatic hydrocarbons will be studied alone and in combination. The effect of preinduction of metal binding proteins (e.g., by Cu and Cd) on the subsequent toxicity of a series of metals including potentially carcinogenic metals will be studied.
PROJECT MILESTONES: 04/77 M-1 Implementation of liver culture system. 10/77 M-2 Develop biochemical indicators of liver cell toxicity. 10/77 M-3 Evaluation of a series of toxic and potentially carcinogenic indicators. 01/78 M-4 Evaluation of a series of organic toxic and potentially carcinogenic indicators.

TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The toxic effect of sulfate aerosols is an important air pollution problem related intimately with the production of energy. Prior studies have shown that sulfate ion is removed from the airways and taken up by lung cells. The processes of removal of sulfate ion from the lung may be related to the toxic effects of sulfate aerosols via histamine release.
APPROACH: To provide clearer kinetic evaluations of the mechanisms of sulfate uptake by the lung, viable lung cells will be prepared by enzymatic digestion. The isolated cells will be characterized by cell type using marker enzymes. The mechanism of sulfate transport into these cells will be elucidated. The effects of cyclic nucleotides and chloride transport inhibitors will be investigated.
RESULTS: These results will be correlated with in vivo inhalation models of sulfate aerosol toxicity.
PROJECT MILESTONES: 12/76 Acquire and install cell culture equipment. 02/77 Complete media and culture condition selection. 03/77 Perform preliminary sulfate ion uptake experiments. 04/77 Begin cloning and animal age experiments. 06/77 Begin 63 Ni uptake studies in vivo for comparison with cells. 12/77 Complete 63 Ni studies in vivo as a pilot indicator of heavy metals. 00/00 Complete kinetic characterisitics of sulfate ion uptake.

77 FUNDING: Environmental Protection Agency FY77:$75,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: A critical problem in correlating the results of chemical analyses and biological screening tests with respect to the potential biohazards of a given crude sample is the degree to which the biological availability of the sample is understood. That is, we need to know the nature of surface chemistry and the potential of a complex sample to release components to biological fluids and tissues. Our objective is to expose rabbit alveolar macrophages (RAMs) in vitro to a variety of elements (specifically cadmium, vanadium, nickel, manganese, chromium, iron, lead, copper and zinc) at differing concentrations and times, and to a variety of particles (both fly-ash particles coated with known elements and representative elements selected from urban air) in order to define morphologically the subcellular reaction of these macrophages to injury. Electron probe microanalysis will be used to study the morphology and distribution of the toxic elements in question. Consequently a parallel and important objective of this work will be to examine in detail the limitations and usefulness of a number of microhistological techniques from a qualitative and semi-quantitative point of view in order to optimize techniques for the identification, localization and distribution of these elements.
PROJECT MILESTONES: 11/77 Project not yet initiated. Anticipated award.

PROJECT DESCRIPTION: The purpose of this project will be to determine the comparative toxicity of particulates to macrophages when exposed in vitro and in vivo.
APPROACH: Chemically characterized crude particulates from industrial processes of respirable size and other particulate samples will initially be screened for relative cytotoxicity to the alveolar macrophage exposed in vitro. From this initial screening in vitro, particulate samples of high, moderate and low toxicity will be selected for in vivo inhalation exposures. Macrophages isolated from these exposed animals will then be examined for a number of parameters including total numbers, viability, ATP content,

phagocytic ability, and bacteriocidal activity.
RESULTS: Results from in vivo exposures will be correlated with results from strictly in vitro exposures in order to validate in vitro findings. Furthermore, in vivo studies, when warranted, will examine the effect of these particulates on animals subsequently challenged with a bacterial infection.
PROJECT MILESTONES: 03/77 Award grant. 05/77 Initiate work. 11/77 Primary screening of particles. 05/78 Secondary screening of particles. 03/78 Annual report. 08/78 Aerosol methodology established. 03/79 Annual report. 10/79 In vivo exposures for macrophage studies completed. 03/80 Infectivity studies completed. 06/80 Final report.

PROJECT DESCRIPTION: The objective of this task is to study the mutagenicity of environmental agents by use of in vitro and combined in vivo-in vitro test systems.
APPROACH: Emphasis during the first year of the task will be on implementation and validation of existing mammalian cell mutagenesis systems. The L5176Y mouse lymphoma forward mutation assay will be combined with a mammalian metabolic activation system to evaluate the mutagenic potential of chemicals in a mammalian cell system. After validation with known mutagens, pesticides, heavy metals, asbestos and other environmental agents will be studied in this system. Emphasis in this project will be in evaluating mammalian mutagenesis as a screening system for environmental carcinogens and mutagens. Pesticides and other agents now being assayed in a tiered test series will be studied in this system. Environmental agents for which the microbial mutagenesis test system is not sensitive (e.g., metals, chlorinated hydrocarbons, etc.) will also be studied. Other mammalian cell systems which are being considered are the V79 cells, Chinese hamster ovary cells, diploid human lymphoblasts and hamster embryo cells. These systems would be employed with and without metabolic activation as may be provided by mammalian liver microsomes or mammalian liver cells.
PROJECT MILESTONES: 07/77 M-1 Validation of 15178Y bioassay with EMS and MNNG. 08/77 M-2 Validation of 15178Y with metabolic activation systems. 10/77 M-3 Validation of 15178Y test systems. 05/77 M-4 Implementation of Salmonella bioassay for macrophage activation. 07/77 M-5 Implementation of Salmonella as an indicator of mutagen activity.

PROJECT DESCRIPTION: In the next few years, sulfuric acid aerosol may be generated in increasingly large amounts with the use of the present catalytic converters on automobiles. This research program will provide: (1) information as to some of the human health effects associated with sulfuric acid aerosol exposure over the concentration range of 0 to 100 microns g/cubic m and a particle size of 0.1 to 0.3 microns m, and (2) relate the human health effects to specific concentrations of sulfuric acid aerosol and thereby contribute to the data base required in formulating criteria for standards.
APPROACH: The study will be conducted in young healthy male volunteers exposed to these concentrations for a period of two hours. The following parameters will be investigated: (1) pulmonary function studies; (2) immune response studies; (3) biochemical studies; (4) cytogenetic screening studies; (5) blood clotting studies; (6) cardiac monitoring.
RESULTS: The first study should be completed with a report of the findings in the fall of 77.
PROJECT MILESTONES: (1) 11/77 1st phase clinical study completed and reported; (2) 11/78 2nd phase clinical study completed and reported; (3) 11/79 3rd phase clinical study completed and reported; and (4) 11/80 4th phase clinical study completed and reported.

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: To quantitatively characterize air pollutants in selected health study communities.
APPROACH: A CHAMP monitoring site (fixed or mobile) is located within potential study communities to obtain measurements representative of the air pollutant exposure to select populations at risk for prospective health studies.
RESULTS: The present status involves contract 68-02-2493 with Xonics, Inc. to operate stations, validate data and perform Quality Assurance to determine accuracy of data produced. This system utilizes automatic continuous air quality measurement instruments and real-time data retrieval at 28 CHAMP sites. This contract provides for continuing operation and maintenance of the CHAMP system consisting of 23 semi-fixed stations and 5 mobile vans.
PROJECT MILESTONES: (1) Progress report due monthly. (2) Quality control reports due periodically--not to exceed six month intervals. (3) Determination of award fee semi-annually.

TITLE: Impact of Environmental Pollutants on the Plasma Membrane of Alveolar Macrophages
PROJECT NUMBER: H601D-7341
PRINCIPAL INVESTIGATOR: Hadley, J.G.
AFFILIATION: Duke Univ., Durham, N.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Hadley, J.G.
77 FUNDING: Environmental Protection Agency FY77:$30,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The objective of this program is to develop a highly sensitive indicator of pollutant effect on the prime mediator of pulmonary defense mechanism--the alveolar macrophage.
APPROACH: Studies will be conducted to examine cell membrane structures on alveolar macrophages obtained from control or low-level pollutant exposed animals.
RESULTS: Examination of the effect of pollutant exposure on the binding characteristics of specific, radiolabeled membrane probes is expected to yield a powerful tool for assessing pollutant damage to the macrophage. The membrane probe proving most sensitive in these studies will be further employed in combination with affinity chromatography techniques in an attempt to isolate and identify those structures of the macrophage membrane which are most sensitive to pollutant exposure. It is believed that these studies will help elucidate the mechanisms by which pollutant exposure can impair host defense systems.
PROJECT MILESTONES: (1) 07/77 Manuscript prepared on Phase 1 of study; (2) 06/77 complete O3 exposures for

membrane receptor study; (3) 09/77 complete cytotoxicity study; and (4) 08/77 initiate NO2 exposures for membrane receptor study.

TITLE: Comparative Particulate Deposition and Clearance in Laboratory Animals
PROJECT NUMBER: H601D-7342
PRINCIPAL INVESTIGATOR: Hu, P.;McNeal, C.
AFFILIATION: Environmental Protection Agency, Research Triangle Park, N.C. (USA). Health Effects Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Hu, P.C.
77 FUNDING: Environmental Protection Agency FY77:$75,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The proposed research is designed to test the effects of air pollutants (SO2, NO2, O3, etc.) on the host-parasite interaction during respiratory infections using Mycoplasma pneumoniae infection of Syrian hamsters as the experimental model. The objectives of this work are three fold: (1) to determine how various air pollutants affect the deposition and clearance of M. pneumoniae from the pulmonary tract, (2) to examine the effect of air pollutants on the histopathological changes of pulmonary tissue during the course of disease production, and (3) to establish a model system for evaluation of the effect of air pollutants on the development of protective immunity against a respiratory surface antigen.
APPROACH: Radioactive-labeled M. pneumoniae organisms will be used to study the respiratory tract of Syrian golden hamster. The use of radioactive-labeled M. pneumoniae will also permit us to determine the geographical distribution of the microorganisms in the respiratory tract which will be correlated to the histological data. A solid-phase radioimmunoassay will be developed to measure the antibody level in the respiratory tract of the infected animals under the stress of air pollutants.
RESULTS: During the first year the model will be developed and validated. In following years, the effects of O3, NO2, and SO2 will be examined to elucidate the dose-response relationship.
PROJECT MILESTONES: (1) 06/77 Completion of experimental design of exposure chamber; (2) 01/78 preliminary tests on the deposition and clearance pattern of M. pneumoniae; (3) test of the effects of gaseous or particulate pollutant; (4) 09/78 completion of deposition and clearance pattern studies; (5) 06/79 completion of the proposed studies; and (6) 10/79 final report.

TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The biological effects of the exposure to an aged aerosol of SO2-O3-olefin mixture will be investigated in a manner to elucidate dose-response relationships. This mixture has been shown to result in the formation of substantial quantities of sub-micron size sulfuric acid aerosol. The quantity and size of the sulfuric acid aerosol which is produced is dependent upon the relative concentration of the three pollutants, the reaction time, and physical environmental conditions, i.e. temperature and water vapor. These components are thought to play a principal role in the formation of atmospheric sulfate in smog.
APPROACH: The biological response to inhalation of these atmospheres will be determined using small laboratory animals (rats and guinea pigs). Estimates of changes in pulmonary function, histopathology, and pulmonary biochemistry will be made to evaluate the acute consequences of inhalation of such atmospheres. The response of high risk or compromised groups, such as animals with chemically produced emphysema-like lesions will also be made. The biologic response to this complex atmosphere will also be compared to the response to H_2SO_4 aerosol generated directly from the chemically pure compound. A 51.3 cubic foot, insulated reaction chamber has been constructed and is undergoing pre-test operational evaluation. The generation of a sub-micron size aerosol with SO2-O3-trans-2-butene has been verified experimentally. The chemical characterization of the gas and particulate phase components of the atmosphere are being characterized prior to the commencement of biological testing.
PROJECT MILESTONES: (1) 05/77 Hire a new principal investigator and (2) 06/78 Set up a pulmonary function laboratory for use with small animals.

DIVISION: Health Effects Research Laboratory
MONITOR: O'Neil, J.J.
77 FUNDING: Environmental Protection Agency FY77:$121,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The objectives of this research are as follows: (1) Determine the acute respiratory physiologic response of guinea pigs to sulfuric acid aerosol inhalation. Conduct dose-response experiments to determine the minimum mass concentration of sulfuric acid which induces an altered respiratory physiologic response. Evaluate this data to determine the appropriate mass concentration of H_2SO_4 aerosol to which human subjects should be exposed. (2) Determine the amount of ammonia in exhaled air from human subjects. From this data develop a mathematical model to predict the amount of ammonia which exists in the alveolar region of the lung. Develop formulas for determining the ability of ammonia to neutralize H_2SO_4 under different respiratory physiologic conditions. Test the validity of the model predictions under simulated conditions of the respiratory system. (3) Determine the influence of exercise on the human response to SO_2-NaCl aerosol inhalation. Also determine the response of humans with pre-existing respiratory disease, i.e., chronic bronchitis and asthma, to SO_2-NaCl inhalation. Initiate a study of the acute human pulmonary physiologic response to sulfuric acid inhalation. Conduct dose-response experiments to determine the minimum mass concentration of H_2SO_4 inhalation which will elicit an alteration in pulmonary physiologic response.
PROJECT MILESTONES: (1) 00/76 Estimated thresholds to SO_2 and NaCl (accumulation mode) in guinea pigs; (2) 04/77 completed study in guinea pigs with SO_2 and droplet Na_2SO_4; (3) 07/77 studied dose response to H_2SO_4 in guinea pigs; (4) 01/77 studied response to SO_2 and droplet NaCl in humans at rest and during exercise; and (5) studied response to SO_2 and droplet NaCl in human patients.

TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: This study is designed to determine the interaction of sulfate and oxidant on the production of lung lesions.
APPROACH: Rats and monkeys will be exposed to a combination of ozone and small particle sulfuric acid aerosol. The contractor shall furnish long term exposure chambers equipped with the necessary chemical instrumentation for accurate control of pollutants on a 24 hr/day schedule over long periods and into which new features such as controlled humidity levels and particulate concentrations can easily be introduced. The contractor shall continue experimental exposure of rats to combined gas and aerosols including SO_2, acid mist, and ammonia to determine the minimal effective doses and combination of these agents which induce tissue injury. The principal response parameters will be pulmonary physiology and microscopic pathology. Electron microscopy will be employed where indicated. The exposures will include acute, sub-acute and chronic exposures up to one year. The monkeys will be exposed to a combination of NO_2 and O_3 starting with a concentration of 0.9 ppm--O_3 and 2 to 3.5 ppm NO_2 and pulmonary physiological performance tests made. Additional studies will be designed on the basis of these measurements so that the reaction of monkeys can be compared to man on the basis of pulmonary physiological response. Monkeys may be exposed at a combination of ozone and sulfur oxide for similar comparison.
PROJECT MILESTONES: (1) 11/77 Complete 10-year exposure of monkeys to 2 ppm NO_2; (2) 11/77 complete 20-month exposure of monkeys to 0.9 ppm O_3; (3) 12/78 complete terminal studies on above animals and controls; and (4) 06/79 final report due at termination of contract.

/ FUNDING: Environmental Protection Agency FY77:$50,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective is to develop chemical methods for the analysis and characterization of ambient particulate matter. The analysis shall include compound, ion and molecular identification and concentration.
APPROACH: The toxic nature of sulfate aerosols has been shown to be detrimental to human health. In order to

fully assess the impact of these particles, generated in great part by the utilization of sulfur-containing coals, a precise measurement and complete characterization of the chemical composition of sulfate materials must be made.
RESULTS: A request for procurement has been let to develop methods and analyze for chemical composition, ambient aerosol samples collected by the EPA Massive Volume Sampler. EPA will make available for the contractor size selected particulate matter samples in gram quantities. The initial analytical effort shall be directed toward broad-based information on a maximum number of samples, but shall also promote quantitative data accompanied by method description and accuracy of measurement documentation and definition. Emphasis shall also be placed on interferences and inter-reactions that occur in performing the analysis.
PROJECT MILESTONES: (1) 04/77 Award contract; (2) 05/77 work plan completed; (3) 06/77 tasks begin--methods developments and analysis; (4) 05/78 final report--1st year's work; (5) 06/78 expansion of effort and more detailed development of organic analysis; and (6) 06/79 final report and analysis results.

PROJECT DESCRIPTION: In cooperation with Japan and Sweden, various studies are being carried out in these countries to evaluate body burdens and metabolism of cadmium. The activity of the U.S. is limited to the collection and analysis of autopsy tissue and tissue from living persons in the Dallas metropolitan area. The autopsy collection will consist of 30 sets of each of the five decades 10-59. The tissue to be collected are: abdominal fat from the umbilical area; psoas muscle; right lobe of the liver; tail of the pancreas; and kidney cortex.
APPROACH: The metals to be analyzed are: cadmium, zinc, lead, and mercury. Twenty-four hour urine and fecal samples from 80 non-occupationally exposed males in Dallas will be collected under a joint Swedish, Japanese, American protocol and analyzed for cadmium.
PROJECT MILESTONES: 10/77 Acceptance final report.

DIVISION: Health Effects Research Laboratory
MONITOR: Gray, L.E.
77 FUNDING: Environmental Protection Agency FY77:$40,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: Experiments are in progress investigating the effects of lead (lead acetate) on the social behavior of the house mouse, Mus musculus (CD-1, Charles River). Social behaviors under investigation include aggressive behavior, sex behavior, and diet activity. In addition, other developmental data is being collected including the age of eye-opening, age at puberty, reproductive success and growth rates. In these experiments, it seems particularly important to control for the undernutrition and retarded growth caused by administering lead acetate in the drinking water. The proper control animals are generated by pair-feeding litters not on lead acetate. Similar experiments have been designed to investigate the toxicity of manganese.
PROJECT MILESTONES: 03/77 Final report on Pb--an evaluation of the hyperactive mouse model. 09/77 Final report on Mn--a description of the behavioral effects of M.
KEYWORDS: NEUROLOGY;PHYSIOLOGY;BEHAVIOR;MICE;BIOLOGICAL MODELS;LEAD;MANGANESE;TOXICITY;SOCIAL IMPACT;DIET;REPRODUCTION;ANIMAL GROWTH;DRINKING WATER;FOOD CHAINS

TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: Determine the effects of heavy metals and organic exposure on catecholamine levels and catecholamine metabolism in various organs of the rat as well as the effect on acetylcholinesterase activity.
APPROACH: The toxic compounds will be administered via feed and/or water at relatively low levels over an extended period of time. Animals will be sacrificed at various times during the exposure regime and the neurochemical analyses performed. Catecholamine levels and the metabolism of catecholamines (NE, E, DA) will be examined in discrete brain regions, the heart and adrenal glands. Acetylcholinestera activity will be measured in discrete brain regions.
PROJECT MILESTONES: 09/77 Interim report on Mn. 09/78 Interim report. 09/79 Interim report.

77 FUNDING: Environmental Protection Agency FY77:$10,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: This research program will involve the sampling and analysis for ambient organic vapor with primary emphasis on carcinogenic substances.
APPROACH: The technique will utilize a system composed of gas chromatography/mass spectrometry/computer utilizing sampling techniques developed under previous contracts. Ambient air samples will be passed through Tenax GC glass cartridges in order to collect hazardous organic vapors from areas involved in high chemical production. Emphasis will be placed on the identification of all the components present with the quantification of the type specific components. The major emphasis will be on carcinogenic and mutagenic pollutants present at each of these sites throughout the continental U.S.
PROJECT MILESTONES: 03/77 Contract award. 03/78 Final Report.
KEYWORDS: ORGANIC COMPOUNDS;AIR POLLUTION;SAMPLING;CHEMICAL ANALYSIS;GAS CHROMATOGRAPHY;MASS SPECTROSCOPY;CARCINOGENS;MUTAGENS;CHEMICAL INDUSTRY;USA;HUMAN POPULATIONS;CARCINOGENESIS;TOXICITY;HEALTH HAZARDS

TITLE: Assessment of the Relationship Between Cancer Mortality and Population Exposure to Selected Environmental and Industrial Factors
PROJECT NUMBER: H601P-7754
PRINCIPAL INVESTIGATOR: Preuss, P.W.;Paulson, G.;Burke, T.;Cohen, W.
AFFILIATION: New Jersey Dept. of Environmental Protection, Trenton (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Nelson, K.
77 FUNDING: Environmental Protection Agency FY77:$73,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The proposed project will correlate the geographic patterns of cancer mortality with environmental and industrial data.
APPROACH: (1) Statewide environmental and industrial data will be collected for as far back in time as the sources permit. (2) A list of approximately 600 environmental and industrial variables will be identified to be correlated to the cancer mortality data. (3) These variables will be correlated with the cancer mortality data. The mathematical techniques will include bivariate correlation and factor analysis. Bivariate correlation is a statistical tool for measuring the relationship between two variables. Factor analysis provides a measure of the extent to which groups of different variables correlate. Through the use of these techniques, both individual and groups of factors which correlate with cancer mortality will be identified. (4) From the results of the correlation of the 600 variables, a list of those 20 to 40 which correlate most strongly with cancer mortality will be generated. (5) Intensive data searches will be conducted in order to reconstruct a 30-year period of population exposure to the 20 to 40 selected variables. (6) Annual exposure rates will then be correlated to annual mortality data to determine if relationships exist between exposure and mortality. In performing these correlations the 20 to 30 year latency period for cancer will be considered.
RESULTS: A final report will be prepared explaining all findings and recommending future courses of action.
PROJECT MILESTONES: 10/77 Award grant. 10/78 Final report due.

TITLE: Compare Effects of Respirable Particles, Gases and Mists Using Small Airway Resistance in Donkeys as the Model for Pulmonary Irritation
PROJECT NUMBER: H625-6704
PRINCIPAL INVESTIGATOR: Lippmann, M.
AFFILIATION: New York Univ., N.Y. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: O'Neil, J.J.
77 FUNDING: Environmental Protection Agency FY77:$100
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The investigations of the effects of (NH4)2 SO4 and H2SO4 aerosols on pulmonary function, regional deposition, and bronchial clearance will be continued in order to clearly establish the nature of the effects produced and their dose-response relationships. This will provide a sound basis for subsequent tests with the same aerosols on human volunteers.
APPROACH: Airway resistance, dynamic compliance, and regional particle deposition were selected as sensitive indicators of physiological response. They will indicate transient effects attributable to the inhalation of airborne irritants at levels which produce no pathological effects. Effects on these physiological functions in donkeys should be essentially similar to those produced by the same irritants in humans. A major purpose is therefore to clarify the dose-response relationship for pulmonary irritation resulting from transient elevations in the ambient pollution aerosol concentration. The intrabronchial deposition patterns of (NH4)2 SO4 and H2SO4 aerosols will also be measured in hollow bronchial casts of donkeys and human airways. The rate of water vapor concentration on aerosol growth and subsequent deposition in hollow casts will be tested in order to evaluate mathematical predictions of droplet growth from physiochemical factors.
PROJECT MILESTONES: 05/77 Completed tracheal clearance and pulmonary function studies. 04/78 Complete chronic exposure of four donkeys to H2SO4. 04/78 Complete tracheal clearance studies on donkeys exposed to H2SO4. 04/78 Complete tracheal clearance studies and pulmonary function studies. 04/78 Start measurements of tracheo-bronchial transport response to H2SO4. 06/78 Final report due at termination of contract.

TITLE: Effect of Material from Alternate Energy Sources on Whole Animal Defense Systems
PROJECT NUMBER: H625-6708
PRINCIPAL INVESTIGATOR: Gause, E.;Graham, J.A.
AFFILIATION: Southwest Foundation for Research and Education, San Antonio, Tex. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Graham, J.A.
77 FUNDING: Environmental Protection Agency FY77:$80,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: As energy sources and energy production technologies change to adjust to the demands of expanding population, new stresses are generated with respect to the health and life expectancy of the population. Not only will the patterns and character of the emissions from these alternate energy sources be different, but ever-increasing numbers of people will be exposed to these agents for an expanding percentage of their life years. The possibility that inhalation of particles from these alternate energy sources in the size ranges which permit deposition in the deep alveoli (i.e., from approximately two microns to submicron sizes) may result in subtle or overt impairment of macrophage function and, subsequently, concomitant alteration in other respiratory defense mechanisms forms the basis for these studies. Such perturbations may, in turn, adversely affect overall particle clearance mechanisms predisposing the host to tissue injury and disease.
APPROACH: Animals will be exposed to various doses of these particles and the following parameters will be assayed: (1) ability of alveolar macrophages to function (viability, phagocytosis, respiration numbers, morphology response to macrophage migration inhibition factor, bacteriocidal activity, lysosomal enzymes, and AHH activity); (2) induction of autoimmunity directed against lung tissue; (3) nucleic acid synthesis in alveolar macrophages; and (4) cyclic AMP levels in pulmonary tissue.
RESULTS: A draft research protocol for fuel and fuel additives will be prepared.

PROJECT MILESTONES: 09/77 Complete draft, research fuel and fuel additive protocol. 01/78 Complete acute exposures on first pollutant sample. 05/80 Complete chronic exposures on first pollutant sample. 01/81 Complete acute exposures on second pollutant sample.

77 FUNDING: Environmental Protection Agency FY77:$100
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The influence of effluents from alternate energy production on the immune system will be investigated.
APPROACH: Mice will be exposed to the pollutant for various time periods. The animals will then be examined for alterations in the immune system (particularly the respiratory immune system). Cell mediated immunity will be tested using the following assays: mixed lymphocyte cultures, functioning of effect on (killer) cells, and mitogen induced transformation. Humoral immunity will be tested using mitogen induced transformation, antibody production by lymphocytes and antibody titers. To correlate functional changes in the immune system with morphologic changes, histologic techniques will also be utilized.
RESULTS: Studies will also be included to identify the quantity and locality of any environmental particulates used in this investigation. The project will also define dose-response relationships using the most sensitive parameters.
PROJECT MILESTONES: 04/78 Complete initial testing of 1st pollutant sample. 08/78 Complete testing of 1st pollutant sample. 08/79 Complete testing of 2nd pollutant sample. 02/80 Complete testing of 3rd pollutant sample.

TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The objective of this contract is to screen a variety of substances for their toxic effect on mucociliary activity using an in vitro model system.
APPROACH: Since cilia play a significant role in pulmonary clearance, proper functioning is essential for defense against various environmental insults. However, ozone, nitrogen dioxide, nickel and cadmium have an adverse effect on this system. Therefore, it becomes increasingly important to determine if alternate energy sources such as shale oil and coal gasification and liquefaction on particulate effluents from power stations, stationary engines or mobile sources produce pollutants toxic to the mucociliarly escalator. Due to the above considerations isolated hamster tracheal rings will be exposed to pollutants in vitro. Parameters to be measured are: (1) effect on ciliary beat frequency; (2) effect on the energy source (ATP) of beating; (3) effect on ciliary and tracheal morphology; and (4) recovery of the tracheal rings after exposure. In all cases, parameters will be tested for dose-response effects.
PROJECT MILESTONES: 01/77 Continual biological screening of particles from alternated energy sources.

77 FUNDING: Environmental Protection Agency FY77:$350,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: To study the nature of the surfaces of particles and the resulting effects of the in vitro exposure of these particles to alveolar macrophage. The biological endpoints form the basis of a valuable screening system for potentially hazardous airborne particulate materials.
APPROACH: In collaboration with analytical chemists who are able to define the surface chemical properties of particulate samples, we will carry out a systematic screening effort to define the biological response of the alveolar macrophage to phagocytized particles in vitro. We will focus on the propensity of crude particles to promote cell lysis, to affect phagocytic activity (as determined by depression in adenosine triphosphate levels), to alter the integrity of the lysosomes and to induce enzyme system capable of activating potentially carcinogenic compound such as the polynuclear aromatics which may be adsorbed to particulate surfaces. We will study the influence of the nature of the surface of standard particles on the extent of adsorption of materials. Furthermore, we will study the influence of internal and external surface area on the time course of release of adsorbed components and the effects of surface chemical components on the biological endpoints measured.
PROJECT MILESTONES: (1) 09/77 Evaluate ATP as a bio-indicator of toxicity in effluents; (2) 08/77 test effluents from fluidized bed combustion pilot study; and (3) 10/77 test effluent from coal gasification pilot study.

PROJECT DESCRIPTION: The objective of this proposal is to examine the modified DNA from cells used in these assays after exposure to the ubiquitous carcinogen benzo(a)pyrene (BP).
APPROACH: The approach will be to incubate tritium labeled BP with microsomes and Salmonella typhimurium tester strains, or with various mammalian cell lines. Cellular DNA will then be extracted, analyzed for radioactivity and fluorescence, and then hydrolyzed to nucleosides which will be analyzed by high pressure liquid chromatography, utilizing appropriate BP-nucleoside derivatives prepared chemically as markers to determine the nature of the BP-nucleoside adducts present. Parallel assays will be done for mutagenicity and transformation and of aryl hydrocarbon hydroxylase and epoxide hydratase activities.
RESULTS: The data will be correlated with our results obtained in intact human tissues where it has been possible to determine the structure of the major adduct formed. This application does not involve recombinant DNA.
PROJECT MILESTONES: 09/77 Initiate project.

77 FUNDING: Environmental Protection Agency FY77:$350,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The objective of this task is to study the relationship between carcinogen metabolism in the alveolar macrophage and the induction of lung cancer.
APPROACH: Using in vitro methods the course of metabolic activation/detoxification of procarcinogens will be investigated in alveolar macrophages obtained from rats and hamsters. Biochemical methods will be used in monitoring induction of metabolic activation/detoxification systems. Microbial mutagenesis will be used to monitor the extent of metabolic activation detoxification by macrophages. Once the conditions for maximal activation/detoxification of carcinogens have been established using in vitro methods, whole animal studies will be initiated employing intratracheal instillation techniques to administer particulates and appropriate procarcinogens. The metabolic activation of procarcinogens will be monitored as described above using macrophages obtained by saline lavage of carcinogen-exposed animals. When optimal conditions have been established, experiments will be performed to demonstrate the relationship between elicitation of macrophage influx, metabolic activation/detoxification of carcinogens and the induction of lung tumors in animals. This is a long-range project that will be approached sequentially with continuation from year to year being dependent upon demonstrated success of initial studies.
PROJECT MILESTONES: (1) 07/77 Implement microbial mutagenesis as an indicator of macrophages; (2) 09/77 procure macrophages from several rodent species for evaluation; (3) 11/77 utilization of microbial mutagenesis in screening for carcinogens; and (4) 01/78 expose macrophages in culture to carcinogens.

PROJECT DESCRIPTION: To determine the effects of low concentration (100 micro gram/m3) H2SO4 aerosol of small particle size (0.1-0.3 micro gram) on the mechanical factors of breathing in normal human subjects.
APPROACH: A modified double-blind study is planned. Subjects will be studied in pairs and will spend 6 hours daily in a Class 100 environmentally controlled chamber on 3 successive days. They will not be told which day the 4-hour exposure to H2SO4 aerosol will occur nor which 2 days they will simply breathe filtered clean air. Pulmonary function tests will be done immediately before entering the chamber and every 2 hours thereafter.
RESULTS: Smokers and non-smokers will be studied. Pulmonary function tests will include the following: (a) Spirometry; (b) plethysmographic determination of specific airway conductance and FRC; (c) closing volume and nitrogen plateau; and (d) dynamic compliance.
PROJECT MILESTONES: (1) 06/78 1st phase clinical studies reported; (2) 06/79 2nd phase clinical studies reported; and (3) 06/80 3rd phase clinical studies reported.

PROJECT DESCRIPTION: The aim of this investigation is to examine the effects of acute exposure to H2SO4 mist in humans and some of the factors affecting toxicity--temperature, humidity, and duration of exposure.
APPROACH: The subjects will be exposed in an environmental chamber to either filtered air .20 mg/m3 or .40 mg/m3 of H2SO4 under four conditions of temperature and humidity: 18 degrees C, 45 percent rh; 35 degrees C, 85 percent rh; 35 degrees C, 45 percent rh; and 35 degrees C, 88 percent rh. Subjects will exercise intermittently at 25 percent of their maximum capacity during the exposure period. Pulmonary function tests will be performed before, during, and after the exposure. Some aspects of cardiovascular performance will be assessed during the exposure exercise periods.
RESULTS: The final report of this study will provide the Agency with important information on the effects of acid aerosol exposure in man.
PROJECT MILESTONES: (1) 06/78 1st annual report on human studies planned for that year; (2) 06/79 2nd annual report on human studies planned for that year; and (3) 06/80 3rd annual report on human studies planned for that year.

TECHNOLOGY: FOSSIL FUEL/Coal (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The impact of pollutants from alternate energy sorces (primarily coal gasification) on pulmonary defense systems against infectious bacterial disease will be investigated. Animal will be exposed to respirable-sized aerosols of the pollutant in a manner to elucidate dose response relationships.

APPROACH: The following parameters will be used in the investigation: (1) mortality and mean survival time following aerosols of pathogenic bacteria; (2) pulmonary bactericidal responses; (3) pulmonary cell populations; and (4) functioning of alveolar macrophages. If adverse effects are found, the influence of article size and duration of exposure will be tested using the most sensitive parameters. The time equired for recovery from adverse effects will also be determined.
PROJECT MILESTONES: (1) 08/77 Award grant, provide 1st test sample; (2) 08/78 complete acute exposures of 1st test sample; (3) 08/78 submit annual report; (4) 08/79 complete acute exposures of second test sample; (5) 10/79 submit annual report; (6) 08/80 complete chronic exposures; and (7) 10/80 submit final report.
KEYWORDS: COAL GASIFICATION;GASEOUS WASTES;INFECTIVITY;BACTERIA;LUNGS;CHRONIC INTAKE;ENERGY SOURCES;AEROSOLS;DOSE-RESPONSE RELATIONSHIPS;PATHOLOGICAL CHANGES;BIOLOGICAL EFFECTS;HEALTH HAZARDS;BIOLOGICAL MODELS;COAL INDUSTRY;AIR POLLUTION

TITLE: Determine Effects of Pollutants from Alternate Energy Sources on Pulmonary Antiviral Mechanisms
PROJECT NUMBER: H625F-7163
PRINCIPAL INVESTIGATOR: Schiff, L.
AFFILIATION: IIT Research Inst., Chicago, Ill. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Graham, J.A.
77 FUNDING: Environmental Protection Agency FY77:$270,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The objective of this project is to determine the toxicity of effluents from alternate energy sources on the respiratory epithelium during and after exposure to infectious agents (influenza virus).
APPROACH: Whole tracheal organ cultures from 2-4 day old and 4 week old hamsters will be exposed in vitro to the appropriate pollutants, with and without influenza virus. The parameters to be measured include: (1) ciliary activity as observed by light microscopy; (2) viral replication and interferon product ion; (3) cellular sites and distribution of viral replication; (4) cytopathologic changes of the epithelium using light, transmission and scanning electron microscopy.
RESULTS: Once adverse effects are found, studies will elucidate dose-response relationships.
PROJECT MILESTONES: (1) 08/77 Complete H2SO4 and carbon exposure, with and without virus; (2) 01/79 complete studies on pollutant sample; (3) 06/79 complete studies to determine the effects of virus; and (4) 02/80 complete studies of the interaction of virus and pollutant

TITLE: Air Pollution and Cardiopulmonary Functions
PROJECT NUMBER: H625F-7166
PRINCIPAL INVESTIGATOR: Nostardi, R.A.;Richardson, E.L.;Atwood, G.T.
AFFILIATION: Akron Univ., Ohio (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Riggan, W.B.
77 FUNDING: Environmental Protection Agency FY77:$154,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The basic structure of this experimental design is to examine the effects of air pollution on various cardiopulmonary parameters.
APPROACH: The design will involve both longitudinal and cross-sectional applications and include a number of age groups. Three geographic locations will be selected and include: (1) an area of heavy population, (2) an area of intermediate or varying population, and (3) a clean area. In each of the areas a minimum of 150 volunteers within each age group will be tested. The various tests which will be conducted and other data collected include: (1) vital data, (2) pulmonary function testing, (3) maximal expiratory flow volume curves, (4) multiple-load exercise test, (5) alpha-1-antitrypsin, (6) methemoglobin, (7) carboxyhemoglobin, (8) mercury and cadmium in blood, (9) mercury and arsenic in urine, (10) tracemetals in hair, and (11) a questionnaire completion. Aerometric monitoring will be carried out at multiple sites within each of the three areas and will include: (1) total suspended particulate, (2) SO2, (3) NOx, (4) hydrocarbons, (5) ozone, (6) trace metals, and (7) meteorological data. The data collected will be analyzed among and between the age groups using multiple linear regression and analysis of variance models.
PROJECT MILESTONES: 11/76 Grant award. 11/78 Progress report. 11/79 Final report.

TITLE: Operation and Maintenance of the Community Health Air Monitoring Program to Quantitate Air Pollution Exposure in Selected Health Study Areas
PROJECT NUMBER: H625F-7167
PRINCIPAL INVESTIGATOR: Sullivan, R.J.
AFFILIATION: Xonics, Inc., Los Angeles, Calif. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Hinton, D.O.
77 FUNDING: Environmental Protection Agency FY77:$400,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: To quantitatively characterize air pollutants in selected health study communities.
APPROACH: A CHAMP monitoring site (fixed or mobile) is located within potential study communities to obtain measurements representative of the air pollutant exposure to select populations at risk for prospective health studies.
SULTS: The present status involves contract 68-02-2493 with Xonics, Inc. to operate stations, validate data and perform Quality Assurance to determine accuracy of data produced. This system utilizes automatic continuous air quality measurement instruments and real time data retrieval at 28 CHAMP sites. This contract provides for continuing operation and maintenance of the CHAMP system consisting of 23 semi-fixed

stations and 5 mobile vans.
PROJECT MILESTONES: (1) Progress report due monthly. (2) Quality control reports due periodically--not to exceed six month intervals. (3) Determination of award fee semi-annually.
KEYWORDS: CHAMP;OPERATION;MAINTENANCE;COMMUNITIES;HUMAN POPULATIONS;HEALTH HAZARDS;MONITORING;AIR POLLUTION;RISK ASSESSMENT;SITE SELECTION

TITLE: In Vitro Screening of Selected Air Pollutants for Potential Carciogenicity
PROJECT NUMBER: H625F-7190
PRINCIPAL INVESTIGATOR: Schechtman, L.M.;Kouri, R.E.;Waters, M.D.
AFFILIATION: Microbiological Association, Inc., Bethesda, Md. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Waters, M.D.
77 FUNDING: Environmental Protection Agency FY77:$47,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The purpose of this contract is to provide the capability for in vitro screening of selected environmental pollutants for potential carcinogenicity.
APPROACH: The contractor shall employ the established BALB/c 3T3 and 10T1/2 bioassay systems for determining morphologic cellular transformation. Metabolic activation systems shall be implemented for employment with the BALB/c 3T3 cells initially and eventually also with the 10T1/2 cells. These activation systems shall be established by use and the correlated with mutagenesis of microbial (Salmonella typhimurium) and mammalian (V79) cell systems.
PROJECT MILESTONES: 03/77 Preliminary report on metabolic activation in V-79 and BALB/3T3c. 08/77 Final report on metabolic activation in V-79, BALB/3T3 and 10T1/2. 10/77 Completion of testing of 10 substances with and without metabolic.
KEYWORDS: AIR POLLUTION;CARCINOGENS;HEALTH HAZARDS;METABOLISM;ANIMAL CELLS;BIOASSAY;MUTAGENESIS;CARCINOGENESIS;BIOLOGICAL MODELS;MICROORGANISMS;MAMMALS;SALMONELLA TYPHIMURIUM

TITLE: Studies to Improve the Reliability and Sensitivity of Bacterial Mutagenesis as a Screen for Environmental Carcinogens
PROJECT NUMBER: H629A-7911
PRINCIPAL INVESTIGATOR: Commoner, B.;Vithayathil, A.;Kemaryrsky, M.;Hair, S.;Waters, M.D.
AFFILIATION: Washington Univ., Seattle (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Waters, M.
77 FUNDING: Environmental Protection Agency FY77:$100,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The proposed program of research is designed to improve the reliability and sensitivity of the bacterial mutagenesis techniques as a screen for the detection of environmental carcinogens. In order to achieve this objective the research is concentrating on elucidating the mechanism of microsomal activation which occurs in this technique and of improving the specificity of this process.
APPROACH: The basic approach employed in this research program is to analyze the biochemical mechanisms involved in microsomal activation.
RESULTS: Current research plans are designed to elucidate further our recent discovery that microsome preparations are themselves capable of inducing a significant increase in the mutation rates of two strains of Salmonella, TA-1533 and TA-98. Specifically, we plan to describe the biochemical processes carried out by the microsomes that mediate this effect and the substances in the bacterial cells that are acted upon.
PROJECT MILESTONES: 07/77 Report on the use of the Salmonella typhimurium liquid suspension. 08/77 Report on the microsomal effect with strain IA 1538. 01/78 Report on preliminary results of mutagenesis screening of urine.
KEYWORDS: BACTERIA;MUTAGENESIS;SENSITIVITY;RELIABILITY;BIOLOGICAL INDICATORS;CARCINOGENS;SALMONELLA TYPHIMURIUM;TOXICITY;URINE;BIOCHEMICAL REACTION KINETICS;CHEMICAL EFFLUENTS;POLLUTION;HEALTH HAZARDS;BIOASSAY

TITLE: Mutagenic Screening of Environmental Chemicals Using Drosophila
PROJECT NUMBER: H629A-7913
PRINCIPAL INVESTIGATOR: Valencia, R.;Waters, M.D.
AFFILIATION: WARF Inst., Inc., Madison, Wis. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Walters, M.D.
77 FUNDING: Environmental Protection Agency FY77:$100
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The objective of this research is to examine the mutagenic activity of pesticides and other toxic substances in genetic variants of Drosophila melanogaster.
APPROACH: The sex-linked recessive lethal test shall be performed on all substances. It is expected that most tests will be done on post-meiotic sperm stages but enough pre-meiotic stages shall be tested to detect extremely sensitive pre-meiotic effects. Positive recessive lethal tests shall be repeated to show that the mutagenic effect is dose related. The number of cultures examined shall be sufficient in all cases to detect a trebling in mutation rate relative to control. Variations in exposure, selection of alternative genetic schemes, and examination of germ cell stages other than specified above shall be considered.
PROJECT MILESTONES: 06/77 Final report on mutagenesis evaluation of environmental chemicals
KEYWORDS: DROSOPHILA;TOXICITY;CHEMICAL EFFLUENTS;MUTAGENS;PESTICIDES;BIOLOGICAL INDICATORS;MUTAGENESIS

TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: (a) To conduct multi-disciplinary carcinogenesis research on selected pesticides and/or toxic substances suspected of producing neoplasms by a direct or indirect normonal effect, (b) to conduct multi-disciplinary mutagenesis research involving the development, validation, evaluation and standardization of testing techniques, and (c) to determine feasibility of establishing an Inhalation Toxicology program.
APPROACH: (a) In vivo bioassays shall be conducted in laboratory animals with trasplacental and oral exposures. Hormonal effects and pharmacodynamics shall be evaluated. (b) Validation of heritable translocation and CHO/HG PRT assays, including modification of CHO/HG PRT to detect promutagens by complying with standard microsomal activation are underway. (c) A and E study and expert panel evaluation of Inhalatien Toxicity Program.
RESULTS: (a) Carcinogenic and estragenic effects of rotenone for human risk assessment. (b) Collaborative assistance in developing registration guidelines for mutagenesis testing and risk assessment. (c) Establish feasibility of developing Inhalation Toxicology Research program at NCTR.
OJECT MILESTONES: 03/78 Rotenone: Dosage--rangefinding and acute toxicity. 12/80 Rotenone: chronic

carcinogenicity studies. 01/79 Mutagenesis: acquisition of data from EMS exposed animals. 10/78 Mutagenesis: development of systems and validation. 03/78 Inhalation Toxicology: conducts meetings with inhalation experts. 06/78 Inhalation Toxicology: submit final report on recommendations.

PROJECT DESCRIPTION: To study the in vivo biosynthesis of N-nitroso compounds from trace level precursors under conditions reflecting environmental exposure.
APPROACH: These studes are based on the quantitative identification of the biosynthesized N-nitroso compounds using the thermal energy analyzer techniques which are sensitive to ppt levels. Included are time- and dose-dependence of dimethyl nitrosamine following administration of nitrite and dimethylamine and Ziram, respectively, and biosynthesis of di-n-propylnitrosamine, N-nitrosocarbaryl and N-nitrosoatrazine following gavage with nitrite and Treflan, carbaryl and atrazine respectively. Studies also included to investigate biosynthesis following inhalation exposure of mice to NO/sub x/ and gaseous amines; modifying effects of catalysts and inhibitors on kinetics of biosynthesis.
RESULTS: Annual progress reports on kinetics of biosynthesis.
PROJECT MILESTONES: (1) 9/78 Report on analytical method for detection of nitrosoamines. (2) 9/79 Report on biosynthesis of dimethyl nitrosamine in the mouse following administration of sodium nitrite and selected nitrosatable amines. (3) 12/79 Report on a strategy for carcinogen precursor exposure monitoring.

PROJECT DESCRIPTION: To determine the factors that influence mercury movement in three soil types.
APPROACH: Three soil types were studied, a sand, loam, and clay. The soils were amended with mercuric nitrate and resultant production of different mercury compounds was monitored. Factors that were considered were soil texture, temperature, pH, organic matter content, time, and microbiological activity. Analyses were

conducted by gas chromatography and Isotope Zeeman Atomic Absorption Spectrophotometry.
RESULTS: Mercury was transformed from the inorganic form to an organic form. This transformation was found to be an abiological phenomena. The methylating factor was isolated to organic acid fraction of the soil.

PROJECT DESCRIPTION: The objective is to determine the interaction of mercury with plants both as assimilation of airborne mercury compounds and the release of mercury products to the air from plants.
APPROACH: Peas were exposed to mercury in exposure chambers designed to allow plant exposure to mercury vapors by air and not by roots. The chambers were further modified so that air samples could be withdrawn directly from the chamber. Special analytical equipment was developed and modified with capability of separating organic mercury compounds and detecting mercury at the picogram level.
RESULTS: Peas have been exposed and equipment built. The presence of volatile organic mercury compounds including methyl, dimethyl, and ethylmercury has been confirmed after exposure to ionic and elemental mercury.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objective was to determine the course of vegetation damage and alleged soil sterility in the vicinity of Hartsfield, Atlanta's International Airport.
APPROACH: Soil and vegetation samples were collected. Preliminary pathology reports indicated chemical damage of unknown origin. Analyses of soil and vegetation collected through a years time showed no jet fuel residues. Garden plants grown under and away from flight paths showed no abnormalities. Soil test for microtial activity and germination capability showed no abnormalities. Aerosol studies using jet fuels in laboratories did duplicate identified field damage. Jet fuel residues were identified frequently in air samples under flight paths. Nonmethane hydrocarbon levels exceeded federal guideline 95% of time.
RESULTS: Project completed, report on soil and vegetation damage was published.
PROJECT MILESTONES: 2/77 Report on soil and vegetation damage at Hartsfield, Atlanta's International Airport.

PROJECT DESCRIPTION: The objective of the Interdisciplinary Technical Support Program is to provide support to Agency operating programs to enable them to fulfill the objectives of the Agency's mandates. Technical support is defined as the application of knowledge in the current state-of-the-art or knowledge derivable from it to solve or to assist in solving, the immediate problems of the Agency.
APPROACH: The Interdisciplinary Technical Support Program is planned and administered by a specific organaizational entity and is carried out by two of the three ORD laboratories which are dedicated to environmental monitoring and support activities. This program with its dedicated resources, complements the incidental continuing level-of-effort support associated with the other 12 ORD laboratories and activities and assures that the most qualified technical personnel are available to the Agency in a timely manner. Technical support will be provided to the requestors, to the extent that resources permit, so long as it has been specifically identified as supportive of the Agency's objectives, and is not otherwise available. The technical support program will give priority to requested services which require unique ORD personnel or equipment and relative priorities among a given user's requests will be established by that user.
RESULTS: Technical Support services typically fall into the following categories: (1) responding to schedules, unscheduled and emergency requirements for field, analytical, and data analysis support to produce data of known quality through specialized field and analytical studies, organizing this data into summaries and providing interpretive reports; (2) adapting and modifying basic state-of-the-art techniques to gather empirical evidence of environmental levels of specified or suspected pollutants; (3) performing complex chemical and physical analyses; (4) testifying as expert witnesses at administrative and judicial proceedings; and (5) consultants.

REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Test, validate and describe optimal water quality monitoring procedures and techniques for quantitatively assessing the contribution of nonpoint source pollutants in a stream segment potentially impacted by oil shale development activities.
APPROACH: Field testing of a surface water quality monitoring design incorporating biological, chemical and physical components was conducted on the lower reaches of the White River in eastern Utah in the vicinity of Federal Oil Shale tracts Ua-Ub, automated in-situ contact sensor packages, automated water samplers, conventional water grab sampling techniques, and a variety of biological sampling techniques were assessed for application in streams of semi-arrid regions characterized by highly variable flows and high levels of suspended materials. Adequacy of the design was evaluated in terms of parameters and parameter phases selected for measurement, frequency of measurement, sample site selection, field sampling and measurement techniques, laboratory analytical techniques and data handling procedures.
RESULTS: Report describing field program and evaluating monitoring design based upon approximately 1-year of field testing in an 18-mile reach of stream adjacent to Ua-Ub Federal Oil Shale tracts. Components of the monitoring design are assessed for application in streams of semi-arrid regions impacted by nonpoint source pollutants, particularly those associated with energy developmental activities.

PROJECT MILESTONES: (1) 6/75 Development of implementation plan. (2) 10/75 Initiate field program. (3) 6/76 Prepare interim progress report. (4) 11/76 Conclude field testing program. (5) 12/76 Begin data evaluation and report preparation. (6) 11/77 Issue product report.

POLLUTANTS: NOXIOUS GAS/SO2 (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To develop imagery interpretation keys, and specifically in the following areas of interest: (1) the evidence and detection of leachate migration from landfills; (2) the effects of SO2 in air or vegetation; (3) a photographic key of typical harbor related pollution problems; (4) non-point source detection, identification and analysis in agriculture, silvicultural, and industry.
APPROACH: The development of imagery keys is a continuous and integral part of all programs conducted by the Remote Sensing Division. Since its inception, the Vint Hill Field Station has been charged with the mission of collecting and developing these keys. A comprehensive search of existing keys has been accomplished. During the course of on-going technical assistance programs within EPIC the need has become apparent for subject oriented environmental imagery keys. Toward this end EPIC will develop the keys listed above from experience and imagery derived from the aforementioned tech assistance programs as time and funds permit.
RESULTS: The Harbor key has been delivered and is being prepared for wide distribution printing. An in-house landfills key has been produced and is undergoing review. The Cornell Landfills report is in final review and may be reformatted into an interpretation key. Work on a key describing SO2 damage will continue based upon program requirements. Subject specific keys of non-point sources will continue.
PROJECT MILESTONES: (1) 5/77 Received Harbor Key. (2) 6/77 1st Draft, In-house Landfill Key. (3) 6/77 Received Cornell Landfill-Leachate Report for Final Review. (4) 12/77 Harbor Key Published for Wide Circulation. (5) 10/77 Continue Efforts on Non-point source Keys.

77 FUNDING: Environmental Protection Agency FY77:$75,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
POLLUTANTS: METALS (33%);PARTICULATES (33%);SPECIFIED OTHER POLLUTANTS/Ozone (34%)
CHARACTER OF STUDY: RESEARCH/Theoretical (25%);FULL SCALE DEMONSTRATION (75%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To design, construct and interpret data from airborne nadir-viewing, laser differential-absorption systems. A CO2 laser system will be developed to measure ozone. A frequency doubled dye laser system (approximately 300 nm) will be developed to monitor sulfur dioxide. The use of differential absorption systems to monitor selected tracer gases will be investigated.
APPROACH: The systems each consist of two lasers, the wavelengths of which have been selected to optimize the difference in reflected signal due to the wavelength dependence of the pollutant or tracer gas. A computer code has been developed to simulate data tapes using a model atmosphere. Simulations are used to develop interpretive software and analyze system parameters. Design considerations preclude the possibility of endangering people with laser radiation.
RESULTS: The ozone monitor system is being redesigned due to laser failure and incompatibility determined in ground tests and preliminary flight tests. The ozone system will be flight tested during 1978 with operational flights to follow. Laboratory studies on the feasibility of using tracer gases have been completed. The SO2 monitor system will be designed in 1978 with procurement and construction to occur in the following 12 months.
PROJECT MILESTONES: (1) 12/77 Tracer gas study report. (2) 12/77 Report on ozone monitor ground tests. (3) 6/79 Second generation ozone system tested and reported. (4) 6/78 Report on other potential measurements using computer simulations. (5) 6/80 Report on SO2 monitor tests.

TITLE: Light Aircraft Sensor Pod (Enviro-Pod)
PROJECT NUMBER: J-620-A-42
PRINCIPAL INVESTIGATOR: Crouch, L.
ADDRESS: Air Force Avionics Laboratory, Dayton, OH 45433
AFFILIATION: Air Force Avionics Lab., Wright-Patterson AFB, Ohio (USA)
MONITORING AGENCY: Environmental Protection Agency, Las Vegas, Nev. (USA)
DIVISION: Environmental Monitoring and Support Laboratory
TYPE OF FUNDING: Interagency agreement-IAG D-4-H492
77 FUNDING: Environmental Protection Agency FY77:$35,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: NOXIOUS GAS (20%);METALS (20%);PARTICULATES (20%);ORGANICS (20%);HEAT, THERMAL (20%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale;DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this program is to demonstrate how essential remote sensing data can be provided by an alternative means that does not involve the high cost of acquisition and maintenance of organic aircraft or the expense of obtaining aerial survey aircraft under contract.
APPROACH: Through an interagency agreement with the U.S. Air Force at Wright Patterson AFB, Dayton, Ohio, the Environmental Protection Agency has tasked the Air Force Avionics Laboratory to design, test, and produce a sensor pod capable of being strapped on a commonly available, light utility aircraft with no modification or change in aircraft registration. The sensor pod developed must be capable of obtaining large scale, high resolution, black and white, color infrared photography.
RESULTS: The ENVIRO-POD was issued a supplemental type certificate (STC) on 19 January 1977 by the Federal Aviation Administration. During Fiscal 77 operational suitability testing was conducted in Regions I, II, III, IV, and Washington D.C. area. It has been recommended that POD production be accelerated. A

final report is to be prepared detailing the recommendations for ENVIRO-POD deployment, based on the demonstrations conducted. Current plans call for the installation and testing of a thermal scanner for the POD and the identification of other possible sensors. A training program will be developed for EPA offices acquiring an ENVIRO-POD.
JECT MILESTONES: (1) 1/77 FAA Certification. (2) 4/77 Operational Suitability Testing Begun. (3) 9/77 Final Report--Recommendations for Deployment. (4) 10/77 Implementation of Thermal Scanner to POD. Begin selection of other sensors. Develop training for USCRS. Other Demonstrations (if called for). (5) 12/77 Test IR Scanner.

77 FUNDING: Environmental Protection Agency FY77:$95,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: PARTICULATES/Dust (100%)
CHARACTER OF STUDY: FULL SCALE DEMONSTRATION (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Design, construct and test a two frequency downward looking airborne lidar system. Lidar systems have demonstrated capability in solving several current pollution monitoring problems: (1) determining mixing layer height over large geographical areas in short periods of time, (2) determining point source plume dimensions, and (3) determining the dimensions of and structure within an urban plume.
APPROACH: The system design utilizes, whenever possible, off-the-shelf components including the laser transmitter. Much of the electronics control and readout subsystem is implemented using two microprocessor systems, thus shifting the construction burden from hardware to software. Much attention is given in the design to operator interaction, including a real time display system for the data.
RESULTS: The optical/mechanical design phase has been completed and the device, minus electronics components, will be delivered by September 1977. Systems design work has been completed on the electronics portion of the device. However, actual implementation in hardware and software will commence after flight testing of the optical system. The completed system will be operational by August 1978.
PROJECT MILESTONES: (1) 12/77 Preliminary ground and flight test. (2) 5/78 Evaluate, modify and refine output systems as necessary. (3) 8/78 Flight test and compare to known distributions. (4) 9/78 Report on system.

TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Microbiological agents (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical (50%);DEVELOPMENT/Pilot plant (50%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To develop a simple airborne laserfluorosensor capable of measuring and mapping out surface water chlorophyll a concentrations for use as a eutrophic indicator for inland waters. In addition, the device can be used for monitoring fluorescent water tracing dyes.
APPROACH: The airborne laserfluorosensor employs a flashlamp pumped dye laser tuned to the absorption peak of chlorophyll a at 440 nm. The laser-induced fluorescence is then collected by a large aperture telescope and focused via a 685 nm interference filter onto a detector. Correction for variation in water transmission is made by concurrently monitoring the laser-induced water OH stretch Raman band at 5172 A. The signal is displayed on a CRT, digitized and recorded on magnetic tape for later analysis. By making repeated passes over a given target, either in a fixed or rotary wing aircraft, it will be possible to produce a contour map of the chlorophyll fluorescence to water Raman ratio for use as an indicator of surface water chlorophyll a concentration.
RESULTS: The system is currently being evaluated in an EPA Bell Huey helicopter over Lake Mead. At a height of 1000 ft. above the surface and under full daylight conditions, good signal to noise ratios are obtained for surface chlorophyll concentrations of the order of 1 microgram/l. Present plans are to compare and correlate airborne and ground truth data with a view to calibrating the airborne system.

PROJECT MILESTONES: (1) 9/77 Report on field evaluation of chlorophyll monitor. (2) 6/78 Report on laser fluorcsensing tc monitor blue-green algae and tracer dyes. (3) 6/80 Design and construct advanced system. (4) 9/82 Laboratory fluorescence feasibility studies.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Southwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To develop a method for selecting the optimum number and disposition of sampling sites for monitoring air quality, encompassing several aspects: meteorology, topography, source distribution, pollutant types, and emissions inventory.
APPROACH: The development of the methodology for optimizing the design of ambient air quality networks requires a field sampling program for collecting air quality data and meteorological data, and the application of these data to an urban airshed simulation model for predicting pollutant concentrations under various meteorological conditions. Optimum sampling locations will be determined by mathematical analysis of several sets of pollution concentration patterns from meteorological simulation for the more commonly occurring weather regimes. The geographical position of the point or points of maximum concentration will be determined and plotted on a map. Monitoring stations will be placed within the overlapping areas for various weather regimes.
RESULTS: Emissions inventory for the Las Vegas Valley, 1975 (1/77); develop a methodology for designing carbon monoxide monitoring networks (3/77); complete field data collection for oxidant modeling in Las Vegas (10/77); apply methodology for the design of a carbon monoxide monitoring network to Las Vegas (12/77); develop a users guide to the SAI urban airshed model (12/77); develop a photochemical oxidant monitoring network optimization guide (12/78).
PROJECT MILESTONES: (1) 1/77 Emissions inventory for the Las Vegas Valley, 1975. (2) 3/77 Development of a methodology for designing carbon monoxide monitoring networks. (3) 10/77 Completion of field data collection for oxidant modeling in Las Vegas. (4) 12/77 Application of a methodology for the design of a carbon monoxide monitoring network to Las Vegas. (5) 12/77 A users guide to the SAI urban airshed model. (6) 12/78 Photochemical oxidant monitoring network optimization guide.

TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: METALS (50%);PARTICULATES (25%);ORGANICS (25%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale;DEVELOPMENT/Pilot plant (90%);ANALYTICAL (10%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Plants, animals, and various indices will be evaluated as to their value as biological monitors and potential for incorporation into operational monitoring networks.
APPROACH: Soil, vegetation, and small mammals will be collected around a coal-fired power plant and in a highly urbanized area. After a potential monitor has been identified, factors affecting the receptor will be studied to determine its response and usefulness. Domestic livestock will also be evaluated. Plant communities will be studied to determine if existing species diversity indices have value as indicators of pollutant impact. Microorganisms will be evaluated to determine usefulness as indicators of pollutant bioavailability in soil systems.
RESULTS: Complete sampling at 4-Corners Power Plant for soil and vegetation has been carried out and analyses for soil conducted for mercury, lead, cadmium, zinc, selenium, and copper. Plant communities have been sampled for indices evaluation and rats collected in Los Angeles for lead.
PROJECT MILESTONES: (1) 5/77 Mercury distribution in soil around a large coal-fired power plant, EPA-600/3-77-063. (2) 9/77 Trace element distribution around a coal-fired power plant. (3) 9/77 Annual

report on biological indices. (4) 9/77 Annual report on usefulness of rats as biological monitors. (5) 9/78 Final report on biological indices. (6) 9/79 Report on trace element concentrations in domestic animals. (7) 10/80 Report on microbiological indicators of pollutant toxicity.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The purpose of this contract is to provide continuing on-site support for the two major activities of the Remote Sensing Division. Evaluates new and existing concepts for methods of remote sensing measurement. Designs and constructs electro-optical instruments for the remote detection and measurement of specific physical and chemical pollutants. Evaluate and field test remote sensing instruments for specific chemical and physical pollutants. Develop and evaluate automated data systems and applicable software for analysis of test data and analyze test results in terms of meeting design objectives and criteria. Plan and conduct aerial data collection missions including all phases of the mission, except operation of the aircraft. Maintain and calibrate instrumentation and data systems. Provide remote sensing required in oil and hazardous material spill response situations. Develop and verify mathematical models for the analysis of land use and water quality data. Operate and deploy the airborne MSS instrument for the acquisition of digital spectral reflectance measurements of land and water surfaces. Operate and maintain multi-spectral data analysis system (DAS) which is designed to automate the analysis of digital remote sensing data. Develop and operate programs for multi-spectral data analysis. Operate photo-processing facilities to produce final imagery for interpretation and project

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Identify, locate and delineate point and non-point pollution sources including outfalls, animal feedlots, sanitary landfills, stationary and mobile emission sources, municipal and industrial waste dumps, automobile dumps, strip and deep mines, holding ponds and all other observable threats to environmental quality. Determine the behavior and migration of spilled oil and hazardous materials and provide guidance to clean-up operations. Investigate agriculture and silviculture practices for environmental impact. Produce and/or update land-use data of environmental significance. Determine environmental trends. Conduct search of imagery to monitor for regulations compliance, locate non-filers, and flag impending environmental episodes.
APPROACH: Work in the imagery exploitation research and development will be continued to: (1) develop keys to the interpretation and analysis of overhead imagery for unique environmental monitoring purposes; (2) identify the observable pollution pathways and biotic efforts; (3) determine the historical relationships between environmental pollution and the use of land; (4) identify deficiencies in interpretation and analysis equipment and techniques with particular emphasis on human factors aspects.
RESULTS: Work will be performed in the field when it is necessary to collect ground truth or confirm imagery interpretation.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Produce guideline documents on selected airborne Remote Sensing Techniques.
APPROACH: Guideline documents, describing the capabilities of the instrumentation and techniques utilized in the remote monitoring of atmospheric particulates, ozone, and water quality, will be prepared. Data from remote monitoring instrumentation (LIDAR, laser differential absorption, and laser fluorosensors) will be compared with data obtained from in situ measurements. This comparison will serve as the basis both for generation of guideline documents and for the introduction of selected remote monitoring methods. In addition to the comparison of data, the guidelines will describe the capabilities of each type of instrument, calibration techniques and frequency of calibration, and the quality control procedures required to insure the precision, accuracy, and defensibility of the data.
RESULTS: Document on Airborne LIDAR is in preparation but awaiting suitable test to obtain comparison in situ data. Earth reflected differential absorption system is being redesigned after preliminary testing. Document will be prepared after suitable instrument test.
PROJECT MILESTONES: (1) 7/78 Guideline Document on earth--reflected ozone monitor. (2) 8/78 Guideline Document on laser fluorosensors for measuring water quality. (3) 8/79 Guideline Document on earth--reflected SO2 monitor.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: A guideline document for the multi-media monitoring strategy around any geothermal resource development. This output will be used by the Federal, State, and local governments to monitor the changes in surface and underground waters as a result of the development of geothermal resources.
APPROACH: Determine the geology, hydrology, and climatology of the Geysers and Imperial Valley, California, geothermal areas, the Klamath Falls, Oregon, area, the Rio Grande Rift zone area, and identify the aquifers in each area. Define the various geothermal systems, quantify the pollutants from geothermal resources development including phase of produce fluids, subsidence possibilities, seismic effects, fluid disposal methods, thermal losses and their possible effects on the biota and groundwater of each area. Select a study area and design a monitoring system for the area. Implement and operate the monitoring program making such recommendations for improvement in the monitoring plan as deemed advisable. As a result of the experience in designing and operating such a monitoring system, make recommendations for a general monitoring methodology that will be most apt to meet the requirements of any geothermal resource development.
RESULTS: Geologic, hydrologic assessment report (2/77); environmental impact research report (6/77); siting and leasing guide (6/77); geothermal resource uses, conversion processes, wastes report (9/77); monitoring strategy design (9/77); pollution control technology report (9/78); final report (9/81).
PROJECT MILESTONES: (1) 2/77 Geologic, hydrologic assessment report. (2) 6/77 Environmental impact research report. (3) 6/77 Siting and leasing guide. (4) 9/77 Geothermal resource uses, conversion processes, wastes report. (5) 9/77 Monitoring strategy design. (6) 9/78 Pollution control technology report. (7) 9/81 Final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Biological samples are collected at geothermal sites and analyzed for selected elements. The objectives will be to (1) provide baseline information prior to full scale energy production and (2) to examine the feasibility of using animals as biological monitors for geothermal pollutants. Rodents, rabbits, chickens and beef cattle represent various aspects of the field sampling program. The relative abundance/density of various wildlife species is also being investigated.
APPROACH: Field collected samples are transported back to Las Vegas and will be analyzed for such elements as lead, arsenic, zinc and cadmium. Concurrent laboratory studies are designed to confirm tissue retention characteristics (or complicating homeostatic factors) for geothermal elements following quantitated oral exposures. These laboratory experiments serve as an essential part of the quality assurance effort and the laboratory generated samples will be analyzed by those techniques used for the field collected tissues.
RESULTS: Samples have been collected from Roosevelt Hot Springs, Utah and from Imperial Valley, California. Relative abundance work on small mammal populations at Roosevelt Hot Springs is also in progress. Analytical data on the field collections, and associated laboratory studies, are not available but should be reported next year.
PROJECT MILESTONES: (1) 9/77 ANNUAL REPORT COVERING IMPERIAL VALLEY AND ROOSEVELT HOT SPRINGS. (2) 9/78 ANNUAL REPORT COVERING IMPERIAL VALLEY AND ROOSEVELT HOT SPRINGS. (3) 9/79 ANNUAL REPORT COVERING IMPERIAL VALLEY AND ROOSEVELT HOT SPRINGS. (4) 9/80 DEVELOPMENT OF MONITORING STRATEGY.

PROJECT DESCRIPTION: Conduct environmental assessment of geothermal energy extraction activities by studying pollutant levels and population characteristics in preoperational and post operational modes.
APPROACH: Soil and plant samples will be colllected prior to geothermal power plant operation to assess baseline levels of pollutants. Samples will also be collected after power plant operation. In addition, characteristics of plant populations will be ascertained, such as species mix and biomass. Two distinct ecotypes will be studied. One is an intensive agricultural area in the Imperial Valley of southern California and the other a range land area near Roosevelt Hot Springs, Utah.
RESULTS: Plant and soil sampling has been conducted at four KGRA's in the Imperial Valley and one KGRA at Roosevelt Hot Springs. AA analyses of samples has begun.
PROJECT MILESTONES: (1) 5/77 BASELINE SAMPLING FOR SOIL AND VEGETATION AT FOUR KGRA'S IN THE IMPERIAL VALLEY, CALIFORNIA, PROCEEDINGS, GEOTHERMAL STATE OF ART. CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Southwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To develop a strategy for air quality monitoring as part of an integrated geothermal monitoring methodology for evaluating the total impact of geothermal development on a given locality.
APPROACH: The design of a monitoring network is accomplished in two phases. Field measurements of ambient air quality will be made and air quality simulations will be made for predicting temporal and spatial distributions of pollutants for various stages of geothermal development. Because meteorological and air quality data for this area are sparse, a two year field program is necessary to document aerometric data. A first year effort would be a pilot study for collecting meteorological data at several sites. Limited air quality data will also be collected during the first year. Data from the first year will be used as a guide to determine the level of effort for an expanded network in the second year. These data will be used as a basis for the air quality simulation phase of the project.
RESULTS: Completion of initial investigation with air monitoring laboratory at 5 sites in the Imperial Valley, California (10/76); completion of second round of air monitoring at 4 sites in the Imperial Valley, California (4/77); initiate collection of continuous meteorological and air quality data at fixed sites near Roosevelt Hot Springs, Utah (10/77); completion of final round of air monitoring at 4 sites in the Imperial Valley (4/78); report on air monitoring strategy around geothermal sites (12/79).
PROJECT MILESTONES: (1) 9/75 FIRST GEOTHERMAL WORKSHOP. (2) 10/76 COMPLETION OF INITIAL INVESTIGATION WITH AIR MONITORING LABORATORY AT 5 SITES IN THE IMPERIAL VALLEY, CALIFORNIA. (3) 2/77 SECOND GEOTHERMAL WORKSHOP. (4) 4/77 COMPLETION OF SECOND ROUND OF AIR MONITORING AT 4 SITES IN THE IMPERIAL VALLEY, CALIFORNIA. (5) 10/77 INITIATE COLLECTION OF CONTINUOUS METEOROLOGICAL AND AIR QUALITY DATA AT FIXED SITES NEAR ROOSEVELT HOT SPRINGS, UTAH. REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND

MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The principal objective is to develop and validate in at least two areas a strategy for monitoring groundwater quality alterations that are occurring or could potentially occur as a consequence of the strip mining of coal; mining and processing of oil shale; conversion of these resources; and effects of other related situations (such as population increases and industrial developments). The areas to be monitored will be in the western United States.
APPROACH: The development of the monitoring strategy will follow, in general, the methodology that is described in the recently printed EPA report entitled ''Monitoring Groundwater Quality: Monitoring Methodology.'' A necessary prerequisite to the development of the strategy will be the collection and evaluation of considerable data on subjects such as the following: geology, water chemistry, identifiable pollutants, aquifer hydraulic characteristics, mining methods, land reclamation processes, oil shale processing methods, and practices for disposal of waste substances. The evaluations will include identification of pollutants and the prioritization of pollution sources. Actual field monitoring will be conducted to show the validity and method of application of the monitoring strategy.
RESULTS: Outlines and draft materials for the first phase of the work have been prepared for Monitoring Approaches and Methods; Sources of Pollution and Methods of Waste Disposal; Identification of Potential Pollutants; Grcundwater Usage; and Hydrologic Framework.
PROJECT MILESTONES: (1) 10/77 Collect, organize, and interpret background data. (2) 6/78 Design the monitoring program. (3) 1/79 Implement the monitoring program for coal strip mining. (4) 10/81 Implement the monitoring program for oil shale.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Conduct research on the development of techniques to monitor potentially hazardous effluents and emissions from nuclear fuel cycle facilities.
APPROACH: Characterize the physical and chemical properties and radiation levels of plutonium and other actinide discharges from a mixed uranium and plutonium oxide fuel fabrication facility. Recommend and collaboratively test methods for monitoring plutonium, uranium and thorium in soil, air and water, including the development of appropriate reference materials for calibration.
RESULTS: The physical and chemical properties and radiation levels of plutonium and uranium discharges have been characterized from stack and environmental samples collected at a mixed uranium-plutonium oxide fuel fabrication facility. The samples were analyzed and individual effluent particles were characterized in terms of activity, size, shape, elemental composition and other parameters by Interagency Agreement with the U.S. Air Force Technical Applications Center. A fusion method and an acid dissolution method for the measurement of plutonium in soil have been evaluated and collaboratively tested. Efforts are underway to prepare appropriate reference material and collaboratively test a method for measuring plutonium in air.
PROJECT MILESTONES: (1) 7/77 Characterization of emissions from a Pu-U oxide fuel fabrication facility. (2) 7/77 Collaboratively tested method for measuring plutonium in soil (fusion technique). (3) 1/78 Collaboratively tested method for measuring plutonium in soil (acid dissolution technique). (4) 10/78 Collaboratively tested method for measuring plutonium in air.

PROJECT DESCRIPTION: The objective is to determine the potential radioactive pollutants for which quality control standards, SRMs, and procedures will be needed as the result of expanded nuclear power, fossil-fuel extraction, and geothermal activities and to supply these standards, SRMs, and procedures to interested laboratories.
APPROACH: A report, "Potential Radioactive Pollutants Resulting from Expanded Energy Programs," was prepared for the EPA through a contractual agreement. Based on the results of this report, standard reference materials and calibrated samples, required for the analysis of samples obtained by monitoring activities in the vicinity of nuclear facilities, fossil-fuel extraction and utilization activities, and geothermal sites, are being developed.
RESULTS: Laboratory intercomparison studies have continued. Standards, including radium-228, have been made available to laboratories upon request. Several guidelines, including use of radiation standards and gamma measurements techniques, have been prepared.
PROJECT MILESTONES: (1) 4/77 Determination of the potential radioactive pollutants for which quality control standards, SRMs, and procedures will be needed as the result of expanded nuclear power, fossil-fuel extraction, and geothermal activities. (2) 5/77 Production of radium-228 standards and continuing traceability studies with NBS. (3) Continuing Laboratory intercomparison studies. (4) 10/76 Publication of guideline describing calibration procedures for gas-flow counters. (5) 11/76 Publication of guideline on the preparation and use of radiation standards.

REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Southwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This project focuses on the field validation of a research-developed methodology for monitoring changes in groundwater quality presented in the report "Monitoring Groundwater Quality: Monitoring Methodology." By applying the methodology to a region related to energy development, an early appraisal can be made of the impact these activities may have on the environment.
APPROACH: The study area selected for this field validation is 17 counties in the eastern part of Texas which contain enormous and widespread quantities of lignite and some of the nation's largest oil fields. A series of procedural steps designed to lead to a program to monitor groundwater-quality deterioration resulting from man's activities are as follows: Step 1--select area or basin for monitoring; Step 2--identify pollution sources, causes, and methods of waste disposal; Step 3--identify potential pollutants; Step 4--define groundwater usage; Step 5--define hydrogeologic situation; and Step 6--study existing groundwater quality and describe the existing monitoring program. Completion of these steps will provide the background information needed to select more localized demonstration sites to be included in future EPA projects to verify the remainder of the monitoring methodology.
RESULTS: Contract work initiated at the time of this report. Contract reporting schedule is as follows: determine and describe the hydrogeology and groundwater use (12/77); inventory pollution sources and

identify potential pollutants (2/78); collect and analyze existing groundwater-quality data (4/78); report on evaluation of groundwater data interpreted with respect to hydrogeology and pollution source (10/78).
PROJECT MILESTONES: (1) 12/77 Determine and describe the hydrogeology and ground water use. (2) 2/78 Inventory pollution sources and identify potential pollutants. (3) 4/78 Collect and analyze existing ground water quality data. (4) 10/78 Report on evaluation of ground water data interpreted with respect to hydrogeology and pollution source.

PROJECT DESCRIPTION: (a) Training of EMSL-LV Remote Sensing Division personnel by NASA in the use of the automated multispectral analysis system. (b) Acquire from NASA and put into operational use the Data Analysis System. (c) Perform analysis and prepare a final report on completion of the transfer of technology.
APPROACH: The training of EMSL-LV Remote Sensing Division personnel on the actual DAS with operational type requirements will greatly enhance the NASA to EPA technology transfer. The DAS was designed with the capability to reduce a broad range of remote sensor data and will be used to reduce the multispectral scanner and ERTS data for land use mapping and water monitoring purposes. The DAS output may be recorded on nine track digital computer compatible tape for further processing, displayed on a high resolution color television monitor, recorded on 9.5 inch wide color or black and white film, or listed on a high speed line printer. A versatile interactive operator control console is included to provide complete operator-processor communication and control.
RESULTS: (a) Demonstration of technique using existing NASA system. (b) Training of EMSL-LV personnel. October 1976--July 1977. (c) Acquire complete DAS system for EMSL-LV. June 1976--September 1977.
PROJECT MILESTONES: (1) 9/66 Demonstration of technique. (2) 7/77 Training EMSL-LV personnel. (3) 9/77 Acquire complete DAS for EMSL-LV.

PROJECT DESCRIPTION: Establish preliminary guidelines for and demonstration of overhead remote monitoring of Western energy related activities.
APPROACH: Cooperative Western energy related overhead monitoring program between NASA and EPA has been established with the purpose to define, demonstrate and develop operational remote sensor techniques to rapidly monitor, in a cost effective, quantitative manner, the success with which an energy-related extraction site has been or is being, rehabilitated to a state suitable for its intended or previous land usage. This includes the determination of environmental baselines for the purpose of establishing rehabilitation criteria as well as environmental effects of mine mouth power plants.
RESULTS: (a) Initiate baseline information studies. (b) Demonstration of multispectral scanner techniques using existing NASA system. (c) Utilizing manual photo interpretation techniques of aerial photographs, perform assessments of environmental impact and rehabilitation efforts. August 1975--August 1976. (d) Utilizing multispectral scanner (MSS) data, perform assessment of environmental imapct and rehabilitation efforts. August 1975--December 1976. (e) Photo Interpretation report preparation. August 1976--September 1976. (f) MSS Data report preparation. December 1976--January 1977. (g) Prepare Western Energy ''Atlas.'' August 1976--December 1976. (h) Evaluation Report. January 1977--June 1977.
PROJECT MILESTONES: (1) 8/76 Baseline Studies. (2) 8/76 Demonstration of Technique. (3) 8/76 Assess

environmental impact. (4) 12/76 Utilize DS-1260 Multispectral Scanner. (5) 1/77 Prepare report. (6) 1/77 Prepare atlas. (7) 6/77 Complete Evaluation report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The ultimate objective of this program is to develop an active airborne monitoring system capable of providing quantitative data on the concentration of total organics in surface waters.
APPROACH: The principle employed is an extension of the laboratory technique of spectrofluorometry. A water sample is irradiated with ultraviolet (uv) light of a specific wavelength and intensity, and the resultant fluorescence emission is then monitored using a monochromator-multichannel detector combination. The fluorescence signal arises from dissolved organic materials both man-made and natural in origin rather than from the water itself, which does not fluoresce. However, the water molecule emits a Raman band which, for very dilute aqueous solutions of organics, has a constant amplitude for a given intensity of excitation radiation. This water Raman emission band is then conveniently employed as a built-in reference source with which to compe the amplitude of the concurrent fluorescence emission. The normalized amplitude of the concurrent fluorescence emission. The normalized amplitude of the signal then provides information concerning the concentration of the dissolved organics.
RESULTS: A number of reports have been published recently which indicate that the uv-induced fluorescence emission is proportional to the concentration of dissolved organic carbon. It is planned to explore this relationship in more detail with the purpose of establishing a firm value for a correlation coefficient. Based on the findings of this correlation study, an airborne laser fluorosensor will be designed, built and tested. This system will have the capability of continuously monitoring and recording the dissolved organic carbon concentration for the surface water below the aircraft.
PROJECT MILESTONES: (1) 9/77 Feasibility report on organic carbon laser fluorosensor. (2) 1/79 Design and construct organic carbon laser fluorosensor. (3) 1/81 Design, construct, test and report on advance system.

PROJECT DESCRIPTION: Establish a water monitoring network throughout the western states to monitor and assess the impact of energy resource development.
APPROACH: Through the use of computer data banks, primarily STORET, water monitoring stations that are currently in operation, back past 1970, and have reported a large number of measured parameters were selected for incorporation into a primary monitoring net. Parameters of interest were identified and a quality assurance program is being established in participating laboratories. Historical data have been reviewed and baseline water quality conditions are being established. A Western Energy Resources Atlas has been published in conjunction with a similar effort on air monitoring.
RESULTS: Data from the primary net stations are being augmented with data from other stations. An assessment of baseline water quality, trends, and impacts on a basin by basin basis is underway. As data gaps, either desired parameters, sampling frequency, or additional stations are identified, actions will be taken with appropriate EPA Regional Offices or other governmental agencies to correct them. The primary net will be updated periodically and extended into areas not presently addressed.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Far West;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Periodic sacrifice of beef cattle from the Energy Research and Development Administration Nevada Test Site herd and concurrent collection of wildlife for pathological and radionuclide analyses of tissues are conducted. Investigation of claims of radiation damage to domestic animals and veterinary information services is provided on an ad hoc basis. Seasonal sampling of wildlife at specific locations on the Nevada Test Site and the migration patterns of the mule deer herd are determined by telemetry.
APPROACH: Semiannually, six animals from a 100 head beef herd maintained on the Nevada Test Site are selected for sacrifice and necropsy and samples are collected for radionuclide analysis and histopathological examination. The Nevada Test Site wildlife (both resident and migratory) are periodically collected, necropsied, and sampled. Animals sampled include: mule deer, rabbits, coyotes, chukar, quail, desert bighorn sheep, and other wildlife. The migratory pattern of Nevada Test Site mule deer are studied by attaching telemetry collars to captured animals. Natural springs are rehabilitated and maintained in order to increase the availability of water for wildlife. Mourning doves are banded to determine their migration patterns from the Nevada Test Site. Educational exhibits are displayed at livestock exhibitions and fairs. Alleged radiation damage to livestock is investigated, bioenvironmental sampling programs at other Energy Research and Development Administration operational sites are developed, and ad hoc sampling programs in response to any release of radionuclides from the Nevada Test Site are initiated.
RESULTS: An annual report of progress-to-date is published in September of each year. An ad hoc investigation report would be prepared and published within six months after each special investigation.
PROJECT MILESTONES: (1) 01/74 Animal Investigation Program 1970 Annual Report. (2) 06/75 Animal Investigation Program 1971 Annual Report. (3) 06/76 Animal Investigation Program 1972 Annual Report. PROJECT DESCRIPTION: An Interagency Agreement between the EPA, EMSL-LV and the U.S. Air Force Civil Engineering Center established a cooperative study to assess the impact of aircraft emissions on ambient air quality. The U.S. Navy, through the Naval Air Propulsion Test Center, is participating by providing funding and technical support through the Air Force. The data provided from the study will be used to calculate air quality frequency distributions and to validate existing airport models.
APPROACH: Collection and processing of air quality and meteorological data from five stations at Williams AFB for a 1-year period. CO, NOx, reactive hydrocarbons, and particulate data are collected. Monitoring will then be moved to Miramar Navy Air Station, San Diego, California.
RESULTS: (1) Final report summarizing procedures and data from Williams AFB. (2) Validated monitoring data in computer compatible format (Magnetic tape) from Williams AFB. (3) Final report summarizing procedures and data from Miramar. (4) Validated monitoring data in computer compatible format (magnetic tape) from Miramar.
PROJECT MILESTONES: (1) 6/77 Complete monitoring, WAFB. (2) 12/77 Final report, WAFB. (3) 1/78 Monitoring start-up, Miramar. (4) 12/78 Complete monitoring, Miramar. (5) 6/78 Final report, Miramar.

PROJECT DESCRIPTION: To study and compare the solubility of transuranium radionuclides in an artificial bovine ruminal-gastrointestinal system, in order to predict the biological availability of various forms of these nuclides in vivo.
APPROACH: A viable rumen juice preparation is augmented with a radioactive tracer and incubated for 24 hours under physiological conditions. This preparation is converted to simulate abomasal and intestinal fluids by the addition of enzymes, bile, and adjustments of the pH. The solubility of plutonium-238, -239, and americium-241 from rumen contents of cattle grazing on plutonium contaminated desert vegetation is determined in in vitro bovine gastrointestinal fluids.
RESULTS: Studies have been completed using purified plutonium-238 nitrate, plutonium-238 citrate, plutonium-238 dioxide, and americium-241 nitrate. A study of the in vitro solubility of plutonium-238, -239, and americium-241 nitrate from rumen contents of cattle grazing on plutonium contaminated desert vegetation at the Nevada Test Site is in progress. Future plans include a study to compare the solubility of plutonium-238 incorporated into biological materials by microorganisms with inorganic plutonium and a study to compare the solubility of plutonium-238 and plutonium-239 particulates.
PROJECT MILESTONES: (1) 02/76 Interim Report on Field Ingested Transuranics. (2) 10/76 Report Relating Purified Forms of Transuranics with Field Ingested Transuranics. RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective is to determine the influence of microbial activity on the solubility and biological availability of plutonium and americium.
APPROACH: Agricultural crops have been planted in ''undisturbed'' plutonium contaminated soil at the Nevada Test Site using portable greenhouses. Plants will also be grown in sterile/nonsterile soils in growth chambers. Solubility of plutonium as effected by sterile/nonsterile soil and various soil extractants will be determined. The influence of microbial activity as exemplified by successive microbial generations on plutonium solubility will be determined.
RESULTS: The portable greenhouse project has been completed and two year's of data collected. The sterile versus nonsterile soil extract study is underway as is the influence of successive microbial generations. Preliminary work has begun on plants growing in sterile/nonsterile conditions.
PROJECT MILESTONES: (1) 06/74 The role of microorganisms in the movement of plutonium-NVO-142. (2) 06/75 The influence of selected variables on the transport of plutonium to the spores of aspergillus niger. NVO-153.

(3) 06/76 Plutonium uptake by a soil microorganism, aspergillus niger. NERC-LV 539-3. (4) 06/76 Possible influence of desert soil microbial changes on plutonium transport. NVO-159. (5) 06/77 Incorporation of transuranics into vegetables and field crops grown at the Nevada Test Site. NAEG plutonium conference. (6) 07/78 Plutonium uptake in plants in sterile/nonsterile soils. (7) 09/79 Influence of selected variables on plutonium uptake in plants.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Far West;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The purpose of this research is to provide input data for hazard assessment of areas contaminated by plutonium, uranium, and americium originating from nuclear testing activities, nuclear power plants, nuclear fuel reprocessing/fabrication facilities, and uranium extraction/fabrication activities. Since man consumes large quantities of dairy products and beef, evaluation of radiological hazards associated with actinide releases must include transport to man via the food chain from cattle which could ingest large quantities of these actinides.
APPROACH: Dairy cows and goats are maintained in metabolism stalls and actinide elements are administered by oral or intravenous routes. Blood, milk, urine, and fecal actinide concentrations are determined daily until the animals are sacrificed for determination of tissue nuclide burdens. The actinides administered are in specific chemical/physical forms which include the forms found in the environment.
RESULTS: Studies to compare the biological transport of Pu-238 and Pu-239 will be conducted soon. The report on this study will complement a series of reports on previous Pu-238 studies in dairy animals. Initial studies with Am-241 have been conducted and published; further studies are being conducted and a summary report on Am-241 is planned for FY-81. Uranium studies will begin in FY 78, and a comprehensive summary report is planned for FY 83.
PROJECT MILESTONES: (1) 09/71 Transfer of Intravenously Injected Plutonium to Milk of Goats. (2) 10/74 Absorption, Distribution and Excretion of Plutonium by Dairy Cattle. POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective is to provide an assessment of the impact of radionuclide releases on an ecosystem from data collected from tissue and ingesta of animals grazing on a contaminated range.
APPROACH: Grazing ruminants (cattle) will live and graze on an area of known radionuclide contamination for extended periods of time. Periodically animals will be sacrificed and samples collected for analysis for radioactivity. Rumen-fistulated steers serve as biological samplers for the determination of animal preference for vegetation as a function of availability and season for correlation with tissue

radioactivity data.
RESULTS: Analysis of samples from studies carried out on cattle at known plutonium-contaminated range on the Nevada Test Site has been completed and a final report is being written. The study area on the site for the Nevada Applied Ecology Group studies of other radionuclides of interest has been selected and is being prepared to start grazing studies in the study area during FY 78.
PROJECT MILESTONES: (1) 06/74 Grazing Studies on Selected Plutonium-Contaminated Areas in Nevada. (2) 02/75 Actinide Concentrations in Tissues from Cattle Grazing near the RF Plant. (3) 06/75 Grazing Studies on Selected Plutonium-Contaminated Areas in Nevada. (4) 11/75 Grazing Studies on a Plutonium-Contaminated Range of the Nevada Test Site. REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine;GEOGRAPHIC AREAS/Far West;GEOGRAPHIC AREAS/Continental;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: These investigations quantitate curium and neptunium transport in commerically significant ruminant species, e.g., dairy goats and cattle which are directly in the human food chain. Since man consumes large quantities of dairy products, any evaluation of radiological hazards associated with an actinide-contaminated countryside should consider transport to milk. On-going studies determine the amount of ingested activity transferred to milk and establish what portion of the activity is retained in various tissues following initial absorption. Additional objectives include (1) quantitating the in vitro solubility of these nuclides in artificial rumen fluids and (2) establishing the biological availability of curium and neptunium once they have been incorporated into an edible animal product.
APPROACH: Dairy goats and cows are maintained at the Nevada Test Site Farm in metabolism stalls to facilitate the collection of blood, milk, urine and feces after the animals have been orally or intravenously dosed with either curium or neptunium. Modified stalls are also used to maintain one week old calves that receive actinide labeled milk obtained from previously dosed lactating adults. Tissue nuclide concentrations are determined for adults and juveniles following subsequent slaughters. Artificial rumen procedures, involving pH and enzymatic alterations, have been perfected for the in vitro nuclide solubility work which is conducted at the Las Vegas Laboratory.
RESULTS: Studies have been conducted with curium and neptunium using dairy goats. Reports have been presented on these topics. One project has also been conducted with curium using dairy cows and another similar study is currently scheduled. Additional studies scheduled this year include neptunium transport in diary cows and the biological availability of curium from in vivo labeled milk. The in vitro solubility of neptunium, using artificial rumen procedures, has been determined and reported. Similar in vitro solubility studies using curium are scheduled for completion this year.
PROJECT MILESTONES: (1) 04/76 Report on Transport of Curium in Dairy Goats. (2) 03/77 Comparison of Curium and Plutonium Transport in Dairy Animals. (3) 03/77 Report on Transport of Neptunium in Dairy Goats. (4) 3/77 Report on In Vitro Solubility of Np Using Artificial Rumen. (5) 06/78 Neptunium Transport in Dairy Cows. TITLE: Exposure/Dose Models Applied to Environmental Carcinogens
PROJECT NUMBER: J601F-01
PRINCIPAL INVESTIGATOR: Friedlander, S.
AFFILIATION: California Inst. of Tech., Pasadena (USA)
MONITORING AGENCY: Environmental Protection Agency, Las Vegas, Nev. (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Schuck, E.A.
77 FUNDING: Environmental Protection Agency FY77:$42,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: To report on a survey of the literature on exposure/dose models relating carcinogens in the environment and human exposure to them and to include a workable copy of each model which proves to have a high applicability to environmental carcinogen transport and impact.
APPROACH: Conduct a comprehensive search of the existing literature for development and application of mathematical simulation models describing the sources, environmental pathways, and exposure/dose relationships of environmental carcinogens and review these documents and evaluate the applicability of these models to selected environmental carcinogens or groups of carcinogens. Test the applicability of one or more of the models, identify the gaps in knowledge and re-scan the literature for additional data as

required.
RESULTS: A literature review has been initiated and will be submitted for evaluation by the Project Officer.
PROJECT MILESTONES: 03/78-Literature review on applicable exposure/dose models and critique

TITLE: Biosynthesis of N-Nitroso Compounds from Trace Level Precursors
PROJECT NUMBER: J601F-05
PRINCIPAL INVESTIGATOR: Epstein, S.S.;Iqbal, Z.M.
AFFILIATION: Illinois Univ., Urbana (USA)
MONITORING AGENCY: Environmental Protection Agency, Las Vegas, Nev. (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Morgan, G.B.
77 FUNDING: Environmental Protection Agency FY77:$36,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: To study the in vivo biosynthesis of N-nitroso compounds from trace level precursors under conditions reflecting environmental exposure.
APPROACH: These studies are based on the quantitative identification of the biosynthesized N-nitroso compounds using the thermal energy analyzer techniques which are sensitive to ppt. levels. Included are time- and dose-dependence of dimethyl nitrosamine following administration of nitrite and dimethylamine and Ziram, respectively, and biosynthesis of di-n-propylnitrosamine, N-nitrosocarbaryl and N-nitrosoatrazine following gavage with nitrite and Treflan, carbaryl and atrazine respectively. Studies also included to investigate biosynthesis following inhalation exposure of mice to NO/sub X/ and gaseous amines; modifying effects of catalysts and inhibitors on kinetics of biosynthesis.
RESULTS: Annual progress reports on kinetics of biosynthesis.
PROJECT MILESTONES: 09/78-Report on analytical method for detection of nitrosamines; 09/79-Report on biosynthesis of dimethyl nitrosamine in the mouse; 12/79-Report on a strategy for carcinogen precursor exposure monitoring.
KEYWORDS: MICE;NITROSO COMPOUNDS;BIOSYNTHESIS;BIOCHEMICAL REACTION KINETICS;METABOLISM;INGESTION;INHALATION;PRECURSOR;AMINES;NITROGEN COMPOUNDS;CARCINOGENS

MONITOR: Wiersma, G.B.
77 FUNDING: Environmental Protection Agency FY77:$13,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: To determine the factors that influence mercury movement in three soil types.
APPROACH: Three soil types were studied, a sand, loam, and clay. The soils were amended with mercuric nitrate and resultant production of different mercury compounds was monitored. Factors that were considered were soil texture, temperature, pH, organic matter content, time, and microbiological activity. Analyses were conducted by gas chromatography and Isotope Zeeman Atomic Absorption Spectrophotometry.
RESULTS: Mercury was transformed from the inorganic form to an organic form. This transformation was found to be an abiological phenomena. The methylating factor was isolated to organic acid fraction of the soil.
PROJECT MILESTONES: 12/76-Methylation of mercury in agricultural soils; 01/77-Abiological methylation of mercury in soil.

MONITOR: Schuck, E.A.
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$55,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: To verify an optimum network design methodology in cooperation with the EPA Region IV Office in a field test around Tampa/St. Petersburg, Florida. To optimize the design of the network for airshed monitoring of the reactive pollutants: oxides of nitrogen, ozone, and hydrocarbons.
APPROACH: The development of the methodology for optimizing the design of ambient air quality networks requires a field sampling program for collecting air quality data and meteorological data, and the application of these data to an urban airshed simulation model for predicting pollutant concentrations under various meteorological conditions. Optimum sampling locations will be determined by mathematical analysis of several sets of pollution concentrates patterns from meteorological simulation for the more commonly occurring weather regimes. The geographical position of the point or points of maximum concentration will be determined and plotted on a map.
RESULTS: Report on preliminary hydrocarbon sampling in Tampa/St. Petersburg (11/76); completion of initial field data collection for pollutant distribution and windfield characterization (9/77); anthropogenic emissions inventory for Tampa/St. Petersburg (2/78); completion of intensive field data collection for oxidant modeling (9/78); application of network design methodology for oxidants in Tampa/St. Petersburg (1/79).
PROJECT MILESTONES: 11/76-Report on preliminary hydrocarbon sampling in Tampa/St. Petersburg; 09/77-Completion of initial field data collection for pollutant distribution; 02/76-Anthropogenic emissions inventory for Tampa/St. Petersburg; 09/78-Completion of intensive field data collection for oxidant model; 01/79-Application of network design methodology for oxidants in Tampa/St. Petersburg.

TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$25,000
TECHNOLOGY: FOSSIL FUEL/General (50%);NUCLEAR/General (50%)
PROJECT DESCRIPTION: Produce guideline documents on selected airborne Remote Sensing Techniques.
APPROACH: Guideline documents, describing the capabilities of the instrumentation and techniques utilized in the remote monitoring of atmospheric particulates, ozone, and water quality, will be prepared. Data from remote monitoring instrumentation (LIDAR, laser differential absorption, and laser fluorosensors) will be compared with data obtained from in situ measurements. This comparison will serve as the basis both for generation of guideline documents and for the introduction of selected remote monitoring methods. In addition to the comparison of data, the guidelines will describe the capabilities of each type of instrument, calibration techniques and frequency of calibration, and the quality control procedures required to insure the precision, accuracy, and defensibility of the data.
RESULTS: Document on Airborne LIDAR is in preparation but awaiting suitable test to obtain comparison in situ data. Earth reflected differential absorption system is being redesigned after preliminary testing. Document will be prepared after suitable instrument test.
PROJECT MILESTONES: 07/78-Guideline document on earth--reflected ozone monitor; 08/78-Guideline document on laser fluorosensors for measuring water quality; 08/79-Guideline document on earth--reflected SO2 monitor.
KEYWORDS: AIR POLLUTION MONITORS;PERFORMANCE TESTING;REMOTE SENSING;PARTICLES;OZONE;WATER QUALITY;LASERS

TITLE: Off-Site Radiological Safety Program for Nuclear Weapons Testing
PROJECT NUMBER: J627D-76
PRINCIPAL INVESTIGATOR: Costa, C.P.
AFFILIATION: Environmental Protection Agency, Las Vegas, Nev. (USA). Environmental Monitoring and Support Lab.
MONITORING AGENCY: Environmental Protection Agency, Las Vegas, Nev. (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Costa, C.P.
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$1,297,000
TECHNOLOGY: NUCLEAR/General (100%)
PROJECT DESCRIPTION: The program is conducted to document environmental radiological levels around areas of nuclear weapons testing in the United States and to provide public protection during the conduct of such tests.
APPROACH: Continuous monitoring of the environment is provided through operation of networks to monitor radiation levels in air, water, and milk and to measure external, whole-body exposures to ionizing radiation. Special projects are conducted to measure radioactivity levels and/or distributions of special radionuclides of interest in other media, such as vegetation and soil. Mobile and aerial monitoring teams are fielded during testing periods to document any inadvertent releases of radioactivity and to take appropriate protective actions.
RESULTS: Quarterly data summaries of results of environmental monitoring and an annual environmental

monitoring report are produced, plus special reports for any projects conducted.
PROJECT MILESTONES: 06/79-Final report on distribution of plutonium in soil around NTS; 05/00-Environmental monitoring report.

TITLE: Off-Site Radiological Safety Program for Plowshare
PROJECT NUMBER: J627E-77
PRINCIPAL INVESTIGATOR: Costa, C.F.
AFFILIATION: Environmental Protection Agency, Las Vegas, Nev. (USA). Environmental Monitoring and Support Lab.
MONITORING AGENCY: Environmental Protection Agency, Las Vegas, Nev. (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Costa, C.F.
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$10,000
TECHNOLOGY: NUCLEAR/General (100%)
PROJECT DESCRIPTION: This program is conducted to document the radioactivity concentrations in ground water around sites of underground nuclear explosive detonations conducted as part of Plowshare (peaceful uses of nuclear explosives), to monitor for any movement of radioactivity from those sources.
APPROACH: Annual samples of ground water are collected from available wells in the vicinity of the Plowshare sites, with special emphasis placed on those that are down the hydraulic gradient from the detonation point.
RESULTS: Data are published in an annual environmental monitoring report.
PROJECT MILESTONES: 05/00-Environmental monitoring report.
KEYWORDS: PLOWSHARE PROJECT;NUCLEAR EXPLOSIONS;CONTAINED EXPLOSIONS;UNDERGROUND EXPLOSIONS;RADIATION MONITORING;GROUND WATER;RADIOACTIVITY;HYDROLOGY;ENVIRONMENT

MONITOR: Jarvis, A.N.
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$35,000
TECHNOLOGY: FOSSIL FUEL/General (20%);NUCLEAR/General (20%);GEOTHERMAL/General (20%);SOLAR/General (20%);CONSERVATION/General (20%)
PROJECT DESCRIPTION: The objective is to provide the standards, reference materials, methods, and quality control procedures required to enforce existing EPA standards and regulations.
APPROACH: Intensive testing of methods within the EMSL-LV will be conducted and the resultant data evaluated. The method(s) and instructions for instituting and maintaining adequate quality control program will be developed and published. Existing laboratory performance (interlaboratory comparison) studies will be conducted on a regular basis and new studies implemented as required. Reference materials required for instrument calibration and chemical yield determination will be developed and distributed on a continuing basis. To assure the continued high quality of these materials, periodic intercomparison studies will be conducted with the NBS.
RESULTS: An ongoing laboratory intercomparison studies program involving environmental media and a variety of radionuclides was conducted. Methods testing has continued. Standards and reference materials are being supplied to laboratories involved in environmental radiation measurements upon request.
PROJECT MILESTONES: 00/00-Collaborative testing of tentative reference methods; 00/00-Traceability studies with NBS; 00/00-Maintenance of inventory of calibrated samples; 00/00-Laboratory intercomparison studies; 10/76-Establishment of traceability to national measurement system of Quality Control; 06/77-Publish document on the procurement, preparation, and use of calibration.

TITLE: Optimization of Aerial Infrared Survey Techniques
PROJECT NUMBER: J620A-40
PRINCIPAL INVESTIGATOR: Dockter, M.
AFFILIATION: Environmental Protection Agency, Las Vegas, Nev. (USA). Environmental Monitoring and Support Lab.
MONITORING AGENCY: Environmental Protection Agency, Las Vegas, Nev. (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Dockter, M.
77 FUNDING: Environmental Protection Agency FY77:$15,000
TECHNOLOGY: CONSERVATION/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: Continued efforts for improvement to aerial infrared scanner survey techniques simultaneously with data collection.
APPROACH: Modification of existing thermal infrared scanner systems to improve quantities, data and reference data equipments.
RESULTS: (1) Modification of RS-310 scanner to include blackbody temperature references and analysis electronics (completion 3/77); (2) develop program to improve efficiency of isothermal plotting techniques and accuracy capabilities (completion 6/77); and (3) incorporate DS-1260 Multispectral Scanner Operating System (completion 12/77).
PROJECT MILESTONES: (1) 03/77 Modify RS-310 Infrared Scanner. (2) 06/77 Improve Isothermal plotting efficiency. (3) 12/77 Incorporate DS-1260 Multispectral Scanner Operating System.
KEYWORDS: INFRARED THERMOGRAPHY;AERIAL SURVEYING;OPTIMIZATION;MEASURING INSTRUMENTS;GEOLOGICAL SURVEYS

TITLE: Application of Aerial Multispectral Techniques for Quantitative Determination of Turbidity
PROJECT NUMBER: J620A-43
PRINCIPAL INVESTIGATOR: Dockter, M.
AFFILIATION: Environmental Protection Agency, Las Vegas, Nev. (USA). Environmental Monitoring and Support Lab.
MONITORING AGENCY: Environmental Protection Agency, Las Vegas, Nev. (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Dockter, M.
77 FUNDING: Environmental Protection Agency FY77:$55,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: Determine the feasibility of using aerial multispectral techniques for remote sensing of sediment in water.
APPROACH: (1) Simultaneously collect ground truth data and multispectral data from an airborne platform at various altitudes and several data sites to allow studies for atmospheric attenuation correction and site-to-site algorithm transferability; and (2) perform analysis and compile a report of results obtained using data collected above and compare to EPA standard laboratory testing methods.
RESULTS: (1) Collect ground truth and multispectral data (completion, 9/77); and (2) perform analysis and compile report (expected completion, 12/77).
PROJECT MILESTONES: (1) 06/76 Surface data collection and analysis (completed). (2) 09/76 Compile report. (3) 09/77 Collect airborne data. (4) 12/77 Compile report. (5) 12/78 Collect data utilizing DS-1260 multispectral scanner.

TITLE: Deterministic Wind Field Submodel for Use in Phoenix, AZ, and Application of a Sea Breeze Wind Field Model to Tampa and St. Petersburg
PROJECT NUMBER: J620A-46
PRINCIPAL INVESTIGATOR: Liu, M.
AFFILIATION: Systems Applications, Inc., San Rafael, Calif. (USA)
MONITORING AGENCY: Environmental Protection Agency, Las Vegas, Nev. (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Schuck, E.A.
77 FUNDING: Environmental Protection Agency FY77:$22,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: (1) To use a dynamic model, developed by Systems Applications, Inc., to simulate the land and sea breeze in the Tampa/St. Petersburg area. The model is based on the finite difference solution of the primitive equations with the hydrostatic assumption; and (2) to use a diagnostic-type of wind model (develcped by Systems Applications, Inc.) based upon the equation for conservation of mass to provide the wind input to airshed model for the Phoenix application.
APPROACH: (1) Re-examine the model formulation and numerical techniques to include up-to-date information; modify the treatment of subgrid-scale processes to include recent results for the characterization of the surface boundary layer; prepare a data base for the Tampa and St. Petersburg application, and exercise the model for no fewer than 3 test days; and to the airshed model; and (2) re-examine the model formulation to investigate the feasibility of an improved treatment for wind values for the empirical coefficients in the model; prepare a data base for the Phoenix area, and exercise the model for no fewer than 10 cases; adapt the wind model so that it is compatible with the input to the airshed model.

RESULTS: The Phoenix windfield model and the Tampa/St. Petersburg seabreeze model have been formulated and coded for computer solution. These are currently being prepared for testing against field data.
PROJECT MILESTONES: (1) 09/77 Phoenix wind field model. (2) 12/77 Tampa/St. Petersburg seabreeze model.

TITLE: Optimum Air Pollution Sampling Network Selection in Urban Areas--Test and Evaluation
PROJECT NUMBER: J620A-48
PRINCIPAL INVESTIGATOR: Vukovich, F.M.
AFFILIATION: Research Triangle Inst., Durham, N.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Las Vegas, Nev. (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: McElroy, J.L.
77 FUNDING: Environmental Protection Agency FY77:$40,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: Develop and field test a method for the design of optimum ambient air monitoring networks.
APPROACH: Evaluate a statistical-dynamical method for optimization in the design of air quality monitoring networks which incorporates station designation using the statistical aspects of the wind field determined with a dynamic meteorological model. An objective variational analysis model based on the wind field, information on atmospheric stability, pollutant observations at the network stations, and the pollutant source inventory is then used to specify the pollutant distribution.
RESULTS: Select optimum meteorological and air pollution sampling network in urban areas (2/77); evaluate optimum siting with respect to air flow (3/78); evaluate optimum siting with respect to air quality (6/79).
PROJECT MILESTONES: (1) 02/77 Optimum meteorological and air pollution sampling network selection. (2) 03/78 Evaluation of optimum siting with respect to air flow. (3) 06/79 Evaluation of optimum siting with respect to air quality.
KEYWORDS: AIR POLLUTION;URBAN AREAS;CHEMICAL EFFLUENTS;ENVIRONMENTAL TRANSPORT;SURFACE AIR;AERODYNAMICS;WIND;TURBULENCE;VELOCITY;MATHEMATICAL MODELS;METEOROLOGY;MONITORING

TITLE: Design of Integrated Monitoring Systems That Are Pollutant Oriented
PROJECT NUMBER: J620A-50
PRINCIPAL INVESTIGATOR: Wiersma, G.B.;Potter, G.D.
AFFILIATION: Environmental Protection Agency, Las Vegas, Nev. (USA). Environmental Monitoring and Support Lab.
MONITORING AGENCY: Environmental Protection Agency, Las Vegas, Nev. (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Schuck, E.A.
77 FUNDING: Environmental Protection Agency FY77:$93,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: Develop a monitoring system based on identification of critical pathways and assessment of exposure/dose to link the critical receptor with identified sources.
APPROACH: Small animal studies will be carried out to define intestinal absorption rate and relationship of blood lead levels to hair levels. Transformation studies on lead in soil will be carried out to determine possible changes occurring to lead in soil systems that will make it more mobile in biological systems. Similar studies will be carried out on lead and plants. Developmental work is also underway on arsenic and cadmium.
PROJECT MILESTONES: (1) 09/77 Annual report--trace element transformation in soil. (2) 09/77 Annual report--trace element transformation in plants. (3) 11/77 Lead absorption in mammals. (3) 09/78 Annual report on organic pollutant in animals, soils, etc.

TITLE: Laboratory Performance and Intercomparison Studies
PROJECT NUMBER: J621A-55
PRINCIPAL INVESTIGATOR: Jarvis, A.N.;Easterly, D.G.;Whittaker, E.L.;Beckert, W.F.;Body, A.L.;Grothaus, G.E.;Kinnison, R.R.;Shawver, J.M.;Siu, L.;Thompson, L.E.;Ziegler, L.H.
AFFILIATION: Environmental Protection Agency, Las Vegas, Nev. (USA). Environmental Monitoring and Support Lab.
MONITORING AGENCY: Environmental Protection Agency, Las Vegas, Nev. (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Jarvis, A.N.
77 FUNDING: Environmental Protection Agency FY77:$140,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The objective is to conduct laboratory performance and intercomparison studies, round-robin studies, operational reviews, audits and evaluation of quality control practices in EPA monitoring activities.
APPROACH: A nationwide, interlaboratory comparison, quality assurance program is being conducted to determine the precision, accuracy and comparability of environmental data produced by Federal, State, local and private laboratories. The data quality is being assessed and the analytical performance of participating laboratories is being determined on a nationwide basis through the preparation and distribution of standard samples, the statistical evaluation of resultant data, and the publication of formal reports.
RESULTS: An ongoing laboratory intercomparison studies program was continued. A round-robin study involving the measurement of aqueous solutions of plutonium-239 was conducted. Assessment of the precision and accuracy of radioactive measurements is being made and computerized reports sent to the participants at monthly and/or quarterly intervals.
PROJECT MILESTONES: (1) Ongoing laboratory intercomparison studies program involving environment. (2) An assessment of the precision and accuracy of radioactivity measurements. (3) 10/76 Milk (report). (4) 03/77 Water (report).
KEYWORDS: US EPA;ENVIRONMENT;MONITORING;RADIATION MONITORING;CHEMICAL EFFLUENTS;RADIOACTIVE EFFLUENTS;ENVIRONMENTAL TRANSPORT;SAMPLING;CALIBRATION;STANDARDIZATION;SURFACE AIR;SURFACE WATERS;CHEMICAL COMPOSITION;RADIOACTIVITY;CHEMICAL ANALYSIS

TITLE: Determination of Various Degradation and Transformation Processes for Specific Water Pollutants
PROJECT NUMBER: K625B-209
PRINCIPAL INVESTIGATOR: Smith, J.H.;Mill, T.;Holt, B.;Bononos, N.;Lee, S.C.;Masey, W.R.
AFFILIATION: Stanford Research Inst., Menlo Park, Calif. (USA)
MONITORING AGENCY: Environmental Protection Agency, Athens, Ga. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Falco, J.W.
77 FUNDING: Environmental Protection Agency FY77:$120,000
TECHNOLOGY: FOSSIL FUEL/General (34%);NUCLEAR/General (33%);GEOTHERMAL/General (33%)
PROJECT DESCRIPTION: The major objective of this research program is to provide laboratory data on selected chemical pollutants that can be extrapolated to provide an assessment of the fates of these pollutants in freshwater aquatic ecosystems.
APPROACH: Laboratory experiments will be carried out to determine the relative rates of three general fates: biological degradation, chemical/photochemical degradation (primarily hydrolysis or oxidation), and physical transport processes (volatilization or sorption onto sediments). Screening studies will be designed to evaluate the relative rates of these loss processes. Detailed studies to provide better estimates of the rates and to determine the degradation products will be carried out only on the faster processes. A simple systems analysis approach will be used to integrate the laboratory data and to assess the overall fate(s) of the pollutant. Upon completion of the laboratory studies, protocols to characterize the biological, chemical, and physical processes involved in the degradation of toxic substances will be developed.
RESULTS: The result of the screening studies will be a report for each pollutant studied that will contain a summary of the current literature, the experimental data, and an assessment of the environmental fate of the pollutant based on all the available data. A report for each of the protocols developed will be published.
PROJECT MILESTONES: (1) 06/75 Start project. (2) 09/77 Publish interim report on screening techniques. (3) 01/78 Publish report on assessment data on compounds. (4) 10/78 Publish report on developed protocols.
KEYWORDS: AQUATIC ECOSYSTEMS;FRESH WATER;HAZARDOUS MATERIALS;ENVIRONMENTAL TRANSPORT;DECOMPOSITION;CHEMICAL REACTIONS;AQUATIC ORGANISMS;METABOLISM;PHOTOCHEMICAL REACTIONS;OXIDATION;HYDROLYSIS;ENZYMATIC HYDROLYSIS;WATER POLLUTION

TECHNOLOGY: FOSSIL FUEL/General (20%);NUCLEAR/General (20%);GEOTHERMAL/General (20%);SOLAR/General (20%);CONSERVATION/General (20%)
PROJECT DESCRIPTION: This two-year study will center on the study of sorption properties of energy-related organic pollutants and various types of soils and sediments. The study will include a detailed review of the literature on soil sorption of organics and the preparation of a critical review on the subject. Laboratory studies will be conducted on ten soil samples of varying types and characteristics with at least eleven organic compounds having a broad range of chemical properties. Sorption isotherms for each compound on each soil-sediment will be determined using radio-labelled chemicals. Statistical analyses of the data will be run using multivariant analysis to determine if chemical properties and soil/sediment properties can be related to yield predictive information about the behavior of other compounds on the soils studied.
PROJECT MILESTONES: (1) 04/78 Literature review report. (2) 07/79 Final report.
KEYWORDS: SOILS;SEDIMENTS;SORPTIVE PROPERTIES;LAND POLLUTION;CHEMICAL EFFLUENTS;ORGANIC COMPOUNDS;LEACHING

TITLE: Study of the Mechanism and Rates of Volatilization of Contaminants from Water Bodies
PROJECT NUMBER: K609A-206
PRINCIPAL INVESTIGATOR: MacKay, D.
AFFILIATION: Toronto Univ., Ontario (Canada)
MONITORING AGENCY: Environmental Protection Agency, Athens, Ga. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Karickhoff, S.W.
77 FUNDING: Environmental Protection Agency FY77:$60,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The objective of this project is to develop a deeper quantitative understanding of the processes by which some environmental contaminants volatilize from water bodies to the atmosphere. Such a predictive capability will be useful in contributing one component to the overall process of modelling environmental systems.
APPROACH: Work will be undertaken in a wind-water tank to measure volatilization rates and in particular measure liquid phase transfer coefficients and correlate these coefficients with wind speed and other fluid flow characteristics. Henry's Law constants will be measured for selected contaminants, notably hydrocarbons and chlorinated hydrocarbons in aqueous systems, pure, with electrolytes and with adsorbing species such as mineral clays, which are encountered naturally.
RESULTS: This work will be initiated in 1977, thus, no progress report is appropriate at this time.
PROJECT MILESTONES: (1) 09/77 Start. (2) 09/78 Annual report. (3) 09/79 Annual report. (4) 12/80 Annual report.

MONITORING AGENCY: Environmental Protection Agency, Athens, Ga. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Paris, D.F.
77 FUNDING: Environmental Protection Agency FY77:$53,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The objective of this project is to investigate the interaction of chlorodane, lindane, and toxaphene with microorganisms, using aerobic and anaerobic systems.
APPROACH: The study will consist of isolating pure or mixed microbial cultures from sediments and water in order to test the biodegradability of these chlorinated hydrocarbons in freshwater ponds. Culture conditions for optimum degradation or transformation of the pesticides in the ecosystem will be determined and will include parameters such as pH, temperature, aeration, etc. Rate constants and metabolites will be determined for the pesticides.
RESULTS: Results of these studies can be used to assess the importance of these processes in aquatic ecosystems.
PROJECT MILESTONES: 02/77 Initiation of project. 02/78 Annual report. 02/79 Final report.
KEYWORDS: AQUATIC ECOSYSTEMS;FRESH WATER;PESTICIDES;SEDIMENTS;CHLORINATED ALICYCLIC HYDROCARBONS;CHLORINATED ALIPHATIC HYDROCARBONS;CHLORINATED AROMATIC HYDROCARBONS;DECOMPOSITION;MICROORGANISMS;METABOLISM;ENVIRONMENTAL TRANSPORT;WATER POLLUTION

TITLE: Evaluative Models for Major Nutrients
PROJECT NUMBER: K609A-302
PRINCIPAL INVESTIGATOR: Lassiter, R.R.
AFFILIATION: Environmental Protection Agency, Athens, Ga. (USA). Environmental Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Athens, Ga. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Lassiter, R.R.
77 FUNDING: Environmental Protection Agency
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: Using the methodologies developed in evaluative models for toxic substances and experimental methodologies developed in both pesticide and nitrogen work, evaluative models for nutrients will be developed. Experimental work in AEcoS and microcosms will be instrumental in testing hypotheses generated by the model and in providing parameter estimates. Runoff of nutrients will be simulated along with point sources. Later work will examine the relationships between nutrient levels and response of the aquatic system to toxic substances.
PROJECT MILESTONES: 03/78 Final report.
KEYWORDS: AQUATIC ECOSYSTEMS;NUTRIENTS;ENVIRONMENTAL TRANSPORT;MATHEMATICAL MODELS;MINERAL CYCLING

TITLE: Development of Dynamic Two-layer Model for Stratified Estuaries
PROJECT NUMBER: K609A-406
PRINCIPAL INVESTIGATOR: Chamberlain, S.G.;Tawari, P.V.;Comery, W.
AFFILIATION: Raytheon Co., Lexington, Mass. (USA)
MONITORING AGENCY: Environmental Protection Agency, Athens, Ga. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Falco, J.W.
77 FUNDING: Environmental Protection Agency FY77:$95,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The primary objective of the project is to develop a two-layer dynamic model of estuarine hydrodynamics and water quality. The model is to be compatible for linkage with appropriate river and loading models to provide a basin planning methodology in coastal areas. A second objective is to test the estuary model on a field data set to define its performance characteristics.
APPROACH: The approach is to complete the development of RAMSES hydrodynamic and water quality model. The hydrodynamic code will be tested as a first phase in this study. Testing will include sensitivity analysis of RAMSES model parameters. The second phase of this study will be directed toward quality model development.
RESULTS: An interim report will be submitted in January 1978 which will summarize the progress of the project. This report will include discussions of hydrodynamic model development. A final report will be submitted at the end of the project that will present the development of the water quality model.
PROJECT MILESTONES: (1) 04/77 Start project. (2) 01/78 Interim report which summarizes hydrodynamics estuary model. (3) 12/78 Final report which summarizes estuary model including water quality model.

TITLE: Simulation of Nitrogen Movement and Transformation in the Root Zone
PROJECT NUMBER: K617A-440
PRINCIPAL INVESTIGATOR: Davidson, J.M.;Graetz, D.A.;Rao, P.S.;Selim, H.M.
AFFILIATION: Florida State Univ., Tallahassee (USA)
MONITORING AGENCY: Environmental Protection Agency, Athens, Ga. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Smith, C.N.
77 FUNDING: Environmental Protection Agency FY77:$65,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The objectives include development and testing of a mathematical model to describe movement and transformation of nitrogen in soils.
APPROACH: Spatial variability of selected soil physical and chemical properties will be evaluated for their influence on the precision with which nitrogen distribution and movement can be predicted and measured in the field. Several sources of existing data will be utilized to test and evaluate the model.
RESULTS: The first phase of this project was completed in March 1977. An EPA report is now being prepared. The project was extended two additional years to develop and evaluate phosphorus transport and

transformation as well as organic nitrogen submodels. In addition, a two-dimensional model for water, nitrogen, and phosphorus movement to tile drains will be the end of the project.
PROJECT MILESTONES: 03/75 Start of grant. 03/77 EPA report. 03/79 Final report.

TITLE: Retention and Transformations of Phosphorus and Selected Pesticides in Soils and Sediments
PROJECT NUMBER: K617B-417
PRINCIPAL INVESTIGATOR: Rao, P.S.;Davidson, J.M.;Out, L.T.;Street, J.J.;Berkhiser, V.E.;Yuan, T.L.;Wheeler, W.B.;Rao, P.V.
AFFILIATION: Florida State Univ., Tallahassee (USA)
MONITORING AGENCY: Environmental Protection Agency, Athens, Ga. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Smith, C.N.
77 FUNDING: Environmental Protection Agency FY77:$183,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: The proposed research project consists of three major parts. The first part is to conduct an exhaustive literature search to compile a preliminary data base of retention and transformation characteristics of common pesticides and phosphorus compounds in soils. The second part of the project deals with basic laboratory experiments to measure equilibrium and kinetic adsorption-desorption and bound residue formation characteristics, nonsingularity or irreversibility in adsorption-desorption processes, as well as measurement of transformation rates under controlled soil environmental conditions. The third part of the project involves routine measurements of adsorption-desorption isotherms and transformation rates of a large number of common pesticides using a broad spectrum of soil types from throughout the United States.
APPROACH: The data base generated by the proposed project will then be used in developing general multiple regression equations that relate retention and transformation coefficients to fundamental soil properties. Such relationships are urgently needed to estimate model input parameters for the nonpoint source pollution simulation models (such as EPA's Agricultural Runoff Management Model, ARM) currently used to identify and recommend soil conservation and land use management practices causing minimum environmental contamination. A multi-disciplinary team of researchers (soil physics, soil chemistry, soil microbiology,

pesticide chemistry, and statistics) has been assembled to accomplish the specified project goals.
RESULTS: The final report will be prepared at the end of the project.
PROJECT MILESTONES: (1) 10/77 Start of grant. (2) 10/79 Final report.

TITLE: Development of a Generalized Planning Model for Evaluation of Alternative Forest Management Practices--Engineering Phase
PROJECT NUMBER: K617C-433
PRINCIPAL INVESTIGATOR: Simons, D.B.;Li, R.M.;Bartlett, E.T.
AFFILIATION: Colorado State Univ., Fort Collins (USA)
MONITORING AGENCY: Environmental Protection Agency, Athens, Ga. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Mulkey, L.A.
77 FUNDING: Environmental Protection Agency FY77:$150,000
TECHNOLOGY: CONSERVATION/Improved conversion efficiency (100%)
PROJECT DESCRIPTION: This is an initial effort to develop a generalized planning model for evaluation of alternative forest management practices as a function of environmental and resource goals. The objectives of this study are: (1) to develop and test a water and sediment routing and yield model for both small and large watersheds and for both short and long term periods; (2) to develop and test a process model which will simulate the erosion and deposition of channel banks for unstable channels in forested upland watersheds. To incorporate this process model into the developed water and sediment routing model, the remaining objectives will be: (3) to develop a procedure for routing forest litter from the land and surface for predicting the loading of stream channels with organic debris; (4) to interface on available nitrogen and phosphorus sediment uptake model with the developed water and sediment routing model; (5) to develop a thermal loading model for predicting the temperature and dissolved oxygen of water loading to the stream; and (6) to link the cause-effect process model and the multiple-objective programming model for the selection of forest management alternatives.
APPROACH: In order to meet the above mentioned objectives, the proposed study will develop numerical models considering the physical significance of the governing processes.
RESULTS: A final report will be published on the tested model system.
PROJECT MILESTONES: 03/77 Start project. 10/78 First report of general planning model. 04/80 Completion/publication of tested modeling system.
KEYWORDS: TERRESTRIAL ECOSYSTEMS;FORESTS;MANAGEMENT;LAND USE;WATERSHEDS;HYDROLOGY;SURFACE WATERS;SEDIMENTS;FOREST LITTER;STREAMS;NITROGEN;PHOSPHORUS;ENVIRONMENTAL TRANSPORT;BIOLOGICAL WASTES;OXYGEN;TEMPERATURE MEASUREMENT;MATHEMATICAL MODELS;WATER QUALITY

TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The objective of the project is to develop and evaluate analytical methods for the identification and determination of inorganic species in water.
APPROACH: A literature survey will assess the significance of inorganic chemical species with respect to health and ecological effects and transport of elements in the environment. Current analytical methodology will be surveyed. Voltammetric methods will be evaluated experimentally with respect to sensitivity, selectivity, and minimum pretreatment of the sample. Means of extending the detection limits of ion-selective electrodes will be sought. Ion exchange techniques will be examined for the preconcentration or separation of ionic species. Spectrometric methods will be explored.
RESULTS: Outputs will be a series of research reports evaluating specific analytical methodologies.
PROJECT MILESTONES: (1) 04/75 Determination of molecular hydrogen sulfide research report. (2) 10/76 Evaluation of prototype instrument for phosphorus research. (3) 10/77 Inorganic species in water research report. (4) 05/78 Inorganic species in water research report. (5) 05/79 Inorganic species in water research report.

TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: Literature surveys on Environmental Applications of Mass Spectrometry were completed for the years 1969--1975. This will be updated through 1976. A method will be developed for quantitating organic compounds eluted during GC-MS runs. Using a series of known standards and the Finnigan GC-MS, the best quantitative technique will be determined. The total ion current and computer programs will be used. After the technique is established with standards, various pollution samples will be tested. The method will be repeated on the Varian GC-MS. A method will be developed for quantitating organic compounds eluted during a GC-FTIR run.
PROJECT MILESTONES: (1) 07/75 Start. (2) 06/76 Literature review completed (1969--1975). (3) 09/77 Literature review completed (1976).

TITLE: Effectiveness of Vegetation Buffer Strips for Controlling Sediment and Other Water Pollutants from Disturbed Watersheds
PROJECT NUMBER: K617B-427
PRINCIPAL INVESTIGATOR: Simons, D.B.;Li, R.M.
AFFILIATION: Colorado State Univ., Fort Collins (USA)
MONITORING AGENCY: Environmental Protection Agency, Athens, Ga. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Mulkey, L.A.
77 FUNDING: Environmental Protection Agency FY77:$183,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The primary objective of this study is to develop a methodology for evaluating the effectiveness of vegetation buffer strips for controlling sediment and other major water pollutants such as nitrogen and phosphorus.
APPROACH: This methodology will be developed considering the physical significance of the governing processes which dominate the hydrologic, hydraulic, and vegetative aspects of the buffer zone. The design of the buffer strip will determine size of zone, shape of zone, and type of vegetation in the buffer strip. This determination would be independent of the land use in other parts of the watershed. The hydrologic analysis will consider type, duration, intensity and recurrence interval of storms, infiltration rate, water, sediment runoff, and the distribution of other major pollutants in the watershed. The hydraulic analysis will consider the rate of surface runoff, resistance to flow, sediment trapping efficiency, sediment and other major pollutants resistance time, channelization from the upstream and progressive head cut from the downstream end of the strip. The hydrologic and hydraulic response of the buffer strip is dependent on the geometry of the watershed. A range of conditions from flat land, intermediate land, and steep land will be investigated. The vegetation analysis will consider the type, height, density stiffness, and natural and flow-induced vibration frequency of the vegetative cover.
RESULTS: An engineering analysis of the sediment control efficacy will be made initially and documented in an interim report. Finally, design criteria including the developed methodology will be published.
PROJECT MILESTONES: (1) 09/77 Start project. (2) 09/78 Report on effectiveness of buffer strips for sediment control. (3) 09/80 Design criteria for stream-side management zones.

PROJECT DESCRIPTION: To determine if direct addition of powdered activated carbon (PAC) to activated sludge units and changes in operating procedure will significantly improve effluent quality and approach Best Available Technology. The role of adsorbents in enhancing biological activity will be investigated, along with their ultimate impact on sludge disposal by land application.
APPROACH: An investigation of activated sludge treatment of refinery process wastewaters will be conducted in laboratory bench-scale system. Side-by-side studies will be made to: (1) determine role of adsorbents in enhancing biological treatment; (2) determine the impact of loading variations on system performance. Additional studies will be conducted to: (1) identify hydrocarbon types which resist removal by biological and physical treatment programs evaluated; (2) investigate the ultimate fate of sludges generated by treatment programs in land application techniques; (3) formulate a work plan for and conduct a full-scale plant evaluation of combined adsorbent-activated sludge treatment based on pilot studies; and (4) develop rough economic assessment of treatment programs investigated.
PROJECT MILESTONES: (1) 7/77 Preliminary testing. (2) 7/78 Bench testing. (3) 10/78 Full-scale design. (4) 10/79 Full-scale testing. (5) 12/79 Final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To monitor soil filtration as sewage effluent in a rural area.
APPROACH: The work plan is presented in two parts: (1) a continuation of an experimental study begun in 1976; and (2) an investigation of the feasibility of lengthening the operating season by under-snow fall and winter application. The first experiment is a plot design to compare: (1) drained vs. non-drained site treatment; (2) zero vs. three inches of application per week; and (3) lagoon effluent vs. irrigation ditch water. Pollutant movement in the soil profile into drainage pipe or into groundwater will be monitored. Biomass yield from the plots will be measured.
RESULTS: Winter irrigation possibilities will be investigated in field plots prepared with ridges and furrows of variable depth and spacing on which an ice cover will be formed as support to the snow overburden. As in the first experiments, movement of pollutants through the profile will be monitored.
PROJECT MILESTONES: 8/77 Project initiation.

PROJECT DESCRIPTION: This proposal outlines a project aimed at facilitating the dissemination of information pertaining to animal production's impact on environmental quality.
APPROACH: This will be accomplished by searching the literature, abstracting pertinent publications, publishing water-related abstracts in Water Resources Information Abstracts, and submitting a cumulative bibliography of abstracts to the Environmental Protection Agency for publication at the end of each budget period. The publications to be abstracted will be examined for the following topics: (1) The environmental impact of animal production activities on water, ground water, air, soil systems, health, and aesthetics. (2) Feedlot, confinement pen, rangeland, and pasture land management, including animal waste management; the use of chemical fertilizers, manures, green manures, and sewage sludge in conjunction with animal production facilities; the use of pesticides in conjunction with animal production areas or animal production-related areas; and pollution effects of crop residues, soil losses and sediments production from animal production areas to animal production-related areas. (3) Legal, economic and social constraints. (4) Research and development. The project staff will maintain a file copy of all articles which appear in the bibliography. Upon request to the project staff, users will be supplied a copy of individual articles at cost.
PROJECT MILESTONES: (1) 3/77 Initiate project. (2) 2/78 Annual bibliography. (3) 2/79 Annual bibliography. (4) 2/80 Annual bibliography. (5) 2/81 Annual bibliography. (6) 2/82 Final bibliography.

PROJECT DESCRIPTION: To determine differences in animal waste from different regions of the United States. Salt concentration in the waste is of special interest. Results from the survey will be used to determine optimum waste loading rates for land disposal to optimize concentrations of feed additives for the different regions of the United States.
APPROACH: Eight animal production operations were selected from six different regions of the United States. Samples of drinking water, lagoon water, soil, feed, manure, and stockpiled manure from each location are collected and analyzed quarterly. Parameters of analysis are chlorides, total nitrogen, total phosphorous, nitrate, nitrite, carbon oxygen demand, percent moisture, percent residue, and ten selected metals.
RESULTS: Results from four quarters have been tabulated.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Northwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective is to develop a method of predicting potential ground water degradation in strip coal mining on the basis of the mineralogy of the overburden.
APPROACH: The approach is to determine the mineralogy of cores in undisturbed overburden adjacent to spoil piles which have undergone extensive chemical and biological weathering. Extensive ground water quality data will be gathered from wells drilled through and down-dip from spoil piles. Using this data base, a method of predicting ground water quality in post coal strip mining operations will be developed.
RESULTS: This project was funded on December 22, 1975. Due to adverse climatical conditions in N.W. Colorado, initial drilling, coring and completion operations were delayed until March 22, 1976. Coring operations have been particularly successful except in spoil piles where high percentage core recovery in this unconsolidated material has been difficult to attain. Portable well pumping and sampling equipment utilizing expandable packers for zone isolation has been successfully demonstrated. Lysimeters and associated fluid recovery systems have been installed in selected wells. Well sampling was begun in June 1976. Analytical data generated from the initial samples will consist of over 45 parameters from approximately 25 samples. Mineralogy of core samples are being determined utilizing X-ray diffraction and X-ray fluorescence. The first interim report on this project is on schedule and will be forthcoming in

October 1976. A grant amendment, R-804162-01-01, is directed toward expanding the Scope of Work outlined in existing Grant 804162-01. This amendment will permit several additional mining sites to be studied, thus broadening the data base to include varying mineralogical and climatological conditions and strengthening the accuracy and applicability of the predictive nature of findings formulated in the original grant.
PROJECT MILESTONES: 1/78 Overburden mineralogy--ground water quality correlation.

TITLE: Infiltration Land Treatment of Stabilization Pond Effluent
PROJECT NUMBER: L611C-47
PRINCIPAL INVESTIGATOR: Dornbush, J.N.
AFFILIATION: South Dakota State Univ., Brookings (USA)
MONITORING AGENCY: Environmental Protection Agency, Ada, Okla. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Enfield, C.G.
77 FUNDING: Environmental Protection Agency FY77:$7,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: Specific project objectives are: (1) Demonstrate the use of infiltration-percolation land disposal as a means of up-grading existing secondary treatment to meet new effluent standards. (2) Determine acceptable loading rates for both a scarified and undisturbed soil for climatic conditions similar to those at Brockings, South Dakota. Identify winter operating constraints imposed by the climatic conditions of the site.
APPROACH: Three pilot infiltration-percolation basins of about 1/6 acre each have been constructed with underdrains at a depth of 2-1/2 feet in silty loam soil. The normal ground water depth is about 4 feet. Stabilization pond effluent is applied at weekly intervals in quantities equivalent to a depth of 18 or 24 inches. Samples collected from the influent and effluent drain of each basin are analyzed for BOD5, suspended solids; ammonia, nitrate and kjeldahl nitrogen; ortho and total phosphorus, specific conductance and fecal coliforms. Infiltration rates are determined using automatic float recorders in each basin. Groundwater levels and quality are also monitored for the area.
RESULTS: Data has been collected since June 1975 and a technical progress report has been prepared describing the construction and operation of the unit into the summer of 1976.
PROJECT MILESTONES: 03/77-Evaluate 75 cm soil for wastewater treatment; 03/78-Evaluate 150 cm soil for wastewater treatment.

TITLE: Determination of Kinetics of Phosphorus Mineralization in Soils Under Oxidizing Conditions
PROJECT NUMBER: L611C-48
PRINCIPAL INVESTIGATOR: Ellis, R.;Subbarao, Y.V.
AFFILIATION: Kansas State Univ., Manhattan (USA)
MONITORING AGENCY: Environmental Protection Agency, Ada, Okla. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Enfield, C.G.
77 FUNDING: Environmental Protection Agency FY77:$29,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The objectives of this research are to determine the kinetics of phosphorus mineralization in soils under oxidizing conditions and to relate these findings to the movement of phosphorus in soils.
APPROACH: The regenerative capacity of soils to fix phosphorus will be studied by determining the influence of rates of application of phosphorus and intervals between application on phosphorus compounds formed and rates of transformation of compounds in soils. The objectives will be accomplished by the following techniques: (1) Determination of phosphate potentials at time intervals for soils to which different rates of phosphorus have been added. Phosphate potentials will be used to identify the phosphorus compounds formed and changes with time. (2) Phosphorus will be added to the soils at different time intervals to determine the best time interval to keep the amount of soluble phosphorus in the soil solution at a minimum to minimize the movement of phosphorus in soils. (3) Sources and solubilities of aluminum, iron, and calcium in the soils will be determined in order to obtain data for these cations which are involved in precipitating phosphorus in soils.

PROJECT DESCRIPTION: The influence of continuous exposure to 5 ppM NO2 on nitrite metabolism and nitrifying

populations will be evaluated using soils with a wide range of pH values.
APPROACH: Experiments will be conducted to assess the effects of continuous exposure of soils to an atmosphere containing low levels of both SO2 and NO2 to determine if there is a synergism. Several agricultural soils will be subjected to a long-term exposure to 1 ppM SO2 and possibly low levels of NO2 to determine whether solubilization of cations takes place. The influence of SO2, NO2, and their solubility products on ammonium-oxidizing and nitrite-oxidizing autotrophic bacteria will be evaluated. For this purpose, respirometric techniques will be employed.
RESULTS: Additional studies will be performed to evaluate in more detail the impact of both SO2 and NO/sub x/ on the nitrogen-fixing activity of blue-green algae indigenous to many soils. Several nitrogen-fixing bacteria will be investigated to establish whether these pollutants suppress nitrogen fixation by heterotrophic populations. Furthermore, the mechanism by which bisulfite and nitrite inhibit blue-green algae will be explored.
PROJECT MILESTONES: 6/78 Final Report.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This project addresses four aspects of the role of the atmosphere as a source of nutrients, acidity, other substances to water and land ecosystems: (1) quantification of loadings of N, P, acidity and other substances in wet and dry fallout in peninsular north Florida; (2) evaluation of the mechanisms of input-comparison of dry and wet fallout and measurement of gaseous (NH3 and NO2/absorption; (3) documentation of the ecological effects of acid rain on the structure and functioning aquatic ecosystems and of the effects of atmospheric nutrients on lake productivity; and (4) evaluation quantification and modeling of the factors affecting atmospheric fluxes of nutrients and acidity.
APPROACH: (1) A small network of sampling stations is being established for objectives and (2). Detailed studies of rainfall composition in comparison with ambient air quality (particularly for atmospheric nitrogen forms) will provide the basis for models of nitrogen transformation and transport through the atmosphere and deposition via rainout, fallout and gaseous absorption. Lakes in north central Florida will be sampled and studied to determine the extent of acidification caused by acid rainfall (mean pH of rainfall in Gainesville, Florida from June, 1976, to June, 1977, is 4.45).
RESULTS: Studies will be done to determine effects of acidification on the lake biota and on productivity, organic decomposition and mineral cycling.

PROJECT DESCRIPTION: In 1974 the Environmental Protection Agency (EPA) began a long-term study of air pollution effects on the grassland ecosystem near coal-fired power plants at Colstrip, Montana. This study is broad in scope but one particular aspect, of concern here, has been on the potential of birds as bioindicators of pollution.
APPROACH: In the three year period, 1974-76, many avian specimens were collected in the Colstrip area by EPA personnel and large quantities of data were gathered on seasonal cycles in body composition, organ system function, and bioenergetics. Since the power plants did not become functional until 1975 and 1976, these data have the potential of providing a solid base of information that can be used to quantify pollution effects which may accrue in the future. At this time, however, many of the collected bird specimens have not undergone laboratory processing nor has existing data been pulled together in useful form.
RESULTS: It is the purpose of the study proposed herein to complete the necessary laboratory procedures on stored specimens, make additional collections, if necessary, to fill informational gaps, compile and

evaluate all pertinent data, and construct a final report of sufficient scope and detail that will constitute an effective documentation of biological function in grassland birds of the Colstrip area.

PROJECT DESCRIPTION: To determine the effect of long term exposure to oxidant air pollutants on a western coniferous forest ecosystem and to develop predictive models for the system.
APPROACH: Nineteen major plots were established along a 35 mile long transect with an oxidant pollutant gradient. Several other smaller satellite plots have also been established for special studies and one large plot is used to study tree mortality. A monitoring network is established to record climate and pollutant conditions. Other subprojects designed to evaluate pollutant effects include: tree growth, rating of visible pollutant injury on major tree species; population dynamics study with bark beetle; measure rate of accumulation and decomposition of litter; measure precipitation, soil moisture, and soil temperature; measure reproduction (cone and seed production) of major pine species known to be affected by the pollutants; evaluate the response of pathogenic organisms to air pollutants; determine rate of new seedling establishment and identify organisms responsible for damping-off; evaluate mortality of tree species and describe successional patterns.
RESULTS: Data collected will be stored in an established data management system and will be used in the development and testing of predictive models.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Research is being conducted to identify and quantify the nature of plant resistance to ozone and sulfur dioxide. Plant resistance is apparently the result of the interplay of three factors: (1) pollutant penetration into the leaf; (2) metabolic processes repairing air pollution injury; and (3) metabolic processes causing lesion formation. Studies are being conducted on pollutant penetration into the leaf to determine if plant resistance is related to a reduced pollutant dose at the cellular level. The influence of stomatal resistance, and mesophyll resistance, the formation and amount of intercellular spaces, and internal cutin is being studied. Metabolic repair processes are also being studied by determining the pool levels of metabolites, energy charge levels, the mile fraction of NAD (p)H, protein

and lipid turnover rate and the activities of bio-synthetic enzymes. The processes of lesion formation, involving the activities of oxidative enzymes and enzymes involved in the formation of secondary metabolites such as phenols, flavones, coumarins and tannins are being determined. Also, metabolite pool levels that are increased or new metabolites that are formed as a result of pollution stress are being studied.
PROJECT MILESTONES: (1) 6/77 Complete analysis of 1976 field study. (2) 6/78 Complete analysis of 1977 field study. (3) 7/79 Report on dose-response curves for the effect of ozone on nitrogen fixation and forage quality. (4) 7/82 Final Report.

PROJECT DESCRIPTION: To find out the critical stage of scotch pine needle development prior to and during the break of the dormancy with relation to pH2 sulfuric acid droplets in producing short needle and/or stunted growth.
APPROACH: One hundred and forty-four (144) two-year old scotch pine planted in ten-inch diameter plastic pots filled with Jiffy mix. Plants will be inoculated with acid droplets pH2 at 10-day intervals, after 10, 20, 30 and 40 days of treatment. This experiment will be started February 2, 1976 through May 21, 1976. (1) 1st group (36) plants will be exposed 2/02 to 3/29. (2) 2nd group (36) plants will be exposed 2/16 to 4/23. (3) 3rd group (36) plants will be exposed 3/01 to 5/07. (4) 4th group (36) plants will be exposed 3/15 to 5/21.
RESULTS: Results will be evaluated with factorial analysis of variance.

PROJECT DESCRIPTION: The objective of this research project is to develop a realistic appraisal of the relationship between plant growth or yield and ambient SO2 exposure.
APPROACH: The research approach is to develop mathematical models for stochastically varying pollutant concentrations, then expose plants over a growing season to a simulated stochastic variation in pollutant concentration, and finally relate the parameters of the stochastic pollutant model to plant growth. A stochastic model was developed which simulates ambient SO2 regimes emitted from area sources. The original model had two parameters: (1) medial SO2 concentrations and (2) standard geometric deviation of the SO2 concentration. A specially designed field exposure system was used to expose 8 plant species (lettuce, onion, radish, snap bean, table beet, alfalfa, Ponderosa Pine, and Douglas Fir) to a stochastically varying SO2 concentration at median concentrations of 2, 6, 15, 20, and 30. The standard geometric deviation parameter was maintained constant at a value estimated for sampled metropolitan sources. Two levels of ozone (0, and 5 pphm) were also introduced as an interacting additional stressor. The data for the abcve research have been analyzed and are being incorporated into a manuscript under preparation. The objective of the second season (1975) of the continuing experiment was to determine the relationship of variable ozone concentrations and variable standard geometric SO2 deviations. Uncontrolled cultural variables caused great variability between treatments.
PROJECT MILESTONES: 11/76 Final Report.

PROJECT DESCRIPTION: The purpose of this research is to determine the sensitivity of Ponderosa Pine and Douglas Fir to variable SO2 exposures administered during the winter season (dormant period).
APPROACH: The two coniferous species were exposed to 0, 2, 6, 10, 15 or 20 pphm SO2 constantly during the (1974-75) winter months. They were transplanted the following spring in a randomized block design at O.S.U.'s Schmidt Research Farm. The seedlings were maintained under field conditions for the remainder of the growing season. The following winter the seedlings were removed in their entirety from the growing area. The roots were washed and the seedlings were separated into roots, new lateral growth, new terminal growth, and old growth. All parts were oven dried at a uniform 70C temperature and bagged in heavy polyethylene bags to prevent absorption of atmospheric moisture.
RESULTS: The following growth parameters will be estimated: (1) Oven dry weight (ODW) new stem plus new needles, (2) ODW new stem, (3) ODW lateral stems and needles, (4) ODW lateral stems, (5) ODW old stem, (6) ODW terminal buds, (7) length new main stem, and (8) length old main stem, (9) ODW roots.

PROJECT DESCRIPTION: To determine the effects of acid rain at different degrees of acidity on processes associated with two experimental ecosystems.
APPROACH: Ecosystem plots consisting of water-sealed enclosures (2.3 m2) have been established in the field to evaluate the effects of acid rain. The plots contain forest soil and two tree species--sugar maple or red alder. A litter layer of the respective trees has been added to the soil surface. In this three year study simulated rain treatments at levels of acidity typical of average values for the United States and at a level representing a possible increase in acidity are applied to the ecosystem plots. Measurements of water flow, decomposition, and plant growth are included to examine the effects of acid rain on nutrient

cycling and plant-soil processes.
RESULTS: This research will provide the framework for the development of simulation and predictive models.
PROJECT MILESTONES: (1) 08/78 Develop mathematical model for total forest ecosystem and for specific components of forest ecosystem. (2) 03/80 Final Report.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: METALS (33%);PARTICULATES (33%);ORGANICS (34%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale;DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Field and laboratory research will be conducted to determine relationships between pollutant concentration and ecological effects.
APPROACH: Single-toxicant and complex wastes will be utilized in the laboratory research using a variety of aquatic organisms. Field studies will be conducted to corroborate laboratory data, using as indices, ecological effects levels, tissue toxicant levels, and toxicant concentrations and forms. Emphasis will be on aquatic forms of established importance and sensitivity (e.g., aquatic insects, zooplankton, salmonid and other important fishes); ecosystem effects will be inherent in the field studies and would be included in post-feasibility studies in laboratory streams or similar laboratory ecosystems. Another phase of the research will be conducted to define, quantify and predict the toxic effects of inorganic pollutants originating from non-point sources and non-renewable energy resource wastes upon the growth of representative algae and invertebrates. Effects of synergistic and antagonistic phenomena as well as bioaccumulation of inorganic pollutants within aquatic ecosystems will be investigated.
PROJECT MILESTONES: 09/81 Final Report.
KEYWORDS: AQUATIC ORGANISMS;AQUATIC ECOSYSTEMS;WATER POLLUTION;TOXICITY;BIOLOGICAL MODELS;SYNERGISM;BIOLOGICAL ACCUMULATION;FISHES;ENERGY SOURCE DEVELOPMENT;WASTE MANAGEMENT;BIOLOGICAL EFFECTS;INORGANIC COMPOUNDS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The effects of a buried pipeline crossing in the Chatanika River are being monitored.
APPROACH: Parameters considered are: (1) Type and rate of flow; (2) Oxygen and carbon dioxide content of water; (3) Water Temperature; (4) Size type and distribution of stream bottom particles; (5) Intra-gravel water flow and chemistry; (6) Quantity and diversity of animal and plant organisms; (7) Organic drift; (8) Primary productivity. Items (1) through (5) are handled by personnel of the Arctic Environmental Research Laboratory, EPA.
RESULTS: Results thus far indicate some siltation downstream from the crossing; loss of a small spawning ground for longnose sucker downstream from the crossing; some increase in organic drift; temporary increase in primary productivity below as compared with above the crossing. It is planned to monitor these factors for another year to determine whether the observed effects are permanent or temporary.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this project is to assess the effects of chronic sulfur dioxide fumigation on primary producers and invertebrate consumers in a mixed prairie ecosystem.
APPROACH: Field experiments are designed to (1)characterize physiological responses of western wheatgrass to four SO2 exposure levels, (2) relate physiological responses to whole plant growth and population dynamics of western wheatgrass on each treatment area; (3) investigate the relationships between physiological status of western wheatgrass and infrared reflections.
RESULTS: Laboratory experiments support and amplify the field experiments. These experiments will be conducted in controlled environment plant growth chambers. These experiments are designed to: (1) characterize the physiological response of western wheatgrass to SO2 fumigation within a minor range of environmental conditions, and (2) determine the relationship between internal sulfur status of western wheatgrass and physiological responses. Variables to be measured include gross photosynthesis, net photosynthesis, photospiration, dark respiration, plant and leaf water potential, stomata diffusion resistance and leaf temperatures.
PROJECT MILESTONES: 6/80 Final Report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Two lichen species native to southeast Montana showed reduced respiration rates and algal cell plasmolysis and bleaching when exposed to 0.02, 0.04, and 0.07 ppm SO2 (geometric means) on a field fumigation site. The major objective of the current project is to collect these same two lichen species to be observed as biological monitors of SO2 emissions from two coal-fired power plants in Colstrip, Montana.
APPROACH: Lichen community information is also being collected in order to detect any changes in epiphytic and soil lichen communities as coal burning proceeds in this area.
RESULTS: All the lichen information will be integrated with plant community data gathered by other researchers in the area in order to determine effects of SO2 emissions (and other coal-burning pollutants) on Ponderosa pine-grassland ecosystems.
PROJECT MILESTONES: 7/80 Final Report.
KEYWORDS: AIR POLLUTION;BIOLOGICAL INDICATORS;FOSSIL-FUEL POWER PLANTS;BIOLOGICAL EFFECTS;FLUE GAS;MONITORING;FORECASTING;ENVIRONMENTAL IMPACTS;LICHENS;PHYSIOLOGY;TERRESTRIAL ECOSYSTEMS;EARTH ATMOSPHERE;HYDROCARBONS;SULFUR DIOXIDE;ECOLOGICAL CONCENTRATION

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Applied (50%);ANALYTICAL (50%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this project is to identify species of grassland birds and/or their organ-systems which are particularly sensitive to the emissions of coal-fired power plants and can be used to monitor and indicate air quality; and predict the impact of chronic, low-level, non-lethal stack emissions on the surrounding ecosystem.
APPROACH: The study site is a grassland ecosystem in Colstrip, Montana, in which two coal-fired power plants operate. Representative grassland birds selected for study at the site are the Western Meadowlark (Sturnella neglecta), Mourning Dove (Zenaidura macroura), Lark Bunting (Calamospiza melanocorys), Vesper Sparrow (Pooecetes gramineus), and Lark Sparrow (Chondestes grammacus). In each case, the histology of the following tissues is examined before (1975-1976) and after (1976-1979) the power plants have gone on-line: (1) tissues which are stress indicators: the adrenal and thyroid glands; (2) tissues which belong to the immune system: the bursa of Fabricius, thymus, and spleen; (3) detoxifying tissues: the liver, kidney, and lung and (4) reproductive tissues: the testis, ovary, and oviduct.
RESULTS: This histological information will be integrated with (1) measures of carcass and tissue composition and other gross measurements made on the same birds, and (2) information on the air quality, weather, and other organisms in the same impacted ecosystem, in order to identify relationships which are useful for (1) predicting the biological effects of given rates of pollution challenge, and (2) siting coal-fired power plants in the Great Plains region.
PROJECT MILESTONES: 7/80 Final Report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The proposed research will test the hypothesis that petroleum hydrocarbon compounds capable of inducing microsomal mixed function oxidases in fish tissues interfere with normal patterns of fatty acid metabolism, specifically microsomal fatty acid desaturation, and that such effects result in modified fatty acid patterns in membrane phospholipids of fish and suboptimal physiological responses to temperature.
APPROACH: Two approaches will be taken. In one, fish will be exposed to petroleum hydrocarbons for one to two weeks at an intermediate temperature. Following this, treated and control fish will be compared with respect to microsomal cytochrome P450 and b5 levels, mixed function oxidase and fatty acid desaturase activities, fatty acid composition of membrane phospholipids, and several physiological responses to temperature known to be dependent in part on specific biophysical characteristics of membranes. In a second approach, fish will be acclimated to extreme temperatures, both in the presence and absence of petroleum hydrocarbons, and compared with respect to ability to carry out known biochemical and physiological adaptations to temperaure (e.g., temperature mediated adjustment of membrane fatty acid composition and the biochemical and physiological adaptations resulting from such fatty acid changes).
PROJECT MILESTONES: 8/79 Final Report.

PROJECT DESCRIPTION: ERDA will operate and maintain a research survey station for the Environmental Protection Agency at Colstrip, Montana, providing approximately 1 man year of effort. ERDA will maintain a scientist at Colstrip who will operate research equipment, as required by EPA, for the measurement of a wide spectrum of airborne pollutants.
APPROACH: It is understood that these pollutants include the measurements of most of the conventional air pollutants which are monitored by the EPA and will require daily calibrations of much of the scientific equipment used for these measurements. It will also require the transfer of data from the various analyzers to an on-board computer for subsequent analysis and transmittal.

PROJECT DESCRIPTION: The two objectives of this program are: (1) to develop procedures which can be used to forecast and assess the impacts of stressants from energy producing activities on affected ecosystems; and (2) to identify and describe the impacts for a given set of ecosystems.
APPROACH: The approach is to combine field measurements with on site field experimentation and laboratory process studies. Remote sensing, modeling activities, and other associated supportive efforts will be utilized to maximize the activity. The Corvallis Environmental Research Laboratory has mounted a field effort in Montana. Besides the normal field facilities (mobile air quality laboratories, biological analysis systems, etc.) an effort has been made to coordinate the project with other scientific centers (Grassland IBP, ERDA, EPA and NOAA) to include the necessary scientific and engineering expertise to guarantee a unified program.
RESULTS: It is intended that the research information gathered from this project be utilized in such a fashion that a set of biological parameters are found that will allow planning managers to project cost/benefit relationships prior to locating an energy producing facility.
PROJECT MILESTONES: (1) Annual Reports. (2) 6/80 Final Report.

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The proposed work is the continuation of a study, previously funded by EPA contracts, to

determine the effect of long term exposure to oxidant air pollutants on a western coniferous forest ecosystem and to develop predictive models for the system.
APPROACH: Nineteen major plots were established along a 35-mile long transect with an oxidant pollutant gradient. Several other smaller satellite plots have also been established for special studies and one large plot is used to study tree mortality. A monitoring network is established to record climate and pollutant conditions. Other subprojects designed to evaluate pollutant effects include: tree growth, rating of visible pollutant injury on major tree species; population dynamics study with bark beetle; measure rate of accumulation and decomposition of litter; measure precipitation, soil moisture, and soil temperature; measure reproduction (cone and seed production) of major pine species known to be affected by the pollutants; evaluate the response of pathogenic organisms to air pollutants; determine rate of new seedling establishment and identify organisms responsible for damping-off; evaluate mortality of tree species and describe successional patterns.
RESULTS: Data collected will be stored in an established data management system and will be used in the development and testing of predictive models.
PROJECT MILESTONES: 05/80-Final report.

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: To develop scientific base for air pollution strategies and to establish secondary air quality standards in compliance with the Clean Air Act, EPA conducts research on effects of air pollutants on individual flora and fauna as well as on the intact ecosystem. When combined with these studies, modeling the response of the terrestrial ecosystem to air pollutant stress is conducted to enable quantitation assessment of these stresses as well as to predict their long range chronic effects for better management of resources. Specific work includes effect of acid rain on forest ecosystem, and impact on a forest watershed of urea fertilization management.
PROJECT MILESTONES: 09/80-Final report.

TYPE OF FUNDING: Grant No.-R804513-02
77 FUNDING: Environmental Protection Agency FY77:$76,500
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: (1) To determine whether concurrent exposure to mixtures of hydrogen fluoride and ozone or hydrogen fluoride and nitrogen dioxide produces interactive effects (antagonism or synergism) on the growth, yield or accumulation of fluoride by vegetation; (2) to provide quantitative estimates of the effects of ambient oxidants on the growth, development and yield of economically-important plants; (3) to provide quantitative estimates of the effects of ambient rainfall and simulated acidic rain on the growth, development and yield of crop plants.
APPROACH: Field exposure chambers, greenhouses and controlled environment chambers specially designed for these studies will be used to expose vegetation to controlled concentrations of pollutants. Dose-response relationships will be determined to provide a basis for the development of predictive models.
RESULTS: We have found that (1) yields of beans and tomatoes are reduced by ambient oxidants occurring in Yonkers, New York; (2) sulfur dioxide may lower or have no effect on the accumulation of fluoride in plants exposed simultaneously to hydrogen fluoride and sulfur dioxide depending on the plant species and pollutant concentrations; and (3) repeated exposure to simulated acidic rain causes necrotic lesions on susceptible herbaceous plant species when pH values are less than 3.4 and on needles of Eastern white pine trees when pH values are less than 2.6.

TITLE: Chronic Ozone Effects on Ponderosa Pine, Dwarf Mistletoe Association
PROJECT NUMBER: M602A-81
PRINCIPAL INVESTIGATOR: Wilhour, R.G.;Neely, G.E.
AFFILIATION: Environmental Protection Agency, Corvallis, Oreg. (USA). Corvallis Environmental Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Corvallis, Oreg. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Wilhour, R.G.
TYPE OF FUNDING: Agency in-house effort-(in-house)
77 FUNDING: Environmental Protection Agency FY77:$30,800
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The primary objective of this research project is to describe the response of the ponderosa pine (Pinus ponderosa L.) and dwarf mistletoe (Arceuthobium campylopodium) to chronic ozone exposures. The growth and developmental aspects of each associate as well as the success and/or progress of specific stages of disease development (e.g., infection) comprise the responses to be characterized.
APPROACH: A replicated factorial design was utilized to treat mistletoe inoculated and noninoculated ponderosa pine to 2 ozone levels (0 and 10 pphm), 6 hr per day, 7 days per week. The experiments were conducted outdoors in specially designed exposure chambers during the months May-October 1973. The initial attempt was severely impacted by very low survival of the inoculum. The germinating dwarf mistletoe seed was apparently killed by high temperatures shortly after inoculation. Therefore, the research shall be repeated during the 1974 growing season. However, inoculation will be accomplished during the early spring while the temperature maxima are lower. Ponderosa pine seedlings were successfully inoculated with dwarf mistletoe during February 1974. Both inoculated and uninoculated seedlings were exposed to either 0 or 20 pphm ozone during the 1974 and 1975 growing seasons. The mistletoe plants became visible during the 1975 growing season and growth measurements were recorded the following winter. The experiment shall be conducted an additional growing season (1976) to allow time for the mistletoe plant to reproduce. The

growth of both the host and the mistletoe and the reproductive status of the mistletoe will be evaluated during the Winter of 1976.
RESULTS: A manuscript shall be prepared shortly thereafter.
PROJECT MILESTONES: 08/77-Final report.

TYPE OF FUNDING: Agency in-house effort-(in-house)
77 FUNDING: Environmental Protection Agency FY77:$8,400
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of this research was to intensively evaluate the seasonal growth and metabolic response of ozone-stressed ponderosa pine (Pinus ponderosa L.). Several integral objectives included a determination of: (a) seasonal, chronic ozone susceptibility, (b) dynamics of recovery, and (c) response to intermittent ozone exposures (1, 2, 3, 4, 5, 6, or 7 days per week exposure).
APPROACH: The experiments were conducted outdoors in specially designed 8 x 8 x 7 ft. teflon covered exposure chambers. The chronic ozone treatment consisted of 10 pphm ozone, 6 hrs daily, and 7 days per week. The ozone treated plants were exposed to charcoal filtered air the remaining 18 hr per day. The check plants were treated with charcoal-filtered air 24 hr per day. A series of bi-weekly harvests and periodic transfer of plants between treatment and control chambers were executed to give the appropriate data necessary to meet the stated objectives.
RESULTS: All the data have been analyzed and a manuscript is in preparation.

77 FUNDING: Environmental Protection Agency FY77:$84,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: In order to obviate certain variations in natural soil systems, a soil/litter simulating microcosm and life support system has been designed, tested, and used to evaluate the effects of cadmium, selenium, used singly and in combination, and copper and zinc used singly and in combination. The cadmium/selenium series showed possible stimulation at low selenium levels, inhibition at moderately high cadmium levels, and marked inhibition in combination, whereas the copper/zinc at moderately high levels showed no detectable effects after 6 weeks incubation. The measured effects were in terms of integrated community response of respiration; i.e., CO2 and heat generation and O2 consumption. Organism detection, enumeration, sizing and from these measurements with certain assumptions, biomass calculation, are being perfected using optical scanning procedures.
APPROACH: The instrumentation for this research includes a Leitz epi-fluorescent illumination interference contrast microscope coupled with an Imance Quantimat-720 image analyzer and Hewlett Packard 9830A computer and x-y plotter. Specimen input to this system is from the microcosms just described.
RESULTS: The ultimate output of the analytical/microcosm system is a computer simulation which will be used to provide educated guesses of pollutant effects on soil decomposer systems.

TITLE: Response of Birds to Environmental Stress
PROJECT NUMBER: M625A-24
PRINCIPAL INVESTIGATOR: Farner, D.S.;Wingfield, J.C.;Donham, R.S.
AFFILIATION: Washington Univ., Seattle (USA)
MONITORING AGENCY: Environmental Protection Agency, Corvallis, Oreg. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Preston, E.
TYPE OF FUNDING: Grant No.-R805409-01
77 FUNDING: Environmental Protection Agency FY77:$29,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: Micro-radio competitive-protein-binding and micro-radioimmunoassays for cortisone in avian plasma have already been developed and adapted for field investigations in this laboratory. Since this method requires less than 100 microliters of plasma, individual birds can be sampled, marked and released for subsequent capture and sampling. The method has been ''field-tested'' extensively on white-crowned Sparrows. Zonotrichia leucoporys gambelii and Z.I. pugetensis.
APPROACH: It is proposed to develop this system further as a means of ''earth detection'' of environmental stress in populations of birds. Using these methods, first on white-crowned Sparrows, the following are proposed: (1) Procurement of base-line data on daily cycles in plasma corticosterone; (2) Procurement of additional data on effects of handling and holding in cages; (3) Examination of effects of induced stress in field (disturbance of flocks, harassment of territorial birds, artificial disturbance of habitat...); (4) Determination of metabolic clearance and half-life of corticosterone in birds; and (5) Observation of effects of ''artificial stress'' (implantation of corticosterone in silastic tubes in territorial birds). Comparable microassays have been developed for testosterone and estradiol. The avian radioimmunoassay of

Pollett, Seanes, and Cunningham for luteinizing hormone (LH) has been modified for passerine birds. Accurate estimates of LH, sex hormone and corticosterone can be made from 200 microliters of plasma from birds that can be bagged and released for subsequent capture and sampling. Laparotomy can be performed on these birds for assessment of gonadal state. For LH and sex hormones data comparable to corticosterone (1-S and 5) will be obtained, insofar as possible, by repeated sampling of individual birds.
RESULTS: Samples will be analyzed from a carnivore, the Western Meadowlark, Sturnella neglecta, at the EPA Montana Coal-fired Power Plant Project, Colstrip, to evaluate the significance of histological and gravimetric observations on adrenal glands.

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of this project is to determine the annual net aerial production in southern California coastal salt marshes to determine productive response to environmental factors, and to estimate marsh contribution to secondary production in the coastal system.
APPROACH: Six study marshes will be selected to represent the variety and latitudinal extent of the southern California coast. Three will be chosen from those with continuous ocean contact, two from those with seasonal contact, and one from diked marsh. Sampling to determine production in each study marsh will be by the harvest method with samples collected at monthly intervals for one year. Environmental measurements will include tidal elevation, inundation frequency and duration, soil salinity, soil nitrogen, soil aeration (redox), and soil temperature. Marsh export of organic detritus will be estimated by analyzing creek water samples from ebb and flood flow for suspended organic particulates.

PROJECT DESCRIPTION: Ocean-outfall disposal of domestic wastes raises pertinent questions concerning prior treatment and preferred outfall location due to a paucity of factual information and data. To resolve these questions, the research in this project is subsumed under three objectives which are to: (1) characterize the plume mixing zone as it relates to the kinds and subsequent distribution of particulates, (2) design and test methods for the sampling and enumeration of viral pathogens and determine the most appropriate treatment procedure, and (3) evaluate outfall-induced (via particulates and pathogens) responses of sessile invertebrates and other important marine animals. Four outfalls in Dade, Broward and Palm Beach counties are designated for intensive and/or comparative research by both marine and medical scientists. The project incorporates both field and laboratory work and involves cooperation with other ongoing research relating to outfalls as well as interaction with user groups. State-of-the-art scientific methods and quality-assurance techniques used during the two-year study ensure that objectives are met on schedule and that all results are scientifically supported. The results will be of use in evaluating the performance standards of ocean outfalls as a disposal method.

TITLE: Technical Studies of Cook Inlet Coastal Wetlands
PROJECT NUMBER: M608C-43
PRINCIPAL INVESTIGATOR: MacDonald, K.;Rabe, F.
AFFILIATION: Idaho Univ., Moscow (USA)
MONITORING AGENCY: Environmental Protection Agency, Corvallis, Oreg. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Kibby, H.V.
TYPE OF FUNDING: Grant No.-R805690-01
77 FUNDING: Environmental Protection Agency FY77:$50,200
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The objective of this project is to provide quantitative data on the primary production of a major coastal wetland site within Cook inlet, Alaska, and to identify and assess the functional interrelationships among wetlands, the adjacent terrestrial ecosystem and the estuarine ecosystem.
PROJECT MILESTONES: 09/78 Final report
KEYWORDS: ALASKA;COASTAL REGIONS;ESTUARIES;AQUATIC ECOSYSTEMS;TERRESTRIAL ECOSYSTEMS;NUTRIENTS;ENVIRONMENTAL TRANSPORT;PLANTS;BIOMASS;PHOTOSYNTHESIS

<072751>
TITLE: Study of Tidal Datums as They Relate to the Upper Limit of Coastal Wetlands
PROJECT NUMBER: M608C-56
PRINCIPAL INVESTIGATOR: Thurlow, C.
AFFILIATION: Department of Commerce, Washington, D.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Corvallis, Oreg. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Kibby, H.
TYPE OF FUNDING: Interagency agreement-D7-0803
77 FUNDING: Environmental Protection Agency FY77:$13,800
TECHNOLOGY: GENERAL SCIENCE (100%)

PROJECT DESCRIPTION: NOS will collect the following data in the vicinity of tidal gaging stations. The locations and specific number of stations will be selected by mutual agreement between both agencies. Land elevations will be selected along selected transects from mean low water datum to the upper limit of the marsh. Along these transects NOS will identify various tidal datums. NOS will analyze tidal data and prepare a report for each site that describes the frequency and duration of inundation for various land elevations identified in 1A above.
RESULTS: NOS will provide EPA with copies of all computer programs used in this study. NOS will provide EPA consultation on characteristics of tidal regimes.
PROJECT MILESTONES: 06/78 Final report.
KEYWORDS: COASTAL REGIONS;MARSHES;TIDE;WATER WAVES;DAILY VARIATIONS;DATA COMPILATION

TITLE: Development of Criteria for Wetland Protection
PROJECT NUMBER: M608C-76
PRINCIPAL INVESTIGATOR: Kibby, H.
AFFILIATION: Environmental Protection Agency, Corvallis, Oreg. (USA). Corvallis Environmental Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Corvallis, Oreg. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Kibby, H.V.
TYPE OF FUNDING: Agency in-house effort-In-house
77 FUNDING: Environmental Protection Agency FY77:$56,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: (1) To delineate the upland boundary of wetlands for the purpose of setting the jurisdictional limits for section 404 of PL 92-500 for coastal and Great Lakes marshes. (2) To determine the physiological requirements of plant species representative of wetland transition zones. (3) To provide environmental assessments which will determine the relative values of wetland zones with respect to overall ecosystem value.
APPROACH: (1) Field studies to determine which plant species represent the transition zone between wetland and upland. The upper limit of this transition zone will be related to a tidal datum. (2) Laboratory and field studies to determine the physiological requirements of transition zone species with respect to physical (e.g., total inundation frequency), water quality, and substrate factors. (3) Assess the social, economic, and ecologic impact of vegetative criteria developed to protect wetlands. This would include an evaluation of the relative values of various wetland types with respect to overall ecosystem values.
PROJECT MILESTONES: 01/77 Report on methodology for determining upper limit of wetlands. 01/78 Report on field test of relationship between tidal datums. 09/78 Final reports from grantees and inhouse staff.

TITLE: Water Quality Effects Caused by Waste Discharges
PROJECT NUMBER: M608C-95
PRINCIPAL INVESTIGATOR: Baumgartner, D.J.
AFFILIATION: Environmental Protection Agency, Corvallis, Oreg. (USA). Corvallis Environmental Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Corvallis, Oreg. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Baumgartner, D.J.
TYPE OF FUNDING: Agency in-house effort-In-house
77 FUNDING: Environmental Protection Agency FY77:$112,000
TECHNOLOGY: FOSSIL FUEL/General (25%);NUCLEAR/General (25%);GEOTHERMAL/General (25%);CONSERVATION/General (25%)
PROJECT DESCRIPTION: Develop scientific foundation for water quality criteria, effluent restrictions, and discharge practices associated with direct (outfalls, barges) and indirect (atmospheric fallout, drainage) sources of pollution.
APPROACH: Effects on total ecosystems and aquatic communities will be sought through studies of the transport, interaction, and accumulation of pollutants, singly and in combination from the point of entry into the aquatic system to the point of ultimate fate. Physical and chemical interactions between sediments, suspended particulates, and the water phase in mixing zone near the initial entry point, receive primary attention with respect to the Agency's need for data on acute and short-term effects. Long-term exposure in relatively dilute systems are of concern for long-lived pollutants likely to cause chronic disorders, subtle ecosystem effects, and food chain accumulation of undesirable materials. Laboratory simulation, controlled ecosystems, and field programs are conducted, especially in locations offering experimental opportunities as in new outfalls or barge dumping operations.
RESULTS: Progress has been achieved on determining the behavior of metals and biodegradable organics in sediments contaminated with sewage sludge. Plans have been made for plume studies and ecological effects in the vicinity of major ocean outfalls.
PROJECT MILESTONES: 03/77 Revision of Plume workbook. 08/77 Working document for the regions based on calculations. 09/78 Revision of Plume workbook, if necessary. 03/79 Final report.

TITLE: National Eutrophication Survey
PROJECT NUMBER: M608A-70
PRINCIPAL INVESTIGATOR: Gakstatter, J.H.;Lambou, V.
AFFILIATION: Environmental Protection Agency, Corvallis, Oreg. (USA). Corvallis Environmental Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Corvallis, Oreg. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Gakstatter, J.H.
77 FUNDING: Environmental Protection Agency FY77:$196,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The goal of the National Eutrophication Survey (NES) is to reduce uncertainties regarding the threat of accelerated eutrophication in the nation's freshwater lakes and reservoirs. The overall objective of the endeavor is to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations and impacts on selected freshwater lakes as a basis for the formulation of comprehensive and coordinated national, regional, and state management practices relating to point source discharge reduction and non-point source pollution abatement in lake watersheds.
APPROACH: Over 800 lakes and reservoirs in the contiguous 48 states were sampled during the period of 1972-75. Each water body was sampled three times during one year at multiple sites and depths. Coincident to the lake sampling program major tributaries and point source inputs were also sampled monthly for one year. The resulting data permitted an evaluation of trophic condition, nutrient inputs, and limiting nutrient for each water body.
RESULTS: Field work for the survey was completed in November 1975, and data evaluation is scheduled to continue until January 1, 1977.
PROJECT MILESTONES: 09/78 Final lake reports.

TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: This study is designed to describe the effects of stream disturbance over time and to assess the significance of the effects on the physical, chemical, and biological features of a subarctic stream. The stream disturbance will be the construction of the Trans-Alaska Oil Pipeline as it is placed beneath the Chatanika River in interior Alaska.
APPROACH: Baseline data at stations above and below the crossing have been collected. After the crossing has been completed, the stations will be monitored for selected parameters to assess the impact of the

disturbance and how rapidly the stream recovers or stabilizes.
RESULTS: The study should be completed in 1978.
PROJECT MILESTONES: 09/78 Final report.

77 FUNDING: Environmental Protection Agency FY77:$154,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: To issue water quality criteria and publish effluent standards as mandated by sections 307(a) and 304(a), the Environmental Protection Agency conducts research on effects of pollutants on representative or key sensitive organisms in freshwater and marine systems, as well as on ecosystem levels and parameters. When combined with these studies, modeling of the ecosystem response to pollutant stress can be an important link between a better understanding of the systems and a prediction ability that allows better management of resources. Modeling in freshwater ecosystems includes: (1) nonpoint source loading and its effect on ecology of streams, (2) nutrient budget, nutrient recycling sediment dynamics in lakes, (3) nutrient manipulation and other restorative techniques of lakes. Modeling in marine ecosystems includes characterization of dredged materials and their effects in ocean dumping.

77 FUNDING: Environmental Protection Agency FY77:$112,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: To develop an understanding of the effects of environmental pollutants, both stimulatory and inhibitory, on the structure and function of marine and freshwater ecosystems. This includes determination of sources, transport, transformations, and fates of pollutants, their uptake, accumulations, and magnification by food chains, and human health implications.
APPROACH: Field studies of natural and perturbed river-lake-estuarine-marine systems, and pilot scale and laboratory simulations, are carried out on specific pollutants to determine their antagonistic/synergistic effects on entire systems. Results of carefully controlled laboratory experiments and assays are followed by controlled pilot scale field studies in experimental ponds and tanks, and results applied to whole system studies.
RESULTS: Laboratory and pilot field studies have recently been employed to assess the effect and usefulness of nutrient inactivants in reducing primary production, and studies are being continued in a natural lake on the effects of waste interception on overall productivity. Studies are in the design stage on the cycling and fate of selected heavy metals in aquatic systems.
PROJECT MILESTONES: 09/78 Report on nutrient recycling in phytoplankton population. 09/79 Report on nutrient recycling in zooplankton, macroinvertibrate. 09/80 Report on nutrient recycling on a community basis.

TYPE OF FUNDING: Grant No.-R805624-01
77 FUNDING: Environmental Protection Agency FY77:$116,000
TECHNOLOGY: FOSSIL FUEL/General (34%);NUCLEAR/General (33%);CONSERVATION/General (33%)
PROJECT DESCRIPTION: The immediate objective is to formulate and validate a model for the effects of azinphosmethyl (Guthion) applied to apple orchards. Generalization to other compounds and terrestrial ecosystems is the ultimate objective.
APPROACH: Work planned includes continuation of experimental field treatment and sampling, laboratory culture and toxicological testing of soil/litter invertebrates, and mathematical modeling of pesticide movement and faunal impacts. One season's samples from the antecedent grant have been analyzed to determine rain-induced vertical movement of pesticide, but no runoff was obtained that year. A second year's samples are being collected in summer, 1977, and will be analyzed to provide the missing parameterization data. Air borne losses will also be measured in 1978.
RESULTS: Computer programs for direct model parameterization from raw field data are being developed. Laboratory data are being used to aid in development of organism submodels. First validation will be attempted using 1978 field data.
PROJECT MILESTONES: 09/80 Final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Develop, evaluate and use electron microscope procedures for identification and concentration determination of fine particles, including asbestos fibers, in tissue from aquatic organisms that have been exposed to such fine particles.
APPROACH: Low temperature ashing on enzymatic hydrolysis of tissue, followed by resuspension on a nuclipore filter and prep for electron microscope observations will be done.
RESULTS: Methodology work has been completed on low temperature ashing and detection limits of the particles in the tissue.
PROJECT MILESTONES: (1) 1/77 Work plan. (2) 10/76 Start lab work. (3) 8/78 Draft final report. (4) 12/78 Submit publication.
KEYWORDS: PARTICLE SIZE;AEROSOLS;AQUATIC ORGANISMS;BIOASSAY;WATER POLLUTION;AIR POLLUTION;ENVIRONMENTAL TRANSPORT;TOXICITY;ASBESTOS;FIBERS;EXPERIMENT PLANNING;MEASURING METHODS;CARCINOGENS;BIOCHEMISTRY;MEASURING INSTRUMENTS;CHEMICAL ANALYSIS

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Freshwater;BIOMES/Estuarine;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The overall objective of this investigation is to provide predictive information with regard to potential toxicants in the aquatic environment resulting from coal and oil shale extraction and conversion. The specific objectives are to identify and quantify those chemical products of coal and oil shale extraction and conversion which may reach surface waters, and to determine by both field studies and laboratory bioassays the degree to which those chemicals may be acutely or chronically toxic to fish and aquatic invertebrates, or may become involved as part of the food chain.
APPROACH: Four categories of energy development will be considered: coal extraction, oil shale extraction and processing, coal gasification, and coal-to-energy conversion. Potential toxicants to the aquatic environment are being identified by a combination of field, laboratory, and literature studies, as well as by information gained from cooperative input from other energy-related research programs. Concurrent chemical and biological laboratory and field bioassays as well as aquatic distribution studies dictate which toxicants are most deleterious to the aquatic biota. Feedback from these bioassays and distribution studies dictate what additional or alternate emphasis is required in the laboratory and field chemical studies.
RESULTS: Results published in reports.
PROJECT MILESTONES: (1) 8/77 Complete five reports on coal stripmining effects on chemistry and biota. (2) 9/77 Reports on biological and chemical effects on coal combustion. (3) 9/77 Reports on baseline studies for oil shale extraction. (4) 1/78 Synthesis report on aquatic effects of coal stripping. (5) 1/78 Synthesis report on aquatic effects of coal combustion. (6) 1/78 Preliminary repots on toxicity and

analyses of coal gasification. (7) 12/78 Completion reports on aquatic effects of coal mining and combustion oil shale extraction and coal gasification.

TITLE: Continuous Flow Bioassays Using Natural Periphyton Communities with Emphasis on the Effects of Coal Leachate
PROJECT NUMBER: N625A-79
PRINCIPAL INVESTIGATOR: Gerhart, D.Z.;Holmetrand, L.L.;Wood, T.J.;Richter, J.R.
AFFILIATION: Minnesota Univ., Minneapolis (USA)
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Miller, W.
TYPE OF FUNDING: Grant No.-R803932-03
77 FUNDING: Environmental Protection Agency FY77:$55,400
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: (1) To quantify the effects of coal leachate on species composition and structures of periphyton communities; (2) to identify leachate components with inhibitory or stimulatory effects; (3) to elucidate possible synergistic or antagonistic interactions among leachate components.
APPROACH: Periphyton communities are grown in laboratory streams on artifield substrates. The bioassay facility utilizes water from Lake Superior and is located at the EPA's National Environmental Research Laboratory in Duluth, Minnesota. In experiments which last from 3 to 8 weeks, periphyton communities are dosed with various concentrations of coal leachate, coal distillate, or fractions thereof, and growth response is measured as changes in biomass (chlorophyll and ash-free dry weight). Algal communities are also examined microscopically to detect changes in species composition and diversity.
RESULTS: Coal leachate appears to stimulate the growth of algae. Current efforts are focusing on identifying the specific chemical factors responsible for this effect.
PROJECT MILESTONES: 01/76 Quantified effects of coal leachate on periphyton communities. 06/76 Identified stimulatory and inhibitory leachate components. 05/78 Identify synergistic or antagonistic leachate interactions.
KEYWORDS: COAL;LEACHING;ENVIRONMENTAL IMPACTS;AQUATIC ECOSYSTEMS;BIOLOGICAL MODELS;FRESH WATER;BIOLOGICAL EFFECTS;ALGAE;PLANT GROWTH;SYNERGISM;CARBON;COAL INDUSTRY

TITLE: Organic Leaching and Particulate Dispersion from Coal
PROJECT NUMBER: N625A-81
PRINCIPAL INVESTIGATOR: Sydor, M.;Caple, R.;Carlson, R.M.
AFFILIATION: Minnesota Univ., Minneapolis (USA)
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Kuehl, D.W.
TYPE OF FUNDING: Grant No.-R803952-03
77 FUNDING: Environmental Protection Agency FY77:$180,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
PROJECT DESCRIPTION: A major thrust of this project will remain the monitoring of polynuclear aromatic hydrocarbons (PAH's) at the micropollutant level (ppm or less).
APPROACH: The high pressure liquid chromatography-gas chromatography (HPLC-GC) identification methodology developed in these laboratories for the analysis of trace PAH's in coal leachates, and in general water samples, will be extended and applied to such problems as the bioconcentration of PAH's in fish tissue, aiding in the analysis of ''second-order'' PAH's (i.e., metabolites, photochemical oxidation products, aqueous disinfection products), and in the PAH analysis of coal steam distillates.
RESULTS: The ultimate goal of the proposed investigation is to determine the long-range influence of a coal loading facility on a Great Lake Harbor in terms of transport of coal particulate matter, using physical and chemical measurements and application of numerical modeling for water quality to the Duluth-Superior Harbor.
PROJECT MILESTONES: 05/77-Chlorination of dissolved polynuclear aromatics; 06/77-Quantitation of polynuclear aromatic hydrocarbons in H20 by HPLC-GC; 07/77-A selective synthesis of polymethylated naphthalenes; 07/77-End on 2nd year progress report; 07/77-Transport in the Duluth harbor; 06/77-Hepatic mixed-function oxidase activity in rainbow trout exposed.

TITLE: Analytical Procedures for Measuring Vinylidene Chloride
PROJECT NUMBER: N608-10
PRINCIPAL INVESTIGATOR: Teasley, J.I.
AFFILIATION: Environmental Protection Agency, Duluth, Minn. (USA). Environmental Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Teasley, J.I.
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$35,200
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: Objective of the study is the development and/or modification of existing analytical procedures which will measure both qualitatively and quantitatively vinylidene chloride as well as its products of degradation in environmental substrates.
APPROACH: Techniques of chromatography will be utilized including GLOO, HPIC and head-space analyses. Detection devices will include e.c., flame-ionization and ultraviolet. Phase separations will be employed to separate the parent component and its possible metabolites from various media. Aquatic animals will then be exposed to ascertain the possible uptake, accumulation and depuration of vinylidene chloride, as

well as the possible acute toxicity.
PROJECT MILESTONES: 04/78-Publish air/water analytical chemistry procedures.
KEYWORDS: AIR POLLUTION;EARTH ATMOSPHERE;WATER POLLUTION;CHEMICAL ANALYSIS;AQUATIC ORGANISMS;UPTAKE;BIOLOGICAL ACCUMULATION;TOXICITY;BIODEGRADATION;ENVIRONMENTAL TRANSPORT;CHLORINATED ALIPHATIC HYDROCARBONS

TITLE: Automated System for Monitoring Ventilatory Movements of Fish
PROJECT NUMBER: N608-13
PRINCIPAL INVESTIGATOR: Drummond, R.A.;Telega, P.;Andrew, R.W.
AFFILIATION: Environmental Protection Agency, Duluth, Minn. (USA). Environmental Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Drummond, R.A.
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$16,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: Develop computer programs that will automatically tabulate cough and opercular rates of fish, before and during exposure to toxicants, perform necessary data reduction and statistically analyze the results.
APPROACH: Electrodes are placed at each end of a chamber containing one free-swimming fish. Bio-electric (action potentials) signals associated with the animals' movements are picked up by the electrodes and transmitted to high-gain amplifiers. The amplified analog signals are digitalized and then transmitted to a mini-computer for analysis.
RESULTS: In the process of developing a computer program that will be capable of distinguishing action potentials produced by coughing movements from those associated with opercular movements, swimming activities and other background noises.
PROJECT MILESTONES: 08/77-Mini-computer purchased; 09/78-Computerized system installed and operating as planned.
KEYWORDS: FISHES;RESPIRATION;BIOLOGICAL MODELS;AUTOMATION;COMPUTER CODES;TOXICITY;DATA PROCESSING;DATA ANALYSIS;WATER POLLUTION

TITLE: Cough Response of Bluegill Sunfish (Lepomis Macrochirus) Exposed to Phenols
PROJECT NUMBER: N608-14
PRINCIPAL INVESTIGATOR: Carlson, R.W.;Drummong, R.A.;Fiandt, J.T.
AFFILIATION: Environmental Protection Agency, Duluth, Minn. (USA). Environmental Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Carlson, R.W.
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$19,200
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: Determine if increases in cough of bluegill sunfish can be used to rank phenols according to their toxicity.

APPROACH: The lowest concentration which causes a significant increase in cough rate of bluegills will be determined for each phenolic compound tested. The phenolic compounds tested will be ranked according to the lowest effective concentrations which cause a significant increase in cough rate; i.e., the lower this concentration is, the more toxic the compound. This ranking will be compared to one obtained from the results of acute bioassay tests completed for each compound. Both cough response and acute bioassays will be evaluated for their usefulness as methods for verifying the structure-activity vs toxicity model for phenolic compounds.
PROJECT MILESTONES: 09/76-Begin lab work; 09/77-End lab work; 12/77-Final report.
KEYWORDS: FISHES;RESPIRATION;WATER POLLUTION;TOXICITY;PHENOLS;BIOASSAY;BIOLOGICAL MODELS

TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The objective of this project is to determine if thermal response data derived from studies of fish samples from one latitudinal location in the U.S. provide a valid foundation for estimates of the anticipated thermal responses of the same species from other locations in the U.S.
APPROACH: The approach is to determine if thermal limits for survival, growth and development of the largemouth bass show significant differences between samples of bass obtained from the Minnesota-Wisconsin

area and from Tennessee. The experiment is further designed to evaluate the effects of where the tests are conducted. To accomplish this the same work plan, developed at ERL-Duluth, is being employed simultaneously at the ERDA lab at Oak Ridge and at the ERL-Duluth lab using interchanged subsamples of the same stocks of fish. Laboratory work at the ERL-Duluth laboratory has been completed and data processing is in progress.
RESULTS: Lab work at the ERDA lab is planned to extend into 1978.
PROJECT MILESTONES: (1) 03/76 Work plan. (2) 04/76 Lab work started. (3) 08/77 Lab work completed. (4) 10/77 Draft final report. (5) 02/78 Manuscript submitted.

TITLE: Development and Evaluation of Methods for Detection of Bacterial Indicators of Pollution in Water
PROJECT NUMBER: N608-19
PRINCIPAL INVESTIGATOR: Veith, G.L.;Fiandt, J.T.;Holcombe, G.;Kuehl, D.W.;Phipps, G.L.
AFFILIATION: Environmental Protection Agency, Duluth, Minn. (USA). Environmental Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISICN: Environmental Research Laboratory
MONITOR: Veith, G.D.
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$200,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The objective of this project is to determine if a correlation exists between selected biological endpoints and the chemical structure of selected groups of classes of organic compounds. If strong correlations exist, then the possibility of predicting the biological effects of groups of compounds instead of individual compounds might become possible.
APPROACH: The approach involves determining the toxic effects of a single group of chemicals (related structurally) to a single fish species. The initial chemical parameter to be correlated with biological effect will be partition coefficient.
RESULTS: Current work involves correlating the partition coefficients of 12 phenolic compounds with acute and chronic toxicity and bioaccumulation.
PROJECT MILESTONES: (1) 11/78 Correlation of chemical structure with acute toxicity of 12 phenolic compounds. (2) 12/78 Correlation of chemical structure with chronic toxicity of 6 phenolic compounds. (3) 02/78 Correlation of chemical residues in fish with chemical structure.

TITLE: Atmospheric Input of Trace Metals to Lake Michigan
PROJECT NUMBER: N608A-10
PRINCIPAL INVESTIGATOR: Eisenreich, S.J.
AFFILIATION: Minnesota Univ., Minneapolis (USA)
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Mullin, M.D.
TYPE OF FUNDING: Grant No.-R805172-01
77 FUNDING: Environmental Protection Agency FY77:$21,400
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of the research project is to determine loadings and deposition rates of selected trace metals to Lake Michigan from atmospheric sources.
APPROACH: The trace metal content of monthly integrating, bulk precipitation samples collected at 22 land-based stations, 2 in-lake buoy collectors and 2 wet/dry units will be measured. The bulk precipitation samples were collected at sites in Wisconsin, Illinois, Indiana and Michigan bordering Lake Michigan from July, 1975 to December, 1976. Trace metals (Zn, Cd, Pb, Cu, Ni, Fe, Co and Mn) will be analyzed by Atomic Absorption Spectrophotometry. Trace metal data will be reported in concentration units (micrcng/l), deposition rates (microng/cm2/month) and in total loadings to the Lake on an annual basis. Statistical techniques will be used to identify sources where possible.
PROJECT MILESTONES: 07/78 Final report due.

TITLE: Optimal Sampling Strategies for Water Quality in Large Lakes
PROJECT NUMBER: N608A-12
PRINCIPAL INVESTIGATOR: Canale, R.P.;Powers, W.F.
AFFILIATION: Michigan Univ., Ann Arbor (USA)
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Dolan, D.M.
TYPE OF FUNDING: Grant No.-R803754-02
77 FUNDING: Environmental Protection Agency FY77:$38,600
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The overall objective of the grant is to develop a methodology that will specify the optimal sampling strategy for large lakes by minimizing costs and experimental error and maximizing the value of the sampling information obtained.
PROJECT MILESTONES: (1) 09/76 Methodology developed, first example presented. (2) 09/77 Second example completed, sample delivered.
KEYWORDS: LAKES;SAMPLING;WATER QUALITY;OPTIMIZATION

<072925>
TITLE: Accumulation and Fate of Potentially Hazardous Substances in Recent Sediments of Lake Huron and Saginaw Bay
PROJECT NUMBER: N608A-14
PRINCIPAL INVESTIGATOR: Robbins, J.A.;Johansen, K.A.;Krezoski, J.R.;Remmert, K.
AFFILIATION: Michigan Univ., Ann Arbor (USA)
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Mullin, M.D.
TYPE OF FUNDING: Grant No.-R804686-02
77 FUNDING: Environmental Protection Agency FY77:$60,200
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The aim of this study is twofold: (1) to obtain present and historical rates of accumulation of metals and nutrients in the fine-grained deposits of Lake Huron and (2) to evaluate the role of resuspension and sediment-water exchange processes in the regulation of water quality.
APPROACH: Sedimentation rates are determined primarily from vertical profiles of lead-210 with fallout cesium-137 providing supplementary information. Concentration data in combination with sedimentation rates give estimates of the net flux of elements to sediments. Resuspension effects and particle sinking rates will be determined from standard and automated microtraps. Long-term resuspension effects will be estimated from resurvey of cesium-137 fine-grained deposits in the Bay. Diver-collected cores will be sectioned and sampled for pore water under conditions approximating the in-situ environment and direct flux measurements on recovered cores will complement pore water studies. The role of benthic fauna on sediment-water exchange will be investigated both in the field and in the laboratory. Multiple radiotracer methods will be used to determine the effect of selected benthos on their sedimentary environment.
PROJECT MILESTONES: 10/78-Final report due.

<072926>
TITLE: Polychlorobiphenyls in Precipitation in Lake Michigan Basin
PROJECT NUMBER: N608A-16
PRINCIPAL INVESTIGATOR: Murphy, T.J.
AFFILIATION: De Paul Univ., Chicago, Ill. (USA)
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Mullin, M.D.
TYPE OF FUNDING: Grant No.-R803915
77 FUNDING: Environmental Protection Agency FY77:$1,400
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objectives of the project were: (1) to determine the concentration of polychlorobiphenyls (PCBs) in precipitation in the Lake Michigan basin and to estimate the relative importance of this source of PCBs to Lake Michigan; (2) to obtain information on the distribution of PCBs in the atmosphere between material present as vapor and that absorbed on particulate matter, in order to understand the mechanism of transport of these compounds by the atmosphere.
RESULTS: PCB concentrations in the parts per billion range obtained from gas samples from a vented landfill indicate that PCB containing materials incorporated into landfills may be an important source of PCBs to the atmosphere.
PROJECT MILESTONES: 08/77-Final report in preparation.

TITLE: Impact of Zooplankton Grazing Upon Phytoplankton in Eutrophic Saginaw Bay and Western Lake Erie
PROJECT NUMBER: N608A-22
PRINCIPAL INVESTIGATOR: McNaught, D.C.
AFFILIATION: State Univ. of New York, Albany (USA)
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Thomas, N.A.
TYPE OF FUNDING: Grant No.-R804573
77 FUNDING: Environmental Protection Agency FY77:$75,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The ability of the herbivorous zooplankton to regulate algal productivity in highly eutrophic Saginaw Bay (Lake Huron) and western Lake Erie will be determined. Total grazing, as well as size-selective feeding on small flagellates as well as large diatoms and blue-green algae will be measured in the field. This information on important carbon fluxes is vital to the modeling team responsible for the ultimate synthesis of data on Great Lakes ecosystems. Field studies of grazing will depend on 14C tagging techniques.
APPROACH: In the laboratory the feeding habits of rotifers, often ignored, will be investigated using new particle counting techniques combined with computer analysis. All of these investigations will be based on progress made by an experimental team during Upper Lakes Reference Study.
RESULTS: Results already show that the crustaceans control algal production in open lake only during the fall months. Biological control of the growth of blue-green algae failed to develop in mid-summer. Discovery of the degree of biological control in the most eutrophic areas of the Great Lakes is vital to understanding the functioning of these ecosystems, ultimately producing validated simulation models for them, and finally managing algal bloom problems.
PROJECT MILESTONES: 04/77-Annual report. 04/78-Annual report. 04/79-Annual report.

TYPE OF FUNDING: Grant No.-R805333-01
77 FUNDING: Environmental Protection Agency FY77:$75,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of this project is to construct a thorough description of the composition, distribution and correspondence to prominent environmental features (e.g., sediment texture, concentrations of toxic chemicals) of benthic animals in Lake Michigan.
APPROACH: A set of 302 samples arrayed over the entire lake was collected by the Canada Centre for Inland Waters in 1975. These samples will be processed under the present contract and supplemented by an additional 252 samples concentrated in the nearshore areas (less than 60 m deep) of the main basin in July

1977. Data from both sets of samples will be analyzed particularly for information about indicator species, so that a benchmark for future comparisons and assessments of relative improvement or deterioration of the benthic environment will be available. Descriptions of other basic characteristics of the benthos, such as arrangements of species into assemblages, and geographical gradients in assemblages which are related to climate or circulation patterns in the lake will also be undertaken.

AFFILIATION: New York State Dept. of Health, Albany (USA). Div. of Labs. and Research (USA)
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Bierman, V.J.
TYPE OF FUNDING: Grant No.-R804689-02
77 FUNDING: Environmental Protection Agency FY77:$75,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: In freshwater environments, limiting nutrient for biological production is frequently P followed by N. Recent studies of nutrient, limited growth in phytoplankton revealed that growth rate is regulated by intracellular nutrient pool(s). In case of P, cellular inorganic polyphosphate (PPi) is the growth regulating pool in Scenedesmus sp. and this pool also appears to affect P uptake along with external P levels. For N, such a reserve compound has not been investigated. Therefore, it will be investigated whether the involvement of PPi in P-limited growth and P uptake is universal in organisms belonging to various taxonomic groups and whether there exists N pool(s) similar to PPi for N-limited growth and N uptake. Attempts will be made to develop kinetic models for growth and N and P uptake involving nutrient pools. The transition between N and P limitation is an important aspect in polluted environments. Growth during this transition is described by a simple threshold equation of nutrient-limited growth. This implies that differing optimal N/P ratio in competing species may be a basis for competitive exclusion and coexistence. Therefore, the variability of the ratio in various species will be studied. In addition to the above problems, the effect of the major environmental variables, temperature and light, on growth and nutrient uptake will be investigated. Emphasis will be placed on the phytoplankters of the Great Lakes and experimental studies will involve the examination of kinetics in continuous culture.

TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The distribution of major nutrients and hazardous substances in Saginaw Bay will be surveyed during 15 cruises in 1976. Objectives of the study are to: support the continuing development and verification of nutrient transport and productivity models; define the distribution and fate of hazardous substances in bay water sediments; and biota. Sampling and in situ monitoring will be conducted at 15 primary stations offshore and 5 secondary stations inshore (i.e., marsh and island littoral zones). Samples of sector, surface films, sediments and aquatic organisms will be analyzed for metals (zinc, copper, cadmium) and organic contaminants (chlorinated hydrocarbons, polynuclear aromatic hydrocarbons, phthalate esters). These and supplemental data will be used to develop a description of mass balance for Saginaw Bay. All cruises will coincide with satellite (ERTS) coverage of the area. This work is part of a continuing EPA study of water quality dynamics in Saginaw Bay, begun in 1973.

TYPE OF FUNDING: Grant No.-R804402
77 FUNDING: Environmental Protection Agency FY77:$37,400
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The primary objectives of this project are to carry out laboratory studies on the nutritional requirements and characteristics of Cladophora glomerata, to evaluate its nutrition under field conditions, and to utilize the results in explaining the occurrence of nuisance Cladophora growths in the Great Lakes and in developing measures to reduce the growths. Emphasis in the laboratory aspects will be in evaluating the effectiveness of Cladophora glomerata in competing with diatoms and other organisms for P and other nutrients likely to be critical in the abundant growths of C. glomerata. C. glomerata and other Lake Michigan organisms will be grown in mixed cultures and made to compete for growth-limiting amounts of critical nutrients. The minimum solution concentrations at which C. glomerata can absorb adequate P and other key nutrients also will be established and compared with similar values for other competing organisms. The emphasis in the field work will be to establish whether the available supply of a specific inorganic or organic nutrient is a key factor in controlling nuisance Cladophora growths in Lake Michigan and particularly Green Bay. These evaluations will be by various biological assays with emphasis on the techniques of plant analysis.

TITLE: Analysis of Planktonic Diatoms from Open Lake Michigan Water
PROJECT NUMBER: N608A-4
PRINCIPAL INVESTIGATOR: Beeton, R.H.
AFFILIATION: Michigan Univ., Ann Arbor (USA)
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Thomas, N.A.
TYPE OF FUNDING: Grant No.-R805138

77 FUNDING: Environmental Protection Agency FY77:$11,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: Two-hundred thirty-five water samples will be analyzed, qualitatively and quantitatively, for species of planktonic diatoms. The samples, now concentrated and preserved, were taken year-round from 5 locations on 47 separate dates from a water intake of a railroad ferry on a transect across Lake Michigan. Analysis of these samples will identify possible differences between the diatoms of inshore and offshore waters and provide the first year-round data of the diatom community in offshore as well as inshore water of Lake Michigan. Various graphical displays and biometric analyses of the data such as contour and isometric projection graphs, principal components analysis and hierarchical or grouping will be used to aid in interpretation of the data. Multiple regression and canonical correlation analyses will be used to determine structural relationships between physicochemical parameters, previously analyzed, and the diatoms.
PROJECT MILESTONES: 02/78 Final report.

TITLE: Growth of Cladophora Glomerata--Relationships to Trace Nutrients, Herbivores and Ecosystem Functioning
PROJECT NUMBER: N608A-5
PRINCIPAL INVESTIGATOR: Patrick, R.;Bott, T.;Larson, R.;Rhyne, C.
AFFILIATION: Philadelphia Academy of Natural Sciences, Pa. (USA)
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Thomas, N.A.
TYPE OF FUNDING: Grant No.-R805106
77 FUNDING: Environmental Protection Agency FY77:$125,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: One objective of the proposed program is to investigate the effect of trace metal and organic phosphorus micronutrients on the growth of Cladophora glomerata. The other is to evaluate Cladophora as a food source for selected herbivores and omnivores. These studies will also aid in understanding how Cladophora growths develop in nature and will permit evaluation of the effect of Cladophora growth on ecosystem structure and functioning.
APPROACH: Cladophora growth studies of two types are planned: micronutrient addition experiments with unialgal cultures, and competition experiments with other algae in microcosms held under near natural conditions in a greenhouse laboratory. Feeding studies will include: food preference experiments, growth experiments, and energetics experiments. The effect of Cladophora growths on the structure and functioning of aquatic communities in streams will be studied in experimental ecosystem streams, in which natural communities can be maintained.
PROJECT MILESTONES: 12/77 Interim report. 12/78 Final report.

TITLE: Application and Development of Eutrophication Planning Models for Lake Ontario
PROJECT NUMBER: N608A-7
PRINCIPAL INVESTIGATOR: Thomann, R.V.;Jeris, J.S.;O'Connor, D.J.;Matystik, W.F.;Bartone, C.
AFFILIATION: Manhattan Coll., New York (USA)
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Richardson, W.L.
TYPE OF FUNDING: Grant No.-R803630
77 FUNDING: Environmental Protection Agency FY77:$157,600
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The primary effort to date on the mathematical modeling of eutrophication in Lake Ontario has been directed towards several areas: (a) initial sensitivity runs using the Lake 3 model; (b) extensive compilation, reduction and plotting of the IFYGL data base; (c) completion of a verification analysis framework for the Lake 3 model; (d) development and preliminary verification of a model of Rochester embayment; (e) reduction and analysis of data on phytoplankton group for a multi-species model.
APPROACH: A detailed and intensive investigation using a three-dimensional representation of phytoplankton growth in Lake Ontario (Lake 3) is one of the objectives of these efforts. The lake wide Lake 1 model which previously has been verified and used for lake wide simulation will be used to further develop the kinetic interactions. Particular emphasis will be placed on an analysis to provide insight into the effect of long term model coefficients (sinking rate and nutrient losses) on phytoplankton dynamics. Work will also begin on a first conceptualization of a model of hazardous substances and the interaction of such a model with the biomass models of Lake 1 and Lake 3.
PROJECT MILESTONES: 01/78 Complete Lake-3 model of Lake Ontario and report. 01/76 Complete development phase of Rochester embayment model. 03/78 Refine Rochester embayment model--Phase II. 03/76 Complete eutrophication model framework for Lake Michigan. 03/78 Conceptualize multi-species model for Lake Ontario. 01/78 Initial report in *Eco* series report. 03/78 Verify and refine Lake-1 model to 8 years data for Lake Ontario.

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objectives of this project are to determine the acute and chronic effects of cyanide, cyanide complexes, and other inorganic and organic material on freshwater fish and invertebrates. Subsidiary objectives are (a) to determine effects of temperature pH, and oxygen on cyanide toxicity; (b) to determine additive or synergistic relationships between heavy metals and cyanide; (c) to determine which life history stages of fish and invertebrates are the most sensitive; (d) to determine application

factors which can be applied to short term test results to predict safe levels of cyanide or cyanide complexes; (e) to determine cumulative effects of cyanide on successive generations of fish; (f) to determine the acute toxicity of various compounds to Daphnia magna and fathead minnows; (g) to determine the effects of these materials on the embryos and the larvae of fathead minnows, and (h) to determine the effects of these materials on Daphnia magna in a life cycle test. These objectives are considered to be important because chronic effects of cyanide and many other toxicants have not been described.
PROJECT MILESTONES: 11/77 Final report--volume 1.

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The proposed work is to investigate the feasibility of utilizing for fishes clinical procedures which are accepted in determining the status of specific organ function in man.
APPROACH: The relative hepatotoxicity of two chlorinated benzene compounds, hexachlorobenzene and 1,2,4,trichlorobenzene will be investigated in Rainbow trout. The hepatotoxicity of each compound to trout will be assessed through clinical procedures which have previously been established as sensitive indicators of liver function in this fish. Histopathological studies will be conducted to correlate specific liver pathology with the degree of apparent functional impairment.
RESULTS: The study will evaluate liver function in the trout following regimes of both subacute and chronic exposure to the proposed toxicants.
PROJECT MILESTONES: 09/78 Evaluation of organ function tests with fish to predict chronicity.

TECHNOLOGY: FOSSIL FUEL/General (50%);NUCLEAR/General (50%)
PROJECT DESCRIPTION: The main objective of the studies is to provide information on the water temperature regimes encountered in eight experimental field channels in which biological experiments are conducted. Heated water is discharged through these channels at low flow velocities.
APPROACH: Field measurements of water temperatures and mathematical models are used to achieve the objective. Field data are subjected to statistical and regression analysis to give information on longitudinal water temperature gradients, diurnal water temperature fluctuations, vertical stratification, longitudinal dispersion, and rate of surface heat loss. Correlation with weather parameters will be provided. Soil temperature conditions are also surveyed.
PROJECT MILESTONES: 07/75 Initiate field measurements. 04/77 Completed development of physical model. 09/77 Completed all field measurements for verification. 03/78 Complete draft final report.

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: This project will measure the effectiveness of several bioassay procedures and chemical tests for defining quality of harbor sediments subject to removal by dredging.
APPROACH: Results of chemical tests for concentration of volatile solids, COD, total kjeldahl nitrogen, oil and grease, PCBs, selected pesticides and polynuclear aromatic hydrocarbons in harbor sediments and/or their interstitial waters will be determined and related to the following: (1) concentration of metals and organic pollutants in chironomicae removed from the sediments; (2) cough response of bluegill sunfish in bioassays using sediment interstitial waters; (3) survival of Daphnia sp. in bioassays with sediment and surficial waters; (4) behavior and survival of Hoxagenia sp. in harbor sediments; (5) bioaccumulating potential, as defined by the lipid/water partition coefficient of organic chemicals in interstitial water will be defined from relationships to concentration in Chironomidae; (6) activity of enzymes in sediment interstitial waters; and (7) bioconcentration of organic pollutants by fish.
RESULTS: The project will provide several reliable and inexpensive short-term tests for accurately defining the pollution status of potential harbour dredge materials.

PROJECT MILESTONES: 09/78 Final report.

77 FUNDING: Environmental Protection Agency FY77:$61,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The final goal for this project is the correlation of toxicity in a particular ecosystem with chemical speciation and use of these correlations to determine realistic water standards. Biological activity most commonly correlates best with specific forms of species of contaminants and water quality standards would be more soundly structured on the probability of an offending species being present or available. Three areas of activity are involved in meeting project goals: A. Predictive computer modeling utilizing speciation and toxicity data; B. Assembling a data base on speciation from literature, experiment, and estimation. C. Collection and interpretation of toxicity data from literature and experimentation. To date, substantial progress has been made on parts A and B.
PROJECT MILESTONES: 10/78-Complete draft of revised chemical speciation model; 10/79-Complete final revised chemical speciation model; 10/79-Apply model to representative water quality criteria.

77 FUNDING: Environmental Protection Agency FY77:$21,000
TECHNOLOGY: FOSSIL FUEL/General (34%);NUCLEAR/General (33%);GEOTHERMAL/General (33%)
PROJECT DESCRIPTION: To determine whether chronic effluent bioassays with daphnids can be used to determine how much that effluent must be diluted before it will not have an unacceptable effect on the biota of the receiving stream.
APPROACH: Five-weed bioassays will be conducted with dilutions of a complex industrial effluent using Daphnia magna and D. parvula. These will be compared to chronic bioassays run in undiluted stream water collected from stations downstream from the point of effluent discharge. Both kinds of bioassays will be compared to macroinvertebrate fish and pariphysic communities at downstream stations in the receiving waters. Toxicant concentrations at the sampling stations will be compared to effluent dilutions causing no adverse effect on bicassay test organisms to determine whether the bioassays can predict where the stream biota will have recovered from the effluent stress.

TITLE: Analysis of Nutrient and Toxic Chemical Fluxes in Great Lakes Sediment
PROJECT NUMBER: N608A-9
PRINCIPAL INVESTIGATOR: Ditoro, D.M.;Jeris, J.S.;Matystic, W.
AFFILIATION: Manhattan Coll., New York (USA)
MONITORING AGENCY: Environmental Protection Agency, Duluth, Minn. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Richardson, W.L.
TYPE OF FUNDING: Grant No.-R805229
77 FUNDING: Environmental Protection Agency FY77:$124,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The analysis of nutrient and toxic chemical fluxes in sediment require a set of

mathematical equations which describe both the mass transport of the material via the dispersion of the pore waters and the dissolved species and the solid phases of the sediment. In addition, it is necessary to formulate and test the proper chemical models which describe the interactions between the dissolved species and solid phases, whether they be precipitations/dissolutions or adsorptions/desorptions. It is these underlying theoretical problems and their applications to Great Lakes problem settings which is the subject of the proposed research. The general approach will be to formulate the mass transport equations together with the reversible reactions in a general way. The equations will be transformed into a set of much smaller and simpler equations which do not explicitly contain the reversible reaction kinetic terms which cause computational difficulties. The transformed equations can then be solved numerically or analytically in a simple and straightforward manner and the chemical equilibria calculations can also be done in a straightforward manner using chemical equilibrium.
PROJECT MILESTONES: 03/79-Finalize quantitative framework for mass transport in Sed.; 06/79-Application of framework to Lake Erie eutrophication; 12/79-Incorporate toxic substances in model; 03/80-Continue verification and improvement of Great Lake Eutrophication; 06/80-Prepare final project report.

TYPE OF FUNDING: Grant No.-R805274-01
77 FUNDING: Environmental Protection Agency FY77:$49,500
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The principle objective of this project is to determine how the effects of a sublethal amount of toxicant on fish ventilatory behavior varies with the pattern of its application. A microcomputer will be used to precisely control toxicant levels and monitor fish responses, including breathing and coughing rates. Fish will be exposed in different tests to a previously determined sublethal quantity of toxicant over a 96 hour test period. The pattern of application of this fixed amount of toxicant will be either constant, continually increasing, continually decreasing, oscillating about a mean level, or introduced in short bursts of higher concentration. The change in ventilatory activity of each fish from its level prior to exposure to the toxicant will be evaluated statistically. Conclusions will be drawn on the implications of this data for setting waste effluent discharge standards and the operation of biological monitoring systems.

TYPE OF FUNDING: Grant No.-R805290-01
77 FUNDING: Environmental Protection Agency FY77:$84,900
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: This proposal specifies research and development which will be carried out at the Monticello Ecological Research Station, Monticello, Minnesota, which will be devoted towards the instrumentation of controlled environmental channels with automatic data recording equipment. This research and development will provide instrumentation to position fish in the channels to the nearest 50 feet. Additionally, data on environmental measurements such as temperature and other pollutant stresses as may be specified, will be recorded simultaneously with the position of the fish. Positioning will require attachment of miniature radio tags to the experimental animals. Subsequent to the development of the automatic data recording system the proposal outlines work to evaluate the effects of these miniature transmitters on the fish. We plan to compare various behavioral and physiological parameters between control and radio tagged fish using several attachment procedures. It is important that this work be executed since at the current time it is impossible to completely separate effects of instrumentation from the effects of pollutant stresses.
PROJECT MILESTONES: 08/77-Initiate field measurement of electromagnetic radiation system; 05/78-Initiate biological assessment of prototype transducers; 08/79-Project draft final report.

TYPE OF FUNDING: Grant No.-R805291-01
77 FUNDING: Environmental Protection Agency FY77:$31,500
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objectives of the proposed research are to determine the toxicity of metallocyanide solutions with special reference to iron and copper compounds of cyanide as they are affected by environmental parameters. A second objective is to give special attention to photodecomposition. A third objective will be to investigate the chemistry of copper-cyanide complex solutions to help evaluate the toxicity of various copper-cyanide complex forms. The plan of work will be divided into two phases: the

first will be an investigation of photolysis reactions of iron cyanide as affected by various factors; the second will deal with the chemistry of cuprous and cupric cyanide complexes and the toxicity of the dicyanocuprate ion to the fathead minnow. After the effect of photodegeneration is determined chemically, the toxicity of resulting components will be determined. The chemistry of copper-cyanide complex solutions will be investigated by setting solutions in which cupric or cuprous copper and sodium cyanide are combined. The rates of dissociation and formation of the cuprous cyanide complex ion and the HCN equilibrium levels in solutions of varying total cyanide concentration of pH and cyanide-to-copper molar ratios will then be examined in detail
PROJECT MILESTONES: 07/78-Final report.

77 FUNDING: Environmental Protection Agency FY77:$16,000
TECHNOLOGY: FOSSIL FUEL/General (34%);NUCLEAR/General (33%);CONSERVATION/General (33%)
PROJECT DESCRIPTION: To develop test methodology for short and long-term controlled release pesticide studies, to determine solubility and degradation product of selected controlled release pesticides, and to determine the hazard to aquatic life from the use of controlled release pesticide formulations which extend the persistence of so called non-persistent pesticides. Research will be conducted in three distinct phases over a 2-1/2 year period. These are as follows: a. Solubility, degradation, and methodology studies. These will be used for general supportive data and to determine methodology for studies in phases b and c. b. Short-term bioassays which include 96 hr statics and 30-day flowthrough tests on sensitive life stages, i.e., larval. c. Long-term studies that will include toxicant levels that will be used on target organisms in the natural environment. Encapsulated methyl parathion has been selected as the first controlled release pesticide for study. Methods for toxicant delivery are being determined. Since solvents immediately leach methyl parathion from the capsules, a method is being devised whereby water saturation can be achieved without solvent usage.
PROJECT MILESTONES: 11/76-Work proposal; 08/77-Began laboratory work; 08/79-End laboratory work; 11/79-Draft final report; 12/79-Submit for publication.

TECHNOLOGY: FOSSIL FUEL/General (34%);NUCLEAR/General (33%);CONSERVATION/General (33%)
PROJECT DESCRIPTION: This research has the objective of determining the effects of dieldrin on the dynamics of populations of guppies and their prey organisms, amphipods, copepods, and microorganisms--interacting in laboratory ecosystems. The prey organisms of the guppies are supported primarily by the addition of food material prepared from dried alfalfa, and the guppy populations are exploited by removal at different rates in different treatment. Ancillary aquarium experiments on the effects of the pesticide on survival, reproduction, and growth of guppies and their prey organisms are conducted in order to be able to evaluate, by comparison to the ecosystem study results, the adequacy of such relatively simple and more generally employed experiments for predicting effects in more complex ecological systems. These aquarium studies will, in addition, provide information of value in interpreting the effects of the pesticide in the laboratory ecosystem experiments.

PROJECT MILESTONES: 09/76-Complete construction of test systems and add test organisms; 09/77-Add pesticide to test systems and begin collection; 09/78-Continue collection of microcosm and individual organism; 09/79-Complete all experimental work; 10/79-Complete draft of final report.

PROJECT DESCRIPTION: A methodology has previously been developed for the study of metallic wastes in combined domestic and industrial sewage.
APPROACH: The methodology is based on general chemical model of the waste and of various dilutions of the waste with seawater and has been applied to the specific case of the Los Angeles County wastewater discharge. It is proposed to extend and improve this work using a new case study such as the dumping of concentrated acidic metallic wastes. The proposed work will involve inclusion of new chemical data in the model, improvement of existing computer program for efficiency and convenience, simplification and generalization of absorption subroutines and, if necessary, implementation of specific kinetic subroutines related to the acid waste disposal problem.
RESULTS: The goal of the project is to improve our predictive capabilities for routine use in the various monitoring, impact assessment and regulation activities associated with metallic waste disposal.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To determine if and how petroleum hydrocarbons affect chemoreception and chemically-stimulated behavior in marine animals. Chemoreception and behavior of lobsters: (a) Measure effects of 0.1-1.5 ppm No. 2 fuel oil (Water Accommodated Fraction) on feeding and general behavior of lobsters: detailed behavior analysis. Determine the narrow range of exposure levels that cause effects on chemically stimulated behavior, without causing gross neuromuscular deficiencies. (b) Document stimulus effects of direct application of 1-10 ppm No. 2 fuel oil (WAF) on neurophysiological responses of antennular chemoreceptors of lobsters. (c) Determine effects of different petroleum hydrocarbon fractions on lobster behavior and chemoreception using selected compounds from chemically separated fractions. (d) Determine contribution of oil-affected chemoreception on behavioral deficits: neurophysiology and morphology of oil-exposed lobster antennules, comparison of oil effects on lobsters with and without antennules, synthesis of project results. Chronic effects on field populations: (a) Compare feeding, substrate selection, and anti-predator behavior of three inshore species (Crangon septemspinosus, Fundulus heteroclitus, and Pseudopleuronectes americanus) from oil spill and uncontamined sites along Buzzards Bay, Massachusetts. (b) Compare feeding and general behavior of lobsters (Homarus americanus)
APPROACH: Behavioral and neurophysiological bioassays; flow-through oil dosing; chemical monitoring of exposure levels.
RESULTS: Low sublethal levels of No. 2 fuel oil (WAF) interfere with lobster feeding behavior and oil acts as a chemical stimulus on distance chemoreceptors.
PROJECT MILESTONES: (1) 10/78 Final Report entitled, ''Sublethal effects of oil on behavior and chemical senses of marine animals.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To conduct analytical chemical studies in support of ecological damage assessment of acute and chronic discharges of petroleum into the near-shore marine environment. These studies will include the following: (1) Chemical analyses of petroleum compounds in selected samples of water, sediments and organisms using a variety of analytical procedures (e.g., column, thin-layer, liquid and gas chromatography; infrared and fluorescence spectroscopy; and combined gas chromatography-mass spectrometry). (2) Development of new methods and modification of existing procedures in support of toxicological and field studies. (3) Participation with other federal laboratories in the development and intercalibration of standard reference materials and methods for petroleum analysis.
APPROACH: Samples will be collected from selected spills of opportunity and sites of chronic oil discharges. The basic analyses of these samples will involve extraction, isolation of petroleum compounds by column and/or thin-layer chromatography, and analysis by gas chromatography using packed metal columns and glass capillary columns. Selected sample extracts will also be analyzed by high pressure liquid chromatography, infrared and fluorescence spectroscopy, and combined gas chromatography-mass spectrometry. In combination with field evaluation and laboratory toxicological investigations, the proposed research will allow a highly integrated, multidisciplinary study of the fate and effects of oil on the marine ecosystem.
PROJECT MILESTONES: (1) 9/80 Final report entitled, ''Chemical studies directed toward ecological damage assessment of petroleum discharges into the marine environment.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Project objective is to supplement the existing data base for marine water quality criteria for temperature. Of particular interest is the consequences of long-term, low level thermal elevations on marine systems. Attention is given here to the indirect effects of prolonged thermal addition on interspecific relationships and community dynamics. The fouling community is employed as the study assemblage.
APPROACH: Ceramic panels are submerged in replicated tanks which are maintained at 0, 2, 4, and 6 degrees C over the natural ambient temperature cycle. Estuarine water is delivered to the near-sea level laboratory barge by a low speed, low head pump equipped with recessed impeller. Field developed and laboratory developed communities are monitored monthly by a non-destructive 75-point sampling technique to document community structure. Life cycle aspects of community dominants are recorded from the community plates or other special study plates, providing data on spawning and larval recruitment and density growth patterns, attainment of reproductive maturity and senescence. There is good diversity on larval plates in this laboratory system, but as the community develops, only three or four species remain as dominants.
RESULTS: Project will run a total of 15 months as a single experiment at ERL-Narragansett. A parallel study being conducted with the warm temperate fouling community at Duke University Marine Laboratory, Beaufort, NC, will continue for an additional two years to further examine conclusions from the Narragansett study.
PROJECT MILESTONES: (1) 7/75 Begin, design, and fabrication of experimental system. (2) 3/76 Experimental system on line, no heat. (3) 8/76 Experimental system on line, with heat. (4) 11/77 Complete thermal exposure tests. (5) 6/78 Complete written reports.

REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/South;COASTS/Other coasts All coastal regions;HYDROGRAPHIC AREAS/Other hydrographic areas All coastal regions
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this project is to elucidate a series of sub-lethal behavioral and physiological parameters to quantify pollutant stress in zooplankton and motile invertebrate larvae. Parameters to be studied include patterns and rates of swimming, motile responses to specific stimuli (light, gravity, food or other chemical cue), feeding, growth and energy budget, and histology.
APPROACH: Behaviors are recorded on video tape and shifts in behavioral patterns quantified by computerized analysis of the tape. Images of study organisms are expressed as X-Y coordinates for each video frame and then analyzed on a time basis to calculate such variables as linear velocity, angular velocity, and rate of change of direction. Behaviors of interest are those which are clearly typical of the field situation and which can be related to population success. Response to environmental cues which influence water column position (vertical migration) of estuarine forms, or swimming responses to sex pheromes are two cases in point. In addition, consequences of pollutant dosing on feeding and metabolic physiology of developing larvae or zooplankton are conducted simultaneously in order to further relate overt behavioral

alterations to developmental success. Metabolic, feeding, assimilation, and growth rates are determined to construct an energy budget for dosed and non-dosed organisms. These budgets are utilized, along with long-term developmental success, to interpret observed shifts in motile behavioral response.
!SULTS: Studies to date with larvae of several species (Balanus spp; Cancer spp; Crepidula fornicata) indicate that the proposed sub-lethal parameters will demonstrate adverse toxicant effects at one to two orders of magnitude below that indicated by general developmental parameters alone.
PROJECT MILESTONES: (1) 6/76 Computerized system delivery, initial in-house project. (2) 6/77 System proven for routine behavioral research. (3) 9/78 Report on behavioral/growth studies with barnacle larvae. (4) 12/78 Report on physiological studies with Crepidula larvae. (5) 6/79 Report on behavioral/physiological studies with Cancer larvae. (6) 12/80 Final report on project.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this research is to develop a benthic bioassay system, with an ecologically meaningful set of sub-lethal response parameters for the deposit-feeding fauna (e.g., Nephtys, Yoldia, and Nucula).
APPROACH: Initial research tasks include development of techniques to quantify sub-lethal effects of pollutant stress on these three dominant benthic deposit feeders, and examination of certain biological aspects (growth rates, reproductive seasons, burrowing rate--metabolic rate/temperature relationship, laboratory food requirements) which are requisite to intelligent design of a future laboratory benthic bioassay system. The final phase entails scaling up small laboratory benthic test systems used for the above work to make them omerable for routine bioassay testing of an array of organic, inorganic, and mixed contaminants. Burrowing rates and behavior, feeding and growth were studies on the polychaete Nephtys incisa by direct observation of thin aquaria or indirectly while held in laboratory ''in-situ'' sediment set ups. Observations made over the full annual temperature range (0-24 degrees, at 6 degrees increments) were compared with field benthic observations and collections of the worm. Whole animal metabolism is measured seasonally in the laboratory to provide an energetic base line. This work will be completed by December, 1977. Development of the definitive laboratory benthic bioassay system will require size experiments to define optimum size and configuration of the test unit, adoption of criteria to assess achievement of chemical equilibria benthic sediments, and determining methods to establish the benthic fauna and to achieve uniform flow-through toxicant dosing. Upon final development of this test procedure, whole system responses will be explored as additional indices of pollution stress to supplement the single species indices cited above.
RESULTS: (1) 1/76 Initiate response parameter development for benthic deposit feeders. (2) 6/78 Complete response parameter development for benthic deposit feeders. (3) 6/78 Initiate laboratory benthic bioassay system development. (4) 12/79 Benthic bioassay pilot studies complete. (5) 12/80 Verify performance benthic bioassay system with diverse toxicant complete.

PROJECT DESCRIPTION: Construction of a laboratory system which will provide running seawater at ambient temperature and at 2 degrees C, 4 degrees C, and 8 degrees C above ambient.
APPROACH: Fouling development and changes in fouling community structure will be followed at each temperature for several years on clay tile plates (232 square centimeter) submerged in October 1975 and April 1976. Larval recruitment at each temperature will also be monitored. Parallel experiments will be conducted simultaneously on plates submerged under the Duke Marine Lab dock.
RESULTS: Data will be used to determine the effect of heated effluents on community structure and function.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (a) To develop a facility and methodology for the experimental analysis of coastal marine ecosystems and their response to energy-related environmental stresses. (b) To relate the experimental results to ecosystem theory and its implications for the management of coastal marine environments.
APPROACH: Replicate meso-scale experimental ecosystems simulating a variety of coastal marine environments will be developed and maintained at a special shore-based laboratory. A number of stresses or environmental perturbations associated with energy development will then be applied over a range of intensities to these systems before, during, and after the application of stress. Similar field experiments may also be carried out on a small scale in some environments.
RESULTS: The first project will involve 9 shore-based experimental water columns (5 m deep x 2 m dia.) with associated bottom sediments and benthos. The microcosms will first be studied for replicability and for differences between tanks that are run as open or closed systems with respect to seawater flow. After this preliminary work is completed, a series of experiments involving the addition of water soluble petroleum hydrocarbons at concentrations of 100 and 1000 mu g/l will begin.

MONITOR: Perez, K.T.
TYPE OF FUNDING: Grant No.-R803983-02
77 FUNDING: Environmental Protection Agency FY77:$184,000
TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: To document the response of a tropical estuary ecosystem (Kaneohe Bay, Hawaii) to the removal of sewage stress and then to arrive at adequate theoretical bases to predict those responses.
APPROACH: To sample components of the ecosystem at frequent time interval approach over a period preceding the sewage diversion and then afterwards; to simulate the change in sewage regime in tank microcosms, and to build mathematical models which describe the responses. To accomplish these goals, the program is divided into seven working groups: chemistry, phytoplankton, zooplankton, nekton, benthes, microcosms, coordination.
RESULTS: Current plans call for beginning the above programs as soon as possible in order to get adequate baseline data before the projected early 1977 sewage diversion and then to continue for at least one year (if necessary, longer) past the time of diversion.

TYPE OF FUNDING: Contract No.-68-03-2543
77 FUNDING: Environmental Protection Agency FY77:$9,500
TECHNOLOGY: FOSSIL FUEL/General (50%);NUCLEAR/General (50%)
PROJECT DESCRIPTION: The contractor shall analyze marine samples of water, organisms, and sediments by instrumental neutron activation analysis. Samples will be provided by the project officer. Analysis shall include data reduction so that data can be returned to the principal investigator in concentration form (e.g. microgram element per gram sample). Samples to be analyzed will include (1) plankton, (2) bottom dwelling invertebrates, i.e. clams, worms, etc., (3) fish, (4) marine sediments, and (5) seawater. Under routine circumstances, a sample load of approximately 40 samples per week may be estimated. However,

changing program emphasis may require additional elements to be quantified or lower detection limits to be obtained. Such efforts are at the current state-of-the-art and will require developmental efforts to ensure data generated is legally defensible. In these cases, it is understood that fewer than 40 samples will be processed in a week. Reports shall consist of the results of analysis reported on a microgram per gram basis or other appropriate units. In addition, a summary letter report shall be prepared each month showing the number and kinds of samples analyzed.
PROJECT MILESTONES: Monthly summary letter reports, no final report.

TECHNOLOGY: FOSSIL FUEL/General (50%);GEOTHERMAL/General (50%)
PROJECT DESCRIPTION: A surveillance of four collectives of pollutants in U.S. coastal waters is being carried out through their concentrations in two sentinel organisms--mussels and barnacles. The pollutant species include heavy metals (lead, cadmium, mercury, selenium, zinc, silver and copper), chlorinated hydrocarbons (DDT residues, polychlorinated biphenyls, hexachlorbenzene, dieldrin, endrin, heptachlor, benzene hexachloride, cis and trans chlordane and the insecticidal derivatives oxychlordane and heptachlorepoxide); artificial radionuclides (plutonium-238, plutonium-239 and -240; americium-241 and cesium-137); and petroleum hydrocarbons (to include measures of the concentrations of alkanes, cycloalkanes and aromatics, including 2, 3, 4, and 5 ring polynuclear condensed species). The program includes sites off the east, west and Gulf coasts of the U.S. as well as off Alaska, Guam and Samoa. Over two hundred and fifty samples will be taken during the first two years of the project and analyzed in 8 laboratories, two for each set of pollutants. Interlaboratory comparisons are being made on the pollutant analyses. The goals of the program will be the assessment to the U.S. coastal waters for the support of marine resources such as food from the sea, the vitality of communities of marine organisms and the continued use of non-living resources such as beaches and harbors and the prediction of future exposure levels of pollutants based upon the best existing information and models.

MONITOR: Beck, A.D.
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$57,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The primary objective of this research is the development of methods and techniques to formulate laboratory diets for larval and juvenile marine fish. Such diets are needed in order to achieve high levels of survival and field-comparable growth of laboratory-cultured animals. If successful, the laboratory marine fish will exhibit minimum variability in the lab bioassay due to nutritional stress. Menidia menidia will be used as a test fish.
APPROACH: Test diets will be evaluated for protein availability and storage stability. The nutritional status of field and diet-fed populations will be compared. The life history stages will include eggs, yolk-sac larvae, post-yolk-sac larvae and juveniles.
RESULTS: Apparent nutritional needs will be determined by qualitative analysis of eggs, yolk-sac larvae, post-yolk-sac larvae and juveniles. The sources of nutrients will be determined by qualitative analysis of laboratory-prepared live or artificial food materials. The test diets formulated from qualitative information will then be assessed for protein availability and storage stability using growth studies with the test fish. Finally, the nutritional status of the larvae and juveniles will be compared with field populations using appropriate response parameters: survival, growth, biochemistry, behavior, and stress response.
PROJECT MILESTONES: (1) 12/77 Determine feasibility of existing artificial diets. (2) 10/78 Final report--nutritional requirements of Atlantic silversides. (3) 12/78 Standard laboratory diet for whole life cycle culture of Atlantic.

TECHNOLOGY: FOSSIL FUEL/General (20%);NUCLEAR/General (20%);GEOTHERMAL/General (20%);SOLAR/General (20%);CONSERVATION/General (20%)
PROJECT DESCRIPTION: The objectives of these studies are to test a new bioassay method at different laboratories to determine the method variances due to operators, seawaters, and organism source.
APPROACH: Work has been completed on a polychaete bioassay using Capitella capitata using cadmium as a toxicant. Variances due to operator and water source and transport offset species were examined. A study using Mysidopsis bahia, whole life cycle flow-through assays evaluating sublethal parameters is currently under way. The Capitella study involved EPA, Univ. California, and France while the mepid study will include two EPA laboratories.

PROJECT MILESTONES: (1) 01/77 Complete research and draft manuscript on Capitella capitata fishes. (2) 06/77 Complete manuscript on Capitella capitata. (3) 06/77 Initiate studies on Mysidopsis bahia. (4) 06/78 Manuscript of Mysidopsis bahia calibration.

TECHNOLOGY: FOSSIL FUEL/General (20%);NUCLEAR/General (20%);GEOTHERMAL/General (20%);SOLAR/General (20%);CONSERVATION/General (20%)
PROJECT DESCRIPTION: Develop a flow-through bioassay system that allows for multiple fixed and modulating salinities and temperature. The system can be externally driven through stored (tape) information or real time using microprocessor to control values, flow, etc. The applications of this system include: laboratory studies using real time salinity/temperature conditions rather than the usual single fixed conditions; the incorporation of salinity/temperature extremes into routine screening bioassays; the use of this system for effluent and mixed waste testing in laboratories remote from field site but with site temperature and salinity profiles.
PROJECT MILESTONES: (1) 09/77 Complete system development for salinity and evaluate biological effects. (2) 06/78 Complete system development for temperature. (3) 06/79 Total evaluation of system for selected species and pollutants. (4) 06/80 Complete adaptation for use in mixed waste testing.

TECHNOLOGY: FOSSIL FUEL/General (34%);NUCLEAR/General (33%);GEOTHERMAL/General (33%)
PROJECT DESCRIPTION: Cytogenetic responses are employed to provide suitable screening methods for the detection of potential chemical mutagens or other DNA-damaging agents in both laboratory and field situations. In the laboratory, early developmental stages of several marine invertebrates, as well as cultured mammalian cells, shall be used. For field investigation, eggs and larvae from adult shellfish collected in spawning condition will be employed. Anaphase preparations are to be utilized for detection of chromosome aberrations such as breaks and bridges. Sister chromatid exchange is to be studied via metaphase preparations.
PROJECT MILESTONES: (1) 01/78 Validate methods for using eggs and larvae of polychaete Neanthes. (2) 06/78 Validate method for using eggs and embryos of the sea urchin, Arb. (3) 06/78 Validate method for sister chromatid exchange studies with CHO ce.

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The current project is concerned with the evaluation and application of the Chinese hamster ovary (CHO) cell system (5-bromodeoxyuridine/visible light selection procedure) as a method for the detection and assessment of small-scale mutations. Emphasis is on the induction, isolation and characterization of nutritional variants. (Compounds evaluated to date are primarily known genetic toxicants, including a broad spectrum of inorganic carcinogens.) Experimental parameters/factors assessed include system sensitivity to direct-acting compounds, effects of variation in the administration of dose, mutagen specificity and effects of variable expression time.
PROJECT MILESTONES: (1) 06/76 Standardization studies with ethylmethanesulfonate and 5-bromodeoxyuridine. (2) 02/77 Mutation assays with 6 inorganic compounds. (3) 12/77 Mutation assays with 7 additional compounds. (4) 02/78 Back mutation rates with several mutant clones of the CHO cell. (5) 06/78 Effects of variation in expression time with known genetic toxic.

TITLE: Adenosine Triphosphate (ATP)
PROJECT NUMBER: P608C-25
PRINCIPAL INVESTIGATOR: Cheer, S.
AFFILIATION: Environmental Protection Agency, Narragansett, R.I. (USA). Environmental Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Narragansett, R.I. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Rogerson, P.
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$38,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: Techniques to accurately measure Adenosine Triphosphate (ATP) are desired for both water and sediment samples.
APPROACH: The basic technique for measuring ATP in water samples by the light-emitting luciferin-luciferose reaction is well established. However, many details of the methodology remain to be clarified. These include such variables as filter type, water volume, physiological state of the phytoplankton, and presence of bacteria. Similarly, problems with sediment samples include extraction effluency and coextraction of inhibition substances. These and other aspects of the ATP methodology remain to be clarified.
RESULTS: Improvements in the state-of-the-art for ATP analyses will be published in the open literature.
PROJECT MILESTONES: (1) 08/74 Improved method for ATP determination and (2) 06/78 Publication on modifications of ATP methodology.
KEYWORDS: ATP;AQUATIC ECOSYSTEMS;MONITORING;WATER POLLUTION;BIOASSAY;WATER;SEDIMENTS

TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$342,000
TECHNOLOGY: FOSSIL FUEL/General (34%);NUCLEAR/General (33%);GEOTHERMAL/General (33%)
PROJECT DESCRIPTION: Techniques to measure many trace elements in water, sediment, and organisms by a variety of analytical techniques are being developed. These techniques include flame and flameless atomic absorption, neutron activation, and alpha particle spectrometry.
APPROACH: Trace element levels in macrofauna and sediments are typically analyzed by flame atomic absorption spectrometry following digestion with concentrated nitric acid. Small organisms, low-level samples, and water are measured by flameless hollow graphite atomization techniques, with water also being measured by chelex preconcentration techniques. Neutron activation analysis is used for selected elements and for solid samples without prior digestion. Contaminant radioisotopes are investigated by alpha particle spectrometry following extensive pre-chemistry.
RESULTS: Data is continuously fed back into the various programs within the laboratory. In addition, new and innovative analytical techniques are published in the open literature. Manuscripts are in preparation describing marine tissue reference materials for atomic absorption, a hollow graphite atomic absorption technique for small organisms, quality control aspects of single organisms atomic absorption analysis, including interferences, and techniques to extend the detection limit for Ag, Cu, Cd, by hollow graphite atomic absorption. Techniques have been published for pre-concentration of many trace elements from seawater by Chelex absorption.
PROJECT MILESTONES: (1) 10/73 Apparatus for the concentration of trace elements in seawater and (2) 01/81 Miscellaneous journal publications.

TITLE: Density Dependent Factors and Their Effects on Growth and Survival of Spotted Seatrout and Lined Sole Larvae (Abbrev)
PROJECT NUMBER: P608C-3
PRINCIPAL INVESTIGATOR: Houde, E.D.
AFFILIATION: Miami Univ., Coral Gables, Fla. (USA)
MONITORING AGENCY: Environmental Protection Agency, Narragansett, R.I. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Beck, A.D.
TYPE OF FUNDING: Grant No.-R804519-02
77 FUNDING: Environmental Protection Agency FY77:$18,500
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: Lined soles and spotted seatrout are being reared in the laboratory to help develop techniques for standardized culture of marine fish larvae. Presently supported research is designed to investigate effects of food concentration, stocking density and food types on survival and growth of larvae. Other factors being investigated include feeding rates and growth efficiencies in relation to size of larvae and type and concentrations of food. Foods that are being used are wild plankton (copepnauplii), the rotifer Brachinous plicatilis, and brine shrimp Artemia salina nauplii. Seatrout and lined soles can be reared from egg to juvenile on either wild plankton or rotifer-brine shrimp diets. Growth during the early larval stages is better on the wild plankton than on rotifers but survival is equally good on both foods. Additional proposed studies include studies on larvae behavior in relation to food types and food concentrations. Also, a comparison of reared and wild larvae of both species with respect to morphometrics and growth characteristics will be initiated during the proposed budget period. The goal of the project is to provide standardized procedure that will insure production of large numbers of marine fish larvae, with physiological characteristics similar to wild larvae, that could be used in pollution and toxicant bioassays.
PROJECT MILESTONES: 05/79 Final report entitled, "Density dependent factors and their effects..."

TITLE: Nutritional Requirements of Marine Larval and Juvenile Fish
)JECT NUMBER: P608C-4
[NCIPAL INVESTIGATOR: Simpson, K.L.;Chichester, C.O.;Lee, T.
AFFILIATION: Rhode Island Univ., Kingston (USA)
MONITORING AGENCY: Environmental Protection Agency, Narragansett, R.I. (USA)
DIVISION: Environmental Research Laboratory
MONITOR: Beck, A.D.
TYPE OF FUNDING: Grant No.-R803818-03
77 FUNDING: Environmental Protection Agency FY77:$25,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The primary objective of this proposal is the development of methods and techniques to formulate laboratory diets for larval and juvenile marine fish. Such diets are needed in order to achieve high levels of survival and field-comparable growth of laboratory-cultured animals. If successful, the laboratory marine fish will exhibit minimum variability in lab bioassay due to nutritional stress. Menidia menidia will be used as a test fish.
APPROACH: Test diets will be evaluated for protein availability and storage stability. The nutritional status of field and diet-fed populations will be compared. The life history stages will include eggs, yolk-sac larvae, post-yolk-sac larvae and juveniles.
RESULTS: Apparent nutritional needs will be determined by qualitative analysis of eggs, yolk-sac larvae, post-yolk-sac larvae and juveniles. The sources of nutrients will be determined by qualitative analysis of laboratory-prepared live or artificial food materials. The test diets formulated from qualitative information will then be assessed for protein availability and storage stability using growth studies with the test fish, rat and rainbow trout. Finally, the nutritional status of the larvae and juveniles will be compared with field populations using appropriate response parameters: survival, growth, biochemistry, behavior and stress response.
PROJECT MILESTONES: 07/78 Final report entitled, ''Nutritional requirements of marine larval...''

MONITOR: Perez, K.
TYPE OF FUNDING: Grant No.-R805463-01
77 FUNDING: Environmental Protection Agency FY77:$75,500
TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: (1) To develop marine microcosm methodology; (2) to compare small and large microcosm behavior; (3) to assess the effects of sewage addition and stresses operating along established sewage gradients and recovery from these perturbations; (4) to assess time varying perturbations of 3; (5) to use the microcosms to determine the effects of multiple stresses on estuarine ecosystems; and (6) to use the microcosms to understand stability and resiliency in estuarine ecosystems.
APPROACH: We propose to continue work with 12 experimental microcosms which are maintained in a water bath in the EPA Environmental Research Laboratory, Narragansett, RI. The tanks will be filled with hand bucketed water from Narragansett Bay to prevent damage to plankton, and intermixed to produce uniform initial conditions in all of the microcosms. New sediment will be collected by box core at the start of each series of experiments. The biological parameters in the microcosm will then be followed for one or two weeks to be sure that they are not diverging before specific experiments are begun.
RESULTS: Four series of experiments are planned as follows: (1) sealing experiments with light and turbulent mixing; (2) comparison of the behavior of small microcosms with large microcosms; (3) stress experiments on microcosms with different levels of sewage; and (4) mixed oligotrophic and eutrophic experiments.

:OJECT DESCRIPTION: The proposed project is intended to monitor water quality parameters over a period of two years that will give detailed information concerning the present water quality status of Santa Rosa Sound, Escambia-Santa Rosa Counties, Florida.
APPROACH: From bi-weekly field samples, water quality parameters will be measured against a background of physico-chemical data. These parameters include B.O.D., inorganic and organic carbon, algal cell counts and types, and bacterial numbers and sizes. The major types of phosphate and nitrogenous species will be determined and correlated with algal population composition and primary production rates (to be measured in situ by the 14-C technique). The effects of nitrogen-phosphorus enrichment on algal productivity will

be determined by employing the primary productivity measurement technique on in situ cultures on a seasonal basis.
RESULTS: In addition to the regular sampling regimen, dual studies will be conducted to delineate daily trends in water quality parameters. Pilot investigations will be conducted periodically to indicate areas needing further investigation. It is anticipated that the information obtained from the proposed study will aid in the establishment of recommendations for the improvement of water quality in Santa Rosa Sound.

PROJECT DESCRIPTION: The purpose of this project is to study chemically induced tumors in teleost fishes.
APPROACH: Both marine and freshwater species will be exposed to low levels of a known carcinogen for 300 days. Fish developing tumors or other pathologies during this period will be sacrificed and tissue from the liver, kidney, intestine, and gills will be studied histologically. Tissues from all the fish with no grossly apparent pathologies at the time the experiment is terminated will be studied in the same manner in order to detect any neoplasias or preneoplastic conditions.
RESULTS: It is expected that this research will: (1) provide evidence concerning the quantities of benzopyrene necessary to induce neoplasias; (2) supply additional data concerning tumors in teleosts; (3) establish the feasibility of using teleost fish as early indicators of carcinogenic substances in the aquatic environment, and (4) demonstrate that this type of system could be used to screen compounds for carcinogenic properties.

PROJECT NUMBER: Q-625-A-1-2
PRINCIPAL INVESTIGATOR: McCutchen, R.
ADDRESS: P.O. Box 1900, Huntsville, AL 35807
AFFILIATION: General Services Administration, Washington, D.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Gulf Breeze, Fla. (USA). Environmental Research Lab.
MONITOR: Davies, Tudor T.
TYPE OF FUNDING: EPA pass-thru funding-IAGD7-01000
77 FUNDING: Environmental Protection Agency FY77:$80,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Indirect-support to pollutant screening (100%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The purpose of this IAG is to provide ADP technical services in support of the Environmental Research Laboratory, Gulf Breeze, research program. This includes work in support of the Bears Bluff Field Station of the Environmental Research Laboratory, Gulf Breeze. This will include support of the modelling program on the fate, persistence and effects of toxic materials on coastal waters, statistical services in the laboratory and data base management of the toxicology program.
PROJECT MILESTONES: (1) 5/77 Begin Data Base Management System. (2) 12/77 Attach Statistical Service Needs to Data Base Service. (3) 6/78 Operate Water Quality Models for Estuaries.
KEYWORDS: AUTOMATIC DATA PROCESSING SUPPORT;ENVIRONMENTAL TRANSPORT;MATHEMATICAL MODELS;COASTAL WATERS;TOXICITY;WEATHERING;BIOLOGICAL EFFECTS;DATA ANALYSIS;MANAGEMENT;DATA PROCESSING;STATISTICAL MODELS;COMPUTER CALCULATIONS;AUTOMATION;DATA ACQUISITION;POLLUTION;ENVIRONMENT

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS
APPROACH: Offshore petroleum extraction may affect marine organisms and ecosystems in the Gulf of Mexico and other areas undergoing intensified petroleum exploitation, extraction, and transportation activities. The research objective is to access the effects of these emissions on marine organisms and communities. Bioassays on single species and communities will be continued on selected components of drilling muds. Work will be initiated on whole drilling muds and other pollutants emitted from extraction activities such as cutting and man-mobilized petroleum hydrocarbons.
PROJECT MILESTONES: (1) 9/77 Progress Report. (2) 10/78 Final Report.
KEYWORDS: PETROCHEMICALS;TOXICITY;SOLVENTS;OFFSHORE OPERATIONS;ENVIRONMENTAL IMPACTS;WASTE MANAGEMENT;AQUATIC ORGANISMS;WASTE DISPOSAL;BIOASSAY;DRILLING FLUIDS;PETROLEUM INDUSTRY;OIL SPILLS;ORGANIC NITROGEN COMPOUNDS;BARIUM

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objectives of the research are to define effects of continuous exposure to chlorine on larval development, juvenile growth, and reproductive parameters for two selected marine decapod crustaceans, Panopeus herbstii and Pagurus longicarpus. Additionally the effects of chlorine on development of the coot clam, Mulinia lateralis, and blood serum constituents of the blue crab, Callinceres sapidus, will be studied.
RESULTS: Preliminary data suggest that responses occur only at chlorine doses close to the lethal concentration. Reliable test systems developed to date will be used to define chlorine effects.
PROJECT MILESTONES: (1) 9/77 Final Report.
KEYWORDS: COOT CLAM;BLUE CRAB;CHLORINE;ENVIRONMENTAL TRANSPORT;AQUATIC ORGANISMS;AQUATIC ECOSYSTEMS;BIOLOGICAL EFFECTS;TOXICITY;PLANTS;CRUSTACEANS;METABOLISM;PHYSIOLOGY;PESTICIDES;CARCINOGENS;ORGANIC CHLORINE COMPOUNDS

PROJECT DESCRIPTION: Detection of carcinogenicity of oils in seawater; use of hybrid fish and food chains
APPROACH: We have developed and are continuing the testing of quick, sensitive method of detection of water-borne carcinogens using laboratory reared fish, as a part of an overall screening system for carcinogens. We hope to extend the technique to a tissue culture system. Early applications are also planned to include the examination of the kinetics of transmission of carcinogens along naturally occurring food chains.
PROJECT MILESTONES: (1) 5/78 Report on Screening Method. (2) 12/78 Final Report on Validated Bioassay Method. (3) 12/79 Final Report on Method and Mechanism.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Determine the dynamics of dispersion and dissipation in marine and estuarine waters and the effects on marine and estuarine organisms.
APPROACH: Identification and quantification of halogenated compounds formed when chlorine is added to seawater. Initial emphasis will describe the inorganic and organic reactions which lead to long lasting by-products. Follow-up studies will investigate the complex and physical chemical fate of identified compounds in simulated and natural marine ecosystems, including complexing with sediments, or uptake and bioaccumulation by organisms. Analytical capability will be applied both to on-site experiment investigations and community studies by the Bears Bluff Field Station of the Environmental Research Laboratory, Gulf Breeze, Florida.
PROJECT MILESTONES: (1) 7/76 Publish Conference ''Environmental Impact of Water Chlorination''. (2) 12/77 Contribute to and Hold Conference on Halogenation. (3) 10/78 Preliminary Assessment of Halogenation. (4) 12/79 Final Assessment of Impact of Treatment.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: An experimental design is proposed in which the behavioral and physiological reactions of scleractinian corals indigenous to hard bank communities in the Gulf of Mexico are determined in response to chronic low levels of drilling fluid components and shale oil products.
APPROACH: The design incorporates time-lapse-macrophotographic and respirometric techniques to measure the response parameters. The corals shall be exposed to the contaminants in ''flow through'' aquaria on board a platform twelve miles offshore of Panama City. Controls shall include parallel observations of corals exposed to uncontaminated sea water in identical ''flow through'' aquaria, and of corals transplanted to the site of the platform at a depth similar to that from which they were collected.
PROJECT MILESTONES: (1) 7/77 Begin Field Collection of Corals for Study. (2) 6/78 Report on Effects of Drilling Fluids on Corals.
KEYWORDS: CORALS;OFFSHORE DRILLING;PETROLEUM INDUSTRY;OIL SHALE INDUSTRY;NATURAL GAS INDUSTRY;ENVIRONMENTAL EFFECTS;PHYSIOLOGY;BEHAVIOR;GULF OF MEXICO;DRILLING FLUIDS;SULFUR DIOXIDE;TOXICITY;WATER POLLUTION

----ACTER OF STUDY: RESEARCH/Laboratory (100%)
ONS OF INTEREST: BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Northwest;COASTS/Northwest;HYDROGRAPHIC REAS/Other hydrographic areas Coastal
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To determine the concentration (body burdens) of selected environmental chemical carcinogens in economically-important mollusks and crustaceans from Oregon bays, estuaries and inshore areas. (2) To determine if there is a potential public health hazard to man from consuming shellfish, harvested from Oregon bays, estuaries and inshore areas, which contain petroleum by-products that are carcinogenic. (3) To survey populations of bivalve mollusks, determine the incidence of neoplastic diseases in these populations and ascertain if there is any correlation between carcinogenic body burdens and the incidences of such diseases. (4) To identify point sources of chemical carcinogens that are present in Oregon bays and estuaries utilized in this study. (5) To determine rates of carcinogenic polycyclic aromatic hydrocarbon uptake and elimination in bivalve mollusks.
RESULTS: Extensive preliminary investigations have been conducted to determine which Oregon bays will be utilized in the study; ascertain which shellfish species will be used; locate sites at which shellfish can be continuously sampled. Bivalve mollusks from different habitats in the various bays are analyzed for the presence and amount of benzo(a)pyrene (BAP) monthly or bi-monthly. Histological sections are prepared so that diagnoses can be made and neoplastic diseases, if present, can be identified.
PROJECT MILESTONES: Final Report, May 78

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This investigation will examine the toxic, sublethal and latent effects of certain polycyclic aromatic hydrocarbons and barium sulfate on larval and adult stages of selected invertebrates and fish.
APPROACH: Experiments are designed to determine the effects of these compounds on: (a) crustacean molt cycles; (b) regenerative limb growth; (c) respiration; (d) heart rate; and (e) histology and ultrastructure of selected tissues.
RESULTS: Studies are aimed to determine the uptake by marine organisms of these pollutants from water and bioaccumulation through aquatic food chains. By using a combination of autoradiographic and convential analytical techniques the sites and extent of accumulation of pollutants in marine organisms will be determined.
PROJECT MILESTONES: (1) 7/77 Hold Symposium on Pentachlorophenol. (2) 1/88 Publish Symposium on Pentachlorophenol. (3) 5/78 Hold Symposium on Drilling Fluids. (4) 6/78 Hold Symposium on Carcinogens in the Aquatic Environment. (5) 9/79 Final Report on Grant.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Rivulus marmopatus: An investigation of its potential as a cancer research and chemical carcinogen screening organism.
?ROACH: Recent evidence suggests a relationship between environmental contaminants and cancer. It should be recognized that cancer is thought to be a multistep process with genetic alteration as the initial step. The mutagenic activity of environmental contaminants may therefore give a good indication of potential carcinogenicity and teratogenicity may be an indication of mutagenicity. The need for a marine vertebrate sensitive to chemical carcinogens is great because there is good evidence that the coastal marine environment is being contaminated at an accelerated rate. The marine fish Rivulus marmoratus possesses numerous attributes that make it particularly attractive as a cancer research and/or screening organism. A

number of more obvious attributes of this fish include: hardiness, ease of maintenance, developmental aspects, short generation time, fecundity and unique genetic and reproductive aspects which are found in no other vertebrates (isogenic, homozygous clones of natural hermaphrodites which reproduce by internal self-fertilization). We propose to evaluate the potential of R. marmoratus as a cancer research and screening organism. Two general approaches will be taken: genetic characterization and correlation of effects with known chemical carcinogens. Information gathered from the genetic characterization (electrophoretic, transplantation and cytogenetic techniques will be used) may
PROJECT MILESTONES: Aug 79: Final Report

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this study is to establish life history and ecological information about salt marsh communities in the North Edisto estuary, Leadenwah Marsh.
APPROACH: This site was chosen because of its isolation from excessive influence of human activities. Additionally the site is adjacent to the E.P.A. Bears Bluff Field Station. There, studies on effects of low levels of halogenated pollutants upon mixed communities of marsh organisms are being done. Studies of the life histories of organisms on the oyster beds, mud, and marsh grass habitats will supply valuable baseline data about breeding cycles, ontogeny and trophic relationships, thereby providing insight for the ecosystem models run at Bears Bluff. The basic study plan combines expertise in mycology, plant physiology, parasitology, genetics, invertebrate and vertebrate zoology, and ecology.
RESULTS: The second year of the study will focus more closely on studies on productivity and trophic relationships among the marsh organisms. Under consideration (among other studies) are habitat selection and trophic relationships of: amphipods, fishes, and fish larvae in the upper marsh; intertidal and subtidal benthic crustacea; and fishes of the larger creeks.
PROJECT MILESTONES: Aug 78: Final Report

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: An Investigation of the Ecological Effects of Residual Ozone to Selected Estuarine Species.
APPROACH: A cooperative effort is proposed between the Academy of Natural Sciences of Philadelphia and the University of Maryland to study the ecological effect of residual ozone to selected estuarine species. We propose to determine the toxicity of residual ozone, both lethal and sublethal effects, to selected commercially and/or recreationally important estuarine finfish and shellfish species and their life stages under various environmental conditions. We will also compare the toxicological effects of residual ozone to those residual chlorines which are being determined on the same species and life stages under the same experimental regimes set forth above. Finally, we propose to evaluate the environmental acceptability of ozone as an alternative to chlorine.
PROJECT MILESTONES: Aug 78: Final Report

PROJECT DESCRIPTION: The effects of a number of polycyclic aromatic hydrocarbons (PAH) which are significant pollutants in the natural environment, will be studied in genetically defined stocks of fish of Xiphophorus and Rivulus. Many of these compounds are involved in chemical carcinogenesis in mammals.
APPROACH: Our aim is to determine whether strain differences exist in susceptibility to PAH-induced carcinogenesis and whether this can be correlated with the degree of heterozygosity. Some of the genetically defined stocks may become sensitive indicators for certain kinds of pollutants.
RESULTS: The susceptibility of genetically defined stock of fish to chemical carcinogens will be determined.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Determine the species level effects of selected pesticides and other organic compounds on marine and estuarine organisms.
APPROACH: The following tasks will meet the objectives of this project: (1) Expose selected marine and estuarine organisms to pesticide-heavy metal combinations. Determine toxicological and physiological effects. Determine rates of pollutant accumulation. Rate of response of organisms to individual pollutants. (2) Expose marine and estuarine planktonic organisms to selected pesticides. Determine toxic concentrations in relation to variations in salinity and temperature. Determine bioaccumulation of pesticide. Determine effects of pesticides on growth characteristics. (3) Expose selected marine and estuarine algae and protozoa species to varying concentrations of toxic organics, such as pesticides, and heavy metal combinations. Determine effects of population dynamics by measuring toxicity growth and productivity. Compare effects of pollutants in combinations with effects of single individual compounds.

(4) Determine, for marine and estuarine organisms commonly utilized in laboratory investigations, the range of environmental parameters optimal for health and survival under unstressed conditions. Environmental parameters to be investigated include temperature, dissolved oxygen, salinity, etc. Determine requirements for culturing, holding and maintaining marine and estuarine organisms. Develop methods of rearing marine and estuarine organisms. Develop methods of rearing marine and estuarine organisms from egg stage to egg stage. (5) Expose selected marine and estuarine organisms to varying concentrations of organic and inorganic
PROJECT MILESTONES: (1) 1976 Research Reports and Publications--Approximately 30-40 reports on the acute and chronic effects of organic and inorganic chemicals on marine and estuarine organisms.

TYPE OF FUNDING: Grant No.-R804993-01
77 FUNDING: Environmental Protection Agency FY77:$100,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The program will study the following aspects of Kepone in the James River, Virginia: (1) The distribution of Kepone in bottom sediments of the James will be determined. (2) The routes of sediment transport below Hopewell will be delineated. (3) Major sediment sinks will be located and the rates of sediment deposition at these sites will be determined. The size, location and mobility of the Kepone reservoir in the James can be determined from this information. (4) The effect of varying environmental conditions of pH and salinity on release of Kepone from sediments will be determined. This data will provide estimates of whether Kepone absorbed to sediments is released to the aqueous phase as the sediments are moved downstream into areas of higher pH and salinity. (5) The ability of filter feeding organisms to concentrate Kepone from contaminated sediments will be determined. Data from this study will provide for a determination of the potential hazards which dredging poses to a variety of filter feeding organisms.

PROJECT MILESTONES: (1) 09/77 Distribution of Kepone in James River sediment/biota/water and (2) 09/78 Report on biological and physical processes transporting Kepone.

77 FUNDING: Environmental Protection Agency FY77:$99,200
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: A study designed to develop a model system approach to analysis of biocide effects, especially those of Guthion and other organophosphorous pesticides, in ecologically diverse localities in South Louisiana. Primary objective is to establish means of alleviating land use conflicts between chemical discharges from agriculture and wetland productivity. Phases of the study involve laboratory analyses of target compound stability under diverse physical, chemical, and microbial conditions and field investigations of organophosphorous chemical behavior, including runoff patterns, breakdown and bioaccumulation in the affected areas. Laboratory studies of the influence of pH, oxidation-reduction conditions, and salinity on the persistence of Guthion in wetland soils are under way. Baseline studies to characterize the community composition of plants, aquatic and benthic animals, and microbial populations at the field sites have been initiated. During the second year, laboratory studies on the effects of controlled physiochemical environments on the fate of the target compound will continue. Field applications of Guthion will be initiated and laboratory and field studies of the effects of the pesticides on community composition and metabolism will be conducted.
PROJECT MILESTONES: 10/79 Final report.

TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: This study consisted of two separate but completely interrelated substudies: (1)

macroecosystem study; and (2) microecosystem study. For purposes of clarity the objectives of each are presented separately, although it is understood that the results of each are interrelated. Macroecosystem: The present study was designed to study the dynamics of a relatively undisturbed marsh-estuarine ecosystem. There are two basic interrelated objectives of this study: (1) to establish baseline data on a undisturbed estuary to provide a scientific basis for comparative studies on the effects of various stresses of pollutants on other estuarine environments; and (2) to develop models of an estuarine ecosystem which would predict the probable effects of environmental perturbation. Microecosystem: The long range objectives of this study were twofold: (1) the prime objective was to develop and test replicate experimental salt marsh units at the microecosystem level as diagnostic tools for the assessment of both long and short term pollution effects on the Spartina alterniflora salt marsh community. (2) Since this study was conducted in conjunction with the ecosystem analysis of North Inlet Estuary, these simulated marshes will be utilized to test, as well as to provide some data relevant to the general overall ecosystem model being constructed for the area.
PROJECT MILESTONES: 02/78 Final report.

PROJECT DESCRIPTION: Preparation procedures of BSA-Kelevan have been perfected, and samples prepared for use as antigen for rabbit immunization. A preparation high in content of covalently linked Kelevan was used for production of a highly active antibody toward fibrinogen-Kel. The Kelevan active antibody preparation was used in biochemical studies of ATPase inhibition and reactivation using fire ant head and dog brain homogenate fractions. Preliminary results are very promising and show quite definitely that Kepone and DCPD inhibition of ATPase activities is reversible. The kinetics of the reactivation process will be determined, including the mole capacity of the Ig fraction for Kepone and DCPD. Studies will be conducted to determine the relative affinity of the Ig fraction for Kepone compared to the affinity of purified

ATPase for Kepone. The reactivation of Kepone inhibited ATPase activities will be compared for different tissues from a single animal and for the same tissue from different animals. Finally efforts will be initiated to covalently attach antibody to a solid support system.
PROJECT MILESTONES: 02/78 Final report.

PROJECT DESCRIPTION: This proposal requests support to continue investigation of environmental changes due to construction and operation of a coal-fired power generating station, two units 527 megawatts each.
APPROACH: The approach is inter-disciplinary, with discrete sections focused on: Aquatic Invertebrates, Fish, Hydrogeology, Water Use Analysis, Wetlands Ecology, Remote Sensing, Aquatic Chemistry, Hazardous Chemicals in Fish, Assessment of a Cooling System, Plume Chemistry, Visual Changes, Mass Flow and Balance of Water, Air, and Chemicals. Data are available through the Columbia Data Bank, IES, Madison.
RESULTS: Originally research was commenced in 1971 under a grant from three Wisconsin power companies. The third year of the current phase of the project will be completed in July 1978. The site is on the floodplain of the Wisconsin River near Portage, Wisconsin. Primary attention is given to the impact on the aquatic environment. A portion of the study is developing, in concert with the Wisconsin Public Service Commission, the Wisconsin Department of Natural Resources, and three Wisconsin public utilities, criteria for the siting of generating facilities.
PROJECT MILESTONES: (1) 74 Complete base line data gathering-air, water, plants and animals. (2) 3/76 Complete construction impacts of power plant and cooling lake. (3) 12/77 Complete data gathering on short-term impacts of operation. (4) 7/78 Complete draft siting criteria document. (5) 7/78 Complete major reports on all impacts on unit 1. (6) 7/79 Complete data gathering on short-term impacts of unit 2. (7) 7/80 Complete major reports on all impacts of units 1 and 2. (8) 12/80 Complete integrative and evaluation studies of impact.

TITLE: Ammonia Toxicity to Fishes
PROJECT NUMBER: V619-93
PRINCIPAL INVESTIGATOR: Thurston, R.V.;Russo, R.C.
AFFILIATION: Montana State Univ., Bozeman (USA)
MONITORING AGENCY: Environmental Protection Agency, Washington, D.C. (USA)
DIVISION: Deputy Assistant Administrator for Energy, Minerals and Industry
MONITOR: Brungs, W.
77 FUNDING: Environmental Protection Agency FY77:$50,000
TECHNOLOGY: FOSSIL FUEL/General (50%);NUCLEAR/General (50%)
PROJECT DESCRIPTION: The objective of the proposed research is to determine the effect on fishes of exposure to fluctuating ammonia concentrations above the proposed EPA criterion level of 0.01 mg/liter HH3(g). Laboratory bioassays will be carried out employing ammonia concentration fluctuation regimes of two types: (1) diurnal fluctuations, and (2) intermittent fluctuations. The experiments to investigate diurnal fluctuations will involve fluctuations in a pattern simulating the diurnal cycle typical of many wastewater treatment plant discharges; i.e., peaks during mid- and late-day, and a low during the early morning hours. The experiments to determine the effect of intermittent fluctuations, simulating accidental

discharges, will include subjecting test fish for only a few hours or days to doses of ammonia at high concentrations known to be acutely toxic. Test fishes will be rainbow trout and fathead minnows. iological parameters to be measured include mortality/survival, blood ammonia concentrations, tissue egeneration, and fish behavior. Bioassay test methods will closely approximate those recommended by the PA Committee on Methods for Toxicity tests with Aquatic Organisms.
PROJECT MILESTONES: 10/78 Final report.

TITLE: Technology Assessment of Western Energy Resource Development
PROJECT NUMBER: V6240-1
PRINCIPAL INVESTIGATOR: White, I.L.
AFFILIATION: Oklahoma Univ., Norman (USA)
MONITORING AGENCY: Environmental Protection Agency, Washington, D.C. (USA)
DIVISION: Deputy Assistant Administrator for Energy, Minerals and Industry
MONITOR: Plotkin, S.
77 FUNDING: Environmental Protection Agency FY77:$200,000
TECHNOLOGY: FOSSIL FUEL/General (34%);NUCLEAR/General (33%);GEOTHERMAL/General (33%)
PROJECT DESCRIPTION: To identify a broad range of desirable and undesirable consequences likely to result from the development of western U.S. energy resources (coal, oil shale, uranium, geothermal, oil, natural gas); to identify, evaluate, and compare policies that will promote desirable consequences and eliminate or reduce undesirable ones; and to identify critical research projects which will enhance the ability of all levels of government to make optimal decisions about future energy development in the West.
APPROACH: The analysis includes a series of impact assessments which examine the physical and social/cultural/economic impacts of development at six sites and the region as a whole. These impact assessments are used, in combination with extensive contacts with decisionmaking and other individuals and groups affected by and concerned with western energy development, to identify critical problems and issues which are then examined in more detail. A critical part of this follow-up analysis is to identify the institutional and political context in which the impacts are evaluated and dealt with, in order to pinpoint situations where the present regulatory, institutional, or political system cannot properly deal with impacts and to identify appropriate solutions to these shortcomings.
RESULTS: A Phase I report (Energy from the West) dealing principally with impact assessment has been published. The remaining work will focus on policy analysis of critical problems and issues, with some effort at expanding the technologies examined and completing some details of the impact assessments.
PROJECT MILESTONES: (1) 03/76 Completion publication of work plan. (2) 08/76 Publication of phase I report, Energy from the West. (3) 03/76 Publication of final impact assessment report. (4) 01/79 Publication of series of policy-oriented final reports.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To provide information needed in direct support of radiation risk estimates at low doses for fission and fusion technologies. Studies of relationships between cell killing, alterations in tissue proliferation rates, and the potential for cancer and degenerative diseases also have general relevance to hazard assessment for fossil fuel conversion processes. The data to be obtained on life shortening, cancer, and other diseases in fission neutron- or gamma-irradiated mice will permit predictive models to be formulated whereby health hazards in humans exposed to low doses of low- or high-LET radiations can be predicted. This program supports directly predictions of health hazards due to atmospheric release of radionuclides, alterations in levels of background radiation, occupational exposures sustained during reactor operation or fuel element reprocessing, and medical uses of low- or high-LET radiations.
APPROACH: Populations of laboratory mice are irradiated with fission neutrons or Co-60 gamma radiation in large-scale studies of late effects, viz. life shortening, age-specific rates of cancer and other diseases, and late injury to the immune, vascular, and hematopoietic systems. Dose-response relationships for life shortening and other end points after single neutron doses are established over a range of 5-240 rad, and for gamma doses over the range of 90-788 rad. Dose-response relationships are also established for long-term exposures, at low dose rates, which continue for duration of life, or over 50% to 20% of the control life span of the animals. The experiments focus specifically on radiation doses expected to produce 2 to 20% life shortening so that predictive mathematical models may be formulated to estimate the relative biological effectiveness of neutrons and excess risk at doses relevant to population or occupational exposure levels. Studies of late effects on cell population will increase our understanding of factors important in (radiation) carcinogenesis and other health hazards. A small complementary

experiment with a longer-lived rodent species, the white-footed mouse, exposed to single doses of neutron or gamma radiation, or to gamma radiation for duration of life provides interspecies response information which will assist with the interpretation of results from animal
RESULTS: Dose-response relationships for life shortening, cancer, and other late effects end points will be established accurately and predictive models will be developed so that risk estimates for fission neutrons or gamma radiation may be made with much greater confidence. The results of these experiments are expected to have impact on the setting of exposure standards for low-LET (gamma) and high-LET (fission neutron) radiation. Information obtained from animals irradiated with fission neutrons may also have general relevance to risk estimation for alpha particles from plutonium or other high-LET radiations.
PROJECT MILESTONES: (1) 12/30/76 Final report on shapes of dose-response curves for life shortening and selected tumor production from model experiments. (2) 9/30/78 Publication of final reports on tumor rates from exploratory studies of injury to immune, vascular, and hematopoietic systems. (3) 12/30/77 Interim report on predictive models for low-dose effects.

PROJECT DESCRIPTION: (1) To understand the mechanisms of tumorigenesis and tumorigenic enhancement in rat liver. (2) Using liver as the model system, to develop the means of detecting tumorigenic enhancers among energy-related pollutants and other environmental contaminants.
APPROACH: Comparisons of liver tumor incidences are made in rats sequentially exposed to a known carcinogen and a putative tumorigenic enhancer. Increases in tumor yield denote enhancers, which are then compared biochemically to uncover molecular indices of enhancement. Regulatory processes in normal liver are also studied as potential sites for the initial neoplastic transformation. Isozyme differences between normal liver, precancerous liver, and liver tumor are studied to detect essential molecular changes associated with neoplasia.
RESULTS: Basic understanding of tumorigenic mechanisms will be increased by molecular studies of enhancer effects, regulation of gene expression, and isozyme comparisons. This will facilitate the development of effective prophylactic and therapeutic anticancer methodology. A method for detecting tumorigenic enhancers will be developed. This will be useful for screening compounds, such as energy-related pollutants, for enhancing activity.
PROJECT MILESTONES: (1) 9/1/76 Initiate studies of cocarcinogen dosage effects on tumor enhancements. (2) 7/1/76 Begin studies of hormonal effects on regulation of liver enzymes in vivo. (3) 7/1/76 Initiate isozyme comparisons between normal and tumor tissue.

PROJECT DESCRIPTION: Provide basic information for evaluating the cancer risk to man from exposure to ionizing radiation. In addition to dose-response information, we must know when, where, and with what absorbed energy the cancer event occurs and whether immune processes are involved.
APPROACH: Mice received injections of a variety of radionuclides under a set of standard conditions to obtain comparative dose-response information on life span and tumor induction. Mice and dogs received Sr-90 under a variety of exposure situations to obtain information relating to dose, dose-rate, latent period, and animal sensitivity in the induction of bone cancer when the physical, biological and temporal parameters of dosage are altered. Bone cancer was induced in mice by other agents (X-ray, Y-90, bone-tumor viruses) and tissue culture techniques are being developed to provide information relevant to radiation oncogenesis.
RESULTS: (1) Ability to estimate the lowest tumor-inducing body-burden of Sr-90 in man on the basis of

information on Sr-90 toxicity in dog along with toxicity of Sr-90 and other radionuclides in mouse. (2) In the induction of bone cancer by radiation in mice, knowledge of (a) how soon after exposure induction occurs, (b) the cell in which the primary event occurs, (c) the amount of energy required, and (3) whether immunity suppresses tumor response.
JECT MILESTONES: (1) Completion of Sr-90 beagle experiment and completion of histopathology. 12/30/77 (2) Perfection of in vitro technique for growing radiation-transformed preosteoblasts from mouse bone marrow. 6/30/78

POLLUTANTS: ORGANICS/Hydrocarbons (40%);RADIATION/Ionizing (40%);HEAT, THERMAL/Thermal (20%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (90%);ANALYTICAL (10%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This program is concerned with the effects of environmental pollutants on selected physiological processes including immune response. Specifically the objectives are (1) to determine how environmental pollutants (ionizing radiation, carcinogenic hydrocarbons) affect physiological regulation in rapidly and slowly aging rodents at low-levels of exposure, (2) to correlate physiological responses with disease and mortality and their relationship to excessive survival variability, and (3) to elucidate the functional development of sub-sets of immunologically competent cells and the influence of pollutants thereon.
APPROACH: Indices of physiological response, i.e., temperature, oxygen consumption, muscular activity, to thermal stress and exposure to environmental pollutants are being monitored continuously and the data subjected to time series analysis. This phase of the study utilizes the short-lived ''house'' mouse Mus musculus and the longer-lived Peromyscus leucopus; interesting facets of the latter are its better cellular repair and protection systems relative to Mus and the closer array of spontaneous tumor types to those in man. In the second facet of the program humoral and cell-mediated immunity and their response to carcinogenic pollutant exposure is being assayed in BCF/sub 1/ mice or cultured spleen cells by immunization with sheep red cells or mouse tumor cells. Fluorescent antibody techniques will be employed to assay development of immunocyte subsets.
RESULTS: The results of the low-level exposure study relate directly to the question of inconsistencies betwen low-dose effects and predictions based on high dose data. This program will provide the objective evidence to test the basic hypothesis that many paradoxes originate from non-specific compensatory responses of organisms to disturbance of their physiological equilibrium. Confirmation of the hypothesis will greatly improve the economy and accuracy of low-dose epidemiological studies. Results of the immunological study will establish the sequence of immunological responses during normal development of the immune system and under conditions of stress induced by environmental pollutants.
PROJECT MILESTONES: (1) Carry out joint epidemiological studies to assess effects of changes in energy levels of neuropsychological processes. 12/30/77. (2) Characterize the enhancing and suppessive factors on intracellular effects. 7/1/77. (3) Test of enhancement of the effect of carcinogens on the immune response. 12/30/77. (4) Determine the environmental conditions that increase or depress the energy and activity level of organism. 7/1/77.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Isolation of subcellular fractions is an important analytical tool for the study of cellular physiology and biochemistry, particularly when supplemented by correlative morphologic examination. This study is directed in part toward the development and application of methods of density-gradient centrifugation that relate the concentration of cellular components to the size of the particulates with which they are associated, rather than to morphologic labels of doubtful meaning. It is useful to use enzymes or other cellular constituents known to be specifically associated with given organelles as biochemical markers
APPROACH: The procedures developed in this laboratory have been valuable in the comparison of tissues from normal animals and those treated in various ways. They have also been successfully adapted as preparative methods. The basic technique has been to layer a preparation (e.g., a tissue homogenate or a suspension of cells) over a density gradient; after centrifugation, successive fractions are collected and analyzed by

appropriate methods: enzyme assays, microscopic examination, cell counts, chemical composition, etc. Since the average particle size in each fraction can be estimated from a sedimentation equation derived from Stokes' law, the relationship between concentration and particle size can be estimated; we have written computer programs to facilitate the mathematical and statistical analyses of such data. Currently we are carrying out tissue fractionations in zonal centrifuges, which provide much finer resolution than can be obtained by other procedures that involve centrifugation.
RESULTS: Specific projects include (1) isolation and enzymatic characterization of peroxisomes from mouse and rat liver cells, (2) use of H/sub 2/O/D/sub 2/O gradients for subcellular fractionation, (3) age-dependent changes in mitochondrial sedimentability, (4) intracellular distribution of liposome-encapsulated actinomycin D in ascites tumor, liver, spleen, and bone marrow cells, and (5) enzyme activities of mitochondria isolated from hearts of mice exposed to neutron or gamma radiation.
PROJECT MILESTONES: (1) Examine the chemical composition and morphological appearance of liver mitochondria from mice. 9/30/77 (2) Complete measurement of sedimentation chemical composition and examine complement of liver organelles in animals 9/30/78

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS
PROJECT DESCRIPTION: The principal objectives of this program are (1) to determine accurate three-dimensional structures and conformation for immunoglobulins, nucleic acids and drugs in the crystalline and solution states, (2) to relate the unique structural/conformational properties for these biomolecules to their biological function, and (3) develop an understanding of circadian phenomena in terms of moleuclar events. A knowledge of biomolecular chemical and structural properties is the essential starting point for definition of the nature of molecular, cellular, and physiological lesions produced by environmental pollutants.
APPROACH: A combined experimental-theroretical approach is being pursued. Structural/conformational data for biomolecules are being obtained by X-ray diffraction and magnetic resonance techniques. These are supplemented by protein sequencing, synthesis of selectively labeled (H-1, C-13) analogues, and theoretical calculations of biomolecular conformation. For the circadian studies the approach adopted involves measurement of critical enzyme and biogenic amine levels in cellular systems and deep body temperature telemetry in animal systems.
RESULTS: Results of this program will yield fundamental information needed to answer important questions regarding immuncglobulin structure and function; molecular mechanisms of replication and transcription, the interplay of forces determining the specificity of structural and conformational features of biological molecules, and the molecular basis for circadian periodicity in eukaryotes, including man. These results will have a major impact on our understanding of biological function in organisms subjected to environmental stress.
PROJECT MILESTONES: (1) Determination of the first complete 3-D structure for an immunoglobulin (IgG) by X-ray diffraction methods. 6/30/77 (2) The first complete description of conformational rules governing 3-D organization of nucleic acids. 12/31/77 (3) Elucidation of the conformational pathways for nucleotide coenzymes function in an enzyme-coenzyme-substrate system. 6/30/78 (4) Role of diet in resetting of the mammalian biological clock. 9/31/78 (5) Influence of drugs and enzymes on biogenic amine levels and the relationship to circadian rhythms. 7/31/77

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The nuclear fuel cycle for the LWR's and proposed LMFBR's involve large quantities of plutonium, small quantities of which might be released to the environment during fuel fabrication, conversion, reprocessing and waste handling, leading to its uptake and retention in the human population. The gonadal retention and distribution will be experimentally studied in animals while concurrent measures of short-term genetic damage will be carried out.

APPROACH: B6CF/sub 1/ hybrid young adult mice will be used and Pu citrate solutions will be injected intravenously at dose levels to yield final gonad burdens that produce about 1 rad/week of alpha irradiation to the total testes tissues. Microdistribution will be studied autoradiographically. Genetic damage will be measured by the dominant lethal mutation rate, frequency of abnormal sperm, changes in testes weight and sperm count, and frequency of translocations induced in spermatogonia. Concurrent single and weekly neutron and gamma ray exposures and continuous gamma irradiation will provide a data-base for full comparative analysis.
RESULTS: The final data will be in the form of a series of dose-response relationships that will permit comparison of LET factors, cell stage sensitivity differences, and dose-rate variables. Appropriate RBE values will be derived and the importance of the heterogeneity of tissue distribution in the gonad to the derived dose-response equations will be evaluated.
PROJECT MILESTONES: (1) First dose-response comparisons for long term exposure to gamma rays and plutonium. 7/1/77. (2) Development of matrix of response data for neutrons, gamma rays and plutonium alpha particles for dominant lethal mutation rate 1/1/78.

PROJECT DESCRIPTION: To study the production and mechanisms of action of lethal, mutagenic and carcinogenic lesions produced in DNA by radioisotopes, chemical agents, and environmental pollutants. Mutagenesis by cellular repair mechanisms is being tested as a model system for carcinogenesis. I-125 is under examination as a possible antineoplastic agent.
APPROACH: Genetic lesions are studied at the chemical and molecular levels in bacteria and bacteriophage. Possible antineoplastic effects are studied in tissue culture cells and in mice.
RESULTS: Results expected are the correlation of specific lethal and mutagenic effects with particular molecular alterations in DNA, as well as with the involvement of particular error prone genetic repair systems; also expect to test feasibility of I-125 as an antineoplastic agent.
PROJECT MILESTONES: (1) Conclusive observation of UV-induction of multiple clustered mutations in bacterium E. coli 12/1/77. (2) Induction of multiple clustered mutations by other strong mutagens 9/30/78. (3) Demonstration of multiple mutations in the Ames' tester bacterial strains developed to test for cancerogenic mutagens 9/30/77. (4) Nature of the repair mechanism for /sup 125/I-induced DNA lesions 9/30/78. (5) Quantitative measurement of the efficacy of /sup 125/I-decay in killing tumor cells after ingestion of liposomes containing this isotope 7/1/77.

TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (50%);WASTE MANAGEMENT (50%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine the mortality rates, and clinical, biochemical, and pathologic responses of beagle dogs subjected to continuous irradiation of the whole body at one of a number of daily exposure rates that allow for survival times approaching those of unirradiated controls. The results are used in interspecies comparisons of responses aimed at developing rational models of mechanisms of radiation-induced injury that will allow for extrapolations to effects to be expected in exposed populations of humans.
ROACH: Dogs are caged in special facilities containing Co-60 gamma-ray sources in such a manner that they are irradiated continuously, at one of 7 exposure rates ranging from 0.4 to 35 R/day, for 22 hours each day. Young adult beagles of both sexes are irradiated either (a) for duration of life, or (b) until they have accumulated total exposures ranging from 600-4000 R delivered at one of the available exposure rates ranging from 5-35 R/day. Pregnant beagles are similarly irradiated from conception to parturition to determine the effects on the developing fetus, and especially on the reproductive capacities of dogs irradiated while in utero.
RESULTS: The data will define the relative importance of total dose and dose rate to the radiation induced

responses of the dog. Causes of death are expected to be highly correlated with daily dose rate, and these relationships will be identified. The most sensitive indicator of radiation-induced damage concerns interference with normal reproduction. The daily dose rate that allows for continued reproduction, and perpetuation of the species, will be determined.
PROJECT MILESTONES: (1) Complete duration of life exposure to dogs at 5-35 R/day 12/30/76. (2) Completed new gamma-ray exposure facility and begin irradiation of dogs at rates of 0.4-2.5 R/day 3/30/76.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Decorporation of toxic metals, with major emphasis on plutonium-239. This work includes: (1) relationships between physicochemical properties of metal compounds and their deposition sites, duration of retention, and pathological effects; (2) utilization of such information to develop decorporation procedures; (3) development of appropriate methodology to facilitate these objectives. Both in vitro studies of mammalian organs and in vivo studies are carried out in rodents and dogs. Experiments are designed to allow extrapolation of results toward man. Most experiments are short-term (less than 6 months) and utilize sub-microgram quantities of metals.
APPROACH: Knowledge of specific deposition sites in tissues of a hazardous metal like plutonium allows selection of appropriate agents and procedures for decorporation. Potentially useful therapeutic agents are tested in mice or rats. If successful in the rodent, critical metal distribution or decorporation experiments are repeated with dogs. If therapeutic promise is confirmed for both rodent (mainly mice) and dog the substances and/or procedures are then evaluated for clinical use in human patients. The main target organs are the skeleton and liver.
RESULTS: Studies in experimental animals are designed to apply to man. The specific population aimed at is the production worker in a nuclear fuel fabrication or reprocessing facility who may become accidentally contaminated with actinides or lanthanides. However, the procedures developed could be used for any member of the human population similarly contaminated.
PROJECT MILESTONES: (1) Completion of the radioisographic studies outlining mineral distribution of plutonium isotopes in animal studies 12/30/77. (2) Demonstration of usefulness of pyran copolymer analogs for decorporation of Pu 12/30/76.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine the long-term effects of radium and other internal emitters in humans.
APPROACH: Epidemiological study of human beings who have been occupationally or iatrogenically exposed to intake of radium. Medical and dosimetric data are obtained by the study of living persons and of autopsy material. The principal end-points are neoplasms and pathologic changes in bone. Whole body counting (in vivo), radiochemistry and microscopic measurements are employed.
RESULTS: To identify diseases associated with internally deposited radium in humans and to determine quantitative relationships between dose and effect.
PROJECT MILESTONES: (1) Quantitative evaluation of the incidence of bone sarcomas and head carcinomas as a function of dose for radium cases (Jan. 1977). (2) Completion of a pilot study of the birth characteristics of offspring of female radium-dial workers (July 1977). (3) Completion of the first comprehensive study of mortality and morbidity of radium-dial workers (Jan. 1978). (4) Completion of pilot studies of mortality and morbidity of 4500 thorium industry workers (July 1979).

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest;HYDROGRAPHIC AREAS/Great Lakes
PROJECT DESCRIPTION: The general objective is to provide the knowledge needed to assess the geochemical behavior of toxic and radioactive materials related to energy production, conversion, etc. in aquatic ecosystems such as the Great Lakes. Specific nuclear and non-nuclear objectives include source terms, sediment-water interactions, chemical speciation, potential long-term accumulation in water, and eventual removal or fate.
APPROACH: The two sub-programs are highly interdependent in that results from either one are essential for a total understanding of the geochemical processes occurring in the Great Lakes. Most of the field sampling work will be conducted in Lake Michigan; in order to verify hypotheses and models, studies will be conducted in the other lakes as necessary.
RESULTS: These studies will provide an essential experimental and theoretical base for the meaningful assessment of the environmental impact of energy-related activities on the Great Lakes. The results of this project will be closely coordinated with biological effects and transport studies.
PROJECT MILESTONES: (1) Report on the seasonal variability in plutonium concentration in Lake Michigan water and its relation to turbulent sediment resuspension and ion exchange processes in the lake January 1977. (2) Progress report on speciation of selected potentially toxic trace elements in Lake Michigan and their biological availability September 1977. (3) An Annual Report will be issued each year containing a summary to date of the work of this project.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest;HYDROGRAPHIC AREAS/Great Lakes
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The general objective is to provide the knowledge required to assess the ecological effects of potentially toxic materials related to energy production and conversion on the Great Lakes ecosystems. Specific problems to be evaluated include: effects of arsenic and cadmium on populations and communities; effects on trophic relationships; and the role of functional groups in the transfer of toxic materials within the system and to man. Communities of interest include plankton, benthos and fish.
APPROACH: Each part of the program addresses potentially significant impacts on a major aquatic community and the functional roles of these communities in the transport of energy-related pollutants. The approach is to unify sub-programs by maximizing coordinated studies and minimizing the number of stress factors to be studied at one time. Complementary lab and field studies will evaluate potential effects and determine actual effects based on existing concentrations (dose-response relationships).
RESULTS: The program will identify serious existing and potential pollutants resulting from or interacting with energy-related effluents and develop predictive capabilities useful in assessing the environmental effects of energy technologies.
PROJECT MILESTONES: (1) September, 1977, 1978 Progress reports and publications on biological activity and effects of selected pollutants in Great Lakes biota. (2) Development of appropriate methodologies to determine physiological and behavioral effects and biological cycling of pollutants in biota.

TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: C-14 assays provide a data base used by NOAA meteorologists to study and model the carbon dioxide cycle in the atmosphere. The large stratospheric injections of C-14 resulting from the detonation of nuclear devices have provided an opportunity to trace the circulation, mixing and diffusion of CO/sub 2/. Previous experiments established that >99% of C-14 is present as CO/sub 2/ and, thus, excess CO-14/sub 2/ (measured concentration minus pre-bomb background) can be used as a quantitative tracer of CO/sub 2/ in the atmosphere. The purpose of the Kr-85 assays at the Savannah River site is to obtain a data base for use by Savannah River and NOAA meteorologists to develop models of air mass movements in the area. When irradiated fuel is processed, the fission product krypton (Kr-85) is released to the atmosphere, providing an ideal tracer.
APPROACH: A light-weight CO/sub 2/ collection apparatus employing molecular-sieve material as the adsorbent is used for sampling at a number of altitudes and latitudes. The sieve material is shipped to ANL in stainless steel canisters where the CO/sub 2/ is removed, purified and assayed for C-14 concentration. Krypton samples are collected at ground level using cryogenic collection apparatus. Sample canisters are shipped to ANL where the krypton is recovered, purified and assayed. The canister is returned to the field for reuse. There are thirteen collection units deployed around the site at distances ranging from 5 to 100 miles.
RESULTS: It is expected that the /sup 14/C assay will continue at the current levels of about three per month in FY 1977 and FY 1978. The /sup 85/Kr program is presently scheduled for completion at the end of FY 1977. If, because of the success of this program it is decided to continue the monitoring through FY 1978, we will continue to provide the analytical capability. However, if this program is not extended, then it is proposed that the previous research program to study the properties of molecular-sieve materials be re-established and expanded in FY 1978. Since the molecular-sieve and cryogenic systems collect many chemical species of great interest to meteorologists, environmentalists and atmospheric chemists, it is proposed that the product canisters from both systems be carefully evaluated for their potential for furnishing many more diverse and valuable data relating to stratospheric trace gases in addition to the /sup 14/CO/sub 2/ information.
PROJECT MILESTONES: Annual reports on C-14 assays are submitted to NOAA. Monthly reports on Kr-85 assays are sent tc Savannah River and NOAA.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The Multi-state Atmospheric Power Production Pollution Study (MAP/sup 3/S) of ERDA/DBER has the goal of developing an improved capability for the regional assessment of longer-term, average effects of pollutants emitted by conversion and combustion of fossil fuels. In order to achieve this goal, advanced numerical models involving improved parameterizations of atmospheric transport and removal processes will be developed.
APPROACH: A series of investigations of the structure and behavior of the Planetary Boundary Layer employs advanced remote-probing techniques and high-resolution sounding methods. Supporting micrometeorological studies evaluate the relevant surface fluxes required for parameterization of the efficiency of mixing in the atmosphere, and of the rate of removal of pollutants at the surface. Improvements are incorporated in numerical models, accordingly.
RESULTS: Improved numerical models capable of assessing those effects on the atmospheric environment that are caused by the transport, deposition and dispersion of pollutant materials carried over mesoscale and regional distances.
PROJECT MILESTONES: (1) Accomplishment of an extended 1976 field program, by 1 December 1976. (2) Completion of tracer feasibility tests by 1 March 1977. (3) Development of a preliminary grid model incorporating improved descriptions of atmospheric transport, transformation, and removal, by 1 June 1977. (4) Completion of the 1977 field program by 1 November 1977.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Three areas of study concerning sulfur oxide effects on crops are (1) interaction between sulfur oxides and other environmental parameters, (2) varietal differences in sulfur oxide resistance to damage, and (3) estimation of sulfur oxide effects under actual field conditions. Overall objective is to determine subtle effects of ambient low-level concentrations and expected increases in sulfur oxides due to combustion and conversion of fossil fuels. A combined field-controlled environment experimental approach is being used. Significant results obtained in growth chamber experiments will be tested under actual field conditions.
APPROACH: A combination of controlled experiments (growth chambers) and in situ (field) studies. Parameters (effects) of interest are photosynthesis and growth, uptake and biotransformation of pollutants, and varietal sensitivity.
RESULTS: (1) Description of chronic effects, dose-response relationships and mechanisms of toxicity of sulfur oxides on important crop plants. (2) Predictive capability, given increases in sulfur oxide emissions and ambient air concentrations.
PROJECT MILESTONES: (1) Construction and testing of zonal fumigation system and programmable controlled environment chambers. (2) Uptake and effects of SO2 on field-grown soybeans. (3) Accumulation and physiological effects of SO2 on chamber-grown plants. (4) Interaction of soil nutrients, climate,and incidence of disease with exposure to SO2.

CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest;HYDROGRAPHIC AREAS/Great Lakes
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) To determine the relationships between plant design, operation and environmental factors most influential in fish impingement. (2) To develop, test, and verify models for predicting impingement at water intakes. (3) To assess the significance and acceptability of impingement losses in a regional or ecosystem context.
APPROACH: Anticipated Program for FY 1977. During FY 1977, the information developed during the last two years will be used to develop perspectives regarding significance and acceptability of the fish impingement losses on a regional basis. From available data, fish losses at water intakes per unit volume of water screened will be estimated and losses for the whole lake on the basis of total water withdrawn from the lake will be projected. Significance and/or acceptability of these losses for two or three important species will be evaluated in the context of Lake Michigan fish, sport and commercial fisheries, and socio-economic applications. The various parts of the program follow.
RESULTS: Final report of the project will contain a comprehensive discussion of the fish impingement problem in a generic and regional context, an assessment of the significance of the problem on a lake wide basis, and guidelines for siting design and operation of intake structures on the lake.
PROJECT MILESTONES: Analysis of available data and identification of important variables-September, 1976. Assessment of impacts-September, 1977.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This activity is primarily aimed at extending our knowledge of elementary, molecular processes which take place at the earliest stages of radiation actions on any molecular substance

including the biological cell and which specifically involve electronic excitation and ionization. Elucidation of those processes is an essential prerequisite to sound and detailed modeling of subsequent chemical reactions and of biological changes brought forth by ionizing radiations in general. A secondary objective is to contribute to development of advanced instrumentation for radiation dosimetry.
APPROACH: Methods of research include both laboratory experiments and theoretical-physics techniques.
RESULTS: The project will generate comprehensive data on the excitation and ionization processes of diverse molecules by energetic agencies (including photons, electrons, and other charged particles), and on the properties of initial products such as excited species, radicals, ions, and secondary electrons. The resulting data will be applied to interpretation and prediction of various phenomena in radiation chemistry and biology.
PROJECT MILESTONES: By the end of each calendar year, an Annual Report will be issued to give a comprehensive account of the progress made in the concluded fiscal year, and about a dozen major journal articles will have been published. By the end of September 1977, application of the data to interpretation and prediction of various phenomena in radiaion chemistry and biology will be stepped up markedly.

CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Causes of death in man are sensitive to socio-economic, cultural, occupational and general environmental pollutant variables. This project is therefore designed to identify the contribution of each factor to the age and cause of death, to quantify its effect and to develop predictive models for impact analysis of energy facility sites and regions of resource development. The models should permit reevaluation of other cause-effect studies of air pollution and human health and the development of a rational cost-benefit analysis of health effects vs. effluent control technology.
APPROACH: The study will utilize existing data bases such as the U.S. vital statistics, census data, commercial and industrial activity data. Standard methods of demographic and life-table analysis will be employed to isolate specific relationships between health effects and socio-economic, etc., factors. The methods of multiple regression and factor analysis will also be employed. Wherever possible we will use data-bases existing in our own and other ERDA facilities.
RESULTS: The predictive models should permit the description of the health status of any population, given a set of economic, social, occupational, cultural and demographic conditions. Variations in health status that might accompany local or regional developments in energy resource utilization, energy facility, siting effluent or pollution level changes, or the myriad of population character changes that occur as economic bases change, can be predetermined so that local and regional governments can make preparations.
PROJECT MILESTONES: (1) Establish data bases and develop first relationships among factors for a test-set of 15 energy facility sites September 30, 1977. (2) Development of first testable model describing inter-relations of health status and socio-economic and other variables September 30, 1978. (3) Development of mortality models and incorporation into the analysis September 30, 1979.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The purpose of this program is to develop a National Environmental Research Park in the midwest region to provide facilities to enable environmental research to be carried out in order to achieve national environmental goals. These lands will be used for both baseline studies and environmental manipulation to permit comparisons of stressed and unstressed ecosystems. Since the Great Lakes are an important resource, these fresh water impoundments will also be included.
APPROACH: Since ANL has only small land holdings of at best limited ecological interest, the ANL/NERP will be an ''archipelago'' of several discrete areas of facilities which, taken together, will represent each of the important ecosystems and energy-effluent impacted environments in the midwest. Since this region borders on the upper Great Lakes and includes many of their watersheds, active consideration is being given to including these critically important freshwater impoundments in the NERP.
RESULTS: A proposal to set up and manage a midwestern National Environmental Research Park.
PROJECT MILESTONES: (1) A preliminary assessment of State and Federal lands available for inclusion in the NERP will be completed (July 1976). (2) An Annual Report will be prepared each year on the activities of the NERP.

REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Continental;HYDROGRAPHIC AREAS/Other hydrographic areas Unspecified
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objective of this program is to define the physiochemical properties of transuranium elements in natural waters, so that a reliable prediction of their fate and transport may be made if further environmental inputs occur.
APPROACH: Combinations of ultrafiltration and ion-exchange technique will be used to determine the chemical speciation of the transuranic elements in the water column. The nature of the complex formation and distribution coefficients relative to various components of the natural system will be defined using tracers. Differential extraction technique will be used to define association of these elements with the different solids in particulates and sediments.
RESULTS: It is anticipated that as a result of this research it will be possible to better predict the chemical form, association, transport and fate of transuranic elements released to the environment.
PROJECT MILESTONES: The determination of the physicochemical speciation of transuranic elements in surface

waters characteristic of the major climatic zones and extreme limnological character will be completed by September 1978. The elucidation of the major solid phases which control the equilibrium concentration of transuranic elements in the Lake Michigan water columns and rates of remobilization back to the water from the sediments will also be completed by September 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To provide the basic information required for the assessment of the impact upon coastal inhabitants of releases to the atmosphere of pollutants from nuclear and fossil fuel power plants located on coastal and off-shore sites, and to develop improved procedures for calculating atmospheric dispersion rates appropriate to marine locations.
APPROACH: Experimental investigations of dispersion, using zero-lift balloons, are conducted over Lake Michigan and over Long Island Sound. The dispersion experiments are supported by measurements of atmospheric turbulence and statistical studies of the properties of the lower atmosphere.
RESULTS: Improved methods, of utility similar to those already available for application over land sites, for calculating the effective dosage to inhabitants of near-shore regions resulting from pollutants released into the atmosphere from power plants located on coastal and off-shore sites.
PROJECT MILESTONES: (1) Publication of improved nomograms for estimating plume dispersion by 1 July 1977. (2) Completion of 1976 Annual Report by 1 July 1977. (3) Completion of building-wake modeling studies by 1 March 1977. (4) Completion of prototype wake-effect studies by 1 November 1977. (5) Publication of a relevant topical report by 1 March 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Cell survival is required for the expression of teratogenic, mutagenic, and oncogenic changes. Cell survival is also critical to the treatment of cancer with radiation and drugs. This project is aimed at elucidating the mechanisms of cell killing.
APPROACH: Mammalian cells cultivated in vitro will be studied as well as the DNA obtained from them. Damage and repair processes will be measured in respect to: metabolic activity, DNA size, cell growth, and cell survival. Acute and intermittent treatment with carcinogens, nonionizing and ionizing radiations will be used.
RESULTS: It is expected from this work that quantitative and qualitative comparisons can be made among various kinds of chemical and physical cytotoxic agents. Further, indications of interactions between one agent and another (e.g., radiation and chemical pollutants) can also be determined.
PROJECT MILESTONES: (1) Selection of cells having contrasting properties and having sensitivity and resistance to radiation and hyperthermia 12/30/77. (2) Identification of pre- and post-replication repair mechanisms in DNA damage 9/30/78.
KEYWORDS: ANIMAL CELLS;SURVIVAL TIME;MUTAGENESIS;TERATOGENESIS;CARCINOGENESIS;NEOPLASMS;BIOLOGICAL RADIATION EFFECTS;DRUGS;CELL KILLING;DNA;BIOLOGICAL REPAIR;CARCINOGENS;IONIZING RADIATIONS;METABOLISM;BIOLOGICAL EFFECTS;RADIOTHERAPY;IN VITRO

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: In vitro mammalian cell systems will be developed for the screening of oncogenic agents and for the study of the molecular mechanisms by which they act so that a rational basis can be made for extrapolation to man.
APPROACH: In vitro cell transformation will be used. Changes in growth morphology, anchorage dependence, or media requirements will be used as indicators of transformation. Tests for neoplastic change will be assayed in appropriate hosts.
RESULTS: Using different rodent cell systems, generalities will be sought of the effectiveness of different carcinogens including ionizing and nonionizing radiation. Cells from mammals closer to man will also be placed in culture, e.g., dog cells, to see if results with in vitro systems parallel those obtained in vivo.
PROJECT MILESTONES: A quantitative comparison of the relative effectiveness of different oncogenic agents in mammalian human cells in culture 9/30/78.
KEYWORDS: ENERGY SOURCES;ENVIRONMENTAL EFFECTS;CARCINOGENESIS;MAMMALS;ANIMAL CELLS;IN VITRO;MORPHOLOGICAL CHANGES;RODENTS;CARCINOGENS;IONIZING RADIATIONS;BIOLOGICAL EFFECTS;BIOLOGICAL RADIATION EFFECTS;BIOASSAY;GAMMA RADIATION;ULTRAVIOLET RADIATION;HYDROCARBONS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The purpose of this study is to assess the behavior and mobility of plutonium in a watershed that has experienced plutonium deposition over a period of years from a processing facility sited close to the Miami River.
APPROACH: This is a field-based aquatic and terrestrial program. Samples of water, soils, sediments and biota will be collected as required and analyzed for their Pu-238, Pu-239 content and for other important parameters necessary for the interpretation of the data.
RESULTS: The program will determine the sources and sinks of plutonium in the watershed, examine mechanisms of resuspension and mobility in water and soil, and assess the role of biological uptake and cycling in transport to man via the food chain.
PROJECT MILESTONES: (1) The characterization of the distribution of plutonium in soils will be completed by October 1977. (2) The distribution and physicochemical speciation of plutonium in canals, ponds, and river water will be determined by October 1977. (3) Discrimination factors for plutonium in plants and tissue distribution of plutonium in fish will be completed by October 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of the research project titled Assessment of Environmental Conditions of the Great Lakes in Relation to Power Production are to: (1) develop, synthesize and integrate information for baseline characterization of regional environmental resources within each of the Great Lakes watersheds; (2) assess the current and projectedimpacts of regional power developments on these resources; and (3) evaluate control technology and resource management options for mitigating adverse impacts associated with power supply and conservation technology developments in each region.
APPROACH: Sources of power related effluents, and physical, chemical and biological processes that influence the transport of pollutants are assessed in the first stage characterization of environmental resources whereas second stage efforts focus on the assessment of regional impacts of power production. Direct and indirect impacts of electric power generation on major biotic communities and physical natural resources are evaluated and cumulative environmental impacts of regional power generation are compared with other human-induced or natural influences in each study region.
RESULTS: Current studies on the Lake Michigan watershed are strongly multi-disciplinary and interinstitutional in scope and will result in approximately 20 published reports treating the regions environmental resources, potential environmental constraints to power development and means to reduce adverse consequences of power production.
PROJECT MILESTONES: (A) Baseline Characterization of Environmental Resources for the Lake Michigan Region Environmental Status of the Lake Michigan Region, Volumes 1-19, 30 Sept. 1976. (B) Regional Assessment of Environmental Impacts Associated with power development and evaluation of control technology, Draft Document, 30 June 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The Regional Studies Program will provide integrated and comprehensive assessments of the health, environmental, socioeconomic and resource impacts associated with alternative energy systems. The National Coal Assessment (NCA) will evaluate the consequences of increased national levels of coal utilization. The framework for comparative assessments will enable the bringing together of the results of fuel cycle assessments being conducted by AES.
APPROACH: Major emphasis will be placed on the conduct of the NCA in concert with the other ERDA labcratories. The NCA will focus on the deployment of technologies in the entire coal fuel cycle and the factors which may limit coal utilization. The NCA will evaluate impacts on a local, state, regional and national scale. Both quantitative and qualitative analyses will be prepared and existing models and data will be adapted and used. The comparative framework development will lead to a mechanism for consistent and comprehensive comparisons of alternative fuel cycles and energy systems.
RESULTS: The NCA will generate outputs that can be used by ERDA and other federal agencies, Congress, and the states. A set of source documents will be prepared to aid other interested groups that are conducting analyses. A series of reports and interim assessments will be developed throughout the program's two year duration so that the NCA can provide input into key decisions that must be made during this period. The framework for energy system comparisons will be directed to AES as an aid in program planning and technology overview.
PROJECT MILESTONES: (1) Initiate Multi-laboratory National Coal Assessment 6/76. (2) Interim National Assessment 10/77. (3) Complete Comparative Assessment Framework 10/77. (4) Complete National Code Assessment 10/78. (5) Complete Example Interfuel Comparison 10/78.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To study and parameterize the fundamental mechanisms that control the exchange of heat, moisture, and momentum between heated water surfaces and the atmosphere, in order to permit the improvement of schemes for predicting the extent and severity of possible adverse environmental effects downwind of both single and multiple cooling pond systems. Furthermore, to develop improved numerical simulations of cooling pond systems, capable of assisting in the design of power plants, and to develop methods for assessing the thermal performance of existing installations.
APPROACH: Micrometeorlogical methods of direct flux evaluaion are applied over an industrial cooling pond; the data derived allow determination of transfer coefficients appropriate in the special, demanding atmospheric conditions that prevail over heated water surfaces. Remote probing methods and simple predictive models are developed and evaluated.
RESULTS: Improved methods for parameterizing thermal exchange from heated water surfaces, and correspondingly improved numerical models capable of predicting the performance characteristics of proposed cooling pond installations. Eventually, the development of models for estimating the local environmental impact of particular cooling pond installations.
PROJECT MILESTONES: (1) Publication of a technical report describing improved parameterization procedures, by 1 December 1976. (2) Completion of analyses of data concerning the generation of cool skins over water surfaces, by 1 March 1977. (3) Conclusion of preliminary investigations of methods for observing the moist thermal plume downwind of a large cooling pond by 1 August 1977.

~SEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
OJECT DESCRIPTION: A. Skin tumorigenesis studies. The long-term objectives are concerned with (1) the identification of molecular lesions which result in transformation or initiation; (2) molecular lesions and systemic factors which influence promotion or expression of tumors; (3) the role of repair mechanisms in tumorigenesis; (4) the interaction of chemical agents and UV light. B. Lung tumorigenesis studies. (1) Determine the influences of cell proliferation and viral respiratory infection on the natural incidence of lung tumors. (2) Examine the use of tracheal and bronchial transplants.
APPROACH: A. Skin tumorigenesis. The test system uses (a) skin of two strains of mice that differ in

susceptibility to the induction of skin carcinomas, and (b) yeast for parallel mutation studies. The mice are exposed to UV light of different spectra furocoumarins and benzo(a)pyrene singly or in combination. The standard exposure regimen for UV light is 3/week for 24 weeks. For the study of tumor promotion regimens varying from 1-24 weeks are used. Biological end points: (1) molecular lesions; (2) repair of lesions; (3) metabolism of carcinogens; (4) mutation; (5) tumor incidence. B. Lung tumorigenesis. Test system: Lungs of mice of two strains and their hybrid which differ in the natural incidence of tumors. Exposure conditions: Sendai virus to young mice with defined flora. Biological end points: lung tumor prevalence rates.

RESULTS: A. Skin tumorigenesis. (1) Establish whether the genetic factors that determine susceptibility for skin tumorigenesis also affect sarcomagenesis. (2) Establish the UV spectral dependence for initiation and promotion. (3) Elucidate the role of cell proliferation, repair capability, and hydroxylation activity in the susceptibility to tumor induction. B. Lung tumorigenesis. (1) Establish whether the risk of lung tumor induction is dependent or independent on the natural incidence. (2) Establish the suitability of (a) in vivo and (b) in vitro mouse lung as a suitable screening test system. (3) Establish the role of respiratory viral infection in lung tumorigenesis.

PROJECT MILESTONES: (1) Establish whether susceptibility to tumorigenesis in skin is cell type specific. 12/30/76 (2) Establish the relationship between inducement of ornithine decarboxylase and susceptibility to tumorigenesis. 12/30/77 (3) Establish the fractionation dependency for initiation and promotion of tumors by exposure to UV light and psoralen. 12/30/77

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS

PROJECT DESCRIPTION: This project examines the genetic factors in sensitivity to the late effects of energy pollutants at two levels: (1) genetic components of tumor induction and life shortening in inbred and hybrid mice exposed to gamma rays and polycyclic hydrocarbons; and (2) differences in carcinogenic effects and life shortening produced by gamma rays and polycyclic hydrocarbons administered to a short-lived and long-lived rodent species. The estimates of genetic variance for the various pollutants will assist in the development of an optimum experiment design for evaluating the long-term hazards of chemical pollutants. The Mus-Peromyscus comparison is important because the longer-lived Peromyscus has greater capacity to repair DNA damage and lower rates of somatic mutation and viral transformation. The correlation of these and other in vitro characteristics with in vivo sensitivity will be made possible in this project.

APPROACH: The mouse genetics study uses five inbred mouse strains that have different life-spans and radiosensitivities. All 25 matings are made, and the progeny are used for the tests. This diallel design allows the extraction of a member of genetic variance component, additive, non-additive, and interactive. The same design and set of genotypes have already been measured for a number of traits, including survival in a conventional environment, survival under continuous irradiations; and measurements of body and organ dimensions. Genetic relations among these characteristics have been identified thereby. We plan to use it to test sensitivity to several energy by-products and to measure various mechanisms of cellular injury and repair, because the information yield increases with the number of different characteristics measured. The rodent species Peromyscus leucopus is a small mouse-like rodent that has a life expectation of 4+ years (vs. 2 years for the mouse) and a maximum span of 8 years. It has a different spectrum of tumors, some of them histologically similar to human neoplasms. It has already been shown by in vitro testing to have a higher rate of DNA repair and a lower rate of point mutation and viral transformation than the mouse. Comparison of these two species will yield more information about mechanisms of injury and repair than testing mice alone. Our capabilities include a cold room for imposing long-term metabolic loads, and much experience in lifetime epidemiological studies on rodents.

RESULTS: One basic purpose of this project is to develop experiment designs that yield more information about the genetic basis of sensitivity to environmental insults. Genetic variance in sensitivity to ionizing radiations has already been demonstrated, but the genetic factor in late effects of chemical pollutants will be even greater because of the larger role of enzymatic mechanisms. Another goal is to produce differences in late effects between populations and species that can be used in the search for correlative, and possibly causal, differences in capacities for cellular damage and repair. We already have found some support for the hypothesis that Peromyscus differ from mice in ways that are a step in the direction toward man. Study of these two systems will, therefore, greatly strengthen the validity and confidence of our prediction of hazards for man.

PROJECT MILESTONES: (1) Completion (3 years) and analysis (1 year) of diallel study of survival and pathology of mice kept in conventional environments. Partial 12/30/77; complete 12/30/80. (2) Completion of first generation of diallel studies on survival in cold environment and under chronic exposure to polycyclic hydrocarbon. 12/30/78. (3) Complete study on survival and pathology in Mus-Peromyscus pair exposed to cold environment, and interaction of cold with a polycyclic hydrocarbon. 12/30/78.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Control mechanisms for chromosome replication are studied in Bacillus subtilis, specifically the biochemical events involved in the initiation and termination of replication. We have also begun a study of immunoglobulin gene and biochemical genetic mutations in mouse myeloma cells. Mechanisms of action of UV and visible radiation in the production of mutagenic and lethal lesions, as well as the effects produced by added chromophores such as the psoralens and acridines are elucidated.
APPROACH: Cell membrane-bound segments of B. subtilis DNA are studied using transformation and density gradient techniques. In vitro mutagenesis using environmental and other mutagens are utilized in mouse myeloma cells. DNA lesions are studied using chromatographic and sucrose gradient techniques. A large monochromator has made possible the high irradiances required for the near UV and visible radiation studies. Mutagenesis in bacteria is studied primarily in continuous cultures (chemostat and turbidostat) in strains of bacteria with appropriate repair properties. The use of continuous culture techniques permits the study of mutation induction at very low levels of mutagen in the absence of detectable lethality.
RESULTS: (1) Control of replication: Lipid synthesis requirements; temperature-sensitive termination mutants. (2) Mouse myeloma: Levels of excision and postreplication repair; eukaryotic cell mutants. (3) UV and visible radiation: Mechanism of action of wavelengths longer than 300 nm; synergistic effects between near UV and other radiations; effects of selected photosensitizers including 8-methoxypsoralen, methylene blue and acridine orange.
PROJECT MILESTONES: (1) Control of replication: To demonstrate initiation and termination mechanisms for cellular control of bacterial DNA replication. 9/30/78 (2) Mouse myeloma: Isolation of molecular genetic mutants in eukaryotic cells. 9/30/78 (3) UV and visible radiation: Demonstration of the role of dimers and single-strand breaks in near UV lethality. 9/30/77 (4) The role of recombination repair in near UV and photosensitized lethality and mutagenesis. 9/30/78

PROJECT DESCRIPTION: Determine the mechanism of transformation of SO/sub 2/ to SO/sub 4//sup =/ in the atmosphere.
APPROACH: Laboratory studies and field sampling experiments in which the oxygen isotope rates in SO/sub 2/, SO/sub 4//sup =/, H/sub 2/O vapor, and O/sub 2/ will be measured. The isotopic composition of SO produced in controlled laboratory experiments will be compared to that in the atmosphere.
RESULTS: It is expected that the isotopic composition of atmospheric sulfate will indicate the major mechanism of formation.
PROJECT MILESTONES: Basic research program.

PROJECT DESCRIPTION: Development of improved monitoring equipment for the on-line detection and characterization of airborne plutonium aerosols which may be released during the nuclear fuel cycle.
APPROACH: Improved sensitivity and reliability over presently available monitors will be achieved by improving the discrimination against natural background activity by utilizing improved mechanical and electronic separation schemes. Prototypical monitors will be constructed and tested under laboratory and field conditions. New techniques will be developed and existing techniques evaluated for determining the activity and aerodynamic particle-size distributions of plutonium aerosols.
RESULTS: Development of on-line airborne plutonium monitors which will be able to rapidly and reliably detect small concentrations of airborne plutonium. Development of techniques to determine the characteristics of a plutonium aerosol.
PROJECT MILESTONES: (1) Establish the basis for design of an on-line airborne plutonium monitor Sept. 30, 1977. (2) Fabricate and test airborne plutonium monitor prototype suitable for commercial development Sept. 30, 1979.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this project is to collect and store in retrievable form data related surface mining of coal and reclamation of mined lands. At present, such data is scattered through the files of various state agencies, mostly in the form of raw data. The envisioned data base would permit rapid, easy access to such data and would allow for the calculation of useful statistical measures related to the environmental impacts of mining.
APPROACH: Argonne is contacting the pertinent state agencies in order to obtain their cooperation and to determine the nature and scope of the data collection problem. Preliminary study indicates project is feasible. After scope of data bank is determined, coding sheets will be prepared. Data collection should begin by mid-summer. Simultaneously, data management program will be developed by Argonne staff. 1977 Coding sheets are in preparation and are completed for two states. Collection of data has begun for Indiana.
RESULTS: The end product of this project will be a data management system capable of storing pertinent data related to the environmental impacts of surface mining of coal. The system will be designed to be open-ended so that data files can be updated periodically and new data files can be updated periodically and new data files can be added as new data becomes available. This system should be of much assistance both to ERDA and to the cooperating state agencies.
PROJECT MILESTONES: (1) Preliminary feasibility study and report to be completed by 1/1/76. (2) Field trips to visit pertinent personnel in Washington, DC, Columbus, OH, and Frankfort, KY completed 5/25/76. (3) Pre-planning documents completed 5/25/76.

ARACTER OF STUDY: RESEARCH/Laboratory (75%);DEVELOPMENT/Laboratory scale (25%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Decorporation of toxic metals, with major emphasis on plutonium-239. This work includes: (1) relationships between physicochemical properties of metal compounds and their deposition sites, duration of retention, and pathological effects; (2) utilization of such information to develop decorporation procedures; (3) development of appropriate methodology to facilitate these objectives. Both in vitro studies of mammalian organs and in vivo studies are carried out in rodents and dogs. Experiments are designed to allow extrapolation of results toward man. Most experiments are short-term (less than 6 months) and utilize sub-microgram quantities of metals.
APPROACH: Knowledge of specific deposition sites in tissues of a hazardous metal like plutonium allows selection of appropriate agents and procedures for decorporation. Potentially useful therapeutic agents are tested in mice or rats. If successful in the rodent, critical metal distribution or decorporation experiments are repeated with dogs. If therapeutic promise is confirmed for both rodent (mainly mice) and dog the substances and/or procedures are then evaluated for clinical use in human patients. The main target organs are the skeleton and liver.
RESULTS: Studies in experimental animals are designed to apply to man. The specific population aimed at is the production worker in a nuclear fuel fabrication or reprocessing facility who may become accidentally contaminated with actinides or lanthanides. However, the procedures developed could be used for any member of the human population similarly contaminated.
PROJECT MILESTONES: (1) Completion of the radioisographic studies outlining mineral distribution of plutonium isotopes in animal studies 12/30/77. (2) Demonstration of usefulness of pyran copolymer analogs for decorporation of Pu 12/30/76.
KEYWORDS: BIOLOGICAL REPAIR;METALS;RADIOACTIVITY;THERAPY;ACTINIDE COMPOUNDS;AIR POLLUTION;LAND POLLUTION;TOXICITY;ENERGY CONVERSION;ELECTRIC POWER;HEALTH HAZARDS;PLUTONIUM 239;IN VITRO;IN VIVO;RATS;DOGS;MAN;RADIONUCLIDE KINETICS;INGESTION;METABOLISM;ANIMALS

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The Land Reclamation Program addresses coordinated applied and basic research into the physical and ecological problems of land reclamation and rehabilitating mined coal land to productive end uses. The purpose of the new program is to conduct research and development projects focused on near- and long-term reclamation problems in all major U.S. coal resource regions, including Alaska, and to coordinate, evaluate, and disseminate the results of related studies conducted at other research institutions. The activities of the Land Reclamation Laboratory program will involve close cooperation with industry and focus on establishing a comprehensive field and laboratory effort. Research demonstration sites are established throughout the U.S. Regional and site-specific problems are addressed. The research is implemented through close cooperation with related efforts at academic institutions and other agencies. The major effort focuses on the complete coal extraction/reclamation cycle where necessary to develop solutions to ameliorating the environmental impacts of coal development.
APPROACH: The activities of the Land Reclamation Laboratory are divided into four key areas: (I) Program Development and Coordination: (A) Identification of key problems and issues; (B) Current research; and (C) Technology transfer. (II) Field and Laboratory Research in Problem Areas: (A) Geophysical and geochemical studies; and (B) Ecosystems studies. (III) Model Development and Generic Statements. (IV) Data System Development.
RESULTS: A cooperative project with the State of Illinois was completed; the effort demonstrated successful rehabilitation of deep-mine refuse. Striking improvements in aesthetics, water quality and biological productivity are evident. Two meetings were cosponsored by ERDA and DOI (BOM) to exchange information among 11 agencies on environmental research related to coal extraction. The interagency meetings have improved coordination with reduced duplication of research related to environmental effects of coal extraction. A land reclamation bibliography for Eastern United States has been developed, assembled and coded for retrieval by computer processing; the computer file of bibliographic citations has been published. It was determined that water quality and biotic parameters of the Tongue River (Wyoming) are unaffected by effluents of an active surface mine. Root development in soil/spoil layers is restricted to topsoil; roots do not penetrate the acid spoil. This observation confirms the need for careful replacement

of topsoil as specified by the Surface Mining Control and Reclamation Law.
PROJECT MILESTONES: (1) Optimization of surface mining techniques that minimize erosion and impact on water quality (Big Horn Mine/Tongue River). Complete development of predictive model 6/78. (2) Adaptation, plant breeding, and efficient water use by native species in arid environments (Jim Bridger Mine/Navajo Mine). Interim report on recommendations of reclamation techniques that minimize erosion 10/78. (3) Initiate feasibility study on water harvesting in arid western regions 10/77. (4) Monitor water quality/ecology of reclaimed deep-mine refuse (Macoupin County, IL). Interim status report. 6/78. (5) Evaluate alternate soil strata to optimize plant productivity (Midwestern Mine). Finalize experimental design 3/78. Initiate field experiments 5/78. (6) Feasibility evaluate of integrated pre-mine planning, reclamation strategies and alternate land use (Eastern Mine). Select site 6/78. Develop integrated plan with mine operator 8/78. Implement plan 1/79. (7) Complete computerized bibliographic file of environmental research related to coal extraction. Bibliographic report of reclamation research in Eastern United States 10/77. Bibliographic report of reclamation in Western United States 6/78.

RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: This training program was developed for Native Americans to provide the knowledge and understanding necessary for working on energy development, environmental and reclamation problems on tribal lands. Special attention is given to energy extraction and development with field trips to coal mines on or adjacent to Reservation lands to observe mining, environmental impacts, and application of various reclamation technologies.
APPROACH: The program consists of a basic and practical six-week educational and training program in energy, resources, conservation, environment, assessment, monitoring, and rehabilitation of disturbed land. The Native Americans are presented lectures, laboratory, and field instruction in: geology, energy resources and development, hydrology, soil science, aquatic chemistry and biota, meteorology, range and watershed management, wildlife ecology, data gathering, and interpretation, and human factors as related to energy develcpment.
RESULTS: It is expected that the program will provide tribal organizations with individuals having the knowledge and basic skills for making decisions affecting tribal energy, resources, environmental and rehabilitation. These individuals can serve in the various Tribal Energy Offices that each tribe has or plans to establish.

AFFILIATION: Argonne National Lab., Ill. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
77 FUNDING: Energy Research and Development Administration FY77:$255,000
TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: In order to determine the risk to man from internally deposited radioactivity, we need theory concerning long-term effects of radiation. Such theory must be capable of synthesizing existing data from cell culture, animals, and man within a logical, mechanistic framework that can be tested by experiment. As a start in this direction, we are developing a theory of the induction of bone cancer by alpha radiation. With relatively simple postulates this theory is proving capable of explaining and fitting the quantitative features of the data for radium in man and in the Salt Lake dogs. If its predictions are confirmed, this theory will provide us with answers to many of the practical questions of the risk to man from long-term alpha radiation from different elements and different schedules of exposure.
APPROACH: Our purpose is to synthesize the data for man, animals, and cell culture which bear on the induction of bone cancer by alpha radiation within a single logical, mechanistic framework. The data of prime importance for such a synthesis are the data for radium in man, because it provides our most extensive experience of the risk of internal alpha irradiation to man. However, to understand the human data we need controlled experiments in animals and culture. By on-line modeling using the computer language SPEAKEASY, we try to fit postulates, mechanisms, and data together in a three-dimensional analysis of tumor rate, dose rate, and time. The first requirement of such modeling is that it fits the data. The second is simplicity; the number of facts fitted must be larger than the number of variable parameters. The third is that most of the parameters of the model should be defined so that they can be measured in separate experiments. And finally, the model itself should be capable of firm predictions that can be tested by experiment. Such a model spotlights the gaps in existing data and points the way towards new experiments. The results should be a more productive interaction between theory and experiment, leading to a reliable summary of existing data and to functions of dose and dose rate that give us the risk to man in practical situations.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Freshwater
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECT
PROJECT DESCRIPTION: To determine kinetics and equilibria of metal complexation with inorganic and organic ligands.
APPROACH: (1) Development of analytical methods for determining concentrations of metal ligands and complexes in aquatic samples (Cd, Cu, Pb, and Zn). (2) Determination of the stoichiometry and stability constants of complexation reactions. (3) Measurement of the complexation kinetics. (4) Assessment of the effects of complexation on toxicity to algae. (5) Spatial and temporal mapping of the concentrations of metals, ligands and complexes in natural waters. (6) Assessment of the biological effects of increased input of metals or ligands into natural waters. (7) Characterization of the component fractions of the environmental ligand pool.
PROJECT MILESTONES: A basic characterization of kinetics and equilibria of chelated compounds in natural waters by Sept. 1979.
KEYWORDS: CADMIUM;COPPER;LEAD;ZINC;BIOLOGICAL EFFECTS;AQUATIC ORGANISMS;AQUATIC ECOSYSTEMS;WATER POLLUTION;ENVIRONMENTAL EFFECTS;CHEMICAL REACTIONS;WATER;CADMIUM COMPLEXES;LEAD COMPLEXES;ZINC COMPLEXES;COPPER COMPLEXES;CHELATES;HUMIC ACIDS;UNICELLULAR ALGAE

77 FUNDING: Energy Research and Development Administration FY77:$20,000
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: RADIATION/Plutonium/enriched uranium/mixed fission product (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objectives of the program are to provide radiation hazard surveillance and maintenance of contaminated surplus facilities. So as to maintain the total safety integrity of the facilities until such time that proper disposal is accomplished.
APPROACH: Periodic air and contamination smear samples are checked for radioactivity level. The data is evaluated and the results are recorded. Samples are taken in the Bldg. 37 - Panhouse No. 1, Bldg. 335 - Juggernaut Reactor Facility, and Building 331 - EBWR reactor shell. Power and maintenance to the surplus facility are to be provided.
RESULTS: Appropriate radiation safety associated with the storage of surplus facilities and appropriate records to verify same.
PROJECT MILESTONES: Continuing surveillance be made and increased as required.
KEYWORDS: SURVEILLANCE;NUCLEAR FACILITIES;RADIATION MONITORING;DECOMMISSIONING;RADIOACTIVE EFFLUENTS;RADIOISOTOPES

POLLUTANTS: RADIATION/Alpha (100%)
CHARACTER OF STUDY: RESEARCH/Applied (75%);ANALYTICAL (25%)
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To provide and evaluate techniques for the decontamination of contaminated metals in light of criteria for release, reuse, or disposal.
RESULTS: Assay methods will be monitored and tested. Conceptual flow diagrams will be prepared.
PROJECT MILESTONES: (1) April 1, 1977 Complete identification of current practices used at ERDA sites for release, reuse, and disposal of alpha-contaminated metals. (2) April 1, 1977 Complete experimental program for test of selected methods for the treatment of metallic equipment to provide data on the efficiency of decontamination and the nature of the product. (3) September 30, 1976 Complete summary report.

TECHNOLOGY: FOSSIL FUEL/Coal (100%)
POLLUTANTS: NOXIOUS GAS/SO/sub 2/;NOXIOUS GAS/NO/sub x/ (50%);METALS/Trace elements (10%);PARTICULATES/Including fines (20%);ORGANICS/Polyaromatic hydrocarbons (10%);SPECIFIED OTHER POLLUTANTS/Waste solids (10%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To provide the Division of Environmental Control Technology with comparative engineering/cost assessments of environmental control technologies for processes for generation of electric power from coal. The power generation processes to be evaluated include processes under development such as fluidized-bed combustion and coal cleaning/combustion, as well as conventional power plants with stack gas cleaning. All factors that affect the selection of the processes and the pollution control systems will be considered.
APPROACH: Information on the costs, pollution control, reliability, availability and energy requirements of power generation processes and the associate pollution control systems will be compiled from reports and discussion with manufacturers, users and developers of these processes and control technologies. A methodology for comparing alternative coal-electricity processes on the basis of their capacity for cost-effective control of environmental impacts will be developed. A comparative analysis of coal-electricity options will be made during FY 1977; this analysis will be revised in subsequent years as

new information from utility installations and process development facilities becomes available. It is planned that subcontractors will be employed to compile and evaluate information on specific control technology areas.
SULTS: The product of the program will be a series of semi-annual reports beginning in October 1977 that describe the current status of development of control technologies for power generation processes. The end-of-year reports issued each October will present the results of the comparative assessments of cost-effective environmental control of alternative coal-electricity processes.
PROJECT MILESTONES: (1) 10/1/76 Environmental Control Technology (ECT) Status Report. (2) 4/1/77 FY 77 Interim Report. (3) 10/1/77 FY 77 Final Report on Assessment of ECT for Coal-Electricity Processes. (4) 4/1/78 FY 78 Interim Report. (5) 10/1/78 FY 78 Final Report on Assessment of ECT for Coal-Electricity Processes.

TITLE: Identification of Refractory Organic Compounds in Treated Refinery Wastewater
PROJECT NUMBER: 800058
PRINCIPAL INVESTIGATOR: Raphaelian, L.A.
ADDRESS: Argonne National Laboratory, Energy and Environmental Systems Division, 9700 S. Cass Ave., Argonne, IL 60439
AFFILIATION: Argonne National Lab., Ill. (USA)
MONITORING AGENCY: Environmental Protection Agency, Washington, D.C. (USA)
TYPE OF FUNDING: EPA pass-thru funding
77 FUNDING: Environmental Protection Agency FY77:$100,000; Energy Research and Development Administration FY77:$77,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (80%);WASTE MANAGEMENT (20%)
POLLUTANTS: ORGANICS/Petroleum and refractory (100%)
CHARACTER OF STUDY: RESEARCH/Applied (80%);DEVELOPMENT/Pilot plant (20%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Site specific Plant locations
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To determine at four oil refineries presently using activated sludge for wastewater treatment: (1) The effectiveness of their present wastewater treatment. (2) The usefulness of a secondary treatment consisting of activated carbon as outlined in EPA's ''Refining Guidelines Document,'' the standard for 1983 ''Best Available Treatment Economically Achievable (BATEA).''
APPROACH: By Gas Chromatography/Mass Spectrometry, each specific organic and its concentration will be determined at the following sampling points: (1) At the influent of the activated sludge treatment plant. (2) At the effluent of the activated sludge treatment plant. (3) At the effluent of the activated carbon treatment.
RESULTS: It is expected that many of the organics present in the influent to the activated sludge treatment will be broken down and missing from the effluent and certain new organics will have been produced. Many of the organics in the effluent of the activated sludge will be eliminated by the activated carbon filter. From the data generated, the effectiveness of activated sludge and activated sludge/activated carbon wastewater treatment can be evaluated.
PROJECT MILESTONES: (1) Development of a suitable method for extracting organics from water samples 31/3/76. (2) Development of GC columns for separating complex mixtures of organics and establishment of limits of detection on the GC/MS/Data System 30/9/76. (3) Setting up collection equipment at oil refineries and collection of samples at four refineries 30/9/76; 31/12/76; 31/3/77; 30/6/77. (4) Isolation and analysis of organics in collected samples of four refineries 31/12/76; 30/6/77; 31/12/77; 30/6/78. (5) Analysis and interpretation of data. Ongoing through 30/6/78. (6) Preparation of final report 30/9/78.

POLLUTANTS: METALS/In mine drainage (25%);PARTICULATES/In mine drainage (25%);ORGANICS/In coal (25%);SPECIFIED OTHER POLLUTANTS/Major, minor and trace elements in mine drainage, coal, and coal overburden (25%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (70%);ANALYTICAL (30%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/Middle Atlantic;GEOGRAPHIC AREAS/South;HYDROGRAPHIC AREAS/Other hydrographic areas Numerous river basins
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To identify sites east of the 100th meridian where surface mining is likely to increase over the next 20 years. To intensely study these sites to obtain a data base from which to assess potential health and environmental impacts from their being mined. To assess the effectiveness of the control technology utilized and examine alternatives. To develop a matrix which will recommend control technologies for new or expanding mines to allow those mines to operate in an environmentally safe manner. To recommend future R and D needs and priorities in environmental control technology.
APPROACH: Survey future coal production areas and select case study sites. Bi-weekly sampling and analyzing of site effluents, collecting and analyzing of climatic, hydrologic, and geologic data. Project site impacts and extrapolate for coal regions. Examine control technology economics and efficiency. Include waste product disposal/reclamation. Matrix site characteristics, control technology practices, and effectiveness of treatment. Analyze matrix and make recommendations for alternatives to existing

technologies and for future R and D needs.
RESULTS: Reports on: (1) 20-year overview of new and expanded surface mining areas and resultant health and environmental impacts. (2) 20-year overview of mining methodology and technology. (3) Control technology effectiveness, economics, and waste products. (4) Evaluation of newly promulgated effluent limitations guidelines. Development of site specific predictive matrix to recommend effluent control technology for existing or expanding mines. Report on control technology research and development needs and priorities.
PROJECT MILESTONES: Milestones being revised to reflect recent decision to extend program through FY 1978. Dates below are current. (1) Report on 20-year overview of new or expanded surface mine production areas and related technology development trends. Report on case study site selection--criteria and rationale July 1, 1976. (2) Report on 20-year projection of potential health and environmental impacts related to increased surface mining based on effluent volume and characteristic data collected at case study sites. (3) Report on effluent control technology effectiveness, economics, and waste product problems. Report on comparison and evaluation of program data with effluent limitations guidelines. Computer storage of information July 1, 1977. (4) Final report with site specification predictive matrix capability to recommend effluent control technologies for existing or expanding mines. Report on control technology research and development needs and priorities October 1, 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To develop for the greater Northeastern U.S. a data base on the distribution and chemical analysis of ambient aerosol pollutants and relate these to energy related sources.
APPROACH: The program will provide for the collection and chemical (molecular) characterization of size and time classified atmospheric aerosols samples obtained at a series of selected sites (3-4) in the N.E. USA. Specific attention will be given to the amount of sulfate present and the degree of acidity in the collected aerosols.
RESULTS: Four hour samples will be taken using a Lundgren impactor sampler and evey fifth one will be analyzed. Particle acidity will be determined by IR spectroscopy with emphasis on sulfate and nitrate species in the 0.3-0.1 mu m diameter particle size range.
PROJECT MILESTONES: FY 77 Select and establish four sites for collection of samples for analysis of aerosol samples. (Sites already identified are at Penn State Univ., Univ. of Virginia and B.N.L.)

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To determine whether oxygen isotopic analysis can be used to differentiate the mechanism of sulfate formation in the atmosphere.
APPROACH: Samples of ambient atmosphere are collected seasonally and analyzed for the isotopic ratio of O16, O18 in SO2 and sulfates and water vapor and the results tested against models for the mechanism of sulfate formation.
RESULTS: The oxygen-isotopic ratio in both atmospheric water vapor and precipitation showed a marked seasonal variation with both phases being relatively more depleted in O18 during winter months. Water vapor is depleted in O18 compared to condensed water by about 10% at all times of the year. The oxygen isotopic ratio of SO2 showed marked seasonal variation similar to atmospheric water vapor but significant deviations were also noted. Oxygen isotopic ratio of aerosol sulfate showed no seasonal variation but sulfate found in precipitation does appear to have an oxygen isotopic ratio similar to the water with

which it is associated.
PROJECT MILESTONES: Continue collection and analyses to confirm seasonal trends and collect samples of dry deposition and observe trends at other locations.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The effects of intermittent environmental stress by agents such as chemicals or extreme temperature frequently depend on timing. Day or night exposures, even exposures a few hours apart, may have drastically different actions. The long term goals of this project are the understanding of timed environmental responses, with a view to their possible modification.
APPROACH: As a model of timed responses, photoperiodism, the control of development by the daily duration of light, has been chosen for study. Experiments are in progress with Lemna perpusilla, a photoperiodic plant, grown in axenic, biochemically defined and usually heterotrophic conditions. By varying the medium, the course of carbon dioxide output can be made to reflect the actions of two known components of plant photoperiodism: the light-absorbing pigment, phytochrome, and a circadian rhythm (or ''biological clock'').
RESULTS: The immediate objective is information on the biochemical results of photoperiodically effective light-dark schedules, using carbon dioxide flux and the underlying metabolic changes as probes. The data obtained should also bear on photorespiration and other metabolic control phenomena that affect the overall photosynthetic efficiency, and thus the productivity, of higher plants in general.
PROJECT MILESTONES: (1) 1-10-77 Improved CO/sub 2/-monitoring system capable of assaying CO/sub 2/ over wide concentration range. (2) 1-10-77 Determination of role of nitrogen source in modifying photoperiodic and circadian rhythm. (3) 1-7-78 Identification of sources of that CO/sub 2/ output which is modulated by photoperiodism. (4) 1-10-78 Initiate studies of metabolic intermediates to identify reactions controlling indicator patterns in photoperiodism.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of our research are threefold: The first of these is the manner in which chromosomal DNA grows, how this growth contributes to the time required for cell reproduction, and how physical and chemical mutagens affect the growth. The second concerns the effect of physical and chemical mutagens on the controls that determine when cells replicate chromosomal DNA and when they divide. The third objective is to determine the function of proteins needed for recovery of gamma irradiated cells before they proceed to mitosis.
APPROACH: (1) The biological materials used are cultured cells and roots of three plant species: Pisum sativum, Helianthus annuus, and Crepis cappillaris. (2) The analyses fall into four categories that are interrelated: (a) cell kinetics and associated aspects of the cell division cycle, (b) chromosomal DNA fiber replication (replicons) of isolated molecules via autoradiography, electron microscopy, and immuno-fluorescence techniques, (c) identification and translation of recovery and cell cycle related proteins by acrylic gel autoradiography and wheat germ translation system, and (d) cell cycle mutant selection and quantitation with emphasis on the reversible process in plants of single cells reversible organcgenesis which is required to determine effect of mutant cells in complex tissues.
RESULTS: (1) A quantitative description of the relationship between the replicons of the chromosome and the cell cycle duration. (2) The interaction between the mutagen, gamma-azaguanine, the functional state of the replicon, and the induction of polyploidy in Pisum sativum. (3) Identification of the more easily mutable cell cycle genes by common energy-related mutagens. (4) A molecular description of the recovery processes of dividing cells exposed to ionizing irradiation.
PROJECT MILESTONES: The first evaluation of the quantitative effects of single cell mutants on the function of a proliferative, complex tissue.

EFFECTS
PROJECT DESCRIPTION: Determination of variations in dose-response curves for important biomedical endpoints including cancer induction, mutation and chromosomal aberration production, and cell killing as a function of the microscopic distribution of energy deposition in tissue and of dose rate.
APPROACH: This project, a collaborative venture between the BNL Medical Department and the Columbia University Radiological Research Laboratory, employs a dedicated 4 MeV Van de Graaff accelerator capable of producing monoenergetic neutrons of from 0.1 to about 15 MeV and charged particles ranging up to about 8 MeV. The accelerator is used to irradiate a variety of experimental materials ranging from rats to single human cells in tissue culture for the study of radiation effects, as well as for microdosimetric measurements of energy deposition.
RESULTS: Careful study of the effects of radiations of different LET at various doses and dose rates and in the presence or absence of oxygen allow the validation and extension of theoretical explanations of the biological and physical mechanisms involved in carcinogenesis, mutagenesis and lethality. Determination of these mechanisms will allow the health effects of the exposure of human populations to the low levels of radiation anticipated from nuclear power generation to be accurately estimated.
PROJECT MILESTONES: (1) July 1, 1977 Completion of Track segment irradiation facility to allow irradiation of single cells with narrow bands of energy deposition ranging from about 10 up to about 200 keV/mu for study of lethality and chromosomal aberration production. (2) July 1, 1979 Completion of hardware for single proton microbeam irradiation of selected sites in cells with an accuracy of about 1 mu m.

ENERGY CYCLE: ELECTRICITY GENERATION (50%)
POLLUTANTS: RADIATION/Co-60 gamma-radiation (20%);SPECIFIED OTHER POLLUTANTS/Heavy water (D/sub 2/O) (80%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Primary emphasis for next two years will be on the effects of ozone and heavy water (D/sub 2/O) on immune reactions. The objectives of these studies on non-nuclear and nuclear energy-related effects on immune systems are directed to the following interdependent areas of study: (1) alteration of antibody responses by exposure of mice to deuterium and pollutants, (2) effects of D/sub 2/O upon anaphylactic shock, (3) alteration of in vitro antigen-antibody reactions, (4) effects of D/sub 2/O on the incidence and time of onset of lymphocytic leukemia in HRS mice, and (5) cellular proliferation in regional and peripheral lymphoid tissues during antibody responses in mice maintained on D/sub 2/O.
APPROACH: (1) It is now apparent that mice seldom survive more than 35 percent substitution of D/sub 2/O for H/sub 2/O in their body water. (2) A preliminary report will be issued in July, 1976 concerning the suppressive effects of D/sub 2/O on antibody responses to tetanus toxoid. (3) A preliminary report may be issued in later 1976 concerning the susceptibility of mice to anaphylactic shock after maintenance of D/sub 2/O. (4) Experiments will be initiated in 1977 concerning in vitro antigen-antibody reactions in the presence of heavy water. (5) Experiments will be initiated in 1977 concerning the effects of D/sub 2/O on the incidence of lymphocytic leukemia in HRS mice (see 189). Initial results would be available in mid-1978.
RESULTS: Preliminary studies in this exploratory research indicate that primary antibody responses are greatly suppressed when mice are maintained on 10 to 40% D/sub 2/O in their drinking water. Higher levels of D/sub 2/O (30-75%) inhibited secondary responses. Even though radiation is not involved with D/sub 2/O, these findings are similar to the radiosensitivity of antibody responses observed in earlier studies after exposure to graded doses of ionizing gamma-radiation. Severe atrophy of the thymus and spleen was observed with the higher amounts of D/sub 2/O. In contrast, lower levels of D/sub 2/O given daily over a period of 60 days resulted in hypertrophy of the thymus and spleen.
PROJECT MILESTONES: (1) A preliminary report will be issued in July 1976, concerning the sensitivity of primary and secondary tetanus antitoxin responses when mice are maintained on graded amounts of D/sub 2/O before and during active immunization to tetanus toxoids. (2) It may be possible to issue a preliminary report by the end of 1976 concerning the effects of D/sub 2/O on sensitivity of mice to anaphylactic shock after maintenance on D/sub 2/O for extended periods of time (weeks and months).

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
OJECT DESCRIPTION: We are determining the structure and function of the solar energy capturing pigment systems of marine and freshwater phytoplankton. These studies provide information on the effects of environmental factors including effluents from power generating on the growth of the primary producers. We are particularly interested in the red tide dinoflagellate algae which are important as a food resource for marine animals and are toxic to man.
APPROACH: We have developed reproducible large-scale culture procedures for growing marine phytoplankton. The algae are grown under varied environmental conditions and growth is measured either by cell number or biomes. Biochemical and physiological studies on phytoplankton include effects of environmental factors on toxin production in dinoflagellate algae. We will examine enzymes concerned with nutrient uptake of phytoplankton.
RESULTS: The effects of effluents associated with power generation in the marine environment may be beneficial if properly managed. These studies will provide information on those nutritional and physical factors which regulate phytoplankton growth. Knowledge of the regulating factors for phytoplankton growth will allow management to achieve optimal productivity and to control undesirable phytoplankton such as toxic red tides. Marine productivity is completely dependent on phytoplankton productivity.
PROJECT MILESTONES: (1) 1977 The structures of the toxins of Gonyaulux tamarensis, the red tide organisms of the northeast coast, will be determined. (2) 1978 An analysis of the environmental factors which regulate phytoplankton growth will be made.

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Marine
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This project seeks a better understanding of the relationships between structure and function in tissues, cells, and cellular organelles. These relationships will be determined for organisms undergoing normal differentiation and development to establish a basis for interpreting cellular and organismal responses to various environmental factors. Among the environmental factors to be studied will be light and temperature regimes, chemical agents, gravity, and high flux magnetic fields. The principal tools are microscopes of three types: (1) conventional high resolution transmission electron microscopes for the study of ultra thin specimens especially sections, replicas, and isolated macromolecules; (2) a moderate resolution scanning electron microscope utilizing secondary electrons to reveal surface topography, and detection of light emitted by cathodoluminescence; and (3) a high resolution scanning transmission electron microscope available under Dr. J. Wall's project, to study biological structures through the use of specific heavy atom labeling and to study thick sections for three-dimensional reconstruction.
APPROACH: The areas of investigation using these electron microscopes are: (1) The relationship of plant cell organelles, especially microtubules, to wall synthesis. Cells will be examined from plants grown under regimens known to influence wall deposition, and cell division (to study new walls), and under environmental influences expected to affect wall formation. The fine structure of cytoplasm will be examined by TEM of thin sections, by SEM of wall and cytoplast surfaces, and by STEM of thick sections. (2) The formation of antigen by Trichinella worms. Isolated worms from the host will be studied by SEM using antibody labeled variously for cathodoluminescence to determine the sites of antigen secretion. (3) Drug synthesis, transport, and accumulation in opium poppy (Papaver) and marijuana (Cannabis). Sites of drug synthesis will be sought at the cellular and organelle level. Developmental aspects of laticifer (in Papaver and Cannabis) and gland development (in Cannabis) will be determined by TEM as related to drug transport and accumulation in cultivars of known high and low drug yield. Morphological changes which accompany floral initiation by environmental induction will be determined by SEM for Papaver. (4) Environmental effects on embryogenesis in carrot cell cultures. Embryos grown in weightless conditions (Kosmos 782 K-102) will be examined to determine morphogenic responses at the organismal and cellular level detectable by SEM or TEM.
RESULTS: Studies with Drug Plants. The relation of epidermal glands of marijuana to drug production will be determined for cultivars of known high and low drug content. Response of the shoot apex of opium poppy to floral induction will be examined. Antigen Formation in Trichinella. Freshly prepared fluorescent-labeled antibody will be used to determine bound antibody distribution on worms by SEM-cathodolumiescence. Plant Cell Wall Formation. The distribution of microtubules relative to other cell organelles and microtubule length will be determined in the cytoplasm adjacent to side and end walls of root meristematic cells. Various stages of mitosis and the new walls following cytokinesis will be explored. Thick sections and serial thin sections for TEM will be used as necessary. Embryogenesis in Carrot Culture. Comparisons will be made in fine structure between embryos which developed under weightless conditions and controls.

PROJECT DESCRIPTION: (1) To devise sensitive assay methods for analyzing tissue levels of proteases thought to be involved in carcinogenesis and the development of emphysema. (2) To synthesize selective protease inhibitors for the analysis of the role of a given enzyme in the pathological process and to provide a method for treatment.
APPROACH: New substrates are produced by synthesis to yield fluorescent products for increased sensitivity. Specific inhibitors are devised by employing affinity labelling. The inhibitors are substrate-like and inactivate target enzymes by chemical reaction. The enzymes of interest are plasminogen activator, plasma kallekrein and elastase. Synthesis and evaluation of the effectiveness of inhibitors will be carried out on purified enzyme preparations. Application to in vivo systems will be by collaboration.
RESULTS: Useful methods of improved analysis and treatment are expected.
PROJECT MILESTONES: (1) Improved assay methods for elastase 1978. (2) Plasminogen activator 1978. (3) Selective inhibitors of the above 1980.

PROJECT DESCRIPTION: To determine the structure of the solar energy conversion system in green photosynthetic bacteria in order to further the long-range goal of developing solar energy converters based on biological principles and able to compete with silicon cells in cost and efficiency.
APPROACH: To break down the bacterial energy conversion system into its component parts by conventional biochemical techniques and to characterize each part by spectrophotometry, electron spin resonance spectroscopy, and polyacrylamide gel electrophoresis. Further to elucidate the organization of the parts in various subsystems and in the intact energy conversion system by x-ray diffraction and electron microscopy.
RESULTS: The isolation and characterization of the photochemical reaction center.
PROJECT MILESTONES: (1) Isolation of a photochemical reaction center free of light-harvesting chlorophyll. (2) Determination of the structure of a reaction-center containing membrane and its relationship to bacteriochlorophyll a-proteins. (3) Determination of the structure of a chlorobium vesicle and its aggregated chlorobium chlorophyll.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To understand basic genetic processes such as regulation of gene expression, replication of DNA and genetic recombination at the molecular level. A simple system is being studied so that a complete understanding might be possible, but techniques and concepts developed and tested in this system should be applicable to more complex systems as well.
APPROACH: A combination of genetic and biochemical techniques are being applied to the study of bacteriophage T7 and its host, E. coli. Approximately 30 T7 genes have been identified, and mutations have been found in 25 of them. The protein specified by each T7 gene has been identified by gel electrophoresis. T7 DNA is being analyzed by cutting with specific restriction endonucleases, and specific signals for transcription, RNA processing, translation and replication are being identified and mapped. Functions of T7 genes involved in regulation of gene expression and replication are being analyzed by using appropriate mutants. Ability of gel electrophoresis to resolve different forms of native and single-stranded DNAs is being defined.
RESULTS: We soon expect to understand completely how T7 DNA is transcribed after infection, and the role of each T7 and E. coli gene involved in this process. Eventually, replication of T7 DNA should be understood in the same detail. The limits in the ability of gel electrophoresis to resolve large DNA molecules are being tested. The T7 system and the techniques developed for analyzing it are finding wide application in studies of the detailed biological effects of mutagens, carcinogens and radiation.

POLLUTANTS: METALS/Manganese;METALS/Magnesium;METALS/Lead (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) To define the sequence and kinetics of interaction of electron-carrying components in the photosynthetic membranes of plants. (2) To determine the ion permeability characteristics of photosynthetic membranes in dark and light, and find which ion movements accompany the establishment and relaxation of the trans-membrane proton gradient. This basic knowledge will aid in the development of a photoelectrodialysis device (see Project 001827). It is also important to understand how light intensity regulates the terminal rate-limiting steps of photosynthesis.
APPROACH: (1) Sensitive differential absorption spectrophotometry in the visible and ultraviolet is coupled with computerized data retrieval and analysis to resolve the complex spectra of electron transport pigments in chloroplasts and thus their role in electron transport in transient and photostationary states. (2) Ion specific electrodes are employed to monitor simultaneously the ion fluxes induced by light in suspensions of isolated chloroplasts. Ionophase antibiotics are used as an exploratory tool to modify membrane permeability. They are also incorporated into inert synthetic membrane matrices to give ion-specific electrodes of required selectivity. These electrodes could find application in monitoring for metal pollutants.
RESULTS: (1) The role of quinones and cytochromes in photosynthetic electron transport will hopefully be resolved in the long term. Near term goals include an understanding of the function of b-type chromosomes. (2) The interaction of illuminated chloroplasts with Mn is under study. The light-induced movements of ions in intact CO/sub 2/-fixing chloroplasts and in intact protoplasts will be investigated as a measure of the ion redistribution across the various cell membranes which must accompany the onset of photosynthesis.
PROJECT MILESTONES: (1) 1-10-76 Understand significance of light-driven Mn uptake by chloroplasts. (2) 1-10-77 Conclude development of Mn-selective electrode. (3) 1-10-78 Determine entire pattern of light-induced ion fluxes in intact green cells. (4) 1-10-79 Elucidation of role of b-type cytochromes in photosynthetic electron transport. (5) 1-10-81 Elucidation of role of quinones cytochromes in photosynthetic electron transport.

PROJECT DESCRIPTION: Determine basic concepts of biological structures and relate molecular architecture to functional properties. Apply structure dependent interactions to biomedical problems like pollutant effects on enzymatic systems.
APPROACH: Structural investigations are being carried out by neutron and x-ray scattering techniques. In order to facilitate such scattering investigations, large high efficiency 2-dimensional counters and beam optical devices are being developed.
RESULTS: Determine the role of water of hydration and hydrogen atoms on enzyme kinetics and specificity. Development of scattering techniques for the analysis of biological complex structures like ribosomes and membranes. Determination of the protein distribution in the 30S subunit of ribosomes Completion of search for agents similar to dichloromethane that prevent sickle cell anemia.
PROJECT MILESTONES: Refinement of myoglobin structure localizing all H atoms. Localization of proteins in riboscmal subunits. Evaluation of light induced structural changes in retinal rods. Characterization of the interactions of anesthetics with proteins, i.e., prevention of sickle cell anemia by dichloromethane and other anesthetics.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: The detailed study of the high resolution protein structure of alpha-thymotrypsin to determine and classify the ordered water structure which interacts with the protein molecule. Also to study the protonation states of the chemically important amino acids in chymotrypsin at varied pH's.
APPROACH: The study will be performed using neutron diffraction. Neutron diffraction has a great advantage over the conventional x-ray technique when studying problems involving protons and water structure. The data will be collected at the HFBR using the recently developed two dimensional counter system. The initial chymotrypsin phasing model will be taken from the previously determined x-ray structure and then refined with the neutron data to obtain an accurate set of neutron phases.
RESULTS: A detailed model including the water structure and protonation states of the proteolytic enzyme chymotrypsin. Such a study has not yet been done on an enzyme and will be of general interest to many scientists working in related fields.
PROJECT MILESTONES: (1) Data collected to 1.5 A resolution 10/1/76. (2) Structure refinement and interpretation 4/1/77.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: In order to understand the mechanism of action of mutagens and carcinogens, a much clearer understanding is needed of the mechanism of DNA replication in cells of higher organisms. The

objective of this project is to contribute to this understanding. Specifically it aims to determine whether the function of the three known DNA polymerases is for normal DNA replication, repair, or some as yet unknown function. It further aims to locate the DNA polymerases within a cell during the cell cycle, and in specific cells in a mixed population such as tissue.
APPROACH: Anti-DNA polymerases beta antibodies will be tested for ability to inhibit DNA polymerases from a variety of sources, including viral reverse transcriptases. The antibodies will be used to locate the polymerase microscopically in sections of various human tissues by labeled antibody techniques. Antibodies will be prepared against polymerase alpha from a suitable human source for similar studies. Isolated nuclei from red cells of anemic chickens, which contain almost exclusively polymerase beta, yet can synthesize DNA, will be studied to determine whether this synthesis is repair or replication and whether the type of synthesis can be modified by addition of purified polymerase alpha.
RESULTS: These studies are expected to add considerable new insight into the location of the individual DNA polymerases in cells and tissues in different stages of proliferative activity, and into their function in the processes of DNA replication and repair.
PROJECT MILESTONES: (1) September 30, 1976 Study on inhibitory action of at least one metal completed. Begin studies on misreading of genetic message. Begin studies on metal inhibition of DNA polymerase alpha. (2) March 30, 1977 Studies on action of at least one metal on fidelity of replication to be completed.

PROJECT DESCRIPTION: Test systems are in vivo mice, dogs and man. In vitro murine, canine and human bone marrow cells are studied and effects on blood cell production, feedback loops, chromosomes, marrow cellularity and induction of leukemia observed.
APPROACH: Radiation effects are being terminated. Radioactive pollutants will be synthesized. The tagged pollutants will be used to treat animals in vivo and stem cells in vitro. The cellular location of the non-nuclear pollutants will be identified by measuring the accumulated radiation effect on frozen cells. Thus through using radioactive labeling of pollutants one will determine the amount of pollutants in target cells by measuring the radiation effect accumulated in frozen state. Initially, acute exposures and later chronic exposures will be used.
RESULTS: The biological endpoints are reduction in number of hemopoietic stem cells, diminution in production rates of differentiated blood cells, induction of chromosome abnormalities and leukemia.
PROJECT MILESTONES: (1) October 1976 Commence development of labeling pollutants. (2) January 1977 Commence utilization of radiolabeled pollutants and measurement of effect in frozen state; stem cell separation and concentration techniques developed and in operation. (3) July 1977 Exposure of whole animals to gases and aerosols commence. (4) January 1978 Initial results on leukemogenesis.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This program aims at developing understanding of how residuals from energy production and use affect human health. The impact of various energy technologies on human health and the environment is an important element in their cost to society. The assessment of the biomedical and environmental costs of residuals from energy production and use can be accurate, especially for costing the impact of residuals present at low levels, only when one has a precise understanding of how they induce effects such as oncogenesis. These studies are having increasing predictive value; they are essential for informed and practical cost-benefit analyses of energy control technologies.
APPROACH: The approach to how energy-related residuals induce effects such as oncogenesis and genetic

mutation is being made in several complementary and directly interrelated ways: (1) study of the interaction and complexes with other molecules such as histones, novel chemicals, and important energy-related pollutants, with the 3-dimensional structure of natural double-stranded DNA's, RNA's and of synthetic polynucleotides; (2) study of factors affecting the mammalian cell proliferation cycle and the effect of important energy-related pollutants on these and associated synthetic enzymes; and (3) study of factors affecting cell function, e.g., lymphocyte transformation and lymphocyte antibody production and the effect of important energy-related pollutants on these.
RESULTS: Scientists at HEW NCI and NIEHS, US EPA and ERDA will be consulted regarding potential hazardous materials produced by major synthetic fuel technologies, including their products and end use. Model hydrocarbon compounds representative of these will be selected and made available for this and other programs. Potentially significant compounds will be complexed with DNA and other polynucleotides and their effects assayed on cell division (in synchronized HeLa cells). Additional information will be obtained on how poly(I.C) interacts with cell membranes to inhibit DNA synthesis and determine where this inhibition takes place in the DNA double-helix.
PROJECT MILESTONES: (1) October 31, 1976 Complete preliminary consultation with scientists at HEW NCI, NIEHS, US EPA and ERDA on hazardous emissions from major synthetic fuel technologies plus collation of these with results of workshop on health effects of synthetic fuels. (2) November 1, 1977 Begin study of interactions of chemicals in emissions recognized as carcinogenic with DNA and other polynucleotides. (3) August 30, 1978 Elucidate site of inhibition of synthesis by poly(I.C) in DNA double-helix. (4) September 30, 1979 Complete several interactions of energy-related pollutants with DNA. Update survey and assessment of synthetic fuels.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The overall objective of this project is to determine and manipulate genetic controls of plant development through the use of cell and tissue culture and the analysis of genetic tumors. By using methods developed for somatic cell genetics, variants can now be induced, recognized and selected with greater speed, precision and economy than is possible with intact multicellular plants. Preparations of wall-less cells, protoplasts, are being used to produce hybrids by fusion of somatic cells, to extend the range of hybridization beyond that possible by cross-pollination, and to introduce foreign DNA and chromosomes with specific effects on plant development, differentiation, and tumor formation.
APPROACH: The experimental approaches have been mainly aimed to exploit genetic uses for plant protoplasts and haploid cell lines. Protoplasts from two different species are prepared by enzymic digestion of the cellulose wall, are mixed under sterile culture conditions in the presence of a fusion-enhancing agent, and are subjected to procedures that select out the products of hetero-fusions. Some hybrid products are sufficiently novel (as intergeneric to interkingdom fusions) to be of intrinsic value for microscopic and immunological analysis of the new genotypes; others can be differentiated into mature plants and produce unique progenies. Haploid cell lines are used for other purposes. They are exposed to mutagens, grown under specific conditions (as a sublethal level of an amino acid analog) and selected for resistance to the toxic agent. They are then analyzed to determine the cause of the resistance, are differentiated, and can finally be subjected to classical genetic tests.
RESULTS: Protoplast research is expected to demonstrate that plant hybrids can be formed by fusion of somatic cell protoplasts and that this method can be used to extend the range of hybridization beyond that possible by sexual means. It is expected that entirely new viable plant types will eventually be produced by this method, particularly in the family Solanaceae which includes tomato, potato, peppers and eggplant. Since a single foreign chromosome introduced into a plant species can cause genetic tumors, it should now be possible, with protoplasts acting as the recipient cells, to introduce small amounts of foreign DNA and eventually to determine the nature of the DNA that controls the switch from normal growth to tumor formation.
PROJECT MILESTONES: (1) 1972 Demonstration that parasexual interspecific hybrids could be produced by protoplast fusion and selection of hybrids on the basis of the less stringent cell culture requirements of the hybrid (tumorous) tissue. (2) 1975 Verification and extension of the original finding, showing high frequency of parasexual hybridization and production of novel chromosomal types. (3) 1976 Demonstration of interkingdom fusion between human (HeLa) cells and tobacco protoplasts.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
SEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
OJECT DESCRIPTION: The main goal is to improve our understanding of the nature of changes produced in living cells by ionizing radiation and the biological, biophysical, and environmental factors that determine and/or modify such responses. The relative effectiveness of several kinds of radiation is being studied as well as the influence of a wide range of dose or dose rate, and varied environmental conditions on radiation responses. Possible synergistic responses of ionizing radiation and air pollution will be examined. Hybrids between existing Tradescantia clones have given several highly mutable seedlings. Some of these should be more highly sensitive to radiation. If so, we hope to find out why.
APPROACH: Higher plants serve as the main test organisms and special genetic stocks with inherently different mutation frequencies have been produced and are used to measure mutagenesis. Growth or survival, somatic mutation and chromosomal damage are the main end points studied. Results to date offer explanations of the marked differences in sensitivities of different clones, species or groups of organisms, and also allow prediction of radiobiological responses in species for which adequate radiobiological data do not exist. Chromosome size and/or DNA content per chromosome are the main factors determining differences in radiosensitivities among species although spontaneous and perhaps induced mutation frequencies can also be influenced by many other factors.
RESULTS: The work has application to problems relating to possible plant or crop damage from ionizing radiation in the environment, and to radiation genetics in general. The high sensitivity of Tradescantia makes it especially useful for the study of genetic effects of low doses or low dose rates. Genetic effects of very low doses of x-rays, neutrons and of beta radiation from tritiated water will be studied.
PROJECT MILESTONES: (1) FY 77 Work on the shape of mutations dose-response curves at low doses and low dose rates will be extended and interpreted in terms of microdosimetry and enzymatic repair of damaged DNA. (2) FY 78 Evidence should be obtained to indicate whether or not certain common air pollutants interact synergistically with ionizing radiation. It is expected that new clones more sensitive to radiation will be available and we hope to show them to be deficient with respect to DNA repair.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: METALS (45%);ORGANICS (45%);RADIATION (10%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The main objective is elucidation of the molecular mechanism of genetic transformation by DNA. This includes uptake of DNA from outside the cell, molecular conversions of the DNA, recombination with DNA inside the cell and repair of mismatched DNA. Bacterial transformation systems can provide a convenient assay of damage to DNA by environmental pollutants. Additional objectives focus on other aspects of the reactivity of DNA within cells: mutagenesis by agents acting directly on DNA; role of DNA methylation; function of DNases, particularly sequence-specific (restriction) endonucleases.
APPROACH: The fate of radioactively labeled DNA in the transformation of pneumococcal bacteria is investigated by analysis of products formed at each step and by characterization of mutants blocked at different steps of the process. Enzymes and other cellular components involved in DNA binding, entry, and recombination within the cell are isolated and analyzed biochemically. An unusual pair of restriction endonucleases in pneumococcus, one of which acts only on methylated DNA and the other at the same sequence but only when it is unmethylated, are also being studied.
RESULTS: Interactions between DNA, surface binding factors and a membrane-located DNase will be clarified and the hypothesis that the DNase acts by pulling in one strand of DNA as it degrades the complementary strand will be tested. Such information will enhance the usefulness of transformation in screening for effects of pollutants on DNA. It may also be applicable to genetic engineering, which requires introduction of DNA into mammalian cells. An enzyme system responsible for mismatch correction in pneumococcal transformation should be isolated and characterized; this system appears to protect the cell from excessive mutation.
PROJECT MILESTONES: (1) May 1977 Determination of mode of binding of DNA to cell surface. (2) August 1977 Elucidation of membrane structure containing DNase involved in DNA entry. (3) December 1977 Determination whether DNA methylation regulates gene function. (4) Isolation of enzyme system responsible for base mismatch repair.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) Determine what might be the genetic and/or somatic effects of long term exposure to radioactive tritium and/or non-radioactive deuterium, isotopes of hydrogen which are major by-products of power reactors. (2) To compare these effects with those arising from exposure to nonradioactive energy related pollutants.
APPROACH: Second generation mice on tritiated water (1 mu Ci/ml and 3 mu Ci/ml) are mated and the pregnant females examined for the frequency of early and late in utero embryoneal deaths. The early deaths are an indication of dominant lethal genetic effects. Mice on tritium throughout their lifetime will be evaluated for changes in growth, life span, liver chromosome abnormalities and alterations in the bone marrow. Microscopic examination of the regenerating liver following partial hepatectomy will be used as an indication of somatic genetic effects. Bone marrow will be evaluated for cellularity and content of hematopoietic stem cells.
RESULTS: The final results will give an estimate of the relative hazard of exposing a population to long-term effects of radioactive and nonradioactive by-products of nuclear power reactors. From what is known about the generation of these products in power reactors, an evaluation can be made of the health effects of a nuclear power technology. As comparable data on the effects of non-nuclear energy related pollutants become available a comparison of the relative health effects of these processes may be made.
PROJECT MILESTONES: (1) Genetic and stem cell studies on animals on 3 mu Ci/ml tritiated water completed 1/12/76, on 1 mu Ci/ml completed 6/1/76. (2) Growth, mortality and tritium distribution studies on 3 mu Ci/ml complete 9/1/76; on 1 mu Ci/ml on animals 12/1/76. (3) First pilot studies on effects of non-nuclear pollutants also to be completed 12/1/76. (4) 9/1/77 Genetic studies on 1 mu Ci/ml animals to be completed and decision to be made as to whether to examine lower H-3 concentrations.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Northeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this basic research program in ecology is knowledge of the structure and function of natural ecosystems. Special emphasis is on the adverse effects of ionizing radiation. The program has been focused in past years on the field-to-forest sere on central Long Island, examining not only the structure and function of the communities of that sere but also the effects of long-term chronic gamma irradiation. It is anticipated that the chronic irradiation will cease in a year or two and be followed by a detailed study of recovery of the severe ecological disturbances presently evident.
APPROACH: The program has contributed importantly to methods of analysis of a terrestrial ecosystem. It has also revealed starkly that ionizing radiation causes changes in the structure of natural systems that are by no means unique; the changes follow definable patterns that are closely related to changes caused by a wide range of different types of disturbance. The patterns appear to be explained in a large part by an hypothesis relating evolution of high resistance to radiation damage to the evolution of low mutation rates, although the topic is extremely difficult to examine in detail. The evidence on radiosensitivity of plants increasingly appears to support this hypothesis. The hypothesis provides one further basis for understanding the patterns of degradation of structure of natural ecosystems caused by accumulating small physical, chemical and biotic changes in the environment.
RESULTS: It is hoped that results obtained will provide further understanding of (1) the effects of chronic ionizing radiation on structure and function of the forest; (2) mineral inventory and recycling (What is the inventory of nutrients required to sustain the forest and the successional communities leading to it.); (3) how fast recovery occurs and is succession the same after damage from gamma radiation as it is after other severe ecological disturbances.
PROJECT MILESTONES: This project is essentially one in which data are accumulated as a function of time of exposure, since no ''milestones'' are reached. However, in spite of the fact that very much remains to be studied and that the project is unique, it seems possible that the irradiation phase may be terminated during FY 1978 and future work would then concentrate on a detailed study of recovery of the severe ecological disturbances presently evident.

PROJECT DESCRIPTION: Interaction of radiation with matter and fundamental dosimetry concepts are investigated. Emphasis is placed on studies which improve our knowledge and understanding of the mechanisms and space and time relations of energy deposition and transport in irradiated tissue-like materials.
APPROACH: Studies of energy deposition in nanometer sized regions of tissue-like materials are made using a special low pressure ionization chamber and theoretical models. Results from these studies are correlated with available data on biological effects to further our insights into possible basic mechanisms of radiobiological damage.
RESULTS: Theoretical models relating nanometer energy deposition patterns, LET, and biological effects are being developed in order to (a) explain variations of RBE with LET, oxygen tension, dose rate and other factors, (b) understand mechanisms responsible for radiation induced tumors, and (c) determine proper methods of extrapolation of data to very low doses where measurements of biological effects are not possible. Collaborative studies of radiation induced mutations and tumors are conducted with members of the BNL Biology and Medical Departments in order to aid in the timely accumulation of data used for testing models and theories of action.

REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Middle Atlantic;COASTS/Northeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objective of this project is development of new scientific instrumentation. The principal areas of effort are radiation detectors, processing of signals from radiation detectors and electronic circuits for signal processing. In radiation detectors particular emphasis will be placed on position-sensitive detectors for charged particles, neutrons, x-rays and gamma rays. These developments are essential to a number of diverse techniques within the ERDA program.
APPROACH: The approach is based on continuing effort in areas which are fundamental to the new instrument development. Two such areas are liquid and gas mixtures as ionization media for radiation detectors and low noise techniques. These efforts are then focused toward recognized particular needs, such as neutron position-sensitive detectors. These detectors are required for molecular and crystal structure determination by neutron diffraction, the method which has opened new possibilities in biological research and in materials research.
RESULTS: (1) A new large area (0.5 x 0.5 square meters) position-sensitive detector for thermal neutrons. (2) New position readout methods. (3) New gas mixtures for high-resolution position-sensitive detectors.
PROJECT MILESTONES: (1) FY 1977 Development of large area position-sensitive detector for thermal neutrons. (2) FY 1978 Investigation of charge-transfer semiconductor devices as radiation detectors.
KEYWORDS: INSTRUMENTATION;POSITION SENSITIVE DETECTORS;DESIGN;THERMAL NEUTRONS

POLLUTANTS: NOXIOUS GAS/Carbon monoxide (30%);METALS/Cadmium (70%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Major experimental efforts using two strains or rats with opposite genetically determined predisposition to experimental hypertension include studies on: (a) the influence of cadmium on hypertension and hyperlipidemia; (b) the influence of chronic carbon monoxide exposure on atherosclerosis in hypertension; (c) the influence of the kidney on blood pressure, as demonstrated by renal transplant; (d) isolation of pressor substance from hypertension-prone rats. Clinical studies involve the measurement of cadmium in the kidney and its correlation to kidney function and steroid metabolism in hypertensive patients.
APPROACH: The effect of a subtoxic dose of cadmium in drinking water on blood pressure, growth, and life span will be investigated in hypertension-prone and hypertension-resistant rats. The effect of cadmium on cardiac output and on regional blood flow will be studied by radioactive microspheres. The cadmium concentration in the kidney of hypertensive patients will be studied by prompt gamma and neutron irradiation technique.

PROJECT MILESTONES: (1) Purification of two strains of rats, with opposite genetic propensities for hypertension January, 1977. (2) The study of cadmium-binding protein, metallothioneins, in two strains of rats January, 1977. (3) Specific pathogen free rat breeding system established May, 1977. (4) Investigate the effects of various trace metals (e.g., cadmium) on the development of hypertension and accompanying behavioral changes September 30, 1978.
KEYWORDS: HYPERTENSION;ETIOLOGY;GENETICS;ENVIRONMENTAL EFFECTS;KIDNEYS;BLOOD PRESSURE;TRANSPLANTS;HORMONES;DIURETICS;BIOLOGICAL EFFECTS;CADMIUM;RATS;HEART;CARBON MONOXIDE

TYPE OF FUNDING: Contract No.-E(30-1)-16
77 FUNDING: Energy Research and Development Administration FY77:$130,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The principal objective of this program in FY 1977 and 1978 will be to determine whether regulatory signals of biological importance have been preserved during evolution. We are particularly interested in determining if similar enzymes are involved in the post-transcriptional processing of RNA in bacterial and mammalian cells.
APPROACH: One approach will be to ask whether extracts prepared from mammalian cells will faithfully process precursor RNAs of bacterial origin. A complementary approach will be to test mammalian precursor RNAs with purified processing enzymes of bacterial origin to see if the mammalian RNA contains processing signals and if specific products are generated.
RESULTS: The studies in progress have required and will continue to require the development of new techniques, both analytical and preparative, that will be extremely useful in studies with more complex biological systems. In addition, the models developed will serve as a foundation for future work in related areas.
PROJECT MILESTONES: In bacteria mutations that impair RNA processing frequently result in the loss of a particular biological function. By knowing what features of nucleic acid structure are important for RNA processing, it is often possible to predict how a certain type of mutation will affect biological function. If it can be demonstrated that similar RNA processing mechanisms exist in bacterial and mammalian cells then it should also be possible to predict the effect of an identical mutation in a mammalian cell.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS
PROJECT DESCRIPTION: To determine the structural change undergone by the allosteric enzyme aspartate transcarbamylase during its activation, and to investigate how the extent of this change is affected by various activators and inhibitors. To determine the rate of this structural change, and to see if any intermediate structures are revealed during it.
APPROACH: The main approach is X-ray solution scattering (at small and large angles) of the enzyme solution. For kinetic experiments using this technique, the X-ray source will be synchrotron radiation emitted from a storage ring. Subsidiary approaches are electron microscopy and standard kinetic experiments using spectroscopic monitoring.
RESULTS: Information concerning the probable structure of the activated form of the enzyme at low resolution. Information about the extent of the structural change in the presence of different concentrations of various activators and inhibitors. Diffraction patterns indicating the speed of the structural change in solution, and the presence or absence of substantial concentrations of intermediate species with substantially different structures.
PROJECT MILESTONES: (1) Survey of qualitative diffraction pattern changes due to principal activators/inhibitors. (2) Quantitative scattering curves for the inhibited and activated forms. (3) Survey of electron microscope images of the inhibited and activated forms using standard preparation techniques. (4) Determination of optimum conditions for kinetic X-ray experiment. (5) First kinetic X-ray experiment.

MONITOR: Carter, C.E.
TELEPHONE: F233-5468
TYPE OF FUNDING: Contract No.-E(30-1)-16
77 FUNDING: Energy Research and Development Administration FY77:$265,000
TECHNOLOGY: FOSSIL FUEL/General (55%);SOLAR/General (5%);GENERAL SCIENCE (40%)
ENERGY CYCLE: COMBUSTION IN SITU (5%);PROCESSING, CONVERSION (25%);COMBUSTION OR END USE (60%);ELECTRICAL TRANSMISSION (10%)
POLLUTANTS: NOXIOUS GAS/Ozone;NOXIOUS GAS/NO/sub 2/ (45%);ORGANICS/Carcinogenic hydrocarbons (50%);RADIATION/Ionizing (5%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Several aspects of the molecular toxicology of oxidizing pollutants and of carcinogenesis/mutagenesis are investigated. Oxidative and free radical mechanisms underlying these effects are emphasized. Specific objectives include assessment of biological damage processes of hydrocarbons and other oncogenic pollutants, evaluation of tumorogenicity and systemic toxicity of ozone and other oxidizing gases, and elucidation of the photochemistry of photosynthesis.
APPROACH: Advanced electron spin resonance (esr) methods are often used, including double resonance (endor,eldor), saturation transfer techniques, and flow apparatus for esr and Q band to follow reactions of free radical forms of carcinogens with target biomolecules. An ozone exposure chamber permits ozonization of animals, cells and biochemicals; and a battery of biochemical techniques plus esr are used to assess effects on blood tissues of female Sprague-Dawley rats. Peroxidation and ozonization reactions on model lipid/protein systems also are studied. Free radicals of natural and synthetic porphyrins and chlorophylls are examined by esr and derivative methods, electrochemistry and optical spectroscopy.
RESULTS: The present hypothesis that metabolically activated forms of carcinogenic pollutants act via formation of addition compounds with DNA should be further supported or refuted. The question of whether tissue distribution and metabolism of some pollutants can be monitored by way of changes in intrinsic tissue esr signals should be answered. The possibility of systemic toxicity and tumorigenicity from respiratory exposure to ozone will be further evaluated and dose-effect relationships established in Sprague-Dawley rats. Knowledge of free radical electron donor and acceptor forms in bacterial and plant photosynthesis may lead to improved methods for conversion of solar energy to electricity or to hydrogen fuels. An interdepartmental (conjoint) radiation facility to study oxidizing damage by chemical and gaseous pollutants, using esr on-line at BNL's Dynamitron electron accelerator, will be established.
PROJECT MILESTONES: (1) Determination of ozone carcinogenicity in rats June 1977. (2) Establishment of conjoint (interdepartmental) radiation facility to study oxidative actions of pollutants from energy generation and use Oct. 1977. (3) Preliminary assessment of tissue esr signals as pollution damage monitors December 1977. (4) Support or refutation of carcinogen free radical hypothesis June 1978. (5) Dose-response data on systemic ozone toxicity and carcinogenicity Dec. 1978.

TECHNOLOGY: SOLAR/Biomass (10%);GENERAL SCIENCE (90%)
POLLUTANTS: METALS (80%);PARTICULATES (10%);ORGANICS (10%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS
PROJECT DESCRIPTION: Determination of the structure of biological molecules at 2 to 5 A resolution with special emphasis on determining the conformation of active sites of proteins, the mechanism of interaction of DNA and protein, and development of capability for direct reading of DNA sequences.
APPROACH: A new Scanning Transmission Electron Microscope (STEM) has been developed which can image single heavy atoms and unstained biological molecules. Specimens will be observed in the frozen state to improve the preservation of the native structure. Interesting sites within the molecule will be tagged in vivo or in vitro with heavy atom reagents. The location of heavy atoms within the biological molecule will then be observed with the STEM.
RESULTS: FY 1977-1978 We expect to be able to sequence normal and abnormal DNA and RNA molecules and study protein binding to these sequences. Rapid analysis possible by direct visualization of individual molecules with on-line computer analysis should allow us to characterize at a molecular level any environmentally produced alteration in the DNA of an organism, as well as any change in its protein binding pattern. Similar programs will be started to characterize the structures of free proteins and membrane bound complexes. Of particular interest are the membrane-bound proteins involved in bioconversion of solar energy.
PROJECT MILESTONES: (1) FY 1977 Opening of user facility, observation of known DNA sequences, observation of known protein structures at low temperature. (2) FY 1978 Sequencing of naturally occurring DNA moecules, determination of effects of pollutants on DNA, determination of structure of protein complexes and membranes.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The Atmospheric Diagnostics Program is concerned with the implementation and development of capabilities for studying the evolution, chemical composition, and physical properties of airborne constituents, both gases and particles under the dynamic meteorological conditions of the atmosphere. The overall goal of the program is to develop the best analytical methodologies (using both continuous and time-averaged sampling) for atmospheric pollutants of interest.
APPROACH: Understanding the regional nature of air-pollutant transport and transformation requires studies of power plant plumes, urban plume transport into rural areas, vertical pollutant composition profiles and ambient aerosol composition and particle size documentation. To obtain this understanding requires implementation of developing analytical techniques and development of a broad range of new techniques. Major emphasis is on analytical methods for specific determination.
RESULTS: In FY 1977 and 1978 laboratory studies of the extent of oxidation of SO/sub 2/ to sulfate on treated quartz and related filters will be completed. Filter sampling procedures for ambient ammonia will be optimized. The effect of ambient ammonia on the measured acidity of airborne particles will be investigated using diffusion under technology. A semi-automated procedure for coulometric determination of titratable acidity in airborne particles and generation of Gram titration curves will be implanted. Use of a dichotomous sampler and a Lundgren impactor in conjunction with the Sinclair diffusion battery will permit determination of size distributions of ambient aerosol particles from 0.01 to 710 mu m diameter. Improvements in determination of soluble nitrate, ammonium, total mass and transition metals in airborne particles collected in connection with the MAP3S program will be implemented.
PROJECT MILESTONES: (1) Determination of acidity, ammonium and soluble sulfate in routinely airborne particle samples collected with time resolution of 10-20 min. in connection with the MAP3S program 1/1/1977. (2) Complete size distributions (with chemical composition determination) from 0.01 to >10 mu m diameter with time resolution of <3 hr 1/7/1977. (3) Real time sulfate monitor for field applications 1/1/1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objective of this study is to obtain an understanding of meteorological processes in the coastal region that affect siting, operations, and safety of power providing and related facilities located either offshore or near a coastline. A major goal of the program is to develop a reliable system for observation diffusion conditions affecting releases from coastal or offshore sites and to predict them from measurable meteorological and surface parameters.
APPROACH: This program is being conducted by a contribution of experiments tracer studies from offshore and coastal sites. Measurements of meteorological parameters, relating the experimental results to the meteorological conditions and incorporating these relationships with mathematical diffusion models.
RESULTS: Results expected included improved methods for plant site relation and prediction of diffusion of materials released to the atmosphere from cover in the coastal zone.
PROJECT MILESTONES: (1) September 1975 Publication of first major contribution on results of project. (2) May 1976 Completion of data analysis from water effects studies on Great Gull Island. (3) August 1976 Start experimentations on diffusion from coastal location. (4) October 1976 Start experiments on diffusion into transition zone from off-shore sites using SF/sub 6/ tracer.

PROJECT DESCRIPTION: To review the fundamental concepts of energy from the perspectives of the basic sciences and engineering, to explore the various aspects of power generation and utilization in an industrial society, and to review energy sources and environmental effects.
APPROACH: Present a series of 32 lectures and working sessions, at which the basic aspects of energy generation are presented. Participants in the program prepare individual papers on some aspects of power generation and utilization, or environmental effect, as may be related to a hypothetical situation on Long Island.
RESULTS: 30 High School science teachers should be better informed on the various aspects of energy as a result of their participation in this program, and should be able to improve their teaching techniques accordingly.
PROJECT MILESTONES: Institute is scheduled from September to May each year. It concludes in May with a presentation by each participant of a paper on some topic in the area of energy production, utilization, or environmental effects.

POLLUTANTS: NOXIOUS GAS/H/sub 2/S;NOXIOUS GAS/SO/sub 2/;NOXIOUS GAS/NH/sub 3/ (100%)
CHARACTER OF STUDY: RESEARCH/Applied (40%);DEVELOPMENT/Laboratory scale (40%);FULL SCALE DEMONSTRATION (20%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Develop improved electron capture gas chromatographic procedures for SF/sub 6/ and other meteorological tracer gases (e.g., perfluoro dimethycyclobutane). Demonstrate new techniques for tracer compounds in actual field tests including grab sampling and portable, real-time continuous determination. Improve existing flame photometric detection methods for determination of sulfur compounds in the ambient. Examine new method for detection of ambient S compounds via conversion to SF/sub 6/. Prepare low rate permeation standards (less than nl/min) for various air pollutants (H/sub 2/S, SO/sub 2/, NH/sub 3/) and ultra-trace sources for meteorological tracer compounds.
APPROACH: The electron capture solute switching technique will be used to improve the signal to noise ratio by at best a factor of 10. Removal of oxygen continuously by catalytic conversion to water or chemical reaction with alkaline pyrogallol will provide continuous detection capability for SF/sub 6/ and other perfluorocarbon compounds. Solute switching and synchronous demodulation detection will also be used to reduce noise substantially from a flame photometric detector. The signal will be enhanced by operating the flame in the presence of added sulfur. Reaction of sulfur compounds with elemental fluorine over a catalyst surface followed by EC detection of the resultant SF/sub 6/ will give at least 3 orders of magnitude better sensitivity than flame photometric detection.
RESULTS: Early in FY 1977 a prototype continuous SF/sub 6/ and perfluorocarbon detector with a limit of detection near 1 x 10/sup -14/ should be ready. An improved sensitivity flame photometric detector will be constructed. A prototype sulfur to SF/sub 6/ converter/detector will be tested. Low rate permeation standards will be available for calibration of field monitoring instruments.
PROJECT MILESTONES: (1) Demonstrate continuous SF/sub 6/ detection by October 1976. (2) Participate in National Oceanic and Atmospheric Administration on tracer experiment at Idaho Falls, September 1976. (3) Test improved flame photometric detector by 31 May 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: This program aims at developing a systematic overview of biomedical and environmental costs of energy production and use. All forms of energy are being considered. The initial focus is on biomedical effects and environmental effects on animals, crops, and other vegetation and on land, known to affect man. This evaluation relies on available information; epidemiological data, field and laboratory studies carried out on appropriate animals and vegetation, and basic biomedical research designed to elucidate molecular and cellular mechanisms underlying biological responses to various residuals. By taking account of the magnitude of energy flow through the system and of the populations exposed, total effects are calculated.
APPROACH: Starting with a compilation of residuals from the energy system, the various pathways to man are traced. Work has been divided into three tasks: (I) Integrative Assessment: integration of best available information into an overall assessment of the total health and environmental cost of energy; (II) Impact Evaluation: Centers on areas identified in Task I as most in need of analysis. Includes (a) impact of coal extraction, transport and conversion, (b) correlation of health effects with energy related residuals, and (c) health impact of energy use in urban environments; (III) Special Studies: as required for the development of the program and as requested by DBER.
RESULTS: Integrated assessment activity in this area is designed to serve two purposes: (1) Guide the allocation of resources in the biomedical research program, and (2) provide information on biological and environmental costs required to make decisions regarding alternative energy systems. The direct products are reports to ERDA and publications in the open literature. The results expected are more rational allocation of biomedical and environmental research efforts in anticipation of energy developments and a wider information base leading to better decision regarding energy development policies.
PROJECT MILESTONES: (1) Report, County Level Energy-Environmental Atlas 30 June 1976. (2) Report on Health Effects of Sulfate Air Pollution 30 September 1976. (3) Report on Integration of Energy Model Data Base, County Level Energy/Environmental Data Base and National Water Emissions Data Base 30 Sept. 1976. (4) Report on Health Effects of Synfuels Production and Use 31 Dec. 1976. (5) Report of Health Effects of the Coal Fuel Cycle 31 Dec. 1976. (6) Report on Demonstration Analysis Using Integrated Energy, Environmental Data Base 30 June 1977. (7) Report, Second Iteration Assessment of Health and Environmental Effects of Energy Systems 30 Sept. 1977.

REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Northeast;COASTS/Northeast;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) To understand the dynamics of seashore transport and diffusion. (2) To obtain coastal circulation and physical data in support of marine ecosystem studies. (3) Development of physical models of coastal region and continental shelf circulation.
APPROACH: An automated ''real-time'' data collections system is used for measuring current, temperatures and salinity supplemented by shipboard measurement of the same parameters in a network of stations and depths on a transect south of Long Island. Physical models are developed to explain the circulation patterns obtained.
RESULTS: Description of the two-dimensional flow pattern of velocity, temperature and salinity in an offshore cross-sectional transect with detail never produced before. Of particular interest is the description of nearshore upwelling and downwelling processes. Development of dynamical models to explain nearshore

circulation.
PROJECT MILESTONES: (1) One full year of data (velocity, salinity and temperature) from the instrumented spar buoy system will be obtained by June 1977. (2) Data for two-three months from deck-readout instruments to supplement (a). (3) The above will lead to a description of circulation in the oceanic coastal boundary layer.
KEYWORDS: COASTAL WATERS;DIFFUSION;TEMPERATURE GRADIENTS;SALINITY;AQUATIC ECOSYSTEMS;DATA ACQUISITION;HEAT TRANSFER;ENVIRONMENTAL TRANSPORT;WATER

TYPE OF FUNDING: Contract No.-E(30-1)-16
77 FUNDING: Energy Research and Development Administration FY77:$105,000
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
CHARACTER OF STUDY: RESEARCH/Applied (50%);DEVELOPMENT/Pilot plant (50%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Northeast;COASTS/Northeast;HYDROGRAPHIC AREAS/Deep ocean;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: This project is concerned with the development of new methods and techniques in systems for continuous large scale and automated data acquisition, monitoring, data verification and experimental contrcl in real-time of oceanographic parameters. Emphasis is given to the following subjects: (1) Development of techniques and instruments concerning filtering sampling, integration and averaging of parameters from sensors; (2) techniques and instrumentation for data communication systems which are suitable for transmission of oceanographic data from remotely located stations and for commanding remotely located stations. Special attention is given to telemetry communication within line-of-sight and satellite communication for longer distances; and (3) application of computer techniques for the purposes of experiment automation, real-time data acquisition, control of experimental equipment and sensors as well as improved data verification in real-time.
APPROACH: Adequate techniques and devices for automated data acquisition and monitoring instrumentation systems which can be used for collection of correlated data from remotely located stations in real-time are still not generally available. These systems are mandatory for environmental and biological studies in the coastal regions. Essential requirements for such systems are (1) low power consumption data acquisition and monitoring stations operating in-situ which are operated remotely in command-response mode from an accessible central station; (2) development and implementation of valid data sampling, averaging and reconstruction techniques; (3) real-time monitoring of the experimental progress from a central, accessible station; (4) command-response telemetry connection between the central, accessible station and the remote stations; and (5) techniques for verification and ordering of collected data in real-time.
RESULTS: (1) (a) A Controllable Automated Environmental Data Acquisition System now used routinely in the Coastal Boundary Layer Transect Experiment in Physical Oceanography. (b) A processor for real-time, in-situ data processing. (c) A Central Station Operation System. (2) Development of large-scale low-power, in-situ memories. (3) Investigation of telemetry link beyond line-of-sight distances. (4) Investigation of Momentum Flux Measuring System. (5) Development of above techniques.
PROJECT MILESTONES: FY77: (1) Development of large-scale, low-power, in-situ memories; (2) Investigation of telemetry link beyond line-of-sight distances; and (3) Investigation of Momentum Flux Measuring system. FY78: Development of above techniques.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Southeast;COASTS/Northeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The responses of cells to the deleterious agents in the environment that arise from nuclear, fossil and synthetic fuel technologies are governed by the fact that DNA is not only the most vulnerable but also the most important cellular target. Thus cellular responses depend on the radiation and chemically induced changes in DNA and how cells cope with these changes. Our goal is to understand the repair systems in a number of different animals, how they mitigate deleterious effects, and if such systems are inhibited by pollutants from fuel technologies.
APPROACH: We analyze, at the molecular level, the characteristics of the repair steps that take place both before and after DNA replication in bacteria and mammalian cells. We attempt to correlate biological, enzymological, chemical and physical data on bacterial and various types of mammalian cells so as to identify quantitatively the changes in DNA that have serious biological consequences, and how physical and chemical agents affect the repair systems themselves.
RESULTS: These data plus a knowledge of the efficiencies of repairing particular types of damage are aimed at permitting us to estimate the hazards of radiations and chemicals to cells and to extrapolate these findings to animals and man.
PROJECT MILESTONES: (1) July 1977 A knowledge of the interaction at the repair level between chemical carcinogens and radiation. (2) July 1978 A relation between chemical damages and radiation damages to DNA in their repair characteristics and their abilities to induce neoplastic transformation will be obtained.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The aim is to understand the molecular basis of damage and repair of DNA in the bacterium Haemophilus influenzae after exposure of the cells to pollutants and radiation.
APPROACH: (1) To obtain and analyze mutants of H. influenzae deficient in various steps of recombination and repair, for the purpose of defining what the various steps are. (2) To determine in radioactively labeled DNA the type and amount of damage made by pollutants and radiation in H. influenzae cells exposed to these agents and to attempt to determine which specific damages cause the mutagenic and lethal effects of the agents.
RESULTS: (1) We expect to understand a process called postreplication repair, in which pieces of damaged parental strands of DNA are inserted into daughter strands, resulting in a distribution of damages between the DNA made before and after treatment. (2) We expect to determine the nature of the photochemical lesion in DNA responsible for mutation by wavelengths 300 to 360 nm.
KEYWORDS: BACTERIA;DNA;BIOLOGICAL REPAIR;ATP;NUCLEASES;MUTANTS;ENZYMES;MOLECULES;MUTAGENESIS;ULTRAVIOLET RADIATION

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this program is the development, testing and application of data, models and assessment tools for regional energy planning. It is part of an integrated multi-laboratory effort aimed at critical energy planning problems requiring analysis at the regional (multi-state scale). Three basic programmatic themes have been identified: (1) The siting of energy related facilities, (2) the increased use of coal, and (3) the increased development of domestic oil.
APPROACH: The Brookhaven program focuses on the Northeastern U.S. Eight tasks have been identified in the program, some of which relate to data and models for the entire region; others concentrate on specific key problems of the region; each is related to one or more of the basic programmatic themes. In all cases the applicability to other regions and to a national picture are important considerations. The tasks that are included in the program are: (1) The analysis of current energy planning activities in the region, interaction with regional users and analysis of possible future regional energy planning institutions; (2) the development of regional energy/environmental and economic data, models and scenarios; (3) the analysis of regional energy conservation strategies; (4) investigations of energy facility siting issues, particularly power parks and site assessment methodologies; (5) urban energy supply options, emphasizing the prediction of health impacts; (6) a study of the potential for, and the environmental implications of, the increased use of coal in the region; (7) studies of offshore and related development, including offshore nuclear plant siting, artificial multi-purpose islands and oil and gas development; and (8) support to other laboratories in the program in the areas of health impacts and characterization of emissions.
RESULTS: The primary outputs of the program are a series of policy analyses and a set of evaluation tools that can be used by state, local and regional agencies as well as utilities and industrial groups with interests in energy-related planning. The interlaboratory collaboration also aims at the integration of the separate regional studies into national energy policy analyses.
PROJECT MILESTONES: Completion of Northeastern Energy Perspectives Study June 1976. Completion of New Jersey Nuclear Center Assessment July 1976. Start of Coal Assessment Program July 1976. Publish Annual Report for FY 76 September 1976.
KEYWORDS: REGIONAL ANALYSIS;ENERGY;PLANNING;ENERGY MODELS;TECHNOLOGY ASSESSMENT;DATA PROCESSING;DATA ACQUISITION;COAL;PETROLEUM;SITE SELECTION;ENERGY POLICY;HEALTH HAZARDS;COST BENEFIT ANALYSIS;SYSTEMS ANALYSIS;SOCIO-ECONOMIC FACTORS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Develop rapid assay of environmental contaminants. Pulmonary alveolar macrophages (PAM)

and epithelial cells (EC I and II) are studied in tissue culture in the presence of energy-derived pollutants.
APPROACH: PAM and neutrophils are exposed in vivo (mice) or in vitro to silica, asbestos, organic particulates, polycyclic hydrocarbons, etc., and allowed to phagocytose and then mixed with EC I and II or both and put into continuous culture.
RESULTS: In culture one observes cell survival, production rate, chromosomal aberrations, and transformation. Transformed cells will be transplanted into syngeneic recipient to test carcinogenic potential.
PROJECT MILESTONES: (1) January 1977 Cell culture systems developed. (2) July 1977 First results on cell survival and production rates. (3) January 1978 First results on transformation. (4) July 1978 First results on carcinogenic potential of transformed cells.

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Middle Atlantic;COASTS/Other coasts Unspecified
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: This program covers radiation protection training activities; in particular, a 10-week problems course in applied health physics for graduate students. Special emphasis is placed on direct field experience in the solution of a wide variety of radiation protection problems at reactors, accelerators, radioisotope labs and medical installations. Discussion of the health and environmental impact of alternate energy sources has been introduced.
APPROACH: A ten-week problems course which includes on-the-job training in applied health physics will be provided for graduate students from institutions such as the Universities of Illinois, Kansas, Lowell and Michigan and Rutgers University. Since most of the students will probably lack financial support, $5000 to $10,000 will be allocated for student support in the form of stipends during the training program. It is planned to broaden the involvement of the summer trainees in the health and environmental impact of alternate energy sources.
RESULTS: Satisfactory training.

PROJECT DESCRIPTION: To identify the block to adenovirus replication in African Green Monkey cells and to discover the mechanism by which Simian virus 40 (SV40) enhances the replication of adenovirus in these cells.
APPROACH: Adenovirus-SV40 hybrids have been isolated which grow with equal efficiency in monkey cells and human cells. The SV40 coded factor specified by these hybrids will be isolated and antibodies will be made against them. These factors will be tested in in vitro systems for their effect on adenovirus-directed protein synthesis and, when possible, on adenovirus-directed RNA synthesis. Preliminary results have indicated that one or more specific late adenovirus messenger RNAs (mRNAs) are deficient and/or defective in infected monkey cells. Our working hypothesis is that any early SV40 coded function alters the metabolism of adenovirus RNA in adenovirus, SV40 co-infected cells. This factor may also affect the interaction of adenovirus mRNAs with ribosomes.
RESULTS: The goal of this project is to identify a biochemial function of an early SV40 coded protein and to relate that function to the mechanism by which SV40 induces malignant cell transformation. The SV40 proteins coded by the Adenovirus-SV40 hybrids Ad2/sup +/ND/sub 1/ - Ad2/sup +/ND/sub 5/ will be identified and related to the early protein(s) coded by Sv40 itself.
PROJECT MILESTONES: (1) Isolation and purification of the SV40 coded proteins induced by the hybrids Ad2/sup +/ND/sub 1/, Ad2/sup +/ND/sub 2/, Ad2/sup +/ND/sub 3/, and Ad2/sup +/ND/sub 4/. (2) Identification of the amino-terminal and carboxy-terminal amino acid sequences of the above proteins. (3) Identification of the relationship of the antigenicity of these proteins to each other and to the SV40 coded T-antigen.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Plants are often a poor source of protein because they are deficient in some amino acids essential to human health. Our goal is to improve the amino acid composition of protein in the edible portion of corn and other cereal grains.
APPROACH: We suspect that the major storage protein in maize endosperm is encoded by one or two genes. We would like to induce mutations in these genes which would cause the substitution of rare essential amino acids into the amino acid sequence of the storage protein. Because this protein makes up 50% of the total seed protein a change in its composition will be reflected in the overall composition of the grain.
RESULTS: The hoped for end result is a storage protein containing appreciable levels of lysine and tryptophan.
PROJECT MILESTONES: (1) Identification of a mutationally altered storage protein which leads to the formation of a kernel with an altered phenotype. (2) Mapping of this mutation in the maize genome. (3) Selection of normal appearing revertants containing lysine and tryptophan. (4) Recombination to obtain a protein with two or more substitutions.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of this research is to localize and identify particular biological molecules (e.g., DNA, or protein, or fluorescent antibody) at electronmicroscopic resolution in intact biological structures (e.g., chromatin). The new technique will be applied in the cell biology of viral transformation. Thus, information on the mechanism of malignant transformation may be derived from a knowledge of the space relationships of SV40 T-antigen and the DNA of transformed mouse fibroblasts.
APPROACH: Particular molecular species are identified by the wavelength of fluorescent light emitted following excitation by electrons (e.g., blue-green for DNA, UV for protein). High resolution in space is obtained by using a finely focussed beam of electrons (not by any focussing of the light). The sensitivity of the technique is increased by a nearly 4 pi photon collector and by maintenance of the specimens at liquid-helium temperature. Low temperature increases the fluorescent efficiency and also the lifetime of fluorescing molecular groups under the beam.
RESULTS: We expect to be able to take electron micrographs which show the distribution of a particular molecular species in the specimen, e.g., the DNA, or (via fluorescent antibody) a particular protein. The best resolution obtained so far is 200A for the space distribution of DNA in hamster chromosomes. Our goal is to obtain 20A resolution for DNA, protein and fluorescent antibody, this being the theoretical resolution limit for the technique.
PROJECT MILESTONES: (1) Utilization of a high-sensitivity photon detector which is under construction (summer or fall, 1976). (2) Operation at liquid-helium temperature (summer, 1976). (3) Detection of single molecules (depends on results of first two milestones, but possibly winter, 1976-77). (4) Detection of ''transforming proteins'' in association with the chromatin of a transformed cell (1977).

PROJECT DESCRIPTION: Provide research vessel support for coastal Oceanography programs.
APPROACH: A multidisciplinary group effort to understand the effects of perturbations of natural marine food chains from the consequences of energy development within the coastal zone.
RESULTS: An understanding and evaluation of the risks involved in energy development of the coastal zone with respect to alteration of production, composition and function of the natural communities.
PROJECT MILESTONES: The FY77 Atlantic coastal experiment three (ACE-III) dealt primarily with the highly-stratified summer hydrographic regime on the Long Island Continental Shelf and the Georges Bank. The experimental field efforts in FY78 will occur in the Mid-Atlantic right during the spring bloom in May and during the fall bloom in October.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global;HYDROGRAPHIC AREAS/Great Lakes
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Particulate pollutants enter the gastrointestinal tract not only from contaminated food and water but also from swallowing inhaled particles cleared from the lung. Consequently, the mucosal surface of the gut is a major site of contact with the environment. The broad objectives of this project are: (1) to study in animals the uptake, distribution and fate of non-viable particles of various size and surface characteristics administered into the intestine and, (2) to establish the biological effects of particulate pollutants including carcinogens and suspended sulfates.
APPROACH: Initially, polystyrene particles of various uniform sizes and tagged with a stable radioisotope will be given by gastric lavage to mice of different ages (fetal through adult) and the uptake, total body burden, organ distribution, and disappearance studied. Concurrently, other particulates such as colloid carbon, asbestos, and carbonized microspheres will be employed. Subsequently, the effect of particulate pollutants, on DNA turnover rates, hematopoietic stem cells, dominant lethal mutations, and carcinogenesis will be established. Dosage schedules will vary from a single exposure to chronic ingestion up to several months.
RESULTS: A prediction of the distribution and fate of various ingested particulate pollutants will result from the animal studies. By providing a valid estimate of the hazard to animals, an approximation of the hazard to man can be established. These studies will also provide useful information on particulate antigen entry in the gut and the immunological response to pollutant haptenes absorbed on particulates.
PROJECT MILESTONES: (1) Clear demonstration that particles up to several microns in size pass the intestinal barrier and enter the circulation. Dec. 1976. (2) Estimations in mice of uptake, organ distribution and half-life of particles of defined size. April 1977. (3) Begin experiments with suspended sulfates and other energy-related particulate pollutants. June 1977.

TECHNOLOGY: FOSSIL FUEL/Coal (100%)
POLLUTANTS: PARTICULATES (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Middle Atlantic;HYDROGRAPHIC AREAS/Great Lakes
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Development of means, and the exploitation thereof, to measure size distributions of aerosol particles in ways which facilitate or contribute to determination of the distribution of chemical species among particles as a function of size from about 0.01 micrometer to over 1.0 micrometers.
APPROACH: (1) Development of the diffusion sampling technique first introduced under this project. (2) Design of a unique aerosol sample concentrator particularly applicable to high-speed sampling of nonvolatile particles. (3) Studies of phenomena related to particle measurement: Time-dependent polydisperse aerosol charging by polydisperse cluster ions; means of analyzing diffusion battery data for extraction of suboptical-sized particle size distribution information.
RESULTS: Using a diffusion battery separated aerosoles in the range of 0.02 um to 0.4 um diameter into 11 fractions and established the mass distribution and chemical composition as a function of size. Results indicate that most of the sub-optical mass can be accounted for by sulfate making reasonable assumptions about the density of the small particles. Two high-volume samplers were built which draw flows of over 200 l/min. and incorporate three very different aerosol sizing and sampling methods; the vertical impactors, the Tundgren impactor and the diffusion processor.
PROJECT MILESTONES: In FY 1978, the high-volume sampler will be employed regularly in a MAP35 airplane for studying power plant plume aerosol chemical composition as a function of particle size and how it changes with distance from 1/4 mile out. Comparison of size distribution data from diffusion battery with similar data from the Electro Aerosol Analyzer.

CHARACTER OF STUDY: RESEARCH/Laboratory (50%);DEVELOPMENT/Laboratory scale;DEVELOPMENT/Pilot plant (50%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Far West;GEOGRAPHIC AREAS/Global;COASTS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: This project has as its goal the development of a functional and economical solar-powered desalination device. It is hoped to develop a photochemically active membrane which will pump salts from sea or saline water against a concentration gradient to the point at which desalination is achieved (less than 500 ppm salt). This process for removing salt is analogous to currently operational electrodialysis devices which, however, consume electrical power.
APPROACH: In chloroplasts in vivo a gradient in pH as great as 3.0 units can be developed across the thylakoid membranes in the light. By addition of exchange diffusion carriers, this could be converted to a salt gradient of 1000:1. A synthetic membrane embodying oriented photochemical reaction centers and exchange diffusion carriers is sought which will be large enough to install in solar ponds. The support phase under study is nylon and the photochemical centers are those from Halobacterium purple membrane, chloroplast photosystem 1, or bacterial photosynthetic particles. The exchange diffusion carrier will be a lipophilic ionophorous antibiotic initially.
RESULTS: Solar panels containing flat membrane sheets on supports behind transparent windows, input and output plumbing. Facility for tandem operation. Throughput of saline for desalination to <500 ppm to be comparable to that of current electrodialysis installations (200,000 gal/day).
PROJECT MILESTONES: (1) Synthetic membrane containing active photochemical reaction centers. (2) As (1), but membrane asymmetric and showing vectorial H/sup +/ pumping. (3) As (2), with exchange diffusion carriers, giving NaCl gradient >10:1. (4) Demonstration model, 1 gal/h (from 5000 ppm NaCl to 500 ppm NaCl).

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Energy-related acid rain fall and acid particulates cause increased stress on Northeast U.S. ecosystems. Poorly buffered, sandy-soiled Long Island ecosystems are especially affected. An investigation has been mounted to determine exactly what the effects are on plant systems, soil chemistry, soil microfleura and the inter-relationships of these three.
APPROACH: Determine constituents and rates of local (Long Island) rainfall. Expose plant foliage to simulated acid rains/aerosols of various concentrations, for various durations/intervals to determine: Physical/chemical injury effects, threshold limits with no injury effects, changes in plant growth and vegetative yields. Study changes in plant cell permeability by monitoring foliage leachates. Study SO/sub 4/ + NO/sub 3/ build-up as related to degree of exposure to acid rains/aerosols.
RESULTS: Establish pH, acidity, specific conductance, NH/sub 3/, NO/sub 3/, Cl/sub 2/, SO/sub 4/ and Na in locally collected rain (using a sequential sampling device for collecting rain). Establish acute effects of acid rains/aerosols on visual and histological levels, and on leaf growth rates. Establish threshold limits beyond which no visual/cellular injury or growth retardation will occur.
PROJECT MILESTONES: It has been determined by use of Scanning Electron Microscopy that Sulphate (SO/sub

4//sup 2-/) acid rain affects the cellular integrity of specific sites on leaf surfaces (of Phoseolus vulgaris and Heliamthus annuus) namely glands (trichomes) and stomates, thus gaining access to the internal leaf structure and creating injury sites at these locations.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The major objective of this project is elucidation of the molecular mechanisms involved in the production of aberrations in the chromosomes of human beings and other eukaryotes by chemical agents and ionizing radiations, particularly those associated with energy production, in order to allow more accurate assessment of their effects on the health of human populations.
APPROACH: Human and other vertebrate cells in tissue culture or in vivo are exposed to mutagenic agents at known stages of the cell cycle and the resulting patterns of aberrations and sister chromatid exchanges determined. Agents are selected either to produce known DNA lesions or, as in the case of ozone, because of their practical importance. Cells from persons with genetic diseases causing increased sensitivity to mutagens are studied to elucidate the role of enzymatic DNA repair mechanisms.
RESULTS: Understanding the basic mechanisms involved in chromosomal effects will not only allow better estimation of this important class of human genetic hazard, thus allowing more realistic health cost evaluation, but may also be expected to yield improved methods for screening such effects.
PROJECT MILESTONES: July 1, 1977, completion of studies of the effect of LET on patterns of aberration production. July 1, 1978, completion of evaluation of the sister chromatid exchange phenomenon as a screening method for environmental mutagens. January 1, 1979, completion of studies of inhaled ozone as a chromosomal mutagen in small mammals.

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: As cancer of the breast occurs in approximately 1 of every 4 adult American women, it is worthwhile to develop an animal model of this disease so that a better understanding of it may be gained in order to prevent or lessen the severity of the disease. Exposure to ionizing radiation has been associated with a high risk for developing breast cancer because women exposed to repeated fluoroscopic examinations, women survivors of atomic bombings, and possibly women treated with x-rays for acute postpartum mastitis, all seem to be at an increased risk of developing breast cancer. Additionally, many women are now undergoing routine x-ray mammography. An animal model system, using the rat as the test object, is being developed in order to understand the qualitative and the quantitative aspects of radiation-induced mammary carcinogenesis.
APPROACH: A graded series of single doses of either neutron radiation or x-radiation has been studied over the entire life span of female Sprague-Dawley rats.
RESULTS: These data are now being analyzed by Professor Kellerer, University of Wurzburg, and answers to the following questions will be forthcoming: As the dose of x-radiation is increased in a regular fashion, is there a concomitant increase in the incidence of mammary tumors. Does the incidence of both malignant and benign tumors increase with dose. Is there an actual increase in the number of tumors or is there only an earlier appearance of the tumors. Does neutron radiation produce the same responses as x-radiation.

TECHNOLOGY: MEDICAL APPLICATIONS OF NUCLEAR TECHNOLOGY (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The use of radionuclides in medicine, i.e., nuclear medicine, is well established. In the past five to ten years one of the most rapidly expanding areas of investigation has involved the use of cyclotron produced nuclides. Short-lived nuclides present advantages in terms of reduction of the radiation burden to the patient, serial studies, and the availability of radioactive oxygen, nitrogen, carbon, phosphorus, sulfur, and halogen isotopes. The radioactive isotopes of oxygen, nitrogen, and carbon are especially attractive for radiopharmaceutical research and design, because they can be used to label biomolecules without distorting structure and hence function in the living organism (as contrasted to unnatural materials such as metal-labeled chelates) and because they are positron emitters and thus make tomographic imaging possible.
APPROACH: Design of radiopharmaceuticals has relied heavily on the laborious empirical approach. The plan is to develop a rationale for radiopharmaceutical design while at the same time developing new compounds for studying function and metabolism in vivo. We intend to use a multipronged approach making use of chemical and biochemical methods to assure the delivery of the labeled material to the site whose biological function is being probed. This will include labeling research, the use of specific enzyme action to aid in localization, the use of ''masked'' compounds to effect delivery to the desired site, the use of structural effects in the labeled compound to alter the desired action in a predictable and controllable way, multi-label techniques to probe in vivo cell growth rate, and the use of in vivo imaging for understanding drug transport and substrate metabolism especially as it is perturbed by disease.
RESULTS: The basic impetus of this research effort is to develop new radiopharmaceuticals, labeled mainly with positron emitting nuclides, that can be used for the dynamic evaluation of a diseased state in order to provide improved diagnostic information. The emphasis will be on function and metabolism, and on materials which can ultimately have broad clinical applicability.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Northeast;COASTS/Northeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH;CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: The objective is to develop, improve and utilize a genetic test system capable of measuring the mutagenic hazards of even weak mutagens, especially those in the gaseous state. Also, this system will be used to evaluate the relative mutagenic potential of chemicals of diverse origins but which are known or suspected of being mutagenic. Because of the high correlation between mutagenicity and carcinogenicity the work also has a bearing on detection of carcinogens in the environment.
APPROACH: We have demonstrated that methods developed for studying the effects of physical mutagens utilizing the Tradescantia genetic test system can be applied with very little modification to chemical mutagen investigation of gaseous chemical mutagens. Also, dose response data from physical mutagen treatments can be used for baseline comparisons with data from chemical mutagen experiments. Present data indicate that the system is sensitive enough to detect a significant increase in mutation frequencies at levels well below 1 ppm for some gaseous mutagens but efforts will continue to try to increase the efficiency and sensitivity of the test system.
RESULTS: Efforts will be made to determine the mutagenicity and overall genetic hazard of both specific ambient air pollutants and certain volatile industrial chemicals. The application of known chemical mutagens with specific modes of action to existing and new repair-deficient sensitive genetic test systems is expected to help elucidate both the extent of and mechanisms involved in environmental mutagenesis. Clean air facilities will be used to try to stabilize background spontaneous mutation frequencies in test systems and to determine whether such mutations are the result of inherent genetic instability or are induced by unknown environmental mutagenic agents. A mobile monitoring vehicle will be employed to assess the mutagenic hazards of ambient air pollution and of toxic industrial pollutants in a few sites in the tristate area (Conn., N.J. and N.Y.). Data from exposures to low concentrations of both pollutants and known mutagens singly or in combination will contribute to the overall assessment of the potential genetic hazard to man of environmental mutagens.
PROJECT MILESTONES: (1) Fall 1976 Completion of clean air facility for use in studies of possible genetic effects of ambient levels of air pollutants from various sources. (2) Fall 1976 Confirmation of metabolic activation of chemical mutagens in plants. (3) Winter 1977 Completion of analysis of first Mobile Unit field monitoring data. (4) Spring 1978 Incorporation of new genetic markers in Tradescantia genetic test clones. (5) Fall 1978 Asessment off Mobile Monitoring vehicle for routine use in genetic monitoring of air pollutants. Production of more sensitive genetic stocks of Tradescantia for use in environmental mutagen studies and monitoring.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global;HYDROGRAPHIC AREAS/Deep ocean;HYDROGRAPHIC AREAS/Continental shelf;HYDROGRAPHIC AREAS/Great Lakes
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: FHP: to assess the environmental factors and the control technologies involved in the Flash Hydropyrolysis of coal (FHP). CO2: to investigate the historical and anticipated concentration increase of CO2 in the atmosphere and its possible effects on the environment, and to assess means of controlling the level of atmospheric CO2.
APPROACH: FHP: (1) conduct laboratory analyses on samples obtained from BNL's experimental FHP unit. Based on the experimental data, prepare conceptual flow diagrams, including mass and energy balances, of full-scale FHP-chemical and FHP-refinery complexes. (2) Survey the literature to determine available ECT's, assess available technology and identify the areas in which new technology is required. CO2: survey the literature and consolidate findings on CO2 emissions and atmospheric concentration levels. Prepare conceptual processing schemes for CO2 recovery and recycle and perform exploratory studies.
RESULTS: FHP: The results of this study will (1) provide an indication of the possible effluents from an integrated FHP complex, (2) provide a basis for establishing environmental guidelines for FHP and related processes, and (3) identify areas in which new control technologies would be required for commercialization of the process. CO2: The results of this study will identify some of the options which are available for controlling the level of CO2 in the atmosphere.
PROJECT MILESTONES: October 1, 1977: (1) FHP: complete preliminary conceptual flow diagram of FHP-chemical complex. Identify potential pollutants and source streams. (2) CO2: complete investigation of the historical and anticipated concentration increase of CO2 in the atmosphere. September 30, 1978: (1) FHP: complete conceptual flow diagrams of FHP-chemical and FHP-refinery complexes based on the data obtained from BNL's experimental unit. Complete literature survey and technology assessment. (2) CO2: complete literature survey, technology assessment and study on available options for controlling the level of CO2 in the atmosphere.

TECHNOLOGY: NUCLEAR/General (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Identify the applicability of existing nuclear standards (ANSI, ANS, IEEE, ASME, ERDAM, etc.) to ERDA-owned reactors, commensurate with a reactor's potential hazards. Identify areas (siting,

design, construction, modification, operation, maintenance, etc.) where existing standards are insufficient or new standards are needed and develop these standards. Develop design guides for ERDA-owned reactors that identify and provide guidance on the application of standards and codes applicable to reactor safety and design.
APPROACH: Categorize ERDA-owned reactors into groups that have generally similar design and operating characteristics. Develop a design guide for each reactor category that identifies the applicability of existing standards to that category of reactor.
RESULTS: Comprehensive guidance to aid contractors in the siting, design, construction, modification operation, maintenance and decommissioning for new or modified reactors in accordance with generally uniform standards, guides and codes applicable to each ERDA owned reactor category.
PROJECT MILESTONES: (1) Reactor Categorization System, 10/76. (2) Complete preparation of seven design guides, 8/78. (3) Revision of design guides to reflect use, 9/79.
KEYWORDS: REACTORS;SAFETY STANDARDS;US ERDA;REACTOR SAFETY;RECOMMENDATIONS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Collect, evaluate, codify newly measured and historical data that pertains to the distribution and evolution of energy related pollutants over the Greater Northeast U.S. To continually build a readily accessible data bank against which regional pollutant transport and transformation models can be tested. To provide baseline air quality data for the greater Northeast to which future assessments of regional atmospheric environmental impacts from new energy technologies may be referred.
APPROACH: Coordinate with participating laboratories to establish mutually agreeable procedures for data collection, evaluation and format. Set up administrative and computer oriented processes to handle data translation and storage at BNL and disseminate such data via magnetic tape exchange and for use by participants. Evaluate existing EPA and State data sets on emissions and ambient air quality and incorporate into a central BNL data bank.
RESULTS: Development of a set of data formats useable for submittal to the central repository at BNL. Develop computer software to implement the methods agreed upon.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Develop ability to assess the environmental effects of energy related pollutants released to the atmosphere and develop a capability to characterize the transport and fate of these pollutants as they move through the atmosphere.
APPROACH: Carryout field measurement studies using aircraft and other platforms in which the chemical and physical form of SO2, particulates are collected and analyzed and correlate these changes with synoptic meteorological observations.
RESULTS: Plumes from power plant have been followed in the Northeast and St. Louis areas. Monitoring flight of hundreds of miles have been carried out to identify the vertical and horizontal distribution of pollutants east of the Appalachian Mountains in cooperation with similar flight west of the mountains by Pacific Northwest Lab.
PROJECT MILESTONES: Summer of 77-conduct monitoring flight in Northeast U.S. Spring of 1977-study SO2-sulfate conversion in an oil fired power plant plume.
KEYWORDS: EMISSIONS;INSTRUMENTATION;ENERGY SOURCES;ENVIRONMENTAL EFFECTS;POLLUTION;AIR POLLUTION;DISTRIBUTION;AEROSOLS;SULFUR DIOXIDE;METEOROLOGY;PLUMES;MONITORING;WEATHER

PROJECT DESCRIPTION: An aircraft has been leased to carry out research projects which are part of the Atmospheric Sciences programs at Brookhaven National Laboratory. The principal use for the aircraft is in conjunction with the Multistate Atmospheric Power Production Pollution Study program.
RESULTS: Approximately one half of the aircraft's scheduled flight time will be utilized to conduct routine MAP3S observations, including horizontal and vertical atmospheric pollutant profiles and regional pollution transport studies. About one quarter of its scheduled flight time will be utilized for plume studies which are part of MAP3S. The remaining scheduled flight time will be used in cooperative atmospheric studies with aircraft and ground observation teams in conjunction with organizations outside BNL, but which are part of the overall MAP3S program.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The ERDA-funded oceanographic programs in the northeast include a diverse array of facilities, talent and research objectives, and are located at geographically-dispersed laboratories and universities. The environments under study range from the open ocean, continental slope and shelf, estuaries, bays, and coastal lagoons to the intertidal zone, with particular strength in the study of estuarine and shelf ecosystems. In order to maximize the usable output from these programs, a high degree of coordination and communication among the investigators and with other programs in the northeast is highly desirable.
APPROACH: Using three types of meetings as primary mechanisms, BNL proposes to encourage better information exchange and liaison among the northeast ERDA contractors. These meetings will include (1) Annual program-review meetings among this entire group of contractors, (2) Meetings and/or experiments for the

intercomparison of methods and instruments, and (3) Meetings on single topics of timely nature. Reports from these meetings will be made available to ERDA for the periodic reevaluation of program goals, deficiencies, and accomplishments.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Site specific Local
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Controlled thermonuclear reactors will require the use of exceptionally large magnets of very high field intensity. The fields near these magnets will vary from approximately 100,000 Oersted inside the shields to possibly 10 Oersted at a few hundred meters. Many biological effects have been reported for such magnetic fields, however, their validity is open to question.
APPROACH: A careful study of somatic, genetic and developmental effects is planned using mutations in Tradescantia stamen hairs as the test organism for somatic mutations and using Drosophila as the test organisms for genetic and developmental effects. Tradescantia cuttings will be exposed for periods from 1 to 20 days in fields of intensity from 1 to 100,000 Oersted. Drosophila will be exposed continuously for several generations in preliminary screening studies. Later, genetic and developmental effects will be separated by exposing flies only before mating for a period of 12 hours.
RESULTS: Effects of field intensity, field gradient and exposure time will be explored. Results will be compared to previous findings involving ionizing radiation and various chemical mutagens. Implications for exposure to man will be considered in terms of appropriate permissible exposure standards for workers and the general public.

PROJECT DESCRIPTION: To determine if radiation and toxic hydrocarbons from fossil fuel effluents activate latent tumor viruses and what dose ranges are effective in these oncogenic processes.
APPROACH: Radiation dose ranges (100 to 1200 rads exposures) will be made on chickens carrying the viruses. Four hundred 400-rad exposures will be used for in-vitro cell cultures infected with viruses. Viral replication and cell transformation will be correlated and dose dependence evaluated. Similar studies will be carried out with 3.4 benzopyrene and 7.12 dibenzanthracene (.1 to 1 mmg/ml).
RESULTS: Evaluation of radiation enhancement or inhibition of in-vivo/in-vitro activation/replication of herpes virus. Evaluation of hydrocarbon activation of viruses, and understanding of mechanism of viral latency and activation in tumorogenesis.
PROJECT MILESTONES: (1) Report data for radiation activation of viruses 1-9-77. (2) Report data for hydrocarbon activation of viruses 1-9-78.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Study the health effects of energy related atmospheric pollutants by integrating the results of in vitro studies, animal toxicology studies, and clinical studies of human pulmonary disease.
APPROACH: In the clinical aspect of the program, the normal structure and function of gas exchange units and non-gas exchange units of the lung will be investigated. Normal biochemical, physiological, and radiological parameters will be established for healthy human beings, and the effects of pulmonary diseases, such as fibrosis, emphysema, and chronic obstructive lung disease, on these normal values will be investigated. Investigations involving patients will include pulmonary biopsies and washings to provide material for tissue culture of pulmonary macrophages and diverse epithelial and endothelial lines for biochemical and histological studies; aerosol deposition and clearance studies; and studies of respiratory physiology.
RESULTS: The conception (Title I phase) of the inhalation facility capable of handling airborne particulate carcinogens was completed and Title II phase drawings are essentially complete.
PROJECT MILESTONES: (1) Well defined animal models of fibrosis and emphysema will be developed, Sept. 30, 1977. (2) The inhalation toxicology facility will be completed and it is anticipated that chronic studies in rodents will have been initiated, Sept. 30, 1978.

REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Marine;GEOGRAPHIC AREAS/Global
PROJECT DESCRIPTION: The goal of the proposed research is the development of flexible, rapid and economical assay systems for the determination of teratologic risk generated by environmental insult, as well as the identification of the primary molecular lesions causal to teratogenesis.
APPROACH: The first phase entails the development of a sensitive morphological bioassay utilizing sea urchin embryogenesis as an indicator system. Sea urchin area will be fertilized and cultured through gastrulation and abnormal development monitored as influenced by potential teratogens (together with studies on the effect of activation in microsomal systems.) A second phase will be the development of a similar detection system using clones of totipotent mammalian embryonal cells derived from teratocarcinomas.
RESULTS: The above bioassay systems are expected to yield a flexible, rapid and economical means of assessing teratologic risk.
PROJECT MILESTONES: (1) FY 77 Development of the sea urchin assay system and initiation of screening tests. (2) FY 78 Development of the teratocarcinoma test system.

POLLUTANTS: ORGANICS/Polycyclic hydrocarbons (25%)
CHARACTER OF STUDY: RESEARCH (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this project are to understand the response of animal cells, both in vivo and in tissue culture, to environmental stimuli including chemical pollutants. A major part of this project is directed to determining mechanisms of action of chemical carcinogens and the characterization of cells transformed by these agents.
APPROACH: Specific studies include the metabolism of polycyclic aromatic hydrocarbons and the binding of metabolic products to nucleic acids, biophysical properties of membranes, growth and metabolic regulation of cells in tissue culture, and sensitivity of these cells to chemotherapeutic drugs. This project also includes investigation of the response of animal organisms to external stimulae. As a model, the anatomical and biochemical changes in brain leading to memory are investigated. Knowledge gained is being used to obtain a better understanding of recovery from brain lesions.
RESULTS: Results expected include identification of surface proteins of normal and transformed cells and determination of the role of membrane lipids in the mobility of these proteins; better understanding of metabolic regulation of glucose metabolism in normal and transformed cells and extension of metabolic regulation; characterization of steps in cell cycle involved in growth regulation of these cells and effects of chemotherapeutic drugs on this cycle; correlation of drug effects in vivo and in cell cultures; investigation of effects of environmental pollutants, correlation of anatomical and biochemical indices

with recovery of brain function after lesion.
PROJECT MILESTONES: (1) Completion of Flow-Microfluorometer May 1, 1977. (2) Identification of an Animal Cell Surface Protein June 1, 1977.

TECHNOLOGY: SOLAR/General (25%);GENERAL SCIENCE (75%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The storage and utilization of energy by biological systems, together with the nature and changes in information content of such systems, are the principal concerns of this research. Emphasis is placed on (1) the role of biological structure on the process of energy conversion in photosynthesis, (2) the way in which nucleic acid structure and organization influence its role as a repository and transmitter of cellular information, and (3) specific steric requirements related to the action of enzymes and other controlling factors in cellular regulation.
APPROACH: A variety of state-of-the-art spectroscopic methods are employed to examine the static and dynamic structures of intact biological systems, their components, and models thereof. Electron paramagnetic resonance, optical absorption, magnetic circular dichroism, circular dichroism, laser Raman, and picosecond spectroscopy are all used to study the primary and other processes in photosynthesis. Nuclear magnetic resonance and fluorescence spectroscopy are used to study the ordering and dynamics of membranes. Nuclear magnetic resonance and x-ray absorption spectroscopy using synchrotron radiation are used to study the pathway of nitrogen and the role of the metal atoms in nitrogen fixation, respectively. Circular dichrosim, NMR, and fluorescence are used to study nucleic acids.
RESULTS: (1) Improved understanding of the processes by which photosynthetic organisms transduce light into chemical energy and materials. These results will provide guides toward utilizing solar energy. (2) Improved understanding of the mode of nitrogen fixation by nitrifying organisms to provide guides to improving this process and adding to the world supply of fixed nitrogen. (3) Improved understanding of the mechanisms by which the nucleic acids perform their functions and how such information may be applied to understanding and ultimately ameliorating diseased states. (4) Improved understanding of the organization and dynamics of membranes and the changes which accompany function and malfunction.
PROJECT MILESTONES: (1) Role of manganese in photosynthetic oxygen evolution 1/1/77. (2) Role of molybdenum in di-nitrogen fixation 7/1/77. (3) Mode of interaction between t-RNA and amino acids 7/1/77.
KEYWORDS: PHOTOSYNTHESIS;ENERGY CONVERSION;SOLAR ENERGY;NITROGEN FIXATION;MEMBRANES;MOLECULAR STRUCTURE;BIOCHEMICAL REACTION KINETICS;PHOTOCHEMISTRY;ENZYMES;CATALYSIS;BIOCHEMISTRY;PLANT CELLS;NITROGEN COMPOUNDS

77 FUNDING: Energy Research and Development Administration FY77:$302,000
TECHNOLOGY: FOSSIL FUEL/General (25%);GENERAL SCIENCE (75%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Far West;COASTS/Far West;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project is designed to increase our fund of basic knowledge in organic, photo-, and geochemistry. As opportunities appear, this expanding basic knowledge is applied to energy and environmental problems. For example, the geochemical studies of kerogen are important contributors to our understanding of the processes of formation of fossil fuels. The studies of energetic carbon-atom chemistry may become important for the specifications of organic material in the vicinity of nuclear reactors.
APPROACH: The accumulated experience of a successful research laboratory (the Lawrence Berkeley Laboratory's Chemical Biodynamics Division) is applied to promising and interesting research in organic, photo-, and geochemistry. The Division's staff seeks basic research areas that have a potential to contribute to the solution of energy-related environmental problems. As an example, the Division's studies of the mechanisms of formation of fossil fuels will aid in the design of ways to utilize these fuels with a minimum of adverse environmental impact.
RESULTS: This research during the next three years is expected to lead to the following results: (1) The availability of diverse polynucleotides; knowledge of their specific properties will greatly increase our understanding of the mechanisms by which nucleic acids direct the formation of enzymes. (2) Understanding of the ways by which light affects enzyme functions. (3) Increased understanding of the ways by which proteins and polynucleotides appeared on the prebiotic Earth. (4) Increased understanding of the processes that led to the formation of kerogen and other fossil fuels. (5) Knowledge of the high energy reactions of carbon, a knowledge of importance to tracer chemistry, radiobiology, and reactor technology.
PROJECT MILESTONES: (1) Determine early stages of kerogen formation through identification of early compounds of algae degradation 1/1/78. (2) Complete study of difference of reactions of benzene with high energy

C/sup +/, CH/sup +/, CH/sub 2//sup +/, and CH/sub 3//sup +/ 1/1/79. (3) Complete synthesis of six hexanucleotides whose sequences will aid in studies of restriction enzymes 6/30/78.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To obtain detailed information about biochemical regulation of photosynthetic and biosynthetic pathways in green plant cells, and the effects on these of environmental variables, including CO/sub 2/, SO/sub 2/ and other gaseous products from fossil fuel combustion. Also the investigation of toxic substances produced by plants, and their biosynthesis.
APPROACH: Radioactively-labelled substrates such as /sup 14/CO/sub 2/ and /sup 32/P-labelled inorganic phosphate, are administered to plants and plant tissue including leaves, unicellular algae, isolated cells, chloroplasts, etc. under a variety of carefully-controlled conditions (e.g. presence and absence of inhibiting pollutants). The plant material is killed, and the radioactive products are isolated and identified, and the extent and location of their labelling is determined. Results are interpreted in terms of the effect of environment on pathways and their regulation.
RESULTS: Information about photosynthetic and biosynthetic pathways, their regulation, and their alteration under the influence of environmental variables including pollutants from energy technologies. Pathways leading to toxic products, and the effect of environment on formation of those products. Information about photosynthetic response, productivity and effects on end products useful in evaluation of plant systems as solar energy converters.
PROJECT MILESTONES: FY 76 Nearly completed (See comments, 96).

PROJECT DESCRIPTION: To characterize energy related particulates as they are found on lung and leaf surfaces with the goal of determining the chemical elements associated with single particles.
APPROACH: Scanning electron microscopy with x-ray spectroscopy is the major tool for determining size, shape and chemical element constituents of the individual particles. Related tissue damage is assessed by electron microscopic study at the site of the particle.
RESULTS: Rapid x-ray mapping of the elemental distribution on a particle by particle basis over the biological surface. We also expect to develop improved low temperature techniques for studying the leaf and lung samples in the hydrated state where more rapid and accurate analysis is possible.
PROJECT MILESTONES: (1) 1 Dec. 1976 Frozen sample techniques for scanning electron microscopy allow start of hydrated lung section study. (2) 30 Mar. 1977 Heavy ion radiography with scanning electron microscope impaging of ultra thin plates is completed for the botanical test surfaces (Onion, Pelargonium). (3) 1 Mar 1977 Rapid x-ray mapping of fly ash samples (in cooperation with Dr. C.L. Fisher, University of California, Davis) is completed and the technique is analyzed for general application value to other aerosols.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This research in the field of molecular biophysics examines light excitation, photochemical energy transfer and storage, and electron-transport in both green-plant (chloroplast) and bacterial photosynthesis. By developing new methods of high-sensitivity, low temperature (4 degrees K and higher) electron paramagnetic resonance (EPR) spectroscopy and of using optical dye lasers as flash initiators of the photochemical steps in photosynthesis, investigations are being made of the mechanisms of photo capture and energy transfer to ''reaction centers'', the process of energy storage through production of photochemical ''charge separation'', and of the steps involving repetitive oxidation and reduction of components of the ''dark'' electron-transport chain which result in the formation of useful chemical energy in the form of ATP and reduced NADP. High-sensitivity EPR spectroscopy at low temperatures has allowed the molecular identification of previously unknown participants in the primary photochemistry of chloroplasts, i.e., bound iron-sulfur protein as the primary electron-acceptor of Photosystem I, and the identification of a chlorophyll-dimer free-radical (P680/sup +/) with the primary electron-donor of Photosystem II. The application of the rapidly-developing laser technology allows the sensing of components of photosynthetic systems with greater sensitivity and with the possibility

PROJECT DESCRIPTION: The objective of the Animal Colony is to provide first class housing and care for the rodents and larger animals used in the BER research projects at LBL. AALAC accreditation is the goal of the LBL Animal Welfare Committee.
APPROACH: The Colony is organized into two wings. The rodent wing operates on a clean-to-dirty flow pattern and has 16 rodent rooms housing 30,000 rodents. Specialized environmental exposure chambers are being developed for exposure of animals to ozone, nitrogen oxide, sulphur oxides, and CO. The larger animal facility includes housing for primates, cats, dogs, rabbits and goats, as well as specialized facilities

to house animals injected with radioactivity.
RESULTS: The results are reflected in the research projects' ''Accomplishments'' section of the LBL investigators using this service facility.

REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To gain a better understanding of cancer risk from agents found in the environment and physiological changes related to cancer induction, and to develop methods of quantifying the risk.
APPROACH: Dose-effect-time relationships in various cancer induction systems will be studied to detect physiological factors contributing to the process. Trends in human cancer incidence will be correlated with environmental influences in carcinogenesis and the possibility of physiological modification of these factors will be studied.
RESULTS: Extension of our present dose-effect-time model is expected. From any systematic quantitative relationships detected, we expect to derive significant biological implications, e.g., (1) characteristics of dose-response relationships may imply an underlying molecular process; (2) comparison of dose-response relationships between species suggests that physiological factors may be involved in cancer induction as well as an underlying molecular-cellular process; (3) the possibility of an anti-carcinogenic process; (4) an improved evaluation of environmental factors in carcinogenesis.
PROJECT MILESTONES: (1) Analysis of mechanisms in cancer induction. (2) Evaluation of methods for estimating cancer risks at low dosage. (3) Evaluation of the present trend in environmentally induced human cancers.
KEYWORDS: CANCER;CARCINOGENESIS;HAZARDS;DOSE-RESPONSE RELATIONSHIPS;ENVIRONMENT;LUNGS;NEOPLASMS;LIFE SPAN;LEUKEMIA;IONIZING RADIATIONS;RADIOINDUCTION;CARCINOGENS;URETHANE;BIOLOGICAL EFFECTS;SAFETY;TOXICITY

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/Applied (80%);DEVELOPMENT/Laboratory scale (20%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Marine;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective and goal of this project is to obtain new information and insights on: (1) the mechanism of pollutant transport in the bloodstream via lipoprotein and apoproteins, (2) the initiation and membrane and cellular damage by pollutants, and (3) correlation of degree of pollutant damage with concentrations of serum lipoproteins and/or proteins.
APPROACH: Pollutants resulting from energy production may have significant genetic and metabolic effects of man and experimental animals. To detect, measure and characterize these potential effects, for example Pb/sup ++/ and Hg/sup ++/, we are developing an automatic quantitative micro lipoprotein and protein screening test for humans and experimental animals. Application will be with experimental animals and humans accidentally exposed to these agents. Where appropriate, detailed biochemistry as well as the morphology and ultrastructure by electron microscopy will be determined on the abnormal tissues and macromolecules.
RESULTS: Qualitative and/or quantitative abnormal macromolecules are expected in both animals and humans exposed to heavy metals such as Pb/sup ++/ and Hg/sup ++/. These macromolecules will be characterized and related to extent of tissues, membrane and other damage in such key organs as liver and kidney. Lipoprotein metabolism is expected to be disturbed with heavy metal exposure and the two major enzyme systems, lecithin:cholesterol acyltransferase and lipoprotein lipase will be effected.
PROJECT MILESTONES: (1) 31 Dec. 1976 Planned completion of time dose response studies for Pb/sup ++/ exposure in the rat. Correlation with tissue damage in such organs as kidney and liver. (2) 1 June 1977 Anticipated completion of time dose response studies for Hg/sup ++/ and its organic form in the rat or other suitable animal model. (3) 1 Oct. 1977 Anticipated completion of first working program for automated quantitative protein microanalysis. (4) Sometime in 1977 Establishing collaboration with scientists with access to

specific individuals or populations at pollutant risk for the purpose of first screening for lipoprotein abnormalities and later for serum protein abnormalities.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To better understand the stability properties of perturbed ecosystems and to develop practical stability indicators for use in predicting the responses of ecosystems to perturbations caused by energy-related activities.
APPROACH: (A) Theoretical analysis of model ecosystems. (B) Development of a laboratory microbiome system consisting of replicate freshwater tank systems. (C) Field work to begin in FY 77. The basic approach will be to perturb replicate systems with effluents expected from coal conversion technologies (phenols, trace metals, polyaromatic hydrocarbons, sulfur compounds, etc.) and to correlate the responses with previously measured parameters characterizing the decomposer-detritus dynamics of the systems.
RESULTS: Prescriptions for measurement of both specific and broad range stability indicators. Laboratory facility for analysis of ecosystem stability properties under controlled, replicable conditions.
PROJECT MILESTONES: (1) Oct. 1, 1976 Completion of basic laboratory facility. (2) Oct. 1, 1977 Completion of preliminary assessment of freshwater ecosystem stability indicators. (3) Oct. 1, 1978 Completion of preliminary field tests of indicators.
KEYWORDS: ECOSYSTEMS;STABILITY;ENERGY SOURCES;ENVIRONMENTAL EFFECTS;BIOLOGICAL MODELS;COAL GASIFICATION;CHEMICAL EFFLUENTS;METALS;HYDROCARBONS;SULFUR COMPOUNDS;BIOLOGICAL INDICATORS;ENVIRONMENTAL EFFECTS;WATER POLLUTION;PLANTS

77 FUNDING: Energy Research and Development Administration FY77:$115,000
TECHNOLOGY: NUCLEAR/Fission Converters;NUCLEAR/Fission Breeders (100%)
POLLUTANTS: METALS/Heavy metals;METALS/General (10%);RADIATION/Internal emitters;RADIATION/Pu-238;RADIATION/Am-241;RADIATION/Sr-90 (90%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To describe quantitatively in monkeys (two species of Macaque) the circulatory transport, gross and microscopic distributions in tissues and bones, and temporal changes of those distributions for some biologically important and potentially hazardous radionuclides, Sr-90, Pu-238, Am-241.
APPROACH: Subjects are Macaques of known age (M. mulatta, M. fasicularis). Single doses of radionuclides are given parenterally as soluble citrate complexes to mimic behavior after absorption into the body. Dosages (5 to 10 mu Ci/kg of Sr-90 or about 0.3 mu Ci/kg of actinides) avoid acute injury but allow accurate radioanalysis. Studies and methods include metabolic balance using radiochemical analysis; kinetics using in vivo whole- and partial-body counting and scanning; and microdistribution and morphology using auto- and microradiography.
RESULTS: Metabolic parameters obtained in a closely related animal provide support for kinetic models used to set intake limits for man. Long-term study groups give insight into the toxicity of these radionuclides in primates. Information needed to develop rational therapeutic measures for decontamination is also obtained: chemical associations of the nuclides with cell and mineral constituents; mechanisms of radionuclide redistribution among tissues and elimination from the body; influences of normal growth and aging.
PROJECT MILESTONES: By July 1, 1977: report on immune binding of plutonium- and americium-transferrin, and on initial distribution of plutonium-238 in M. mulatta and M. fasicularis; complete injections of 5-year plutonium-238 and americium-241 study groups. By July 1, 1978: prepare interim report on long-term strontium-90 studies in M. mulatta, and on comparative morphology of aging monkey and human bones; complete injections of intermediate term (3 to 15 months) study groups for plutonium-238 and americium-241.
KEYWORDS: TRANSURANIUM ELEMENTS;METABOLISM;MONKEYS;TISSUE DISTRIBUTION;BONE TISSUES;STRONTIUM 90;PLUTONIUM 238;AMERICIUM 241;RADIATION DOSES;RADIOCHEMICAL ANALYSIS;SCINTISCANNING;DECONTAMINATION;TRANSFERRIN;DOGS;CERIUM 141;RADIONUCLIDE KINETICS;IN VIVO

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To evaluate the physiological impact on the hemopoietic system of mammals resulting from exposure to a variety of environmental pollutants associated primarily with non-nuclear energy technologies.
APPROACH: Living rats, mice, rabbits, and goats and/or tissues obtained from such species will be exposed to different levels of gaseous pollutants (O/sub 3/, NO/sub x/, SO/sub x/, CO/sub x/, O/sub 2/, H/sub 2/S). Such animals will also be exposed acutely or chronically to various concentrations of heavy metal pollutants such as Pb, Hg, Cd, Pt, As, either by ingestion or injection. Various conpartments of cells in the hematopoietic system will be assessed quantitatively using the CFU-S, CFU-E, CFU-M, CFU-G, and ACFU techniques during pollutant exposures. Changes in the gas transport function of the blood (pH, pCO/sub 2/, pO/sub 2/, and P/sub 50/) will also be measured as will changes in hormones and humoral agents regulating the formation of blood cells.
PROJECT MILESTONES: (1) Systematic knowledge of temporal changes in various animal models of hematopoietic tissue will be acquired FY 80 and on; (2) fundamental knowledge of control processes involved in regulating proliferation of blood-forming tissues will be obtained with possibility of ultimate use in ameliorating any damage caused by energy pollutants in future.

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The major goals of this project are to assess the potential adverse late effects of ionizing radiations of high linear energy transfer in normal animal tissues. In particular we are concerned with tumorogenisis and delayed functional effects. We will utilize rat skin, hamster lung and rat spinal cord as model systems.
APPROACH: As required by the systems being studied, skin, spinal cord, or thorax will be irradiated with accelerated beams of Neon, Argon or Carbon Ions. Some exposures will be made with oxygen ions. At appropriate times after irradiation the animals will be either sacrificed or subjected to appropriate functional tests.
RESULTS: Will determine threshold doses and dose-response relationships for degenerative changes as well as relative biological effectiveness ratios for the end-points selected.
PROJECT MILESTONES: (1) October 1976 Complete studies on late effects on skin. (2) March 1977 Complete studies on lung. (3) July 1977 Prepare to start human therapy trials.
KEYWORDS: TISSUES;LET;IONIZING RADIATIONS;DELAYED RADIATION EFFECTS;NEON IONS;ARGON IONS;CARBON IONS;OXYGEN IONS;FUNCTIONAL MODELS;BIOLOGICAL RADIATION EFFECTS;SKIN;VERTEBRAE;CHEST;SPINAL CORD;BIOLOGICAL MODELS;RATS;DOSE-RESPONSE RELATIONSHIPS;LUNGS;HAMSTERS;NEOPLASMS;KIDNEYS;X RADIATION

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Northwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) A quantitative estimate of energy deposition by energetic particles and the

channeling of this deposited energy into various modes leading to chemical and biological changes in living systems. (2) To demonstrate quantitatively the correlation between actions of chemical agents such as environmental pollutants and physical agents such as radiation. (3) To apply knowledge acquired by correlating radical concentration to DNA damage in radiation therapy.
PPROACH: Theoretical model studies involving energy computation and related biological effects supplemented by physical as well as chemical experiments. Biochemical approach to the objectives will constitute an important aspect of the study.
RESULTS: (1) Quantitative results for the concepts of dosimetry for chemical, biological and physical agents. (2) Effect of chemical sensitizers and protectors in radiation therapy. (3) A possible means of harnessing energy from water as hydrogen.
PROJECT MILESTONES: Mechanism of biological damage by physical and chemical agents.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (5%);METALS (25%);ORGANICS (70%)
CHARACTER OF STUDY: RESEARCH (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of this project is to develop the methods of electron microscopy so that they can be used to investigate complex biological structures at the molecular and atomic level. Knowledge must be developed concerning the structure of biological materials, organelles, and cell membranes in order to better understand the effects that potentially harmful products and effluents of energy technologies may have in altering the function and internal structure of living organisms, including man.
APPROACH: The project is among the leaders in developing electron microscopy as a structure analysis method of comparable power to x-ray diffraction. To do this, we have had to develop image processing and 3-D structure programs for the computer. We have also had to innovate new and appropriate methods for hydrated specimen preparation of biological materials. Finally, sophisticated analysis must be made of electron scattering, diffraction, and image contrast in order to account for so-called dynamical diffraction effects that rarely occur with x rays.
RESULTS: It is expected that electron microscopy will be a powerful, new structure analysis method that is capable of structure determination in many important cases where x-ray diffraction cannot succeed. Examples are virus structure; small membrane sheets; highly ordered, subcellular components (e.g., microtubules); important crystalline macromolecules which are available in quantities that are too small to support x-ray crystallographic work (e.g., proteins that are involved in the control of DNA repair, replication, and regulation).
PROJECT MILESTONES: (1) 3-D structure analysis of the T-4 bacteriophage tail-structure at 30 A resolution.

(2) Structure analysis of an organic specimen test-material (e.g., crystalline cholesterol films) at 3.5 A resolution, which is the instrumental limit. (3) Structure analysis of a native cell membrane (e.g., the gap junction complex from mouse liver cells).

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To characterize pollutant induced membrane damage in isolated mitochondria and cultured mammalian cells, concentrating on the role of oxygen in damage propagation. To study the protective role of antioxidants and free radical scavengers.
APPROACH: Cells and organelles are subjected to pollutant stress under aerobic and anaerobic conditions and damage is assessed by physical techniques (EPR, electron microscopy) at the structural level and biochemically in functional terms. Chemical protective measures are applied to further identify damage mechanisms and potential clinical countermeasures.
RESULTS: Basic knowledge about oxidative membrane damage initiated by noxious gases in the environment at the cellular and subcellular level. Identification of protective countermeasures of potential benefit to man living in a polluted environment.
PROJECT MILESTONES: (1) To identify threshold concentrations of NO/sub 2/, light induced reagents which produce delectable structural and functioned membrane damage. (2) To localize damage among specific membrane components. (3) To identify and demonstrate the effectiveness of protective measures.
KEYWORDS: CELL MEMBRANES;MITOCHONDRIA;OXYGEN;BIOLOGICAL REPAIR;POLLUTION;HEALTH HAZARDS;BIOLOGICAL STRESS;ULTRASTRUCTURAL CHANGES;CHEMICAL REACTION KINETICS;BIOCHEMISTRY;NITROGEN DIOXIDE;NITROGEN OXIDES;RESPIRATION;IN VITRO

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objectives are (1) to develop new techniques for the measurements of gaseous trace contaminants, (2) to develop complete instruments using these techniques in order to make them available to the scientific community and (3) to cooperate with environment or health programs which apply the instruments.
APPROACH: The techniques are investigated and developed by teams of physicists, chemists and engineers who are expert in the fields of physical and chemical processes. The developments are then designed into complete instruments by engineering teams. The techniques are selected for development on the basis of their potential for solving problems in monitoring environmental or health hazards.
RESULTS: We expect to develop new instrumental techniques and to produce complete instruments for monitoring various trace gaseous contaminants. The instruments will be designed with the idea of transferring the technology so developed into commercial channels, where applicable.
PROJECT MILESTONES: (1) Completion of prototype microwave spectrometer for SO/sub 2/ and other gases October 1977. (2) Completion of development of NO detection method using Zeeman-shifted light sources; decision whether to engage in cooperative combustion research application October 1977. (3) Determination of usability of liquid crystal techniques for personal dosimeters for contaminant gases October 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To develop and apply physical methods to the measurement of environmental pollutants likely to cause health and other deleterious effects. Physical methods offer much greater potential for large scale high speed detection and analysis.
APPROACH: The program is based initially on the application of x-ray methods to elemental analysis. These methods are now being extended to analysis of the chemical state of elements by such methods as observation of the detailed shapes of x-ray absorption edges. The effort is also recently being applied to the plutonium field measurement problem.
RESULTS: Improved large-scale analysis systems capable of providing continuous automatic monitoring of many important pollutants.
PROJECT MILESTONES: (1) Already have demonstrated large-scale monitoring of elements in the field. (2) Chemical analysis of selected elements addressed to specific problems in FY 1977. (3) Plutonium monitoring demonstration of sensitive system by FY 1977-78.

POLLUTANTS: RADIATION (50%);SPECIFIED OTHER POLLUTANTS/Mutagens (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To provide a quantitative framework for evaluation of the health effects and hazards of tritium (and other DNA damaging mutagens) in mammalian cells.
APPROACH: (1) Test system: mammalian cells (human, chinese hamster, and mouse), normal and malignant, from various organs including lung, kidney, ovary, testis, and skin. (2) Exposure conditions: tritium, I-125, IUdR, BudR, visible light (fluorescent) UV, ionizing radiation, nitrosoguanidine, and other carcinogens and mutagens. Route of administration: incorporation into DNA and other macromoleculaes. Dose and duration: acute 37 degrees C, chronic exposures at 4 degrees C and -196 degrees C. (3) Endpoints to be assessed: reproductive death, cell cycle kinetics, mutagenesis, chromosome changes, transformation, recovery, and molecular repair processes.
RESULTS: (1) Quantitation of the toxic and mutagenic effects of tritium with respect to ionizing radiation and other environmental mutagens. (2) Mapping of the gene organization by new non-conventional genetic techniques.
PROJECT MILESTONES: Tritium damage is analogous to x ray damage in terms of cell killing 75 and also in terms of mutagenesis June 1976. I-125 decays are like high LET radiation 75, and have been used to demonstrate the existance of critical function DNA in mammals 1976. BUdR induces mutations only when incorporated into specific parts of the mammalian cell nucleus 1976

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: A comprehensive survey has been made of instrumentation suitable for environmental characterization, measurement and monitoring. Instruments being investigated are those useful for measurements in air quality, water quality, radiation and biomedicine in energy related research and operations.
APPROACH: Consideration has been given to instruments and techniques presently in use and to those developed for other purposes but having expected application to the environmental aspects of energy related technology.
RESULTS: More than 3500 volumes of the survey are presently in use throughout the world.
PROJECT MILESTONES: During the first 3 years of the project (1971-1974), gaseous air, water, radiation and bicmedical instrumentation were surveyed. In 1975 air particulate methods were reviewed together with instrument calibration procedures. In 1976 sampling methods have been studied. The contents of the survey will be continually reviewed, updated and revised in the future.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Plume chem.
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objective of the program is to establish and to quantitate the relative roles of homogeneous (gas-phase) and heterogeneous (gas-particle) reactions in the formation of suspended sulfur, nitrogen and carbon species. The principal emphasis is on catalytic and surface chemical reactions involving combustion generated carbonaceous and other particles and principal pollutant gases, such as SO/sub 2/, NO, NO/sub 2/ and NH/sub 3/.
APPROACH: The project is mostly of laboratory nature, but supplemented and complemented with specific experiments and small scale sampling programs in the field. Physical methods, such as x-ray photoelectron spectroscopy, infrared spectroscopy, x-ray fluorescence, laser raman spectroscopy are used for chemical characterization. Wet chemical methods are also being used.
RESULTS: Quantitative results on the rate and mechanism of SO/sub 2/ yields sulfate conversion. Results should be applicable for use in plume modeling studies.
PROJECT MILESTONES: Completion of laboratory simulation exp. approximately Dec. 1976. Completion of the first phase of field exp. approximately July 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: This project has three main objectives: (1) To perform a detailed case study of the dynamics, environmental, and socio-economic impacts of geothermal development by examined what has happened and is happening at the Geysers Geothermal Area of Sonoma and Lake Counties, Calif. (2) To provide certain forms of specialized technical assistance to the government of Lake County. So far, we have helped them in compiling socio-economic data, analyzing public opinion concerning geothermal development, and evaluating the various air pollutant abatement strategies proposed by the Pacific Gas and Electric Company. (3) To assess the environmental (including socio-economic) impacts of wide spread use of solar energy. The project is concentrating on solar-termal conversion, but will branch out to other technologies.
APPROACH: The approach to this study is to use a methodology called the ''systems approach.'' This involves structuring the project along the lines of the most recent work in systems design. In this process certain issues of components and relationships are brought out and dealt with. Born as a management tool, the systems approach has recently matured enough to be used in a more general manner such as dealing with ''social systems.''
RESULTS: The results of this study will be compiled in a report at the end of the first year of investigation. This report will consist of information to be used by the resident, planners and decision makers of Lake County. This information will deal with the social system impacted by the geothermal development program in Lake County.
PROJECT MILESTONES: 1 Oct. 1977 Preliminary Report.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The effects of non-nuclear energy pollutants on the production, secretion and metabolism of hormones in rats will be studied. Specifically, we will study the effects of gaseous pollutants such as hydrogen sulfide, ozone, and the oxides of carbon, nitrogen and sulfur, and metal pollutants such as lead, mercury, cadmium, zinc, nickel, selenium, chromium, copper, manganese, arsenic and cobalt. Initially, we will concentrate on the hormones of the anterior pituitary and their target organs and then the study will be extended to other endocrine systems.
APPROACH: In vivo studies, including both acute injections and chronic administration in drinking water or by inhalation, of the pollutants listed above will be carried out in rats. Following exposure, the rats will be sacrificed by decapitation and serum and the anterior pituitary saved for hormone assay. All six of the anterior pituitary hormones will be assayed. Mainly the radioimmunoassay technique will be used, but when useful, other assay systems such as bioassay, polyacrylamine gel electrophoresis and receptor assays will be used. After this initial survey, studies directed to an assessment of the ability of the pituitary to secrete all of its hormones in response to specific stimuli (stress, TRH, LHRH) will be carried out in rats with indwelling cannulae. Studies concerning the metabolism of the pituitary hormones will also be carried out in such animal preparations.
RESULTS: Since administration of many of the above listed pollutants are known to result in central nervous system pathology, it is expected that effects will be observed in pituitary function. Because pituitary hormone secretion responds so rapidly to a variety of influences, it is hoped that this study will lead to early hormonal changes which may be used as indicators of exposure to pollutants.
PROJECT MILESTONES: First a survey will be made of a complete anterior pituitary hormone profile in the serum and pituitary of laboratory animals exposed both acutely and chronically to various gaseous and metallic energy pollutants. The second phase will consist of studies involving the secretory ability of the anterior pituitary to various stimuli and the metabolism of pituitary hormones as tested by clearance studies. The most profitable areas for these studies will be dictated by observations made in the initial survey. Finally the project will extend itself into other non-pituitary endocrine areas.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: A new assay system will be developed for testing mutagenic, carcinogenic, and possibly teratogenic effects of environmental pollutants on animal cells and human cells grown in tissue culture.
APPROACH: Animal and human cells will be grown on the surface of plastic or solid agar under extremely tightly controlled and reproducible conditions so that the morphology of the growing colonies of cells is accurately measurable and reproducible by a television camera which will examine time-lapse photographs of the growing colonies and report the results to an on-line moderate sized computer.
RESULTS: A dose response curve for a number of known mutagens and carcinogens will be obtained using changes in colony morphology for Chinese hamster ovary cells and for several other cell types including human diploid cells. It is hoped that these results will be of practical application in estimating the danger to human health of a wide variety of environmental pollutants.
PROJECT MILESTONES: (1) Detection of known mutagens, carcinogens, and perhaps teratogens with the Chinese hamster ovary cell system. (2) Establishment that known non-mutagens, non-carcinogens and non-teratogens produce no effect on the colonies of growing cells. (3) Establishment of dose response sensitivity for these cells. (4) Repeat the same work with at least two other cell lines, including at least one human cell line or with normal human cells.

CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Estuarine;GEOGRAPHIC AREAS/Far West;COASTS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Our approach to understanding and assessing the implications of expanding energy-related activities on the chemical environment of San Francisco Bay/Delta ecosystems is to investigate those fundamental processes which determine the interactions between trace elements and organics and their individual or combined transport and fate. Subsequent chemical modeling and laboratory bioassay experiments will enable prediction of the biological impact of expanded energy-related activities in San Francisco Bay.
APPROACH: The water and suspended particulate samples are collected from a depth of 2 m with a special

pumping system. Suspended particulate samples are collected on a separate membrane filter. Concurrently with the collection of trace element samples, measurements are conducted for salinity, temperature, pH, partial pressure of dissolved oxygen, nitrate-N, nitrite-N, ammonia, phosphate, and silica. In the laboratory total carbonate alkalinity and concentrations of dissolved organic carbon, Na, K, Mg, Ca, sulfate, and sulfide are determined. We are applying a computerized chemical model, WATEQ, to our data to determine whether specified chemical information, necessary for the modeling of dissolved trace element specification, has been overlooked. Application of the model may result in the discovery of other chemical parameters which should be included in our analytical program.
RESULTS: Information concerning trace metal behavior in estuaries.
KEYWORDS: ESTUARIES;WATER POLLUTION;TRACE AMOUNTS;AQUATIC ECOSYSTEMS;CALIFORNIA;BIOLOGICAL EFFECTS;ENERGY SOURCE DEVELOPMENT;CHEMICAL EFFLUENTS;COMPUTER CODES;W CODES;MATHEMATICAL MODELS;METALS;ENVIRONMENTAL TRANSPORT;BIOLOGICAL MODELS;NITROGEN OXIDES;SULFUR DIOXIDE

77 FUNDING: Energy Research and Development Administration FY77:$20,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Develop and publish a reference document which will describe and provide practical guidelines for administering a comprehensive earthquake safety program. The objective is to simplify and speed up the practical application of seismic safety to ERDA facilities.
APPROACH: Utilize LBL's experience and its specialized consultants (in all aspects of earthquake science) to describe techniques, appoaches, policies, and standards which have been developed in the process of carrying out LBL's own earthquake safety program. Experience has shown that most earthquake damage has been the result of failure to implement relatively simple principles already known about earthquake engineering.
RESULTS: This project will produce a document which will provide general guidelines for performing an earthquake safety survey and implementing a comprehensive earthquake safety program. It will cover existing and new physical plant facilities as well as operational conditions and recommend an approach to risk management of the hazard. Commentary will be augmented by a compilation of seismic criteria, standards and examples generalized for use at other sites throughout the ERDA Complex.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Determine the effects of a variety of pollutants of energy producing technologies on endocrine physiology and especially those life processes which are either controlled or in part influenced by steroid hormones.
APPROACH: Rats will be exposed to oxides of nitrogen, sulfur, and certain hydrocarbons. Effects of heavy metals such as mercury, cobalt, manganese, cadmium, nickel, lead, arsenic (and organic salts of mercury and cadmium) will be studied by administration to rats. Changes in reproduction or adrenal steroid hormone synthesis and secretion and the ability of the gonad and adrenal to respond to pituitary tropic hormones will be assessed by highly sensitive and specific radioimmunoassay and radioreceptor analytical methods.
RESULTS: Adult male rats have been exposed to ozone concentrations (0.8 to 1.0 ppM) which are near the oridant concentrations reported in urban areas during serious smog alerts. Exposures have been chronic and for various times in these initial experiments, six weeks being the longest. Preliminary results suggest that exposure tc ozone significantly depresses the ability of the rats' testes to produce testosterone in vitro.
PROJECT MILESTONES: Experiments will be done to gain an understanding of the rat endocrine biochemistry which provides females greater protection to ozone exposure than males Sept. 30, 1978. Studies of gonadal response to pollutant exposures will be extended to include the functional changes observed in the tubular compartment (spermatogenesis); thus, the entire physiological response of the testis can be correlated to pollutant evoked gonadal damage.

PROJECT DESCRIPTION: To study the chemical and physical behavior of indoor combustion-generated air pollution in residential and commercial buildings.
APPROACH: Indoor air pollution will be characterized and important sources, abundances and fate identified. The exposure of occupants will be characterized and health and welfare effects studied. Abatement procedures for indoor air pollutants will be evaluated.
RESULTS: Field and laboratory characterization studies have included detailed studies of nitrogen compounds in the indcor environment. Levels of CO and NO2 in the field study were found to approach or exceed existing U.S. ambient air quality standards.
PROJECT MILESTONES: (1) An epidemiological study to determine respiratory symptomatology and function in non-smoking housewives exposed to varying amounts of nitrogen oxides determined by their cooking and heating use Sept. 30, 1978. (2) In the epidemiological study, the identification and characterization of the field sample will be completed Sept. 30, 1979.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: To explore and quantify biological effects caused by stationary and varying magnetic fields at the molecular-cellular level and in mammalian systems. To develop guidelines for protection of professional personnel and the population. Thomas Budinger, M.D., Ph.D., will be in charge of medical aspects of this investigation. The frequencies covered include D.C. to about 30 megacycles.
APPROACH: We will build and develop a variety of magnetic exposure devices for exposure of biological materials and humans to controlled field distribution with other environmental variables under rigid control. Next an assessment of the basic effects on cells and molecules will be measured. Certain types of

suspect effects, especially visual and nervous system effects, will be investigated in mammals and man.
RESULTS: Expect to (1) establish basic relationship between field intensity, spatial and temporal variations and biological effects; (2) remove the existing controversial and confusing information that exists; and (3) make recommendations for safe operation of future power systems.
PROJECT MILESTONES: (1) Complete 1/2 instrumentation July 1977. (2) Complete instrumentation July 1978. (3) Initial assessment effects July 1979.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine the effects, if any, of the stationary and alternating magnetic and electric fields produced by controlled thermonuclear reactors, high-voltage transmission lines, magnetic energy storage systems and magnetohydrodynamic systems.
APPROACH: This is an epidemiological study of 2000 scientists and technicians who have been exposed to high fields for substantial cumulative exposures.
RESULTS: A critical evaluation of A.M. Vyalov's report of 1500 workers who had ill effects from magnetic field exposures will be completed. Medical data on at least 500 exposed subjects and 500 matched controls will be obtained.
PROJECT MILESTONES: Analysis of the data on the first 500 exposed subjects will be completed. The data base will be increased to include 2000 case histories of cyclotron workers and high energy researchers. The potential data base from high tension linemen, power station operators, and European scientists will be investigated.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine the feasibility of using sperm motility as a measure of physiological and metabolic toxicity of energy related effluents as they affect the intact male mammalian organism. If feasibility is established, the method will then be applied to the screening of a variety of substances obtained from energy power plants (fossil, nuclear, geothermal) and in situ processes (coal gasification, oil shale).
APPROACH: We will use the flow-spectrophotometric method to determine sperm motility. This method, developed in our laboratory, uses the optical anisotropy of sperm to measure their capacity for randomization after flow alignment forces are discontinued. We will first test the flow-spectrophotometric method with sperm of various laboratory mammals (rat, mouse, rabbit) and then determine whether sperm motility is affected by known noxious pollutants such as metal ions and hydrocarbons.
RESULTS: Sperm motility method as a rapid, objective method for screening energy related pollutants. Rapid screening by using sperm cells obtained at different times after male mammals are exposed.
PROJECT MILESTONES: (1) 4/7/77 Determine feasibility of using flow-spectrophotometric method with laboratory mammals. (2) 8/1/77 Test for deleterious effects of known pollutants. (3) 10/1/77 Screen a variety of unknown substances in effluents from energy sources.

BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Global;COASTS/Other coasts All coasts;HYDROGRAPHIC AREAS/Other hydrographic areas Streams
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The aims of this research are (1) to identify in the intact animal (mainly the mouse) effects induced by low exposures to tritium, other important radionuclides, and external radiation during the highly sensitive embryonic, fetal, and postnatal stages of development (the most vulnerable parts of the mammalian life cycle); and (2) to quantify these effects at the cell-population level, thus obtaining the data necessary for critical comparisons at low-level exposure where hazard evaluation is most urgently needed.
APPROACH: The approach is to give acute or chronic exposures to animals in utero and postnatally, then to

evaluate selected cell populations in terms of residual cell numbers and functions. Attention is focussed on oocytes and neuroblasts because they are highly radiosensitive and their cell numbers are set by birth or shortly after. The male germ line, also highly radiosensitive, is studied as an example of a continuously renewing population.
RESULTS: Expected results are (1) determination of the lowest exposure levels at which important cell populations are significantly affected during development, (2) measurement of quantitative dose-effect relations, (3) determination of relative effectiveness and related data required at low exposures for reliable safety standards and exposure guides.
PROJECT MILESTONES: (1) Dec. 31, 1976 Oocyte age-radiosensitivity relationship determined; Studies of tritium effects on developing nervous system well started. (2) June 30, 1977 Dose-effect relationship for neutron irradiation of oocytes measured; Endocrine effects on oocyte radiosensitivity clarified. (3) Dec. 31, 1977 Preliminary results for tritium effects on developing neurons expected; Comparative studies on tritium and gamma irradiation of the male germ line well started. (4) June 30, 1978 Results expected for effects of chronic tritium and gamma irradiation of male germ line (RBE measured); Effectiveness of tritium in damaging developing neurons quantified.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To develop sensitive bioassay methods using mammalian spermatogenesis and particularly mature sperm as indicators of genetic, teratologic and general toxicity.
APPROACH: The project uses optical, automated, high-speed, and content-oriented methods to measure the morphology, the variability in DNA content, and the nuclear protein composition of sperm and testis cells.
RESULTS: The project should result in the development of practical and sensitive assay that can be used in the laboratory and in the field on mammals (or shell fish, etc.), including man. Flow systems measurement of DNA content of mammalian sperm will be freed of the orientation artefact and will be applied to other properties of the sperm. Application to a variety of pollutants should give beginning dose-response and sensitivity information.
PROJECT MILESTONES: (1) 1 July 1976: (a) Initiate testing of 4 chemicals to determine transmissable genetic damage in spermatogenic cells of mice. (b) Continue parameterization of fluorescence frequency distributions to identify effects of sperm morphology. (c) Start study of Drosophila sperm DNA content. (2) 1 Jan. 1977: (a) Make decision on manpower commitments for new flow chamber design. (b) Produce manuscript on nuclear protein of sperm from normal and mutagen treated mice. (3) 1 July 1977: (a) Complete tests on 4 chemicals (sperm morphology, DNA content and visible chromosomal aberrations). (b) Complete study of effects of x-irradiation on sperm DNA content. (4) 1 Jan. 1978: (a) Complete study of Drosophila sperm DNA content from euploid and aneuploid males. (b) Complete study of sperm DNA content from mice with isolated Robertsonian fusions (F/sub 1/ of M. poschiavinus). (5) 1 July 1978 Initiate testing the effects of effluents and other pollutants on sperm morphology and DNA content of germ cells.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: This project aims at improving our flow systems capabilities by incorporating the most advanced techniques. It includes the modifications, improvements,and maintenance necessary for both ongoing and new programs in the Biomedical Division. Flow systems are essential to a wide variety of projects in cell biology, mutagenesis, flow cytogenetics, reproductive biology, and cancer detection now in progress in the Division.
APPROACH: Instrument development under this project will be directed primarily by requirements developed within various experimental programs within the Division. Examples are a need to develop methods of handling asymmetric cells, improved flow stability for chromosome measurements, and incorporation of a volume sensor. There is a continuing effort to advance the state of the art in flow systems.

RESULTS: Improved flow systems will provide better, more consistent and reliable data for experimental biology programs. New developments will permit measurements not yet possible due to instrument limitations.
PROJECT MILESTONES: There are no direct definable milestones in this project.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project is concerned with general biological applications of the flow system facilities of the division. Several projects will be supported. These include: (1) the analysis and sorting of individual human chromosomes for biological and biochemical experiments involving the effect of clastogens on chromosomes, (2) the analysis of sperm populations to reveal the presence of aberrant sperm, (3) the identification and characterization of cell mutants, (4) the development of new techniques for cell cycle analysis, (5) the development of methods for the recognition of carcinogenesis and mutagenesis, and (6) the recognition of abnormal exfoliated cervical-vaginal cells.
APPROACH: Support is provided to scientists interested in utilizing flow-systems in the study of a particular problem. This support includes flow systems operation, maintenance of permanent data-storage facilities, routine computer analysis of user generated data, help in incorporating flow-system technology into experimental design and in interpreting the resulting data, and the provision of suitable biological materials and information necessary for the development and testing of biologically useful flow systems. In addition our own investigations are initiated in areas where flow-systems technology might be useful.
RESULTS: Results in several areas are expected: (1) Continued progress will be made in the analysis of isolated chromosomes. Attempts will be made to analyze chromosomes from human cells. (2) A decision will be made concerning the utility of flow systems in the recognition of aberrant sperm. (3) Continued work will be devoted to the identification and characterization of cell mutants. (4) Newly developed cell cycle analysis techniques will be used in studies of the effects of chemicals on cell populations. (5) Continued work will be devoted to studies of mutagenesis and carcinogenesis and (6) to the recognition of abnormal cervical vaginal cells. (7) In addition, considerable effort will be devoted to the development of computer codes for the display and analysis of two parameter flow system data.
PROJECT MILESTONES: This project plays a support role in the division; the designation of specific milestone is therefore inappropriate.

PROJECT DESCRIPTION: The project is oriented toward the development and application of cytochemical procedures as biophysical cytological probes for the identification and quantitation of enzymes, nucleic acids, and protein constituents on cells and subcellular components.
APPROACH: Is the use of specific peptides coupled to 4-methoxy-beta-naphthylamine as cytochemical substrates for the assay and subcellular localization of tissue proteinases, and the use of other fluorophores for the assay of esterases and nucleotidases.
RESULTS: To develop enzyme assays to evaluate the physiologic and pathologic state of tissues, cells and cellular organelles.
PROJECT MILESTONES: To develop enzyme assays to evaluate the physiologic and pathologic state of tissues, cells and cellular organelles. (1) Development of colorimetric and fluorescent techniques for quantitation of plasminogen activator using the substrate CBZ-gly-gly-arg-4M beta NA. (2) Application of enzyme techniques to flow systems and correlation of enzyme activity to phases of the cell cycle. (3) Measurement of nuclear protease content in response to carcinogens and mutagens. (4) A colorimetric and fluorogenic test for gamma-glutamyl-transpeptidase as a means of following myocardial infarctions.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project combines a Cell Culture Facility as a service to the Biomedical Division and an experimental program dealing with mutation in cultured mammalian cells. The latter activity is aimed at understanding mutational phenomena in near-diploid Chinese hamster cells and demonstrating their usefulness as a model for somatic mutation in vivo. Procedures are being developed for isolating mutations producing temperature sensitivity for growth; these are then characterized from the cellular and biochemical viewpoints, and then applied to genetic questions.
APPROACH: Tritiated aminoacid suicide procedures are being developed to select large numbers of mutations affecting specifically protein synthesis. Suitable biochemical and genetic analyses are applied to these mutants as well as others expected to come from an automated-colony-growth approach done in collaboration with U.C. Berkeley. In addition, the relevance of the new sister chromatid exchange assay to mutagenesis is being assessed by testing for its correlation with mutation induction at the HPRT locus.
RESULTS: We expect to isolate many protein synthesis mutants, including at least five classes of aminoacyl-tRNA synthetase mutants, in response to chemical mutagenesis. We shall use these to (1) test for evidence that we have structural (as opposed to regulatory) gene alterations and (2) test whether the genes being altered behave genetically as haploid or diploid.
PROJECT MILESTONES: (1) 10/1/76 Test for a correlation between mutation induction and sister chromatid exchange after exposure to chemical agents. (2) 1/1/77 Establish the spectrum of protein synthesis mutants isolatable (after chemical mutagenesis) using tritiated aminoacid suicide procedures. (3) 1/7/77 Establish whether this cell system behaves as diploid (vs. haploid) for certain aminoacyl-tRNA synthetase genes. (4) 10/1/77 Purification and assay of altered protein as evidence for true mutation.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project is directed towards determining if gene expression errors are: (1) subject to a self-amplifying effect, (2) an important cause of cell failure and death, (3) an indirect cause of an enhanced spontaneous mutation rate, and (4) significantly induced by exogenous agents.
APPROACH: The initial phase of this project involves in vivo studies in the procaryote Escherichia coli. We explcit an ability unique to this system, to manipulate, both genetically and chemically (aminoglycoside antibiotics, etc.) the gene expression error rate, and to measure that rate by determining the level of variant, thermolabile forms of an unusually large and highly inducible enzyme (beta-galactodidase). Mutagenic effects of such errors are sought through measuring mutations induced in the bacterial virus T4 during its replication in treated cells.
RESULTS: A definitive fulfillment of the project's objectives would provide the groundwork for a critical and uninvestigated area in environmental toxicology.
PROJECT MILESTONES: Anticipated milestones in the initial, procaryote phase of the project were: (1) Demonstration of mutagenesis caused by errors in gene expression 3/77; (2) Determination of rate of error catastrophies in causing cell death 9/77; and (3) Definitive demonstration of error amplification 3/78.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The purpose is to define the enzymic regulation of folate one-carbon metabolism and to develop and validate new genetic markers in these pathways for their potential use 'in pollutant mutagenesis assays. This research will also provide needed information on this metabolism and fate of energy-related pollutants that exert their toxicity via one-carbon fragments.
APPROACH: The experimental approach is at the in vitro cellular and molecular level; it makes extensive use of cultured somatic cells, primarily chinese hamster ovary (CHO) lines. Several CHO mutants have been characterized as lacking the enzyme, folylpolyglutamate synthetase; other mutants will be derived by mutagen treatments. Once characterized, each mutant will then be evaluated as a possible mutagen tester strain. In additant, normal CHO cells and mutants with impaired folate metabolism will be employed to determine the mechanisms by which methanol metabolites damage cells and cellular components.
RESULTS: Expected end-products are a battery of biochemically characterized mutants, a few of which should serve as in vitro mammalian cell systems with which one can identify the presence of certain types of mutagenic agents. Their specificity may also allow measurements of mutation frequencies in terms of gene loci. Biochemically characterized markers which represent varied categories of genetic damage are necessary to permit a rapid, yet thorough, screening of the mutagenicity of potentially hazardous agents, particularly their quantitative dose-effect relationships.
PROJECT MILESTONES: (1) Sept. FY 1977 The ability of known mutagens to induce revertants of CHO auxotrophs requiring glycine + adenosine + thymidine will have been determined. Our research has recently shown that this triple auxotrophy is due to a specific enzymic defect in folate metabolism. (2) Sept. FY 1977 The feasibility of isolating CHO mutants with known enzymic defects in methionine biosynthesis will have been established. (3) Sept. FY 1978 The relative toxicities of methanol metabolites to normal and mutant CHO cells with markedly differing intracellular folate pools will have been ascertained; preliminary data on the mutagenicities of methanol versus formaldehyde and formate will have been obtained.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) Develop information needed to understand mutagenesis. (2) Delineate molecular mechanisms by which certain mutations are expressed in animal cell membranes. (3) Obtain information needed to develop mutant markers for testing mutagenic agents from energy technologies. (4) Obtain information needed to understand structure and function of membranes of normal and cancerous cells. (5) Determine effects of energy-technology pollutants on cytodifferentiation. (6) Understand some important serum-cell membrane interactions.
APPROACH: We will biochemically and biophysically characterize the nature, structure, function and expression of protein (glycoprotein) markers associated with cell membrane mutations. Cells for in vitro study include (1) HeLa, CHO and other animal cells differing in sensitivity to ouabain and in cation transport, and (2) sheep erythrocytes differing in internal K+ and Na+ concentration and in Na+-K+-activated, ouabain-inhibited membrane ATPase activity.
RESULTS: (1) Biochemical and biophysical delineation of differences between normal and mutant cell membranes in glycoproteins, glycolipids, proteins, enzymes. (2) Use of these results to devise a system for mutagen testing; forward mutations to ouabain resistance are promising phenotypic changes to monitor in testing pollutant mutagenicity. (3) Valuable information in understanding the role of membranes in mutagenesis and carcinogenesis. (4) Understanding certain important serum-cell membrane interactions because they will affect dose-response of organisms to pollutants. (5) Understanding pollutant effects on cytodifferentiation.
PROJECT MILESTONES: (1) Sept. 1977 Biochemical and chemical elucidation of some important differences between normal and mutant cell membranes in glycoproteins and proteins. (2) April 1978 Elucidation of biochemical and chemical differences in membrane NA/sup +/-K/sup +/-ATPase and ouabain resistance between normal and mutant cells. (3) Sept. 1978 Biochemical and chemical elucidation of further differences between normal and mutant cell membranes in glycoproteins and proteins. (4) Sept. 1978 Elucidation of some effects of environmental pollutants on cytodifferentiation. (5) Sept. 1978 Elucidation of some effects on cells of interaction between serum constituents and cell membranes and demonstration of importance to dose-response to environmental pollutants.

POLLUTANTS: METALS/Mercury;METALS/Platinum;METALS/Thallium;METALS/Cadmium (10%);ORGANICS/Polycyclic aromatic hydrocarbons (60%);RADIATION/Hydrogen-3;RADIATION/Gamma;RADIATION/Alpha (30%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Biochemical, biophysical, and cytogenic techniques will be applied to the analysis of DNA, chromatin, and chromosome structure. Correlations are being drawn between the quantitative distributions of satellite DNA and cytologic heterochromatin on one hand and variations in chromosome structure on the other hand in kangaroo rat species. These studies reveal an apparent new level in the control heirarchy of the genome, a global level that may be involved in adaptations to the environment and evolution of species. The chromatin studies are directed toward an analysis of those factors involved in the packaging of DNA in chromatin and mitotic chromosomes that may be responsible for the differential sensitivity of hetero- and euchromatin to chemical mutagens and radiation.
APPROACH: The chemical properties, chromosome location, timing of replication, accessibility to nuclease digestion in chromatin, and the comparisons of satellite DNA properties have revealed greater similarities broadly through the Order Rodentia than hitherto recognized. A function for satellite DNA that has been subject to selective conservation for at least 50 million years is implied by the data. In the chromatin studies, particular emphasis will be given to characterizing the biochemical structure of hetero- and euchromatin with respect to the types of chromosomal proteins that may be present, the extent of their modification by acetylation, methylation and phosphorylation, the spatial organization of these proteins on DNA, and the thermal stability of protein-DNA interactions.
RESULTS: Further studies on satellite DNA will extend to additional rodents and other animal species, and will include chromosomal location by in situ hybridization. The sequence organization in the poorly understood DNA fraction of density 1.702 g/ml will be evaluated as a possible ''library'' source of simple sequences for amplification into satellite DNAs. The chromatin proteins of mouse sperm are being characterized and micro techniques are being developed specially for the analysis of the chromosomal proteins in FMF sorted chromosomes. Projected studies will involve the separation of euchromatin and heterochromatin and analysis of nucleoprotein structure in each type, examination of the effects of x-rays and chemical mutagens on chromatin packaging in sperm, and characterization of the chromatin proteins in FMF sorted chromosomes and chromosome fragments.
PROJECT MILESTONES: (1) Dec. 1976 Complete characterization of sperm proteins (mice); complete further species survey of prevalence of specific satellite DNAs in rodents and other mammals. (2) Oct. 1977 Analysis of chromatin protein complement in abnormal sperm from individuals treated with X-rays and chemical mutations. In-situ hybridization studies of satellite DNA localization. Isolation of defined fragment of constitutive heterochromatin (satellite DNA containing) using restriction enzymes-partial characterization of chromosomal protein complement. Preliminary analysis of histone proteins in FMF sorted chromosomes (Muntjac). Characterization of protein-DNA interactions in different types of chromatin by thermal denaturation with ultraviolet spectroscopy. (3) Oct. 1978 Characterization of isolated heterochromatin with respect to histones and preliminary analyses of non histone proteins, and protein-protein interactions.

REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This program will investigate chromosome aberrations: Mechanisms of production, specificity of induction, persistence in cell populations in vivo and in vitro, and their functional significance. The ultimate goal of this study is to identify cytogenetic lesions formed in response to chronic exposure to pollutants and to establish a rapid quantitative measure of the lesions for monitoring exposed human populations for both somatic and genetic damage.
APPROACH: Both in vivo (rodents, rabbit, blood, bone marrow, testes) and in vitro (human diploid cells, various animal cells). Test systems will be utilized. Known mutagens/clastogens (alkylating agents or radiation) will serve as a positive control for experiments. Unknown mutagens/clastogens (heavy metals, hydrocarbons) will be evaluated for their activity following acute or protracted administration. An aerosol delivery system is also proposed. Clastogen test systems will be evaluated as they can be applied to quantitation of damage. This includes flow systems analysis of chromosomal DNA content, formation and persistence of sister chromatid exchanges and direct chromosome breakage.
RESULTS: Endpoints expected include: (1) Identification and quantification of cytogenic lesions in vivo and in vitro associated with chemical exposure. (2) Functional significance of the lesions-whether it results in mutagenesis, toxicity or other biochemical defect. (3) Development of an automated approach to clastogen screening. (4) Application of this information to monitoring human populations.
PROJECT MILESTONES: (1) Dec. 1, 1976 Correlation between sister chromatid exchanges and point mutations. (2) July 1, 1977 Establishment of a dose response curve for clastogen damage (radiation initially) using flow cytometry of isolated chromosomes. (3) Dec. 1, 1976 Determination of inducibility of sister chromatid exchanges and their persistence in heterochromatin and euchromatin. (4) July 1, 1977 Design of an aerosol facility for small animals.

PROJECT DESCRIPTION: Design and development of an instrument for measuring in-situ americium and plutonium contamination, especially in soil. The instrument is to be portable and capable of operation by one person in a field situation.
APPROACH: Based upon previous experience with high purity germanium detectors, a full-scale detector system is being developed.
RESULTS: An instrument for quantifyirg in-situ americium and plutonium in soil. The sensitivity will be higher than any available technique currently in use. It will be suitable for use at all nuclear facilities and for monitoring waste management and disposal.
PROJECT MILESTONES: (1) Nov. 1976 Design completed. (2) Feb. 1977 High purity detectors fabricated. (3) Nov. 1977 Preamplifiers, amplifiers, gating circuits fabricated. (4) April 1977 Field test started. (5) Aug. 1977 Field test completed. (6) Sept. 1977 Data analysis and final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: This project will address the following problems: (1) the individual and population doses from normal and accidental releases of radionuclides, (2) the environmental and biological costs of emissions from nuclear and non-nuclear modes of power production, (3) derived working levels and emergency reference levels for radionuclides in the environment near specific nuclear facilities, (4) long-term dose commitments to Marshall-Island inhabitants as a consequence of the U.S. nuclear testing program, (5) radiological pollution effects associated with accelerated uranium production in the Southwest.
APPROACH: The approach is to develop and update models and data bases for predicting transport and fate of radionuclides and to use these models to evaluate individual and population doses from radionuclide releases; these are used to evaluate the impacts from radionuclide releases and to develop secondary and tertiary radiation protection standards. Integrated assessment of dose commitments for the Marshall Islands includes the evaluation of alternate living patterns, remedial actions and agricultural practices.
RESULTS: Reports will document: (1) each pathway model and its data base, (2) generalized estimates of man-rem via environmental pathways and total man-rem per curie released for major nuclides, (3) derived working limits for nuclides in environmental media, (4) assessments of individual and population doses from specific nuclear activities such as weapons testing in the Marshall Islands, and (5) environmental impact from accelerated uranium production in the Southwest.
PROJECT MILESTONES: Report will be published to document the following: (1) Revised forage-cow-milk-man pathway model FY 1976; (2) Assessment of dose commitments for the returning Bikini population FY 1976T; (3) Revised plant-herbivore-meat-man pathway model FY 1977; (4) Revised soil-root-plant-man pathway model FY 1977; (5) Assessment of regional environmental impacts from uranium production in the Grants Mineral Belt, New Mexico August 1977; (6) Assessment of generalized man-rem via various exposure pathways and total man-rem per curie released for major nuclides FY 1977 or 1978; and (7) Revised aquatic foods-man pathway model FY 1978.

PROJECT DESCRIPTION: To assess and to predict the impact of phyto-toxic air pollution on photosynthesis (primary productivity) of plant stands, and to apply the method at the San Bernardino National Forest and other sites in the economically important Western yellow pine complex (ponderosa pine dominant) where air pollution causes considerable losses.
APPROACH: A portable, temperature-controlled, null-balance leaf diffusion porometer was developed for extensive measurements on diverse leaf types where both photosynthesis (C/sup 14/O/sub 2/ methods) and transpiration are measured simultaneously. A larger, less-portable cuvette system for intensive, controlled fumigations was also developed and is used in the field. Sites are chosen in cooperation with US Forest Service.
RESULTS: At San Bernardino National Forest (SBNF) the chronology of ozone damage to ponderosa pine was found to occur initially as changes in mesophyll and carboxylation resistances before visual symptoms appeared, and subsequently as changes in stomatal response and light harvesting capability by the time chlorosis and necrosis appeared. Three major efforts underway are (1) an experimental determination of the interaction of ozone and water stress on physiological light and temperature responses including abcissic acid formation in ponderosa pine, (2) correlation of photosynthetic response with the Miller damage rating index, and (3) pine-associated species studies to generalize a process model for predicting the forest succession.
PROJECT MILESTONES: (1) July 76 Intensive study at SBNF. (2) August 76 Extensive study at SBNF for correlation with Miller Index. (3) Sept. 76 Extensive study at Sequoia National Forest. (4) Jan. 77 Data summary and analysis completed. (5) March 77 Plan for next field studies. (6) July 77 Field studies resume.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective is the physical and chemical characterization and the atmospheric transformations of the hazardous trace elements, radionuclides, and sulfates emitted from the stacks of fossil-fueled electric power stations. The inhalation lung-deposition of these emissions will be estimated.
APPROACH: The approach is to carry out in situ particle-sizing and collection by simultaneously using in-stack and airborne downwind cascade impactors. Gases are collected using in-stack and airborne charcoal traps. The particles and gases are analyzed for bulk trace element using neutron activation analysis, x-ray fluorescence analysis, and atomic absorption. Particle sizes are determined by electron microscopy. Chemical speciation of sulfur is done by ESCA techniques.
RESULTS: (1) Particle-size distributions and emission rates of trace elements emitted from stacks of coal plants using electrostatic precipitator (ESP) and wet scrubber control systems. (2) Emission rates and size distribution of sulfur species from scrubbers and ESP's. (3) Emission rates and size distribution of radionuclides from scrubbers and ESP's. (4) Lung-deposition of trace elements, radionuclides, and sulfates.
PROJECT MILESTONES: June 1977 Progress Report for FY 1977.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Estuarine;GEOGRAPHIC AREAS/Site specific Any 300 x 300 km
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To develop a three-dimensional time dependent atmospheric boundary layer numerical

simulation model(s). Also to develop a three-dimensional time-dependent reactive plume model for the study of large point sources of reactive pollutants and their effect on the surrounding environment. The boundary layer model(s) will be used to investigate atmospheric behavior on a scale of 40,000 to 90,000 sq. km.
APPROACH: Studies of various numerical techniques are done first with one and two dimensional models to ascertain an appropriate numerical method for solving the system of equations. Then further studies are performed using one and two dimensional problems that contain more relevant physics. After the model(s) are verified against analytical solutions for certain closed problems now realistic verification studies are conducted using measured atmospheric parameters.
RESULTS: We expected to formulate numerical models that would be used to help assess energy alternatives and options that are required to meet the nation's energy needs while at the same time producing a minimal impact on the environment. These models can also be used to study the impact of placing controls on energy related emissions and their cost/benefit to society.
PROJECT MILESTONES: (1) A working model to study an urban boundary layer. (2) A three dimensional time dependent model for studying the boundary layer over an 80,000 sq km area. Effect of terrain is to be included. (3) A three dimensional time dependent model to investigate the transport, diffusion and chemical reactions of a large point source of pollutants. (4) To be able to use some of the above models for estimating pollutant concentrations in real-time.

PROJECT DESCRIPTION: The objective of the ARAC service is to provide real time predictions of the effects of atmospheric releases of hazardous materials as rapidly and accurately as possible. When implemented, the ARAC would provide advisories to support ERDA and designated sites in handling routine and accidental releases.
APPROACH: The technical basis for ARAC includes the present state-of-the-art of technology (sensing, monitoring, communications, data banking, data quality control), the utilization of existing or recently developed and validated atmospheric transport diffusion models, the use of evaluated dose conversion constants for various modes of exposure, and the availability of an advanced computer center.
RESULTS: The prototype phase ended in FY 1975 and the implementation phase, scheduled over a five year period, began in FY 1976. At the end of FY 1980 approximately 10 ERDA sites will be served 24 hours a day by ARHC.
PROJECT MILESTONES: (1) Jan. 30, 1976 3 sites (LLL, RFP and SRP) in operation in ''stand alone'' mode. (2) Dec. 31, 1976 Central facility, communication sites established. (3) Sept. 30, 1977 1 additional site on line. (4) Sept. 30, 1978 2 additional sites on line. (5) Sept. 30, 1979 2 additional sites on line.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: This investigation provides a basis for characterizing the rates and mechanisms of the various physical, chemical and biological processes that control the behavior of nuclear-related pollutants in the coastal environment.
APPROACH: Marine samples including water, sediment and biota are collected from specific environments and analyzed for radionuclides by a variety of radiochemical techniques. Transuranics are included among the radionuclides investigated.
RESULTS: The Humboldt Bay environmental radiological data are being assembled with consideration of the

objectives set out in Appendix I to 10 CFR Part 50 and in a series of guides acceptable to the NRC staff contained in Regulatory Guide I.EE, regarding the transport of routine releases of radionuclides in the liquid pathway. This effort will demonstrate how the research developed through ERDA support is directly applied to provide answers for the nuclear industry to comply with regulatory guidelines.
PROJECT MILESTONES: An interim report of our expected results described in Item 93C will be distributed by the end of the year.

BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Continental;GEOGRAPHIC AREAS/Global;COASTS/Far West;HYDROGRAPHIC AREAS/Other hydrographic areas Inland water
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) Definition of priority regional problems created by the development and use of energy. (2) Development of modeling and assessment technigues that can be used to evaluate regional-scale health and environmental impacts of future growth of energy-resource development. (3) Development of coordinated regional data bases which can be interfaced among different regions or among different uses within a region. (4) Assessment of regional energy-related problems. (5) Aid in the transfer of assessment data and results to federal, state, regional and local user.
APPROACH: Integrated assessment of the impact upon the environmental, health, social and economic sectors. This will require literature review, data coordination and identification of information and research needs and information transfer to user groups.
RESULTS: (A) Impact of increased coal utilization in California: (1) Related to ERDA National Coal Assessment; (2) Will be used by California State Energy Commission. (B) Relationship of Energy/Water in Califcrnia; this is a critical issue for any energy resource development in California and the far west in general. (1) Will be used in ERDA national scope energy supply/demand scenario. (2) Will be used by Califcrnia State Energy Commission.
PROJECT MILESTONES: Depending upon initiation of funding; the programs will begin in FY 1977 or FY 1978. Preliminary assessments and identifications of specific problem areas will be identified during the first year of funding; evaluation of these specific topics will begin within a framework of integrated assessment to evaluate the environmental, health, social and economic impacts associated with increased coal utilization and energy/water relationships in California.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Marine;GEOGRAPHIC AREAS/Site specific Marshall Islands;HYDROGRAPHIC AREAS/Other hydrographic areas Lagoon and ground water
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objectives of this study are (1) to develop recommendations to minimize the passage of radionuclides (emphasizing the transuranium elements) to human populations; (2) to evaluate the cycling of radionuclides through critical processes essential for the establishment and continuity of life at the atolls; (3) to provide a fundamental base of data from these contaminated environments which will be useful in predicting future transuranic impacts on the aquatic environment from different global sources such as reactors, reprocessing facilities and accidents; (4) to provide data and recommendations to assist cleanup and reconstruction at the atolls; (5) to recommend and assist in providing usable resources of ground water for future generations of the atoll.
APPROACH: Ground water and marine samples are collected and radiochemically analyzed for the transuranics and other specific radionuclides. The data are used to construct models of radionuclide fluxes and transport mechanisms in the environment.
RESULTS: The final product will be useable models to describe the cycling of the transuranics in the terrestrial-groundwater-marine environment.

PROJECT MILESTONES: (1) Several reports on the ground water quality and radionuclide inventory at Enewetak are in preparation and will be completed during this fiscal year. (2) Ground water and drinking water quality at Bikini will be reassessed during 1977. (3) Enewetak lagoon samples are being analyzed for transuranics and an extensive report on the levels, source terms and cycling these radioelement in the marine envircnment will be started in 1977.

ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Far West;COASTS/Far West;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Our objectives are to obtain data for radionuclides to predict their fate in marine ecosystems and their dose to man from the marine pathway. We are investigating under controlled laboratory conditions their transfer coefficients and concentration factors, their biotransformation in chemical reactions occurring in the sediment and water columns, and the critical pathway (food, water, sediment) in their accumulation in marine organisms.
APPROACH: Radionuclide transfer coefficients and concentration factors are investigated in large pool systems that contain critical compartments in marine ecosystems; the water is spiked with radionuclides and then changes in radioactivity are followed in serial samples of the compartments. Biotransformation products are tested to determine their effect on radionuclide availability. Radionuclide pathways to marine biota are investigated by exposing the organisms to differentially labeled food, water, and sediment.
RESULTS: Budget A. In our experiments on radionuclide availability we will use yellow substance, a biotransformation product isolated from local waters. For each radionuclide we will determine in seawater of known chemical composition the fraction that is ionic and chelated (bound to yellow substance) and the approximate molecular sizes of the chemical species present. In addition, the amount bound to yellow substance in the presence of measured quantities of inorganic particulates of known chemical composition will be assessed as well as the amount bound in the presence of measured quantities of specific phytoplankton species. This data on the effect of a biotransformation product on the partitioning of radionuclides among some of their most probable states in seawater in ecosystems and their availability to the marine biota will be studied.
PROJECT MILESTONES: (1) 10/1/76 Final report on the transfer coefficients and concentration factors of manganese and zinc in the marine clam Mya arenaria. (2) 2/1/77 Final report on accumulation of Ag, Cd, Co, Cr, Cs, Fe, Mn, and Zn by kelp, abalone, mussels, and blue rockfish. (3) 6/1/77 Final report on the effect of yellow substance on radionuclide availability.

PROJECT DESCRIPTION: The objective of this project is to develop methods of improving the sensitivity of detection methods used in assaying transuranium elements in the lung, to identify and resolve current weaknesses in calibration techniques, and to execute a program to intercalibrate the detector systems in use at ERDA-supported laboratories.
APPROACH: This program will be carried out with the guidance of an Intercalibration Committee, chaired by the principal investigator, and will involve the use of anthropomorphic phantoms, accidentally exposed personnel, and human calibration studies.
RESULTS: It is expected that this program will establish standard calibration procedures that can be easily applied at all participating laboratories, providing common absolute calibrations. This will permit meaningful intercomparisons of data obtained throughout the United States.
PROJECT MILESTONES: (1) Oct. 1, 1976 Complete construction of the first anthropomorpphic phantom designed for

use with low-energy photon emitters, specifically for the lung. (2) Jan. 1, 1978 Completion of first phantom intercalibration study. Beginning of human intercalibration program.

PROJECT DESCRIPTION: Evaluate the effects of an individual's occupational and recreational activities in altering his exposure to resuspended plutonium aerosols.
APPROACH: While performing simulated recreational and occupational activities, an individual's exposure to resuspended plutonium aerosols is measured using small battery-powered air samplers. Comparison is made to a reference concentration measured by a routine high-volume air sampler. Samples of clothing will also be assayed for plutonium contamination from the soil surface.
RESULTS: An evaluation of several ''personal'' pathways for the transfer of plutonium from soil to man.

PROJECT DESCRIPTION: (1) To make measurements that will delineate the rates of uptake, redistribution, and removal of radionuclides in the ecosystem, and to develop or refine the concentration factors for the critical radionuclides, especially for food species in order to improve predicted dose assessments to the returning population. (2) To develop further understanding of the terrestrial foodchains so as to derive guidelines for agricultural practices and for agricultural development such that population exposure via terrestrial foods will be minimized.
APPROACH: Test Plantings and Radionuclide Recycling. Test plots of coconut, pandanus fruit, breadfruit, squash, papaya, banana, watermelon, lime, and sweet potato have been established. The food products will be analyzed as they become available for direct estimates of radionuclides concentrations that potentially reach a resident population. Soil and soil-water nuclide concentration data will also be taken, and leaf samples will be analyzed for radionuclide content. All of these data will be used to improve predictive models to assess a potential dose commitment before a food product is readily available for consumption.
RESULTS: Reports in the uptake, cycling, retention times and concentration factors in the atoll environment for key food products. (2) Reports on update dose assessments. (3) These data will lead to better evaluation of potential rehabilitation time lines and long-term use of the atoll.
PROJECT MILESTONES: Reports during FY 1977 on initial results from annual crops and plants. Observation during FY 1978 of time dependence of radionuclide removal in annual crops and native plants.

PROJECT DESCRIPTION: (1) Accumulate baseline data on water quality in Imperial Valley, California. (2) Detect and evaluate any impacts of geothermal development on water quality. (3) Participate in evaluation of alternate heat sinks for geothermal power. (4) Participate in regional water resource analysis. (5) Explore ways that geothermal resources could be used to improve water quality in Imperial Valley.
APPROACH: These objectives will be accomplished by accumulating water quality data already available from many federal, California, and local agencies, collecting additional data specific to our needs, and integrating these data into an overall assessment. Water quality sampling networks will be established, and some locations will be instrumented with recording conductivity meters.
RESULTS: (1) Baseline data on water quality in Imperial Valley before geothermal development takes place will be collected and published. (2) The potential impacts on water quality will be assessed, and mitigation measures will be proposed if appropriate. (3) Various heat sink options will be studied and evaluated.
PROJECT MILESTONES: (1) 1977 Initiation of domestic well water monitoring. (2) 1977 Initiation of mobile laboratory studies. (3) 1977 Interpretation of data base begins. (4) 1977 Initiation of model construction using data base. (5) 1978 Completion of valley-wide sampling. (6) 1978 Development of water quality and water demand scenarios. CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The purpose of this program is to develop flow cytometry of isolated chromosomes to aid karyotyping, enumerate chromosomal aberrations and yield purified chromosomes for biochemical studies. Specifically we hope to rapidly and quantitatively screen human populations for inherited cytogenic anomalies, establish dose-effect relationships for aberrant chromosomes produced by exposure to environmental clastogens and miniaturize the biochemical assays for DNA and protein so that purified chromosomes can be examined at the molecular level for mutagen/clastogen induced lesions.
APPROACH: Initially the flow instrumentation and chromosome isolation procedures must be calibrated and standardized. This will involve developing a chromosome isolation procedure for human lymphocytes in culture and eventually for animal tissues extracted by biopsy. The sources of error (preparative and instrumental) must be identified. Initially dose-response effects will be sought for acute clastogen damage (initially radiation) with later application to protracted exposure. Chromosome preparative procedures and flow sorting instrumentation will be optimized to obtain chromosome fractions of high purity for further biochemical analysis. Animal systems (hamster) in vitro will be utilized initially but human chromosomes will be used whenever possible.
RESULTS: We hope to establish a rapid screening method for clastogen damage in human populations. Specifically this would require the withdrawal of a few milliliters of blood from individuals, short term culture of the lymphocytes, isolation of the chromosomes and flow cytometric analysis of DNA content. Abnormal chromosomes produced by clastogens would produce altered DNA distributions and could be further analyzed by flow sorting. It is estimated that 40-50 individuals could be processed and analyzed per day with optimized chromosome preparative and instrumental procedures.
PROJECT MILESTONES: (1) Attainment of a dose-effect relationship with animal test systems for acute clastogen damage July 1, 1977. (2) Collection of a large number of mitotic cells from human lymphocyte cultures Dec. 1, 1976. (3) Isolation of chromosomes from human lymphocytes preserving the DNA stainability. (4) Attainment of dose-effect relationships with human chromosomes exposed to clastogens, beyond FY 1977.

PROJECT DESCRIPTION: To provide baseline data and to examine the potential long-term effects of geothermal development in Imperial Valley on shoreline habitats, aquatics, agriculture, desert ecosystems, consumptive water-use, air pollution effects, and site-specific problems. The goal is to collect and preserve inorganic and organic materials for baseline reference data and to identify existing or potential stresses on ecosystems.
APPROACH: Seven research teams were organized to follow the above areas of focus to collect data and identify potential ecosystem stresses. Two developers of geothermal energy production sites and 10 outside agencies (universities, colleges, and government agencies) are collaborating in the field programs.
RESULTS: Baseline data banks against which future changes can be measured, publications and reports evaluating present environment of Imperial Valley and potential environmental changes likely to occur with geothermal development.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: This project provides funding support for the project leadership of the MAP3S program. The MAP3S goal over the next three years is to improve the understanding of temporal and spatial relationships between ambient levels and emissions from utilities in order to develop the capability to simulate more accurately the changes in pollutant concentration and nature, precipitation chemistry, and atmospheric behavior relevant to understanding and evaluating human health and ecological effects which could result from alternative strategies of generating power with fossil fuel in the northeastern United States.
APPROACH: The project director is to provide program leadership that will integrate the individual efforts of the ERDA National Laboratories and other contractors into a cohesive program.
RESULTS: The director will be responsible for formulating plans for the program and for an advisory committee, to be established directly under DBER auspices, and to provide responsive direction of the MAP3S project. The project director is to provide for the interface of this project with other related

studies and to represent this project to other agencies as required by DBER.
PROJECT MILESTONES: During 1977-78 a detailed program description document will be published together with quarterly newsletters. Plans will be finalized for major field experiments.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Measurement of baseline levels of H/sub 2/S, SO/sub 2/, O/sub 3/, CO/sub 2/, NH/sub 3/, NO/sub x/, and particulates in Imperial Valley. Measurement of source terms from geothermal facilities and other sources. Characterization of Imperial Valley's Atmospheric transport properties. Use of above data to predict effects of geothermal development on a valley-wide basis.
APPROACH: A network of six fixed-location air-quality and meteorological stations is being established in Imperial Valley. Source terms will be measured at stacks or evaluated through the use of a mobile air-quality laboratory. Existing air transport and pollutant conversion codes will be modified as necessary to perform the predictive calculations.
RESULTS: Baseline data on air quality in Imperial Valley before geothermal development takes place will be collected and published periodically. The potential impacts on air quality will be assessed, and mitigation measures will be proposed if appropriate. Actual impacts on air quality will be documented. Noise from geothermal operations will also be measured.
PROJECT MILESTONES: July 15, 1976 installation of six air-quality stations completed. September 30, 1976 mobile van operational. October 31, 1976 first quarterly data report.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Far West;GEOGRAPHIC AREAS/Site specific Imperial Valley
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To evaluate in a quantitative manner the impact upon man and the environment resulting from geothermal development in the Imperial Valley and to make this information available to other agencies, legislative bodies, and planning groups.
APPROACH: To accumulate data from existing sources and ongoing research programs and organize into a data management system for the purpose of conducting thorough and balanced analyses of the significant direct and indirect consequences or impacts of geothermal energy development in the Imperial Valley.
RESULTS: The project will result in a description of the Imperial Valley and the potential geothermal development within it. This data base will serve as a focal point for the development of alternative geothermal scenarios. Assessments of the environmental and socioeconomic impacts resulting from the various geothermal scenarios will be conducted. The results of these integrated assessments will be provided to the appropriate decision-making bodies to insure that geothermal developments in the Imperial Valley proceed on an environmentally sound basis.
PROJECT MILESTONES: (1) FY 1977 Imperial Valley description and geothermal scenario development. (2) FY 1978 Assessment of alternative water management schemes, impacts of gaseous pollutants on major agricultural crops and completion of an integrated assessment.

POLLUTANTS: NOXIOUS GAS (15%);METALS (5%);ORGANICS (80%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Northwest;GEOGRAPHIC AREAS/Site specific N.E. Wyoming;HYDROGRAPHIC AREAS/Other hydrographic areas Ground water
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECT
PROJECT DESCRIPTION: Part of this project is aimed at measuring and assessing the effects on ground-water quality that may be caused by the underground reaction products of in situ coal gasification. Additional objectives include the development of predictive capabilities, for large scale in situ coal gasification, and the identification of appropriate control technologies. Another part of this project is aimed at developing predictive capabilities and identifying control technologies appropriate for the ground movement and subsidence effects that will accompany large scale in situ coal gasification.
APPROACH: The ground-water qualities studies include water sampling and analysis (including GS-mass spec studies) before, during, and after in situ coal gasification experiments. Also included are laboratory ash-leaching and coal-sorption studies of reaction product contaminants. Computer modeling is used to predict the evolution of the contaminated plume of ground water. The subsidence studies involve the application and validation of a 3-D finite element computer code for subsidence prediction. The modeling studies will be enhanced by strength measurements of overburden cores, and by surface and subsurface geotechnical measurements in conjunction with in situ coal gasification experiments.
RESULTS: (1) A description of the nature and distribution of the underground contaminant source. (2) Information concerning the transport and sorption of the contaminants. (3) Data concerning the subsidence and ground movement that accompanies in situ coal gasification experiments. (4) A capability for computational prediction of ground-water contamination and subsidence effects that may result from in situ coal gasification. (5) An identification of appropriate technologies for controlling ground-water contamination and subsidence effects.
PROJECT MILESTONES: October, 1977: Annual Report, including: (1) A preliminary description of the underground contaminant source. (2) Preliminary subsidence and ground movement predictions. (3) A preliminary discussion of potential control technologies.

TECHNOLOGY: GEOTHERMAL/Hydrothermal (100%)
ENERGY CYCLE: EXTRACTION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This project has the objectives of documenting the naturally occurring levels of subsidence and seismicity in the Imperial Valley of California and of identifying any increase in these processes due to the development of geothermal resources. Included are development of criteria for distinguishing natural subsidence from induced movement and natural seismic activity from induced activity. A geological model of the Imperial Valley will be developed as well as a predictive model of potential subsidence due to geothermal production activity.
APPROACH: Subsidence detection is based upon precise leveling networks, surveyed to first- or second-order standards. Repeated surveys at intervals of one or two years will show any changes in elevation of points on the network, thus measuring land-surface elevation changes. A regional seismographic network and microseismic network will be utilized to determine baseline seismic activity in the Valley.
RESULTS: Baseline levels of subsidence and seismicity will allow for determination of whether or not new patterns develop after geothermal production begins.
PROJECT MILESTONES: (1) Resurvey of Imperial Valley subsidence detection network Winter 1977. (2) Installation of seismographic stations late Fall 1976. (3) Predictive model of the potential for induced subsidence 1978. (4) Construction of geological model of Imperial Valley; conclusion of project 1979.

ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: NOXIOUS GAS/Hcl (20%);PARTICULATES/Smoke (50%);RADIATION/Radioisotopes in smoke (30%)
CHARACTER OF STUDY: DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental;COASTS/Other coasts USA;HYDROGRAPHIC AREAS/Other hydrographic areas Surface waters
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: This project is directed towards devising efficient means for protecting HEPA (high-efficiency particulate air) filters and associated ductwork systems from the effects of heat and smoke particulates from fires. Excess heat will cause the filter to leak; smoke particles will plug the filter. Either can cause the release of toxic or radioactive materials into the atmosphere, since the filters are used to trap particulate matter which may escape from the work areas.
APPROACH: Employing a full scale fire test compartment, fires are set using various furnishings simulating actual fuel- and smoke-generating loadings, and their effects on heat damage and filter plugging determined. Heat abatement and smoke-scrubbing techniques are studied, and evaluated for their technical and cost effectiveness. Included in the studies is work aimed at mitigating the effects of a fire in one work area as related to a common exhaust plenum system serving several work areas.
RESULTS: (1) Recommended designs for heat abatement. (2) Recommended designs for smoke scrubbing. (3) Subsidiary recommendations re early fire warning and fire suppression methods.
PROJECT MILESTONES: (1) July 1, 1976 Complete activation and major instrumentation of full scale test facility. (2) Oct. 1, 1976 Complete assessment of filter plugging problem. (3) July 1, 1977 Complete evaluation of countermeasures. (5) Oct. 1, 1977 Start of experiments on plenum chamber. (6) Oct. 1, 1978 Interim report of cost effectiveness of various countermeasures.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Design guidelines are needed to provide safe design of ERDA facilities against potential seismic hazards. This study will assist ERDA to develop seismic design guidelines appropriate for both existing and new facilities being evaluated.
APPROACH: (1) Obtain and review all available seismic/tornado related information on all ERDA sites and critical locations. (2) Determine where potential problems and deficiencies exist. (3) Establish appropriate seismic/tornado design criteria. (4) Determine the adequacy of existing critical facilities.
PROJECT MILESTONES: Phase I-through October 1976: (1) Identification of actual seismic risk to each site. (2) Categorization of structures by risk levels. (3) Recommendation of appropriate methods of seismic analysis for each structural category and documented basis for such recommendations. (4) A more definitive overall Phase II. Phase II-Commences in 1977.

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Far West;GEOGRAPHIC AREAS/Northwest;COASTS/Gulf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this project is to determine the key environmental issues of inventory available environmental data, make an assessment of available environmental data, and determine what informational gaps exist in present environmental data at 10 known geothermal resource areas assigned high priority for energy development by the Department of Energy's Division of Geothermal Energy.
APPROACH: Some work is being done in-house by the Lawrence Livermore Laboratory (LLL). Part of the work is being contracted out to various university groups by LLL. Workshops are being held to gather information. Publications, reports and personal contacts provide further information.
RESULTS: The product of this project will be 10 plans (one for each of 10 KGRAs) describing the state of environmental information and knowledge at the KGRAs and making recommendations for needed studies and research.
PROJECT MILESTONES: 5/77 Initiation of subcontracts for St. Mary's College, University of California at Davis, United Oregon, University of Utah, University of Texas.
KEYWORDS: EMISSIONS;KGRA;ENVIRONMENTAL IMPACTS;DATA ACQUISITION;ENERGY SOURCE DEVELOPMENT;TRACE AMOUNTS;METALS;PLANTS;ANIMALS;NOISE;GROUND SUBSIDENCE;METEOROLOGY;SULFUR COMPOUNDS;WASTE WATER;PLUMES;GEOTHERMAL RESOURCES;GEOTHERMAL ENERGY

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: Identify environmental control technologies to be used in activities for which application is made for a geothermal loan guarantee. Assess these and other environment and safety concerns.
APPROACH: Review applications and environmental impact assessments and statements; as needed request supplemental information and site visits. Draw on appraisals of state-of-the-art of control technology and field experience with its use, in assessing effectiveness and practicability.
RESULTS: Reviews (comment) on demand of low guaranty applications.
PROJECT MILESTONES: Annual report distribution by fiscal years.
KEYWORDS: GEOTHERMAL ENERGY;ENVIRONMENTAL IMPACTS;SAFETY;LIQUID WASTES;AIR POLLUTION CONTROL;WATER POLLUTION CONTROL;LAND POLLUTION CONTROL;TECHNOLOGY ASSESSMENT;GOVERNMENT POLICIES;FINANCING;GROUND SUBSIDENCE;WASTE MANAGEMENT;SULFUR COMPOUNDS;SEISMIC EFFECTS;FINANCING

CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Southwest;COASTS/Northwest
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To provide identification and assessment of the efficacy and practicability of control measures to be employed by Government-sponsored geothermal energy programs in the Imperial Valley; and to provide a description of the IVEP control technologies for use in preparation of ERDA ER/EIS's for geothermal energy development in the Imperial Valley. A further objective is to confirm performance criteria of control technologies in the Imperial Valley.
APPROACH: (a) Search literature to avoid overlap with prior and ongoing assessments of environmental control

technologies. (b) Identify various environmental control technologies which were used, such as (1) water quality, (2) air quality, (3) subsidence/seismicity, and (4) integrated assessment. (c) The environmental control technologies will be assessed for engineering efficacy and practicability.
;ULTS: Identify and assess IVEP control technologies. Write a final report to include nonelectric and process heat systems in the Imperial Valley which may receive government sponsorship especially for the engineering efficacy and practicability.
PROJECT MILESTONES: Interim report on (b) and (c) (above) to be issued soon and a final report in 1978. An interim report on surveillance of IVEP control technology will be issued in 1978.
KEYWORDS: EFFLUENTS;INTEGRATED ASSESSMENT;IMPERIAL VALLEY;GEOTHERMAL ENERGY;ENERGY SOURCE DEVELOPMENT;ENVIRONMENTAL EFFECTS;TECHNOLOGY ASSESSMENT;WATER QUALITY;AIR QUALITY;GROUND SUBSIDENCE;SEISMOLOGY;POLLUTION CONTROL;PROCESS HEAT;ENVIRONMENTAL ENGINEERING

TECHNOLOGY: NUCLEAR/Fission (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (80%);WASTE MANAGEMENT (20%)
POLLUTANTS: RADIATION/Plutonium and Related Alpha Emitters (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The development of a highly sensitive transuranic aerosol measurement system (TAMS) with pseudo real-time response for measuring transuranic aerosols in stack and in ambient air for the nuclear fuel cycle.
APPROACH: The system utilizes high flow rate air sampling, alpha particle detection by a large surface area solid state detector array enclosed in an evacuated detection chamber which is isolated from the corrosive collection stream; special gating logic, and a decay analysis scheme to differentiate natural alpha-emitting radon daughters from transuranic alpha emitters. The monitor has two windows, one for 238Pu, 239Pu, 240Pu, 241Am and 243Am and the other for 242Cm and 244Cm.
RESULTS: A prototype system completely field tested and evaluated and ready for commercial production, capable of measuring one maximum premissible concentration (MPC-40-hr occupational) of plutonium in 30 minutes with a fractional standard deviation of less than 0.33.
PROJECT MILESTONES: (1) November 1977 Completion of first phase of field testing. (2) May 1978 Evaluation of initial field tests completed and retrofits completed. (3) June 1978 Initiation of final field testing. (4) September 1978 Completion of field tests. (5) May 1979 Completion of modifications indicated by field tests and transfer to commercial producers.

POLLUTANTS: RADIATION/Gamma rays (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To extend our knowledge of the long-term effects of continuous whole-body exposure to low levels of ionizing radiation by bridging the gap between the effects of dose, dose rate, and age at exposure. The results should allow an intelligent assessment and extrapolation to man.
APPROACH: This study utilizes mice exposed to gamma-ray sources at dose rates as low as 0.7 rad/day and total doses as low as 20 rads. Age at exposure is varied from newborn to 15 months. Exposure times vary from essentially prompt to being continuous over the animal's life span. In addition to the life-shortening analyses, radiation-induced chromosome aberrations are being observed, and histopathological examinations are being performed at death, with particular emphasis being placed upon carcinogenesis as the primary cause of demise.
RESULTS: We expect to obtain chromosomal changes in circulating blood that will be proportional to dose, leading to a quantification of low doses in man. Pathological findings should lead to evaluation of changes that occur in low-dose life-span shortening, including cancer production.
PROJECT MILESTONES: (1) FY 1976 Begin studies of dose rate, total dose, and age at exposure to cobalt-60 gamma rays. (2) FY 1977 Additional replications of same experiment. (3) FY 1978 Begin phasing out program and data analysis. (4) FY 1979 Data analysis and writing.

POLLUTANTS: PARTICULATES/Plutonium and other actinide oxides (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To evaluate the tumorigenic/carcinogenic risk of radioactive particles, particularly actinide oxides, in the lung, especially in comparison with the risk from diffuse distributions of comparable activity.
APPROACH: Animal model experiments in which Syrian hamsters are exposed to known levels of radioactivity in the lungs by administration of uniform microspheres which lodge in the lung capillary bed of solutions which expose the entire lung uniformly.
RESULTS: Dose-response curves for tumorigenesis by the several types of exposures; numerical values for the relative hazards; information on the mechanisms of action and reasons for differences; and confirmation or modification of maximum permissible exposure levels for inhalation of radioactive aerosols.
PROJECT MILESTONES: (1) FY 1976 qualitative demonstration of minimal exposure conditions for the induction of lung tumors by plutonium microspheres in the hamster. (2) FY 1978 dose-response curves for tumorigenesis by microspheres in rodent species. (3) FY 1979 and beyond, identification of reasons for different responses to focal vs. diffuse exposure and better extrapolations to man.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global;HYDROGRAPHIC AREAS/Continental shelf;HYDROGRAPHIC AREAS/Great Lakes
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine quantitatively the metabolic parameters of certain inorganic substances upon which information is lacking for establishing or revising health protection guidelines and standards.
APPROACH: Multiple species (mice, rats, dogs, and monkeys) are administered radionuclides by various routes. Organ distribution patterns and whole-body retention are quantitated for extrapolation to humans. Radioactive tracers are used not only to follow potential radioactive contaminants but also elements that may prove hazardous in nonradioactive form.
RESULTS: Metabolic patterns from interspecies comparisons are used to extrapolate to man for establishing radiation protection guides.

PROJECT MILESTONES: (1) FY 1976 begin phasing out of larger scale metabolism studies; data analysis and writing up of backlog. (2) FY 1977 reduce experimentation; data analysis; writing. (3) FY 1978 further reduce experimentation for phase-out; continue analysis and writing backlog.

CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To investigate the mechanisms controlling cell proliferation and conversion to the neoplastic state.
APPROACH: Examine biochemical processes which prepare cells for DNA replication and division in synchronized cultured cell systems; examine agents such as X rays which subvert natural processes.
RESULTS: A ''map'' of biochemical events will be constructed in which preparations for genome replication and cell division are shown to proceed through a complex series of coordinated, sequentially ordered steps.
PROJECT MILESTONES: (1) 7-1-75 Demonstration of cell-cycle-specific variations in chromatin structure. (2) 12-1-75 Demonstration of region and specific amino acid residue phosphorylated in histone f1 at different stages in the cell cycle. (3) 3-1-76 Proposal of correlation between cell-cycle-specific state of chromatin structure and specificity of association between dna-interactive drugs and the genome.

POLLUTANTS: RADIATION/Ionizing (100%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To describe the interrelationship between radiation-induced changes in chromatin metabolism (and structure) and the ability of the irradiated cell to perform specific metabolic functions.
APPROACH: Parameters to be examined include DNA replication and the effect of radiation on DNA replicon initiation and chain elongation; functional correlation between radiosensitive chromatin histone modification and DNA replication; the influence of radiation-induced alterations in histone modification on chromatin structure and cell morphology; and examination of the ability of the irradiated cell to perform specific synthetic functions as it undergoes the delayed transition from a rapidly dividing state to an arrested state (e.g., reproductive death) and the phase of the cell cycle in which arrest occurs.
RESULTS: It is anticipated that such studies will allow one to identify specific cellular lesions associated with reproductive death of the irradiated cell.
PROJECT MILESTONES: (1) FY 1976 Effects of ionizing radiations on deoxyribonucleoside triphosphate metabolism. (2) 10-1-76 Mechanisms of DNA replication and effects of x irradiation thereon. (3) 2-1-77 Cell-cycle distribution of cells at long times after irradiation and the phase at which cells undergo reproductive death.
KEYWORDS: IONIZING RADIATIONS;BIOLOGICAL RADIATION EFFECTS;ANIMAL CELLS;CELL CYCLE;METABOLISM;CELL KILLING;DNA;BIOSYNTHESIS;RNA;X RADIATION

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine whether, in an in vitro mammalian cell system free of the secondary stimuli

encountered in vivo, moderate doses of ionizing radiation cause alterations in the metabolism of informational macromolecules of a nature and to an extent that they could be determinants of the observed biological effects of radiation.
APPROACH: The studies have involved an analysis of the synthesis, processing, and function of RNAs in cultured Chinese hamster cells following exposure to 800 rads of x irradiation.
RESULTS: A definition of the biochemical sequelae to a radiation-induced lesion may be of value in assessing accurately the risk and in formulating protective mechanisms.
PROJECT MILESTONES: (1) 10-1-75 Demonstrated effect of ionizing radiation on messenger RNA metabolism. (2) 11-1-75 Began studies of synergistic effects of irradiation and toxic agents produced during fossil fuel processing.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To describe normal histone metabolism and the relationship between histone function and the toxicity of coal-based hazardous substances at the cellular and molecular levels.
APPROACH: Identification of coal technology by-products which interfere with cell proliferation will be initiated, with emphasis initially placed on the effects of cadmium and lanthanum on growth-related histone phosphorylation. These metals are known to be discharged into the environment as a result of coal-based technology, and they are known to interfere with calcium and cyclic-AMP metabolism involved with histone kinase activity, mitotic apparatus formation, and chromosome condensation.
RESULTS: These investigations are expected to determine the processes of damage from such trace metals and will provide a rational basis for designing procedures for amelioration and recovery from the deleterious effects of exposure to such pollutants.
PROJECT MILESTONES: (1) 10-1-76 Commence search for coal-based by-products relevant for investigation. (2) 4-1-77 Initiate dose-response studies of cell proliferation in cultures exposed to hazardous by-products of coal technology. (3) 10-1-77 Initiate studies of histone phosphorylation response to hazardous by-products of coal technology. (4) 10-1-78 Evaluate histone phosphorylation studies.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine how much lanthanum binds to the cell surface, whether this binding replaces the normal calcium pool of the cell surface, and to determine the consequences of cellular processes of such binding.
APPROACH: The experimental approach will use cultured cells as a model system and begin by quantifying binding per cell under conditions that do or do not affect cellular growth and metabolism of cell-surface constituents (matrix components such as glycoproteins and mucopolysaccharides).
RESULTS: The results hopefully will give insight into the pathogenesis of metal toxicity at the cellular (i.e., general) level of life processes.
PROJECT MILESTONES: (1) 1-10-76 Quantitation of cellular binding of lanthanum. (2) 1-10-77 Determine the effect of lanthanum binding on calcium pool of the cell surface. (3) 1-10-78 Determine the fate of lanthanum binding under nonlethal conditions.
KEYWORDS: EXTRACELLULAR MATRIX;METALS;BIOLOGICAL EFFECTS;ANIMAL CELLS;CELL WALL;LANTHANUM;TOXICITY;CALCIUM;METABOLISM;PATHOLOGICAL CHANGES

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To develop a precise correlation between chemical changes produced by gamma or x irradiation in nucleic acids and changes observable in their functioning in enzymatic replication, transcription, or repair processes.
APPROACH: Model DNAs whose nucleotide sequences are known are superior to naturally occurring DNAs in studies of this sort because unique results can be obtained, unhampered by the confusion of different nucleotide sequences present in natural material. Model DNAs (polydeoxynucleotides) are synthesized by established organic chemical and enzymatic procedures. Physical characteristics (melting transition, molecular-weight distribution) are established by mathhematical analysis of the results of experimental measurements utilizing computer codes developed in this Laboratory.
RESULTS: Because the sequences are unique, the fidelity of enzymatic transcription or replication processes is determined easily. Changes produced by irradiation on all properties are determined concurrently.
PROJECT MILESTONES: (1) 12-1-76 Anticipated completion of development of methodology for carrying out gel permeation chromatography of irradiated double-strand polynucleotides under denaturing conditions. (2) 12-1-77 Anticipated completion of comprehensive study of irradiated d(A,T)/sub n/ sequences (to include effects on transcription and repair processes).
KEYWORDS: POLYNUCLEOTIDES;GEL PERMEATION CHROMATOGRAPHY;DNA;BIOSYNTHESIS;RADIOSENSITIVITY;GAMMA RADIATION;X RADIATION;MUTAGENESIS;CARCINOGENESIS;BIOLOGICAL RADIATION EFFECTS;COMPUTER CODES;NUCLEOTIDES

CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Northwest;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This program is specifically directed toward repair of DNA damage caused by pollutants connected with coal extraction, processing, and combustion technology, but it will also be pertinent to pollutants associated with coal conversion and oil shale technologies.
APPROACH: The biological consequences of toxic agents which exert their effects because of interactions with DNA can be eliminated or modified if the DNA lesions are recognized by repair endonucleases and undergo subsequent enzymatic steps to remove the lesions and to fill in the excised DNA regions. A precise understanding of the enzymes involved in these repair systems will be required before the biological action of many of these agents will be understood. Purifying specific endonucleases from mammalian tissues depends on developing an assay which can detect damage-specific endonucleases in the presence of nonspecific endonucleases.
RESULTS: Terminal deoxynucleotidyl transferase has been purified from human sources. Following the same procedure, the enzyme was prepared from human leukemic cells supplied by Drs. David Baltimore and Patrick Kung of the Massachusetts Institute of Technology. Drs. Baltimore and Kung are attempting to produce antiserum against human terminal transferase and to develop a radioimmunoassay system for early detection of the enzyme in potential leukemia patients. We have also been supplying terminal transferase from calf thymus glands for recombinant DNA studies being pursued in various laboratories. We feel that the technology developed in recombinant DNA studies is a prerequisite for sequence mapping of isolated homogeneous populations of individual segments of DNA. This will allow the detection of genetic defects and genome mutation caused by ionizing radiation or aromatic hydrocarbons, and it also has the potential of providing a new method by which new, functionally defined sequence of genetic information can be introduced into mammalian cells.
PROJECT MILESTONES: (1) 4/5/76 Endonuclease II of Escherichia coli isolated and purified. (2) 5/3/76 Methylmethanesulfonate and other aromatic hydrocarbons or alkylating agents will be reacted with tritium-labeled d(A)/sub n/ . d(T)/sub n/, d(A-T)/sub n/, d(C)/sub n/ . d(G)/sub n/, and d(C-G)/sub n/ . d(C-G)/sub n/ to determine endonuclease II specificity. (3) 8/2/76 Purification of mammalian endonucleases facilitated by development of a method to measure enzyme activity specific for damage to DNA. (4) 10/4/76 Prepare tritium-labeled sectional block polymers or heteropolymers.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To identify aberrations induced in chromatin by selected energy-related chemical by-products, including alkylating and cyclic hydrocarbons, and to relate these lesions to structural and functional changes in mammalian chromatin.
APPROACH: Chromatin, purified nuclei, and cultured cells will be exposed to chemical agents of choice and utilizing various analytical methods of analysis (membrane filter assay, column chromatography, velocity and isopycnic centrifugal techniques, gel electrophoresis). The induction of various classes of lesions in chromatin, including addition-type products and intercomponent crosslinks, will be monitored.
RESULTS: Correlations between the frequency of specific types of lesions induced in chromatin and morphological changes in chromosomes and physiological changes in cells (transformation, death) will be made. Studies concerning the detection and biochemical analysis of repair mechanisms in cells which recognize and react with chromatin aberrations of concern will be initiated.
PROJECT MILESTONES: (1) FY 1977 This project is a continuing effort; however, during this year, we anticipate using various analytical methods we have developed to analyze chromatin, to quantify chemically induced aberrations in chromatin, and to examine cellular capacities to repair such lesions. (2) FY 1978 We anticipate continued studies in defining chromatin lesions induced both in vitro and in vivo and in defining biochemically repaired mechanisms.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To develop new preparative and staining methods compatible with analytical systems to provide protocols for quantitative immunofluorescence and fluorescent enzymatic assay, to be coupled with the DNA, protein, cell volume, and light-scatter methodology; to apply flow-systems techniques to study and assess potential biological hazards associated with energy production, particularly those associated with oil extraction from shale (including perturbation of cell growth and proliferation, hematopoietic and immunocompetence); and to apply the flow systems techniques to prescreening and diagnosis of human and animal diseases.
APPROACH: Flow-systems techniques have been used to determine cell proliferation patterns and chlorophyll content of algae, and multiangle light-scattering analysis was used to identify a number of algae types within a mixed population.
RESULTS: Studies completed to date have shown this new application of flow-systems technology to be a feasible approach for life-cycle analysis studies akin to those already performed on mammalian cells. Algae can be used as bio-indicators of freshwater and marine environments. Information relating to specific algae types and growth patterns is useful for determining the immediate and long-term effects of pollutants resulting from energy-related activities such as coal and oil shale extraction and utilization, as well as thermal conditions in various cooling-water systems.
PROJECT MILESTONES: (1) 3-1-77 Evaluate cell dispersal for solid tissues; RNA staining; develop toxicology assay method with WI38 cell line; characterization of model tumor systems. (2) 6-1-77 Environmental effects on the immune system (initial).
KEYWORDS: CYTOLOGY;MEASURING INSTRUMENTS;AUTOMATION;CELL CULTURES;TISSUES;NEOPLASMS;ANIMAL CELLS;BLOOD;DISEASES;DNA;ECOSYSTEMS;IMMUNOLOGY

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project will contribute to a better understanding of the relationships between chromosome damage and chromosome function.
APPROACH: New methodologies for assessing chromosome damage will be developed and utilized to gain new insights into the ultimate genetic consequences of induced chromosome aberrations. Chromosome analysis is and will continue to be an important monitor of cellular damage from external insults.
RESULTS: This project will attempt to quantitate the relationships between aberration rate and mutation rate and will result in more meaningful interpretations of data on population aberration analysis.
PROJECT MILESTONES: (1) 1-10-76 Evaluate methods for automated karyotype analysis. (2) 1-10-77 Analyze metaphase chromosomes from cells exposed to heavy metals. (3) 1-10-78 Analyze metaphase and interphase cells exposed to toxic energy-related materials as determined by ERDA.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To obtain quantitative information on the subcellular distribution of agents in treated cells; changes in chromatin organization induced by specific agents; growth-related changes in chromatin and, correspondingly, growth-related differences in susceptibility of chromatin to specific agents; localization of hazardous agents in specific chromatin subfractions; mode of interaction of an applied agent with cellular or nuclear targets and the nature of stable lesions produced by such interactions; reversibility or amelioration of measurable damage which would indicate the preexistence or induction of protective or repair mechanisms.
APPROACH: This program has previously developed methods for measuring growth-related changes in chromatin structure and is continuing to investigate the regulation of structural and functional organization of DNA in using a variety of probes (e.g., nucleases with different specificities and DNA-specific drugs and dyes).
RESULTS: The cultured cell systems employed in previous studies within this activity have afforded the opportunity to study growth-related processes at the cellular, subcellular, and molecular levels. This flexibility will provide an additional advantage in consideration of bioconversion mechanisms in the activation or inactivation of various hazardous substances and their consequent effects on specific subcellular or molecular targets.
PROJECT MILESTONES: (1) 10-1-77 Publication of report on studies of the cellular pathways for metabolism of Cd/sup 2+/ and subcellular fate of this heavy metal. (2) 1-1-78 Publication of report on studies on the molecular basis for cellular dysfunction attributable to Cd/sup 2+/ exposure.

PROJECT DESCRIPTION: To evaluate and apply the cell flow instrumentation to research problems in radiation biology and to study changes in age distribution of cells after exposure to low and high LET radiations.
APPROACH: Single cells from culture or from biopsies taken from rodents or dogs before and after a given treatment will be stained, and fluorescence and scattering measurements using cell flow instrumentation will be made. Basic radiobiology studies using alpha particles from plutonium will be conducted to improve our understanding on the sensitive sites of cells.
RESULTS: This work covers an important application of cell flow instrumentation to problems in radiobiology and provides basic information relevant to ongoing programs on hot particle and biomedical programs of negative pions and heavy ions.
PROJECT MILESTONES: (1) 3-1-77 Review of results regarding preparation of single-cell suspensions from tissues and scattering and fluorescence measurements to problems in radiation biology. (2) Continuing, work where the application is more effective.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project will establish statistically significant measurements of the base-line concentrations of environmental plutonium in the general population of geographic areas of interest to ERDA, monitor those areas where the base line has been established to determine if changes have occurred, measure the tissue distributions of plutonium in occupationally exposed workers, determine the particle size distribution of plutonium oxide aerosols in tissues of occupationally exposed workers, and evaluate the histological effects of deposited plutonium on the tissues of exposed workers.
APPROACH: Collect organs of interest from autopsies; record pertinent epidemiological information; analyze quantitatively for plutonium and normalize the results to a concentration value; statistically evaluate the distributions.
RESULTS: Plutonium tissue concentrations for inhabitants of various geographic areas are being determined. Median values for each tissue type will be indicative of base-line levels and will permit statistical comparisons between localities. Each area will be monitored for changes in the base line.
PROJECT MILESTONES: (1) 1-1-77 Statistically significant base lines of plutonium concentrations in general population identified for areas in Colorado, New Mexico, and Pennsylvania. (2) 1-6-77 Complete statistical

evaluation on effects of age, sex, area of residence, etc., on plutonium retention (general population). (3) 1-1-78 Identify particle size distribution and retention in lungs of plutonium in four or more occupationally exposed workers.

PROJECT DESCRIPTION: To determine the distribution, biological availability, and transport of plutonium and americium in industrial liquid waste disposal areas.
APPROACH: Permanent plots are sampled periodically to determine the concentrations and relative distribution of radionuclides in soils, plants, and animals.
RESULTS: The results will be applicable to evaluating environmental problems surrounding nuclear energy development.
PROJECT MILESTONES: 1-1-77 Publish six technical articles related to the project subject.
KEYWORDS: RADIOACTIVE MATERIALS;LIQUID WASTES;WASTE DISPOSAL;DISTRIBUTION;PLUTONIUM ISOTOPES;AMERICIUM ISOTOPES;SOILS;PLANTS;ANIMALS;NUCLEAR ENERGY;ENVIRONMENTAL EFFECTS;RADIOECOLOGICAL CONCENTRATION;CONTAMINATION;ENVIRONMENTAL TRANSPORT;RADIONUCLIDE MIGRATION

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To determine resuspension parameters, migration of deposited contaminants, and performance of air-cleaning procedures used in nuclear facilities against dense submicron particulates; provide aerosols for toxicology studies related to oil shale processing.
APPROACH: Parameters that govern the resuspension and migration of deposited contaminants with controlled experiments will be obtained utilizing a wind tunnel. These parameters will include (1) saltation rate in terms of mass and number flux, accelerated wind conditions, and surface roughness; (2) the performance of HEPA filters against submicron particles having densities comparable to particulates likely to be encountered in nuclear fuel processing and recovery facilities; and (3) generation and characterization of aerosols for inhalation toxicity studies of materials related to oil shale processing.
RESULTS: Initial studies are directed toward producing aerosols of raw and spent oil shales.
PROJECT MILESTONES: (1) 5-1-76 Generate reproducible aerosols of raw oil shale. (2) 7-1-77 Measure the vertical flux and resuspension rates of micron sized particles with saltating particles of 100 to 300 microns in diameter; measure HEPA filtration efficiency against submicron aerosols having densities varying up to approximately 18. (3) 3-1-78 Carry out resuspension measurements from surfaces of different roughness heights.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To accumulate data available on the biological and environmental behavior and the effects of the transuranic elements in order to answer specific questions and to allow analysis of potential hazards to health.
APPROACH: Many of the projects are undertaken to answer immediate problems of ERDA, while others are continuing studies of identified issues.
RESULTS: Current studies involve the derivation and justification of a limit to be used in burial of transuranic wastes, a study of the possible importance of plutonium in causing genetic changes, and derivation of methods for estimating costs of reactor accidents, with an emphasis on comparing light water reactors with the LMFBR.
PROJECT MILESTONES: (1) 8-1-76 Review of gonadal dose from plutonium. (2) 1-1-77 Draft of limits for transuranic waste burial.
KEYWORDS: PLUTONIUM;TRANSURANIUM ELEMENTS;PUBLIC HEALTH;DATA;HEALTH HAZARDS;ENVIRONMENTAL EFFECTS;RADIOACTIVE WASTES;LMFBR TYPE REACTORS;GENETIC EFFECTS;REACTOR ACCIDENTS;UNDERGROUND DISPOSAL;SAFETY;GENETIC RADIATION EFFECTS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To provide a sound ecological basis for rehabilitation of uranium mill tailings in the arid southwestern United States.
APPROACH: Obtain and evaluate ecological data relative to emissions, phytotoxicity, and alternative rehabilitation methodologies.
RESULTS: This study is designed to define the vegetative toxicological and ecological factors to be considered in establishing a program of rehabilitation and/or stabilization alternatives for the 21 inactive uranium mill sites. This will be accomplished by measurement of stable and radioactive elemental analysis of tailings, soils, biota, and surface waters during the initial phases of study. These data will then be evaluated from an ecological perspective to recommend a long-term rehabilitation protocol for each site studied. Several alternative measures are expected to apply to each site because of the diverse environmental situations represented by the 21 sites now available; the anticipated expansion of uranium mining and milling to support increased nuclear fuel-cycle activities will require research results that will apply broadly to management policies and aid in careful selection of priorities in long-range planning exercises.
PROJECT MILESTONES: (1) 12-1-76 Tailings pile characterized. (2) 10-1-77 Tailings pile emissions characterized. (3) 12-1-77 Data report on revegetation trials. (4) 6-1-78 Alternative rehabilitation measures evaluated. (5) 10-1-78 Rehabilitation protocol recommended.
KEYWORDS: URANIUM MINES;MILLING;RESIDUAL FUELS;DATA;EMISSION;ENVIRONMENTAL EFFECTS;LAND RECLAMATION;SPOIL BANKS;STABILIZATION;MANAGEMENT;URANIUM;TOXICITY;TERRESTRIAL ECOSYSTEMS;SOIL MECHANICS;SOIL CHEMISTRY;REVEGETATION;TECHNOLOGY ASSESSMENT;RADIONUCLIDE MIGRATION

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To document the major effects of terrain irregularities on the transport, dispersion, and deposition of effluents released to the air.
APPROACH: An integrated program of field experiments and modeling to identify the important physical mechanisms and incorporating them into an objective generic analysis scheme. Most of the major energy

production and related facilities are situated in areas where terrain variations play a vital role in the distributions and effects of airborne effluents. An integrated program of field experiments and modeling is pursued as the only viable method capable of identifying locally important physical mechanisms and incorporating the mechanisms into an objective generic analysis scheme.
SULTS: Transport and diffusion models and appropriate field data, including tracer studies, to evaluate and improve the models. The results should be generally applicable to a wide variety of locations.
PROJECT MILESTONES: (1) Late FY 1976 tracer experiments to document phenomenology. (2) FY 1977 initial model and experiment comparison tests. (3) FY 1978 model upgrade and expansion to larger areas.
KEYWORDS: TERRAIN;GASEOUS WASTES;AIR POLLUTION;DATA;FUNCTIONAL MODELS;DIFFUSION;METEOROLOGY;CLIMATES;AIR

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To monitor and evaluate the ecological consequences of the Trans-Alaska pipeline on the Alaskan north slope by the use of suitable indicator species of biota.
APPROACH: Basic biological studies of Arctic tundra nesting birds, small mammals, moose, caribou, and carnivores in the vicinity of the Trans-Alaska Oil pipeline. Special attention is being given to the dynamics of fox populations.
RESULTS: Ecological research that will describe the ecological consequences of Alaskan North Slope petroleum development in terms that will allow evaluation and possible mitigation of the environmental impact of resource developments.
PROJECT MILESTONES: 1976 initiation of radio telemetry study of tagged Arctic foxes. 1976 initiation of Caribou Range Forage Project. 1976 establishment of field camps at Prudhoe Bay, Franklin Bluffs, and Happy Valley study sites. 1976 second season of winter tagging of Arctic foxes. 1976 collection of samples and data on radionuclide cycling and transmission through the food web of the Anaktuvuk Pass region. 1976 initiation of moose study along the Colville River. 1977 evaluation of rabies epidemic on north slope. 1978 redirection of moose study toward evaluation of range extension. 1978 initiation of Colville River fox study. 1979 completion of second year of fox study on Colville River. 1979 conclusion of small mammal and bird studies at Prudhoe Bay. 1979 completion of caribou winter feeding selectivity studies.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT MILESTONES: Terminated FY 1978. Whole-body counting of Anaktuvuk Pass Eskimos will continue on a semiannual basis in order to document closely their dietary habits as they respond to the combined effects of social changes that result from increased petroleum resource developments in northern Alaska and the serious decline in the western Arctic caribou herd upon which they are dependent for a major food resource. Sampling of soil, lichens, caribou, and carnivores at Anaktuvuk Pass will continue to provide necessary samples to be analyzed for Sr-90, Cs-137, Po-210, Pb-210, transuranic elements, and neutron-activation products. Emphasis will be shifted to evaluation and documentation of ecological aspects of petroleum developments in the region utilizing the extensive data base of radionuclide concentrations and cultural information on the Anaktuvuk Pass people.

POLLUTANTS: RADIATION/Plutonium (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To study possible late deleterious effects of internally deposited plutonium in all current and terminated plutonium workers (2924) at Los Alamos using epidemiologic methods; to investigate the relationship between any medical effects that may be demonstrated and the magnitude of the body burden of plutonium.
APPROACH: The incidence of serious disease and causes of death will be determined in all persons with measurable body burdens of plutonium for comparison with similar medical findings in persons with very low body burdens and those with no exposure.
RESULTS: The results of this study will report comparative disease incidence between exposed groups and those with little or no exposure. The study will help ascertain whether any detectable long-term effects of plutonium are observable in these workers. Such data are considered essential to an improved understanding of the risk of plutonium exposure in humans.
PROJECT MILESTONES: (1) 3-1-77 Current report on 26 Manhattan Project plutonium workers; roster of LASL workers for study completed. (2) 10-1-77 Tracing of morbidity subjects continues; first survey of mortality completed; project transferred to national epidemiology study (LASL F111).

PROJECT DESCRIPTION: To evaluate the interactions of pollutants connected with coal extraction, processing, and combustion with DNA. These studies will also be relevant to the coal conversion and oil shale technologies.
APPROACH: Using the defined model DNAs we have prepared and activated intermediates of selected pollutants, we will determine which intermediates and which pollutants interact with DNA, what the effect is on the physical-chemical properties of the DNA, what exact chemical sites are attacked, what the dose-response relationships are, and what sequence effects are evident. Other parallel studies will evaluate the effects of such interactions on the fidelity with which DNA is copied by nucleic acid polymerases (mutagenesis) and evaluate which lesions are recognized by DNA repair enzymes.
RESULTS: We propose to investigate how pollutant-DNA interactions are influenced by several factors, including the presence of chromatin proteins, and how interactions at one DNA site influence properties of other DNA regions. Results of this work will be important in evaluation of the dangers of different pollutants and in determination of which types of damage might be repaired.
PROJECT MILESTONES: (1) 8-1-76 Complete literature search and decide which pollutants to use in initial experiments. (2) 10-1-76 Begin synthesis of required activated intermediates. (3) 11-1-76 Begin studies of interaction of pollutants and DNA, conduct dose-response studies, chemico-physical analysis. (4) 11-1-77 Reevaluate program to decide upon most productive future approaches.

CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Freshwater
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To pursue a genetic approach to analyzing the eucaryotic cell life cycle and to use in vitro genetic systems to assess mutagenicity of classes of compounds derived from the coal gasification process.
APPROACH: Conditional-lethal, temperature-sensitive, life-cycle mutants in mutagenized cultures of the hamster cell line CHO have been derived. A collection of mutants will be phenotypically characterized for temperature-sensitive blocks in life-cycle traverse using flow microfluorometry. Genotypic characterization will involve cell-to-cell hybridization to determine if mutations affecting specific phases of the life cycle are complementary and recessive or dominant. The temperature-sensitive collection will be used to assess the potential mutagenicity of by-products of coal gasification.
RESULTS: In addition to genetic analysis of the eucaryotic cell life cycle, this program includes a very promising project using cell-membrane mutants to elucidate the biochemistry of cell-to-substratum attachment. Results of this collaborative effort suggest that one of the complex carbohydrates, hyaluronic acid (HA), acts as a modulator of cell-to-substratum adhesion. A mutant unable to synthesize HA exhibits resistance to substratum detachment with trypsin or EDTA, while a mutant with excess HA is very readily detached.
PROJECT MILESTONES: (1) 11-1-76 Phenotypic characterization of temperature-sensitive life-cycle mutants of CHO cells. (2) 2-1-77 Usable in vitro mutagen-activation system of hamster embryo cells. (3) 9-1-77 Genotypic analysis of life-cycle mutants; establish reversion frequencies of temperature-sensitive mutants on activation system. (4) 5-1-78 Classes of potential mutagens assessed as inducing stable genetic revertants. (5) 9-30-78 Coal gasification by-products classed as mutagens or nonmutagens.

77 FUNDING: Energy Research and Development Administration FY77:$150,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (70%);FULL SCALE DEMONSTRATION (30%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To synthesize compounds labeled with stable isotopes so that they are available to various ERDA investigators.
APPROACH: Projects within this group are the use of stable isotopes as probes for elucidating the mode of action of carcinogens and the assessment of effects of energy-related pollutants on enzymes.

RESULTS: A National Stable Isotopes Resource has been established at Los Alamos by the National Institutes of Health.
PROJECT MILESTONES: FY 1977 initial studies of carcinogenic metabolites and effects of pollutants on enzymes.
EYWORDS: STABLE ISOTOPES;LABELLED COMPOUNDS;TRACER TECHNIQUES;ECOLOGY;ENVIRONMENT;CARCINOGENS;ENZYMES;CARBON 13;NITROGEN 15;SYNTHESIS

TITLE: Epidemiologic Study of Plutonium Workers
PROJECT NUMBER: 001879
PRINCIPAL INVESTIGATOR: Voelz, G.L.
ADDRESS: Health Division (MS690), Los Alamos, NM 87545
AFFILIATION: Los Alamos Scientific Lab., N.Mex. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Weyzen, W.W.
TELEPHONE: F233-3631
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$195,000
TECHNOLOGY: NUCLEAR/General (50%);NUCLEAR/Fission Converters;NUCLEAR/Fission Breeders (50%)
ENERGY CYCLE: PROCESSING, CONVERSION (90%);WASTE MANAGEMENT (10%)
POLLUTANTS: RADIATION/Plutonium (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To study possible late deleterious effects of internally deposited plutonium in all current and terminated plutonium workers in ERDA-contractor plants in this country using epidemiologic methods. The incidence of serious disease and the causes of death will be determined in all persons with measurable body burdens of plutonium for comparison with similar medical findings in persons with very low body burdens and with no exposure. To investigate the relationship between any medical effects that may be demonstrated and the magnitude of the body burden of plutonium.
APPROACH: Persons to be studied will first be selected from contractor health physics and personnel records. The study will ultimately involve about 16,000 subjects, of which about 7200 have had detectable plutonium depositions. The others will serve as controls. This list of persons will be surveyed periodically for causes of mortality. A subset of about 5000 persons will also be surveyed annually with questionnaires in a prospective morbidity study.
RESULTS: Reports will compare the disease incidence and mortality between exposed groups and little and no exposure groups. The study will help ascertain whether any detectable long-term effects of plutonium are observable in these workers.
PROJECT MILESTONES: (1) 6-1-77 Initial data processing systems design operational. (2) 10-1-77 Initial morbidity data collection completed; selection of Rocky Flats study subjects completed. (3) 3-1-78 Selection of subjects at all ERDA plants completed. (4) 7-1-78 First mortality check on all subjects initiated.

ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: PARTICULATES (40%);ORGANICS (20%);RADIATION (40%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (75%);FULL SCALE DEMONSTRATION (25%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Stratospheric monitoring, modeling, and atmospheric transport studies using radionuclide and chemical analysis as basic tools for investigation.
APPROACH: Whole-air and particulate samples are collected by an aircraft flying in the lower stratosphere. These samples are analyzed to determine the fate of selected radionuclides and certain nonactive atmospheric chemical constituents. These substances collected, in general, are man-made in origin; however, they do react and interact with the natural atmospheric component.
RESULTS: The immediate end results of this portion of the Airstream program are to supervise the sample collection activities while obtaining satisfactory samples for subsequent analysis.
PROJECT MILESTONES: Milestones are established for each sample collection period. Typically, the sampling periods are established during each April, July, and October.
KEYWORDS: STRATOSPHERE;AIR POLLUTION;AEROSOL MONITORING;EARTH ATMOSPHERE;RADIONUCLIDE MIGRATION;ENVIRONMENTAL TRANSPORT;CHEMICAL EFFLUENTS;RADIOACTIVE EFFLUENTS;WEATHER;RADIOISOTOPES;TRACER TECHNIQUES;SAMPLING

TITLE: Ecological Investigation of Dry Geothermal Energy Demonstration
PROJECT NUMBER: 002153
PRINCIPAL INVESTIGATOR: Rea, K.H.
ADDRESS: Environmental Studies Group (MS490), Los Alamos, NM 87545
AFFILIATION: Los Alamos Scientific Lab., N.Mex. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Haugh, John R.
TELEPHONE: F233-4905
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$140,000
TECHNOLOGY: GEOTHERMAL/Hot dry rock (100%)

ENERGY CYCLE: EXTRACTION (80%);ELECTRICITY GENERATION (20%)
POLLUTANTS: NOXIOUS GAS (5%);PARTICULATES (20%);HEAT, THERMAL (50%);VISUAL AESTHETICS (25%)
CHARACTER OF STUDY: RESEARCH/Applied (40%);DEVELOPMENT/Pilot plant (40%);FULL SCALE DEMONSTRATION (20%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To establish biotic and abiotic inventories; identify key ecosystem components; and study the environmental consequences of off-site effluents.
APPROACH: Seasonally sample the various communities and identify any agents responsible for community change and identify the mechanisms by which they operate.
RESULTS: Results of this investigation will lead to refined procedures for the mitigation of ecological imports due to development of hot, dry-rock geothermal resources. Many questions regarding the bioenvironmental consequences of such installations will be answered, and comparisons will be able to be made between the ecological impacts of this and other energy-producing systems.
PROJECT MILESTONES: (1) 9-1-76 First integrated report of flora, fauna, and climatological parameters. (2) 9-1-77 First predictions as to rates of change. (3) 5-1-78 Implementation of fully automated weather monitoring equipment.

TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$100,000
TECHNOLOGY: FOSSIL FUEL/General (30%);NUCLEAR/General (35%);NUCLEAR/Fission (35%)
POLLUTANTS: NOXIOUS GAS (25%);PARTICULATES (75%)
CHARACTER OF STUDY: RESEARCH/Applied (75%);DEVELOPMENT/Laboratory scale (25%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To evaluate on request of ERDA, DOS, non-NIOSH approved respiratory equipment, determine efficiency of equipment, and recommend continued use or suspension of use of the equipment; and determine the effect of respirators on human physiology during respirator use.
APPROACH: Review and test ERDA-contractor respiratory equipment and physiologically monitor persons wearing respirators.
RESULTS: Respiratory equipment used by ERDA to be NIOSH-approved or equivalent. Medical criteria for evaluation of respirator users to be developed.
PROJECT MILESTONES: (1) 10-1-76 Initiate tests on ERDA contractor respirators; plan for stress testing with air purifying respirators. (2) 11-1-76 Submit medical protocol, recruit subjects, and perform physicals. (3) 1-1-77 Send report to LASL Respirator Advisory Committee; initiate tests on second ERDA contractor

respirator. (4) 2-1-77 Begin stress testing. (5) 8-1-77 Finish testing. (6) 9-1-77 Write report. (7) 4-1-77 Advisory Committee meeting regarding respirator test reports. (8) 6-1-77 Advise DSSC of committee decisions; initiate tests on third ERDA contractor respirator. (9) 9-1-77 Send results to committee.

TECHNOLOGY: FOSSIL FUEL/General (25%);NUCLEAR/General (35%);NUCLEAR/Fission (40%)
ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: METALS (10%);PARTICULATES (90%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (85%);DEVELOPMENT/Laboratory scale (15%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To evaluate air sampling procedures utilized in plutonium work areas; to develop air sampling strategies that provide the best estimate of worker exposure at a reasonable cost; to develop sampling procedures for plutonium that provide estimates of particle size and solubility; and to develop a course in air sampling methods for persons responsible for ensuring healthful work environments in ERDA facilities.
APPROACH: Determine correlations between air sampling data and bioassay data; evaluate current air sampling procedures and determine validity of current procedures for determination of inhalation hazards; and develop and evaluate air sampling instruments for determination of particle size and solubility.
RESULTS: Provide instrumentation and procedures that give reasonable estimates of inhalation hazards in work areas with potential releases of radioactive particulates.
PROJECT MILESTONES: (1) 6-1-76 Complete study of ventilated patterns in plutonium areas. (2) 12-1-76 Relate plutonium solubility to particle size. (3) 9-1-77 Develop recommended sampling strategies. (4) 6-1-78 Develop criteria for central sampling systems. (5) Continuing aerosol training.

ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: PARTICULATES (100%)
CHARACTER OF STUDY: RESEARCH/Applied (20%);DEVELOPMENT/Laboratory scale (80%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To establish the capability of predicting the air flow in the ventilation system of a plutonium reprocessing facility due to tornado accident conditions.
APPROACH: Existing analytical methods of determining flow of air through ventilation system components will be utilized in development of a computer code.
RESULTS: A suitably accurate computer code for flow prediction will be available to the user so that the effects of tornado depressurization upon the ventilation system can be evaluated.
PROJECT MILESTONES: (1) 3-1-75 Interim Report, Los Alamos Scientific Laboratory LA-5894-PR. (2) 11-1-75 Interim Report, Los Alamos Scientific Laboratory LA-6120-PR. (3) 4-1-76 Interim Report, Los Alamos Scientific Laboratory LA-6293-PR.

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY

PROJECT DESCRIPTION: To derive methods for obtaining rational limits for radioactive contamination on or in property to be disposed of to the public.
APPROACH: Derivation and justification of a guide for U and Ra in soils of land to be returned to the public and the study of a rational method for deriving guides for surface contamination of items to be released to the public.
RESULTS: Guidelines for U and Ra in soils. Continued effort on methodology for assessing risk from surface contamination.
PROJECT MILESTONES: FY77, review literature on Ra and U.
KEYWORDS: RADIOACTIVITY;CONTAMINATION;PUBLIC HEALTH;URANIUM;RADON;SOILS;INGESTION;INHALATION

<084068>
TITLE: Plutonium-Induced Mutation Frequency in Mammalian Cells
PROJECT NUMBER: 2438
PRINCIPAL INVESTIGATOR: Barnhart, B.J.
ADDRESS: Los Alamos Scientific Laboratory, Los Alamos, NM 87545
AFFILIATION: Los Alamos Scientific Lab., N.Mex. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
77 FUNDING: Energy Research and Development Administration FY77:$50,000
TECHNOLOGY: NUCLEAR/Fission Breeders (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Somatic cell mutagenesis provides the basis for a relatively short-term (16- to 26-day) assessment of the mutagenic activity of physical and chemical agents. The availability of a simple, clean, and easy source of high LET radiation (i.e., plutonium alpha particles) developed at LASL permits the irradiation of large numbers of mammalian cells in culture.
