POLLUTANTS: RADIATION/Gamma;RADIATION/Neutron (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Japan
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To establish reliable radiation dose estimates for the A-bomb exposed survivors of Hiroshima and Nagasaki. Studies include exposure to atomic bomb radiation, other possible radiation contaminants, and to medical and dental radiation procedures.
APPROACH: Radiation dose is estimated from (1) the spatial distribution of gamma and neutron radiation at the times of the bombs, (2) calculations of dose and linear energy transfer inside anthropomorphic phantoms exposed to model radiation fields, (3) subject exposure to fission products deposited by fallout, (4) subject exposure to induced radiation, and (5) subject exposure to medical diagnostic and therapeutic radiation.
RESULTS: Results: (1) Dose response curves for leukemia and chromosome aberration have been constructed for the Hiroshima and Nagasaki exposed populations March 31, 1977; and (2) calculations of tissue dose for specific organ sites will be made March 31, 1977.
PROJECT MILESTONES: A prospective survey of medical and dental x-ray examinations in representative Hiroshima and Nagasaki hospitals will be completed September 30, 1978.
KEYWORDS: GAMMA RADIATION;NEUTRONS;DOSIMETRY;EPIDEMIOLOGY;MAN;A-BOMB SURVIVORS;RADIATION DOSES

POLLUTANTS: RADIATION/Gamma;RADIATION/Neutrons (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Japan
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine whether or not there are any measurable genetic effects in children born of A-bomb exposed parents in Hiroshima and Nagasaki.
APPROACH: Surveys are conducted of children from parents who were proximally exposed, distally exposed and non-exposed. Four different areas of effects are being looked at: (1) mortality, (2) cytogenetics, genetics, and (3) growth and development.
RESULTS: Mortality survey and cytogenetics survey--no clearly significant effect of parental exposure on survival of the children or frequency in chromosome anomalies has been seen. The study of growth and development of high school students has been completed and a report on stature is under final review.
PROJECT MILESTONES: (1) An analysis of the mortality data will be made, updating the previous report to 1976, Sept. 30, 1978. (2) Increase the genetics sampling rate up to full laboratory capacity of 400 per month from the current level of 250 per month, Sept. 30, 1978.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Japan
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Determination of possible late radiation effects on the lifespan of A-bomb survivors.
APPROACH: Biennial medical examinations of heavily exposed survivors in both cities, autopsies, pathological studies and examination of death certificates are used to determine types of illnesses and abnormalities which have occurred as a consequence of exposure to ionizing radiation.
RESULTS: The 8th mortality report has been completed and indicated that the relasionship between dose and cancer, other than leukemia, especially lung cancer and breast cancer, is stronger than previously reported. Pathology studies of breast cancer, brain tumors and Hashimoto's thyroiditis were completed.
PROJECT MILESTONES: Complete an intensive analysis of the results of early cancer testing, Sept. 30, 1979.
KEYWORDS: HUMAN POPULATIONS;BIOLOGICAL RADIATION EFFECTS;GAMMA RADIATION;NEUTRONS;MORTALITY;LIFE CYCLE;LIFE SPAN;EPIDEMIOLOGY;JAPAN;MEDICAL SURVEILLANCE;A-BOMB SURVIVORS;RADIATION EFFECTS;DISEASES;MEDICINE

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Japan
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine whether there are specific diseases, processes or physiologic phenomena related to A-bomb survivors.
APPROACH: Tumor and tissue registries are active in Hiroshima and Nagasaki. A-bomb survivors are examined for ophthalmologic effects, immunologic competence, and chromosomal aberrations. Prospective epidemiological study of coronary heart diseases and stroke in a migrant Japanese population in Hawaii and California.
RESULTS: Several thousands of A-bomb survivors have been studied for the presence of chromosomal aberrations in their peripheral lymphocytes. These studies have shown a strong relationship between dose and the presence of aberrations. These individuals will continue to be watched closely for the development of neoplastic disease.
PROJECT MILESTONES: Complete studies of ophthalmologic effects in A-bomb-exposed individuals, Sept. 30, 1978.
KEYWORDS: METABOLISM;PHYSIOLOGY;DISEASES;EPIDEMIOLOGY;NUCLEAR MEDICINE;GAMMA RADIATION;NUCLEAR ENERGY;HEALTH HAZARDS;NUCLEAR WEAPONS;NUCLEAR EXPLOSIONS;NEUTRONS;BIOLOGICAL RADIATION EFFECTS;HUMAN POPULATIONS;MEDICAL SURVEILLANCE;JAPAN;PATHOLOGICAL CHANGES;DELAYED RADIATION EFFECTS;A-BOMB SURVIVORS

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION/Gamma;RADIATION/Neutrons (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Japan
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Definition of radiation related factors for various specific cancer sites.
APPROACH: As radiation related tumors are identified in A-bomb survivors, they are subjected to intensive studies to confirm or disprove the radiation effects.
RESULTS: Radiation relationships have been established for cancers of the breast, thyroid, lung and stomach. Differences in the dose response curves for leukemia incidence in Hiroshima and Nagasaki suggests a much greater leukemogenic effect for neutrons than for gammas. Preliminary reports have been prepared on aplastic anemia, multiple myeloma and the development of leukemia in women treated for breast cancer.
PROJECT MILESTONES: (1) Summary of the results of the study of tumor development in exposed children, Sept. 30, 1978. (2) Complete a retrospective study of A-bomb exposed survivors to study the relationship between cancer frequency by histological type and A-bomb radiation dose, and relationship between liver cancer and liver cirrhosis.
KEYWORDS: HUMAN POPULATIONS;DELAYED RADIATION EFFECTS;HIROSHIMA;BIOLOGICAL RADIATION EFFECTS;NUCLEAR ENERGY;HEALTH HAZARDS;A-BOMB SURVIVORS;NUCLEAR EXPLOSIONS;NUCLEAR WEAPONS;NEOPLASMS;NAGASAKI;MEDICAL SURVEILLANCE;PATHOLOGICAL CHANGES

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Japan
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The purpose of the biochemical variability study is to search for variants in the protein systems among the children of the exposed and nonexposed, to determine whether exposure has resulted in an increase in mutations measurable at the biochemical level in offspring.
APPROACH: Conduct laboratory studies to detect biochemical variability in a number of enzyme and protein systems in the red blood cells and cerum.
RESULTS: The number of samples being processed and studied for biochemical variance has been expanded to the present laboratory capacity of around 250 per month.
PROJECT MILESTONES: (1) A preliminary analysis of the data collected will be completed Sept. 30, 1979.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Marine;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objective of these projects is to document the deposition rate and accumulation of initially airborne particles on the surface of the earth. This information is used to develop mechanisms and models for predicting contamination patterns following a release of radioactive debris to the atmosphere.
APPROACH: The monthly strontium-90 fallout rate is measured by sampling total deposition at 100 land stations using high-walled stainless steel pots or funnel-ion exchange column collectors. Soils are collected in selected geographical areas for determining the lateral and vertical distribution of natural and artificial radionuclides. Wet and dry fallout are sampled on a monthly basis at a regional station 35 miles due west of lower Manhattan, and at two remote baseline stations, Mauna Loa, Hawaii and American Samoa.
RESULTS: The distribution of strontium-90 fallout and the annual inventory is obtained based on the monthly samples received from the global network stations. Soil sampling and analysis provide data on the effects of topography and climatology on the cumulative deposition of radioactive particulates. The information can be applied to models for predicting the long-term behavior of nuclides in the environment. Separating wet and dry fallout provides information on the source of various nuclides.

TELEPHONE: F660-3616
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$284,000
TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The HASL Surface Air Sampling Program provides data on the latitudinal distribution of nuclear weapons debris, arrival times of fresh debris, and transfer of this debris between hemispheres. These radionuclide concentrations in surface air are related to measurements of deposition on the earth's surface. Lesser efforts are devoted to releases from nuclear facilities.
APPROACH: Particulates in surface air are sampled continuously on Microsorban filters at about twenty sites covering the latitude spread from 77 degrees N to the South Pole. The samples are combined into monthly

composites and split; half for non-destructive assay by germanium diode gamma spectrometry and half for radiochemical analysis. The routine program involves analyses for beryllium-7, strontium-90, zirconium-95, cesium-137, cerium-144, lead-210 and plutonium-239. Air concentrations and dispersion of plutonium-239 in the vicinity of Rocky Flats, Colo. are being observed on a routine basis at three downwind locations from the plant.
RESULTS: The surface air sampling network covers a wide geographical latitude and provides an early indicator of fresh nuclear test debris and delineates the tropospheric dispersion of radioactivity from French and Chinese nuclear tests. Air concentrations of plutonium at Rocky Flats are being related to wind statistics and accumulated disposition measurements for studying the phenomena of resuspension and redepcsition.

TITLE: Radioactivity in Stratospheric Air
PROJECT NUMBER: 000530
PRINCIPAL INVESTIGATOR: Hardy, E.P. Jr.
ADDRESS: 376 Hudson Street, New York, NY 10014
AFFILIATION: Energy Research and Development Administration, New York (USA). Health and Safety Lab.
MONITORING AGENCY: Energy Research and Development Administration, New York (USA). Health and Safety Lab.
DIVISION: Health and Safety Laboratory
MONITOR: Harley, John H.
TELEPHONE: F660-3616
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$291,000
TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objectives of this program are: to document the concentrations of radioactivity in the stratosphere as a function of latitude, altitude and season; to compute stratospheric burdens of critical tracers; to develop and test stratospheric transport models; and to provide basic data for other scientific programs in studying the ultimate deposition of these tracers in the environment.
APPROACH: This program is comprised of two separate projects: the High Altitude Balloon Sampling Program and Project Airstream involving aircraft sampling. The balloon program provides samples from 20 to 27 km at 65 degrees N, 33 degrees N and 9 degrees N several times a year. The aircraft sampling extends from 75 degrees N to 10 degrees S in the western hemisphere and ranges in altitude from 12 to 19 km. At least three aircraft missions are flown per year. The filters are analyzed for long-lived fission products, plutonium isotopes and radon daughter products.
RESULTS: The fission product data reflect the patterns of recent atmospheric nuclear weapons testing. The plutonium mass isotopic composition aids in characterizing the stratospheric debris. Lead and polonium-210 in the stratosphere are natural tracers of tropospheric origin and are useful in assessing the extent of stratosphere-troposphere interchange.
KEYWORDS: RADIOACTIVITY;STRATOSPHERE;AIR POLLUTION;MATHEMATICAL MODELS;DIFFUSION;TRACER TECHNIQUES;RADIATION MONITORING;AERIAL MONITORING;AEROSOLS;FISSION PRODUCTS;PLUTONIUM ISOTOPES;DAUGHTER PRODUCTS;LEAD;POLONIUM 210

TITLE: Evaluation and Development of Sampling Systems
PROJECT NUMBER: 002481
PRINCIPAL INVESTIGATOR: Breslin, A.J.
ADDRESS: 376 Hudson Street, New York, NY 10014
AFFILIATION: Energy Research and Development Administration, New York (USA). Health and Safety Lab.
MONITORING AGENCY: Energy Research and Development Administration, New York (USA). Health and Safety Lab.
DIVISION: Health and Safety Laboratory
MONITOR: Harley, John H.
TELEPHONE: F660-3616
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$111,000
TECHNOLOGY: FOSSIL FUEL/General (75%);GEOTHERMAL/General (25%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Aerosols (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Methods are sought to improve air sampling sensitivity for particulates in very low concentrations, such as tropospheric background aerosols, stratospheric aerosols, and for trace constituents in urban and industrial areas. Substantially better sensitivity than presently available is required fcr measuring the concentrations of substances that may be hazardous even in low concentrations and for determining baseline concentrations of various atmospheric constituents.
APPROACH: Means are developed to improve sample air volume, collection efficiency, background of the collection medium, and contamination or loss of sample during handling subsequent to collection individually and on an integrated basis to produce optimized sampling systems. Existing sampling systems are examined for possible adaption to meet ERDA's specific needs.
RESULTS: A current study of filter loading phenomena should yield information on increase of resistance of a variety of commonly used sample filters under typical conditions of environmental monitoring. This will be useful in selecting filters for specific monitoring applications. A study on electrically-augmented particle collection in fibrous filters may enable the collection efficiency of inherently low-efficiency filters to be increased substantially without increase in pressure drop. The production of extraneous particles in electrostatic samplers by gas-to-particle conversion and corona wire ablation will be assessed to determine its potential as a source of sample contamination.

TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Marine;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Several programs involving sampling and analysis of biological materials are carried out in order to investigate the transfer to man of radionuclides. Primary objectives are to correlate human body burdens with intake levels, to evaluate the long-term behavior of radionuclides in the environment and in man, and to determine the dose commitments from nuclear power production.
APPROACH: Radionuclides from nuclear weapons testing provide the major tool for our studies. The nuclides investigated include plutonium, americium, strontium-90, cesium-137, and tritium. Quarterly estimates of strontium-90 intake in total diet in New York City and San Francisco are determined from analyses of nineteen representative food items purchased every three months. Since 1961, specimens of human vertebrae have been obtained in the New York and San Francisco areas, while daily milk and tapwater sampling in New York City has been carried out since 1954.
RESULTS: The diet sampling provides a continuing record of the changes in radionuclide dietary intake. The long-term variations and the significance of the accumulated deposit in soil relative to the current rate of deposition are evaluated. The human bone sample strontium-90 concentrations are related to the dietary intake, and the absorption and retention properties for both adults and children can be inferred. Results have been useful in predicting future strontium-90 concentrations in diet and bone.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objective of this project is the development of improved radiochemical, radiometric and analytical procedures to determine the levels of radionuclides, particularly the transuranium elements, in biological and environmental matrices. These analyses must be capable of isolating and determining these transuranic nuclides in large quantities of soil, water, tissue, food and excreta samples. The method once developed must withstand extensive evaluation by analyzing actual samples over extended periods of time so that reliable accuracy and precision statements are possible.
APPROACH: We will investigate and apply both classical and new analytical techniques to radioanalytical problems.
RESULTS: Methods will be provided for determination of plutonium and americium in large environmental samples. Matrices such as urine (20 liters), soil (kilograms), sea water (55 liters), food ash (100 grams), and bone ash (100 grams) will be handled. Comparable procedures for environmental tritium determinations in soil, water, food, tissue and precipitation samples will be provided.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING

PROJECT DESCRIPTION: Woods Hole Oceanographic Institution (WHOI) is funded by ERDA to carry out extensive research utilizing strontium-90, cesium-137 and plutonium in sea water and ocean sediments. HASL arranges contracts with commercial laboratories for the radiochemical analyses of the sea water. Recently, additicnal samples generated under the GEOSECS program (funded by the National Science Foundation) have been combined with the routine WHOI project.
APPROACH: Commercial laboratories claiming the ability to quantitatively analyze sea water for low concentrations of strontium-90, cesium-137 and plutonium, are ''qualified'' by HASL. This involves submission of blank, duplicate and known samples and subsequent evaluation of the results. Requests for proposals from qualified laboratories are then evaluated by a panel and a contractor is selected.
RESULTS: The data frcm this program are used by the investigators at WHOI and by the scientific community in understanding physical and chemical oceanographic properties such as circulation patterns, sedimentation rates and currents. In addition, the information is valuable in evaluating planned or unplanned releases of radioactive wastes to the environment.

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (50%);ANALYTICAL (50%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The project is designed so that general methods can be derived and applied to problems in radiation shielding, radiation dosimetry, environmental health and sometimes to non-nuclear oriented problems.
APPROACH: Following the identification of a safety-related problem, fundamental physical principles and data are employed in the development of a method that can be applied to a group of such problems. Oftentimes complete reliance on measurements does not lead to a general solution, so we have developed or adapted computational methods that can be verified with benchmark experiments. This systematic approach, for example, has led to generally acceptable radiation shielding calculations and environmental radiation measurement methods.
RESULTS: Theoretical computational and experimental methods for characterizing man's environment and how it is perturbed should be reported in the literature and applied to a variety of real and perceived safety problems concerning HASL and other ERDA programs.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Basic computational and experimental methods are applied to practical radiation dosimetry investigations of concern to ERDA and other organizations. Man's external radiation exposure usually occurs at low dose rates so the methods must be carefully employed, particularly with regard to quantifying the time and location dependence of components on the environmental radiation field.
APPROACH: Systems for the accurate determination of dose to man from manmade and natural sources are developed. These systems include the specification of the underlying principles; the instrument and methods for its use; and the eventual data recovery and interpretation. HASL-developed computations are employed to guide the design and interpretation of field and laboratory measurements.
RESULTS: The project provides basic data on human exposure to natural radiation, occupational sources and power-related emissions.
KEYWORDS: RADIATION MONITORING;DOSIMETRY;BIOLOGICAL RADIATION EFFECTS;HUMAN POPULATIONS;ENERGY;HEALTH HAZARDS;OCCUPATIONS;BACKGROUND RADIATION;RADIOACTIVE EFFLUENTS

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Southwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The exposure of man and his environment to airborne radioactive substances is studied in terms of the successive steps from sources via environmental pathways to ultimate sites of deposition including the respiratory tract. Particular attention is being given to public exposure to background radon and radon daughters. The long range objectives of these investigations are to improve capabilities to assess, monitor and control contaminants in public and occupational environments.
APPROACH: Emphasis is on field investigations of the sources of radioactive air contaminants, the concentration and physical properties of the airborne radionuclides (including particle size and solubility of particulates), and the resultant exposure to humans. Field measurements are complemented by laboratory experiments to provide a bridge between actual conditions of exposure and precise measurements of the physical properties and human intake of specific contaminants.
RESULTS: A pilot study will provide data on ambient radon and radon daughters in buildings in the New York metropolitan area using integrated monitors that have been developed for that purpose. As time and additional instrumentation permit, this will be expanded to yield estimates of average exposure to a representative cross-section of the local population. An investigation of exposures of uranium mill workers to uranium ore dust should provide information on the validity of assumptions on which the present maximum permissible concentration is based. Measurements include the distribution, particle size, and solubility of radionuclides in the airborne dust as well as fractional deposition of the dust in the respiratory tract.

TECHNOLOGY: FOSSIL FUEL/General (75%);GEOTHERMAL/General (25%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Fundamental information is developed about the characteristics of airborne particles and techniques for particle generation and measurement which is needed for filtration studies, inhalation studies, and calibrating size-classifying air samplers.
APPROACH: Information about the properties and behavior of aerosols such as particle size, density, charge, diffusivity, and agglomeration is obtained to meet existing or anticipated demands of HASL research in health protection and population exposures to airborne particulates. Similarly, techniques for aerosol generation and measurement are developed in the absence of existing methods in order to fulfill research requirements in related programs.
RESULTS: A more sensitive condensation nuclei counter than earlier models developed here (with ranges of about 10/sup 6/ to 5 x 10/sup 2//cm/sup 3/ and 5 x 10/sup 2/ to 1/cm/sup 3/) is being designed with a limit of detection as little as 10/sup -3//cm/sup 3/. This will have application in measuring the size distribution of background aerosols and the collection efficiency of High Efficiency Particulate Aerosol filters. Commercial high volume cascade impactors are being evaluated for their accuracy and reliability in measuring the particle size distributions of environmental aerosols. The effects of particulate bounce and wall losses are receiving particular attention because of their potential contribution to errors. It is anticipated that this evaluation will provide a basis for selecting the best available unit for future environmental studies.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
ROJECT DESCRIPTION: The objective of this project is to develop new instrumentation for application to field and laboratory measurement problems. New sensor concepts are investigated for translating physical parameters to electronic signals. Also, instrument circuitry and computer based systems for data acquisition and equipment control are improved.
APPROACH: Methods of utilizing new types of sensors are developed. These include optical, mechanical, and electronic transducers which respond to input stimulus and transmit a related electronic signal. Since the integrated circuit and the microprocessor are making complex digital systems economical and efficient, a

considerable effort is related to the interfacing of detectors and standard digital subassemblies. The systems assembled contain direct input for multiple sensors and correlate interrelated parameters to determine the necessary computer based control and data acquisition information.
RESULTS: Desirable sensor concepts with poor stability can be used successfully if calibrated just prior to measurement. The microprocessor circuits can be the basis of systems to automatically control this function. Transfer standards and control circuits will be adapted for this technique.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objective of this project is to improve the sensitivity and reliability of measurements based on the characteristics and quality of new components and of instrument techniques.
APPROACH: New devices are characterized and new instruments investigated as the basis for predicting performance in a particular application. The uniqueness of response of optical, electronic and mechanical transducers to their stated parameters is determined by testing. Correlation with theoretical principles is performed so that efficiency of design can be deduced. Also, the instrument or device response is investigated at conditions of temperature, pressure, humidity and physical abuse so that the limits of reliability can be described.
RESULTS: The solid state devices used as electrical transducers for air pressure measurements will be characterized for linearity, stability and accuracy. These can be used for automatically recording differential pressure drop across filters and orifices. The metal oxide semiconductor transistors are particularly susceptible to humidity. The change in this device's characteristics will be related to the moisture content of the air, and its feasibility as a humidity detector will be determined. Optical absorption techniques will be applied to the detection of gaseous contaminants in the atmosphere, such as ozone.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objectives of this program are to develop methods of analysis for selected trace elements, anions, organic and gaseous pollutants in environmental and biological materials; and to determine the reliability of the selected method for the specific pollutant with variations in major and minor constituents. Individual pollutants will be investigated based on potential toxicity to man, reported levels of environmental contamination, and reported reliability of existing methods and measurements. Methods to be developed will be subjected to extensive evaluation by analyzing actual samples over extended periods of time so that accuracy and precision statements are possible.
APPROACH: Both classical and newer analytical techniques for isolating the material and sensitive instrumentation for determination will be investigated.
RESULTS: Investigations are in progress to handle larger samples and to include chemical isolation in order to increase analytical precision and accuracy. Methods for analyzing anions and trace metals in precipitation samples from baseline stations will be provided. Methods for analyzing selected gaseous and organic pollutants in air and water samples will also be developed as required.

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Marine;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objective is to measure and evaluate trace metal concentrations in various biological materials and systems with specific emphasis on the pathways to man and the levels in diet and human tissue.
APPROACH: Human metabolic balance experiments utilizing the cadmium, copper, manganese, nickel, lead and zinc naturally present in the diet are carried out on a cooperative basis with Dr. Herta Spencer of the Hines Veterans Administration Hospital near Chicago. Trace element concentrations in various trophic levels of the food web leading to man will be determined in an area where a coal-fired fossil-fuel plant is to be constructed. Sediment cores from four lakes will be chronologically sectioned and analyzed for trace metals to obtain a history of anthropogenic pollution. The cores will be taken by the Woods Hole Oceanographic Institution as part of a joint project.
RESULTS: The controlled intake and excretion experiments are designed to compare trace element behavior under various intake conditions with regard to absorption and retention patterns. Identification of natural pathways of trace metals in an area where a coal-fired plant will be constructed will allow assessments to be made of the impact on biological systems when the plant or similar plants is in operation. Observed time trends in trace metal concentrations in human tissues will be compared with air and diet measurements to assess the more important exposure route.

PROJECT DESCRIPTION: This project has been undertaken to document the naturally occurring radioactive nuclides in man and his environment.
APPROACH: Measurements of natural radionuclides including radium-226, lead and polonium-210 in wet, dry, and total fallout in the urban environment will be performed. Analyses will be made of World Health Organization human bones for radium-226 and stable calcium. Measurement of samples from areas around coal-fired power plants to document their discharge of natural radionuclides will also be performed.
RESULTS: The expected data should illustrate seasonal and spatial variations of natural radionuclides. The World Health Organization bone analyses offer a relatively fast and inexpensive method of locating areas of high natural radioactivity for detailed study.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The HASL Surface Air Sampling Program provides stable lead particulate concentrations through the entire range of pollution levels from the global baseline concentrations observed at Mauna Loa, Hawaii to some of the most highly contaminated urban centers in both hemispheres. Measurements of sulfate, nitrate and a number of trace metals will be initiated at selected sites. The basic aim is to document the air concentrations of energy-related pollutants as part of the input information required to assess their impacts on the environment and man.
APPROACH: Twenty stations extending from 77 degrees N to the South Pole collect particulates on Microsorban filters. Similar air sampling is carried out at a regional station 35 miles west of lower Manhattan. Measurements of industrial gaseous pollutants will be initiated at the regional site. HASL will evaluate, supervise the manufacture, and field test special gas chromatographic-electron capture analyzers developed

by NOAA for planned releases of atmospheric tracers. The air samplers at some of the regional and global baseline stations have been modified to collect as a function of wind direction so that only clean air, unperturbed by local sources, is sampled. Techniques and capabilities developed in this program will be applied to the Multistate Atmospheric Power Production Pollution Study (MAP/sup 3/S).
RESULTS: The sampling network will provide data on transport mechanisms and on sources of pollution. The tracer studies are intended to test models of transcontinental atmospheric transport.

PROJECT DESCRIPTION: Methods are developed for assessing and reducing exposures to man from hazardous air contaminants arising from energy production.
APPROACH: The reliability of techniques for monitoring exposures to toxic substances is improved through studies of the performance of monitoring instrumentation in practical applications. Methods of measurement are developed to improve definition of hazardous aerosols through proper recognition of the effects of physical and chemical properties on respiratory tract deposition and retention. The basic elements of control technology are evaluated for their effectiveness as applied to processes that generate hazardous atmospheres. Deficiencies are remedied by improving existing methods or devising alternatives.

77 FUNDING: Energy Research and Development Administration FY77:$37,000
TECHNOLOGY: SOLAR/Biomass (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Development of the sterile male technique for lepidopteran species (pink bollworm, tobacco budworm, corn borer, cabbage looper, codling moth, flour moth) would permit the control of important agricultural pests without continued reliance on pesticides. This approach has proven successful in several dipteran species. However, lepidopteran species require extremely high radiation doses to induce sterility, and this may affect field competitiveness. These species also have holokinetic chromosomes, and we are investigating the possible relation between kinetochore structure and radioresistance. Sterility involves either failure of the treated males to transfer eupyrene sperm or the induction of dominant lethal mutations in the sperm. Studies include the cytogenetic nature of dominant lethal mutations and their time of expression, effects of radiation on sperm transfer and other aspects of reproductive physiology, determination of optimum stage to irradiate to minimize debilitating effects, use of sterile hybrids from interspecific crosses, biochemical and electron microscope studies of lepidopteran chromosomes and dividing cells.
APPROACH: (1) Majority of insects can transfer eupyrene sperm at the fully sterilizing doses; (2) at semi-sterilizing doses the F/sub 1/ progeny are more sterile than the treated parent, but the F/sub 1/ males often do not inseminate the females. (3) Unlike the Diptera, dominant lethal mutations induced in

sperm produce late embryonic deaths. (4) Holokinetic chromosomes do not always confer radioresistance. (5) Eupyrene sperm transfer is required in order for the female to start ovipositing and become unreceptive to future matings. (6) Photoperiod drastically affects the reproductive ability of these species.

PROJECT DESCRIPTION: Balloon-borne particulate and gas samplers are flown to altitudes of 70, 80, and 90,000 ft from sites at Fairbanks, Alaska; Alamagordo, New Mexico; and Panama Canal Zone. Flights to 105, 120, and 135,000 ft are capable of being flown. Schedules are coordinated with Project Airstream, the aircraft-borne sampling program which, together with Project Ash Can, constitutes the ERDA upper air sampling program. Payloads are recovered using ground or aerial recovery techniques and filter papers are sent to the ERDA Health and Safety Laboratory for analysis of particulate radioactivity. Exposed molecular sieve is analyzed at Argonne National Laboratory for carbon-14. Interpretative analysis of data is by HASL

and the Air Resources Laboratory, NOAA. The project also includes several test flights for research and development of samplers, associated equipment, and sampling techniques. Guest payloads are flown on most routine and test flights.

PROJECT DESCRIPTION: The research is directed toward improving techniques for predicting the distribution, transport, and deposition of radioactive debris in the atmosphere while simultaneously using radioactive debris as tracers to investigate atmospheric processes. Balloon, aircraft, and surface sampling systems have provided data on various radioactive tracers from nuclear testing, from other atmospheric inputs, and from natural processes. These tracers have been used to develop models of stratospheric circulation, of stratospheric-tropospheric exchange, of interhemispheric mixing, temporal and spatial deposition, and verification of global circulation models. This project also provides technical assistance to the high altitude sampling program, model development and long-range transport studies applicable to fossil fuels as well as radioactive contaminants.
KEYWORDS: FALLOUT;RADIATION MONITORING;EARTH ATMOSPHERE;DEPOSITION;AERIAL MONITORING;BALLOONS;AIRCRAFT;MASS TRANSFER;AIR POLLUTION;MATHEMATICAL MODELS

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Spain

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Study of the physiological and ecological behavior of plutonium oxide in a contaminated rural environment.
ROACH: This is a four-point program designed to obtain information on (1) uptake and excretion of plutonium and uranium by a population group, (2) resuspension of plutonium from contaminated soil, (3) internal and external contamination of agricultural products, and (4) temporal migration and redistribution of plutonium oxide in the soil.
RESULTS: A summary of the data obtained in Project Indola was prepared.
PROJECT MILESTONES: Annual review of the program and evaluation of equipment requests.

PROJECT DESCRIPTION: A WB-57F aircraft flies particulate, whole air, and tritium samplers from bases at Anchorage, Alaska; Tacoma, Washington; Houston, Texas; and the Panama Canal Zone three times a year at four altitudes ranging from 40-63,000 ft to provide a nearly continuous sampling profile from 75 degress N to 10 degrees S latitude along the west coast of the Western Hemisphere. Schedules are coordinated with Project Ash Can, the balloon-borne sampling program in the Northern Hemisphere, which, together with Project Airstream, constitutes the ERDA upper air sampling program. Filters and whole air samples are sent to the ERDA Health and Safety Laboratory for analysis of particulate and gaseous radioactivity and other constituents including fluorocarbons. Tritium samples are analyzed by the University of Miami. Interpretive analysis of data is done by HASL and the Air Resources Laboratory, NOAA. Guest payloads are flown on many flights.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Kr-85 is a radioactive noble gas which is produced and released into the environment in large quantities in fission reactors. To define the biological hazard from Kr-85 released into the environment experimental animals are being exposed to a cloud of Kr-85. The study will evaluate long-term exposure effects in guinea pigs and chronic exposure of rats to w-10,000 times the occupational MPC/sub (a)/ for Kr-85.
APPROACH: The distribution, rate of removal and the dose to several organs in the animals were determined. Following this evaluation animals were exposed to determine the acute LD/sub 50-90/ for acute exposure. Chronic exposures to Kr-85 with lifetime of observation of the animals are in progress to evaluate long-term hazards. Rats will be exposed in utero and chronically post-natally to Kr-85 in a beta infinite geometry at multiples of the occupational MPC/sub (a)/.
RESULTS: The results of this research will make it possible to define the acute and chronic effects of exposure to Kr-85 in rodents. Evaluation of the effects from these exposures relative to other radiation sources and determination of relative biological affectiveness of Kr-85 exposures is essential. This will make it possible to determine if MPC/sub (a)/ and other standards for this noble are appropriate.
PROJECT MILESTONES: (1) FY 78 Evaluate carcinogenic and other biological effects of high level Kr-85 exposures which produce major life-shortening. (2) FY 79 Evaluate life shortening, total tumor incidence and other biological alterations in rats and guinea pigs exposed to lower levels of Kr-85 either as a single exposure or chronically. (3) FY 80 Determine how the data support or suggest changes in current standards. Evaluate the need for future studies.

PROJECT DESCRIPTION: To establish a U.S. National Diving Accident Network capable of giving medical advice and rendering emergency treatment of diving casualties and to develop a program of training in underwater technology.
APPROACH: Conduct a comprehensive analysis of emergency medical technician/diver training available in the U.S. and the design and implementation of a hyberbaric training program for physicians. Conduct a survey of hyperbaric treatment facilities and make recommendations based on previously established acceptance criteria for their inclusion in the network of emergeny treatment centers. Provide support for the development of a program leading to an Associate of Science Degree in Underwater technology.
RESULTS: The program for hyperbaric medicine training has been established and six physicians have completed the course and are now capable of functioning in the proposed network. The survey of hyperbaric treatment facilities is underway. The college-level training program in undersea technology has currently over 60 students enrolled in the first year class which commences in January 1976.
PROJECT MILESTONES: A preliminary report on the possible network of hyperbaric treatment centers will be prepared September 30, 1978.

REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: A set of issues related to productivity and health/safety as they relate to coal mining to the year 1985 will be assembled through a review of the literature and through interviews with representatives of industry, labor, government and public interest groups. The study team will particularly concentrate on issues that highlight or exemplify the regional differences that exist in Eastern and Western mining activities.
RESULTS: The product of task I will be a compilation and discussion of the occupational health/safety and productivity issues associated with coal mining through the year 1985. The product of task II will be a series of displays that reflect the relationship between the cost of coal and factors affecting productivity and occupational health/safety.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Prepare a detailed analysis of (at least) the following: (a) ''The National Energy Plan'' (4/29/77), (b) The National Energy Act (H.R. 6831-4/29/77), (c) The President's Environmental Message (5/24/77), (d) ''Fact Sheet'' for Environmental Message. This analysis shall give particular attention to those areas in the above four national policy documents in which there are trade-offs implied between environmental factors and energy development and use.
APPROACH: This analysis shall further be oriented toward the practical implications of these national policy statements as they affect the design of programs in the Office of the Assistant Administrator for Environment and Safety for FY 1978 through FY 1980, with full consideration of similar factors that are likely to be important in the proposed Department of Energy.
PROJECT MILESTONES: This analysis shall be completed according to the following schedule: (1) Briefing and draft report, submitted to the AES Office of Environmental Policy Analysis, within 7 weeks of contract award (12 copies); (2) Final report-12 weeks from award of contract (25 copies).
KEYWORDS: ENERGY POLICY;ENERGY SOURCE DEVELOPMENT;ENVIRONMENTAL IMPACTS;GOVERNMENT POLICIES;DATA ANALYSIS;DOCUMENT TYPES;ECOSYSTEMS;TECHNOLOGY ASSESSMENT

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: Dr. Wang proposes to develop an instrumental capability for the measurement of OH, OH2 and ClO at various altitudes based on laser-induced fluorescence techniques. Particular attention will be given to region 20 to 35 km, which covers the ozone belt. No measurements have been made at low altitudes in the field. In 1974 this group was the first to measure OH in ambient air (laboratory), with a detection limit of approximately 5 x 10atsup 6at OH/cm3. The problems facing them for a field measurement capatility are to overcome interference effects including: (a) Two-photon dissociation of water; (b) Laser-induced dissociation of ozone; and (c) Dissociation of various trace constituents. They will concentrate on two-photon excitation for OH measurements. The companion radial, HO2, will require development of the use of a third harmonic of a dye laser (2,000 A).

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Copper, nickel and zinc are three potential contaminants that are often present in discharge waters of power plants. Because additional power plants will be constructed along or off the east coast of the United States to meet increased electrical demand, the biogeochemical behavior of contaminants that will be released from these facilities must be known so that potential adverse effects on fisheries can be evaluated. Long-range objectives of this research are to (1) develop a dynamic model of the cycling and fate of these three metals in coastal waters of North Carolina and (2) determine the effects of dissolved organic compounds originating from watersheds and salt marshes on the physical transport and biological availability of copper to marine organisms. Specific objectives for FY 76 are to (1) determine baseline levels including temporal and spatial variability of concentrations of nickel,

copper and zinc in dissolved and particulate phases of water and in dominant pelagic organisms in coastal waters near Beaufort, North Carolina and (2) determine the concentrations and spatial variability of dissolved and organically chelated copper in the Newport River and estuary.

POLLUTANTS: HEAT, THERMAL (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective is to determine the location in a simulated power plant condenser system where physical damage is done to small aquatic organisms, principally fish eggs and larvae, that are entrained in cooling water. The engineering objective is to provide design criteria for condenser piping and pumps that will minimize damages.
APPROACH: The approach is to pass test organisms through a simulated condenser cooling system and to observe immediate and latent mortality, or behavioral changes that could affect survival. Emphasis will be on the pump design in current experiments since previous work has concentrated on the condenser. Effects will be associated with specific features of pump design and operation where feasible, e.g., specific speed, and net positive suction head. A redesigned simulated condenser system is being constructed for experimentation in the spring of 1976.
RESULTS: Marine and freshwater organisms will be tested as available for collection or laboratory culture.

TITLE: Non-nuclear Pollutants on the Earth's Surface
PROJECT NUMBER: 002477
PRINCIPAL INVESTIGATOR: Volchok, L.
ADDRESS: Health and Safety Laboratory, 376 Hudson Street, New York, NY 10014
AFFILIATION: Energy Research and Development Administration, New York (USA). Health and Safety Lab.
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Slade, David
TELEPHONE: C(301)353-4374;F233-4374
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$156,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: METALS/Lead;METALS/Cadmium;METALS/Nickel;METALS/Vanadium (80%);PARTICULATES/Sulfate;PARTICULATES/Nitrate;PARTICULATES/Chlorate (20%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Deposition of a number of stable trace metals is being measured routinely in New York City and San Francisco. In addition to the total deposit, a specially designed collector is being used to separate wet and dry fallout. A "regional" baseline station has been established at Lloyd, New York. The site, on land owned by New York State, has an instrumented 300 ft meteorological tower in addition to standard ground level weather observation instruments. Presently, total, wet, and dry fallout sampling is being carried out over monthly intervals. "Baseline" stations at Mauna Loa, Hawaii; Barrow, Alaska; American Samoa; and Antarctica are available to HASL through NOAA for carrying out long-term measurements of non-nuclear pollutants. The objective is to learn about geographical differences and time trends of pollutants which are distributed globally as opposed to emissions from local or regional sources. Through the French Atomic Energy Commission, HASL will also be able to maintain sampling equipment on Kerguellen Island. The present goals are to develop and improve low background sampling and analytical systems, to monitor the impact of energy systems upon global, regional and urban baseline levels and, to relate sources to concentrations and transport mechanisms.
APPROACH: Total as well as wet and dry fallout collected over monthly periods is being analyzed for lead, cadmium, nickel, and vanadium. This sampling is done in New York City, San Francisco, and Lloyd, N.Y. A wet-dry fallout collector has been developed and tested successfully in New York and San Francisco for over a year. Analytical methods are being developed for sulfate, nitrate, and chloride in wet and dry monthly fallout.
KEYWORDS: LEAD;CADMIUM;NICKEL;VANADIUM;AIR POLLUTION;CHEMICAL EFFLUENTS;GLOBAL ASPECTS;AIR SAMPLERS;METALS;TRACE AMOUNTS;PERFORMANCE TESTING;NEW YORK;CALIFORNIA;SAMPLING;SULFUR COMPOUNDS;DEPOSITION

TITLE: Standard Neutron Fields
PROJECT NUMBER: 600034
PRINCIPAL INVESTIGATOR: Schwartz, R.B.
ADDRESS: Department of Commerce, National Bureau of Standards, Gaithersbury, MD
AFFILIATION: National Bureau of Standards, Washington, D.C. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Operational and Environmental Safety
MONITOR: Vallario, E.J.

TELEPHONE: F353-5640
TYPE OF FUNDING: Contract No.-F49-01-3800
77 FUNDING: Energy Research and Development Administration FY77:$70,000
CHNOLOGY: NUCLEAR/General (100%)
LLUTANTS: RADIATION (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific ERDA contractors
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To make available four (4) monoenergetic neutron beams (thermal, 2 keV, 25 keV, and 144 keV) for use in evaluation and development of neutron dosimeters and portable survey instruments. These beams will be maintained afterwards for such work and as a calibration facility.
APPROACH: Filters appropriate to transmission of the desired energy are inserted into radial beam from the core of the reactor. Thereby creating a beam of nearly monoenergetic neutrons.
RESULTS: The following beams will be available at the end of the project: thermal, 2 keV, 25 keV, and 144 keV.
PROJECT MILESTONES: Project completion 1 October 1976.
KEYWORDS: OCCUPATIONAL EXPOSURES;NUCLEAR ENERGY;ENVIRONMENTAL EFFECTS;NEUTRON BEAMS;RADIATION DETECTORS;NEUTRONS;MAINTENANCE;PERSONNEL DOSIMETRY;US ERDA;DESIGN;RADIATION PROTECTION

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Northeast;COASTS/Northeast;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine principal processes that control the distribution of hydrocarbons such as adsorption--desorption between sediments and water, diffusion between pore waters and overlaying water; physical mixing of sediment and overlaying water, biological activities (bioturbation, ingestion, and metabolism).
APPROACH: Simple mixing experiments will be conducted and current velocities will be varied over experimentally enclosed sediments to form a background for comparison of hydrocarbon distribution and composition to biological activity. Biological effects will be measured by using benthic systems isolated in enclosed chambers, first in the laboratory then in the field, at Buzzards Bay and the New York Bight. Factors will be introduced consecutively to elucidate the role of each.
RESULTS: A determination will be made as to which chemical compartments the hydrocarbons are located, how tightly they are bound, how extraction by organisms compares with solvent extraction. Clarification will be made of the role of benthic animals changing the composition of the hydrocarbons and redistributing hydrocarbons at the mud-water interface.
PROJECT MILESTONES: First year--complete chamber experiments in laboratory with Cape Cod and Buzzards Bay sediment and biota, hold two sampling cruises in these areas, short sampling cruise to New York Bight. Second year--continue water partition experiments, make cruises in Cape Cod and Buzzards Bay and New York Bight for field collections and ''in-situ'' chamber experiments.
KEYWORDS: AQUATIC ORGANISMS;HYDROCARBONS;METABOLISM;SEDIMENTS;SEAWATER;ATLANTIC OCEAN;COASTAL WATERS;NEW YORK;CONTINENTAL SHELF;BENTHOS;WATER CURRENTS;VELOCITY;DEPTH;ECOLOGICAL CONCENTRATION;PETROLEUM PRODUCTS;BIOCHEMISTRY

TITLE: Non-Nuclear Pollutants in Stratospheric Air
PROJECT NUMBER: 001783
PRINCIPAL INVESTIGATOR: Hardy, E.P. Jr.
ADDRESS: 376 Hudson Street, New York, NY 10014
AFFILIATION: Energy Research and Development Administration, New York (USA). Health and Safety Lab.
MONITORING AGENCY: Energy Research and Development Administration, New York (USA). Health and Safety Lab.
DIVISION: Health and Safety Laboratory
MONITOR: Harley, John H.
TELEPHONE: F660-3616
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$171,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objectives of this project are: to document the concentrations of selected stable tracers (particulates and gases) in the stratosphere as a function of latitude, altitude and season; to inventory the stratospheric burdens of these substances; to develop and test stratospheric transport models; and to supply basic data for other scientific programs in evaluating the ultimate deposition of tracers in the environment.
APPROACH: Particulate sampling is conducted by both aircraft and balloons. The balloon program provides samples from 20 to 27 km at 65 degrees N, 33 degrees N, and 9 degrees N, several times a year. The aircraft sampling extends from 75 degrees N to 10 degrees S in the western hemisphere and ranges in altitude from 12 to 19 km. At least three aircraft missions are flown per year. The National Center for Atmospheric Research receives a portion of each filter for analyses of sodium, potassium, calcium, magnesium, chloride, sulfate and nitrate. Total stratospheric air is collected in stainless steel spheres through compressors. The total air samples are analyzed at HASL for Freon-11 (CCl/sub 3/F), sulfur hexafluoride (SF/sub 6/) and other halocarbons. Nitrogen oxides, specifically N/sub 2/O will be added to the program.
RESULTS: Freon-11 and sulfur hexafluoride are ideal tracers for global atmospheric diffusion studies and the Freons are also important for their potential effect on the ozone shield. The other halocarbons and N/sub 2/O now appear to have a considerable bearing on the chemistry of the stratosphere and should help to explain atmospheric behavior of trace gases.

TITLE: Development of a Technical Assistance Manual for Management of Transmission Line Rights of Way for Fish and Wildlife
PROJECT NUMBER: 007403
PRINCIPAL INVESTIGATOR: Quinn, H.B.
ADDRESS: Office of Biological Services, Fish and Wildlife Services, Department of the Interior, Washington, DC 20240
AFFILIATION: Fish and Wildlife Service, Washington, D.C. (USA). Office of Biological Services
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Watters, Robert L.
TELEPHONE: F233-5329
TYPE OF FUNDING: Contract No.-EE-77-A-28-3232
77 FUNDING: Energy Research and Development Administration FY77:$50,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of the project is to prepare a technical assistance manual which integrates specific management problems, proven fish and wildlife management techniques, and special problems in transmission line ROW management into comprehensive management strategies for land used as transmission line ROW by electric utilities. This manual could then be used by biologists to develop specific management plans for overhead transmission line ROW. This manual will treat separately the various biological provinces and communities of the United States and will address the management problems specific to each. The manual will provide the technical guidance necessary to implement a management plan in a particular biological community in any province.
RESULTS: The project will be in two phases. In Phase I, 37 biological communities within 19 provinces throughout the U.S. will be studied. The number of communities treated in Phase II will be dependent on the results of Phase I, but will include approximately 35 biological communities in 14 provinces in the conterminous U.S.

PROJECT DESCRIPTION: To determine the sorption and desorption of SO2 and O2 during condensational growth of droplets, fogs and aerosols. Preliminary studies indicate that during rapid condensation concentrations do not follow Henry's Law. The resulting supersaturation may explain H2SO4 formation in plumes.
APPROACH: (a) Test the effects of various dissolved salts on enhanced absorption of SO2. (b) Determine whether the supersaturations levels observed with SO2 are also obtained with O2. (c) Measure the desorption rates following cessation of growth. (d) Investigate the phenomenon of enhanced absorption on single droplets and clouds of nuclei of known size and composition.
RESULTS: Results of this work will provide further input into the understanding of chemistry of SO2 in fossil fuel plumes.

CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Perform an environmental analysis of the National Plan for energy research, development, and demonstration on an annual basis, beginning with the 1977 Plan. The purpose of this analysis will be to assess the environmental impact of planned major technologies at national and broad regional levels through the year 2000.
APPROACH: The individual energy supply technologies and conservation initiatives which comprise the National Plan scenarios will be analyzed in terms of model plant characteristics and impacts. These activities will be individually examined within each of the general program areas of conservation, fossil energy, nuclear energy, solar energy, and geothermal energy. An integrated analysis of the combined environmental and indirect economic impacts of all energy supply technologies and demand activities, at both national and regional levels, will be undertaken.
RESULTS: Annual environmental analysis report.
PROJECT MILESTONES: Complete first report, September 1977.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: This project is designed to provide ECT of ERDA with sufficient background on the state of knowledge in the developments of Biomass Conversion Technology to document the known and potential environmental impacts from widespread applications of these technologies for energy production. The impacts will include air pollution, water pollution, and land impacts resulting from both the disposal of residues remaining after processes and the utilization of the derived fuel. A general planning document will be completed by mid fiscal year 1978. This document will identify those technologies that have immediate application. Environmental control technologies will be investigated to determine their effectiveness in controlling the environmental impacts.
APPROACH: Data from pilot plants using biomass conversion processes using solar derived fuels will be collected. These data will include characterizations of all waste streams from the plants as well as the residuals. These data will be analyzed to document the environmental impacts, both known and potential, from the disposal of these wastes. A careful investigation of the effectiveness of environmental control technologies that are being used at the pilot plants will be conducted. Waste characterization studies will be conducted only where data do not exit and other studies are not under way.
RESULTS: A documentation of the environmental impacts from biomass conversion of solar derived fuels and an evaluation of current environmental control technologies to allieviate these impacts.
PROJECT MILESTONES: A general planning document outlining the state of knowledge of biomass conversion technology including an evaluation of their potential for immediate, intermediate or long range application on a large scale will be prepared by mid fiscal year 1978.
KEYWORDS: EMISSIONS;LAND;WASTE;BIOMASS;SOLAR ENERGY CONVERSION;SYNTHETIC FUELS;ENVIRONMENTAL IMPACTS;AIR POLLUTION;LAND POLLUTION;WATER POLLUTION;AIR;SEWAGE;WATER

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: PNL will prepare a plan to recommend alternative possibilities of energy conserving industrial waste treatment processes. This program would provide an overview of ERDA work in this area and develop a center of excellence available to ERDA for such matters as pollution abatement, regulation interpretation, and appraisal of other government agency's programs. Additionally, the program will analyze what is currently happening in industrial pollution control, forming a quantitative data bank and pinpointing key problem areas for detailed study.
APPROACH: An extensive literature review, along with industry contacts will be used to establish an industry priority list, develop industry process diagrams, determine pollutant discharges, identify current study areas and outline possible future study areas.
RESULTS: The data will be presented in a final report suitable for use as a program guide in determining possible future study areas.
PROJECT MILESTONES: (1) October 1, 1977 Industry priority list, process diagrams, and pollutant discharges. (2) October 15, 1977 Current research summary and possible future study areas. (3) October 31, 1977 Draft final report.

TITLE: Partial Support from the Energy Research and Development Administration for the ICMSE Study on University Oceanography
PROJECT NUMBER: 7402
PRINCIPAL INVESTIGATOR: White, R.M.
ADDRESS: 610 Executive Blvd., Rockville, MD 20852
AFFILIATION: Federal Council for Science and Technology, Washington, D.C. (USA). Interagency Committee on Marine Science and Engineering
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: McCammon, Helen
TELEPHONE: F233-5549
TYPE OF FUNDING: Interagency agreement-EE-77-A-28-3234-ERDA
77 FUNDING: Energy Research and Development Administration FY77:$10,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Marine
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objectives of this research are to conduct a comprehensive study of funding of academic marine science research, to determine the adequacy of funding in terms of various goals and objectives and to assess its impact on the development of the marine sciences over the past decade. A

primary objective is to distinguish those problem areas which exist across higher education and the sciences from those which are peculiar to marine sciences.
RESULTS: The results of the study will be helpful in policy formulation and program development for the marine sciences community and the funding agencies.
JECT MILESTONES: 2/78 Final report.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Middle Atlantic;HYDROGRAPHIC AREAS/Other hydrographic areas Simulate
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To assess and evaluate the state-of-the-art of existing harbor offshore-oil spill cleanup capabilities in the event of an oil spill during drilling operation for oil in the outer shelf.
APPROACH: Three offshore oil skimming devices (a MARCO Class V, a cyclonet 100, and an Offshore Devices, Inc.) will be tested and evaluated in the Oil and Hazardous Materials Simulated Environmental Test Tank (OHMSETT), located in Leonardo, N.J. The tank is 667 feet long, 65 feet wide and the tank holds 8 feet of water. Waves as much as 2.5 feet high can be generated, simulating harbor conditions.
RESULTS: The data will be analyzed for each item, a report written plus color slides and a 20 minute movie film will be prepared.
PROJECT MILESTONES: Report by February 1978.
KEYWORDS: OIL SPILLS;CLEANING;DRILLING;OFFSHORE OPERATIONS;SKIMMERS;DATA ANALYSIS;TESTING;SIMULATION

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Middle Atlantic;COASTS/Northeast;HYDROGRAPHIC AREAS/Other hydrographic areas Study tank
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To test and evaluate oil spill control and/or cleanup equipment in the EPA Oil and Hazardous Simulated Environmental Test Tank (OHMSETT) facility located at Leonardo, New Jersey. The test simulates actual operational conditions by generating waves up to 2.5 feet high and other complex wave motion found in harbors. The equipment to be tested has been developed by private enterprise and is offered for sale to the general public.
APPROACH: Equipment to be tested is placed in a tank (667 feet long by 65 feet wide and a depth of eight feet) wave motion generated then the control equipment is moved over the surface at simulated operation speeds. Various skimmers are tested to collect oil from the water surface, then grab samples of water are collected and analyzed to evaluate the effectiveness of the equipment.
RESULTS: Written reports will be available; slides of the tests will be available; a 15 minute movie will be developed for loan to persons or organizatons interested in the results.
PROJECT MILESTONES: The field testing will be completed during the summer and fall of 1977.
KEYWORDS: OIL SPILLS;CLEANING;SKIMMERS;EQUIPMENT;TESTING;EVALUATION;CONTROL;SIMULATION;OFFSHORE OPERATIONS

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: Phase--Investigation of environmental impact from in situ operations due to trace organic compounds: (a) effusion through overburden, (b) leaching by breakins of water from underground basins or water tables, and (c) evaluation of these and other possible emission sources from in situ operations. Phase 2--Development of monitoring strategies and control technologies for the in situ and above ground emissions from oil shale processing.
APPROACH: (1) Establish (a) sources of possible emissions (pollution) from in situ operations, particularly with respect to water quality, and (b) study possible mechanism of mobilization of trace organic and complex materials. (2) Bench scale study of the detection and monitoring of these pollutants. Field study on pilot or demonstration sites. (3) Study of possible abatement of these pollutants to be compatible with the type of in situ operation.
RESULTS: (1) Effective control technology for in situ oil shale operations. (2) Possible application of the same or related technology for above ground retorting operations.
PROJECT MILESTONES: (1) Evaluation of possible sources of pollution and health hazards from various in situ operations--estimated 4 months. (2) Bench scale evaluation of pollutants and possible abatements. Laboratory evaluation of mutagenic and/or carcinogenic and ecologic effects. Water quality--estimated 12 months. (3) Field tests. Establishment of sampling and monitoring protocol--estimated 8 months. (4) Recommendations for control technology--estimated 2 months.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Far West;GEOGRAPHIC AREAS/Northwest;GEOGRAPHIC AREAS/Site specific a;COASTS/Gulf;COASTS/Far West
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objectives of this study are to identify and evaluate technology for control of H2S emissions from existing and several planned geothermal energy developments, to prepare a state-of-the-art report describing all previous and ongoing attempts to control H2S emissions from geothermal energy systems, and identify potentially applicable H2S removal technologies which are available, or could be developed within a commensurate time frame to control H2S emissions from several planned geothermal development projects.
APPROACH: The study will be divided into two major areas, emphasizing H2S removal technology for existing and planned geothermal energy developments, respectively. The efforts will be performed concurrently for approximately the duration of the project. An initial task of short duration (about 1 month) will involve a literature search to provide data inputs for both subsequent task areas.
RESULTS: The state-of-the-art report will support ERDA activities in evaluation of available control options relative to existing, proposed, and anticipated standards and in resource allocation for development of specific control options. The summary of H2S control technology for planned geothermal energy developments will serve as a basis from which to establish the feasibility of meeting future H2S ambient concentration standards.
PROJECT MILESTONES: The first task (Literature Search and Data Acquisition) is scheduled for completion on

about September 1, 1977. Tasks 2 and 3 will run concurrently through about January 15, 1978. Draft copies of the state-of-the-art report and the draft final report will be submitted to the project officer on or before April 1, 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The project involves two subtasks. The goal in the first is to quantify costs (especially of fuel) associated with the choice of condenser cooling systems for base load steam-electric power plants. The goal in the second is to investigate the operation of supplementary cooling systems for the purpose of meeting environmental constraints on temperature increases induced in receiving waters.
APPROACH: In Subtask 1, state-of-the-art cooling systems (river diffusers, artificial cooling ponds, wet and dry towers) are designed and their performances compared for a hypothetical site on the Mississippi River. Eventually the results will be aggregated to yield comparisons on a national level. Subtask 2 involves a case study of TVA's Brown's Ferry Nuclear Power Plant which has been designed to operate its cooling system in open, helper and closed modes. A predictive model for natural temperature fluctuations and a short-term projection model for induced temperatures are being developed to study the effects on plant efficiency of the nature of the temperature standard, the placement and timing of temperature monitors, the performance characteristics of the cooling system and the mode change design criteria.
RESULTS: Subtask 1: A consistent set of design procedures for each cooling system has been developed. Of particular interest has been the development of a quasi-steady representation of the transient response of systems with large thermal inertia (e.g., cooling ponds). Using these procedures the operational and construction costs of cooling systems will be comparable on a one site basis (this year) and on a national basis (next year). Subtask 2: A one-dimensional natural water temperature model has been developed. Several statistical time series models have been developed and compared in terms of their ability to reduce the variance between observed and predicted induced temperature rises. The sensitivities listed above will be examined shortly.
PROJECT MILESTONES: Quarterly progress reports have been distributed for periods 9/1/76 to 11/30/76, 12/1/76 to 2/28/77 and 3/1/77 to 5/31/77. The first year's report covering work through 8/31/77 is forthcoming.

TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS (100%)

CHARACTER OF STUDY: RESEARCH (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The purpose is to determine the rates of absorption and effects on photosynthesis of the air pollutants, sulfur dioxide and nitrogen dioxide.
APPROACH: Plants will be exposed to controlled concentrations of pollutants in chambers and chemical, physiological, and biological parameters will be measured.
RESULTS: The results will help answer the following questions: what are the doses of sulfur dioxide and nitrogen dioxide which inhibit photosynthesis and growth of plants; do these pollutants act synergistically on plants; which properties of the plant determine absorption rates of sulfur dioxide and nitrogen dioxide; what is the effect of ozone or ethylene on the response of plants to sulfur dioxide and nitrogen dioxide; can exposure to low concentrations of sulfur dioxide or nitrogen dioxide improve sulfur or nitrogen nutrition of nutrient deficient plants.

TECHNOLOGY: FOSSIL FUEL/General (100%)
POLLUTANTS: NOXIOUS GAS (100%)
CHARACTER OF STUDY: RESEARCH (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The purposes of this study are to determine: (1) the rate of uptake and metabolic transformations of SO2 in plants; (2) the effect of SO2 on plant diseases; (3) the effect of SO2 on production of insect attractants and occurrence of insect infestation in plants; (4) the combined effects of SO2 and NO2 on plants.
APPROACH: Plants will be exposed to controlled concentrations of SO2 or SO2 and NO2 in chambers and chemical, biochemical and biological measurements will be performed.
RESULTS: These investigations will help answer the following questions: (1) what is the mechanism of action of SO2 in plants; (2) does SO2 enhance plant susceptibility to diseases or insect infestation, (3) does NO2 alter the phototoxicity of SO.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Northeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To determine the source of anomolous high ozone readings which are observed at the remote Whiteface Mt. station and to see what correlations exist with simultaneously measured sulfate aerosols.
APPROACH: Collect samples of air at the Whiteface Mtn. site and analyze for ozone, sulfate, natural radioisotopes of Be-7, P-32 and P-33 (tracers for stratospheric input) and trace elements, and evaluate the results in terms of meteorology and trajectory models.
RESULTS: A large mass of data on concentration of ozone, sulfates, trace elements and natural radioisotopes will be generated and an evaluation made of the relative contribution of stratospheric and long range transport of ozone. The correlations between anthropogenic ozone and sulfates will be developed.
PROJECT MILESTONES: Annual report of first year results, mid 1978.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To produce a Water Conservation Program for use with in situ production of shale oil that will permit full exploration of this new energy resource within economic, public health, and environmental constraints. (Region of study: Green River Formation marlstone, State of Colorado.)
APPROACH: Total project consists of 7 tasks. LBL is responsible for Task 1, parts a and b, and Tasks 6 and 7: Task 1, Identify water requirements and management, and effluent characterization and discharge, strategies for alternate oil shale technologies; Task 6, Develop water-quality monitoring strategy; and Task 7, Discuss implications of study results for oil shale development and deployment policies.
RESULTS: Final product is a detailed plan which solves the problems of the potential impacts of water availability and water quality.
PROJECT MILESTONES: Completion of Tasks listed under 93b are the milestones for which LBL is responsible. Those for which the U.C. Sanitary Engineering Research Lab is responsible include: (a) water quality and demands by subsequent use category; (b) identification of economic, public health, and environmental impacts of state-of-the-art oil shale processes; (c) assessment of alternate strategies to mitigate water impacts; and (d) identification of remaining unabated impacts on water availability and quality. Dates for completion of specific tasks have not been established.

TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (50%);ANALYTICAL (50%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To develop basic information on the effect of local mechanical perturbations on the overall cryogenic stability of large superconducting MHD magnets.
APPROACH: Analytical and experimental studies of local relative motions of conductors which result in pulsed heating will be related to methods for the design and analysis of winding and support configurations.
RESULTS: The resultant information will provide a rational basis for understanding the effect of mechanical perturbations on the cryogenic stability of ETF and base-load superconducting magnets for the program.
PROJECT MILESTONES: (1) Establish geometry, boundaries, and major components for local models. (2) Develop and refine local models. (3) Define and start laboratory tests. (4) Analyze various techniques for predicting coil deformations. (5) Define needed development in techniques and improve techniques.
KEYWORDS: MHD GENERATORS;SUPERCONDUCTING MAGNETS;DISTURBANCES;STABILITY;CRYOGENICS;DESIGN;MATHEMATICAL MODELS;SAFETY

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) Investigate waste by-products associated with conversion and use of coal. (2) Characterize by-products physically and chemically. (3) Suggest safe disposal methods for these materials. (4) Describe environmental impact.
APPROACH: This study, which currently is studying the utilization of waste products from coal conversion plants, consists of the following five tasks: (1) Develop Sulphurtain process. (2) Examine potential use of acid mine drainage sludge for purification of sewage and waste waters. (3) Study use of fly ash for neutralizing strip mine spoil. (4) Prepare fired structural materials (bricks and blocks) using coal-fired power plant ashes and sodium. (5) Examine and evaluate underground disposal of coal wastes.
RESULTS: Work needed on the utilization of these waste by-products will be accomplished in this study.
PROJECT MILESTONES: (1) Develop Sulphurtain process (2) Examine use of acid mine drainage sludge. (3) Study use of fly ash. (4) Prepare fired structural materials. (5) Examine and evaluate underground waste disposal.
KEYWORDS: COAL MINING;COAL PREPARATION;COMBUSTION PRODUCTS;COAL;WASTE MANAGEMENT;WASTES;CHEMICAL PROPERTIES;PHYSICAL PROPERTIES;ACID MINE DRAINAGE;FLY ASH;WASTE PRODUCT UTILIZATION;UNDERGROUND DISPOSAL;SULFUR COMPOUNDS;WATER POLLUTION

TYPE OF FUNDING: Interagency agreement-E(49-18)-1542
77 FUNDING: Energy Research and Development Administration FY77:$70,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT;OS
PROJECT DESCRIPTION: To demonstrate MHD generator performance efficiency of 20 percent enthalpy extraction with greater than 60 percent turbine efficiency. Several subsystems could involve safety related considerations.
APPROACH: Assemble and test components of a high performance demonstration facility. Operate the facillity.
RESULTS: A demonstration of MHD generator performance efficiency of 20 percent enthalpy extraction with greater than 60 percent turbine efficiency.
PROJECT MILESTONES: (1) Facility development. (2) Flow components. (3) Generator system. (4) Magnet system. (5) Shakedown and operation.
KEYWORDS: MHD GENERATORS;THERMAL EFFICIENCY;ENTHALPY;EFFICIENCY;SAFETY;DEMONSTRATION PROGRAMS;TEST FACILITIES;PERFORMANCE TESTING;MAGNETIC FIELDS;BIOLOGICAL EFFECTS

TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: NOXIOUS GAS (100%)
CHARACTER OF STUDY: RESEARCH/Applied (50%);DEVELOPMENT/Laboratory scale (50%)
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY:OS
PROJECT DESCRIPTION: Design and construct an 8 lb/sec. total gas flow direct coal-fired MHD power generator test facility. Design, fabricate, install and test MHD components in the 8 lb/sec. facility. Perform tests in an existing facility to support the design of the 8 lb/sec. facility.
APPROACH: Use an existing test facility to develop engineering data for the design of a larger facility and its MHD components. Test components in this larger facility.
RESULTS: The primary goal is 100 hours of continuous testing of the UTSI combustor-generator by August 1977. A secondary goal is 300 hours of cumulative operation on the various system segments including combustor-channel, slag/seed separation, seed recovery and pollution control.
PROJECT MILESTONES: (1) Supporting experiments for the design of a coal-fired MHD flow facility. (2) Design and construction of the coal-fired flow facility. (3) Program for open cycle, direct coal-fired technology development. (4) Materials application support program. (5) Data analysis. (6) Additional ERDA test programs in new facility.
KEYWORDS: COAL-FIRED MHD GENERATORS;TEST FACILITIES;DESIGN;PERFORMANCE TESTING;DATA;MATERIALS TESTING;SULFUR DIOXIDE;COAL;COMBUSTION;ENVIRONMENTAL IMPACTS

TYPE OF FUNDING: Grant No.-E(49-18)-2019
77 FUNDING: Energy Research and Development Administration
TECHNOLOGY: FOSSIL FUEL/Coal Conversion gasification (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: PARTICULATES/Ash (60%);SPECIFIED OTHER POLLUTANTS/Miscellaneous (40%)
CHARACTER OF STUDY: RESEARCH/Applied (30%);DEVELOPMENT/Pilot plant (40%);ANALYTICAL (30%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Conduct tests to characterize coal gasifier ash and other waste materials with regard to the amounts of toxic, water-soluble chemical species they contain and to determine the rates at which they are released by leaching treatments.
APPROACH: (I) Obtain representative ash and other waste samples from several operating gasification pilot plants. (II) Leach the Task I samples with distilled and natural ground water, an ammonium acetate solution, and sulfuric acid, using standard column chromatography techniques. The ammonium acetate (an ionic, buffered medium) will cause the release of many ions that are not removed by simple solubility in water, yet it will not mask the subsequent analysis of the toxic species. The sulfuric acid will indicate the amounts of metals that may be released over a long time. (III) Perform a qualitative and quantitative elemental analysis on the leachates obtained in Task II to determine whether or not ground and surface water contamination may result from the interaction of natural forces with the fly ash, slag, and other by-products of coal gasification plants.
RESULTS: When coupled with baseline data on the presence of naturally occurring minerals in water, such an investigation may be expected to delineate the possibilities for ground and surface water contamination.
PROJECT MILESTONES: (1) Obtain representative waste samples. (2) Leach samples with different liquids. (3) Qualitative and quantitative analysis of leachates.
KEYWORDS: COAL GASIFICATION;ENVIRONMENTAL IMPACTS;TRACE AMOUNTS;BY-PRODUCTS;AEROSOLS;FLY ASH;TOXICITY;WATER POLLUTION;LEACHING;SULFURIC ACID;AMMONIUM COMPOUNDS;SLAGS;BASELINE ECOLOGY;ECOLOGICAL CONCENTRATION;METALS;QUANTITATIVE CHEMICAL ANALYSIS;QUALITATIVE CHEMICAL ANALYSIS

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Provide data concerning contaminants in process streams to assist in the design of proper purification procedures for producing environmentally acceptable supplemental fuels.
APPROACH: Products from coal gasification and liquefaction including gas, oil, tar, water, and char will be investigated for toxic or hazardous components. Analytical techniques will be developed for determining organic and inorganic constituents. Trace elements that possibly are toxic in the vapor form or produce hazardous compounds will be investigated by spark-source mass spectrometry, neutron activation, atomic

absorption, and other techniques. Organic material associated with these streams will be analyzed by high-resolution mass spectrometry, combined gas chromatography-mass spectrometry, and other appropriate spectral techniques. Organic and inorganic contaminants also will be evaluated in terms of standard lists of hazardous compounds such as Threshold Limit Values (American Conference of Government Industrial Hygienists, U.S. Coast Guard List), lists prepared by the National Research Council, the Toxic Substance List published by HEW in 1971, and recent lists of carcinogens released by OSHA.
PROJECT MILESTONES: (1) 9/77 Screen liquefaction products. (2) 9/77 Determine hazardous elements in synthane. (3) 9/77 Determine hazardous elements in by-product waters. (4) 9/77 Investigate tars and chars. (5) 9/77 Develop techniques. (6) 9/77 List standards.
KEYWORDS: SUPPLEMENTAL FUELS;COAL GAS;COAL LIQUIDS;COAL LIQUEFACTION;COAL GASIFICATION;HAZARDOUS MATERIALS;TAR;CHARS;TOXIC MATERIALS;CARCINOGENS;MAXIMUM PERMISSIBLE CONCENTRATION;WASTE WATER;SYNTHANE PROCESS;STANDARDS;TRACE AMOUNTS;SPECTROSCOPY;SYNTHETIC FUELS;REFINING

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Middle Atlantic
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECT;OS
PROJECT DESCRIPTION: (1) To provide for the documentation of the effects of the synthane pilot plant on the ambient air. (2) To provide invaluable data for demonstration and commercialization work with coal conversion processes. (3) To provide a model example how coal conversion processes can work in harmony with the environment.

APPROACH: This project will require the contractor to fabricate two trailers equipped with air pollution equipment to monitor the air around the synthane pilot plant.
RESULTS: Two fully equipped trailers and auxiliary equipment.
KEYWORDS: VEHICLES;MOBILITY;LABORATORY EQUIPMENT;AEROSOL MONITORING;TITANIUM;VANADIUM;SELENIUM;NICKEL;LEAD;IRON;SULFUR DIOXIDE;NITROGEN OXIDES;CARBON MONOXIDE;HYDROGEN SULFIDES;AIR POLLUTION MONITORS;SYNTHETIC FUELS;ENVIRONMENTAL IMPACTS;PILOT PLANTS;SYNTHANE PROCESS;COAL GASIFICATION

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Middle Atlantic
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECT;OS
PROJECT DESCRIPTION: (1) To provide documentation with emission flow rates for the thermal oxidizer. (2) To provide characterization and quantification of these emissions based on process conditions and coals used. (3) To provide a model example of how coal conversion processes can work in harmony with the environment and ERDA's efforts in this regard.
APPROACH: The thermal oxidizer is approximately 75 feet in height. Sampling points are positioned at approximately two stack diameters from the top of the stack. The outside diameter of the stack is approximately 84 inches at the sampling point. Two sampling ports are provided at ninety degree angles to one another.
RESULTS: Source sampling for particulates, NOx, SO2, organics and metals will be required. Temperatures would be in the range of 1650 to 1700 degrees F.
KEYWORDS: THERMAL OXIDIZER;COAL GASIFICATION;STACK DISPOSAL;FLUE GAS;SAMPLING;SYNTHANE PROCESS;AIR POLLUTION;ENVIRONMENTAL IMPACTS;AEROSOL MONITORING;WATER VAPOR;COAL INDUSTRY;MATHEMATICAL MODELS;PARTICLES;NITROGEN OXIDES;SULFUR DIOXIDE;HYDROCARBONS;METALS;SYNTHETIC FUELS;AIR QUALITY

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Middle Atlantic
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECT;OS
PROJECT DESCRIPTION: (1) To provide documentation reports and analysis on the effects of the Synthane Pilot Plant on the ambient air environment. (2) To maintain to EPA standards the monitoring equipment including calibration and cross-referencing and provide documentation on maintenance operations. (3) To provide consultative services on field placement and operation of equipment.
APPROACH: The work site would encompass six (6) ambient air monitoring sites. At two (2) sites ambient air monitoring trailers are located. At the remaining four (4) sites would be located Hi Vol Samplers, Dustfall Jars and Huey Plates, one of each at each site. The sites would be at key locations of the Windrose for the Synthane Pilot Plant.
RESULTS: Ambient air monitoring data for the Synthane Pilot Plant.
KEYWORDS: COAL GASIFICATION;SYNTHANE PROCESS;AIR POLLUTION;MONITORING;ENVIRONMENTAL IMPACTS;DOCUMENTATION;AIR POLLUTION MONITORS;SITE SELECTION;METEOROLOGY;EARTH ATMOSPHERE;ENVIRONMENTAL TRANSPORT;TITANIUM;VANADIUM;SELENIUM;NICKEL;LEAD;IRON;SULFUR DIOXIDE;NITROGEN OXIDES;CARBON MONOXIDE;HYDROGEN SULFIDES

MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECT
PROJECT DESCRIPTION: To assess the environmental acceptability of landfill disposal of coal conversion solid wastes.
APPROACH: An information assessment was prepared which summarizes and evaluates existing literature on solid waste disposal as it bears on the potential impacts arising from disposal of wastes from demonstration plants. FY 78 and FY 79 will involve laboratory and field leaching tests.
RESULTS: An evaluation of the potential problems and controls needed for handling the solid wastes from coal conversion facilities.
PROJECT MILESTONES: FY 77 completion of information assessment document.
KEYWORDS: COAL GASIFICATION;WASTE MANAGEMENT;SOLID WASTES;SANITARY LANDFILLS;ENVIRONMENTAL IMPACTS;DEMONSTRATION PLANTS;INFORMATION NEEDS;BENCH-SCALE EXPERIMENTS;LAND USE;SYNTHETIC FUELS

ENERGY CYCLE: PROCESSING, CONVERSION (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To develop an energy requirement survey methodology for coal conversion processes suitable for the identification of energy conservation opportunities. Identify and document energy conservation opportunities and provide guidelines for their selection, analysis and implementation.
APPROACH: (1) Initiate and maintain in-house energy consumption data base. (2) Measure heat losses from process units. (3) Determine technical feasibility of energy recovery efficiencies for various process units. (4) Calculate theoretical thermal efficiency, and compare theoretical with actual data. (5) Make recommendations based on these findings.
PROJECT MILESTONES: All relevant data have been collected and are now being analyzed so that recommendations can be made.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To evaluate present treatment and control practices at pilot plant facilities and determine future needs for commercialization of these processes.
APPROACH: (1) Assess and evaluate current environmental effects in control technology applications at ERDA-owned and sponsored pilot plants. (2) Review and document state of the art and related alternatives to existing control technology and treatment. (3) Provide specific recommendations as to alternative treatment and control application. (4) Assess and evaluate the environmental treatment techniques used in these pilot plants for water and solid waste handling and disposal. (5) Evaluate suitability of this control technology at demonstration and control facilities. (6) Outline areas of needed research.
RESULTS: This evaluation should produce information necessary to the development of suitable pollution control technology for fossil energy technology.
PROJECT MILESTONES: A final review of data on the performance of existing facilities will be completed.
KEYWORDS: COAL GASIFICATION;COAL LIQUEFACTION;PILOT PLANTS;ENVIRONMENTAL EFFECTS;POLLUTION CONTROL EQUIPMENT;WASTE WATER;SOLID WASTES;WASTE MANAGEMENT;INFORMATION NEEDS;SYNTHETIC FUELS;WASTES;WASTE MANAGEMENT

ENERGY CYCLE: EXTRACTION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To characterize the contaminants in oil shale residuals and determine the potential for

their management to meet environmental quality standards.
APPROACH: (1) Investigate spent shale characteristics from an environmental standpoint. (2) Refine analytical methods for quantitative determinatiion of trace elements in spent shale. (3) Conduct solubilization studies of organic trace compounds in the presence of inorganic/soluble organic complexes with trace elements. (4) Cooperative cofunded effort with EPA, FEA, and EPA, and NSP.
RESULTS: Spent shale contaminant characteristic information is needed from environmental standpoints in order that information will be available when EIA's and EIS's are developed for compliance with NSPA.
PROJECT MILESTONES: Commerce study on June 4, 1976; complete study during last quarter of FY-77.

ENERGY CYCLE: PROCESSING, CONVERSION (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Ft. Lewis, WA
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To prepare an up-to-date review of the environmental characteristics of the SRC plant at Ft. Lewis.
APPROACH: (1) Gathered and reviewed technical and environmental reports on the operation and design of the SRC plant constructed and operated by the Pittsburgh and Midway Coal Mining Co. at Ft. Lewis, Washington. (2) Conducted a site visit to the pilot plant facility to: (a) observe plant and environmental control systems operations; (b) discuss with plant personnel past operations and future plans; and (c) collect data and technical information on ambient off-site and on-site environmental conditions, types and quantities of residuals and effectiveness of control systems. (3) Prepared a draft environmental review of current and future plant operation.

RESULTS: Study concluded that the plant was operating, overall, in an environmentally clean manner. All pollution control systems were operating properly. Design modifications required by the original environmental assessment had been made.

PROJECT DESCRIPTION: To ensure that Coalcon Demo Plant NEPA requirements were met; to support ADES in chairing the asscciated task force; to ensure that E and S aspects of demo plant projects would meet AFE needs for monitoring and characterization of these technologies.
APPROACH: (1) Prepared analysis of socioeconomic impact of the Clean Boiler Fuel Project. (2) Reported on Environmental Data Summary from Demonstration Plants Division documents. (3) Reported on evaluation of environmental analysis report of the Clean Boiler Fuel Project.
RESULTS: The project was necessary to ensure the fulfillment of NEPA requirements.
PROJECT MILESTONES: (1) Contract for Coalcon did not provide details of E and S requirements. (2) Preparation of EIS's is likely to be on critical path of demo projects. (3) Demo projects should have significant E and S work associated with them as they are being viewed by EPA as a major source of regulatory data.

PROJECT DESCRIPTION: To determine the impact of Clean Air Act amendments on FE research programs, the emphasis of the FE programs and commercial environmental acceptability of FE technologies.
APPROACH: Monitored the progress of Clean Air Act amendments in House, Senate and Conference and briefed task monitor on any amendments likely to affect FE technologies. Analyzed key amendments singled out by task monitor for their impacts on: (1) relative cost and environmental competitiveness of FE technologies; (2) siting of FE research and commercial plants; (3) cost and technical feasibility of FE technologies given the emission control implication of the specific amendment; and (4) possible delays in programs and commercialization due to controls.
RESULTS: Project concluded that although current FE technologies would not violate the Clean Air Act or amendments thereto, further work was needed to verify that violations would not occur. Further work would be concentrated in three areas: (1) terrain considerations, (2) hydrocarbon control, and (3) impacts of coal liquefaction.

TITLE: Labile SO2 Complexes as a Scavenging Basis
PROJECT NUMBER: E-501
PRINCIPAL INVESTIGATOR: Kubas, G.J.
ADDRESS: Los Alamos Scientific Laboratory, P.O. Box 1663, Los Alamos, NM 87545
AFFILIATION: Los Alamos Scientific Lab., N.Mex. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Basic Energy Sciences
MONITOR: Stevenson, F. Dee
TELEPHONE: F233-5008
TYPE OF FUNDING: Contract No.-W-7405-ENG-36
77 FUNDING: Energy Research and Development Administration FY77:$80,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS/SO/sub 2/ (100%)

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The interaction of sulfur dioxide with a variety of chemical compounds is being investigated in order to develop the basic chemistry necessary to provide for a regenerative process of SO/sub 2/ removal, from flue gases, etc. A major goal is to develop compounds which will bind SO/sub 2/ reversibly, have a vapor pressure of SO/sub 2/ which will differ by 10/sup 3/ to 10/sup 4/ over a modest temperature range, and be relatively inexpensive. Re-use of the SO/sub 2/-depleted substrate is thus the key objective.
APPROACH: Exploratory work involving synthesis and characterization of a variety of substrates suitable for reversible SO/sub 2/ addition must be carried out as a first step. A thorough understanding of the various modes of SO/sub 2/ bonding to transition metals, metal ligands, organic compounds, and ionic salts will facilitate the search for substrates. Infrared and Raman spectroscopy, x-ray crystallography, and thermal analyses are the major tools employed to both gain further insight into the problem and to assess a particular compound's utility as a SO/sub 2/ scavenger. Reactions of coordinated SO/sub 2/ with, for example, oxygen are also being carried out in order to examine the possibility of using cyclic multi-reaction schemes to scavenge SO/sub 2/.
RESULTS: The expected result of this project is basic research which will evaluate the feasibility of using compounds that bind SO/sub 2/ reversibly as substrates for a regenerative process for removal of SO/sub 2/ from flue gases. Promising compounds will be tested for all the basic requirements (e.g., stability toward flue-gas components other than SO/sub 2/).
PROJECT MILESTONES: The major project milestone is most certainly the discovery of an inexpensive substrate capable of binding SO/sub 2/ reversibly, preferably at temperatures above ambient, that meets the basic requirements for SO/sub 2/ scavenging. Two new classes of substrates have been discovered to date: the methyl phenyl phosphine copper(I) iodides and mercaptides; and a third class, the ionic iodides of large cations was developed. All show reversible SO/sub 2/ binding and have low SO/sub 2/ pressure at room temperature and high SO/sub 2/ decomposition pressures at greater than or equal to 100 degrees C.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;
PROJECT DESCRIPTION: (1) Atmospheric Particle Chemistry. The purpose of this study is to characterize the atmospheric pollutants, especially ammonium sulphate-sulfuric acid particles, and to elucidate the mechanisms by which they are formed and dispersed. (2) Sulfur-Emission Control Studies. The purpose of this study is to understand the basic processes involved in the cyclic use of solid absorbents as retainers of sulfur combustion products in the use of coal.
APPROACH: (1) Atmospheric Particle Chemistry. This study is carried out by developing rapid, quantitative analytical methods for collecting, characterizing and studying the mechanisms by which atmospheric particulate pollutants derived from the combustion of sulfur in fossil fuels are formed and dispersed in the atmosphere. (2) Sulfur-Emission-Control Studies. This study involves the application of thermodynamic and kinetic studies to high temperature systems in which dolomite is used as a scavenger for sulfur oxides. Regeneration of the absorbent is one of the important goals of this program for both economic and environmental considerations.
RESULTS: (1) Atmospheric Particle Chemistry. A knowledge of the factors affecting the formation and transport of ammonium sulfate particles associated with the combustion of fossil fuels. (2) Sulfur-Emission Control Studies. An understanding of the processes by which dolomite or limestones can be used to fix the oxides of sulfur formed in the combustion of fossil fuels.
PROJECT MILESTONES: (1) Atmospheric Particle Chemistry. Among the milestones projected for this study are: (a) Knowledge of detailed kinetics of chemical reactions, e.g., hydrolysis and oxidation of the sulfur-oxides and their salts. (b) Knowledge of the factors affecting the transport of particulate pollutants and their lifetime in the atmosphere. (2) Sulfur-Emission-Control Studies. (a) The development of a method for the rapid economical regeneration of the sulfur absorbent. (b) The development of basic knowledge relating the morphology of absorbent-pollutant structures to their efficiency.

PROJECT DESCRIPTION: To establish the spectroscopic foundation for long-path infrared absorption monitoring of gaseous atmospheric pollutants using diode lasers, and to design and evaluate new measurement techniques based on the diode laser so that simple and reliable routine monitoring devices can be made.
APPROACH: Unlike present hit-and-miss approaches in determining the proper spectral regions for absorption measurements, we start from comprehensive spectroscopic information to predict where reliable spectral lines occur for each of the pollutants. A systematic search for all of these analytical lines is made and further refined by experimental measurements. For the continued development of the proper instrumentation for routine monitoring, we designed a unique double-beam technique where the background is automatically compensated for, so that more reliable measurements are possible.
RESULTS: We expect to compile and make available critical spectroscopic information for infrared absorption monitoring of the atmosphere for every pollutant of interest, particularly the oxides of nitrogen, the sulfur compounds, the simple hydrocarbons, aldehydes and ketones. With this information, we expect to be able to design and properly evaluate measurement techniques, to include existing methods and new concepts. Our predictions of the best analytical spectral lines will be immediately useful in existing monitoring schemes based on infrared absorption.
PROJECT MILESTONES: (1) FY 1977 Comprehensive results on nitrogen oxides. (2) FY 1979 Comprehensive results on sulfur compounds evaluation scheme for on-site measurements developed. (3) FY 1981 Comprehensive results on aldehydes and ketones scheme for combustion diagnostics developed. (4) FY 1983 Comprehensive results on simple hydrocarbons.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To develop and expand upon our existing capabilities for measuring the levels of trace metals in various types of specimens. Methods developed are applicable to (1) air pollution studies, (2) water pollution studies, (3) evaluating the effects of trace metal pollutants on biological systems, and (4) geochemical studies.
APPROACH: Various methods of compensating for matrix effects in x-ray fluorescence analysis (XRYA) are being developed. These include (1) the application of thin specimen preparation techniques where matrix effects can be minimized and (2) the use of the Compton scattered excitation radiation intensity as a measure of the mass absorption coefficient to correct for matrix absorption effects when analyzing geochemical specimens. Study the release of heavy metals from naturally occurring organic matter after oxidation with ozone by anodic stripping voltametry (ASV).
RESULTS: Accurate XRTA methods will be established for trace analysis of both coal and geochemical specimens. Also we will continue to collaborate in ongoing air pollution and gas particle interaction studies. Ozone

will be developed as a general reagent for the oxidation of trace organic matter prior to the analysis of trace metals by ASV and other techniques.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Extremely complex, sunlight-initiated reactions of trace gas pollutants form condensation nuclei (cn) which eventually become the sulfate, nitrate and organic aerosols which are responsible for many detrimental effects to man and his environment. The key to improved characterization of gas-to-particle processes is the quantitative description of the chemical reactions leading to nuclei formation, the chemical and physical properties of nuclei and their subsequent evolution. We are involved in a comprehensive study of these nuclei-forming reactions initiated under controlled conditions in gases excited by UV-light and ionizing radiation, using both pulsed and steady-state sources. These studies have developed into a unique method for determining gas phase reactivities of many important transient species involved in atmospheric chemistry.
APPROACH: The nuclei detection instrumentation we have developed over the past four years places us in a unique position to study gas-to-particle processes. We are able to detect, size, and count embryonic nuclei of near-molecular dimensions (5 A to 100 A) whereas other nuclei counters are seldom reliable even down to 500 A. It is specifically those aerosols in the submicron region which are of greatest biological significance. The research on rate constants of atmospheric reactions measurable by this technique is related to measurements of radical rate constants by pulse radiolysis.
RESULTS: The original version of the Argonne cn discriminator (ACND-I) gave quantitative results only with mono-disperse nuclei distributions (10 to 250 A dia) and thus has been abandoned in favor of ACND-II which is able to discriminate any nuclei distribution between 5 and 1000 A sizes. Considerable modifications and improvements to ACND-II have been effected. The reproducibility and high resolution allows us to obtain detailed kinetic results for the reaction of OH or HO/sub 2/ radicals in nuclei-forming reactions with SO/sub 2/ by competitive kinetics. The change in nuclei yield in the presence of inhibitors is yielding rate data for OH plus SO/sub 2/, CO, CH/sub 4/ and H/sub 2/, and HO/sub 2/ plus SO/sub 2/, NO and NO/sub 2/, each an important process in atmospheric chemistry.
PROJECT MILESTONES: Results of this research are presented at appropriate scientific meetings and published in scientific journals as appropriate units of the work are completed.

PROJECT DESCRIPTION: The purpose of this program is to develop an understanding of the chemistry of iodine and other selected fission products in aqueous and organic systems. Specific concerns involve: (1) the determination of the quantities and chemical forms of significant fission product species in aqueous process solutions; (2) an examination of possible interactions among various fission product species in process streams; and (3) the development of alternate, more efficient methods for fission product control as a result of expanded understanding of the chemistries of the fission products.
APPROACH: Fruitful research areas are identified in close consultation with personnel in the LWR and LMFBR fuel reprocessing projects.
RESULTS: The ultimate goal of this effort is to develop improved methods for minimizing radioactive effluents from nuclear fuel reprocessing plants.
PROJECT MILESTONES: Technical information generated in this project is disseminated through widely available technical journals and, where applicable, through patents. Papers which will appear or be completed within the next 12 months concern a process for electrolytic trapping of iodine from gas streams, a method for

the prediction of the operation of the Iodox iodine trapping system based on equilibrium and kinetic principles, a process for removal of iodine from reactor fuel solutions by precipitation as insoluble palladium iodide, and the oxidation of organic compounds by hyperazeotropic nitric acid.

PROJECT DESCRIPTION: To utilize the results of many years of basic research on the chemical reactions of fluorine with inorganic materials to develop solid absorbents for radon and xenon and to apply these absorbents to problems associated with uranium mining and to other portions of the nuclear fuel cycle where emissions of radioactive rare gases must be measured or controlled.
APPROACH: Chemical methods have recently been developed for the collection of radon and xenon, the two heaviest noble gases. This approach has a number of advantages as compared to physical methods, such as cryogenic distillation, charcoal adsorption, solvent extraction and permselective-membrane diffusion, which have been known for some time. The gases can be collected at ambient temperature, for example, in small beds of reagents. They can also be separated from each other and from lighter noble gases by selective oxidation. These new methods, which are potentially useful for analyzing radon and xenon isotopes in the atmosphere, reducing emissions from nuclear power plants and fuel reprocessing plants, recovering stable xenon isotopes, and trapping xenon-133 in nuclear medical facilities, are currently being investigated at Argonne.
RESULTS: We have now developed a new method for analyzing radon gas in uranium mine atmospheres. Present methods of analysis for the gas are cumbersome and inaccurate, requiring that the radon concentrations be inferred from the radioactivity of the daughters in the radon decay chain. In the new method, an air sample is drawn through a tube of drying agent and a small plastic cartridge containing 1-2 g of O/sup +//sub 2/SbF/sup -//sub 6/. The radon is quantitatively captured. The gamma emission of the cartridge is then measured with a scintillation counter. In developing this method, five types of cartridge were designed and tested with samples of air containing 5 to 15,000 pCi/l of radon-222 to determine the effect of height, volume and reagent loading upon collection and counting characteristics. The method was shown to have a precision of approximately 2% which is comparable to that of the best laboratory method now in use for measurement of radon.
PROJECT MILESTONES: Results of this research are presented at appropriate scientific meetings and published in scientific journals as appropriate units of the work are completed.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To utilize pulse radiolysis methods to study free radical reactions occurring in the combustion of organic compounds.
APPROACH: The combustion process is complex, involving competing, sequential and branching reactions. With our pulse radiolysis technique we can isolate for study, individual reactions involving chain carriers such as OH and HO/sub 2/, and follow the buildup and decay of the individual transient species. We can also examine end products of the simplified reactions using a sensitive mass spectrometric technique. Our techniques simultaneously give us information related to the more efficient combustion of fossil fuels and to understanding and minimizing the consequent pollution effects. Although these radicals are generated photochemically in the atmosphere, pulse radiolysis is the most effective technique for studying their reactions in the laboratory.
RESULTS: Rate constants reported for the very important atmospheric reaction HO/sub 2/ + HO/sub 2/ yields H/sub 2/O/sub 2/ + O/sub 2/ have varied by more than a factor of two. We have determined that the reported discrepancies can be explained by the presence of water vapor, since HO/sub 2/ and water form a relatively stable complex which influences the rate of recombination of HO/sub 2/ radicals. Work is continuing on this reaction in the presence of third bodies of varying polarity. We are beginning research on the reactions of HO/sub 2/ with SO/sub 2/, NO and NO/sub 2/ and are extending our program to determine the

reactivity of OH and HO/sub 2/ with organic compounds.
PROJECT MILESTONES: Results of this research are presented at appropriate scientific meetings and published in scientific journals as appropriate units of the work are completed.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: This program consists of a study of the application of cyclic separation processes to problems arising in the technology of energy production and utilization. The cyclic processes of interest include pressure swing adsorption, heatless adsorption, parametric pumping, cycling zone adsorption, and various forms of preparative chromatography. Applications presently under study involve isotope separations of interest in nuclear reactor technology. Of special interest is the development of cyclic separations processes for the removal of tritium from reactor fuel processing plant effluents, heavy water moderator, and CTR streams.
APPROACH: The program involves process design studies, experimental measurement of equilibrium and kinetic properties of selected fluid-solid separation systems, and measurement of characteristics of cyclic separation processes employing these systems.
RESULTS: Processes will be developed to the bench- or pilot-scale stage for tritium removal from fuel processing plant effluent, heavy water moderator, and CTR streams.
PROJECT MILESTONES: Measurements will be made of the T-H equilibrium separation factor between H/sub 2/-HT and vanadium monohydride and of the kinetics of the exchange reaction in flow systems by September 30, 1977. The performance of a single stage of the heatless adsorption process for tritium separation using the vanadium hydride-hydrogen system will be examined by September 30, 1978.

PROJECT DESCRIPTION: Our goal is to work out the basic chemistry of sulfur dioxide and chemicals formed from it under conditions that are relevant to the emission of SO/sub 2/ from the burning of coal and oil. This will include the basic chemistry appropriate to various methods of removing SO/sub 2/ from stack gases.
APPROACH: The studies to date have centered on the aqueous solution chemistry of SO/sub 2/. Raman and ultraviolet spectroscopy are being used to characterize species and to determine equilibrium constants. Nuclear magnetic resonance will be used to measure exchange rates. The rates and products of disproportionation and oxidation reactions will be studied. A limited amount of effort has been devoted to the reaction of SO/sub 2/ with ammonia.
RESULTS: The results should provide a firm chemical basis for the modification, improvement and development of processes for removal of SO/sub 2/ from stack gases.

PROJECT DESCRIPTION: To perform research and development of analytical methodology in the identification and quantification of constituents in fossil fuel processes which may be hazardous to environmental health and safety.
APPROACH: Samples will be obtained from private sources and collaborating agencies. These, in conjunction with synthetic mixtures, will be used to develop the techniques for analyzing classes of organic compounds in any complex and/or natural matrix as well as for trace metals. Identification of organic materials will be made using low and high resolution mass spectrometers coupled with gas chromatographs (GCMS). Identification and analysis of trace metals will be made using spark source mass spectrometric isotope dilution techniques (IDSSMS).
RESULTS: Methods for the analysis of possibly harmful organic materials in fossil fuel conversion systems should be developed with confirmation by mass spectral analysis using a combination of GCMS. Multielement capability of trace metals in both organic and aqueous systems is expected using IDSSMS techniques.
PROJECT MILESTONES: (1) Development and improvement of ion sources for low resolution organic mass spectrometry. The ''dry spike'' method of isotope dilution spark source mass spectrometry will be further investigated. (2) Methods will be developed by GCMS for the identification and analysis of organic components in complex mixtures. (3) Analysis of organic mixtures and chromatographic effluents will be studied by field ionization techniques. (4) Investigate the use of a channel electron multiplier array (CEMA) electro-optic ion detection system for spark source mass spectrometry (SSMS). (5) Analysis of trace metals by SSMS using the CEMA electrical detection system.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To carry out basic study of homogeneous and heterogeneous bubble nucleation and explosive boiling, and measurement and calculations of the properties of metastable fluids. The purpose is to understand the properties of metastable liquids and the mechanisms of contact-vapor explosions which are of concern in the operation of nuclear reactors, in metallurgical and smelt processing, and in the transport and storage of liquefied natural gas (essentially methane).
APPROACH: The measurement of the pressure-volume-temperature properties of stable and metastable fluids will permit the devising of equations of state for the study of explosions in the complex systems of interest.
RESULTS: Equations of state for metastable liquids near critical temperature. These results, all of which could be reliably extrapolated to the thermodynamic limit of superheat, have shown that the thermodynamic limit of superheat was significantly higher than the kinetic limit.
PROJECT MILESTONES: Two reviews of bubble nucleation in liquids have been completed, which detail the relation of bubble nucleation to contact-vapor explosions and other phenomena. Three equations of state have been devised for liquid argon, ethane and hexane near the critical temperatures. These efforts will continue and will be extended to more complete coverage of hazardous systems.

TITLE: Partitioning and Concentration of Long-Lived Radioelements from Reactor Wastes
PROJECT NUMBER: ANL 54400, Part C
PRINCIPAL INVESTIGATOR: Horwitz, E.P.
ADDRESS: 9700 South Cass Avenue, Argonne, IL 60439
AFFILIATION: Argonne National Lab., Ill. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Office of Molecular, Mathematical and Geosciences, Division of Physical Research
MONITOR: Haubach, Walter J.
TELEPHONE: F233-3167
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$215,000
TECHNOLOGY: NUCLEAR/Fission (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: RADIATION/Actinides and fission products (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: On the basis of waste compositions, half-lives and biological effects, it is concluded that the major long-term biological hazards in reactor wastes will be Pu-239 and Am-243, the former far

outweighing the latter in impact. This is based on the fact that when taken into the body, these elements are extremely potent bone-seeking carcinogens. They are present in the wastes because approximately 0.5% of the plutonium and essentially all of the americium and curium are left behind in the processing of spent fuel as currently practiced. Our objective is to develop methods for removing these nuclides (and other actinides and long-lived fission products) from wastes so that these materials can be handled more simply as separated wastes or utilized for practical purposes.
APPROACH: Our approach to a solution of this problem is to attempt to develop a specific reagent or a series of reagents to be used in a liquid-liquid extraction (LLE) system requiring no prior preparation of the waste solutions. Through use of such a reagent (or reagents), maximum removal of the transuranics can be achieved without increasing the volume of waste (excess water may be evaporated off, if desired) and without the use of additives with their economic and practical drawbacks. In our approach, the elements chosen for primary investigation for extractability are plutonium and americium. (An accompanying secondary study of curium is made and certain long-lived fission products may eventually be studied in a similar fashion.)
RESULTS: Some of the new extractants that we have prepared and studied show efficiencies equal to or exceeding those for our previously reported extractants which removed >99.99% of the ''non-extractable'' plutonium in a single contact. Some of these new extractants also show great improvement in the rate of reaching the maximum extraction value. Some of our new other formulations, especially those of (GO)(ClCH/sub 2/)P(O)OH-type, have been shown to be orders of magnitude more efficient in removing Am, Cm and selected M(III) lanthanides than extractants previously investigated. Studies to determine the degree of polymerization of plutonium in both aqueous and extractant-organic phases and to determine the effect of other polymeric metal species on the extraction of plutonium have been initiated.
PROJECT MILESTONES: Research results are reported at scientific meetings and published in the literature as appropriate segments of the work are completed.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS/NO/sub x/ (75%);SPECIFIED OTHER POLLUTANTS/Organic chlorides (25%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: (1) Characterization, measurement, and monitoring: A ground-based method is being developed that may be able to measure the total vertical column and the approximate vertical distribution of nitrogen dioxide in the stratosphere. (2) Environmental transport-physical and chemical processes and effects: The objective is to obtain an improved understanding of the global effect of stratospheric pollution, in particular from stratospheric aircraft, from organic chlorides, and from nitrous oxide.
APPROACH: (1) A small telescope, spectrometer, optical multichannel analyzer, and minicomputer are used to follow light directly from the sun and from Rayleigh-scattered zenith sky light during sunrise or sunset. (2) Laboratory studies are made of elementary chemical and photochemical reactions for which rate constants are needed for model calculations in the atmosphere, and such model calculations are made.
RESULTS: (1) By the end of calendar 1976, we hope to have established the feasibility (or not) of the method being used. (2) The results expected are new rate constants for reactions involving HO, HOO, Cl, ClO, and NO/sub 3/ free radicals and for molecular N/sub 2/O/sub 5/.
PROJECT MILESTONES: (1) If the method is feasible, the apparatus will be simplified to a maximum possible extent, and another simpler system will be built. (2) Each new or better rate constant is a goal in itself, and it can be entered in tables of such values used by modelers of atmospheric reactions or of other processes involving the same reactions.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Understanding of the chemical processes involved in the solar photolysis of chlorcfluorocarbon compounds, and the subsequent consequences of this introduction and removal of chlorine and other halogen atoms into the stratosphere. One major effect involves the reactions of chlorine species with ozone, and the possibility of substantial depletion of the natural ozone in the stratosphere.
APPROACH: (1) Laboratory measurement of the cross-sections for absorption of solar ultraviolet and visible radiation by molecules of stratospheric interest, including CCl/sub 2/F/sub 2/, CCl/sub 3/F, CClFO,

ClONO/sub 2/, etc. (2) Laboratory measurement of chemical reaction rates pertinent to stratospheric chlorine chemistry. (3) Computer calculations of atmospheric profiles for various chemical compounds, including CCl/sub 2/F/sub 2/, CCl/sub 3/F, CClFO, etc. (4) Consideration of the physicochemical processes for removal of halogen-containing molecules from all parts of the atmosphere.
ESULTS: (1) Completion of above tasks. (2) Formulation of new problems in response to results and/or interpretations of experiments described above. The results should aid in control decisions on the possible ban of certain chlorofluorocarbon compounds (and exclusion of others) because of the hazard of stratospheric ozone depletion.
PROJECT MILESTONES: (1) No scheduled decision dates. (2) No dates scheduled for completion of particular instruments, or for particular research tasks among those listed above. (3) Next scheduled project report: September, 1977. (4) Reports on completed phases of the scientific work as each phase reaches a suitable stage of completion.

POLLUTANTS: METALS/Cadmium;METALS/Zinc;METALS/Mercury;METALS/Lead (100%)
CHARACTER OF STUDY: RESEARCH/Applied (50%);DEVELOPMENT/Laboratory scale (50%)
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: (1) To develop highly selective methods of separation of certain metals for use in analytical procedures. (2) To determine extraction constants for new metal extraction systems. (3) To develop laboratory procedures which have potential of being scaled up for rapid, simple and inexpensive methods of detoxification and removing impurities from industrial waste water. (4) To determine various properties of metal complex-HMWA compounds such as their solubilities and stabilities.
APPROACH: (1) Screen various toxic metal ions such as Cd, Zn, Pb and Hg with commercially available high molecular weight amines. (2) Develop laboratory methods for systems which show promise from screening studies. (3) Apply the developed methods to the detoxification of actual industrially polluted water on the laboratory scale.
RESULTS: Methods to be recommended which can be scaled up to economically remove cadmium, zinc, lead and mercury ions from industrial waste water.
PROJECT MILESTONES: Much of the basic research has been completed. Two research papers have been published.

ENERGY CYCLE: COMBUSTION OR END USE (100%)

POLLUTANTS: NOXIOUS GAS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Ours is an experimental program for determining the concentration, and in some cases th isotopic composition, of the trace gases, studied as far as possible in minimally polluted atmospheres. The ultimate objective is to contribute information for understanding of the natural cycle of each of these gases in order to be able to assess the effect of technological emissions on the troposphere and stratosphere. One need is to carry out accurate determinations of the concentration of the trace gases. These measurements are difficult to make because of the extremely low concentrations in which the gases occur, and in some cases because of chemical reactivity.
APPROACH: In the case of gases, mass spectrometric methods are generally the most reliable and accurate of all analytical methods. Determinations of the isotopic composition of the gases are made, where possible and useful, for establishing the sources to the atmosphere, whether natural or anthropogenic. The Argonne 100-inch radius research mass spectrometer is a particularly valuable tool in this connection.
RESULTS: The first part of the carbon monoxide program consists of completing the development of a mass spectrometric method for the determination of carbon-14 in milligram quantities of carbon. This technique will then be applied to the analysis of carbon extracted from atmospheric CO in order to provide an added tool for deducing the source and life cycle of the gas. The second part of our program consists of systematic seasonal studies of atmospheric CO in both the northern and southern hemispheres. The results for the northern hemisphere will be valuable for comparison with the data from our studies in 1969-1971 in showing the effects of emission controls introduced in the U.S. Measurements of the concentration of N/sub 2/O in a small number of stratospheric air samples collected between 1971-1975 have also been carried out. The results are valuable in fixing the vertical eddy diffusion mixing coefficient in the stratosphere, an important factor in models of the stratospheric ozone cycle.
PROJECT MILESTONES: Results of this research are presented at appropriate scientific meetings and published in scientific journals as appropriate units of the work are completed.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objective of the program is to obtain fundamental information on separation of tritium from materials associated with thermonuclear (fusion) or fission reactors. The hazards of tritium will impose restraints on future nuclear reactors and will have an especially large impact on the applications of fusion reactors where the quantities of tritium involved will be several orders of magnitude greater than those for fission reactors. Concentrations of tritium in the blanket and coolant materials of fusion reactors must be maintained very low (less than 1 ppm) to prevent embrittlement of structural materials, to hold inventories to acceptable levels, and to limit the rate at which tritium is released to the environment.
APPROACH: This program incorporates fundamental studies of techniques needed for separating and handling tritium for fusion reactors, but many of the results are also useful to fission reactor programs. Guidance and direction for this program is provided by mission-oriented development efforts for an experimental fusion power reactor which is currently in progress at ORNL. Those applied development programs frequently encounter needs for fundamental data and studies which are appropriate for this program. Fusion reactors are particularly new and novel devices, and the needs for such studies are numerous.
RESULTS: Current efforts are providing information for evaluating methods for recovering tritium from liquid lithium blankets and from solid blankets of aluminum and sintered aluminum product (SAP), containment of tritium permeating through metal vessels and piping, and transfer of tritium via deep sorption beds. These results are having immediate impact on conceptual designs of reactor systems.
PROJECT MILESTONES: This project includes a variety of studies reported in open literature papers and reports. Each paper represents a near term milestone. Long range goals of this project include providing some of the fundamental information needed to meet milestones in the applied development programs. The fusion reactor program plans to build an experimental power reactor in the 1980's and a demonstration reactor in the 1900's.

PROJECT DESCRIPTION: The purpose of this program is to provide basic technical information required for treating waste streams in nuclear fuel reprocessing plants. The Nuclear Fuel Cycle and Production Division of ERDA has established a program at ORNL on Waste Management Analysis for Nuclear Fuel Cycles, and an important aspect of the evaluation is to investigate the feasibility of removing the long-lived, hazardous materials (primarily actinides) from wastes generated in the nuclear fuel cycle for commercial power reactors. The program described here will provide supplementary information needed for developing feasible process methods. Studies will include (1) investigation of ''inextractable'' plutonium, (2) control of neptunium and plutonium valences, (3) application of fused salt processing methods for treating solids, and (4) methods for removing americium and curium from high-level waste.
APPROACH: Small-scale experiments will be carried out in hot cells with high-burnup fuel and in laboratories with non-radioactive, synthetic process solutions.
RESULTS: Basic technical information on the chemical behavior of actinides and fission products will be published.
PROJECT MILESTONES: Research results are reported and published as appropriate.
KEYWORDS: RADIOACTIVE WASTE PROCESSING;ACTINIDES;SEPARATION PROCESSES;PLUTONIUM;AMERICIUM;CURIUM;FISSION PRODUCTS;NEPTUNIUM

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The project objective is to conduct an environmental analysis of the impact of the fusion energy development program.
APPROACH: Each of the principal types of fusion reactors will be examined, and the general nature of the environmental impacts will be estimated. These impacts then will be compared to the impacts for other power plants expected to be operating at the time fusion power plants are introduced. Potentially adverse impacts will be studied to determine (1) the research and development efforts necessary for defining impacts, and (2) possible methods for reducing impacts.
RESULTS: An environmental analysis report will be published, summarizing the results of the project. This will be supplemented by a series of topical reports, each providing more detailed information in specific areas of the analysis and providing reference and guidance for future R and D.
PROJECT MILESTONES: (1) Issue draft environmental analysis December 1975. (2) Complete publication of Topical Reports November 1976. (3) Issue environmental Analysis Report December 1976.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To complete an Environmental Impact Assessment (EIA) for the Solar Heating and Cooling of Buildings (SHACOB) Program. (1) Assess the environmental implications of the widespread deployment of solar technologies. (2) Construct comprehensive environmental development plans. (3) Assist ERDA decision makers in reaching budget decisions and project choices.
APPROACH: (1) Collection of environmental data related to solar technologies. (2) Environmental and socio-economic assessment of solar technologies. (3) Comparative analysis of various supply technologies. A general Environmental Assessment has been completed for the SHACOB program and will be used as the basis for the EIA of that program.
RESULTS: (1) Program plan for environmental assessments. (2) Expansion of the decision variables available to management.
PROJECT MILESTONES: Final report due September 7, 1976.

77 FUNDING: Energy Research and Development Administration FY77:$75,000
TECHNOLOGY: SOLAR/Direct heat - cool (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Fluids and additives (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine the transport and effects of fluids and additives in soils, and to analyze the paths for entry of fluids into groundwater supplies.
APPROACH: (1) Estimate the capacity of various soils to absorb the fluids and additives, and the effects of these fluids on soil chemistry and microbiology. (2) Investigate the effects of working fluids on vegetation, particularly those plants commonly grown near residential and commercial buildings. (3) Determine the movement of fluids through various soils, geologic formations, and groundwater supplies. (4) Estimate the concentration of working fluids expected in groundwater supplies following leakage from heating and cooling systems, and the risk of contaminating municipal and private water supplies. (5) Determine the effect of working fluids on residential septic systems. (6) Consider the pattern of working fluid leakage expected from normal operations, overheating, and fire.
RESULTS: (1) As a protection for human health, estimates of the potential danger of working fluids leakage to septic systems, municipal and private well systems will be available. (2) The effect of leaked fluids on lawns, gardens, and natural vegetation near residential and commercial buildings utilizing solar heating and cooling will be available to mitigate potentially expensive damage to flora.

CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY:OS
PROJECT DESCRIPTION: To identify and to promulgate a list of acceptable material, heat transfer fluids and storage media used in solar home heating and cooling units.
APPROACH: (1) For FY 1977 the list of candidate materials will be reviewed for acceptability of toxicity, flammability, economics, and engineering properties as defined in the literature. A publication, identifying those acceptable materials, will be made available to the public. (2) For FY 1978 those materials which required experimental confirmation of acceptability will be reviewed and a supplementary publication will be prepared.
RESULTS: Resolution of a major uncertainty related to solar home heating and cooling units.
KEYWORDS: SOLAR AIR CONDITIONERS;SOLAR HEATING SYSTEMS;WORKING FLUIDS;TOXICITY;FLAMMABILITY;ECONOMICS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT;ECT;OS
PROJECT DESCRIPTION: To prepare for the eight Solar Technologies and Environmental Development Plan which will be used as a chapter in their respective program planning documents.
APPROACH: A team from ERAB, the technology and the contractor will participate in the preparation and review of EDPs. Each EDP will review the status of the technology and any relative environmental and safety research. Further, environmental and safety issues will be outlined, and a research plan presented to develop needed information. The research plan and legislative environmental requirements will then be folded into the technology development plans.
RESULTS: The EDP will provide an environmental research plan that is in step with the technology. Thus most environmental and safety issues will be identified early in the R and D phase of the technology so mitigation or control can be developed before widespread rise.
KEYWORDS: SOLAR ENERGY;SAFETY;ENVIRONMENTAL IMPACTS;PLANNING;PHOTOVOLTAIC CELLS;OCEAN THERMAL ENERGY CONVERSION;SOLAR ENERGY CONVERSION;HEATERS;SOLAR HEATING SYSTEMS;SOLAR AIR CONDITIONERS;AGRICULTURE;INDUSTRY;PROCESS HEAT;WIND POWER;WIND TURBINES

TITLE: Preliminary Assessment of the Impact of Solar Collectors on Desert Ecosystems
PRINCIPAL INVESTIGATOR: Patten, D.T.
ADDRESS: Arizona State Universty, Tempe, AZ 85281
AFFILIATION: Arizona State Univ., Tempe (USA). Dept. of Botany and Microbiology
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Office of Solar, Geothermal and Advanced Energy Systems
MONITOR: Frankel, Eugene
TELEPHONE: F376-4478
77 FUNDING: Energy Research and Development Administration FY77:$20,000
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) To develop methodological guidelines for the systematic evaluation of the impacts of solar collectors on desert ecosystems. (2) To develop a research plan to monitor ecological impacts at a collector site or simulated model of collector array.
APPROACH: This will be a planning study to evolve a detailed research plan. The investigator will determine: (1) The instruments, measurements, and experiments required and the results expected from each. (2) The advantages and disadvantages of building a simulation model vs. monitoring an actual site. (3) Methods for monitoring the effects of construction and routine operations. (4) Detailed characteristics of a simulation model should one be required. Investigator will search existing literature and meet with officials responsible for solar thermal electric demonstration plants at Albuquerque and Barstow.
RESULTS: ERAB intends to fund an extensive monitoring program to determine the effects of arrays of solar collectors on the desert ecology. This study will enable us to take the most intelligent approach and resolve certain methodological problems at an early date.
KEYWORDS: SOLAR COLLECTORS;TERRESTRIAL ECOSYSTEMS;DESERTS;ENVIRONMENTAL IMPACTS;MONITORING;SIMULATION;EVALUATION;ECOLOGY

<094064>
TITLE: Assessment of Environmental and Occupational Health Effects of Photovoltaic Cell Manufacturing
PRINCIPAL INVESTIGATOR: Boeniger, M.
ADDRESS: 4676 Columbia Parkway, Cincinnati, OH 45226
AFFILIATION: National Inst. for Occupational Safety and Health, Cincinnati, Ohio (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Office of Solar, Geothermal and Advanced Energy Systems
MONITOR: Frankel, Eugene
TELEPHONE: F376-4478
TYPE OF FUNDING: Interagency agreement-ERDA
77 FUNDING: Energy Research and Development Administration FY77:$200,000
TECHNOLOGY: SOLAR/General (100%)
POLLUTANTS: NOXIOUS GAS (40%);METALS (30%);PARTICULATES (30%)
CHARACTER OF STUDY: RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine the levels of emissions of toxic chemicals in the manufacture of silicon, cadmium sulfide and gallium arsenide solar cells. To determine the health effects of these emissions at the manufacturing plant and the immediate surroundings. To recommend control options for reducing emissions and preventing exposure.
APPROACH: Investigators will perform, at minimum, the following tasks: (1) Doping Compounds Emissions, Concentrations, and Effects Evaluation for Silicon Cells. (a) Ambient air levels of boron trichloride (BCl3) and phosphine (PH3) in and around photovoltaic silicon cell manufacturing plants shall be monitored and potential levels of exposure on and off-site estimated. (b) Health effects studies (literature review and laboratory research) will be carried out to identify chronic exposure effects of these compounds at or near the observed concentrations. (c) If ambient levels are commensurate with potential adverse effects, control options for reducing emissions or preventing exposure will be evaluated. (2) Integrated Analysis of the Cadmium Emissions Associated with Cadmium Sulfide Cell Production. (a) For each step in CdS cell manufacturing--mining, purification, CdS production, and cell fabrication--an inventory of cadmium use and associated emissions to air, water, and solid waste will be prepared. Where adequate estimates of emissions are not available, emission sampling will be performed. The inventory will show the amount of emissions and the physical and chemical form of the emissions. (b) Ambient monitoring of cadmium air levels within these facilities will be carried out and representative exposure for workers and nearby residents estimated. (c) Long-term CdS inhalation toxicity studies will be performed at levels commensurate with those identified
RESULTS: Occupational health effects due to exposure to toxic emissions in the manufacturing process are among the most serious environmental impacts of solar cell technology. This project will provide a generic environmental and occupational health assessment of the principal photovoltaic cell manufacturing processes. It will help fulfill ERAB's obligation to monitor and suggest control measures for important environmental effects of solar energy development.

TITLE: Over-Temperature and Fire Hazard Investigation of Residential Solar Heating-Cooling Systems (SHAC)
PRINCIPAL INVESTIGATOR: Benjamin, I.
ADDRESS: National Bureau of Standards
AFFILIATION: National Bureau of Standards, Washington, D.C. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Safety, Standards and Compliance
MONITOR: Weintraub, Arnold
TELEPHONE: F353-5610
TYPE OF FUNDING: Interagency agreement-ERDA
77 FUNDING: Energy Research and Development Administration FY77:$50,000
TECHNOLOGY: SOLAR/General (100%)
POLLUTANTS: NOXIOUS GAS (50%);METALS (10%);PARTICULATES (10%);SPECIFIED OTHER POLLUTANTS/Toxic liquids (30%)
PROJECT DESCRIPTION: To analyze the structural characteristics and operational functions of various heating and cooling designs under consideration by ERDA in order: (1) To determine the potential for seepage or introduction of toxic or hazardous substances into areas accessible to people in over-temperature conditions and before, during, or after a fire. (2) To develop countermeasures, where necessary, to safeguard the occupants and the dwelling.
APPROACH: (1) Conduct engineering analysis of 8 to 10 different systems under development, either partially or wholly by ERDA. (2) Subject systems to over-temperature and fire conditions to identify design features that could result in system or component failures leading to: (a) Seepage or introduction of toxic or hazardous substances into living or working areas. (b) Ignition of roof or other portion of building structure. (3) Determine nature of design and/or material defects. (4) Develop recommendations to improve design and/or upgrade materials to withstand the adverse effects of over-temperature and fire.
RESULTS: The safety of residential SHAC systems with respect to over-temperature and fire will be documented as adequate or the method for upgrading their safety to an acceptable level will be developed. Data for development of improved safety standards will be available.

PROJECT DESCRIPTION: To evaluate methods of treatment, packaging, interim storage, transporting and disposal or recycling of selected toxic or hazardous chemicals, e.g., transfer fluids, that have completed their service life in Solar Heating and Cooling (SHAC) systems.
APPROACH: 1. Evaluate the safety of proposed methods to be used for treatment, packaging, interim storage, transporting, disposal or recycling of the acceptable working fluids. 2. Identify the need for new or improved methods to meet the objective.
RESULTS: At the present time, there are no established means of disposal of the finite lifetime chemicals of SHAC systems. As a result, toxic liquids may be discarded in municipal sewage systems or directly on the ground.

TECHNOLOGY: SOLAR/Direct heat - cool (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;OS
PROJECT DESCRIPTION: Conduct hazards assessment as needed to define and quantify health effects associated with the large-scale utilization of solar heating and cooling of buildings.

APPROACH: (1) The results of the preliminary toxicological survey will be reviewed and evaluated by toxicologists. (2) Toxicological testing will utilize a multi-tier approach employing a series of test systems of different biological complexity. To the extent possible, rapid screening in simple biological systems (microorganisms, Drosophila, or mammalian cell culture) and short-term testing in intact animals will be emphasized. (3) Quantitative dose-response data will be used to develop predictive models applicable to human exposures; to the extent possible, such models will be validated against human data.
RESULTS: Output from the testing effort will help to (1) develop human exposure guides, (2) define needs for control technology, (3) guide decisions regarding technology advancement, (4) develop cost/risk/benefit analyses, and (5) prepare comprehensive environmental impact statements.

CHARACTER OF STUDY: RESEARCH/Laboratory (20%);DEVELOPMENT/Laboratory scale (80%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Characterize the reaction of liquid lithium with materials likely to be present in fusion facilities and develop materials and methods for extinguishing lithium fires and for removing lithium smoke from the atmosphere.
APPROACH: Perform lab and bench scale tests to characterize the reaction of lithium with air, nitrogen, argon, carbon dioxide, concrete and selected insulating materials. Perform tests to evaluate effectiveness of various lithium fire extinguishing agents and methods. Perform tests with various cleanup systems for removal of lithium smoke and aerosols.
RESULTS: Experimental data characterizing reaction of lithium with air, other gases, concrete, and insulating materials. Recommended procedures and materials for extinguishing lithium fires. Recommended methods and equipment for removing lithium smoke aerosols from ventilation systems. Computer codes to model lithium reactions for safety analysis.
PROJECT MILESTONES: (1) Complete correlation of lithium and sodium hazards September 1979. (2) Complete aerosol air cleaning development September 1980. (3) Complete lithium fire extinguishment tests September 1981. (4) Complete large scale verification tests of lithium spill codes September 1982.

TYPE OF FUNDING: Contract No.-AT(45-1)-1830
77 FUNDING: Energy Research and Development Administration FY77:$90,000
TECHNOLOGY: NUCLEAR/Fusion Magnetic (100%)
ENERGY CYCLE: EXTRACTION (5%);TRANSPORTATION (5%);ELECTRICITY GENERATION (70%);WASTE MANAGEMENT (20%)
POLLUTANTS: METALS (10%);RADIATION (90%)
CHARACTER OF STUDY: ANALYTICAL (100%)
PROJECT DESCRIPTION: To develop recommendations for an Environment and Safety Program Plan for Magnetic Fusion.
APPROACH: Based on information developed in previous, related work in analyzing potential environmental impacts of fusion power, identify key R and D needs and the timing of results needed as input to facility design, safety analysis or environmental impact assessment.
RESULTS: Recommendations for MFE environment and safety program plan, and identification of criteria

specified for environment and safety aspects of fission which may be applicable to fusion. Preparation of draft Environmental Development Plan for Magnetic Fusion.
PROJECT MILESTONES: Complete draft Environmental Development Plan and preliminary identification of applicable safety criteria--October 1977.
KEYWORDS: MAGNETIC FIELDS;ELECTROMAGNETIC RADIATION;SAFETY;RADIATION PROTECTION;TRITIUM;RADIOACTIVE WASTE MANAGEMENT;THERMONUCLEAR REACTIONS;ENVIRONMENTAL IMPACTS;RECOMMENDATIONS;DESIGN

CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY:OS
PROJECT DESCRIPTION: To carry out a comprehensive review and evaluation of the environmental and safety aspects of fusion reactors, and to identify R and D needs.
APPROACH: A series of comprehensive position papers is being prepared on waste management, tritium management, blanket protection and safety, and magnet protection and safety. These will define important factors and problems in each area and will identify R and D programs to develop solutions.
RESULTS: Recommendations will be made for input to an overall MFE environment and safety program plan.
PROJECT MILESTONES: Project completion in FY 1977.
KEYWORDS: THERMONUCLEAR REACTORS;SAFETY;WASTE MANAGEMENT;TRITIUM;MAGNETS;RESEARCH PROGRAMS;RECOMMENDATIONS;ENVIRONMENTAL EFFECTS;THERMONUCLEAR REACTIONS

ENERGY CYCLE: EXTRACTION (20%);WASTE MANAGEMENT (80%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/General (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: (1) Determine attenuation and source characteristics of earthquakes occurring at the Geysers. (2) Differentiate between earthquakes natural to the geothermal area and those induced by production activities. (3) Define active faults at the Geysers, determine cumulative slip with time, and predict cumulative slip if microearthquake activity continues at its present level.
APPROACH: Monitor seismic activity at the Geysers using the Geysers-Clear Lake automated seismograph network augmented by 3 additional stations. Obtain wide band spectral information from 4 three-component seismographs. Collect data over four-month period. Analyze results to determine possible seismic discriminants.
RESULTS: (1) Updated hypocenter map of the Geysers. (2) Magnitude distributions of earthquakes in and out of the geothermal production zone. (3) Temporal variation of seismicity. (4) Fault plane solutions. (5) Seismic moment deformation rates. (6) Source characteristics, rupture propagation, and seismic attenuation.
PROJECT MILESTONES: Submit draft final report--12/30/77.
KEYWORDS: GEOTHERMAL FIELDS;EARTHQUAKES;SEISMIC DETECTION;GEYSERS;MONITORING;SEISMOGRAPHS;DATA ACQUISITION;SEISMOLOGY

HNOLOGY: NUCLEAR/General (100%)
RGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: RADIATION (50%);SPECIFIED OTHER POLLUTANTS/Sludge (50%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/Applied (50%);DEVELOPMENT/Laboratory scale;DEVELOPMENT/Pilot plant (50%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global;COASTS/Other coasts All;HYDROGRAPHIC AREAS/Continental shelf

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The long-term objective is to develop the necessary technology for cost beneficial use of a maximum amount of radioactive waste. New developments have radically altered the cost picture. Sandia develcped process for separating radioisotopes from radioactive waste may compare in cost with current calcining process and the radiation technology developed makes possible sewage sludge treatment a cost-effective way of destroying pathogens.
APPROACH: Technical approach is to be achieved through two major task areas. (1) Task A, Development of a Radiation Applications Technology: (a) Subtask 1, waste resources utilization program for sewage sludge treatment; and (b) Subtask 2, studies of other potential applications. (2) Task B, Separation Technology and Source Development: (a) Subtask 1, development of a separation technology; and (b) Subtask 2, source development.
RESULTS: Successful use of cesium-137 from reactor waste to eliminate pathogens from sewage sludge. The sludge can then be safely used as a fertilizer or possibly an animal feed supplement. Scale up to pilot plant facility based on determined process, accurate cost/beneficial results. Based on operating experience with the pilot plant, engineering data and advice will be provided for the construction of full-scale treatment facility
PROJECT MILESTONES: (1) Develop treatment parameters to kill bacteria, viruses and parasites by end of FY 1978. (2) Complete cost benefit studies by mid FY 1977. (3) Complete pilot plant facility end FY 1978 operation through FY 1980. (4) Begin construction of full-scale plant FY 1979-80. (5) Complete separation technology end FY 1978. (6) Source development of Cs-137 end FY 1979.
KEYWORDS: THERMORADIATION;NUCLEAR ENERGY;SLUDGES;LAND POLLUTION;LAND USE;WASTE DISPOSAL;PUBLIC HEALTH;RADIOACTIVE WASTES;USES;ENVIRONMENTAL EFFECTS;COST BENEFIT ANALYSIS;RADIOISOTOPES;MATERIALS RECOVERY;CESIUM 137;GAMMA RADIATION;HEAT;DISEASES;SEWAGE;PATHOGENESIS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To generate meaningful data on the in-situ marine effects on nuclear fuels for the space program which may be inadvertently deposited in the ocean due to a space mission abort; and to determine effects of heat and radiation on the marine life in proximity to these nuclear fuels.
APPROACH: Long-term, in-situ ocean exposure of solid nuclear fuels samples, clad and unclad, is conducted by placing pellets in perforated cages at shallow depths. Natural occurring and implanted marine life in the cages is periodically sampled and analyzed. The pellets are periodically extracted and examined and after long exposure are returned to laboratory for analysis of effects. Various types of fuels of interest to the space program are placed in the program as they become available.
RESULTS: Data generated in the program is used to assess the risk of utilizing nuclear space systems and to provide information for reducing the risk by inputs to safety design of the hardware.
PROJECT MILESTONES: Results are issued quarterly.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To determine the effects on the atmosphere of large heat releases from cooling towers at energy centers and to develop methods to mitigate the adverse impacts of such releases.
APPROACH: The basic approach is to develop and validate atmospheric models through the use of flight test data and gathering of data on present thermal release situations which approach those of energy centers. The combined efforts of ORNL, ATDL (NOAA), PNL, ANL, RAND Corp. and Penn State University are applied to this effort.
RESULTS: The major result is a viable atmospheric model so as to predict the impact of heat release on the atmosphere and weather. Additionally recommended procedures for mitigating such releases will be developed.
PROJECT MILESTONES: (1) Complete initial atmospheric model 1978. (2) Model operation 1979. (3) Program completion 1981.

TECHNOLOGY: NUCLEAR/Fission Converters (100%)
POLLUTANTS: NOXIOUS GAS/Noble gases;NOXIOUS GAS/Halogens;NOXIOUS GAS/Volatile oxides (10%);METALS/Cesium;METALS/Ruthenium;METALS/Other fission products (20%);PARTICULATES/UC/sub 2/;PARTICULATES/ThC/sub 2/;PARTICULATES/Other fission products (20%);RADIATION (50%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (40%);DEVELOPMENT/Laboratory scale (20%);ANALYTICAL (40%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: (1) Provide information to accurately predict release of fission products to the environment and the effect on public safety during HTGR accident conditions. (2) Determine the need for test facilities to better measure the potential hazard to the public from accident and off-normal HTGR conditions. (3) Develop analytical models and experimental data to better predict HTGR containment atmosphere response during HTGR blowdown accidents. (4) Develop methods to verify the seismic adequacy of critical HTGR components.
APPROACH: (1) Prepare program plan for fission product studies and tests based on a literature search, accident analysis studies, and small-scale scoping tests. (2) Conduct desorption and lift-off tests on material samples removed from the decommissioned Peach Bottom HTGR. (3) Based on the above program plan, survey existing and planned out-of-pile test loops and make a recommendation based on facility cost-effectiveness. (4) Select suitable and important HTGR components appropriate both for analysis and subsequent full-scale testing.
RESULTS: (1) Develop an analytical model which combines fission product release, diffusion, vaporization, gas phase transport, adsorption and desorption from both graphite and metal surfaces...all at high temperatures and low flow rate conditions. Priority effort will be on the release, transport and plateout of iodine in the HTGR environment. (2) Develop a knowledge of blowdown jet and plume behavior among helium, steam and air in the HTGR containment environment. Develop knowledge on forced-convection flow patterns and means to assess the heat transfer coefficients throughout the HTGR containment during accident blowdown conditions.
PROJECT MILESTONES: (1) Issue report on preliminary fission product plateout model Jan. 1977. (2) Complete fuel particle release rate Phase II tests, issue report May 1977. (3) Prepare containment atmospheric response test program Apr. 1977. (4) Design and plan integral loop tests for core heatup Sept. 1977.

TITLE: GCFR Safety Aspects of Fuel and Core
PROJECT NUMBER: 01353
PRINCIPAL INVESTIGATOR: Avery, R.;Sevy, R.H.
ADDRESS: Argonne National Laboratory, 9700 South Cass Avenue, Argonne, IL 60439
AFFILIATION: Argonne National Lab., Ill. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Nuclear Research and Applications
MONITOR: Emon, Donald E.
TELEPHONE: F233-3661
77 FUNDING: Energy Research and Development Administration FY77:$680,000
TECHNOLOGY: NUCLEAR/Fission Breeders (100%)
POLLUTANTS: NOXIOUS GAS/Noble gases;NOXIOUS GAS/Halogens;NOXIOUS GAS/Volatile oxides (10%);METALS/Cesium;METALS/Ruthenium;METALS/Other fission products (20%);PARTICULATES/UO/sub 2/;PARTICULATES/PuO/sub 2/;PARTICULATES/Other fission products (20%);RADIATION/From all of the above (50%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (50%);DEVELOPMENT/Laboratory scale (25%);ANALYTICAL (25%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: (1) The assessment of GCFR safety related fuel and core features under normal and accident conditions to pinpoint safety and design related concerns. (2) The assessment of GCFR core and reactor structure response to core-disruptive type accidents. (3) The evaluation of accident consequences (radiological) to the outside of a GCFR containment building. (4) The formulation of a GCFR safety test program. (5) The design, procurement and assembly of GCFR test trains for in-pile safety tests.
APPROACH: The GCFR designer (General Atomic) will identify the abnormal operations, component malfunctions, and system faults which could lead to a radioactive material release to the reactor containment building. Under this project, CA048, ANL will be developing concurrently a matrix of reactor accidents' consequences in terms of core and/or containment structure damage sequences as a function of the accident energy and time. The General Atomic sets of accident conditions will be the input to ANL's matrix of consequences, i.e., when any specific set of accident conditions is over-laid on the ANL matrix of consequences, a particular set of bounding consequences will be shown.
RESULTS: The following information will be obtained from the code development and analytical efforts, and from the laboratory-scale and engineering-scale test programs funded under this project: (1) fuel motion after loss of cooling; (2) disrupted core behavior; (3) core debris characteristics; (4) post-accident heat removal; (5) inherent shutdown mechanisms; and (6) radiological material transport and effects (consequences to the public).
PROJECT MILESTONES: (1) Modify SAS-3A (major LMFBR Safety Analysis Code) for GCFR application Dec. 1975. (2) Complete report on the GCFR Safety Test Program Plan July 1976. (3) Initial PCRV Structural Response Analysis July 1976. (4) Begin ANL/ORNL fission product release in helium from GCFR fuel Jan. 1978. (5) Begin major post-accident heat removal test program July 1978. (6) Begin transient in-pile tests of GCFR fuel in helium Jan. 1979. (7) Factor-in the results of GCFR in-pile and out-of-pile test results into the GCFR safety analysis codes and results July 1980.

POLLUTANTS: NOXIOUS GAS/Noble gases;NOXIOUS GAS/Halogens;NOXIOUS GAS/Volatile oxides (10%);METALS/Cesium;METALS/Ruthenium;METALS/Other fission metals (20%);PARTICULATES/UO/sub 2/;PARTICULATES/PuO/sub 2/;PARTICULATES/Other fission products (20%);RADIATION/From all of the above (50%)
CHARACTER OF STUDY: RESEARCH/Applied (20%);FULL SCALE DEMONSTRATION (70%);ANALYTICAL (10%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: (1) Develop the conceptual design for a gas reactor in-pile safety test loop including definition of system and handling requirements, definition of major design features, completion of safety and environmental impact reports. (2) Design, procure and assemble all hardware for the test loop and its supporting systems. (3) Develop all check-out and proof-test procedures, operating procedures, operator training, and the experimental test and examination procedures. (4) Operation of the test facility; reduction and reporting of the test data.
APPROACH: (1) Review the GCFR safety test program formulated by Argonne National Laboratory. (2) Evaluate various test reactors as potential test locations for the in-pile tests. (3) Perform configuration and cost trade-off studies of the in-pile tube and of the external test loop for the test reactor selected. (4) Develop cost-estimates and schedules to support the construction, procurement and/or modification of the test facility and support equipment. (5) Provide management and inspection of construction activities for the test loop. (6) Train the operating and maintenance personnel. (7) Conduct the required tests; reduce and report the test data.
RESULTS: (1) Demonstrate the time and mode of fuel rod failure for the loss-of-flow (coolant circulator failure or flow blockage) accident and for a transient over-power accident, both without scram. (2) Demonstrate the fuel motion and inter-element behavior after loss of cooling. (3) Demonstrate inherent reactivity shutdown mechanisms such as fuel vapor, fission product vapor, or coolant dispersal of fuel. (4) Demonstrate radiological material transport.
PROJECT MILESTONES: (1) Provide conceptual design and management report for a steady-state GRIST loop design based on use of the Experimental Test Reactor June 1976. (2) Provide costs and schedule for FY 1978 line item funding of the steady-state GRIST loop design June 1976. (3) Start conceptual design study for a transient GRIST loop design July 1976. (4) Complete conceptual design and management report for the transient GRIST design Oct. 1977. (5) Begin design of a steady-state or transient GRIST loop design March 1978. (6) Begin construction and long-lead time component procurement Jan. 1979. (7) Complete construction: transient facility Jan. 1981; steady state facility Jan. 1982.
KEYWORDS: ACCIDENT TESTING;NUCLEAR FUEL;GCFR TYPE REACTORS;REACTOR SAFETY;LOSS OF FLOW;LOSS OF COOLANT;TEST FACILITIES

CHARACTER OF STUDY: RESEARCH/Theoretical (50%);ANALYTICAL (50%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: (1) Identify and evaluate various high risk accidents for the GCFBR. (2) Apply this information to identify practical improvements in reactor system design or operating procedures to reduce these risks. (3) Apply this information to provide guidelines and priorities for selecting safety-based R and D for GCFBR's. (4) Maintain close liaison and input to other organizations performing safety testing and/or analysis on GCFBR for ERDA and NRC.
APPROACH: (1) Develop and apply methods for the collection, evaluation and retrieval of component failure rate data applicable to GCFBR plants. (2) Refinement of probabilistic methods to better estimate the high risk failure sequences of plant components and systems. (3) Develop analytical methods to describe the behavior of fuel and control elements under severe reactivity transient and undercooling accident conditions. (4) Develop methods for the integration of safety targets into the GCFR engineering effort and to integrate the results of safety tests and studies into the GCFR licensing reviews.
RESULTS: (1) Detailed fault-tree and event-tree diagrams defining the high risk failure sequences which result from various accident initiators. (2) Analytical methods (code development) to define the thermal-hydraulic behavior of GCFBR fuel under various accident conditions. (3) Determination and dynamic characterization of various fuel failure mechanisms and scram reliability. (4) Determination of the licensability, reliability and operability of a fast breeder reactor in a utility power grid.
PROJECT MILESTONES: (1) Preliminary report on GCFR initiating accident events and accident sequences June 1975. (2) Summary report on GCFR accident analysis July 1976. (3) Annual reports on further studies of accident initiators and progression analysis Sept. 1977, Sept. 1978, etc. (4) Planning of fuel element ductwall melting analysis Sept. 1976. (5) initiation of fuel element ductwall melting experiments Oct. 1977. (6) Complete GCFR Safety Program Plan, Sept. 1977.
KEYWORDS: ACCIDENT ANALYSIS;RISK ASSESSMENT;GCFR TYPE REACTORS;REACTOR SAFETY;REACTOR ACCIDENTS;RESEARCH PROGRAMS;PLUTONIUM

<095016>
TITLE: Gas Cooled Fast Reactor (GCFR) Safety Experiments
PROJECT NUMBER: 00354
PRINCIPAL INVESTIGATOR: Hanson, D.L.
ADDRESS: Los Alamos Scientific Laboratory (LASL), P.O. Box 1663, Los Alamos, NM 87545
AFFILIATION: Los Alamos Scientific Lab., N.Mex. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Nuclear Research and Applications (NRA)
MONITOR: Emon, Donald E.
TELEPHONE: F233-3661
TYPE OF FUNDING: Contract No.-W-7405-Eng-36
77 FUNDING: Energy Research and Development Administration FY77:$250,000
TECHNOLOGY: NUCLEAR/Fission Breeders (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (20%);DEVELOPMENT/Laboratory scale (70%);ANALYTICAL (10%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;OS
PROJECT DESCRIPTION: (1) To understand the GCFR fuel element duct melt-through and fall-away phenomena for the loss-of-flow (LOF) accident with scram. (2) To perform fuel cladding melting and relocation tests for the LOF accident without scram. (3) To perform similar GCFR accident simulation tests on test assemblies representing the GCFR control element.
APPROACH: (1) All tests will be run out-of-pile using direct electrical heating (DEH) equipment available at LASL from the ROVER program. (2) The DEH equipment will be used to simulate the decay heating for an LOF accident with scram in fuel element models of approximately full-section and full-size in the GCFR fuel element. (3) For the test condiion representing an LOF accident without scram, the test assemblies will use a partial-section of a full-size GCFR fuel element in order to drive the simulated fuel rods at heating rates corresponding to several times full power operation.
RESULTS: (1) Determine where and when the fuel element will be melted through by direct radiation and conduction heating. (2) Determine whether and when the fuel elements will drop freely from the core assembly when their ducts are completely melted through. (3) Determine whether the molten fuel cladding will freeze at the core-blanket interface region, and if it does, whether molten cladding will flow radially against the fuel duct. (4) Determine similar accident condition behavior for the GCFR control elements.
PROJECT MILESTONES: (1) Complete design of partial-section test assembly for decay power level tests Feb. 1977. (2) Complete design of full-section test assembly for full power level tests Sept. 1977. (3) Complete design for fuel element drop-out testing Jan. 1988. (4) Complete test of partial-section test assembly at decay power level Sept. 1977. (5) Complete test of full-section test assembly at full power level May 1978. (6) Complete test of fuel element drop-out test Sept. 1978. (7) Complete reports on all tests with safety design recommendations March 1979.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental;HYDROGRAPHIC AREAS/Other hydrographic areas Estuaries
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Provide a demonstration of the drift performance of large natural draft cooling towers fitted with improved drift eliminators.
APPROACH: (1) Direct measurements of drift rates at the large hyperbolic natural draft salt water cooling tower at the Chalk Point Power Station (Unit No. 3) using suitable techniques (such as isokinetic sampling, sensitive paper, etc.). (2) Detailed meteorological measurements of the cooling tower plume itself to thoroughly characterize plume rise. (3) Analyses of data obtained during the course of the field measurement study.
RESULTS: Favorable drift performance, along with evidence (from other ongoing studies) that expected drift levels will not have unacceptable environmental impacts, will enhance the acceptability of such salt water cooling towers systems for use in future power plants, and will facilitate the siting of power plants in areas where water supplies have high salt content.
PROJECT MILESTONES: (1) Experiment design and equipment fabrication 7/74. (2) Baseline measurements 3/75. (3) Continuous monitoring 10/75. (4) Seasonal intensive testing 12/76. (5) Final report 6/78.

TITLE: LMFBR Safety Program
PRINCIPAL INVESTIGATOR: Griffith, J.D.
ADDRESS: Energy Research and Development Administration, Germantown, MD 20767
AFFILIATION: Energy Research and Development Administration, Washington, D.C. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Reactor Development and Demonstration Division
MONITOR: Griffith, Jerry D.
TELEPHONE: F233-3424
77 FUNDING: Energy Research and Development Administration FY77:$52,000
TECHNOLOGY: NUCLEAR/Fission Breeders (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/Applied (75%);DEVELOPMENT/Laboratory scale (25%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The objective of the LMFBR Safety Program is to support future decisions regarding construction of demonstration or prototype breeder reactor plants and, ultimately, regarding the commercialization of the Breeder reactor. The supportive objectives are: To provide technical information on safety approaches so that LMFBR designers can make rational choices while considering cost, safety and performance. To provide analytical tools and data base for plant safety analysis of LMFBR's. To support LMFBR licensing applications. To develop risk assessment methodology tailored to LMFBR's. To reduce uncertainties in the LMFBR radiological dose and effects estimation. To complete the engineering, procurement and construction of new facilities (or facility modifications) that will provide the test environment for doing safety experiments.
APPROACH: The approach being used is a defense in depth approach. The first level addresses the prevention of accidents through the intrinsic features of the design of the plant and the quality, redundancy, testability, inspectability and foul-safe features of the components of the reactor and plant. The second level concerns providing protection against potential accidents through the use of reliable shutdown systems and devices that assure any such incident will be prevented, arrested, or accommodated safely. The third level supplements the first two through features which add margin in the plant design as additional assurance that protection to the public is provided even in the event of the occurrence of extremely unlikely and unforeseen circumstances.
RESULTS: A family of analytical models, computer codes, and experimental confirmation will be developed and documented for use by reactor designers, licensing authorities, and other interested parties to permit assessments of the safety of LMFBR's to be made.
PROJECT MILESTONES: To provide documentation of the status of safety technology for LMFBR's to reactor designers with sufficient technical information to ensure that the above objectives are met to the satisfaction of licensing and regulatory requirements with acceptable impact on plant cost and performance. Specific dates at which the technology data base will be developed and documented will be tied tc project schedules as they become available.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Characterize a large synfuels industry able to provide substantial (10 x 10/sup 6/ BPDE) substitutien for petroleum in 1980 - 2000 time frame, identify impacts critical to the achievement of that industrial capacity, and examine in detail those economic, social, environmental energetic (net energy) impacts that are crucial to constraining its growth. Recommend policy actions for mitigation of adverse impacts.
APPROACH: Technology assessment: standard systems analysis techniques, stakeholder analysis, critical impacts and, air quality/dispersion modeling, growth (population) modeling, scenario construction, capital formation of discounted cash flow analysis, net energy analysis, resource depletion/cost analysis, etc.
RESULTS: Know clearly what range of impacts constrain development of a significant industrial capacity for synfuels in the 1900-2000 time frame, evaluate mitigation strategies in terms of modifying rates of growth, scales of development, and potential siting configurations. Examine in detail the resource depletion/cost relationships to determine long-term viability of coal as a resource base for fuels.
PROJECT MILESTONES: (1) October 1976 Publish Phase I final report: Synthetic Liquid Fuels Development: Assessment of Critical Factors ERDA 76-129. PROJECT DESCRIPTION: (1) 1974-75: EPA-originated impacts analysis of utilizing electric cars in LA. (2) 1975: impacts on St. Louis and Philadelphia. Examined air quality, energy economics for different technologies (batteries and vehicles) or different driving cycles, for varying quantities of electric cars. (3) 1976-78: Impacts on Honolulu, characterizing many battery technologies, improve air quality analysis and apply to national level. Complete commercialization analysis. Examined opportunity/risk, institutional factors, incentives and material aspects of electric and hybrid vehicle commercialization. Input to PL-413, Sec. 13 reports to Congress.
APPROACH: Future case-study approach examining particular cities in assessing air quality, economic and energy benefits of using electric cars. Some diffusion modeling, scenario construction, engineering economics and systems analysis. National level methodology developed. Marketing/incentives analysis.
RESULTS: Understand how useful electric cars may be in improving air quality and reducing fuel consumption, especially petroleum. Begin to decide which vehicle/battery/performance characteristics are optimal for which benefit/risk combinations, and how these may be ultimately manufactured and sold.
PROJECT MILESTONES: (1) 1974 Publish Los Angeles study. (2) 1975 Publish St. Louis and Philadelphia studies. (3) 1976 Publish national level methods, Honolulu study and improved characterization. (4) 1977 Workshop on electric car feasibility. (5) 1977 Publish full national analysis and release report to Congress. (6) 1978 Publish summary findings and commercialization analysis.

TITLE: Psychological Strategies to Reduce Energy Consumption
PRINCIPAL INVESTIGATOR: Seligman, C.
ADDRESS: Center for Environmental Studies, Princeton, NJ 08540
AFFILIATION: Princeton Univ., N.J. (USA). Center for Environmental Studies
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Research and Technology
MONITOR: Collins, L.
TELEPHONE: F376-4711
77 FUNDING: Energy Research and Development Administration FY77:$150,000
TECHNOLOGY: CONSERVATION/General (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
PROJECT DESCRIPTION: Application of behavioral science theory and findings to the task of assisting consumers to utilize energy more efficiently offers significant potential for energy savings.
APPROACH: In FY 1976, a contract was initiated with Princeton University psychologists to begin to test promising strategies which are not dependent upon technology and which might later be utilized on a large scale. The major effort of the first year was a feedback experiment conducted in the planned unit development of Twin Rivers, NJ, which indicated that provision of information to homeowners about their household energy consumption can be an effective means of encouraging reduction in consumption for both

heating and cooling. In FY 77 Princeton will further develop the feedback strategy, including testing a ''money meter.''

DIVISION: Division of Buildings and Community Systems
MONITOR: Wrabel, M.M.
TELEPHONE: F376-4708
77 FUNDING: Energy Research and Development Administration FY77:$150,000
TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: The League of Women Voters, through its Education Fund, will manage a pilot project to educate residential consumers on energy conservation applications.
APPROACH: Three to four of the League's local chapters will be chosen to participate in this project. This audience will be reached in four ways: (1) through public meetings on energy-conservation techniques; (2) through ''how-to'' clinics or do-it-yourself installation of energy-conserving features in the dwelling; (3) through a local clearinghouse to which individuals can come to get information; and (4) through publicity campaigns to promote all of the above. Findings will be reported at the 6-month point and at the conclusion of the 12-month contract.
RESULTS: The final report will serve as a model for developing and managing other energy conservation activities directed toward this consumer audience.

TITLE: Strategy/Economic Analyses on Transition From Oil and Gas to Alternate Fuels in Energy Conversion Devices
PRINCIPAL INVESTIGATOR: Shipman, H.B.
ADDRESS: Alexandria, VA
AFFILIATION: Sante Fe Corp., Alexandria, Va. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Conservation Research and Technology
MONITOR: Burnett, W.
TELEPHONE: F376-4943
77 FUNDING: Energy Research and Development Administration FY77:$150,000
TECHNOLOGY: CONSERVATION/General (50%);GENERAL SCIENCE (50%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
PROJECT DESCRIPTION: This study contains the tasks necessary to develop and implement an analytical methodology for use by CONRT management in program strategy formulation. Santa Fe, under previous contract to ERDA, developed the strategy concept of a smooth transition from oil and gas to alternate fuels in conversion devices. An analytical methodology will be developed which allows any development effort to be measured or evaluated in terms of its contribution to accomplishing this strategy.
APPROACH: To accomplish the above objective, three specific tasks will be undertaken. The first task is an economic evaluation of the impact of energy efficiency on industrial productivity. The second task consists of the actual methodology development. The final task in this effort will consist of the application of the methodology developed in Task 2 to the CONRT program.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Southwest
PROJECT DESCRIPTION: Objective of the social and economic part of the study is how can a ''National Laboratory'' respond to the needs of federal energy planners but, also, serve local and regional planners. Socio-economic data will be needed on investment and labor costs in both the energy development activities and secondary effects in community and supporting services.
APPROACH: The data base task will accept socio economic impact inputs and make them accessible for modeling activities. Existing environmental and economic models will be extended and applied and integrated into the Regional Assessment Model.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine the effects of an environmental carcinogenic pollutant, benz(a)pyrene, on develcpment of cellular and humoral immunity. This program will provide information related to resistance to disease and carcinogenesis in populations exposed to this agent.
APPROACH: Mice will be treated with benz(a)pyrene at identificable stages in development of immune competence. The treatment will be in utero, perinatal, and postnatal. Their immune competence will be assayed both in vitro and in vivo to determine the rate of post-treatment development and the level of immunccompetence reached in comparison to untreated mice. This pollutant will be given at dose levels and frequencies to simulate industrial or environmental exposure.
RESULTS: I will identify the relative sensitivity to benz(a)pyrene of different stages in development of immune competence. In addition, I will determine the levels of frequency exposure that result in altered development or capacity of the immune response. I will then relate these changes to susceptibility to infection and carcinogenesis.
PROJECT MILESTONES: (1) Develop assay procedures and begin description of developmental stages of the immune response. 7/31/76. (2) Set up and begin treatment of experimental animal groups. 7/31/77/ (3) Continue the original protocol and add new groups as indicated by results of ongoing experiments. 7/31/78. (4) Continue as before and publish the results of the research project as appropriate. 9/30/78.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine the applicability of the procedure for studying tumorigenic enhancement in rat liver as a screening procedure for testing fossil fuel combustion by-products (such as polycyclic aromatic hydrocarbons) for tumorigenic enhancing activity.
APPROACH: Rats are fed the liver carcinogen, 2-acetylaminofluorene (AAF), for 2.5 weeks. The test substances are then fed throughout the experimental period and tumor incidences in these rats are compared with that in rats given only the limited AAF treatment. Effects of the test substances on liver size and DNA synthesis are also compared. The first hydrocarbon to be tested is benz(a)anthracene.
RESULTS: Relative tumorigenic enhancing abilities of different energy-related pollutants will be estimated and correlated with their relative effects on liver DNA synthesis and liver size. An evaluation of the procedure as a method for screening pollutants for enhancing activity will be possible.
PROJECT MILESTONES: (1) Assessment of benzanthracene tumorigenic enhancing ability 12/30/76. (2) Initiate

tumorigenic enhancing study with bence pyrene 3/30/77. (3) Begin examinations for tumors 4/15/76. (4) Progress report on benz(a)anthracene study 8/1/76. Decision as to whether to test second hydrocarbon or modify test procedure to increase sensitivity.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This study is concerned with providing fundamental information on damage production in key biological molecules by toxic pollutants at molecular levels. Among specific objectives are an identification of putative target sites on susceptible biomolecules, definition of chemical and conformational properties predisposing biomolecules to damage, and a correlation of toxicant properties with biological reactivity. Interactions of primary interest are those involving constituents from two key target sites, cell membranes and nucleic acids, and several classes of fossil fuel toxicants, nitrogen and sulfur oxides, and trace metals, protonic acids, and polycyclic hydrocarbons.
APPROACH: A two-fold approach involving investigation of chemical reactivity and structural properties will be employed. Reaction products of nucleic acid and membrane constituents with toxic pollutants (trace metals, aromatic carcinogens) will be prepared by bio-organic synthetic methods, and their chemical and structural properties confirmed by analytical and spectroscopic measurements. Detailed conformational studies are planned for all product molecules following magnetic resonance measurements (H-1, C-13) and computational procedures developed for nucleic acids.
RESULTS: Results of this study are expected to give an insight into reaction products of toxic effluents from fossil fuel combustion with nucleic acids and membrane constituents. Specifically, we expect to identify nucleic acid-trace metal covalent bonding interactions and the influence of these on structural and hydrogen-bonding properties of nucleic acids. Similar results are expected for nucleic acid-aromatic carcinogen systems. For membranes information will be developed on the dynamical motional properties of constituents as they are affected by trace metal and carcinogen incorporation.
PROJECT MILESTONES: (1) Isolation, chemical and structural characterization of nucleic acid-trace metal (Hg, Cd, Be) adducts 12/30/77. (2) Completion of study of heavy metal perturbations of bilayer membrane structure 9/30/78. (3) Chemical and structural characterization of complexes between nucleotides and aromatic carcinogens 6/30/77.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: We propose to develop methods to probe subtle changes in enzyme levels, modification of cell transport, destruction or modification of binding sites in vivo using non-invasive techniques so that acute changes which may lead to more serious chronic changes in humans can be assessed at very early stages of exposure to these body function-altering materials. The classes of compounds for intended study are hydrocarbons, compounds formed by the photooxidation of hydrocarbons from auto exhaust in the presence of nitric oxide (photochemical smog; such as formaldehyde, peroxyacetyl nitrate, acrolein, etc.), certain organometallics and the oxides of nitrogen. Incomplete combustion of hydrocarbon-containing fuels such as gasoline and oil and incomplete combustion of coal lead to a variety of organic and organometallic

compounds.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The biological effects of physical and chemical mutagens and carcinogens, in all systems studied including man, depend to a great extent on the abilities of cells to repair DNA damage. Cells that are defective in one of the repair pathways are more sensitive to killing, mutation, and transformation. The chemicals associated with new energy technologies may be hazardous by themselves or may exacerbate the effects of already existing environmental hazards. Our goal is to evaluate these hazards.
APPROACH: We shall compare the amounts or excision and postreplication repair in bacterial and mammalian cells treated with combinations of chemical agents and UV radiation so as to determine whether they act independently, additively and synergistically. The effects of primarily volatile agents on protein function and conformation will be measured in terms of their effects (a) on purified repair enzymes acting in vitro, and (b) on the conformation of well characterized proteins by x-ray and neutron diffraction studies and by spectroscopic analyses. The latter work will suggest the mode of action of such compounds on other enzymes.
RESULTS: The results will give quantitative estimates of the chemical hazards in terms of UV damage. The latter has been well quantitated at the molecular and cellular levels and there exist good animal data for UV damage as well as extensive data for the effects on UV on the United States population.
PROJECT MILESTONES: (1) July 1977 Interaction between two known carcinogens will have been measured. (2) July 1978 Effect of inert gases on protein conformation will have been determined.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The burning of fossil fuels, particularly coal, releases into the atmosphere a number of metals in the particulate discharge. Several of these have been implicated in carcinogenesis or mutagenesis. The goal of this project is to determine whether or not physiological concentrations of these metals will interfere with the action of the DNA polymerases, either by inhibiting them or by causing errors in transmission of the genetic message.
APPROACH: Using in vitro test systems, the ability of the various trace metals to inhibit the incorporation of radioactive deoxynucleotides into DNA by the principal DNA polymerases of human tissues will be measured. (Most metal ions will inhibit at sufficiently high concentrations.) By varying the concentrations of metal, template-primer, substrate, and required co-factors, the manner in which a metal exerts its effect will be determined and dissociation constants calculated. Similarly, using synthetic polynucleotide models of DNA, the ability of the metals to promote incorporation of incorrect bases will be measured.
RESULTS: This project is expected to yield quantitative knowledge of the effects of trace metals on the kinetic parameters of the DNA polymerase reaction. With this information, one will be able to calculate the tissue concentration of a metal which should cause concern with regard to DNA replication.
PROJECT MILESTONES: (1) September 30, 1976 Human polymerase alpha preparation to be injected into animals. Studies in avian erythrocyte nuclei to begin. (2) January 1, 1977 Studies on inhibitory action of antipolymerase beta to be completed.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To develop information about putative free radical reactions involved in the molecular and cellular damage reactions of carcinogenic/mutagenic polyaromatic hydrocarbons and other organic pollutants derived from fossil-fueled energy conversion and utilization processes. (2) To use spin-label methods to provide a rapid measure of DNA binding of enzymatically activated test compounds as a cheap and easy prescreening assay for carcinogenic/mutagenic potential of pollutants.
APPROACH: (1) Continuous-flow reactors designed at BNL for EPR at Q band are used in a two-stage mixer version to detect and identify short-lived free radical addition compounds of nitroquinoline oxide, benz(a)pyrene, dimethylbenzanthracene, and other hydrocarbon derivatives with nucleic acids and their components. (2) Specifically spin-labeled test oligonucleotides will be synthesized to test binding of enzymatically activated test compounds which need not be individually prelabelled. It is anticipated that saturation-transfer (fast-passage EPR spectroscopy, ENDOR or ELDOR) will be needed to detect changes in spin-label motion with the large molecular complexes that will be used.
PROJECT MILESTONES: (1) Completion of EPT/flow facility for testing reactions of carcinogen free radicals: December 1976. (2) Test reactions of nitroquinoline oxide and benz(a)pyrene derivatives with DNA components: June 1977. (3) Extension to other carcinogen classes: December 1977. (4) Synthesis of appropriate spin labels: December 1977. (5) Evaluation of EPR/flow method as a predictor of DNA binding: June 1978. (6) Spin label tests with oligonucleotides and polynucleotides: June 1978. (7) Effects of activating enzyme systems on the spin-label assay: December 1978. (8) Final evaluation of spin-label method as a carcinogen/mutagen prescreen: June to October, 1978.

PROJECT DESCRIPTION: To determine the applicability of several advanced modes of scanning electron microscope operation (characteristic x-ray, cathodoluminescence, secondary electrons) to studies of the morphology and chemistry of energy related particulates and their effect of airways, lung macrophages and pulmonary lymph nodes.
APPROACH: A systematic study of each scanning electron microscope analytic mode will be made and the effectiveness of the SEM compared with electron probe and mass spectrometry methods. Materials will be lung tissue and leaf surfaces following exposure to selected atmospheric environments.
RESULTS: The results should indicate the most effective instrumentation and preparative methodologies for the study of lung surfaces by these techniques. Overall advantages for elemental mapping and rapid scanning of deposited particles can be estimated.
PROJECT MILESTONES: (1) 1 Nov. 1977 Determination of elemental distribution in lung macrophages and pulmonary lymph nodes by x-ray SEM completed. Effectiveness of this technique should be well determined. (2) 15 Jan. 1978 High resolution low temperature specimen facilities on new SEM should be operating at a level to produce true freeze-fracture in live time while viewing in SEM. (3) 1 June 1978 High voltage electron microscopy of lung sections completed and results compared to the scanning electron microscope data on this tissue.

PROJECT DESCRIPTION: To determine the influence of the gaseous air pollutants, NO/sub 2/ and SO/sub 2/, on lung carcinogenesis including effects on latent time, stages in tumor induction and risk of tumors.
APPROACH: The influence of NO/sub 2/ and SO/sub 2/ on relationship of dose to latent time and to yield in urethan induction of mouse lung cancer will be studied. The base for latency is being refined by collecting data on tumor size vs. time in 600 mice treated with urethan. First NO/sub 2/ trials will be at 15 ppM for 48 hr, with pre- or post-exposure to urethan. The morphology of lung tissue affected by these agents is being studied with the scanning electron microscope to investigate the mechanism of carcinogenesis.
RESULTS: (1) Quantified cocarcinogenic effects of NO/sub 2/ and SO/sub 2/ with urethan in mouse lungs. (2) Determination of stages in the process of carcinogenesis. (3) Extension of the data base for our previcusly published hypothesis about the relation between dose and latent period in carcinogenesis.
PROJECT MILESTONES: Begin exposures of mice to NO/sub 2/ with pre- and post-exposure to urethan (7/1/76). (2) Complete counting and measuring of lung tumors from urethan latest period experiment; begin analysis of results (8/1/76). (3) Begin exposures of mice to SO/sub 2/ with pre- and post-exposure to urethan (9/1/76). (4) Begin exposures of mice to labeled SO/sub 2/ to determine distribution in respiratory tract (10/1/76). (5) Determine by SEM examination earliest carcinogenic changes in lung tissue (12/1/76). (6) Begin preliminary experiments with benzo(a)pyrene as cocarcinogen with NO/sub 2/ and SO/sub 2/ (1/1/77).

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This research is aimed at understanding the interactions of chemical mutagens and carcinogens with mammalian cells. These interactions include metabolism of the compounds, binding to cellular macromolecules, and repair of chemically induced lesions.
APPROACH: The method of analysis in this project will be primarily spectroscopic but will also include isotope exchange studies, electron microscopy, polyacrylamide gel analysis of DNA structure, and DNA sequencing. The experiments with mammalian cells will be carried out in cell culture and will involve determining the metabolic products of polycyclic aromatic hydrocarbons in mouse epithelial cells. These products will be structurally characterized and their biological effects on the cells will be analyzed. These products will also be tested in the Ames chemical mutagen assay.
RESULTS: This project should give a better understanding of the mechanism(s) involved with chemical mutagenesis and carcinogenesis. From these findings will come more definitive estimates of the biological hazards involved with energy production through fossil fuels.
PROJECT MILESTONES: Initiate project, 1/10/77.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To apply the available inventories of energy and environmentally related data bases and models to specific requirements of ERDA/DBER. Task 1 Establish cost effective technique for future data exchange and network capability. Task 2 Evaluate optimum system design for management of R and D data.
APPROACH: To survey the current computer science technology to accommodate the above-mentioned task. This includes: (1) large storage technologies for storage of large data bases; (2) the use of networks for access and storage of the data; (3) the computer processing requirements for processing this data; and (4) survey of data base technology. Employing available data bases of the National Index, selected subsets will be created and made available to user requirements by magnetic tape, over computer networks, and in hard copy.

RESULTS: Current Plans: (1) to develop major milestones for the gathering of data necessary to support the survey; (2) to develop guidelines for organization, storage, location, and access of data; and 93) to develop a guideline to help program the ability to determine potential valuable data.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: These studies are designed to determine the nature of lung cell injury and the processes by which lung tissue recovers from damage resulting from exposure to energy-related pollutnats such as H/sub 2/SO/sub 4/ or acid sulfate particles.
APPROACH: Lungs of animals exposed by inhalation to sulfuric acid mist or ammonium sulfate will be evaluated using advanced morphological and histochemical methodology. Correlative light and electron microscopic studies will be done taking advantage of three basic methods of morphologic evaluation: (1) light microscopy, (2) transmission electron microscopy, and (3) scanning electron microscopy. Selected histochemical tests will also be performed. Tissues examined at different times post-exposure will provide information on the relative sensitivity of specific lung cell types, the nature of cell injury and the sequence of events leading to cell repair.
RESULTS: Initial results from animals exposed to acid sulfates and sulfuric acid mist will provide comparative information on the nature and sequence of cellular injury and repair. These data may be used to predict the human health impact associated with release of sulfur-containing materials and the need to control such emissions.
PROJECT MILESTONES: Initiation of single exposure to acid sulfate aerosols 1 October 1976. (2) Initial evaluation of specific cell response to acid sulfates 1 January 1977. (3) Initiation of repeated exposure to acid sulfates 1 January 1977. (4) Comparison of early effects from single or repeated exposure 1 June 1977. (5) Completion of repeated exposure to acid sulfates 1 January 1978 (6) Evaluation of cell repair following acid sulfate exposure 1 July 1978.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Epidemiological studies have indicated an increased incidence of mortality from respiratory disease during periods of elevated sulfur oxide levels. Since laboratory studies have not shown SO/sub 2/ alone to significantly affect pulmonary clearance, this project will examine the effect of oxidation products of SO/sub 2/ on pulmonary clearance mechanisms. Specifically, acid sulfates such as zinc sulfate or zinc ammonium sulfate and sulfuric acid mist will be used.
APPROACH: Mice will be chronically exposed by inhalation to graded levels of sulfates ranging from ambient air concentrations to high concentrations. The pulmonary clearance mechanisms will be examined which include the removal of particles from the deep lung, ability to kill inhaled bacteria such as Staphylococcus aureus and the ability to survive a respiratory viral infection such as influenza.
RESULTS: The results will indicate whether or not acid sulfates do reduce the susceptibility of animals to pulmonary infections and thus whether they may be an important factor to measure and control in polluted air. In addition, their role in reducing clearance of particles from the deep lung may be an additive factor in assessing hazatds from toxic particulates.
PROJECT MILESTONES: (1) Initiation of particle clearance study, chronic exposure acid sulfates H/sub 2/SO/sub 4/ 1 October 1976. (2) Initiation of mycoplasma studies, chronic exposure H/sub 2/SO/sub 4/ 1 February 1977. (3) Initiation of influenza studies, chronic exposures H/sub 2/SO/sub 4/ 1 June 1977. (4) Initiation of particle studies, chronic exposures and sulfates 1 October 1977. (5) Initiation of mycoplasma studes, chronic exposures acid sulfates 1 Febuary 1978. (6) Initiation of influenza studies, chronic exposure acid sulfates 1 June 1978.

POLLUTANTS: PARTICULATES/Acidic sulfates (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project will investigate the physiological and morphological alterations of the cardiopulmonary system resulting from chronic inhalation of environmentally relevant levels of acid sulfate aerosols known to be present in fossil fuel combustion effluents.
APPROACH: Guinea pigs will be exposed for one hour to atmospheres containing 0.1 and 1.0 mg/m/sup 3/ of 0.5 micron sulfuric acid and ammonium sulfate aerosols while breathing patterns and pulmonary mechanics are monitored. Dogs will then be similarly exposed and monitored as a species comparison and to characterize relatively sensitive and insensitive populations. Information thus obtained will be used to design studies in which dogs will be chronically exposed and serial, comprehensive physiological evaluation will be performed during exposure and after cessation of exposure.
RESULTS: The chronic exposure data will aid in defining risks incurred by continuous inhalation of low levels of sulfates, will yield information on the ability to recover from functional and structural alterations, and will serve as a pilot study for further low-level, chronic exposure studies.
PROJECT MILESTONES: (1) Completion of species comparison 3 Jan 1977. (2) Completion of individual sensitivity evaluation 1 April 1977. (3) Decision on chronic exposure protocol 1 June 1977. (4) Initiation of chronic dog exposures 1 Sept 1977. (5) 9 mo sacrifice, chronic dog exposures 1 June 1978. (6) 1 year sacrifice, chronic dog exposures 1 Sept 1978.

POLLUTANTS: NOXIOUS GAS/NO/sub x/;NOXIOUS GAS/SO/sub x/ (20%);METALS/Cadmium;METALS/Vanadium;METALS/Nickel;METALS/Manganese (40%);PARTICULATES/(NH/sub 4/)/sub 2/SO/sub 4/ (40%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS
PROJECT DESCRIPTION: The objective is to develop technology for the generation and characterization of 0.01 to 0.5 mu m diameter fine particle aerosols of (NH/sub 4/)/sub 2/SO/sub 4/, H/sub 2/SO/sub 4/, organic compounds or metal oxides.
APPROACH: Vapor phase reactions will be used for the production of fine particle aerosols. For (NH/sub 4/)/sub 2/SO/sub 4/ and H/sub 2/SO/sub 4/ direct mixing of reactants and for organic compounds photochemical reactions will be used. Metal oxide aerosols will be produced by vaporization of readily vaporizable forms of the metal followed by thermal degradation. The reliability of diffusion battery, high resolution electron microscopic technique and electrical aerosols size analyzor for fine particle aerosol spectrometer will be developed.
RESULTS: Methods will be developed for the production and characterization of fine particle aerosols suitable for detailed laboratory investigations and animal exposure studies designed to evaluate inhalation hazards associated with fossil fuel fired electrical generating stations. Although an important fraction of particulate pollutants released from fossil fueled electrical generating stations is likely to be of condensation aerosols of less than 0.5 mu m size, very little reliable information is available for evaluating the inhalation hazards associated with these fine particles.
PROJECT MILESTONES: (1) Fine particle aerosols of (NH/sub 4/)/sub 2/SO/sub 4/, photochemical organic chemicals and H/sub 2/SO/sub 4/ will be produced and studied 1/6/1977. (2) Evaluation of different methods and instruments for the size determination of fine particles will be completed 1/10/1977. (3) Development of general methods for the generation and characterization of fine particle aerosols of metal oxides will be completed 1/1/1978. (4) Fine particle aerosols of Cd, V, Ni, Mn, As, Se, Cr, and Pb will be generated and size and chemical characteristics studied 1/10/1978.

PROJECT DESCRIPTION: To evaluate the mechanisms of physical and chemical toxic agents associated with fossil fuel energy production of the mammalian hematopoietic system.
APPROACH: Apply newly developed automated flow-systems technology to measure the effects of exposure (inhalation) to toxic agents on hematopoiesis by analysis of peripheral blood cell numbers and types.
RESULTS: Based on detailed toxicological investigations, the severity of dose-damage relationships can be established, thus providing a basis for establishing guidelines for estimating risks to occupationally exposed populations and society-at-large.
PROJECT MILESTONES: (1) 1-8-75 Initiate program including selection of animals and the application of flow-systems technology to peripheral blood cell characterization. (2) 1-1-77 Begin development of analytical techniques for bone marrow cells. (3) 1-9-77 Initiate preliminary tests on animals exposed to oil shale dusts. (4) 1-6-78 Begin detailed toxicological studies on the hematopoietic system.

PROJECT DESCRIPTION: To study the basic immunofunction in animals during recovery from chemical insults and preceding and during carcinogenesis so that the immune system may be assessed in an intelligent fashion as a prophylactic or therapeuic measure in dealing with such health hazards to the human population.
APPROACH: Considerable effort was spent in selecting our animal model system for studying the effects of potential carcinogenic agents on the immune system, but it enables us to perform nine tests on a single animal to detect perturbations in specific lymphocyte numbers, functions, and interactions. Studies will shortly proceed to expose animals to known chemical carcinogens to establish base lines using this model system for its future use in work with other potentially hazardous agents in the environment.
RESULTS: Investigation of the role of the immune system during experimentally induced carcinogenesis may lead to results that could be applied to various disease states of man.
PROJECT MILESTONES: (1) FY 1976 Develop animal model for testing immunocompetence. (2) FY 1977 Utilize model to test the immunologic effects of known carcinogens. (3) FY 1978 and continuing: Utilize model for testing toxicity of oil shale products.

PROJECT DESCRIPTION: To use the unique and rapid cell analysis and sorting instrumentation at the Los Alamos Scientific Laboratory to quantitate certain cellular aspects of the human immune response to specific hazardous agents generated by coal gasification and oil shale production technologies.
APPROACH: Flow microfluorometry (FMF) is currently being used to provide a sensitive means for measuring lymphocyte stimulation in vitro before and after addition of specific and nonspecific mitogens. It is proposed to extend this work to determine the dose-effect relationship of lymphocytes to undergo immunostimulation following in vivo (animal model systems) and in vitro exposure to specific hazardous agents. Second, macrophage ingestion of specific nonnuclear particulate matter will be quantitated. The subsequent effect on the ability of such a macrophage to participate in its role of immunostimulation will be determined on a per cell basis using rapid cell-analysis techniques.
RESULTS: It is anticipated that these studies will provide information relating to defense mechanisms of the immune response (i.e., the role suppression plays in this most important response to hazardous agents).
PROJECT MILESTONES: (1) 1-1-76 Report on initial technique development. (2) 7-1-76 Animal sensitization under way; lymphocyte stimulation measurements initiated. (3) 1-1-77 Review developments pertaining to automated assay development anad its suitability for evaluating immune system damage.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To develop a fast-response, in situ aerosol mass and sizing instrument. The instrument incorporates the use of a piezo-electric microbalance coupled with size collection stages. This technique produces aerosol mass distributions as a function of particle size. The size data may be resolved down to a few tenths of a micrometer for individual particles.
APPROACH: The prototype device has now been assembled in the laboratory where it is and has been undergoing preliminary stability and operational characterization tests. Modeling of the hydrodynamics of the cascade impactor stages is under way to improve the methodology for calculating cascade stage performance. There are several operational situations which present unanswered responses from the instrument. Future laboratory and fieldproof tests will be conducted to verify electronics hardening and to provide answers

to these previously puzzling responses.
RESULTS: It is anticipated that one or two early field tests with the present prototype instrument will precede completion of the laboratory investigations. This leapfrog experiment will be conducted as a part of a larger group of experiments flown on a low-altitude balloon over a large metropolitan area. It was felt that this opportunity for a genesic field experiment should be capitalized upon because of its uniqueness and appropriateness.
PROJECT MILESTONES: (1) 10-1-76 Completion of laboratory calibrations. (2) 2-1-77 Completion of environmental testing. (3) 6-1-77 Instrument environmental hardening. (4) 7-1-77 Prototype instrument field tests. (5) 9-11-77 Prototype instrument first flight. (6) 10-1-77 to 6-1-78 Proof test flights.

PROJECT DESCRIPTION: The overall objective of this research effort is to provide dose-response data which will permit rapid assessment of the potential dangers to vegetation resulting from release of gaseous coal conversion effluents to the atmosphere. This information will be provided by conducting fumigation experiments in the laboratory initially using a single species, kidney bean (Phaseolus vulgaris), which will be exposed to a pollutant mix collected from the effluent stream of ORNL's coal conversion pilot plant. Specific objectives of the research effort are four-fold: (1) to develop a controlled system for exposure of plants to the potentially hazardous gaseous effluents of coal liquefaction; the complexity of the effluent mixture makes achievement of this objective a crucial first step. This phase of the work is on schedule. (2) to obtain, through close cooperation with Analytical Chemistry and Chemical Technology Divisions, the best practicable chemical characterization of the effluent mix collected and used in our effects studies. This phase of the work is on schedule. Should results warrant more detailed investigations, research will focus on identifying potentially phytotoxic subfractions of the total effluent mix. (3) To identify the potential of bulk effluents from a coal liquefaction facility for causing acute injury to vegetation using Phaseolus vulgaris as a test organism, to assess

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of this project is to evaluate the potential for producing malignant transformation by energy conversion by-products. The assay involves treatment with by-products of cultured mouse cells, which contain an integrated (endogenous) form of the virus in their cellular DNA, but which do not actively produce virus. Toxicity tests are conducted first to determine sub-toxic levels of the chemicals and assays for virus activation and transformation are conducted using concentrations of by products known to be non-toxic. Briefly, treated cells and controls (i.e., inactive and active activating agents) are assayed for activation of endogenous virus by immunofluorescent assays for viral antigens and for infectious virus by co-cultivation with appropriate indicator cells. The BALB/c 3T3 and AKR mouse cell lines are used initially as the test system because these cells are sensitive to activation procedures. Unfractionated by-products will be used in the first stage of the study to provide any possible interaction between two or more fractions. Treated and untreated cultures will be tested for transformation by observing for changes in morphology and growth in soft (0.3%) agar since it is known that positive results in these assays show a high correlation with tumorigenicity. Cells which are morphologically transformed will be cloned and tested for tumorigenicity in athymic (nude) mice.

PROJECT DESCRIPTION: The purpose of the project is: (1) to develop a new bioassay system for testing of respiratory tract carcinogens and cocarcinogens. (2) to study injury and repair of respiratory tract epithelium to carcinogenic and toxic fossil fuel combustion products.
APPROACH: Heterotopically transplanted tracheas are used as target tissues for test substances. The test substances are incorporated into a matrix or incased into a capsule which allows slow controlled release of the test substance into the lumen of the trachea. Selected matrix and incasing materials are studied in an in vitro system to study release rates. Materials showing desirable release characteristics are tested in vivo for tissue toxicity. If found to be nontoxic, they will be used for the incasement of test substances in vivo.
RESULTS: Result expected during the next two years is identification of substances that can serve to incase a number of chemical carcinogens and cocarcinogens and release them into the target tissue at variable but controlled rates. Subsequently the system will be used for carcinogenesis studies.

PROJECT DESCRIPTION: To determine whether the diethylnitrosamine (DEN) tumor system in hamsters can be used as a model system to test cocarcinogenicity of various reactive gases. To determine whether formaldehyde and nitrogendicxide enhance the respiratory tract tumor response to DEN.
APPROACH: Hamsters are injected repeatedly with low doses of DEN (0.5 mg/wk for 10 weeks). They are exposed to nitrogendioxide or formaldehyde either simultaneously with the DEN exposures or starting after cessation of DEN exposure. Lung, tracheal, and nasal tumors will be counted under the dissecting scope using a clearing and staining technique.
RESULTS: This experiment will show whether the DEN tumor system can be used to screen air contaminants for cocarcinogenic activity. If this is feasible, it would greatly facilitate such tests since we have developed methods that allow us to detect tumors in the respiratory tract of hamsters without performing expensive histopathology. The experiment is also expected to give an indication whether formaldehyde and nitrogendioxide are cocarcinogenic.
PROJECT MILESTONES: The first phase of the studies will explore the cocarcinogenic activity of nitrogendioxide and formaldehyde on a nitrosamine-lung tumor system. Animals will be exposed to repeated doses of a nitrosamine. They will subsequently be exposed to the above mentioned air pollutants.

PROJECT DESCRIPTION: It is important to define criteria by which various epithelial lesions can be classified in terms of their biological potential, i.e., normal and abnormal growth behavior, nutritional requirements, cell turnover, differentiation, etc. since the histopathological and cytopathological criteria used for diagnosis of pre-cancerous lesions are very unsatisfactory. The purpose of the studies is to determine the growth behavior of epithelial lesions induced in vivo by carcinogens. This will be accomplished by placing tracheal explants in vitro and observing the growth behavior of such epithelium under various in vitro conditions. The stability of preneoplastic lesions induced by different dose levels of polycyclic hydrocarbons will be investigated.

ENERGY CYCLE: PROCESSING, CONVERSION (50%);COMBUSTION OR END USE (50%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Damages to developing embryos from environmental agents are the subject of immediate human concern. In the past, extensive work on mouse embryos has utilized radiation as a teratogen and has identified critical periods as well as dose-effect relations. Little if any work of a similar systematic nature has been done with chemical teratogens. This project will develop systematic and sensitive methods for detecting the effects of environmental teratogens in vivo. These methods will subsequently be used to

test a number of chemicals, especially those related to coal-conversion and -utilization technologies.
APPROACH: Preliminary exploration has resulted in the choice of a mouse strain whose natural potentialities cause it to straddle the threshold for certain quantitative characters. It is hoped that in this developmentally labile situation, the effects of even small chemical disturbances will be discernible. Pregnant mouse females will be injected at one of up to four chosen stages of pregnancy with the putative teratogens. Embryo mortality will be measured, and survivors will be studied for a number of external and skeletal characters. In choice of compounds and analysis of results we shall coordinate our efforts with mutagenesis studies and with work on germ cell differentiation in the mouse.
RESULTS: The system chosen should be easily capable of quantitation, and even small effects should be detectable. We expect to identify compounds that are teratogenic and subsequently explore dose-effect relationships for such compounds. Qualitative differences in the actions of different compounds may be revealed by differences in relative stage sensitivity.
PROJECT MILESTONES: (1) November 1976 Completion of base-line experiments using x-rays (positive control) and decision on stages and systems to be chosen for most efficient tests. (2) June 1977 Completion of experiments using benzo(a)pyrene in various concentrations. (3) December 1977 Completion of experiments with three other chemicals related to energy technologies. (4) September 1978 Establishment of dose-effect relationships for 3 different energy-related agents.

PROJECT DESCRIPTION: To assess deleterious effects of energy related compounds whose mode of action on cells requires light in the near uv and visible.
APPROACH: Study damage and repair of DNA which is the target molecule in cells. Use various compounds known to interact with DNA and irradiate with 300-400 nm light. Measure formation and repair of chain breaks.
RESULTS: From in vitro studies the mechanism of action can be obtained. From this one can better predict and understand the results obtained with intact cells. It is expected that the ability of a compound to be taken up by a cell will greatly determine the influence on the cell of that compound. Conceivably, a need will arise to quantitate the uptake of any compound and to locate where in the cell that compound is likely to accumulate. Fluorescence may provide a useful tool to use.
PROJECT MILESTONES: (1) Oct. 1, 1976 Initiate tests on DNA in vitro. (2) July 1, 1976 Initiate tests on DNA in vivo.

POLLUTANTS: METALS (25%);ORGANICS (75%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this project are: (1) to utilize model cell regulatory systems wherein genetic transcription, translation, and turnover of key nucleic acids and proteins can be analyzed and manipulated to determine mechanisms of cellular damage to these processes by hazardous agents associated with coal and oil shale technologies; and (2) to determine if partial or total expression of oncogenic viruses is involved in malignant transformation by polycyclic hydrocarbons.
APPROACH: Hepatoma cells containing inducible enzyme system (tyrosine amino transference) are exposed to PAH compounds and trace metals to determine if agents affect transcription, translation, in RNA turnover, protein turnover. If ''yes'' effects are analyzed further biochemically to define molecular species affected. Fibroblasts containing latent integrated viral genome are exposed to PAH to determine if expression of one or more viral components is involved in transformation.
RESULTS: Projects should yield essential information on the nature of the cellular, regulatory mechanics affected by polycyclic hydrocarbons and other hazardous agents generated in fossil fuel conversion technologies, and to determine if partial expression of latent viral genomes is involved in cellular transformation by these agents.
PROJECT MILESTONES: (1) Jan. 1, 1977 Determine if high levels defined polycyclic hydrocarbons or nontoxic levels of undefined mixtures generated in coal conversion have significant effects of transcription, translation, RNA or protein turnover. Determine if cyclic nucleotide levels affected by these compounds.

(2) Jan. 1, 1977 Begin analyses of effects of trace metals on cellular regulatory mechanisms. (3) Aug. 1, 1976 Begin analyses of effects of polycyclic hydrocarbons on expression of RNA tumor virus genomes, especially partial expression.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project will examine the role of the alveolar macrophage, alveolar epithelial cells, and other pulmonary cells in influencing the distribution within the lung, and the clearance for the lung, of several inhaled metal oxides, initially those of lead, cadmium and mercury.
APPROACH: Electron microscopy will be employed to examine quantitatively the distribution and damage from metal oxides in the lung. Other studies will assess the degree of inhibition of clearance of a test aerosol given after metal oxide inhalation. The project is emphasizing the acute pathological effects of cadmium monoxide and its mechanism of action in the lung.
RESULTS: Data from these studies will be useful in the following ways: (1) establish exposure limits for acute heavy metal inhalation exposures; (2) define the health effects resultant from these exposures; and (3) examine mechanisms of toxic action and potential methods to minimize ('treat') these toxic effects once exposure has occurred.
KEYWORDS: LEAD OXIDES;CADMIUM OXIDES;MERCURY OXIDES;TISSUE DISTRIBUTION;LUNGS;INHALATION;RETENTION;ANIMAL CELLS;EPITHELIUM;MACROPHAGES;ELECTRON MICROSCOPY;AEROSOLS;ANIMALS;PATHOGENESIS;TOXICITY;PARTICLES

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Site specific Rocky Mountains
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this study is to investigate and model the source, transport, physical and chemical reactions, stability, and fate of wastes from oil shale processes including overburden leachates, retort water, mine dewatering salines, and prerefining waste.
APPROACH: Batch and column studies will be used to measure the equilibrium and kinetic parameters which control the fate and transport of the wastes and leachates through typical soil systems of the oil shale regions. A computer simulation program will be developed to predict pollutant transport through these soils. The model will be useful in evaluating various disposal alternatives for these wastes and in the reclamation of mined land.
RESULTS: Development of a suitable shale reaction and transport model will allow prediction of the ground water pollution potential by oil shale retort wastes and accumulation of waste products in soil systems. Determining properties of waste components can be utilized to set standards of performance for pollution control equipment. The predicted concentration of pollutants derived from this research can be coupled with toxicological data to predict the potential that oil shale process wastes have on permanent environmental damage.
PROJECT MILESTONES: (1) 1 Nov 1976 Completion of literature study. (2) 1 Jan 1977 Establish preliminary predictive model of trace element transport. (3) 1 Nov 1977 Complete development of methods for characterization of waters. (4) 1 Sept 1978 Major waste, soil-spent shale, and interaction parameters completed.

REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Far West;GEOGRAPHIC AREAS/Northwest;COASTS/Far West;COASTS/Northwest;HYDROGRAPHIC AREAS/Other hydrographic areas Rivers
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This research program is designed to provide data for establishing water quality criteria for the protection of freshwater resources and ecosystems, and to evaluate ways to minimize the effects of pollutants arising from coal utilization. The proposed program will concentrate on the immediate behavioral or physiological effects on aquatic organisms of thermal and chemical effluents reaching freshwater systems via releases to the atmosphere, surface waters and ground waters due to fossil fuel combustion and utilization.
APPROACH: A state of the art literature review will be made to assess the most efficient mode of action toward new areas of research using the most advanced techniques employing biological and physiological detection thresholds. Behavioral studies employing parameters such as heart rate, cough response, avoidance-attraction response, social hierarchy changes, and alterations in learned responses in fishes will be monitored using a polygraph and closed-circuit videotape instrumentation for recording observation and electrographic information. These sublethal measures, coupled with information concerning the 96 hour LC/sub 50/, will permit determination of detection thresholds for toxicants which may be well below the lethal levels of the toxicants.
RESULTS: A literature review will be completed to determine the chemistry of a variety of compounds and elements originating from coal combustion, liquefaction, gasification, the toxicity of these materials, current knowledge in regard to aquatic organism behavioral and physiological responses and up-to-date techniques to monitor these responses. The results of this literature survey and information from other ongoing programs from the King Report are being used as the basis for designing a comprehensive research program.
PROJECT MILESTONES: (1) 30 January 1976 Complete behavioral and physiological portion of the literature review. (2) 1 April 1976 Design and initiate construction of testing apparatus for behavioral and physiological monitoring of several species of fish. (3) 30 June 1976 Completion of final portion of literature review. Selection of toxicants to be tested and experimental design and test approach for next year's program of research.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Little information is presently available concerning the effects of chlorinated (or other biocide treated) salt water upon non-target estuarine or marine organisms. This project has the objective of determining the effects of short-term exposures of Pacific Northwest meroplankton and infaunal species to power plant biocides and biocide-organics.
APPROACH: Laboratory studies will be conducted in proven continuous flow-through systems which will include both continuous and intermittent exposures of planktonic life stages of important fishes and invertebrates, and chosen infauna, to the selected stressor conditions. Chlorine has been identified as the initial biocide for study, and other chemicals such as bromine chloride and ozone will be employed later. Another important part of the study is the compilation of data on actual biocide usage schemes, and other important stressors encountered by organisms experiencing passage through power plant systems, or existing as permanent benthic forms in effluent areas. Biocide-organic compounds formed during chlorination of salt water will also be studied.
RESULTS: This proposed research project will determine effects of short-term exposures of important saltwater and marine organisms tc power plant biocides in studies which will simulate actual power plant situations. The result will be water quality criteria which answer real world needs for protecting important estuarine and marine organisms. The lack of such information in the face of an increasing potential for impact could lead to inadequate planning of power plant locations and operating practices with the attendant potential

for the degradation of extremely valuable and productive saltwater habitats.
PROJECT MILESTONES: (1) May 1977 Development of a suitable analytical methodology for chlorinated organics and initiate exposure experiments. (2) December 1976 Issue interim report on the effects of chlorine and organic constituents on meroplankton. (3) December 1978 Initiate studies with other selected biocides, e.g., ozone, chromates, etc., on plankters and infauna.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLCGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objectives are to identify the forms of chemicals in power plant effluents (e.g., chlorine, copper, chromium and nickel) that are biologically active, how they are modified by physical parameters such as heat, and to determine their single and combined effects on important marine and estuarine species and communities. Short-term laboratory experiments will lead into long-term, low-contaminant-level investigations. These will be compared to field verification studies at existing power plant effluents.
APPROACH: The above effects are being evaluated by comparing individual and community (communities developed on portable artificial substrates) responses to single and combined chemicals in terms of LC50's, ash-free dry weights, respiration, and species numerical and compositional variations as determined by indices of species evenness, richness, dominance, and affinity. All toxicant bioassays will run with and without heat modification.
RESULTS: The anticipated results are the establishment of realistic water quality criteria for thermal discharges, the optimization of biocide dosages when combined with other chemicals having known toxic effects, the relative toxicities of chemical releases and how they are modified by heat, and the long-term, low-level effects of combined releases on marine and estuarine communities.
PROJECT MILESTONES: (1) December 1977 Determination and assessment of the concentrations of single chemical contaminants needed to produce an effect on marine communities and representative individuals. (2) January 1978 Determination and assessment of the combined effects of chemical contaminants on marine communities and representative individuals. (3) December 1978 Determination and assessment of the effects of heat on single and combined toxicities of chemical contaminants on marine communities and representative individuals.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This is a program to define effects on marine intertidal communities from oil refineries and transfer facilities at specific sites in the Puget Sound region of the Pacific Northwest.
APPROACH: Effects are being measured in terms of organic content of sediment, general community structure, and change in the age structure, recruitment, growth and mortality of an important clam species. The sites chosen for study include the Cherry Point region, an operating and developing refinery site; the Port Angeles region, an area for which a deep water port and pipeline terminus is proposed; and, the Sequim Bay region, an area to serve as an uncontaminated control.
RESULTS: Anticipated effects would result from refinery wastes, chronic spillage of crude or refined oil, and the possible large spillage associated with tanker collision or grounding. Output is to be in terms of data summary and statistical measures of sampling sensitivity.
PROJECT MILESTONES: (1) March 1976 Review and interpret existing data to design research program (complete).

(2) August 1977 Describe within year sensitivity of measures for parameters. (3) October 1978 Assess between year variability in parameter estimates. (4) January 1980 Verify predictions of changes in parameters related to chemical measurement of source.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project will provide information on the interactions between the physiologic event of bronchoconstriction caused by exposure to sulfur pollutants and related physiologic and biochemical changes which may place sensitive individuals at risk from heart attacks or exacerbation of bronchitis or emphysema.
APPROACH: We will define those vasoactive agents responsible for bronchoconstriction caused by inhalation of sulfur pollutants in guinea pigs. Possible vasoactive agents will be evaluated by pretreating the animals with specific pharmocologic blocking agents. If the response to sulfuric acid mist is absent or reduced following pharmocologic blockage, the agent being blocked will be assumed to be involved in the normal pulmonary response to sulfuric acid exposure.
RESULTS: The primary output of this study will be to define the biochemical agents responsible for changes in pulmonary function caused by exposure to sulfur pollutants. As a consequence of this initial finding, possible beneficial effects of inhibiting the action of these responsible agents will be evaluated to determine whether individuals highly sensitive to sulfur pollutants can be protected. If this research proves fruitful, a means of protecting the health of sensitive individuals in the human population may be available without the economic drain of scrubbers to remove all sulfur compounds from power plant effluent.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objectives of this study are to evaluate the rate of generation and atmospheric release of elemental pollutants at the new Colstrip, Montana power station, to describe their chemical transformations, and to measure the dispersion and subsequent accumulation and impacts on components of the ecosystems they invade.
APPROACH: (1) Qualitative description and quantitative measurement of major and minor elements in mass balance study on Colstrip Unit 1. (2) Evaluation of wet and dry deposition rates of air pollutants and characterization of chemical transformations of key pollutants after stack releases. (3) Measure the accumulation of gaseous and particulate pollutants in terrestrial vegetation, and evaluate their effects on plant community structure, growth, and pathogenesis. (4) Determination of pollutant elements in principal animal species. (5) Measurement of efficiency and rate of transport of elemental pollutants down a model watershed to its impoundment. (6) Evaluation of impoundments for changes in water and sediment composition, biomass, algal succession, and bioconcentration of toxic trace elements. (7) Laboratory measurements of rates of uptake and bioconcentration of key pollutant elements by dominant algae and macrophytes. (8) Evaluation of the accumulation and turnover of toxic pollutant elements in controlled studies on ruminant animals.
RESULTS: Formulation of a model describing the nature and environmental behavior of pollutants generated from coal combustion in a modern coal-fired power plant and evaluation of the environmental impact of the stack effluents on terrestrial and aquatic ecosystems in the Northern Great Plains.
PROJECT MILESTONES: FY 77 Characterize environmental levels of sized air particulates/trace elements composition and gaseous effluents downwind from Colstrip Unit No. 1 and establish a mass balance between coal and combustion products; characterize physical and chemical transformations of effluents during atmospheric transport. Measure plant community characteristics and productivity in study plots in terrestrial and aquatic systems influenced by the plume of Colstrip No. 1. Continue trace element analysis on water, soil, precipitation and dominant species of flora and fauna from established study sites. Carry out toxicity studies of key toxic elements on aquatic flora. Initiate metabolic turnover studies of toxic elements in ruminant animals. Continue watershed and soil mapping for watershed models. FY 1978 More carefully define nature of coal-generated pollutants and their chemical and physical changes in the environment. Begin formulation of a model describing nature and environmental behavior of pollutants. Evaluate bioconcentration of trace metals in terrestrial and aquatic flora and fauna. Determine pollutant effects on plant pathology, productivity, frequency, cover, and diversity. Assess effects of fly ash sources of trace elements on algae using in situ model systems. Continue turnover studies in herbivores using radionuclide species of high priority toxic elements.

ENERGY CYCLE: EXTRACTION (25%);COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (25%)
POLLUTANTS: NOXIOUS GAS (40%);PARTICULATES (30%);ORGANICS (30%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The broad objectives of this study are to develop the basic science, the investigative methods and the hardware so that the demanding analytical requirements associated with the characterization of organic and inorganic pollutants in effluents from energy generating sources can be met in a viable practical manner. Particular emphasis is devoted to the development of multipollutant analytical concepts and on the determination of ultratrace pollutants. Special attention is being placed on those inorganic and organic pollutants which are or may be emitted from fossil-fueled energy sources and from coal liquefaction and gasification plants. Many of these pollutants are certainly health hazards, and some already identified are proven carcinogens.
APPROACH: Two approaches are utilized. The first involves laser pumped luminescence and microwave resonance (LPLMR) spectroscopy. The second approach is focused on the compositional characterization of air particulates and is based on drawing the polluted air through polycarbonate membrane filters of exceptional high purity having pore diameters of 0.8 mu m. These filters are then dissolved and the resulting solutions are analyzed by the ultrasensitive inductively-coupled plasma, atomic emission spectroscopic technique developed in the Ames Laboratory.
RESULTS: (1) The development of the LPLMR technique should allow the characterization and quantitation of carcinogenic polynuclear atomatic hydrocarbons at the ppb level by three independent spectroscopic ''fingerprints.'' (2) The development of a practical technique for the simultaneous determination of the trace element content, of air particulates, at powers of detection far superior to any other analytical technique.
PROJECT MILESTONES: (1) 1978 The laboratory demonstrations that reproducible and accurate mass calibrations can be achieved by a laboratory particulate deposition facility will be completed. The air sampling concept will be tested in the field. (2) 1979 Authentic air and water samples will be analyzed for the common carcinogens by the LPLMR technique and the performance will be evaluated critically. Recommendations on the desirability for the development of a commercial facility will be made.

TITLE: The Study of Autoxidation of Lipids of Biomembranes and of Lung Surfactants Initiated by Oxidative Pollutants and Its Inhibition by Antioxidants
PROJECT NUMBER: 004151
PRINCIPAL INVESTIGATOR: Mead, J.F.
ADDRESS: 900 Veterans Avenue, Los Angeles, CA 90024
AFFILIATION: California Univ., Los Angeles (USA). Lab. of Nuclear Medicine and Radiation Biology
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Carter, L.
TYPE OF FUNDING: Agency in-house effort;EPA pass-thru funding
77 FUNDING: Environmental Protection Agency FY77:$51,000; Energy Research and Development Administration FY77:$60,000
TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS/NO/sub 2/;NOXIOUS GAS/O/sub 3/ (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this research are to understand how oxidative pollutants such as NO/sub 2/ and O/sub 3/ can initiate oxidative damage in ordered arrangements of lipids such as the membrane bilayer, how the reaction proceeds, once initiated, and how it may be prevented or arrested with antioxidants and other substances. The knowledge gained from these studies will be applied to biomembranes and to whole animals in an attempt to find means of protection against this type of damage.
APPROACH: The initial studies are performed on model systems of lipid mono and bilayers and involve measurement of the damage to the unsaturated fatty acids by the radical chain oxidation and its modification by membrane components. Similar studies are under way with membrane systems from experimental animals in which similar modifications of membrane composition are attempted.
RESULTS: In FY 1976, the physical and chemical nature of the model system will be understood and the nature and mechanism of formation of the products of monolayer fatty acid autoxidation (epoxides) are clarified. The effect of saturated fatty acids is found to decrease the autoxidation rate if the acyl chain extends more than 6-8 carbon and cholesterol increases autoxidation although its esters afford some protection. The mechanism of action of the tocopherols is shown to be complete blocking of autoxidation by alpha-tocopherol until it is decreased and to the point where autoxidation is released, less effective blocking for longer periods of time by alpha-tocopherol and still longer less effective blocking by a tailored antioxidant, a hydroquinone, containing fatty acid. In 1977, a complete understanding of the model system will be achieved and experiments designed to control the composition of the rat-liver microsomal membrane will continue. The relationship between dietary antioxidant and polyunsaturated fatty acid and exposure to oxidative pollutants as NO/sub 2/ and O/sub 3/ will be assessed and, in 1978, protective measures will be considered.
PROJECT MILESTONES: (1) In FY 1976 the nature of the model membrane system and the information it affords for membrane autoxidation and antioxidants will be reported. (2) In FY 1977 the knowledge gained with the model system will be applied to the biomembrane system in vitro and in vivo. (3) In FY 1978 the manipulation of the biomembrane by dietary means will be attempted in order to suggest protective measures against the effect of oxidative effluents.

TITLE: Reparative and Adaptive Mechanisms in Respiratory Systems of Rodents and Monkeys Exposed to Sulfur Compounds and Particulates
PROJECT NUMBER: 004152
PRINCIPAL INVESTIGATOR: Goldman, M.
ADDRESS: Davis, CA 95616
AFFILIATION: California Univ., Davis (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Carter, C.
TYPE OF FUNDING: Agency in-house effort;EPA pass-thru funding
77 FUNDING: Environmental Protection Agency Energy Research and Development Administration FY77:$200,000
TECHNOLOGY: FOSSIL FUEL/Coal (90%);FOSSIL FUEL/Oil and Gas (10%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS (50%);PARTICULATES (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To determine the functional and morphological consequences of injury to the respiratory system of rodents and monkeys by inhalation of effluents from coal-burning power sources. Sulfuric acid and particulates will be used as models of injury. (2) To determine the site and sequence of biochemical, immunological, and cellular mechanisms responsible for the injury. (3) To determine cellular and subcellular mechanisms of adaptation and repair according to intensity and duration of injury, and to plot the extent to which recovery is possible as a function of exposure concentration and time. (4) To examine the relationships between the factors involved in the balance between injury and adaptation/repair, and to assess their relative roles in the development of chronic bronchitis, emphysema, interstitial fibrosis, and proliferative states capable of increasing the risk of carcinogenesis.
APPROACH: Rodents and monkeys will be exposed 23 1/2 hours/day to aerosols of H/sub 2/SO/sub 4/, particulates including fly ash, and combinations for 3-12 months. Some animals will be examined at the end of the exposure and others after a 3-12 month period in clean air. The test systems will include whole rodents and monkeys and in vitro organs, tissue slices, and cells from those animals. Mechanisms of injury, adaptation, and repair will be determined and evaluated using sensitive techniques of respiratory physiology, biochemistry, immunology, microbiology, cell biology, and descriptive and quantitative pathology. We will study respiratory system; (1) Ventilatory and airway response and exchange area function; (2) clearance of inhaled radiolabeled partices and of bacteria; (3) biochemical markers of injury, adaptation, and repair; (4) immune responsiveness of lymphoid tissues and functional capabilities of the immunccompetent cells; (5) pathology using light, transmission electron, and scanning electron microscopy; and (6) cell kinetics and functions using autoradiography and histochemistry.
RESULTS: The basic processes of injury, adaptation, and repair will be determined, correlated, and evaluated in terms of intensity and duration of injury, extent of recovery, roles in the development of chronic lung diseases, and increased risk of cancer. This information will be useful to assess the relative human health hazards of exposures to energy related effluents.
PROJECT MILESTONES: (1) June 30, 1977 Preliminary report of effects of 3 month exposures of rodents to fly ash and H/sub 2/SO/sub 4/ aerosols separately. (2) December 30, 1977 Preliminary report of 3 month recovery by rodents from effects of 3 month exposure to fly ash and H/sub 2/SO/sub 4/ aerosols separately. (3) January 30, 1978 Preliminary report of repairative and adaptive mechanisms in rodents. Peliminary report of effects of 3 month exposure of rodents to aerosols of fly ash and H/sub 2/SO/sub 4/ combined. (4) December 30, 1978 Preliminary report of effects of 3-6 month exposure of monkeys to combined fly ash and H/sub 2/SO/sub 4/ aerosols. (5) February 1979 Completion of exposure facility expansion and exposure facility lab.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To determine basic responses of the respiratory system to inhaled toxicants and elucidate mechanisms of particulate matter clearance, translocation, and retention. (2) Identify and characterize key enzymes in essential lung metabolism. (3) Define the significance of physical and chemical properties in determining the toxicity of aerosols.
APPROACH: (1) Study of rodents, dogs, and man after carefully controlled inhalation exposures. In animal work, study of pulmonic lymphatic permeation, lymphoid uptake, and retention. (2) Use of microscopy and electron microprobe to study role of alveolar macrophage in particle clearance. (3) Use of tracer methodology to develop kinetic models to describe fate of inhaled toxicants. (4) Develop methods to characterize aerosol particles and produce monodisperse particulate preparations.
RESULTS: (1) Basic information for the design of respiratory dosimetric models appropriate to inhaled toxicants of both chemical and radioactive types. (2) Information regarding effects of airborne toxicants (such as SO/sub 2/, NO/sub x/, asbestos, or ozone) on normal pulmonary function, including clearance functions. (3) Molecular basis for the quantitative assessment of important pulmonary function (e.g., production of surfactants). (4) Techniques for simultaneous measurement of aerosol particle size and abundance and for generating aerosols that are monodisperse with respect to aerodynamic diameter but differ in other respects.

PROJECT MILESTONES: (1) Time-of-flight measurement of atmospheric aerosol size distribution Dec. 1976. (2) Finish collaborative study on attachment of radon decay products to airborne particulates June 1977. (3) Begin develcpment of methods for producing monodisperse aerosols for use in study of lung clearance Dec. 1977. (4) Begin development of analytical methods for U-232 and U-233 June 1978. (5) Initiate studies with neutron-activated coal dust Oct 1978. (6) Determine unique features of atmospheric particles which serve to identify their origin Dec 1978. (7) Complete human studies on preliminary absorption of lead Jan 1979. (8) Ccmplete initial phase of pulmonic lymphatic permeation study in dogs Nov. 1979.

77 FUNDING: Federal Energy Administration FY77:$20,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: NOXIOUS GAS/Sulfur dioxide (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: Under Section 4 of ESECA, EPA was tasked with reviewing all State Implementation Plans for potential overkill and with advising states of its results. The EPA summary released in July 1975 is inadequate because it fails to address those air quality control regions which had insufficient data or which were rated marginal or poor. In addition, on August 27, EPA promulgated SIP's for Ohio employing new methods for SIP development. Since these methods were not applied to the incomplete ESECA Reviews, FEA finds this exercise necessary in order to encourage coal utilization in the ESECA Program.
APPROACH: Radian shall become familiar with the ESECA Section 4 Reviews for each state and the Summary Report and shall evaluate the methodology and results. Those states which were rated ''poor'', ''N.A.'', or ''marginal'' in the Reviews, but appear to have revision potential on the basis of the Ohio methodology, shall be identified. To the extent that a quantification of the impact of SIP revision on allowable coal sulfur is possible, that value shall be listed along with the identification of State SIP revision potential. In addition, Radian will develop instructions for applying the Ohio methodology to existing State SIP's in order that FEA can give guidance to states in effecting SIP revisions.
PROJECT MILESTONES: Final report expected 30 Sept 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The contractor shall, in collaboration with, and under the guidance of, the GTR, perform technical analyses of the implications for energy resource development, in terms of balancing energy and economic considerations with environmental objectives, of the following EPA emerging policies and regulatory directives: (a) Significant Deterioration; (b) Compliance Date Extensions; and (c) Proposed Guideline on Air Quality Models.
APPROACH: Some of the other issues include regulatory and administrative delays, choice of atmospheric dispersion models, allocation/partitioning of the increments, natural violations, and other pollutants. Methods of enforcing prevention of significant deterioration is of particular concern. The concept itself is new and innovative enforcement techniques will be necessary. It is important that we examine these techniques to ensure that they do not exacerbate a concept already thought to be restrictive of economic growth. The contractor shall also address the following additional issues: procedural delays; methods of enforcement; other pollutants; and number of Class I areas.
PROJECT MILESTONES: (1) Interim report Oct. 15, 1977. (2) Draft final report Dec. 31, 1977. (3) Final report Feb. 28, 1978.

CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Global
PROJECT DESCRIPTION: This project is a two-stage experimental study examining the chemical controls on the formation of different types of siliceous rocks. These rocks, commonly called cherts or porcelanities, are rather common in deep-sea sediments and in certain continental regions form important petroleum reservoir rocks.
APPROACH: In the first stage of this study, the chemistry and mineralogy of siliceous organisms will be determined and low temperature hydrothermal experiments will determine the effects of carbonate and clay minerals on the crystallization process. The second stage will examine the effect of various inorganic impurities on the chemical reactions in marine and fresh water environments and extend the laboratory studies to Deep Sea Drilling Project samples.
RESULTS: Results from this project will provide significant insight into both the origin and evolution of these sedimentary rock sequences.

POLLUTANTS: NOXIOUS GAS/CO;NOXIOUS GAS/O3;NOXIOUS GAS/NOx;NOXIOUS GAS/HC (50%);PARTICULATES (50%)
CHARACTER OF STUDY: RESEARCH/General (100%)
PROJECT DESCRIPTION: This is a continuation of work under Grants GI-36338 and ENV75-02667 A04 on the trace elements and polycyclic aromatic hydrocarbons in size-graded particulates emitted by power plants (coal- and oil-fired), municipal refuse and sewage-sludge incinerators, automotive traffic, airports, and the rural background. The objective is to identify sources of toxic elements and to trace the origins of ambient particulates. A second objective is to elucidate certain aspects of homogeneous gas reactions in polluted air and to determine the conditions that control ozone formation in power-plant and industrial plumes.
APPROACH: This grant extends the study to the combustion of refuse-derived fuel and to industrial sources represented by steel-making, petroleum refining, cement manufacture, and nonferrous smelting. Trace elements are analyzed by neutron activation and atomic absorption. Polycyclic aromatic hydrocarbons are measured in the particulate and gas phases. Studies in the meteorological forecasting of stagnation periods will assist in evaluating the significance of the source emissions. Studies of rainfall pH will attempt to correlate the acidity of rain with the chemistry of power plant emissions. Aircraft sampling will be continued to elucidate the factors controlling the appearance of ozone bulges in power plant and industrial plumes by coordinated measurements of ozone, hydrocarbons, nitrogen oxides, carbon monoxide, humidity, condensation nuclei, and temperature.

TITLE: Chemical Model Systems for Dioxygenases
PROJECT NUMBER: CHE74-03096-A02
PRINCIPAL INVESTIGATOR: Brown, D.G.
ADDRESS: Moscow, ID 83843
AFFILIATION: Idaho Univ., Moscow (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Division of Chemistry
77 FUNDING: National Science Foundation FY77:$23,500
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
PROJECT DESCRIPTION: The goal of the project is to devise chemical systems which will be models for the aromatic dioxygenases. Synthetic work will be directed toward synthesizing complexes with a predetermined structure and anticipated reactivity. Special emphasis will be placed on gaining a complete understanding of the oxidative aromatic ring cleavage reaction which has been discovered.
APPROACH: Work will be aimed at expanding the types of systems which react with O2 to give ring opening and to make the reaction catalytic. Potential applications of this dioxygenase-like chemistry include: (a)

develcpment of synthetically useful mild ring opening reactions; (b) formulation of a chemical means of oxidatively degrading aromatic pollutants; (c) a new approach to bleaching; (d) understanding the pathways of oxidative aromatic degradation; and (e) homogeneous catalysis as related to U.S. energy problems.

77 FUNDING: National Science Foundation FY77:$55,600
POLLUTANTS: METALS/Heavy (50%);SPECIFIED OTHER POLLUTANTS/Hydrocarbons (50%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
PROJECT DESCRIPTION: The Biological Effects Program (BEP) is conducting laboratory studies to evaluate the effects of metals, petroleum, chlorinated hydrocarbons and phthalates on marine organisms. The objectives of this program are to determine which species, life cycle stages and physiological processes are most effected by various types of pollutants, and at what levels. In addition, the investigators are looking specifically for biological indicators which could be used as an early warning system to detect pollutant-induced perturbations in the open ocean.
APPROACH: This project intends to precisely define certain sublethal physiological responses particularly sensitive to pollutant-mediated perturbation in marine animals. Highly purified ''model pollutants'' representative of three major marine pollutant types will be evaluated. These include industrial chlorinated hydrocarbcns, hydrocarbon-type pollutants, and heavy metals.
RESULTS: Two types of sublethal responses will investigate the growth energetics and energy budgets of marine larvae, which involve measurements of growth rate, feeding, assimilation, respiration and excretion by marine larvae during exposure to sublethal concentrations of model pollutants, and the corticosteroid stress response in fish. Fish will be exposed to sublethal concentrations of the model pollutants and be monitored over an extended period of time for plasma cortisol, cholesterol and glucose, interrenal and hepatic ascorbic acid concentrations and hepatic microsomal mixed function oxidase activity. In addition, newly hatched larvae of fish will be exposed continuously to the pollutants for a month and monitored for evidence of ascorbic acid depletion and scurvy. These responses may, in turn, provide valuable early warning indices which indicate when pollutants have reached damaging levels in the oceans.

TITLE: Geochemical Ocean Sections Study--GEOSECS--Isotopic Measurements
PROJECT NUMBER: OCE76-05057-A01
PRINCIPAL INVESTIGATOR: Kroopnick, P.M.
ADDRESS: 2444 Dole St., Room 101, Honolulu, HI 96822
AFFILIATION: Hawaii Univ., Honolulu (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISICN: Division of Ocean Sciences
77 FUNDING: National Science Foundation FY77:$47,400
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: RADIATION (50%);SPECIFIED OTHER POLLUTANTS/Miscellaneous (50%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: HYDROGRAPHIC AREAS/Deep ocean
PROJECT DESCRIPTION: The Geochemical Ocean Sections Study, GEOSECS, is a coherent oceanographic research program whcse purpose is to make detailed measurements of oceanic constituents at all depths along sections in the Atlantic and Pacific Oceans from the Arctic to the Antarctic. The purpose of these measurements is to provide, for the first time, a set of physical and chemical parameters measured on the same water and applying the same analytical techniques for each compound on an oceanwide basis.
APPROACH: This proposal will support the operation and maintenance of the laboratoy analyses for stable carbon and oxygen isotopes in total CO2 PCO2 and dissolved oxygen for GEOSECS samples. The data will be used to model the variations of in situ CO2 production, O2 consumption and organic particulate flux mineralization in the deep-sea. This will give accurate estimates of the proportions of deep-sea CO2 which comes from the mineralization of organic matter versus dissolution of CaCO3.
RESULTS: The results of these measurements will provide data for quantitative studies of oceanic diffusion and mixing against which the distribution of future levels of fission and waste products and other pollutants in the sea can be evaluated.
KEYWORDS: OCEANOGRAPHY;MATHEMATICAL MODELS;SEAWATER;PHYSICAL PROPERTIES;CHEMICAL COMPOSITION;DIFFUSION;MIXING;CARBON;OXYGEN;MINERAL CYCLING

TITLE: Optimization of Environmental and Energy Related Systems
PROJECT NUMBER: ENG76-05191
PRINCIPAL INVESTIGATOR: Kortanek, K.O.
ADDRESS: 4400 5th Avenue, Pittsburgh, PA 15213
AFFILIATION: Carnegie-Mellon Univ., Pittsburgh, Pa. (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Div. of Engineering
77 FUNDING: National Science Foundation FY77:$23,900
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
PROJECT DESCRIPTION: The research is principally concerned with the continued development of models and solution techniques for use in solving problems of environmental protection and energy conservation.
APPROACH: New control engineering models have been developed for optimizing air pollution abatement policies originally stemming from problems encountered in the Pittsburgh area. The basic control problem is to regulate the emission rate distribution of the polluting sources in order to achieve desirable air quality throughcut a geographic region. The optimization may be governed by any of a number of policy goals, such

as seeking a feasible emission distribution which minimizes the total economic-energy impact due to its implementation. This research concentrates on the related recovery problem of seeking solutions to integral equations having random disturbance terms by using a two-sided approximation of functions approach. Based on our Lagrangian interpolation study, the problem is focused for a (real) time-dependent analysis of system identification and adaptive-feedback control.
RESULTS: Numerical studies were made on the model in an attempt to find solutions. this led to new computational schemes and computer codes for solving extremum problems involving polynomial or orthogonal systems of functions, termed moment problems.

TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Smoke stack emissions (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
PROJECT DESCRIPTION: This investigation is concerned with the development of methods for enchancing detection schemes for remote monitoring of various pollutants emitted from smoke stacks and other sources.
APPROACH: The major technique to be investigated involves periodic modulation of the concentration of specific constituents in the sampled region by intense ultraviolet illumination combined with detection of infrared or other wavelength emissions from the modulation products. Signal to background emission noise enhancement is provided by differential detection and signal integration techniques. Electronic systems necessary to perform the signal processing will be constructed and measurements will be made on the gases NO2, SO2, and NH3.

<110011>
TITLE: Distribution of Spilled Oil in Relation to Beach Morphology
PROJECT NUMBER: ENV76-06898 A01
PRINCIPAL INVESTIGATOR: Hayes, M.O.
ADDRESS: Administration Bldg., Room 115, Columbia, SC 29208
AFFILIATION: South Carolina Univ., Columbia (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Div. of Advanced Environmental Research and Technology
77 FUNDING: National Science Foundation FY77:$9,000
TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Oil spill (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Global;COASTS/Other coasts All
PROJECT DESCRIPTION: This additional research is designed to measure the rate by revisiting the beaches six months after the original trip and re-measuring the beach profiles using the permanent survey points as reference markers.
RESULTS: Under the present NSF grant, the beaches have already been classified, profiles drawn, oil distribution defined, and permanent survey markers installed. Much oil is being removed by beach erosion which removes sediment and the included oil. The oil is then lost to the water and the resulting clean sediment is washed up onto another beach. This process of erosion and deposition is continuous and results

in a clean-up of those beaches subject to erosion. At other beaches, the oil in place is being covered by fresh sediment being washed in. Although this erosion-deposition process is understood, the rate at which it occurs is not.

TITLE: Reactor and Crossed-Jet Studies of the Dynamics of Free-Radical Reactions
PROJECT NUMBER: CHE76-09574 A03
PRINCIPAL INVESTIGATOR: Bowman, J.M.
ADDRESS: 3300 S. Federal Street, Chicago, IL 60616
AFFILIATION: Illinois Inst. of Tech., Chicago (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Div. of Chemistry
77 FUNDING: National Science Foundation FY77:$50,700
TECHNOLOGY: GENERAL SCIENCE (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
PROJECT DESCRIPTION: The objective of the planned research is to obtain new and useful quantitative information of the elementary gas reactions of polyatomic organic free radicals which are important reactive intermediates in high temperature combustion, and which are also involved in the transformation undergone by gaseous substances emitted into the atmosphere by man's activities.
APPROACH: Complementary quantitative studies are planned which will probe both the sources and sinks of polyatomic free radicals. The reactions of O atoms and OH radicals with gaseous organic molecules will be studied in heated crossed jets, and the free radicals produced will be detected and identified using a special photoionization mass spectrometer designed and built for these studies. These experiments will directly determine the open reactive routes of these reactions. Rate constants for the individual routes of each reaction will be measured at several temperatures in separate experiments using a heatable fast-flow reactor to quantitatively establish the relative importances of the separate routes of each reaction and how they vary with temperature.
RESULTS: Subsequent reactions undergone by these reactive polyatomic free radicals will be also quantitatively studied using a new photochemical reactor as well as with a new relaxation technique developed especially to obtain this kind of information.

TITLE: Hydrogen Sulfide and Reduced Forms of Sulfur in Air
PROJECT NUMBER: ENV76-09585-A02
PRINCIPAL INVESTIGATOR: Braman, R.S.
ADDRESS: 4202 E. Fowler Avenue, Tampa, FL 33620
AFFILIATION: Florida State Univ., Tampa (USA). School of Natural Sciences
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Division of Advanced Environmental Research and Technology
77 FUNDING: National Science Foundation FY77:$42,500
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Sulfur compounds (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
PROJECT DESCRIPTION: The proposed research is aimed at developing convenient field methods of sufficient sensitivity to permit getting quantitative values at ambient levels well above detection limits. This is necessary in order to arrive at reliable quantitative estimates of the natural biogenic contributions of hydrogen sulfide and other volatile sulfur compounds for comparison with man-made sources of atmospheric sulfur, such as combustion sources of sulfur dioxide. The ultimate goal is to provide methodology to help assess the relative contributions of natural and man-made precursors of toxic airborne sulfate particulates. This is an extension of Grant ENV-76-9585A01.
APPROACH: Analytical techniques to be evaluated include absorption of gaseous species in metal-coated beads with subsequent high-temperature expulsion into suitable detection systems, and selective retention and expulsion of certain sulfur species in gas-chromatographic columns. For solid particulate materials, experiments will be done by heating in inert gases, by acid treatments, by solvent extraction, and by heat treatment in the presence of hydrogen gas. Water and sediment samples will be handled by comparable methods.

TITLE: Statistics and Origin of Haze in the Central United States
PROJECT NUMBER: ENV77-12125
PRINCIPAL INVESTIGATOR: Robinson, G.D.
ADDRESS: 275 Windsor Street, Hartford, CT 06120
AFFILIATION: Center for the Environment and Man, Inc., Hartford, Conn. (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Division of Advanced Environmental Research and Technology
77 FUNDING: National Science Foundation FY77:$49,600
TECHNOLOGY: SOLAR/General (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Haze (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Midwest
PROJECT DESCRIPTION: This research is investigating the frequency, intensity, nature and origin of atmospheric haze in an area in the midwest, and the reduction of available solar energy at the earth's surface by this haze.
APPROACH: Joint statistics of visual range, stability of the lower atmosphere, and cloud type and amount are being studied. This allows the estimation of the attenuation coefficient and scale height of the haze, and computation of the depletion of solar radiation. Validating evidence is being sought in the records of recent air quality programs in the St. Louis area. In addition to the statistical studies, a sample air quality model, previously developed by the investigators, is being used to investigate the origin of the haze and the proportion of sulfate to other particles. Validation of the model is sought in Environmental Protection Agency air quality records.

TITLE: System Control of Anabiotic and Catabiotic Phenomena in the Below-Ground Ecosystem
PROJECT NUMBER: DEB75-13468 A02
PRINCIPAL INVESTIGATOR: Coleman, D.C.;Hunt, H.W.
ADDRESS: Fcrt Cclins, CO 80521
AFFILIATION: Colorado State Univ., Fort Collins (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Div. cf Environmental Biology
77 FUNDING: National Science Foundation FY77:$166,200
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
PROJECT DESCRIPTION: This research will describe and quantify the interconnections between the dominant energy and nutrient flow pathways in the below-ground portion of a grassland ecosystem. It is conceptually based on a complex, two-phase paradigm of system anabolism or primary production, and system catabolism or heterotrophy centered chiefly on biophagic grazing on roots and saprophagic activity and its attendant grazing phenomena.
APPROACH: Using microcosms and simulation modeling approaches to better conceptualize and examine key processes, four key areas will be examined: (1) Root growth, exudation, and respiration; (2) Root grazing; (3) Microbial productivity, turnover, and mineralization; and (4) Saprophagic grazing, and subsequent release of available minerals. With a series of controlled experiments microcosms (in the first two years) will be treated with varied moisture and temperature regimes and with atmospheric pollutants (e.g., SO2, NO2, O3). Subsequently, in the third year (1977--1978) field studies with similar variables are anticipated using portions of the Ecosystem Stress Area (ESA) on the Pawnee Site (shortgrass prairie).

MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Div. of Advanced Environmental Research and Technology
77 FUNDING: National Science Foundation FY77:$90,000
PROJECT DESCRIPTION: The information Center Complex of Oak Ridge National Laboratory is providing a variety

of information support services to the NSF-RANN program on Chemical Threats to Man and the Environment intended for the broad community of users of the information generated by program research.
APPROACH: The services include: (1) the preparation of overview documents summarizing current literature on halogenated organic compounds, focusing on the organohalides of strategic environmental and human health concern; (2) the publication and distribution of a bimonthly abstract journal and newsletter covering all research results published by the Chemical Threats program grantees; (3) the annual publication of the Chemical Threats Directory of program participants; (4) the management of a technical information system file and (5) the operation of an environmental response and referral center which provides literature searches, bibliographies, summaries of information and replies to specific questions requested by the community of researchers, governmental agencies, industrial organizations and interested individuals concerned with the environmental and human health aspects of trace contaminants.

POLLUTANTS: NOXIOUS GAS (50%);PARTICULATES (40%);SPECIFIED OTHER POLLUTANTS/Water vapor (10%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
PROJECT DESCRIPTION: The objective of the study is to determine the effects on visibility, clouds and precipitation of the effluents (particles, gases, heat and water vapor) from modern coal-power plants.
APPROACH: Measurements will be made from a research aircraft which is equipped with state-of-the-art instrumentation for measuring particles, gases and the structure and microphysics of clouds. Particular attention will be paid to the effluents from the plants and their effects on drop size distributions, ice particles and the production of precipitation in clouds located downwind from the power plants.
RESULTS: The data obtained will be analyzed to determine the difference in cloud processes and precipitation of ambient vs. prevailing conditions as a result of the plume contaminants. Results from this project should aid in the evaluation of the environmental effects of power plants and help in the siting of new power plants.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: METALS/Mercury (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater
PROJECT DESCRIPTION: This supplement will allow the completion of work begun three years ago, involving scientists from the Oak Ridge National Laboratory in cooperation with their colleagues of the Mines of Almaden in Spain. This is an ecological study of mercury in both the terrestrial and aquatic ecosystems in the vicinity of Almaden with the objective of defining the range of mercury concentrations in critical ecosystem compartments, identifying indicator species (if they exist), and charting the distribution of environmental mercury away from the mining area.
KEYWORDS: SPAIN;MERCURY;ECOLOGICAL CONCENTRATION;TERRESTRIAL ECOSYSTEMS;AQUATIC ECOSYSTEMS;WATER QUALITY;AIR QUALITY;ENVIRONMENT

<110022>
TITLE: Precise Experimental Determination of the Carbon Dioxide Buffer Factor of Sea Water
PROJECT NUMBER: OCE74-21496-A02
PRINCIPAL INVESTIGATOR: Keeling, C.D.
ADDRESS: P.O. Box 1529, San Diego, CA 92038
AFFILIATION: California Univ., San Diego (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Division of Ocean Sciences
77 FUNDING: National Science Foundation FY77:$16,800
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/CO2 (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Marine
APPROACH: A series of precise measurements of K1, K2, and the buffer factor will be made by relating by direct measurement, variations in CO2 partial pressure, alkalinity, and total inorganic carbon in the range 0 to 30 degrees, at varying salinities. In the proposed study, pH measurements will be included as an adjunct to overdetermine the chemical system and ferret out and eliminate any systematic errors.
RESULTS: The accuracy of knowledge of the CO2 buffer factor should be increased by at least a factor of ten, possibly by a factor of 50. The accuracy of prediction of carbonate solubilities should be improved and substantially a better measure of pH at low temperatures where conventional electrode experiments are not reliable will be provided.

TITLE: Special Foreign Currency Award (2,530,000 Polish Zlotys) to Study Flame and Detonation Propagation in Coal, Dust, Methane, Air-Mixtures
PROJECT NUMBER: INT-75-22131
PRINCIPAL INVESTIGATOR: Wojcicki, S.
ADDRESS: Pl. Jednosci Robotniczej 1, Warsaw, Poland, XX
AFFILIATION: Politechnika Warszawska (Poland)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Div. of International Programs
77 FUNDING: National Science Foundation FY77:$42,300
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: PARTICULATES/Coal dust (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
PROJECT DESCRIPTION: This cooperative research program between the Technical University of Warsaw and the University of Michigan is concerned with some fundamental aspects of coal mine explosions and is a natural outgrowth of other combustion and explosion work.
APPROACH: The study would concentrate on various mixtures of coal dust (ranging from a brown coal to a blast furnace coke) and gases (such as methane-oxygen-nitrogen). Analytical as well as experimental approaches would be employed, wherein the latter would be restricted to the university laboratory type investigations. The Warsaw group would investigate the transition from a flame to a detonation, the dust ignition phenomena, and the burning time of the coal particles; the Michigan group would investigate the propagation of a coal dust detonation, the ignition of coal particles behind a shock wave, and the energy release required for detonation.

<110025>
TITLE: Fundamental Aspects of Flame and Detonation Propagation in Coal Dust, Methane, Air Mixtures
PROJECT NUMBER: ENG-76-22958
PRINCIPAL INVESTIGATOR: Nicholls, J.A.
ADDRESS: School of Engineering, Ann Arbor, MI 48106
AFFILIATION: Michigan Univ., Ann Arbor (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Div. of Engineering
77 FUNDING: National Science Foundation FY77:$60,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (50%);ANALYTICAL (50%)
PROJECT DESCRIPTION: The research covers primarily three phases: (1) Shock Wave Ignition and Burning Time of Coal Particles. (2) Propagation of Detonation in Coal Dust--Methane--Air Mixtures. (3) Blast Wave Initiation of Detonation.
APPROACH: Under No. 1 above, an important aim will be to identify the contribution of the reaction of the

volatiles of the coal as compared to heterogeneous surface reaction. Theoretical support of the experimental work will consist of the calculation of the rate of heat transfer to the particles and the acceleration of the particles by the flow behind the shock. Under No. 2, above, to extent possible uniform particles of coal will be injected into a shock tube. The prime variables to be investigated will include type of coal, particle size, particle loading fraction, oxidizer concentration and methane concentration. Experimental measurements will be made. A mathematical model will be used to interpret the experimental data. Under No. 3 above, the research deals with the phenomena of a blast wave which is basically a shock wave followed by an expansion zone. The blast wave is to be calibrated using planar blast wave theory so that for any given operating condition the effective initiator energy will be known. The main information sought here will be the determination of whether detonation is realized or not.
KEYWORDS: COAL FINES;METHANE;FLAME PROPAGATION;DETONATIONS;AIR;CHEMICAL REACTION KINETICS;IGNITION;SHOCK WAVES;BENCH-SCALE EXPERIMENTS;MATHEMATICAL MODELS;COORDINATED RESEARCH PROGRAMS;USA;POLAND

TITLE: Study of the Abundance of Carbon Dioxide in the Atmosphere and Its Exchange with the Ocean
PROJECT NUMBER: ATM76-23053
PRINCIPAL INVESTIGATOR: Keeling, C.O.
ADDRESS: P.O. Box 1529, San Diego, CA 92038
AFFILIATION: California Univ., San Diego (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Division of Atmospheric Sciences
77 FUNDING: National Science Foundation FY77:$58,300
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/CO2 (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
PROJECT DESCRIPTION: A study of the content and variability of carbon dioxide in the earth's atmosphere and the exchange of carbon dioxide between the atmosphere and the oceans is proposed as a continuation of a program initiated during the International Geophysical Year and continued through 1974.
APPROACH: The prospect that fossil fuel combustion will lead to large increases in the concentration of atmospheric carbon dioxide over the coming decades has led to plans by several nations to investigate CO2 variation under the guidance of the World Meteorological Organization. The WMO has proposed a world wide network of stations to measure CO2 with the Scripps laboratory designated as the WMO central CO2 calibrating facility. To aid the WMO effort, support will go to maintain WMO primary reference gases, to provide secondary reference gases to national networks, and to participate in intercalibrations between national central laboratories and field stations.
RESULTS: Support will be given to aid the WMO effort by continuing observations of CO2 in equatorial regions and in the southern hemisphere and to carry out detailed model studies of the time-dependent carbon cycle.
KEYWORDS: CARBON DIOXIDE;ECOLOGICAL CONCENTRATION;ENVIRONMENTAL TRANSPORT;SEAWATER;MATHEMATICAL MODELS

<110027>
TITLE: Antarctic Tritium
PROJECT NUMBER: DPP76-23433
PRINCIPAL INVESTIGATOR: Ostlund, H.G.;Mason, A.S.
ADDRESS: 4600 Rickenbacker Causeway, Miami, FL 33149
AFFILIATION: Miami Univ., Fla. (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Division of Polar Programs
77 FUNDING: National Science Foundation FY77:$37,100
POLLUTANTS: NOXIOUS GAS/Hydrocarbons (50%);METALS/Tritium (50%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
PROJECT DESCRIPTION: The concentrations of tritium gas, tritiated water vapor, and tritiated hydrocarbons will be measured at the Clean Air Facility at South Pole Station in Antarctica during 1978 and 1979. In addition, airborne samples will be taken during the austral summers of 1977/78 and 1978/79 from one of the C-130 resupply aircraft.
APPROACH: In austral summer 1977/78, two people will install sampling equipment at South Pole Station, and one person will operate the sampling equipment on the C-130. In austral summer 1978/79, two persons will conduct measurements at South Pole Station and one will operate the equipment on the C-130.
RESULTS: This project is expected to yield (1) representative data for a global scale inventory of atmospheric tritium and its variation with time caused by releases from nuclear industry, (2) a measure of the amount of subsidence of stratospheric air as a part of the global circulation pattern of the atmosphere, and (3) information on the exchange of water between the air and drifting snow.
KEYWORDS: ANTARCTIC REGIONS;TRITIUM;RADIOECOLOGICAL CONCENTRATION;GASEOUS WASTES;WASTE WATER;HYDROCARBONS;AEROSOL MONITORING;RADIOACTIVE EFFLUENTS;NUCLEAR ENERGY;STRATOSPHERE;EARTH ATMOSPHERE;SNOW;PRECIPITATION SCAVENGING;RADIONUCLIDE MIGRATION;AIR QUALITY

TITLE: Effects of Air Pollution on Epiphytic Cryptogams
PROJECT NUMBER: DEB76-24084
PRINCIPAL INVESTIGATOR: Hoffman, G.R.
ADDRESS: Vermillion, SD 57069
AFFILIATION: South Dakota Univ., Vermillion (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Division of Environmental Biology
77 FUNDING: National Science Foundation FY77:$15,000
TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS/SO2 (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
APPROACH: Naturally occurring cryptogams can be useful as natural monitoring systems for levels of air pollution. This study will make use of cryptogams in the northern plains states to monitor sulfur dioxide

pollution from coal-fired power generators. Quantitative studies will show the demise of sensitive species from the vicinities of the generators and maps will be developed to correlate cryptogam species distributions with levels of sulfur dioxide pollution.

77 FUNDING: National Science Foundation FY77:$39,000
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS/CO2 (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: HYDROGRAPHIC AREAS/Deep ocean
PROJECT DESCRIPTION: The Geochemical Ocean Sections Study, GEOSECS, is a coherent oceanographic research program whose purpose is to make detailed measurements of oceanic constituents at all depths from the Arctic to the Antarctic. The purpose of these measurements is to provide for the first time, a set of physical and chemical parameters measured on the same water and applying the same analytical techniques for each compound on an oceanwide basis. The results of these measurements will provide data quantitative studies of oceanic mixing and organic productivity and simultaneously serve as a baseline for the levels of fission and waste products being added to the sea.
APPROACH: The proposed study will further develop a model of these transport routes that will serve to predict the distribution of CO2 between the ocean and atmosphere over the next 50 or so years.
KEYWORDS: OCEANOGRAPHY;GEOCHEMISTRY;ARCTIC REGIONS;FOSSIL FUELS;ENVIRONMENTAL IMPACTS;CARBON DIOXIDE;ENVIRONMENTAL TRANSPORT;MATHEMATICAL MODELS;MINERAL CYCLING;ENERGY;FOOD;ECOLOGY;MANAGEMENT;COAL;PETROLEUM;SEAS;POLLUTION;MARINE DISPOSAL;BIOADSORBENTS;FISSION PRODUCTS;RADIOACTIVE WASTE DISPOSAL;BASELINE ECOLOGY;METEOROLOGY

TITLE: Measurement of Sulfur Dioxide Oxidation on Particulate Surfaces
PROJECT NUMBER: ENV76-81817
PRINCIPAL INVESTIGATOR: Mohnen, V.A.
ADDRESS: 41 State Street, Albany, NY 12203
AFFILIATION: State Univ. of New York, Albany (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Division of Advanced Environmental Research and Technology
77 FUNDING: National Science Foundation FY77:$92,400
POLLUTANTS: NOXIOUS GAS/SO2 (50%);PARTICULATES (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
PROJECT DESCRIPTION: The objective of this program is to develop and evaluate procedures for investigating the mechanisms and importance of sulfur dioxide oxidation on the surface of solid particulate matter of natural and anthropogenic origin.
APPROACH: Sulfate formation on well characterized particle and reference surfaces will be studied using molecular beams of sulfur dioxide, oxygen and water. Auger electron spectroscopy and mass spectroscopy will be used to measure the rate of product formation. It is anticipated that reaction rates and orders can be determined for a variety of surfaces during the course of this work. Surfaces to be examined include: carbon, oxides of vanadium, oxides of iron, and particulate matter collected from ambient air, power plant stacks, and laboratory flames.
KEYWORDS: SULFUR DIOXIDE;CHEMICAL REACTION KINETICS;PARTICLES;AEROSOLS;OXIDATION;ELECTRON SPECTROSCOPY;MASS SPECTROSCOPY;CARBON;VANADIUM OXIDES;IRON OXIDES;AIR POLLUTION;FLUE GAS;FOSSIL-FUEL POWER PLANTS;FLAMES;ENVIRONMENTAL IMPACTS

PROJECT NUMBER: OCE76-82035
PRINCIPAL INVESTIGATOR: Takahashi, T.;Broecker, W.S.
ADDRESS: Palisades, NY 10964
AFFILIATION: Columbia Univ., Palisades, N.Y. (USA). Lamont-Doherty Geological Observatory
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Division of Ocean Sciences
77 FUNDING: National Science Foundation FY77:$73,400
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS/CO2 (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: HYDROGRAPHIC AREAS/Deep ocean
PROJECT DESCRIPTION: The Geochemical Ocean Sections Study, GEOSECS, is a coherent oceanographic research program whose purpose is to make detailed measurements of oceanic constituents at all depths from the Arctic to the Antarctic. The purpose of these measurements is to provide for the first time a set of physical and chemical parameters measured on the same water and applying the same analytical techniques for each compound on an oceanwide basis. The results of these measurements will provide data for quantitative studies of oceanic mixing and organic productivity and simultaneously serve as a baseline for the levels of fission and waste products being added to the sea.
APPROACH: This research is based on CO2 data collected during the Atlantic and Pacific phases of GEOSECS studies and other related field experiments. Models for CO2 ocean uptake and calcite dissolution will be constructed from this data base. Initially a two-dimensional advection-diffusion model will be used to characterize thermocline mixing. Later extension of the model to the third dimension should result in important input to other areas, such as the role of the ocean in influencing climate.
KEYWORDS: CARBON DIOXIDE;ENVIRONMENTAL TRANSPORT;MINERAL CYCLING;MATHEMATICAL MODELS;ARCTIC REGIONS;OCEANOGRAPHY;GEOCHEMISTRY;SEDIMENTS;DIFFUSION;TWO-DIMENSIONAL CALCULATIONS;SEAS;FOSSIL FUELS;ENVIRONMENTAL IMPACTS;METEOROLOGY;CLIMATES;BIOADSORBENTS

TITLE: Organic Geochemical Interactions in the Okefenokee and Everglades Peat-Forming Environments
PROJECT NUMBER: EAR76-84069
PRINCIPAL INVESTIGATOR: Casagrande, D.J.
ADDRESS: Park Forest, IL 60466
AFFILIATION: Illinois State Univ., Park Forest (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Division of Earth Sciences
77 FUNDING: National Science Foundation FY77:$33,800
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: METALS (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: HYDROGRAPHIC AREAS/Deep ocean
PROJECT DESCRIPTION: This project concerns the determination of the geochemical changes occurring in organic matter during the processes of transformation from plant to litter to peat and ultimately to lignite in the early stages of coalification.
APPROACH: Field measurements of geochemical parameters and samples of water and of organic materials will be then taken from both fresh water (Okefenokee) and marine (Everglades) peat-forming environments. Special attention will be given to the chemistry of sulfur and of various metals in order to determine how, when, and under what conditions they are incorporated into the precursors of coal.
KEYWORDS: PLANTS;MINERAL CYCLING;PEAT;LIGNITE;GEOCHEMISTRY;SULFUR;WATER;COAL;SWAMPS;FLORIDA

<1110034>
TITLE: Phthalate and Chlorinated Hydrocarbon Effects on Marine Biota
PROJECT NUMBER: OCE76-84073
PRINCIPAL INVESTIGATOR: Giam, C.
ADDRESS: School of Science, College Station, TX 77843
AFFILIATION: Texas A and M Univ., College Station (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
DIVISION: Division of Ocean Sciences
77 FUNDING: National Science Foundation FY77:$94,600
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Phthalates (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Global
PROJECT DESCRIPTION: This award is to study the biological effects of phthalate ester plasticizers on marine organisms. The major objective is to evaluate the use of structure-physiological activities in predicting the toxicity of chemicals to marine organisms. The phthalate ester plasticizers have been chosen as model compounds for the study because dialkyl phthalates are produced in large amounts, are widely used and are present in all samples from the Gulf of Mexico. Although phthalates are more abundant than PCB's or DDT, they are less toxic to higher organisms. But these compounds or their degradation products are potentially toxic to lower organisms, larvae and eggs.
APPROACH: Marine organisms will be exposed to phthalates (lower homologues of dialkyl phthalates) and chlorinated hydrocarbons. An analysis will be made of the different uptake and concentration factors of the two classes of compounds. Models for the chemical structure vs the physiological responses of marine organisms will be developed to help predict toxic effects of classes of organic chemicals on marine organisms.
KEYWORDS: PHTHALATES;ORGANIC CHLORINE COMPOUNDS;HYDROCARBONS;AQUATIC ECOSYSTEMS;TOXICITY;BIOLOGICAL EFFECTS;AQUATIC ORGANISMS;CHLORINE COMPOUNDS;PLASTICIZERS;BIOLOGICAL INDICATORS;WATER POLLUTION;ALKYLATING AGENTS;PHYSIOLOGY;BIOLOGICAL MODELS

PROJECT NUMBER: AER-76-23403
PRINCIPAL INVESTIGATOR: Harrje, D.T.
ADDRESS: Center for Environmental Studies, Princeton, NJ 08540
AFFILIATION: Princeton Univ., N.J. (USA). Center for Environmental Studies
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
FUNDING: National Science Foundation FY77:$50,000
TECHNOLOGY: CONSERVATION/End use (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
CHARACTER OF STUDY: FULL SCALE DEMONSTRATION (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: This grant is a renewal to NSF grant number AER 76-23403 entitled ''Energy Conservation

in Housing."
APPROACH: This renewal will allow the data analysis team of the Princeton/Twin Rivers project to expand and finish their analysis of the data collected to date.
RESULTS: This analysis will focus on finishing the analysis of the effect of the energy crisis on winter gas consumption, modeling the summer energy consumption, the effects of retrofits and price on summer gas consumption and two parameter modeling of monthly gas consumption.
KEYWORDS: ENERGY CONSERVATION;USA;HOUSES;RESIDENTIAL SECTOR;COMBUSTION;ENERGY EFFICIENCY;SYSTEMS ANALYSIS;ENERGY CONSUMPTION;DATA COMPILATION;DATA ACQUISITION;SIMULATION;NATURAL GAS;CONSUMPTION RATES;SEASONAL VARIATIONS;ENERGY MODELS;RETROFITTING;COST;ECONOMIC IMPACT;DATA;EVALUATION

TECHNOLOGY: CONSERVATION/Improved conversion efficiency (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (75%);WASTE MANAGEMENT (25%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This research is a continuation of analysis of alternative agricultural production techniques that have the potential for increasing the efficiency with which limited resources are used--NSF Grant AER-74-18438.
APPROACH: The first component continues a comparative study of corn belt farms that do and do not use chemical fertilizers and pesticides with particular emphasis on field measurements of corn and wheat yields under the two systems, as well as measurements of their comparative effects on soil properties and on grain protein. The second component extends and generalizes work previously undertaken on the impact of energy problems and declining water tables on the economics of crop production under sprinkler irrigation in the Great Plains. This work will encompass more locations in the Plains and will compare various methods for allocating limited energy and ground water reserves. The third component is an investigation of the use of sewage sludge as a fertilizer for Corn Belt farms. This work will analyze the economic viability and resource-intensiveness of sludge use, and will seek to identify the factors working for and against farmers' willingness to use sludge and other off-farm organic wastes. It will also examine the comparative effects of sludge and conventional fertilization on the nutrient levels of several

Midwestern soils under typical sludge utilization practices.
RESULTS: Determinants of energy vulnerability of corn belt agriculture to shortages of water and limited energy. Analysis of results of use of sludge as fertilizer.
KEYWORDS: AGRICULTURE;ECONOMICS;WATER RESOURCES;REGIONAL ANALYSIS;CROPS;IRRIGATION;FERTILIZERS;SEWAGE SLUDGE;PESTICIDES;BIOLOGICAL EFFECTS

CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The overall objective of this study is to evaluate the energy vulnerability of corn belt agriculture and to analyze alternative production techniques which are intended to make agricultural production less vulnerable to potential shortages of energy, fertilizer and ground water resoures. The final two years of this project will complete the work underway on organic farming, the use of sewage sludge and ground water irrigation.
APPROACH: The organic farming component objective is to compare the performance of farms which do not use chemical fertilizers or pesticides with conventional farms. The second component objective is to examine costs and benefits of using sewage sludge as fertilizer on working farms. The third component objective is to analyze the economics of irrigated farming in the Great Plains taking account of energy supply problems and ground water depletions.
RESULTS: Determinations of energy vulnerability of corn belt agriculture to shortages of energy, fertilizer and ground water resources.
KEYWORDS: AGRICULTURE;ECONOMICS;CROPS;NUTRIENTS;BIOLOGICAL WASTES;SEWAGE SLUDGE;FERTILIZERS;COST BENEFIT ANALYSIS;SOILS;COMPARATIVE EVALUATIONS;PESTICIDES;BIOLOGICAL EFFECTS;WATER RESOURCES;REGIONAL ANALYSIS

CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: This project addresses the question whether the biogenic emissions believed to be dominant on the global scale are also significant for the production of airborne sulfate particulates in regions impacted by anthropogenic sources of sulfur dioxide like coal- or oil-burning plants.
APPROACH: The research will be done by gas-chromatographic analysis of estuarine and oceanic waters and the overlaying air in an urban environment (Norfolk, Virginia) and in a pristine area (Wallops Island, Virginia). Samples will be analyzed for hydrogen sulfide, sulfur dioxide, methyl mercaptan, dimethyl sulfide, carbon disulfide, and carbonyl sulfide. Meteorological observations will be made as aids to the identification of sources. Surface emission rates for marsh, shallow bay, and ocean will be estimated by

calculations of the gas flux across a water-air interface using the method of Liss and Slater (Nature, 247, 181 (1974)).
RESULTS: Measuremens of worldwide emissions of volatile sulfur compounds from biogenic sources.
KEYWORDS: AIR POLLUTION;FOSSIL-FUEL POWER PLANTS;SULFUR COMPOUNDS;COASTAL REGIONS;WATER POLLUTION;SULFUR DIOXIDE;ENVIRONMENTAL TRANSPORT;METECROLOGY;CHEMICAL EFFLUENTS

TITLE: Hydrogen Sulfide and Reduced Forms of Sulfur in Air
PROJECT NUMBER: AEN-77-14875
PRINCIPAL INVESTIGATOR: Braman, R.S.
ADDRESS: Tampa, FL 33620
AFFILIATION: University of South Florida, Tampa (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
77 FUNDING: National Science Foundation FY77:$68,300
TECHNOLCGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: NOXIOUS GAS (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The proposed research is aimed at developing convenient field methods of sufficient sensitivity to permit getting quantitative values at ambient levels well above detection limits.
APPROACH: For field surveys to estimate the fluxes of hydrogen sulfide and other volatile sulfur compounds from land and water surfaces, there are needed analytical methods capable of measuring these substances at expected ambient levels in the sub-part-per-billion range. These measurements are needed for estimating the fluxes to the atmosphere of volatile sulfur compounds emanating from biogenic sources in natural envircnments like marshes, estuaries, and land areas where biological reduction of sulfate may occur. Analytical techniques to be evaluated include absorption of gaseous species in metal-coated beads with subsequent high-temperature expulsion into suitable detection systems, and selective retention and expulsion of certain sulfur species in gas-chromatographic columns. For solid particulate materials, experiments will be done by heating in inert gases, by acid treatments, by solvent extraction, and by heat treatment in the presence of hydrogen gas. Water and sediment samples will be handled by comparable methods.
RESULTS: This is necessary in order to arrive at reliable quantitative estimates of the natural biogenic contributions of hydrogen sulfide and other volatile sulfur compounds for comparison with man-made sources of atmcspheric sulfur, such as combustion sources of sulfur dioxide. The ultimate goal is to provide methodology to help assess the relative contributions of natural and man-made precursors of toxic airborne sulfate particulates. This is an extension of Grant ENV 7609585A01.

TECHNOLOGY: CONSERVATION/General (100%)
ENERGY CYCLE: WASTE MANAGEMENT (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The main objective of this research is to determine the cost-effective limits of recycling municipal waste from a single metropolitan area on nearby agricultural land.
APPROACH: The metropolitan region of Omaha and Council Bluffs will be the study site because the combined problems of high nutrient waste disposal and costly high energy agriculture exist within a closely integrated urban/agricultural complex.
RESULTS: The research will determine how much and what kinds of waste is available, estimate its chemical fertilizer equivalent, determine whether any of the available waste is potentially hazardous to crops or soils, determine whether sufficient close-in agricultural land is available for land application, determine whether the soil involved is suitable for land application, assess the systems available for transporting wastes to agricultural land, survey potential sites for assembling and treating municipal wastes, and calculate the per-ton costs of delivering wastes to possible application sites of increasing distances from waste sources. This study will examine the possibilities of converting waste problems into a rescurce opportunity. As such it will contribute to the emerging national concern to think how best to restore the bulk of our depleted resources through recycling and re-use.

PROJECT DESCRIPTION: The objective of this award is to initiate a proof-of-concept scale evaluation of

utilizing thermal discharges from cooling of condensers at power generating stations to culture edible aquatic animals.
APPROACH: An aquaculture facility utilizing Delaware River water, heated in the condensers of the Public Service Electric and Gas Company's Mercer Generating Station at Trenton, New Jersey, is being used for the sequential culture of freshwater shrimp from May through October and rainbow trout from November through April. Wastes from the processing of other foods are being investigated for their potential in reducing aquaculture-feed costs.
RESULTS: This research should confirm the technical feasibility of the concept, evaluation of which was started under NSF Grant No. AEN-74-4079, at a sufficiently large scale to determine its commercial feasibility concentrating upon process reliability, reproducibility and product acceptability. Subcontracts for portions of the research plan have been awarded to Trenton State College (Dr. A. Eble) and Rutgers University (Dr. A. Farmanfarmaian). Nutritional factors being studied include amino acid and calcium diet supplementation, food conversion efficiencies and physical factors influencing intestinal absorption of food and potential pollutants such as coal, chlorine and heavy metals. The Trenton State College effort is concentrated on improvement in management procedures including field application of nutritional data, intensification of culture techniques and brood stock management. Also under subcontract Long Island Oyster Farms, Inc. is assisting in evaluation of commercial feasibility and the New Jersey Department of Agriculture's Division of Rural Resources is studying adaptation of agricultural facilities to production of fingerling trout.
KEYWORDS: THERMAL POWER PLANTS;THERMAL EFFLUENTS;AQUATIC ECOSYSTEMS;BIOLOGICAL EFFECTS;AQUACULTURE;SHRIMP;TROUT;WASTE HEAT;WASTE PRODUCT UTILIZATION

TITLE: Evaluation of Alternative Energy Leasing Strategies and Schedules for Federal Lands
PROJECT NUMBER: AER-76-19778
PRINCIPAL INVESTIGATOR: Kalter, R.J.
ADDRESS: 445 Warren Hall, Ithaca, NY 14853
AFFILIATION: Cornell Univ., Ithaca, N.Y. (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
77 FUNDING: National Science Foundation FY77:$104,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: This grant is a continuation of NSF Grant SIA 74-21846. The objective of the original grant was to develop a comprehensive analytical framework for evaluating alternative energy leasing strategies and schedules for federally owned energy resources and to apply the evaluation model to several specific energy resources.
RESULTS: Such an evaluation was completed for the outer continental shelf gas and oil resources. This continuation will allow extension and refinement of the model, the completion of the evaluation of coal and uranium strategies now underway, and application of the model to geothermal and onshore petroleum resources.
KEYWORDS: EVALUATION;LAND USE;ENERGY SOURCES;ENERGY MODELS;ECONOMICS;NATURAL GAS;PETROLEUM;CONTINENTAL SHELF;COAL DEPOSITS;URANIUM DEPOSITS;GEOTHERMAL RESOURCES;NATIONAL SCIENCE FOUNDATION;LAND LEASING;PLANNING;PUBLIC LANDS;LEASING;OFFSHORE SITES;NATURAL GAS DEPOSITS;PETROLEUM DEPOSITS;SIMULATION

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;ECT;OS
PROJECT DESCRIPTION: To define in detail the geomorphology, coastal sedimentation pattern and dynamic physical processes shaping the coastal zone of the Metule oil spill and of the New England coastal area between Maine and New York City; a classification of sensitivity of coastal zones to oil spill damage.
APPROACH: Detailed data collected on: (1) geological history; (2) coastal zone morphology; (3) regional sediment patterns; (4) wave and nearshore conditions; (5) tidal regime; (6) climate; (7) oil accumulation.
RESULTS: Delineation of coastal zone of New England into areas of varying degrees of potential oil spill damage; also less detailed classification of the southern Alaska area. On understanding of oil-sediment interaction would lead to recommendation for oil spill treatment.
KEYWORDS: COASTAL MORPHOLOGY;OIL SPILLS;COASTAL WATERS;ATLANTIC OCEAN;SHORES;MAINE;NEW HAMPSHIRE;MASSACHUSETTS;RHODE ISLAND;CONNECTICUT;NEW YORK;REGIONAL ANALYSIS;OILS;DIFFUSION;ENVIRONMENTAL EFFECTS;WATER POLLUTION;LAND POLLUTION;SEDIMENTS;CLIMATES;TIDE;ENVIRONMENT;CHEMICAL EFFLUENTS;PETROLEUM PRODUCTS;HYDROCARBONS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this program is to determine the role of microorganisms (bacteria, yeasts, and fungi) in the biodegradation of petroleum accumulating on beaches and in beach sand from spills, drilling accidents, or poor handling procedures at production sites. The rate, amount, and qualitative pattern of biodegradation in the Straits of Magellan by indigenous microorganisms will be studied.
APPROACH: The objectives of the project are being accomplished by collecting samples of beach sand and seawater at the site of the oil spill from the Supertanker METULA in the Straits of Magellan. The naturally occurring bacteria, yeasts, and fungi are being analyzed to determine the rate, extent, and pattern of microbial biodegradation of the oil. Field work is done to determine environmental parameters influencing microbial biodegradation.
RESULTS: It is expected that the microbial degradation, occurring on the beaches of the Straits of Magellan, will be characterized, with respect to rate, extent, pattern, and seasonal fluctuation of the microbial biodegradation. The results of this study will be extrapolated to the geomorphological similar sites in New England and Alaska to predict probable effects of oil spills in those regions on the beach areas.
PROJECT MILESTONES: (1) First microbiological study ever made of the beach sand and seawater of the Straits of Magellan. (2) First integrated study of the biodegradation of petroleum incorporating geomorphology, chemistry, and microbiology in a near-antarctic site. (3) First measurement of the rate of microbial biodegradation and extent of biodegradation of crude oil in a near-antarctic site. (4) At the completion of the project, the rate and extent of crude oil biodegradation carried out by the indigenous microflora of beaches will be provided.
KEYWORDS: PETROLEUM INDUSTRY;ENVIRONMENTAL EFFECTS;WATER POLLUTION ABATEMENT;SEAWATER;FRESH WATER;BIODEGRADATION;WASTE MANAGEMENT;OIL SPILLS;CLEANING;PETROLEUM;BACTERIA;YEASTS;FUNGI;HYDROCARBONS

POLLUTANTS: ORGANICS/Hydrocarbons in water (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Estuarine;GEOGRAPHIC AREAS/Northeast;COASTS/Northeast;HYDROGRAPHIC AREAS/Other hydrographic areas Estuary
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Identify, characterize, and measure the sources of petroleum pollution in the Delaware estuary, including urban runoff and treatment plant effluents as well as spills and refinery wastes; trace the fate of this contamination in the estuary, and its effect upon fish shellfish and environmental quality; consider the beneficial effects of alternative remedial programs.
APPROACH: Initially attention was given to three fronts, (a) the investigation of sources, particularly urban runoff, (b) the mechanics of estuarial flow, and (c) the effects of given petroleum concentrations upon biota. While (c) is being developed, more work on other sources, and on fates, will complete the study of causation. Remedial programs will then be considered.
RESULTS: A more balanced view as to where petroleum pollution actually comes from, and the relative priority and economy of various types of controls.
PROJECT MILESTONES: (1) Evaluation of quantities of petroleum in urban runoff. (2) Effects of ultraviolet light in increasing toxicity of Fuel Oil No. 2 in water. (3) High toxicity of petroleum to oysters when ingested on clay particals.

CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECT;OS
PROJECT DESCRIPTION: The objective of this program is to develop and evaluate procedures for investigating the mechanisms and importance of sulfur dioxide oxidation on the surface of solid particulate matter of natural and anthropogenic origin.
APPROACH: Sulfate formation on well characterized particle and reference surfaces will be studied using molecular beams of sulfur dioxide, oxygen and water. Auger Electron Spectroscopy and Mass Spectrometry will be used to measure the rate of product formation.
RESULTS: It is anticipated that reaction rates and orders can be determined for a variety of surfaces during the course of this work. Surfaces to be examined include: carbon, oxides of vanadium, oxides of iron, and particulate matter collected from ambient air, power plant stacks, and laboratory flames.
KEYWORDS: SULFUR DIOXIDE;CHEMICAL REACTION KINETICS;PARTICLES;SULFATES;OXIDATION;CARBON;VANADIUM OXIDES;IRON OXIDES;FLUE GAS;LABORATORY EQUIPMENT;COMBUSTION PRODUCTS;FLAMES;EARTH ATMOSPHERE;AIR POLLUTION

TITLE: Interdisciplinary Study of Environmental Pollution by Lead and Other Metals
PROJECT NUMBER: 77-15085
PRINCIPAL INVESTIGATOR: Rolfe, G.L.
ADDRESS: Institute of Environmental Studies, Urbana, IL 61801
AFFILIATION: Illinois Univ., Urbana (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
77 FUNDING: National Science Foundation FY77:$18,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);WASTE MANAGEMENT (50%)
POLLUTANTS: METALS (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECT;OS
PROJECT DESCRIPTION: This is a supplemental award to achieve the research objectives supported under NSP Grant No. ENV74-24276 A03. This has been a comprehensive research project centered on the environmental impacts of lead emissions resulting from the combustion of leaded gasoline.
APPROACH: The project includes studies on the effects of soil and atmospheric lead on crop yields of corn and soybeans. In addition, plant burdens of lead as a function of various soil lead levels are being studied. The distribution of lead in an urban area, including building interiors, is being determined to identify regions of elevated exposure.
RESULTS: Lead samples have been characterized in terms of physical and chemical form as a first step toward identifying the environmental transport pathways and transformations of lead. A risk/benefit economic analysis is using data from this project and elsewhere to weigh the benefits of continued use of leaded gasoline against the risk to health and crop productivity. The supplemental effort is concerned with testing and evaluating a computer-based model which is designed to predict how lead induced stresses in agriculturally-important plants may affect crop yield.
KEYWORDS: LEAD;ENVIRONMENTAL IMPACTS;GASOLINE;ADDITIVES;SOILS;EARTH ATMOSPHERE;AIR QUALITY;COST BENEFIT ANALYSIS;HEALTH HAZARDS;AGRICULTURE;BIOLOGICAL EFFECTS;PLANTS;MAIZE;SOYBEANS;ECOLOGICAL CONCENTRATION;AIR

TITLE: Remote Measurement of Pollutants
PROJECT NUMBER: 77-10198
PRINCIPAL INVESTIGATOR: Murray, E.R.
ADDRESS: Menlo Park, CA 94025
AFFILIATION: Stanford Research Inst., Menlo Park, Calif. (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
77 FUNDING: National Science Foundation FY77:$167,000
POLLUTANTS: NOXIOUS GAS (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECT
PROJECT DESCRIPTION: The present grant is a continuation of work done under Grants GI-38986 and AEN75-14997 A02. The objective is the development of laser methods for remote measurement of atmospheric levels of gases such as sulfur dioxide (SO/sub 2/), nitrogen dioxide (NO/sub 2/), ozone (O/sub 3/), ethylene (C/sub 2/H/sub 4/), and ammonia. These techniques are needed for monitoring ambient levels of gases in polluted air and for obtaining average concentrations integrated over kilometer (or longer) pathlengths to provide data for testing pollutant dispersion models.
APPROACH: The work employs the differential absorption laser-radar (DIAL) technique whereby light transmitted from a laser source is back-scattered from atmospheric particles or from topographic targets (like a hillside). The light beam is tuned to a wavelength strongly absorbed by a molecule of interest. From the time delay between the sending and the receipt of the returned back-scattered signal pulses, one can determine gas concentrations at various distances along the path. The concept has been tested for measurement of SO/sub 2/ and O/sub 3/ in the ultraviolet and of NO/sub 2/ in the visible spectrum.
RESULTS: Under the present grant the investigators will demonstrate the performance of the system under different pollutant-gas levels and variable meteorological conditions. The technique will be extended to the infrared to explore the advantages of this spectral region for detecting a wider variety of gases and for potentially greater detection sensitivity. Special attention will be given to ammonia and ozone in the infrared.
KEYWORDS: AIR POLLUTION;REMOTE SENSING;SULFUR DIOXIDE;NITROGEN DIOXIDE;OZONE;ETHYLENE;AMMONIA;MONITORING;ENVIRONMENTAL TRANSPORT;PERFORMANCE TESTING;INFRARED SPECTRA;HYDROCARBONS

TITLE: The Supply and Demand Potential of Eastern Coals
PROJECT NUMBER: AER 76-24680
PRINCIPAL INVESTIGATOR: Newcomb, R.T.
ADDRESS: West Virginia University, Morgantown, WV 26506
AFFILIATION: West Virginia Univ., Morgantown (USA)
MONITORING AGENCY: National Science Foundation, Washington, D.C. (USA)
77 FUNDING: National Science Foundation FY77:$49,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: EXTRACTION (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Middle Atlantic
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The objective of this new research grant is to establish an economic framework for the assessment of geological and mineral processing engineering factors in the production and use of bituminous coals. The emphasis is on the supply technologies, especially mining and mineral preparation and on conventional demands for fuel derived from power generation and metallurgical processes, rather than on demands for the advanced conversion processes.
APPROACH: The advance over current economic modelling will be the ability to consider the impact of variations in the geologic properties of coal seams and the technical aspects of mining and coal preparation on the delivered prices. This research draws upon data and models developed under NSF grant AER 73-07799 entitled, "The Potential of Coal Based Fuel and Energy Complexes." An existing quadratic programming model will be modified to give a simple workable model of the eastern energy submarkets which can assess the supply costs of coal under submarket demand constraints and supply conditions. The research has been co-funded by the Electric Power Research Institute.
RESULTS: Programming model of eastern energy submarkets for assessing the supply costs of coal.
KEYWORDS: SUPPLY AND DEMAND MODEL;QUADRATIC PROGRAMMING;BITUMINOUS COAL;AVAILABILITY;ECONOMICS;MARKET;ECONOMIC IMPACT;TECHNOLOGY ASSESSMENT;ENERGY MODELS;MATHEMATICAL MODELS;PLANNING;POWER GENERATION;METAL INDUSTRY;PREDICTION EQUATIONS;ECONOMETRICS;COAL INDUSTRY

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Site specific Narragansett Basin
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;ECT;OS
PROJECT DESCRIPTION: Objective: to determine whether reserves of coal of sufficient quantity and quality exist in the Narragansett Basin, so as to justify development of the resource. The first year has emphasized geologic exploration of the Basin and has relied on data from drill cores. Funds provided by NSF have been applied toward management, utilization studies and geological research connected with the project, while costs of drilling are covered by contributions from other organizations.
APPROACH: Among the scientific studies to be performed in the continuation period are: (1) detailed petrographic analysis of cores, including a study of illite crystallinity as a basis for prediction of metamorphic grade of coal; (2) lithologic analysis of cores for determination of sedimentary environmental of coal deposits and prediction of stratigraphic sequence and distribution of coal beds; (3) additional

floral studies for stratigraphic correlation; (4) additional photogeologic study for mapping geologic structure; (5) analysis of geophysical well logs; and (6) additional gravity survey coverage of the Basin.
RESULTS: Follow-on in the nongeologic area will emphasize solutions for legal, economic, environmental, and societal problems associated with coal-mining development in the Basin and upon funding ways of utilizing the coal that are economically and environmentally acceptable to the region.
KEYWORDS: COAL RESERVES;ENERGY SOURCE DEVELOPMENT;PENNSYLVANIA;ECONOMICS;ECONOMETRICS;COAL INDUSTRY;PETROLOGY;GRAVITY SURVEYS;GEOLOGICAL SURVEYS;GEOPHYSICAL SURVEYS;WELL LOGGING;DRILLING;LEGAL ASPECTS;SOCIAL IMPACT;ECONOMIC IMPACT;ENVIRONMENTAL IMPACTS;ECOSYSTEMS;FINANCING;COAL MINING;LAND USE

TECHNOLOGY: CONSERVATION/General (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (50%);ANALYTICAL (50%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECT;OS
PROJECT DESCRIPTION: Under a previous grant SIA 75-03481 the National Science Foundation supported the instrumentation of a subsurface building being constructed on the University of Minnesota campus. This grant supports the measurement of data from this instrumentation, the analysis of the thermal properties of the building envelope and the surrounding soil and the development of computer models to predict the thermal behavior of subsurface construction.
APPROACH: The use of subsurface construction offers significant opportunities for reducing the energy required to heat and cool buildings. The present data base on thermal design data and energy use in such construction is limited. The lack of such data tends to deter engineers, architects and planners from fully utilizing subsurface construction.
RESULTS: This research program will generate the urgently needed data and analytical models for estimating the thermal performance of subsurface buildings.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The objective of this research is the development of a technologically based framework to aid policy makers in the Southwest by providing comparative analysis of the environmental and economic costs of alternate energy development strategies.
APPROACH: The research program will develop a mathematical model of the potential energy and fuel industry in the region which will (a) examine the responses of industries to variations in prices of factor inputs and to environmental policy instruments; (b) examine the costs of providing energy for different type fuels by considering the costs of production, transmission and residuals disposal; and (c) act as an energy conversion-fuel production submodel for a large regional study of the impact of energy development in the Southwest.
RESULTS: Analyses of several alternative energy development strategies in terms of environmental and economic costs.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT;ECT;OS
PROJECT DESCRIPTION: The objectives of this new research grant are to: (1) develop the methodology for the comprehensive systems integrated design of cost effective, synergistically coupled industrial complexes and (2) communicate to prospective users guidelines and recommendations for the practical application of the co-siting methodology that will result from this study.
APPROACH: Synergistic co-siting involves the carefully planned grouping of industrial and/or agricultural activities in complexes that provide mutually beneficial utilization of energy, raw materials, land, plant wastes and transportation facilities.
RESULTS: This research will utilize systems analysis to identify candidate industries for co-siting, design

them into realistic complexes and evaluate the economic, resource and environmental costs and benefits of these complexes as compared to conventional industrial siting approaches. The prospective users of this research are government and industry planners and policy makers.
KEYWORDS: INDUSTRIAL SITING;SITE SELECTION;SYNERGISM;ECONOMICS;TERRESTRIAL ECOSYSTEMS;ENVIRONMENTAL IMPACTS;ENERGY CONVERSION;ENERGY PARKS;ENERGY FACILITIES;LAND USE;PLANNING;INDUSTRY

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To identify the mechanisms responsible for chemical transformations in coal-fired power plant plumes. Emphasis will be placed on the SO/sub 2/-sulfate and NO-NO/sub 2/-nitrate conversions.
APPROACH: Crosswind profiles and average concentrations of the various plume constituents are obtained by traversing the plume with an instrumented aircraft. Measurements are made at different altitudes for each of several locations downwind of a power plant. Additional gaseous and particulate samples are collected and returned to the laboratory for detailed analysis. Data will be collected under various meteorological conditions.
RESULTS: The data obtained will be used to calculate conversion rates for primary effluents. These rates will be correlated with changes in temperature, relative humidity, solar intensity, and plume constituent concentrations. A mechanism will be postulated to explain the observations.
PROJECT MILESTONES: (1) TVA internal report on SO/sub 2/ oxidation rates 10/76. (2) TVA internal report on meteorological effects on SO/sub 2/ oxidation 10/77. (3) Milestone report on plume chemistry 11/78. (4) Final report 6/81. (5) Complete testing of chamber 1/77. (6) TVA internal report on SO/sub 2/ oxidation 10/77. (7) Milestone report on SO/sub 2/ oxidation. (8) TVA internal report on stack gas study 6/79. (9) Final report 3/81.

PROJECT DESCRIPTION: To develop a quantitative regional model to describe the transport and transformations of the SO/sub 2/-sulfate complex in the Tennessee Valley region. This model will be useful in determining the relative importance of TVA emissions as compared with other upwind sources of emissions.
APPROACH: Measurements of the SO/sub 2/-sulfate complex and other pollutants are made using an instrumented aircraft at various locations and altitudes in the region of interest. Data collected at various meteorological stations are used to study air-parcel trajectories. Intensive field studies will be conducted under various meteorological regimes.
RESULTS: The data obtained will be helpful in understanding transport, diffusion, and chemical transformation of species of interest. Correlations with the meteorological data will explain relative importance of temperature inversions, wind velocity, climatic regime, and precipitation. A quantitative regional model will be the final product.
PROJECT MILESTONES: (1) TVA internal report on regional model 6/77. (2) Milestone report on regional model 6/78. (3) TVA internal report on model refinement and existing networks 12/78. (4) Final report 11/80.

TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: NOXIOUS GAS/SO/sub 2/ (Coal-fired power plant emissions) (100%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To identify and quantify the impact of coal-fired power plant effluents on crop species of economic significance to the southeastern United States.
APPROACH: Determine impact on yield and crop appearance through the use of field (polluted) air exclusion system and charcoal-filtered air greenhouses.
RESULTS: Relationship between crop appearance and yield will be determined; relationship between exposure dose and yield will be determined; effect of other environmental parameters on modifying plant response to SO/sub 2/ will be determined.
PROJECT MILESTONES: 1st year: 30 air filtration systems to be established; results to be obtained for soybeans and cotton. 2nd year: 30 additional air filtration systems to be established, continue soybean and cotton tests, and add conifers, small grains. Remaining years: test other varieties of soybeans/cotton, other locations, vary soil fertility, soil ph.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine the individual and combined effects on vegetation of SO/sub 2/, NO/sub 2/, and O/sub 3/ exposures at concentrations, dosage rates, and environmental conditions typically occurring during surface exposures in the vicinity of large coal-fired power plants.
APPROACH: Using a fumigation chamber within a growth chamber and a pollutant injection system capable of duplicating actual field fumigations, crop plants will be exposed to power plant effluents and other atmospheric pollutants to determine their effects on yield and plant sensitivity.
RESULTS: The relationship between pollutant dose, foliar injury, and yield for stage of growth of crop plants most sensitive to yield reduction will be determined. The relationships between effects of multiple pollutant exposures (SO/sub 2/ + NO/sub 2/, and SO/sub 2/ + O/sub 3/) and yield will be established for soybeans and other crops important in the southeastern United States.
PROJECT MILESTONES: (1) 1st Year: Construct exposure chamber and perform SO/sub 2/ fumigation for several different dosage curves on soybeans. (2) 2nd Year: Perform fumigations with NO/sub x/ and O/sub 3/ on soybeans using same system as above. (3) 3rd Year (and subsequent years): Perform multiple pollutant exposures.

PROJECT DESCRIPTION: Characterize and quantify the transfer, fate, and effects of SO/sub x/, NO/sub x/, and acid precipitation on terrestrial ecosystems representative of the Tennessee Valley region.
APPROACH: A series of forested watersheds is being established, instrumented, and calibrated in order to evaluate atmospheric inputs of SO/sub x/, and NO/sub x/. An acid rain simulator will be utilized to evaluate plant and soil response to precipitation pH.
RESULTS: A compartmental mass balance will be developed for selected elements in several biotic and abiotic compartments. This information will be used to evaluate atmospheric input in relation to system alteration and response.
PROJECT MILESTONES: (1) Completion of watershed characterization and baseline studies (FY 1977). (2) Completion of watershed response evaluation period and related studies (FY 1980).

PROJECT DESCRIPTION: To assess the contribution of sulfur and other plant nutrients to the terrestrial ecosystem from the atmosphere.
APPROACH: Sulfur and other plant nutrients in rainfall and dry particulates are collected and analyzed. Sulfur also enters the terrestrial ecosystem as SO/sub 2/ and a technique for measuring accumulation in this manner under field conditions is needed. Four methods of measuring SO/sub 2/ uptaken by vegetation will be evaluated and the best method selected for use at various locations relative to coal-fired power plants to measure SO/sub 2/ uptake by soil. Assessment of past deposition of sulfur to soils needs to be evaluated. Samples of native soil will be collected on different radials from coal-fired power plants and the sulfur content compared with samples collected from areas remote from the power plants.
RESULTS: The results of this investigation will be used to estimate the amount of sulfur contributed by coal-fired power plants to meet the sulfur requirements of vegetation. The consequences of a possible sulfur deficiency occurring if this source of sulfur is eliminated can be evaluated.

PROJECT DESCRIPTION: Evaluate impact of moisture, salts, toxic trace metals, released from natural draft and mechanical draft cooling towers on the terrestrial environment.
APPROACH: Study plots located in areas of maximum and minimum deposition will be utilized to evaluate the effect of increased moisture levels, salt deposition, and toxic heavy metals on plant growth and vigor of selected species; accumulation of heavy metals on and in vegetation, as well as nutrient loss and accumulation in the soil.
RESULTS: Estimates of plant uptake and/or foliar contamination will be obtained. Changes in soil nutrient status will be monitored as will ice damage and increased incidence of plant pathogens and insects. Deposition information can be used to verify deposition models for areas within 6 miles of the source.
PROJECT MILESTONES: (1) Establishment of study plots and completion of initial survey of local flora FY 1977. (2) Completion of evaluation under operating conditions FY 1980.

CHARACTER OF STUDY: RESEARCH (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southeast
PROJECT DESCRIPTION: The development and refinement of remote sensing techniques for monitoring and evaluating the effects of SO/sub 2/ emissions from fossil-fueled, electric-generating plants on terrestrial vegetation.
APPROACH: Initial studies involve comparisons of ground-truth data (on effects) of foliar SO/sub 2/ effects to vegetation, primarily soybeans and pines; and color, color-infrared, and multi-spectral imagery obtained by conventional aircraft. If these methods prove satisfactory, then the feasibility of satellite imagery for effects monitoring will be evaluated.
RESULTS: Remote sensing methods for routine surveillance of biological effects of large areas which would permit permanent, quantitative documentation of the extent and severity of effects for economic assessment and determination of trends.
PROJECT MILESTONES: (1) TVA internal report on instrumentation 12/76. (2) TVA internal report on reflectance characteristics 10/77. (3) Milestone report discussing instrumentation and reflectance characteristics 7/78. (4) TVA internal report on high-altitude studies 8/78. (5) TVA internal report on remote sensing 8/79. (6) Final report 2/81.

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest;HYDROGRAPHIC AREAS/Other hydrographic areas Streams and rivers
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The goal of this project is to demonstrate methodologies for predicting the impact on downstream biotic communities, based upon the characteristics of the site to be mined.
APPROACH: (1) Identify the occurrence and significance of trace metals in a strip mined area. (2) Calibrate existing regionalized hydrologic models using data from surface mined watersheds. (3) Develop or extend nonpoint source water quality models so that the natural-area environmental loadings of important water quality constituents can be predicted. (4) Relate the transport of significant trace metals and other important water quality constituents to the hydrology of small strip mined watersheds. (5) Develop relationships between the chemical composition of strip mine overburden and the downstream transport of important constituents over and above the natural-area environmental levels. (6) Relate the transport of important constituents to the structure and function of biological communities.
RESULTS: The end product of this research will be a methodology for planners or regulatory bodies for assessing the effects of incremental strip mining on water quality and the viability of the aquatic community. This methodology will be user oriented with the minimum amount of field data collection necessary to produce acceptable predictions.
PROJECT MILESTONES: (1) TVA internal report summarizing the findings of field investigations 12/76. (2) Milestone report summarizing the findings of field investigations 10/77. (3) TVA internal report which summarizes the studies of formation rates and transport mechanisms 8/78. (4) TVA internal report discussing treatment and reclamation evaluations 8/79. (5) Final report 8/81.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To evaluate and refine the analytical models used for radiological impact assessment of nuclear power operations. Emphasis will be placed on models used to predict radiation doses from two components of direct radiation: (a) from radioactive materials confined within the plant, and (b) from radioactive materials in the gaseous effluent plume.
APPROACH: External radiation exposure levels in the vicinity of an operating, riverside nuclear power reactor(s) will be measured, and the results will be used in the development of accurate computer codes for calculating doses. Pressurized ionization chambers will be used for the measurements. Parametric analyses will be performed in conjunction with literature searches in an effort to improve the dispersion portion of the analytical model used for assessment of plume impact.
RESULTS: (1) Report(s) on direct radiation measurements at a BWR (PWR). (2) Report(s) on refined dosimetry and dispersion models and computer codes. These models and codes will be used to assess more accurately radiological impact of uranium fuel cycle operations. Improved assessment should facilitate the efficient and economical design of nuclear power plants and other uranium fuel cycle facilities.
PROJECT MILESTONES: (1) Direct radiation measurements at a BWR January 1979. (2) Final report on measurements and development of refined analytical models and computer codes August 1980.

PROJECT DESCRIPTION: (1) To develop and maintain a model quality assurance program for radiological surveillance. The emphasis in this task will be on development of a multiple-laboratory program. (2) To develop improved radiological monitoring techniques. (3) To develop an optimized radiological monitoring program.
APPROACH: (1) To produce an analytical quality control document which can be used by radiological laboratories for quality control monitoring of procedures, counting equipment, and data handling. (2) To develop a program of interlaboratory studies, standards, and analytical and counting procedures to use as standard methods in multiple laboratories. (3) To produce guidelines for gamma countig and data reduction techniques. (4) To develop a cost-effective radiological surveillance program through the use of statistical methodology, parametric studies, and improved sampling procedures.
RESULTS: (1) Analytical quality control manual for radioanalytical laboratories. (2) Demonstration of effective approach to multiple-laboratory quality assurance, to assure comparability of data produced throughout the U.S. for assessing radiological impact. (3) Reports on gamma data reduction techniques subsequent to or part of analysis using NaI(Tl) or Ge(Li) detection systems. (4) Improved environmental radiolcgical surveillance program, to facilitate the efficient and economical design of nuclear power systems.
PROJECT MILESTONES: (1) Least Squares Analysis of Gamma Spectra by ALPHA-M November 1976. (2) Applications of Ge(Li) Detectors in Environmental Analyses December 1977. (3) Cost-Effectiveness of Environmental Monitoring Schemes October 1978. (4) Final ''Pass-Thru'' Report February 1981.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: Determine effects of high intensity fields. There is much public concern, as well as concern within the power industry itself, about the effects on people exposed to electric fields from EHV and UHV power lines and equipment. The solution of problems associated with exposure to these fields involves the identification of biological effects and biomedical problems and the advancement of technology to eliminate these effects.
APPROACH: This project will consist of an ongoing review of research being conducted nationally, investigations of specific problems and solutions related to electric fields on the TVA power system, and investigation of ways to apply the results of the national effort to the TVA power system. No funds are included for an intensive monitoring and/or development program.
RESULTS: Instrumentation was developed to monitor electromagnetic and electrostatic fields under transmission lines, substation buses, transformers, generators, and other energized equipment. Actual field mapping under certain TVA's 500 kV transmission lines and switchyards have been conducted to evaluate present exposure conditions. Laboratory and actual field tests are being conducted on an American optical demand pacemaker to determine if electromagnetic or electrostatic fields have any adverse effects on these life essential devices.
PROJECT MILESTONES: Presently no particular milestones have been established.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objectives of the programs are to ensure that adequate data from TVA's power plants are available, that TVA is informed on the state of the art of NO/sub x/ removal or control, that NO/sub x/ removal or control projects are well defined, and that implementation of project plans is adequate.
APPROACH: Reviewing and commenting on advanced concepts associated with NO/sub x/ removal or control. Assisting in developing and reviewing project plans for EPRI programs related to NO/sub x/ removal or control. Testing at TVA's power plants, where data are not available, to determine NO/sub x/ emissions. The scope of this program consists of obtaining NO/sub x/ emission data; reviewing and visiting advanced NO/sub x/ removal or control systems; and reviewing, developing, and commenting on proposals.
RESULTS: Work is in progress reviewing and commenting on advanced NO/sub x/ removal or control systems.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/South
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The major objective of the project is to develop reliable closed loop mist eliminator systems for lime/limestone systems now in operation or planned in the near future; also, to the extent possible, develop less costly advanced high velocity scrubbers.
APPROACH: Determine the factors adversely affecting the mechanical and process reliability of mist eliminators in lime/limestone wet scrubbing systems.
RESULTS: Previous projects were initiated to provide technical design input for the full-scale scrubber installation at Widows Creek. Recent tests on new mist eliminator operating modes have been promising. This study will expand in more detail the viability of these recent tests.
PROJECT MILESTONES: Final report on vertical mist eliminator study. Final report on high velocity scrubber and mist eliminator combination study.

TYPE OF FUNDING: Contract No.-TV-42660A
77 FUNDING: Electric Power Research Inst. FY77:$114,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: NOXIOUS GAS/SO/sub 2/ (60%);PARTICULATES/Fly ash (20%);SPECIFIED OTHER POLLUTANTS/Scrubber sludge (20%)
CHARACTER OF STUDY: RESEARCH/Laboratory (15%);DEVELOPMENT/Laboratory scale;DEVELOPMENT/Pilot plant (85%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/South
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objectives of this program will include making heat balances for several reheat schemes and evaluating materials of construction along with system operability; to evaluate a horizontal scrubber system at the 1-MW level; to evaluate the erosion and corrosion of various materials used in the construction of scrubber systems; to determine the range of variability of the solids in sludges produced from scrubbers operated by various utilities and to correlate the variability with plant operating conditions.
APPROACH: Design, construction, and operation of each reheat system, horizontal scrubber, erosion/corrosion test loop. Contacting full-scale lime and limestone scrubber installations requesting sludges for chemical and instrumental analysis.
RESULTS: This project is directed to expanding an existing development and process evaluating program at the TVA Colbert lime/limestone scrubbing pilot plant to include four additional high priority tasks required in achieving a commercial design base for lime/limestone scubbing on high-sulfur coal.
PROJECT MILESTONES: Final report on each task.
KEYWORDS: REHEAT;SCRUBBING;CORROSION;SLURRIES;SCRUBBERS;DESIGN;CONSTRUCTION;OPERATION;LIMESTONE;PILOT PLANTS;COAL;ENVIRONMENTAL EFFECTS;WASTE MANAGEMENT;FLUE GAS;EROSION

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (60%);DEVELOPMENT/Laboratory scale;DEVELOPMENT/Pilot plant (40%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Southeast;HYDROGRAPHIC AREAS/Other hydrographic areas River
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To obtain data on the variables in pilot plant production of fertilizer from scrubber product sludges, on the compatibility factors involved in storage and mixing of this fertilizer material with conventional fertilizer, or how scrubber operation affects sludge characteristics, and a detailed physical and chemical characterization of the waste solids from various fluidized bed combustion systems burning coal.
APPROACH: To determine the technical, economic, and environmental feasibility of producing a fertilizer material from scrubber sludge, to determine the range of variability of the solids produced from the scrubbers operated at the Shawnee Test Facility and correlation of this variability with plant and scrubber operating conditions, and an evaluation of disposal methods for and the characteristics of fluidized bed combustion waste products.
RESULTS: (1) A fertilizer material product from scrubber sludge. (2) A disposal method for fluidized bed combustion waste products and understanding of their characteristics. (3) A correlation of the variability of sludge characteristics to scrubber operation.
PROJECT MILESTONES: (1) Pilot plant studies and supporting work with fertilizer September 1976. (2) Shawnee sludge-scrubber correlation work September 1976. (3) Fluidized bed combustion characterization October 1976.
KEYWORDS: SCRUBBING;SOLID WASTES;WASTE DISPOSAL;RECYCLING;FLUIDIZED-BED COMBUSTION;WASTE MANAGEMENT;COMBUSTION PRODUCTS;COAL;AIR POLLUTION;CONTROL;LIMESTONE;FERTILIZERS;PRODUCTION;SLURRIES;SULFUR COMPOUNDS;WATER;SLUDGES

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this project is to determine whether a fish pump can be efficiently utilized to reduce impingement at Browns Ferry Nuclear Plant.
APPROACH: The scope of the project includes the purchase and installation of a fish pump, operation of the pump, data acquisition through identification and enumeration of fish impinged on the screens and of those transported by the pump, data evaluation, and reporting.
RESULTS: The project workplan, environmental evaluation record, and activity authorization have been completed. A 6-inch diameter pump and 7-1/2 hp motor have been purchased and installed at the plant. After operational testing, modifications to improve performance have been made. An operational schedule has been established to allow for two sampling periods per week. The facility began operation in March 1975 and approximately 6 months of data have been obtained on fish pump efficiency and survival rates. The facility did not operate for several months during the winter of 1975-76, while the screen well in which the dust pan is located was dewatered for maintenance. The facility has experienced operation and maintenance problems. Recommendations for modification of the facility are being prepared by a TVA interdivisional work group.
PROJECT MILESTONES: Final report on the project

ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Chlorine and chlorine compounds (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Southeast
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: Assessment of the overall program needed to comply with chlorine discharge regulations under the NPDES permits program will be made.
APPROACH: The study will evaluate and summarize the methods by which chlorine discharges from once-through cooling systems and cooling tower blowdown may be reduced. Also, alternative mechanisms to treat

biofouling will be studied.
RESULTS: The study will recommend methods to reduce chlorine discharges and may suggest alternative mechanisms to treat biofouling.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Southeast;COASTS/Southeast;HYDROGRAPHIC AREAS/Other hydrographic areas Freshwater lakes and reservoirs
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objective is to (1) characterize coal pile drainage, (2) assess the pH adjustment on ash pond effluent, (3) assess and then design an effective program for monitoring ash pond effluent, (4) evaluate chlorinated water effluent quality in the discharge canal, (5) assess, characterize, and quantify coal ash leachate effects on ground water, and (6) study gaseous emissions from many types of boilers.
APPROACH: The project will cover (1) characterization and quantification of physical and chemical components of coal pile drainage, (2) assessment and quantification of the chemical and physical nature of ash pond effluent after pH of the ash pond has been adjusted to meet existing standards, (3) evaluation of an ash monitoring program to determine the sampling necessary to obtain reliable, representative information, (4) assessment and characterization of coal ash leachate on ground water quality, (5) evaluation and quantification of chlorinated effluent in the discharge canal, and (6) characterization and quantification of gaseous effluents from tangential and wall-fired units.
RESULTS: Final results will help provide chemical information to design treatment systems for effluent waters. Also, one task will address the efficacy of presently specified monitoring programs. Another task will produce information to define methods to reduce chlorine usage. Another will assess the influence of chemical constituents from the Ash Pond on ground water quality. Finally, one task will provide information to characterize gaseous, vapor and fine particulate emissions from different types of boilers.
PROJECT MILESTONES: Characterization of coal pile drainage 12/78. Assessment of pH adjustment on ash pond effluent 12/78. Complete study on the design of an effective monitoring program for ash pond effluent 8/77. Evaluation of chlorination of once-through condenser systems 6/78. Coal ash leachate effect on ground water quality 6/78. Assessment of gaseous emissions from different boilers 12/79.

PROJECT DESCRIPTION: The objective is to investigate and evaluate various mechanisms for the reduction of intake structure effects at power plants, to investigate alternate cooling devices, and to investigate the application of membrane technology to power plants.
APPROACH: Determine whether one or more mechanisms may be beneficially utilized to reduce entrapment and entrainment. Evaluate the Engineering and Environmental aspects of wet/dry cooling towers by full scale demonstration and to participate in the development of the cherne spray thermal rotor system. Evaluate the use of membrane processes for refurbishing power plant discharge waters by testing on pilot scale test equipment and modules.
SULTS: Definition of the applicability of membranes to treat power plant effluent streams and which membrane best treats a particular effluent stream. Demonstrate full scale the engineering and environmental aspects of wet/dry cooling. Test a field device to reduce fish impingement.
PROJECT MILESTONES: (1) Publish final report on application of membrane technology to power plant water

effluent 6/78. (2) Publish report that evaluates a method to reduce intake structure impact 6/79. (3) Complete operational testing of the wet/dry cooling tower and publish final report 6/79.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/Continental;GEOGRAPHIC AREAS/Global;COASTS/Southeast;COASTS/Northwest
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The primary objectives of the study project are to summarize the energy requirements of selected power plant stack gas SO/sub 2/ removal processes and then prepare economic and feasibility analyses of process modifications for reducing and optimizing the energy requirements for the processes. Conceptual design and cost studies will be surveyed for energy requirement data. Also a survey will be made of the energy requirement data for any existing demonstration and commercial units.
APPROACH: Establish premises for study; survey published data on energy requirements for selected processes; survey data on energy requirements for operating and planned demonstration and commercial units; prepare summaries of current energy requirements based on the above surveys; prepare a feasibility and economic evaluation study of process modifications for reducing energy requirements for selected processes.
RESULTS: The data obtained from these surveys will be summarized and analyzed to establish a current base energy requirement level for each of the processes. Feasibility and economic evaluations will then be made of process modifications and variations for reducing and optimizing the energy requirements. Process modifications and variations to be studied will include such items as scrubber type, reheat level and type, heat recovery systems, etc.
PROJECT MILESTONES: (1) Complete premises for study including selection of processes. (2) Establish base energy requirements for the selected processes based on surveys of available data. (3) Complete draft report on the feasibility and economic evaluation of process modifications for reducing and conserving the energy requirements for the selected processes.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/Continental;GEOGRAPHIC AREAS/Global;COASTS/Southeast;COASTS/Other coasts South
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The initial purposes and corresponding scopes of this project, including the economic reviews of potentially attractive SO/sub 2/ removal processes and assessments of their technical development (Task 1) and an economic study of sludge disposal alternatives for lime-limestone scrubbing processes (Task II), have been stated in previous quarterly reports and remain unchanged. Revision of the subagreement was made during the quarter with three additional tasks being added to the project. Task III consists of continuing assistance to EPA in analyzing published cost estimates of power plant stack gas emission abatement systems and preparing brief reports of critique. In Task IV, a comparative economic study will be made of front-end process alternatives, such as coal conversion systems and coal washing techniques, to stack gas treatment for SO/sub 2/ emission abatement. Task V is an economic and technical assessment of selected NO/sub x/ abatement processes for power plant application.
APPROACH: Selecting of processes for evaluation (by TVA and EPA); defining study objectives and economic premises; contacting sources of technology, preparing flowsheets, material balances, and layouts; estimating equipment costs; preparing capital investments and operating costs; evaluating costs sensitivities; preparing report draft.
RESULTS: Assistance to EPA in analyzing published cost estimates of power plant stack gas emission abatement systems and preparing brief reports of critique.
PROJECT MILESTONES: Continuation of assistance to EPA in selection of processes for demonstration-scale testing. Selection of Phase I processes for economic studies. Phase I will cover three processes: one citrate; one sulfur-producing, regenerable; and one double-alkali. Completion of flowsheets, material

balances, and layouts of Phase I processes. Completion of base-case capital investment and operating costs of Phase I processes.

PROJECT DESCRIPTION: The purpose of this study is (Task I) to identify the quantities of abatement by-products which could be produced with air pollution abatement processes installed at power plants and other significant point sources of sulfur emissions to meet air pollution standards in the 48 contiguous states of the U.S.; (Task II) determine competitive costs of existing processes which utilize elemental sulfur, and analyze existing markets in the 48 contiguous states in the U.S. with respect to potential for an orderly utilization of abatement sulfur by-products into these markets.
APPROACH: Potential marketing of by-products (S, H/sub 2/SO/sub 4/, (NH/sub 4/)/sub 2/SO/sub 4/, CaSO/sub 4/) from power plants in the U.S. through use of systems analysis of SO/sub x/ abatement processes.
RESULTS: (Task III) determine the most economical market, distribution, and transportation systems, and using a systems approach simulate and evaluate alternative strategies for utilization of sulfur by-products with respect to an optimal technology mix considering product markets (sulfur, sulfuric acid, ammonium sulfate, phosphate fertilizers, gypsum wallboard, and etc.); process cost differentials; and clean fuel alternatives.
PROJECT MILESTONES: Preliminary report on economic evaluation of the fertilizer market potential for abatement ammonium sulfate. Refine and verify data basis for abatement production and marketing of sulfur and sulfuric acid. Input data for production and marketing of abatement calcium sulfate. Market simulation runs for abatement sulfur and sulfuric acid. Market simulation runs for abatement calcium sulfate.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The primary objectives of the test facility studies are to continue to develop and optimize lime and limestone wet scrubbing technology as it pertains to treating power plant boiler flue gas. The studies are being performed in intermediate size equipment (gas flow is equivalent to a power generating capacity of about 10 megawatts) so that data will more readily transfer to commercial size units.
APPROACH: Two wet scrubbing systems (each equivalent to 10 megawatts) are operated continuously to treat a side stream of flue gas from a commercial size power plant boiler. Lime and limestone are used as the primary absorbents. Additives such as magnesium oxide can be used to alter the process chemistry. The studies are designed to evaluate process variables, and plant operating and design concepts that can be used to guide the design and operation of commercial size systems.
RESULTS: Chemical process, equipment, and operating parameters that are useful to the industry in selecting, designing and operating flue gas cleaning systems.
PROJECT MILESTONES: Study of the fundamentals of calcium-based wet scrubbing of boiler flue gas. Identify primary chemical and mechanical limitations of the flue gas scrubbing process. Optimize chemical, mechanical, and operating components of the scrubbing process. Develop and/or evaluate techniques for ultimate utilization of waste products from the scrubbing process to reduce the environmental and economic

impact of the commercial application of scrubbing technology.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The project provides bench-scale level laboratory investigation of promising concepts for improving SO/sub 2/ removal and recovery processes. Scrubbing systems using ammonia, potassium, calcium, and zinc salts in solutions and slurries will receive attention. Studies will be made of the absorption and regeneration steps including solubility of absorbents and reaction products in scrubbing liquors; oxidation, precipitation, decomposition, and reduction steps for applicable systems; and gas-liquid contacting devices.
APPROACH: Laboratory and bench-scale studies of absorption and regeneration in a potassium-based scrubbing system.
RESULTS: Improvements in utility-energy consumption, raw material requirements, process reliability, and capital cost will be pursued. Test data will be reported; conclusions and recommendations will be made.
PROJECT MILESTONES: Complete laboratory studies of the absorption step including effects of phosphate addition on solubility and oxidation of potassium pyrosulfite. The report will cover tests of antioxidants. Complete laboratory studies of decomposition of potassium pyrosulfite with and without phosphates and antioxidants. Complete laboratory studies of the reduction of potassium sulfate with solid reductants. Complete bench-scale decomposition and reduction studies. Summary report including material and energy balances.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To identify and develop the most economic means of applying insulation and reducing heat loss from existing homes heated electrically, especially those owned by people with low income. To demonstrate to such homeowners the potential energy and cost savings for these improvements.
APPROACH: Select a limited number (80) low-income homes with electric heat and high energy use. Determine and implement measures needed to reduce heat losses substantially (add insulation, weatherstripping, etc.) and work with homeowners to better manage heat energy and appliances. Work with local community service agencies to assist in adding ceiling insulation in up to 300 homes of low-income owners as needed.
RESULTS: Demonstrate to others in community and area the energy conservation and cost benefits of adding insulation and other home winterization techniques. Obtain data on energy consumption and results. Publish data for use of consumers, utilities, and insulation contractors.
PROJECT MILESTONES: June 30, 1976 installations completed. July 1, 1976 begin evaluation of methods and procedures. Spring 1977 begin obtaining and disseminating results data.

CHARACTER OF STUDY: RESEARCH (75%);ANALYTICAL (25%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/Site specific Chattanooga, TN
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Our Load Metering Program involves the installation of special metering facilities to determine the time integrated load characteristics for sample groups of retail customers. One purpose of the program will be to evalute metering techniques, sampling theory, and data processing requirements for future load research activities. However, the main purpose of the program will be to yield information that is urgently needed for current cost-of-service, rate design, forecasting, and load management research assignments, and the scope of this initial research has been developed accordingly.
APPROACH: A stratified sample of six hundred retail customers of the Electric Power Board of Chattanooga, Tennessee, was selected and assigned to six residential intervals, eleven commercial-industrial (no demand) intervals, and seven commercial industrial (with demand) class of customers. These customers were next interviewed using questionnaires to obtain pertinent demographic, appliance data, construction characteristic, etc., which may impact energy use patterns of customers. TVA purchased and retains title to all metering equipment, the distributor (Electric Power Board of Chattanooga) will be reimbursed for the cost of installing and removing the equipment and for obtaining customer questionnaire responses for the test customers. The distributor will be responsible for installation and removal of meter tapes at selected intervals. TVA will provide for the translation of meter tapes and such computer programming as may be required to analyze the data.
RESULTS: The electricity demand for the sample customers will be recorded for up to a three-year period. This data will provide us information that is urgently needed to help facilitate current cost of service, rate design, forecasting, and load management research. In addition, this pilot program will help evaluate metering techniques and equipment that will be utilized in later projects to test specific rate designs.
PROJECT MILESTONES: (1) August 14, 1975 The contract for joint services on this program was signed between TVA and the EPB of Chattanooga. (2) November 1975 The first meter was installed on a retail customer's dwelling. (3) April 27, 1976 The last meter was installed to complete the installations for the customers selected in the sample.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine the rate of recovery of a damaged ecosystem in response to intensive remedial treatment of a problem surface mine. The project involves a problem watershed in which 400 acres of forested land were disturbed by coal surface mining in the early 1970's. Unsuccessful reclamation efforts resulted in adverse environmental impacts within an 11-square mile watershed that includes a city water supply reservoir.
APPROACH: Project objectives will be accomplished by applying intensive remedial land treatments (TVA funds) and evaluating their effectiveness by measuring the degree of recovery of the affected terrestrial and aquatic ecosystems. Environmental data collected during the period of mining and early reclamation effort will serve as initial baseline study data. Monitoring (soil, vegetation and receiving stream ecology) is being conducted through treatment and will be continued thereafter on a more limited basis as long as significant recovery is noted.
RESULTS: Results should provide new and significant information in the evaluation and correction of problems associated with future mining of a coal seam found extensively in East Tennessee.
PROJECT MILESTONES: (1) 9/76 TVA Internal Report on baseline assessment. (2) 6/77 TVA Internal Report on first year evaluation. (3) 6/78 Milestone Report on first year evaluation. (4) 6/79 TVA Internal Report on second year evaluation. (5) 1/81 Final Report.

TITLE: Transmission Line Right-of-Way - North Georgia Avian Study
PROJECT NUMBER: TV-42218A
PRINCIPAL INVESTIGATOR: Meyers, J.M.
ADDRESS: School of Forest Resources - University of Georgia, Athens, GA
AFFILIATION: Georgia Univ., Athens (USA). School of Forest Resources
MONITORING AGENCY: Tennessee Valley Authority, Chattanooga (USA)
DIVISION: Forest Fisheries and Wildlife Development
MONITOR: Fowler, Dale K.
TYPE OF FUNDING: Contract No.-TV-42218A;Agency in-house effort;Interagency agreement-Tennessee Valley Authority
77 FUNDING: Tennessee Valley Authority FY77:$5,625
TECHNOLOGY: FOSSIL FUEL/General (50%);NUCLEAR/General (50%)
ENERGY CYCLE: ELECTRICAL TRANSMISSION (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/Site specific N. GA
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) Conduct a three-year study of bird populations along a TVA transmission line to determine the impacts of right-of-way clearing methods on bird numbers and species diversity. (2) Compile a state-of-the-knowledge reference list of transmission line construction effects on avian populations.
APPROACH: Field data will be statistically analyzed to determine the effects of three post construction land treatment plots on birds. Plot treatments include: (1) total cleared right-of-way with wildlife food plantings of Orchard grass, clover, and autumn olive; (2) selectively cleared right-of-way plots with no attempt to revegetate; and (3) total cleared right-of-way plots planted with Kentucky 31 fescue.
RESULTS: In power line right-of-way construction and maintenance, secondary vegetation succession is controlled by mechanical and occasionally chemical methods. It is generally assumed that such rights-of-way create habitat conditions beneficial to wildlife, increasing both numbers and diversity. This study is expected to substantiate this hypothesis or to indicate what constitutes enhancement of right of habitat for wildlife (avian).
PROJECT MILESTONES: Quarterly reports of seasonal field survey reports and intermediate assessments and analysis of collected data. A final report will be prepared.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Site specific Unspecified
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of the study is to determine what aquatic arthropod pests, mainly mosquitoes, are breeding in strip mine pools, to what extent, and whether these breeding sites will serve as a focus of annoyance to surrounding communities.
APPROACH: The survey will employ the use of several sampling techniques for both adult and larval forms of aquatic arthropods.
RESULTS: The study should show the species composition of arthropod pests associated with strip mine pools and demonstrate both naturalistic and physical methods of control. Results from the study should reflect both spatial and temporal measurements of vegetation in coal strip mine pools and their probable influence

on production of arthropod pests (mosquitoes).
PROJECT MILESTONES: (1) Milestone Report presenting preliminary results after two years of the planned study June 1978. (2) Final Report discussing results and findings of arthropod pests associated with the different types of coal strip mine pools June 1980.
KEYWORDS: SURFACE MINING;WATER RESERVOIRS;MOSQUITOES;ANIMAL BREEDING;PEST CONTROL;BLOOD;WATER;INSECTS

REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Southeast;HYDROGRAPHIC AREAS/Other hydrographic areas Large rivers and reservoirs
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: (1) To evaluate alternative methods of aerating reservoirs and reservoir releases. (2) To develop design criteria, cost estimates, and methods of operation for small bubble oxygen injection diffusers. (3) To quantify the aquatic impacts and benefits of aeration to various minimum dissolved oxygen levels.
APPROACH: (1) Feasibility study of alternative aeration techniques and their application. (2) Laboratory experiments to test techniques (e.g., small bubble oxygen diffusers tested in 40' x 7' diameter tank). (3) Field test to develop design criteria, cost data, and operating procedures. (4) Full scale field operations to examine aquatic effects.
RESULTS: Reports containing: (1) Design criteria. (2) Cost estimates. (3) Operating procedures. (4) Identification of potential benefits. Will help define the benefits, costs, and best techniques for increasing DO content in oxygen deficient waters.
PROJECT MILESTONES: (1) Completion of feasibility study. (2) Completion of laboratory tests and reports. (3) Completion of pilot field tests and reports. (4) Completion of background aquatic studies. (5) Completion of aquatic impact studies and reports.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To extend and verify a theoretical computer model of thermal effluents from power generating plants. Such effluents are generally three-dimensional and turbulent. The computer model which will be utilized is a three-dimensional unsteady finite difference technique. This model is unique in that the conservation equations of all three directions are solved in an efficient manner. Most previous models have attempted to describe a thermal effluent with two-dimensional equations or at the very most made restricting assumptions concerning transport in the third dimension.
APPROACH: TVA has been investigating these phenomena for several years. As a result, TVA has amassed a vast amount of data and experience on effluents under a variety of flow and meteorological conditions. These data include surface and submerged discharges and were obtained from boat surveys, aerial infrared imagery, permanent monitors, and lab experiments. The model to be improved and verified was developed by William R. Waldrop and Richard C. Farmer of the Louisiana State University. Dr. Waldrop is currently employed by the TVA Engineering Laboratory, and Dr. Farmer has shown an interest in spending his sabbatical leave of absence from LSU at the Eng. Lab. participating in this project.
PROJECT MILESTONES: (1) Initiation of study. (2) Progress report on the complete review of field data and the isolation of specific tasks to be studied. (3) Progress report on preliminary results of model studies. (4) Report on model studies and comparison with data.
KEYWORDS: THERMAL POWER PLANTS;THERMAL EFFLUENTS;MATHEMATICAL MODELS;FLUID FLOW;PLUMES

CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: As a part of its ongoing economic research program, TVA is in the process of developing a Regional Economic Simulation Model of the TVA region and its principal subregions. The objectives of the present work are to expand the existing model for use in: (1) assessing an area's sensitivity to various national parameters; (2) evaluating the impact in small areas (economic area or multicounty planning area) on population, labor force, employment, etc. of a major construction activity; e.g., construction of a large nuclear energy plant; and (3) providing the macroeconomic data base at a multicounty level that is necessary for rigorous site specific analyses. Much of the conceptual work has been done, but a significant effort is required to make the model an operational tool for driving energy and environmental planning models. A demonstration of the two sector model (population-labor force and employment sectors) for a multicounty area will be completed by 12/76.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Output will consist of reports, computers programs with documentation, a demonstration of the program, and consultation as required. The model will be developed in conjunction with and in parallel to the development of the TVA Power System Integrated Planning Model. The model will include the capability to predict the residual output of a power system on a plant-by-plant basis. It will provide inputs for detailed dispersion models for evaluating expansion policies of a power system. The model may also be used independently of the TVA Power System Integrated Planning Model.
APPROACH: The model will be based on a power system simulation model developed by TVA.
RESULTS: A preliminary conceptual design of the model has been completed and interfaced with the overall conceptual design report of the TENNESSEE VALLEY AUTHORITY Power Program Integrated Planning Model. Immediate plans are to modify an existing power system operation model to output environmental residuals.

DIVISION: Division of Reactor Safety Research (Experimental Fast Reactor Safety Branch)
MONITOR: Silberberg, Melvin
TELEPHONE: F427-4329
TYPE OF FUNDING: Interagency agreement-Nuclear Regulatory Commission
77 FUNDING: Nuclear Regulatory Commission FY77:$1,675,000

TECHNOLOGY: NUCLEAR/Fission Breeders (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The objective of this program is to provide the experimental data and analytical techniques necessary to make conservative and realistic assessments of the quantities, characteristics, and transient behavior of radionuclides that may be released into an LMFBR secondary containment as a result of a range of accident conditions up to and including severe core disruptive accidents.
APPROACH: A multi-faceted experimental and analytical approach is required to meet the objectives. A variety of fuel and fuel simulant aerosol generation techniques are used to study fuel aerosol characteristics and behavior in several different size containments. An electrical technique, using capacitor discharge, is used to place fuel and UO/sub 2/ into appropriate post-CDA states. The mechanisms of conversion of that fuel into airborne materials are studied and release potential established. A sodium facility is used to study the interactions of the molten fuel with the sodium and containment environment to identify (and quantify) possible source alteration as the released material is transported through the sodium. Fuel simulant aerosols are generated and sodium is burned simultaneously in an intermediate-size vessel to establish behavior in secondary containments.
RESULTS: Experimental data and calculational models should result that will allow mechanistic determinations of the quantities and characteristics of the radionuclides released into the secondary containment and to determine the transient behavior there. It is expected that this program will provide initial input data and aerosol characteristics for core dispersal and aerosol behavioral codes (e.g., HAARM-2) and provide experimental validation of the models for a variety of conditions.
PROJECT MILESTONES: (1) Complete UO/sub 2/ experiments and issue draft report to define an ''upper limit'' source term 6/30/77. (2) Complete ''upper limit'' confirmatory tests with real fuel 7/31/78. (3) Complete tests to determine effects of source interactions and transport through sodium (completion date not yet scheduled). (4) Complete tests on effects of radiation level (completion date not yet scheduled). (5) Complete tests to establish co-existent behavior of fuel and sodium aerosol in the presence of sodium fires (completion date not yet scheduled).

TECHNOLOGY: NUCLEAR/Fission Converters (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: This program is designed to provide analytical and research support to the Reactor Safety Research (RSR) Division of the Nuclear Regulatory Commission (NRC) in the area of Safety for High Temperature Gas Reactors (HTGR's). The support includes development of a safety program for HTGR's under guidance of the NRC by organizing a group at Brookhaven National Laboratory (BNL) which will determine, analyze, supervise and delineate the necessary analytical and experimental work required for insuring safe construction and operation of HTGR's.
APPROACH: The support includes a continuing in-depth review of HTGR safety analytical methods and physical and experimental phenomena bearing on the safety of HTGR's as they exist now and as they are developed in cooperation with RSR and Los Alamos Scientific Laboratory (LASL). It will in time provide RSR with a completely independent analytical and experimental capability in HTGR safety. The support will make full use of both BNL and outside expertise and will be coordinated with a similar effort at LASL.
RESULTS: Analytical models are being developed to be used for calculating the courses of, the progression of, and the consequences of HTGR accidents. The completed models will be distributed as packaged comptuer codes. Experimental measurements are being made to establish an independent data base to be used with the analytical models being developed.
PROJECT MILESTONES: FY 77: (1) Complete construction of helium loop for conditioning and environmental control of metallic fatigue and creep test samples. (2) Initiate thermal chromatography measurements with individual fission products. FY 78: (1) Complete high temperature mass spectrometer. (2) Complete assessment of development of localized flammable mixtures in the secondary containment. (3) Initiate high temperature creep test program with controlled helium environment.

77 FUNDING: Nuclear Regulatory Commission FY77:$500,000
TECHNOLOGY: NUCLEAR/Fission Breeders (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical (50%);ANALYTICAL (50%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To provide coordination of fast reactor safety research by the RSR Division of NRC. An independent assessment of basic technical problems in accident analysis is made, and means of validating safety codes are suggested. Progress in safety research is reviewed for NRC and ACRS.

APPROACH: Fast reactor safety analysis studies on a limited scale are undertaken to maintain expertise and to give insight into important safety problems. Discussions and meetings are held with RSR contractors to obtain as to what the important safety problems are and how they should be solved.
RESULTS: Studies are made of the initiating phase of accidents in LMFBR's. An improved fuel-coolant interaction code has been developed. A model of a boiling pool of fuel and steel has been developed and recriticality studies are being made with it. Reactivity coefficients and power distribution for the CRBR demo plant have been calculated.
PROJECT MILESTONES: (1) Oct. 1976 Present paper on loss-of-flow calculations for CRBR using demo and gas. (2) Oct. 1976 Present paper on epic fuel-coolant interaction code. (3) Oct. 1976 Present paper on boiling pool studies. (4) Sept. 1976 Begin calculation of reactor parameters in 2-D and 3-D hexagonal geometry.

TITLE: Critical Experiment Program for Monte Carlo Code Validation
PROJECT NUMBER: A2018
PRINCIPAL INVESTIGATOR: Gelbard, E.M.;Le Sage, L.G.
ADDRESS: 9700 South Cass Avenue, Argonne, IL 60439
AFFILIATION: Argonne National Lab., Ill. (USA)
MONITORING AGENCY: Nuclear Regulatory Commission, Washington, D.C. (USA)
DIVISION: Division of Reactor Safety Research
MONITOR: Wood, Phillip M.
TELEPHONE: FTS-427-4326
TYPE OF FUNDING: Contract No.-A2018
77 FUNDING: Nuclear Regulatory Commission FY77:$624,000
TECHNOLOGY: NUCLEAR/Fission Breeders (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (50%);ANALYTICAL (50%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The NRC program in Fast Reactor Safety currently concentrates heavily upon defining the limiting consequences of severe hypothetical core disruptive accidents (HCDA). This program is designed to provide a method for experimentally validating analytical methods used in the study of such accidents. Subtask A: This subtask relates to the Monte Carlo analysis of safety-related critical experiments so as to verify the Monte Carlo algorithms and basic nuclear-data sets. It includes the development and validation of special computational techniques for the utilization of Monte Carlo in the analysis of such experiments, and the use of Monte Carlo to check other analysis methods. Subtask B: The criticals program planning for safety-related critical experiments encompasses the planning for a program of critical experiments bearing on LMFBR DEMO safety. This also involves the establishment of the objectives of the experimental program, the evaluation of the experimental alternatives, the identification of material requirements for core construction, and the identification of experimental and analytical techniques development required for the successful completion of the program. Subtask C: This subtask covers the actual performance of the safety-related critical experiments. Included are the construction of the core on the critical assembly, operation of the critical assembly, performance of the measurements, evaluation and analysis of the data, and publication of the results.
RESULTS: Subtask A--Monte Carlo Analysis of Safety-Related Criticals: (1) determine the accuracy of various alternative S/sub n/ and diffusion theory techniques, as applied to the analysis of the critical experiment sequence; (2) complete detailed VIM analysis of reference core and one meltdown configuration; and (3) compare R-Z diffusion and S/sub n/ computational results with corresponding results from VIM. Subtask B--Criticals Program Planning: (1) perform ZPR safety analysis; (2) develop program plan for safety-related criticals; and (3) participate in reviews of program plan and obtain program approval. Subtask C--Safety-Related Critical Experiments: (1) start critical experiments (07-01-77); (2) complete experiments on reference core; and (3) start experiments on meltdown configurations.
PROJECT MILESTONES: (1) Oct. 1975 Complete VIM computation of ZPR-3-27. (2) April 1976 Complete VIM computation of ZPR-3-28. (3) Dec. 1976 Complete plans for safety criticals. (4) Sept. 1977 Complete hypothetical core disassembly methods analysis. (5) Jan. 1978 Begin safety-related critical experiments.

TITLE: Analytical Studies of Aerosol Behavior Predictions for Fast Reactor Safety
PRINCIPAL INVESTIGATOR: Gieseke, J.A.
ADDRESS: 505 King Avenue, Columbus, OH 43201
AFFILIATION: Battelle Columbus Labs., Ohio (USA)
MONITORING AGENCY: Nuclear Regulatory Commission, Washington, D.C. (USA)
DIVISION: Division of Reactor Safety Research
MONITOR: Silberberg, Mel
TELEPHONE: FTS-427-4329
TYPE OF FUNDING: Contract No.-W-7405-eng-92, Task 56
77 FUNDING: Nuclear Regulatory Commission FY77:$361,000
TECHNOLOGY: NUCLEAR/Fission Breeders (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The objective of this proposed study is to provide improvements and verification for the aerosol behavior models, perform sensitivity analyses for typical LMFBR systems, provide theoretical support and pre-analyses for experimental aerosol studies, obtain experimental data related to specific aerosol agglomerate properties, and provide technical assistance to RSR in the area of aerosol behavior.
APPROACH: Improvements will be made for aerosol behavior models used to predict the leakage of radioactive materials from LMFBR containments under postulated accident conditions. These improvements will be concerned with better representations for aerosol agglomerate properties such as shape factors, effective volumes, effective densities, and particle-particle collision efficiencies. In addition, improved size distribution representations will be used in the analyses and thermal wall deposition included in a more descriptive fashion. Experimental measurements of agglomerate properties and thermal forces will be made to provide information needed in the model improvements. Sensitivity analyses and model verification by comparison with experimental results will be used to evaluate model adequacy and the importance of assumed conditions on aerosol leakage from containments.
RESULTS: Expected results are the development or improvement and verification of analytical models for

predicting aerosol behavior within containments. Detailed improvements in descriptions of agglomerate characteristics will be provided from experimental measurements and incorporated into the model. Verification of behavior models will be made by comparisons with a continuously updated review and compilation of experimental data. Sensitivity analyses with the developed models will provide an assessment of the importance of containment geometry and assumed input parameters.
PROJECT MILESTONES: (1) Report on NA/sub 2/O agglomerate behavior 7-77. (2) Begin PuO/sub 2/ aerosol experiments 7-77. (3) Complete reference aerosol code.

RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The project is a continuing program of analysis and experiments in phenomenology important to the safety of LMFBR's of commercial size with either oxide or advanced fuels. Included are fuel element behavior intransients, accident analysis, post accident heat removal and fuel-coolant interactions.
APPROACH: Numerical methods are used to investigate phenomena important to accident progression. Experiments will be performed to evaluate methods of post accident heat removal and for understanding the nature of fuel-ccolant interactions.
RESULTS: Modeling of fuel elements in transients including fission gas behavior, analysis of fuel channel plugging, analysis of debris bed dryout, model of fuel-coolant interactions and thermodynamic data for advanced fuels.
PROJECT MILESTONES: Topical reports will be issued as work is completed.

CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Selected problems in the release and transport of aerosols in an LMFBR core disruptive accident are being investigated as part of NRC's Aerosol Release and Transport (ART) program. One objective is to coordinate with and assist the model development and experimental program underway in the ART program at ORNL.

APPROACH: Classical analytical methods are being applied in the following areas of study of interest to the ART program: (1) Transport of core materials from the core location to the sodium pool above the fission gas plenum. (2) The generation of small (submicron) size fuel particles from homogeneous nucleation, with particular emphasis on results from the ORNL fuel vaporization tests. (3) Generation of particles from mechanical fragmentation of liquids. (4) Particle interactions at liquid sodium surfaces, with the objective of examining phenomena which might provide effective removal mechanisms for aerosols from a two-phase bubble in the sodium pool. (5) Nonequilibrium evaporation and condensation during uranium oxide fuel expansion.
RESULTS: In fiscal year 1976, a final report for the study of nonequilibrium evaporation and condensation during uranium oxide fuel expansion is expected. Detailed definitions and initial analysis of problem areas (1) and (2) above will be made.
PROJECT MILESTONES: (1) Report on effects of transport phenomena on HCDA Bubble dynamics, 8-77. (2) Report on fuel particle size analysis, 9-77.

TECHNOLOGY: NUCLEAR/Fission Converters (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The objective of the program is to provide an independent technical basis for assessment of HTGR safety. Within the scope of the program are the review of HTGR vendor research, computer codes, and experiments, as well as the independent development of computer codes and the performance of experiments. Coordination with all U.S. HTGR safety-related activities is required. The immediate focus of the program is on HTGR designs in the licensing process, but the scope of safety research will include advanced designs and applicable Gas-Cooled Fast Reactor technology.
APPROACH: The LASL program is subdivided into six tasks: (1) Fission Product Release and Transport, (2) Primary Coolant Impurities, (3) Structural Evaluation, (4) Safety Instrumentation and Control Systems, (5) Accident Delineation, and (6) Phenomena Modeling and Systems Analysis. The emphasis in the program is placed on analysis and study of problems arising from abnormal or accident conditions.
RESULTS: Analytical models are being developed to be used for calculating the causes of, the progression of, and the consequences of HTGR accidents. The completed models will be distributed as packaged computer codes. Experimental measurements are being made to establish an independent data base to be used with the analytical models being developed.
PROJECT MILESTONES: Initial versions of computer codes developed for fission product transport (LARC and SUVIUS), coolant impurities (CIMPRE), chemical equilibrium (QUIL) and systems modeling (CHAP) will be published in FY-1976 and FY-1977. Experiments relating to fission product transport and seismic modeling will be well underway in FY-1977. FY 78: (1) Publish Fort St. Vrain version of CHAP, (2) Complete transient fuel failure experiments.

PROJECT DESCRIPTION: The objective of this project is to provide plans, analyses, and recommendations for fast breeder reactor safety experiments, experiment facilities, and experiment diagnostic instrumentation.
APPROACH: The approach proceeds from (1) a review of safety information needs, to (2) definition of experiment requirements, and then to (3) setting of facility requirements. Facility concepts are analyzed to determine capabilities and desired experiments are analyzed to refine experiment and facility requirements. Diagnostic instrumentation systems are experimentally evaluated to determine capabilities.
RESULTS: Specific plans and recommendations for experiment programs, facility types and designs and instrumentation systems are provided.
PROJECT MILESTONES: (1) June 30, 1975 provide preliminary experiment and facility requirements. (2) September 30, 1977 complete analyses of experiment nonprototypicalities. Provide experiment requirements. (3) September 30, 1979 provide conceptual facility designs and experiment vehicle designs.

CHARACTER OF STUDY: RESEARCH/General (70%);ANALYTICAL (30%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The objective of the project is to perform the necessary experiments and develop an analytical numerical model of fuel and cladding melting, motion, and disposition in a Gas Cooled Fast Reactor (GCFR) fuel assembly following a loss of flow (LOF) situation. The numerical code may be used as a part of a safety analysis program.
APPROACH: Experimental models using Pb/Sn alloys to simulate stainless cladding and shaped electrical heating elements are used to gain insight into the mechanisms of cladding melting, motion and disposition in fuel channels. Analytical models are developed for fuel and cladding actions in LOF situations and numerical codes are prepared as modules for safety analysis programs.
RESULTS: Computer code modules of fuel and cladding motion and disposition for GCFR-LOF safety analysis.
PROJECT MILESTONES: (1) Model for cladding disposition 12/76. (2) Model for fuel motion and disposition 9/77. (3) Model for cladding, melting and motion 12/77.

77 FUNDING: Nuclear Regulatory Commission FY77:$348,000
TECHNOLOGY: NUCLEAR/Fission Breeders (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: This program involves investigation of thermohydraulic phenomena of importance in fuel relocation and heat removal following a hypothetical disruptive accident in liquid metal fast breeder reactors (LMFBR). The models describing such phenomena, as applied to LMFBR safety assessment are to be verified. Initially the program will concentrate on (1) heat transfer and fluid mechanics characteristic of heat generating pools and (2) dynamics of molten material streaming/freezing in cold channels, and (3) the dispersion characterization of boiling pools with internal heat generation.
APPROACH: Perform relevant laboratory experiments with non-reactor materials and develop appropriate phenomenological models.
RESULTS: Experiments will be performed to measure local heat transfer from a heat-generating boiling pool to test plates in vertical, inclined and lenticular geometries. A calculational model will be developed to allow prediction of the local heat transfer from a pool to the surrounding walls. A series of experiments on fluid freezing/streaming will be performed. Experiments on the dispersion characteristics of boiling pools with internal heat generation will be started. Appropriate analytical models will be develcped.
PROJECT MILESTONES: (1) Complete experiments on boiling pool heat transfer to vertical and inclined walls, 12-77. (2) Complete experiments and models for single-phase fuel streaming, 4-77.

77 FUNDING: Nuclear Regulatory Commission FY77:$564,000
TECHNOLOGY: NUCLEAR/General (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: This project is a program for the development of an experimental study for large-scale sodium interactions with reactor materials in support of the NRC confirmatory research program for the LMFBR. The sodium/concrete interaction task has four objectives: (a) Quantitative measurement of the quantity and composition of the evolved gases. (b) Quantitative measurement of the penetration rate of the sodium reaction zone into the concrete, including estimates of thermal cracking and exfoliation. (c) Identification of the influence of specific engineering features such as the presence of cracks and steel reinforcement on the sodium penetration rate. (d) Development or confirmation of an analytic model of the process for use in licensing verification. The sodium/liner interaction task will be an experimental and analytic program to explore the consequences of hot sodium spills or sprays on steel liners over concrete substructures. Both hot and cold liner designs will be studied in the situation where a flaw is present to allow direct sodium/concrete interaction.
APPROACH: The general approach is to develop an experimental facility which has sufficient flexibility to perform both current and future tests. The concept is to develop a reaction chamber approximately 8 feet by 8 feet by 7 feet high to contain the sodium reactor products, which will be located at a remote testing site. Utilizing this facility, large scale sodium interaction tests will be conducted with substantial instrumentation employed to produce the desired data.
RESULTS: The results will have immediate applicability to LMFBR licensing. The longer term program will provide the technical base for evaluating and interpreting other experimental work, for providing the required support for licensing future LMFBRs and for laying the basis for regulatory guides.
PROJECT MILESTONES: (1) October 1, 1976 Sodium/concrete test chamber fabricated. (2) December 31, 1976 Concrete cured, sodium/liner test chamber fabricated, and sodium/concrete interactions initiated. (3) February 15, 1977 Liner test specimens fabricated. (4) March 15, 1977 Sodium/liner interactions initiated. (5) November 1, 1977 Investigation of additional liner concepts initiated. (6) December 15, 1977 Report on analysis and implication of FY 77 program prepared. (7) March 1, 1978 Tests on other concrete types initiated.

RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: This project is a broad program of fast reactor safety research with emphasis on experimental studies and the development of phenomenological models for use in the safety assessment of fast reactors.
APPROACH: The following tasks are included in this program: (1) prompt burst energetic experiments will be performed on single-pin geometries, (2) in-pile post-accident heat removal debris bed experiments have been undertaken to characterize the thermal behavior of internal heated debris beds to determine their melt-through potential in order to provide information needed for analysis of post-accident containment, (3) fuel motion diagnostic scoping studies for fast reactor safety test situations will be performed with various techniques, (4) planning for in-pile experiments on post-accident heat removal from molten fuel pools will be conducted, (5) equation-of-state high temperature vapor data for fresh and irradiated oxide fuels and advanced fuels and advanced fuels will be obtained, and (6) transition phase studies will be performed.
RESULTS: This program will provide understanding of accident phenomenology for use in the safety assessment and licensing of liquid metal fast breeder reactors.
PROJECT MILESTONES: (1) Complete initial series of single-pin fresh-oxide-fuel prompt-burst energetics test in ACPR, 10/77. (2) Complete initial series of debris-bed dry-out experiments in ACPR, 10/77. (3) Perform initial small-scale molten-fuel pool experiments in ACPR, 9/77. (4) Complete dynamic measurements of UO/sub 2/ vapor pressure, 9/77. (5) Prepare 37-pin in-core fuel-motion diagnostics experiment, 12/77.

TITLE: HTGR Safety Analysis and Research
PROJECT NUMBER: B0122
PRINCIPAL INVESTIGATOR: Ball, S.J.
ADDRESS: Building 9201-3, mail Stop 7, P.O. Box Y, Oak Ridge, TN 37830
AFFILIATION: Oak Ridge National Lab., Tenn. (USA)
MONITORING AGENCY: Nuclear Regulatory Commission, Washington, D.C. (USA)
DIVISION: Office of Nuclear Regulatory Research, U.S. Nuclear Regulatory Commission
MONITOR: Schamberger, Robert D.
TELEPHONE: P427-4323
TYPE OF FUNDING: Interagency agreement-U.S. NRC
77 FUNDING: Nuclear Regulatory Commission FY77:$230,000
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Identify, acquire, develop, and implement analytical methods for study of system and component response characteristics and perform certain tests on the Fort St. Vrain reactor to verify the adequacy of methods and data used in analyses. Develop information concerning behavior of HTGR systems under accident conditions, with particular reference to transient response characteristics of the system as a whole and of critical safety-related components. Provide a firm basis for verification of analyses contained in safety analysis reports and for improving definition of design safety margins and overall risks. Perform safety-related research in areas as indicated by the results from studies.
APPROACH: Computational methods will be obtained from the General Atomic Company, vendor for the HTGR; these methods will be evaluated by executing parametric studies for input variables and comparing the results with those from self-generated computations. Primary system component models developed in this study will be used to develop a system dynamics code. The overall system code will be used to predict and correlate data obtained from the Fort St. Vrain operation.
RESULTS: This task will produce an evaluation of analytical models of components of the type found in the primary system of HTGRs. A primary system dynamics computer program will be produced that is specifically applicable to the Fort St. Vrain reactor design. An evaluation will be made of the computational methods used by the vendor, General Atomic Company, to design and evaluate the performance of large HTGR plants.
PROJECT MILESTONES: (1) System and Safety Analysis Methods: (a) Adapt primary system code to the Fort St. Vrain reactor. (b) Plan and implement experimental verification tests. (c) Document evaluation of TAP and RECA codes of GAC. (2) Systems and Safety Analysis: (a) Complete initial LOFC and DBDA analyses. (b) Complete FSV system response predictions. (c) Complete initial analysis of reactivity accidents.

TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To provide data needed to confirm current NRC cable separation requirements (RG 1.75) and to determine ways to decrease the vulnerability of a water reactor plant to fire, to determine ways for better control of fires and to determine ways to mitigate the effects of fires on plant safety systems.
APPROACH: (1) Cable fire separation tests will be conducted on currently utilized cable types. (2) Tests of cable in conduit and with fire barrier will be conducted. (3) Tests will be conducted to evaluate the effectiveness of fire retardent coatings. (4) Aged cable and coating materials will be tested. (5) Fire extinguishing agents and detection systems will be evaluated.
RESULTS: Test procedures will be developed and test equipment will be evaluated.
PROJECT MILESTONES: FY 76: (1) Identify program elements. (2) Preliminary information on adequacy of RG 1.75 (Physical Separation Criteria). FY 77: (1) Final results on adequacy of RG 1.75 (Physical Separation Criteria). (2) Computation of list of combustable products in nuclear power plants. (3) Define tests for aged cable and coating materials. (4) Preliminary data on the effectiveness of cable coating materials.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The research objective is to develop an advanced computer code for the prediction of accident-induced thermohydraulic transients in light water reactors with: (1) Implementation of one-dimensional drift flux model to describe nonhomogeneous nonequilibrium flow in reactor components. (2) Component modeling to accommodate processes characteristic of individual components. (3) Automatic computation of steady-state and initial conditions. (4) Prediction of transient one-dimensional neutron kinetics. (5) Freedom to select spatial detail of computation through discrete, as well as lumped-parameter descriptions, wherever possible. (6) Self-sufficient program sets for constitutive descriptions. (7) Modular code structure. (8) Model two and three dimensional mist flow effects on heat transfer during reflood. (9) Provide consulting services.
APPROACH: Build up the code through the development and verification of component modules.
RESULTS: Task 1: (1) Preliminary system code assembly completed. (2) Preliminary comparison with data from integral system experiments. Task 2: (1) Measurement capabilities with Laser-Doppler anemometer have been established. (2) Analytical model for solid particles suspensions in gas are being verified.
PROJECT MILESTONES: (1) Complete PWR Code Assembly (THOR-1) 12/31/77. (2) Complete BWR Code Assembly (THOR-1) 4/30/78. Final code verification (THOR-2) 9/30/78.

PROJECT DESCRIPTION: To develop a computer code capable of analyzing transient two-phase flow and heat transfer within the reactor vessel (PWR and BWR). The particular objective during 1977/78 is to apply the code to the analysis of PWR upper heat injection (UHI), which is an alternate ECC system. Of interest is the multi-dimensional, time-dependent flow pattern and heat transfer in the upper head, upper plenum, and in the core, during the blowdown and the reflood phases of LOCA.
APPROACH: Perform water and air single phase flow blockage tests and develop computer model of thermal hydraulic performance of nuclear fuel rod bundles.
RESULTS: Analysis. (1) 1-D and 2-D Reflood Computations will be demonstrated. (2) The applicability of the Drift Flux Model for PWR downcomer analysis will be evaluated. Experiments. Water and air single phase flow blockage experimental data will be reported.
PROJECT MILESTONES: (1) Synthesis of fuel rod quench test transfer model compatible with COBRA-IV numerical hydrodynamic techniques (top and bottom quench). (2) Simulation of decoupled hydraulic phenomena in UHI guide tubes and support columns. (3) Simulation of upper headmixing pertinent for UHI analysis. (4) Preliminary simulations of PWR vessel blowdown and lower plenum refill including upper head draining. (5) Extend UHI simulation in 4 above to include reflood.

PROJECT DESCRIPTION: This task covers development of a multidimensional transient compressible flow program based on the LASL KACHINA code, which provides a general short-term code for independent evaluation of water reactor containment systems. Work is planned to simplify and extend the program to also provide long-term containment analysis capabilities.
APPROACH: Modify existing KACHINA code to evaluate reactor containment systems.
RESULTS: (1) Perform analytical model review of KACHINA to provide comprehensive understanding of program capabilities with report on limitation and capabilities. Provide technical representative to the Marviken

containment program. (2) INEL plans to develop BEACON, based on numeric and hydrodynamic capabilities of KACHINA developed by LASL, to include: mixed dimensional cell geometry, modified equation of state for air and water system, addition of fluid obstacles, modification of boundary conditions, addition of source cells, essentially single component and single phase flow, initiate interphase mass transfer model develcpment, and general code improvements.
PROJECT MILESTONES: (1) Continue adaptation of KACHINA to containment modeling 7/1/76. (2) Provide support for Marviken test program FY 1977.

PROJECT DESCRIPTION: CATEGORY I: The basic purpose of this activity is the improvement and addition of new analytical models to the RELAP code. This includes modifying advanced model concepts and developing programming techniques so that new models can be introduced into the RELAP code structure, improving existing RELAP models, maintaining an operational code, and maintaining RELAP configuration control. CATEGORY II: The objective of this task is to select, from the NRC analysis development results, improved analytical models for the LOCA hydrodynamic processes and to establish, in conjunction with the RELAP Experimental Code Development effort, methods for incorporation of these models into RELAP. The improvements sought under this effort are for the purpose of establishing more accurate best-estimate models for the physical processes which occur during a LOCA and to improve the evaluation model codes.
APPROACH: Using existing experimental data, develop improved computer models of the hypothetical LOCA.
RESULTS: CATEGORY I: (1) RELAP4/MOD006, an improvement of MOD5 blowdown and an extensionn of MOD5 into PWR reflood, was developed and released internally. (2) An experimental version of RELAP4/MOD007, an extension to BWR reflood, was written. (3) RELAP4 configuration control was maintained and service provided to all code users. This includes change control and documentation of all changes. CATEGORY II: The two principal tasks conducted included 1-D hydrodynamic model development and coding (RELAP 5) and 3-D component code development. The first of these tasks includes: drift flux model development, flow regimes map improvement, and initiation of RELAP modularization. The second task includes development of a user convenient SCORE/EVET code and documentation, incorporation of a set of heat transfer, friction factor, and cther correlations in SCORE/EVET, completion of PWR reflood and blowdown problems using SCORE/EVET, and release of SCORE/EVET to the Argonne Code Center.
PROJECT MILESTONES: (1) Release of MOD 6 for NRC use, Version 1 on 12/31/76 and Version 2 on 5/31/77. (2) Release of SCORE/EVET to Argonne Code Center on 4/14/77.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGCRY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To identify and characterize the physical conditions which must be met in order for a steam explosion to occur when molten LWR core materials cotact water. The information will be used to estimate the probability of occurrence of steam explosions under a variety of hypothetical LWR accident situations. An objective is to set realistic limits on the magnitudes and time characteristics of pressure pulses, (1) which are needed to trigger explosive interactions, and (2) which result from explosive interactions.
APPROACH: Expose small masses of molten material to external pressure pulses while submerged under water. An experimental apparatus will be designed and constructed in which small masses (25g) of molten materials experiencing film boiling will be subjected to transient external pressure pulses while submerged under water. The following parameters will be investigated: temperature of hot and cold liquids, composition of hot molten phases (steel and UO/sub 2/-Zr-steel mixtures), total external pressure, and magnitude and duratiCn of transient pressure pulse.
RESULTS: Data on measured temperature, composition-pressure of liquid systems leading to a characterization of conditions, which must be met in order for a steam explosion to occur, have been generated. The ability to artificially trigger an energetic interaction between molten core materials and water has been demonstrated.
PROJECT MILESTONES: (1) Complete laboratory scale testing 12/31/77. (2) Complete larger scale scoping tests 6/30/78. (3) Complete analysis of containment failure via vapor explosion 9/30/78.

PROJECT DESCRIPTION: To characterize the chemical and physical interactions between prototypical materials likely to be encountered during hypothetical core melt accidents in LWRs. This program will concentrate on identifying and understanding the response of concrete to molten LWR core materials in order to evaluate: (1) the generation rate of water vapor and non-condensable gases; (2) the effects of gas generation on fission product release; and (3) the chemical reactions occurring in the complex system.
APPROACH: The principal safety-related and scale-dependent phenomena will be identified through experiment and modeled.
RESULTS: Experiments will be planned and conducted in the following areas: (1) response of concrete to high heat fluxes; (2) phenomenological studies of interfacial phenomena with simulant materials; (3) thermal decomposition of concrete by DTA, TGA, and other laboratory thermal decomposition techniques; and (4) phenomenological experiments on small-scale (approx. equal to 10 kg melt) and large-scale (approx. equal to 100 kg melt) examining the response of concretes made with limestone and basaltic aggregates. Large- and small-scale experiments will be related through scaling analyses. Concrete penetration has been shown to be dominated by thermal effects. Aggregate composition has secondary effects on physical phenomena but possibly primary effects on chemical phenomena.
PROJECT MILESTONES: (1) Develop improved model of core-concrete interaction, 10/30/77. (2) Perform small-scale experiments with capability to sustain melt, 12/30/77.

77 FUNDING: Nuclear Regulatory Commission FY77:$12,900,000
TECHNOLOGY: NUCLEAR/Fission Breeders (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The Power Burst Facility (PBF) is a testing tool to obtain data on the performance of fuel rod clusters under abnormal power, flow and energy density conditions. The data obtained will be used to develop or confirm analytical capability which can be used to predict fuel response in power reactors during off-normal operating conditions.
APPROACH: Perform nuclear irradiation tests on single fuel rods or clusters of fuel rods under abnormal conditions.
RESULTS: A. The following tests are scheduled for FY 1977: (1) PCM (Power-Cooling Mismatch) 1 test; (2) IE (Irradiation Effects) 3 tests; (3) Gap Con (Gap Conductance) 3 tests; (4) Gap Conductance (Piggyback) 3 tests; and (5) LOCA 1 test. B. PCM tests will be performed to characterize the behavior of single unirradiated PWR fuel rods at power densities from the normal operating range through the range where critical heat flux (CHF) is exceeded. Other tests determine the modes, mechanisms and consequences of fuel cladding failure under various overpower or undercooling conditions. The tests to be performed are: (1) PCM 4 (Completed). C. IE Tests will be performed with fuel rods and components obtained from the Saxton Experiment Reactor Program: (1) IE Test No. 2 (Completed); (2) IE Test No. 3 (Completed); (3) IE Test No. 5 (Completed). D. Gap Con Tests will be performed with a 4-rod array, to measure fuel pellet centerline, fuel pellet surface, and fuel cladding surface temperatures pending development of adequate surface temperature measuring capability. In addition, 3 piggyback tests are planned. (1) Gap Con 2-1 (Completed); Gap Con 2-2 (Completed); Gap Con 2-3 (Completed). E. LOCA (Loss of Cooling) test No. 11. F. Instrumentation Development and ID Services; Instrumentation Development will be supported as necessary. Tests to be initiated after FY 1976: (1) LOCA Tests; (2) PCM Small Cluster Tests; (3) Inlet Flow Blockage Tests; (4) RIA Tests; (5) Lead Rod Transient Test.
PROJECT MILESTONES: Conduct LOCA Test No. 11 10/1/77.

TECHNOLOGY: NUCLEAR/Fissicn Converters (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The purpose of this project is to study fission product decay heating rates, with emphasis on short decay times. Isothermal calorimetry will be used to perform benchmark experiments for decay times between 20 seconds and 2000 seconds with an absolute accuracy of better than 5 percent. Experiments will be done with U-235 (TASK 1) and eventually Pu-239 (TASK 2). Thermal neutron spectra will be used for the irradiations. It is expected that this program will be of immediate use in nuclear safety evaluations for reducing the uncertainty in fission product decay heating at short cooling times, and that the experimental data will be a suitable benchmark for summation calculations and reduce undertainties of the error band associated with comparisons to summation calculations.
APPROACH: Use isothermal calorimetry to measure decay heat of U-235 and Pu-239.
RESULTS: Final results have been obtained on integral decay heat from thermal fission of U-235 and have been incorporated intc a revised ANS standard.
PROJECT MILESTONES: (1) Prepare U-235 thermal fission decay heat report 9/30/76. (2) Prepare Pu-239 thermal fission decay heat report 3/31/76.

TECHNOLOGY: NUCLEAR/Fissicn Converters (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Develop a comprehensive fission product release model based on mechanistic understanding of fuel behavior in LWR fuel elements undergoing a wide range of accidental overheating conditions. The need for a physically realistic description of fission product release and fuel swelling has been indicated for certain hypothetical LWR accidents. Complementary information on fission product release during steady-state and load-following operation may also be obtained.
APPROACH: Use a direct electrical heating apparatus to cause fission products to leave irradiated fuel pellets and then characterize these fission products. Develop a computer model for fission product release. The direct electrical heating apparatus (DEH) which has been designed and constructed for this program will be used to subject fuel pellets irradiated in the H. B. Robinson-2 power reactor to a series of programmed thermal transients. Auxiliary activities include: (1) Optimization of the technique for removing fuel pellets from the clad. (2) Pre- and post-test examination of the fuel. (3) Optimization of the techniques for measuring temperature and calculating thermal profiles. (4) Collection and characterization of the fission products released during the test. The thermal conditions examined during FY 76 are expected to encompass those anticipated in hypothetical power-cooling mismatch (PCM) accidents. Empirical correlations may be derived from the data. The modifications to the apparatus needed to generate thermal ccnditions typical of other types of accidents (LOCA, ATWS, RIA, BWR flow blockage) will be identified. A concurrent analytical effort will develop the mechanistic models of fission product release. The SST (Steady-State and Transient) subcode has been developed based on a similar LMFBR model and calibrated against in-pile fuel rod data. During FY 76 the GRASS (Gas Release
RESULTS: A comprehensive fission product release model has been developed, based on both analytical and experimental investigations of LWR fuel. Rates and total amounts of fission gas released during PCM thermal transients have been correlated to the total surface area of the fuel created by interconnected porosity. Similar behavior has been observed between DEH-tested fuel and fuel subjected to similar thermal transients in the Power Burst facility test reactor.
PROJECT MILESTONES: (1) Provide final models of gas release and fuel swelling 9/30/77. (2) Prepare and submit draft report 12/31/77.

RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To provide methodology for analyzing fission product transport and deposition for light water reactor primary systems and spent fuel shipping casks during hypothetical LOCA conditions. The results of the analyses can be used to: (1) help evaluate the degree of conservatism in current accident analysis assumptions; e.g., estimate the reduction in the radiological source term by deposition on the walls of the primary system; (2) assist in the design of verification experiments; and (3) form the basis for more detailed model development if the need arises.
APPROACH: The technical approach to be followed superimposes analytical models of the transport properties of the various chemical and physical forms of fission products in a steam environment on state-of-the-art

calculations of thermal hydraulic conditions during design basis LOCA (e.g., RELAP-4 FLOOD). The collection of available data on chemical and physical interactions of fission products is an auxiliary activity to model development. The analytical unit which is assembled will be modular, and provisions for parametric variation will be made where insufficient data exist.
RESULTS: Results to date include: (1) available data compiled on chemical interactions, fission product deposition, reactor and cask geometries, and thermal hydraulic conditions; (2) PWR model designed and assembled; (3) BWR model designed and assembled; and (4) fuel cask model designed and assembled.
PROJECT MILESTONES: (1) Complete sensitivity analysis of pressurized water reactor during controlled LOCA 7/31/77. (2) Modify model for meltdown accidents 7/30/78.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To develop correlations for determining heat transfer rates by natural convection from enclosed fluid volumes having internal heat generation. This is an important safety consideration in the evaluation of the postaccident heat removal capabilities for both thermal and fast reactors under postulated core melt conditions.
APPROACH: Perform heat transfer experiments examining effects of geometry and multiple layers and derive analytical representations of the results.
RESULTS: (1) Correlations of the form NU - cRa/sup m/ have been reported for horizontal layers with an upper isothermal and a lower insulated boundary having Ra approximately equal to 10/sup 13/ and steady-state internal heat generation. (2) Horizontal layers with transient internal heat generation have been used to observe phenomenological heat transfer behavior and times to onset of steady-state conditions. (3) A hemispherical dish model has been constructed and used to determine heat transfer rates by natural convection under steady-state conditions.
PROJECT MILESTONES: (1) Complete transient tests and report initial results for hemispherical geometry 8/31/77. (2) Complete horizontal layer and hemispherical dish tests with multifluids 8/31/77.

77 FUNDING: Nuclear Regulatory Commission FY77:$125,000
TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To identify and understand the physical conditions which must be met in order to trigger explosive interactions between two liquid phases. This information will be used to estimate the probability of occurrence of a steam explosion during hypothetical LWR accidents in which contact between molten LWR core materials and water is postulated. Information generated by related work in foreign countries will also be assimilated into the state-of-the-art.
APPROACH: Establish criteria for the occurrence of vapor explosions based on experiments in which pairs of liquids are brought into contact and provide a mechanistic interpretation of these criteria.
RESULTS: Subtask A: The applicability of the ANL interfacial temperature criterion to pairs of fluids having instantaneous interfacial contact temperature far above the critical temperature of the cold liquid has been demonstrated. Low and high temperature cutoffs for the occurrence of explosive interaction has been demonstrated. A high-pressure cutoff has also been demonstrated. Subtask B: The effects of localized chemical reaction on the explosive potential of the fluid system is being tested. Subtask C: Interfaces for exchange of research results with foreign laboratories have been established. Cooperative tests using several kg of molten NaCl and water at Ispra are being planned.
PROJECT MILESTONES: (1) Issue summary report on small-scale tests 9/15/77. (2) Complete experiments with simulant fluids to measure effects of mass on energy conversion efficiency 6/30/78. (3) Complete NaCl--H/sub 2/O experiments 10/30/78.

AFFILIATION: Oak Ridge National Lab., Tenn. (USA)
MONITORING AGENCY: Nuclear Regulatory Commission, Washington, D.C. (USA)
DIVISION: Division of Reactor Safety Research
MONITOR: DiSalvo, Raymond

TELEPHONE: C(301)427-4266
TYPE OF FUNDING: Interagency agreement-U.S. Nuclear Regulatory Comm. (NRC)
77 FUNDING: Nuclear Regulatory Commission FY77:$322,000
TECHNOLOGY: NUCLEAR/Fission Converters (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Characterize the radionuclide release from LWR fuels under a range of conditions applicable to spent fuel transportation accidents and successfully terminated in-reactor LOCA in order to provide source term data for use in accident analysis. Particular attention will be given to determining chemical and physical states for incorporating into fission product transport models. Analytical techniques to characterize the fission products will be developed.
APPROACH: The principle experiments examine the nature of the fission product source term (particularly I and Cs) released from simulated and irradiated LWR fuel segments as functions of temperature and environmental conditions. Knudsen cell mass spectrometric tests examine the potential for formation of compounds between fuel and fission products before they are released from the rod. Control tests are used to check out the experimental apparatus and to develop characterization techniques by injecting a known fission product source into the test train environment. The test train consists of an injection interaction zone in which specimens are heated in flowing gas, a thermal gradient tube, and a series of filters and gas traps. Implant tests combine the previously-mentioned test aspects and provide preliminary information of an integral rod nature and can be used to examine specific phenomena identified in tests with irradiated fuel. Tests with low and high burnup irradiated fuel provide prototypicality to the experimental program so that the results may be applied with some confidence to real reactor and spent fuel cask conditions.
RESULTS: Correlations of fission product release from LWR fuel as functions of time, temperature, and environmental conditions have been generated for commercial LWR fuel in steam at 500 to 1100 C.
PROJECT MILESTONES: (1) Submit draft report on implant tests 8/15/77. (2) Submit draft report on high burnup fuel tests 1/1/78.

TECHNOLOGY: NUCLEAR/Fission Converters (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To develop a scientifically defensible method of predicting decay heat and its standard deviation for thermal converter reactors by using available experimental data and established physical laws.
APPROACH: Calculation from listed ENDF/B-IV data is the standard method, to be analyzed according to the uncertainties of the data and validated by comparison with integral experiments at LASL and HNL (ORNL).
RESULTS: Computation of the error caused by yield uncertainties has produced a working standard shutdown power algorithm complete with defensible standard deviation. This has been confirmed by review of errors caused by other uncertainties, currently believed to be either small or well-defined. Since yield errors are not part of ENDF/B-IV, their documentation will be systematized. Constraints such as mass, neutron emission and charge balance in fission, have been used to keep the errors consonant with physical laws. A power reactor operating history is only simulated approximately by a constant U-235 fission rate, constant flux history. An appreciable fraction of the power comes from fast fission of U-238, and at the end of life a major fraction comes from thermal fission of Pu-239. This latter is also of importance for mixed oxide fuel. The properties of shutdown heating following Pu-239 and U-238 fission have been investigated analytically by the methods already developed for U-235, and shutdown heating from realistic reactor histories incorporating these fissions has been modeled. Pre- and post-operational analysis of the LASL and HNL shutdown heating experiments will be performed and pre-operational analysis will be completed and reported. Emphasis will be on predicting the gamma-ray spectra from fission-product decay as escape of gamma-rays from the experiments (a spectrum-dependent escape) is a major source of experimental uncertainty. Liaison will be maintained with EPRI programs on gamma transport, which are related to this phenomenon.
PROJECT MILESTONES: Complete final verified correlation for UO/sub 2/ 12/31/77.

77 FUNDING: Nuclear Regulatory Commission FY77:$250,000
TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The purpose of this experiment is to measure total beta and gamma energy release rate

from fission product decay following thermal neutron fission of fuel materials U-235 and Pu-239. The accuracy goal is 3% to 5% of the overall energy release rate; interim reports of moderate precision data (7% to 10%) will be provided for U-235. Energy release rates will be determined for approx. 2 to 2000 (or longer) seconds after fission by thermal neutrons separately for beta and gamma rays using spectrometers; as a side benefit, the corresponding spectra of beta and gamma rays will be available at modest resolution.
APPROACH: Perform in-pile irradiation experiments and measure the fission product decay energy.
RESULTS: Measurements of decay energy release from thermal neutron fission of U-235 have been completed. Final results have been released and reported and incorporated into a revised ANS standard for decay heat. Planning and initial work on the external beam normalization check will be completed and necessary system changes for Pu-239 studies will be determined.
PROJECT MILESTONES: (1) Prepare final U-235 article 8/30/77. (2) Prepare final Pu-239 article 12/30/77.

TITLE: Fuel Behavior Verification
PROJECT NUMBER: A6046
PRINCIPAL INVESTIGATOR: MacDonald, P.E.
ADDRESS: 550 Second Street, Idaho Falls, ID 83401
AFFILIATION: SEE CODE- 9502158 EG and G Idaho, Inc., Idaho Falls (USA). Idaho National Engineering Lab.
MONITORING AGENCY: Nuclear Regulatory Commission, Washington, D.C. (USA)
DIVISION: Division of Reactor Safety Research
MONITOR: Scott, Harold
TELEPHONE: F427-4284
TYPE OF FUNDING: Interagency agreement-US NRC
77 FUNDING: Nuclear Regulatory Commission FY77:$1,675,000
TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: This project encompasses: (1) assistance to the Division of Reactor Safety Research in the development and coordination of a comprehensive program for determining the behavior of reactor fuels under abnormal and accident conditions, (2) the development of detailed analytical and experimental project descriptions, (3) the evaluation of experimental data and the development and verification of LWR fuel and cladding material property correlations, including properties for plutonium recycle fuel, (4) the verification of analytical fuel behavior models by comparison of calculations with appropriate experimental data, (5) the fabrication and irradiation of certain instrumented test assemblies in the Halden Reactor, and (6) the development and execution of a program for postirradiation examination of typical power reactor fuel.
APPROACH: Obtain pertinent experimental data and check codes against these dates.
RESULTS: (1) The program description will be updated. Assist NRC-RES with Fuel Behavior Program coordination and provide short-term analytical and technical support. (2) Direct the acquisition of data from test assembly, IFA-429. Complete the design and fabrication of the second Halden test assembly IFA-430. Compile, reduce and present Halden data. Initiation of post irradiation examination of IFA-429 rods will be conducted if warranted. (3) Plutonium recycle properties, transient cladding, transient fuels and steady-state fuel and cladding models will be developed or improved. MATPRO correlation uncertainties will be determined. Gap conductance and transient gas pressure evaluation of PBF data will be conducted. (4) Design and conduct steady-state and transient gas flow tests at room temperature and 500 degrees F. Characterization of CP and L cladding by eddy current, dimensional and metallographic methods will begin. (5) FRAP-S3 and FRAP-T3 will be compared with appropriate experimental data, the models will be reviewed, checked and a verification report issued. Sensitivity studies will be conducted and reported.
PROJECT MILESTONES: (1) Issue four Experimental Needs Specifications 2/15/77. (2) Prepare MATPRO Documentation (TREE-NUREG-1005) 12/30/76. (3) Transmit FRAP-T3 Report to NRC 2/15/77.

77 FUNDING: Nuclear Regulatory Commission FY77:$500,000
TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: This task is scoped in terms of: development of models particular to the transient code FRAP-T, models particular to the steady-state code FRAP-S, models common to both codes, and activities directed toward the actual generation of the computer codes.
APPROACH: Review literature and develop computer models of fuel rod behavior under steady state and transient conditions.
RESULTS: (1) Development of models in modular form to describe the deformation of cladding during thermal cycling and irradiation. (2) The updating and incorporation into FRAP of gas release and gas conditions as subcodes to couple to the thermal and/or mechanical subcodes. (3) Extend the present one-dimensional conduction analysis into a two-dimensional radial and azimuthal analysis. (4) Develop analytical procedures to show failure criteria for clad failure and the effect of a statistical spread in MATPRO (material properties data). (5) FRAP is developed to calculate the response of a fuel rod during: transient accident conditions such as LOCA, PCM and RIA; steady-state operation for initial conditions. (6) Integrate material property subcodes in the FRAP computer code.

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Gap Conductance is a study of the heat transfer coefficient between the fuel and the cladding. The purpose of this experimental project is to determine the proper fuel temperature under conditions prior to and during LOCA. It is expected that existing models will be verified and improved for SS fuel computer codes.
APPROACH: Perform both in-reactor and ex-reactor experiments to measure the thermal conductance of the gap between the urania fuel and Zircaloy cladding.
RESULTS: The primary objective of the proposed work is to obtain well characterized experimental data that will be used in the verification of the best estimate version GAPCON-THERMAL and FRAP-S computer codes. This data will also provide a series of benchmarks for indexing other thermal performance codes used for reactor safety analyses. These objectives will be attained by conducting a series of in-reactor and ex-reactor tests. The ex-reactor tests will be conducted to extend the contact conductance work of Ross and Stcute to more relevant gas pressure, temperatures, and gas compositions. The in-reactor tests will be conducted in the Halden Reactor. The initial irradiation experiments will be directed towards obtaining data cn fuel relocatien mechanism and kinetics. Fission gas release kinetics and the effects of various gas compositions will also be investigated to obtain sufficient data for code verification. (A-1) Pretest predictions for IFA-432, liaison with U.S. Halden representative, complete fuel pellet pre-characterization, issue topical report on fuel rod component characterization. (A-2) Receive raw data on magnetic tape and establish masterfile, perform error analysis, analyze dynamic temperature data from IFA 431 and 432, evaluate effects of pellet eccentricity, prepare topical report incorporating irradiation results from 431. (A-3) Select site to perform PIE, perform destructive and nondestructive exam to include profilometry, gamma scan, fission gas analysis, metallography and immersion density.
PROJECT MILESTONES: (1) Prepare first topical report on conductance models 8/30/77. (2) Prepare topical report cn post irradiation examination of assembly 431 6/30/78.

77 FUNDING: Nuclear Regulatory Commission FY77:$500,000
TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The purpose of this project is to obtain quantitative information on the effect of oxidation on the mechanical behavior of Zircaloy in order to evaluate the conservatism of the acceptance criteria for emergency core cooling systems in light-water reactors. This program will provide data on the strength and ductility of Zircaloy-2 and -4 as a function of temperature, oxygen concentration, microstructure, and strain rate by conducting uniaxial tensile, four-point bend, biaxial tube-burst, and impact on tests on the materials. While the range of test variables in this program encompasses the conditions of interest in postulated LOCA situations, the mechanical-property results will also provide a data-base for fuel-element modeling codes that are used to predict cladding deformation for other power-cooling mismatch (PCM) situations.
APPROACH: Perform tensile tests and burst tests on Zircaloy containing oxygen. Develop finite analysis code for determining the strength and ductility of Zircaloy fuel cladding containing oxygen gradients.
RESULTS: Subtasks (A) Development and Characterization of Test Specimens: The investigation of the effect of temperature and oxygen concentration on the kinetics of grain growth in Zircaloy has been completed and the results reported. Information on the Zircaloy-oxygen phase diagram has been reported. (B) Mechanical Properties of Zircaloy-Oxygen Fuel Cladding: Tests have been conducted to determine the strength and ductility of Zircaloy fuel cladding as a function of oxygen content, temperature and internal pressure. (C) Development of Failure Criterion for Oxygen-embrittled Zircaloy Fuel Cladding: An elastic-plastic, finite element analysis for the strength and ductility of Zircaloy will be developed for uniaxial and biaxial loading conditions. Results from subtasks (a) and (b) will be incorporated into the analysis, and the results reported. Test parameters from the ORNL multi-rod burst tests will be used in the analysis to complete the deformatien of Zircaloy cladding for comparison with the experimental results. A tentative embrittlement criterion will be developed.
PROJECT MILESTONES: (1) Determine the effect of temperature, oxygen concentration, microstructure and strain rate on the tensile properties of Zircaloy 6/30/77. (2) Develop finite analysis code 6/30/78. (3) Issue final reports 9/30/78.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Characterize deformation behavior of LWR fuel cladding under conditions predicted for LOCA, using single and multirod, internally pressurized electrically heated fuel pin simulators to determine the effects of rod interactions, blockage patterns, rupture temperature-pressure relationship and flow resistance coefficients.
APPROACH: Build and test bundles of zircaloy tubing to determine how tubing responds to pressure and temperature transients.
RESULTS: Task 1: Planning Analysis. Published report on Zircaloy tubing characteristics. Continue development of program plans and schedules for large bundles and analysis of single rod tests. Task 2: Experimental Facilities. Complete design of multirod test facility to permit testing of 4 x 4 arrays; prepared site, install services and utilities and construct DC power modifications. Task 3: Single Rod Tests. Fabricated and tested 15 fuel pin simulators without heated shroud. Initiate examinations of simulators and analysis of data. Task 4: 4 x 4 Bundle Tests. First 4 x 4 bundle constructed and installed for test. Take partial delivery of heaters for second and third bundles. Place order for internal thermocouples for 3rd bundle. Procure and perform in-house preparations (end seals) on exterior thermocouples for bundle to be used in temperature mapping experiment. Task 5: 8 x 8 Bundle Tests. Initiate development of test criteria and bundle configuration.
PROJECT MILESTONES: (1) Constructed multirod burst test facility 1/1/77. (2) Complete first group of 4 x 4 tests 1/1/78. (3) Analyze and report data on first group of 4 x 4 PWR bundles 10/1/78.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: This work will determine the factors that affect the collapse behavior of Zircaloy fuel cladding, including temperature, pressure differential across the cladding wall, and the stress state of the cladding. It is expected that this work will define the collapse and creep limits below which such deformation is not a significant factor.
APPROACH: Build facilities for creepdown, collapse and multi-axial yield tests perform experiments in these facilities and compare data with BUCKLE code predictions.
RESULTS: Out-of-reactor collapse and creepdown tests will be completed and results reported. Design of in-reactor tests has been completed. Characterization of cladding through dimensional measurements, metallography, and X-ray texture work will continue throughout the year.
PROJECT MILESTONES: (1) Perform and report interim results on creepdown tests 6/15/76. (2) Perform and report final results on creepdown tests 9/1/77. (3) Perform in-reactor creep tests FY 77-78.

TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To provide a mechanical property data base on irradiated cladding that can be used to predict the performance of Zircaloy cladding under various off-normal, transient, and reactor accident conditions. Data will be obtained for development of strain-to-failure correlations when burnup is high and failure is probable by mechanical interaction with fuel at relatively low temperatures. Correlations will be obtained also between pressure, heating rate and temperature of failure under transient heating conditions.
APPROACH: Perform tensile, bend, expanding mandrel and transient heating burst tests on irradiated cladding.
RESULTS: (1) Annealing of radiation damage in both isothermal and transient heating tests has been determined by hardness measurements on one lot of material in scoping tests. (2) The master lot of irradiated

cladding has been obtained and preliminary for defects, crud, ridging, gamma scanning, etc. has been completed on several rods. (3) Design and construction of equipment for bend, expanding mandrel, and transient burst tests will be completed, and the equipment has been installed in the hot-cells. (4) Tensile, bend, expanding mandrel, and transient heating burst tests have been conducted on the master lot of material at several temperatures and data reported.
PROJECT MILESTONES: (1) Complete tests on lot 1, 12/31/77. (2) Complete tests on lot 2, 4/30/78. (3) Complete all property tests and provide verified correlation, 9/30/79.

TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The purpose of this project is to provide highly reliable kinetic data pertaining to zircaloy metal water oxidation phenomena. This effort will provide additional information regarding cladding oxidation phenomena expected to occur in case of LOCA with resulting operation of ECCS. This research is primarily applicable to the LWR's that have zirconium alloys as cladding for nuclear fuel pins. The Zirconium-Water Oxidation Kinetics (ZMWOK) Program will supply information on reaction rates and diffusion required to predict the oxidation behavior of LWR fuel claddings during various temperature excursions postulated for LOCA's.
APPROACH: Perform experiments to determine transient oxidation and reaction rate behavior.
RESULTS: Measurements of oxygen diffusivity in beta Zircaloy between 900 and 1500 deg C have been completed using two different techniques. Thermometry Error Analysis, Modeling Analysis, and Diffusion of Oxygen in beta-Zircaloy Reports have been issued. Isothermal and transient temperature oxidation experiments are completed as are scoping experiments in the steam pressure effect study.
PROJECT MILESTONES: (1) Complete and issue final report on diffusion of oxygen in beta-Zircaloy 6/30/76. (2) Complete and issue final report on reaction rates and correlations 8/31/77.

TYPE OF FUNDING: Contract No.-AT(49-24)-0162
77 FUNDING: Nuclear Regulatory Commission FY77:$180,000
TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To conduct experimental studies that investigate the steam-water interactions including ECC penetration, hot wall delay, and lower plenum voiding in 1/15 and 2/15 scale models of typical PWR's. FY 77 plans call for (1) obtaining correlations of penetration and entrainment data in 1/15- and 2/15-scale models of PWR's for model development; (2) investigate the scaling of these small scale data; (3) investigate the applicability of steady-state penetration and entrainment data to transient (steam flow) conditions; (4) provide lead-in information for experiments planned in larger scale systems; (5) develop correlation based models of penetrative and entrainment behavior and incorporate into the RELAP code; and (6) provide technical assistance to RSR (as requested) and participate in review group activities.
APPROACH: Experimental studies of ECC penetration and lower plenum voiding under steady-state conditions in a 1/15-scale steel vessel; ECC penetration and lower plenum voiding in a 2/15-scale vessel under steady-state conditions and transient (steam flow) conditions with and without hot walls; flow visualization studies in a transparent 1/15-scale vessel.
RESULTS: (1) Complete the fabrication and construction of a 2/15-scale vessel and attendant facility. 92) Extend the 1/15-scale transparent vessel studies to provide flow visualization movies of the various regions in which steam-water interactions occur. (3) Carry out penetration and entrainment studies in the 2/15-scale model to determine effect of system size, transient (steam flow) effects an hot wall effects.
PROJECT MILESTONES: (1) Complete the design and construction of 2/15-scale facility 1/7/77. (2) Complete 1/15-scale testing 12/7/76. (3) Complete shakedown testing of 2/15-scale facility 2/25/77. 94) Report results of 1/15-scale testing 6/22/77. (5) First round of 2/15-scale data 8/18/77.

TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: DEVELOPMENT/Pilot plant (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: (1) Provide separate and integral effects experimental data for developing and/or verifying LOCA computational methods. (2) Provide data for (a) optimizing selection of LOFT test parameters, (b) assessing reliability of LOFT instrumentation, (c) evaluating LOFT test results and (d) addressing LOFT design compromises.
APPROACH: Perform the following series of loss of coolant accident experiments in a scaled non nuclear facility to generate system effects data for code verification. Group 1 Tests: To provide a data base for comparing isothermal blowdown performance of the Semiscale System and the LOFT system. Group 1 consisted of 6 tests. Group 2 Tests: To investigate the blowdown heat transfer characteristics of the Mod 1 core. Group 2 consisted of 9 tests. Group 3 Tests: To provide information on the reflood heat transfer characteristics of the Mod 1 system. Group 3 consisted of 12 tests. Group 4 Tests: To establish a data base for subsequent investigation of alternate ECC concepts. Group 4 consisted of 9 tests. Group 5 Tests: To establish the benefit of alternate ECCS injection locations. Group 5 consists of 9 tests. Group 6 Tests: To provide a data base for comparing integral test performance of the Semiscale Mod 1 system, with LOFT nuclear tests. Group 6 consists of 5 tests. Group 28 Tests: Special tests to investigate steam generator tube rupture and core power control. Group 28 consists of 4 tests.
RESULTS: (1) Group 4 Baseline ECC Test Series: (A) Complete Experimental Data Report (EDR) within 3 months after each test; and (B) Complete preparation of Test Results Report (TRR) within 6 months after completion of test group. (2) Group 5 Alternate ECC Test Series: (A) Complete Experimental Data Report (EDR) within 3 months after each test; and (B) Complete preparation of Test Results Report (TRR) within 6 months after completion of test group. (3) Group 6 LOFT Nuclear Supportive and Counterpart Tests: (A) Conduct 5 tests; and (B) Prepare: (a) Test predictions and quick look for each test, (b) Experimental Data Report (EDR) within 3 months after each test, and (c) Test Results Report (TRR) within 6 months after completion of test group of the LOFT supportive tests. (4) Group 28 Special Tests: (A) Conduct 9 tests; and (B) Prepare: (a) Test predictions and quick look report for each test, (b) Experimental Data Report within 3 months after each test, and (c) Test Results Report (TRR) within 6 months after completion of test group. (5) Complete Design, Fabrication and Assembly of: (A) Broken loop pump; and (B) Broken loop steam generator. (6) Initiate System Mods for 2-Loop Operation. (7) Initiate design procurement and fabrication of a 12' core with a typical PWR upper plenum to simulate and investigate the upper head injection concept of Westinghouse (Vessel and loop to be designated as MOD-3).
PROJECT MILESTONES: (1) Complete conversion to Mod 3 2/1/78. (2) Complete Baseline Test Series with Mod 3 8/1/78. (3) Complete UHI Test Series with Mod 3 2/1/79. (4) Complete Alternate EUS Test Series with Mod-2 (non UHI Upper Plenum) 4/8/80.

TITLE: Class I Equipment Qualification Test Study
PROJECT NUMBER: A1051
PRINCIPAL INVESTIGATOR: Bonzon, L.
ADDRESS: Sandia Laboratories, P.O. Box 5800, Albuquerque, NM 87115
AFFILIATION: Sandia Labs., Albuquerque, N.Mex. (USA)
MONITORING AGENCY: Nuclear Regulatory Commission, Washington, D.C. (USA)
DIVISION: Division of Reactor Safety Research
MONITOR: Feit, Ronald
TELEPHONE: F427-4272
TYPE OF FUNDING: Interagency agreement-U.S. Nuclear Regulatory Commission
77 FUNDING: Nuclear Regulatory Commission FY77:$853,000
TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (50%);DEVELOPMENT/Laboratory scale (50%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: (1) To develop a model that can be used to simulate the natural aging process by accelerated aging methods. (2) To determine the current qualification test environment based on RG 1.89. (3) To determine the sensitivity to changes in qualification test parameters including synergisms. (4) To determine adequate criteria to certify qualification tests.
APPROACH: (1) Based on recommendations made in a FY 76 state-of-the-art report, specific component aging models and test methods are being developed. (2) Currently utilized radiation source simulators are being evaluated as to their suitability to duplicate the required radiation source. Dose rate studies will be conducted and refinements made on source term calculations. (3) Qualification test facilities will be fabricated and validated and a determination made on the comparison of sequential and combined testing.
RESULTS: Mathematical models, test procedures, test equipment and test data.
PROJECT MILESTONES: (1) FY 76 Assessment of the state-of-the-art of aging models and identification of future research; completed definition of nuclear source term based on RG 1.89; preliminary test procedures and specimen test chamber for synergistic testing developed. (2) FY 77 Preliminary data to verify the adequacy of the aging models under development; nuclear source simulator evaluation completed and preliminary data on dose-rate and dose-depth studies; synergistic effects determined.

RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: (1) Construct equipment suitable for determining the true mechanism for flooding and for evaluating the wave structure and interfacial interactions during upflow. (2) Measure wave structure and pressure characteristics during the flooding process. Determine definitive criteria for the onset of flooding. Evolve information on the flooding mechanism. Model the flooding process and develop suitable correlations based on the observed physical mechanism. (3) Measure the wave structure, interfacial shear and wave form drag during upflow conditions. Model the interfacial interactions between gas and liquid based on the physical mechanisms revealed by the experiments.
APPROACH: Develop experimental facility and measure wave structure and interfacial interactions during flooding and upflow.
RESULTS: (1) Flooding measurements have been completed and two mechanisms of flooding have been determined. (2) Film flow measurements over the flooding range have been completed.
PROJECT MILESTONES: (1) Equipment: (A) Assemble and test laser system for measurements of lateral motion of large drops 6/15/77; and (B) Various methods for penetrating liquid film at will will be explored in order to prevent distortion of laser beam. (2) Film Flow and Flooding: (A) Complete film for measurements 4/1/77; (B) Develop model for momentum interaction at interface; (C) Develop model for flooding 9/1/77; and (D) Issue report 9/30/77. (3) Lateral Motion of Droplets: Obtain preliminary measurements on the lateral motion of large drops in concurrent and countercurrent flow 9/1/77.

RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To conduct experimental studies which investigate the steam-water interactions, including ECC penetration and sweepout, in 1/15 and 2/15-scale models of typical PWR's.
APPROACH: Experimental studies of penetration and entrainment will be carried out in the 2/15-scale model to provide data and information on the effect of system size on penetration to evaluate whether the parametric behavior observed in the 1/15-scale model carries over to the 2/15-scale model, to determine whether steady-state penetration and entrainment data can be used to predict the behavior under transient (ramped steam) conditions, and to evaluate the effects of hot walls in a larger size system.
RESULTS: The data and results of these studies will be used in the development of correlations for use in best estimate model development. FY-76T and -77 plans include the following: (1) obtain correlations of penetration and entrainment data for 1/15- and 2/15-scale models of four-loop PWR's for use in model development; (2) investigate the scale-up of these small-scale data; (3) investigate the applicability of steady-state penetration and entrainment data to transient (ramped steam flow) conditions; (4) provide lead-in information to experiments planned in larger size systems; and (5) develop correlation-based models of penetration and entrainment behavior, incorporate these and other similar existing models into the RELAP code, and test the ability of the models to predict the penetration and entrainment behavior in the existing 1/15- and 2/15-scale model systems.
PROJECT MILESTONES: (1) Report results of initial 60 psig tests 5/15/76. (2) Complete 1'' annulus tests 7/15/76. (3) Extend ECC-penetration test results 11/30/76.

RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To develop the best estimate code for PWR and BWR Containment Analysis.
APPROACH: Adapt existing computer codes to model the pool dynamics in the containment system of a boiling water reactor.
RESULTS: (1) To explore the applicability of existing computer programs to the problem of air/steam venting in BWR suppression pools. (2) To obtain a 2-dimensional numerical solution for the discharge of a single relief valve vent in a BWR suppression pool. (3) Extend the relief valve vent solution to account for flexible (finite modulus) pool walls.
PROJECT MILESTONES: (1) Adapt configuration and multiphase models to CHAMP-II 3/30/77. (2) Document CHAMP-II 9/30/77.

TECHNOLOGY: NUCLEAR/Fission Converters (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The primary role of Idaho Nuclear Engineering Lab. (INEL) as technical advisor to the NRC Industry Cooperative Programs is to ensure that the data from these programs are adequate for verification of analytical models for predicting reactor system response to a LOCA. In this role, INEL will provide support for the BWR-BDHT and reflood separate effects test programs. In addition, INEL will assist in defining experimental requirements for future test programs as they are conceived.
APPROACH: Independent analysis of information produced by industry under contract to NRC, including technical audits of plans, designs, data and reports.

RESULTS: (1) Will complete reviews of PWR-BDHT, FLECHT-SET, BWR-BD/ECC program documentation, models and test data. (2) Will begin analyses of BWR LOCA response and relate to performance of TLTA to assess typicality and scaling adequacy. (3) Will complete predictions of selected BWR-BD/ECC and PWR-BDHT experiments. (4) Will conduct comparisons of RELAP4 calculations with selected data from PWR-BDHT, BWR-BD/ECC, FLECHT-SET and other test programs. (5) Will perform various code application tasks as specified by NRC.
PROJECT MILESTONES: (1) Complete RELAP-4 BWR-6 model, issue letter report 8/8/77. (2) Issue letter report on FLECHT Data Comparisons with MOD 6 12/8/77. (3) Issue letter report on selected TLTA 848 BD/ECC predictions 12/31/77.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To determine time to CHF and heat transfer rates during pre- and post-CHF phases of blowdown as influenced by variation in power, system pressure, coolant flow, and break location.
APPROACH: Conduct blowdown tests in a non-nuclear facility using an electrically heated bundle of rods designed to simulate a portion of a pressurized water reactor (PWR) fuel bundle.
RESULTS: Complete operations with first 49-rod bundle in THTF. Begin procurement for the 64 rod bundle. Make pretest predictions for selected THTF blowdowns using RELAP4. Refine means for obtaining dispersed flow in THTF spool pieces. Examine extrapolation of low pressure two-phase flow calibrations to high pressure conditions. Develop alternate methods for two-phase flow measurement. Continue single rod BDHT tests to assess heaters and instrumentation. Complete second phase of error analysis of THTF instrumentation.
PROJECT MILESTONES: (1) Complete second test series (inactive rod and separate effect studies) 10/30/77. (2) Complete third test series (power decay studies) 7/30/78.

77 FUNDING: Nuclear Regulatory Commission FY77:$731,000
TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To study LOCA in the area of heat transfer from nuclear fuel to fluid during blowdown and ECC injection. These are non-nuclear tests using electrically heated fuel simulators. Investigations will be extended into blowdown/ECC integral testing with the objective of providing data to characterize interaction of ECC with the blowdown phenomena. These are scaled systems tests in which separate effects are studied. The purposes of the RPRI/NRC/GE integral Blowdown/Emergency Core Cooling, BD/ECC, test program are: (1) Obtain and evaluate basic BD/ECC data from test system configurations which have calculated performance characteristics similar to a BWR with 8 x 8 fuel bundles during a hypothetical LOCA. (2) Determine the degree to which models for BWR system and fuel bundles describe the observed phenomena, and as necessary, develop improved models which are generally useful in improved LOCA analysis methods.
APPROACH: Perform non-nuclear experiments on phenomena related to a postulated boiling water reactor loss-of-coolant accident.
RESULTS: Test Series Designations A: 8 x 8 BDHT without ECC Interaction; B: Early BD/ECC Spray Interaction; C: Intermediate Pressure BD/ECC, with Spray and Flooding; D: Early BD/ECC Spray Interaction, Skewed Axial Power; E: Early BD/ECC Spray Interaction, Alternate BD Configuration.
PROJECT MILESTONES: (1) Issue topical report on Test Series A 12/20/77. (2) Issue topical report on Test Series B 11/30/78. (3) Issue topical report on Test Series C 2/25/80. (4) Issue topical report on Test Series D 8/31/80. (5) Issue topical report on Test Series E 2/28/81.

FY77:$19,200,000
TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To model PWR features, to simulate reactor system transient responses to Loss of Coolant Accidents (DBA), to develop measurements to validate and improve analytical predictive codes, used for engineered safety features performance.
APPROACH: Conduct a series of nonnuclear loss-of-coolant experiments in a scaled pressurized water reactor (PWR) facility then load a nuclear core and conduct a series of nuclear loss-of-coolant experiments to provide complete systems effects tests of the hypothetical loss-of-coolant accident and operation of the emergency core cooling systems.
RESULTS: Data to verify and develop LOCA codes. Understanding of PWR behavior during wide variety of postulated accidents.
PROJECT MILESTONES: (1) 1977 Conduct fifth non-nuclear LOCE (LI-4, on May 3). Begin to load core, Sept. (2) 1978 Precriticality tests. Criticality and zero power tests. Conduct final non-nuclear test, LI-5. Requalify core. Conduct power range tests.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The purpose of this activity is to provide verified analytical models for predicting the system response of BWR and PWR power plants to a Loss-of-Coolant Accident (LOCA). This is accomplished by establishing the requirements for analytical model development and supporting experiments, and by comparing model predictions with data in order to assess the uncertainty bands of the model predictions. Experiments of concern are: the LOFT Program, Semiscale Program, Plenum Filling Experiment, Industrial Cooperative Programs, and other domestic or foreign programs furnishing data related to analyses of the LOCA.
APPROACH: Verify computer models through comparison with experiments.
RESULTS: (A) Developmental Verification: (1) RELAP4 Mod 6 analysis results were compared with the following data: (a) FLECHT run 0085, (b) FLECHT-SET run 3105B, (c) Semiscale runs S-03-2, S-03-6 and S-02-9; (2) Checkout runs made for RELAP4 Mod 6 were: (a) PWR reflood response, (b) metal/water reaction study, and (c) oscillation study; and (3) RELAP4 Mod 7 analysis results were compared with the following data: (a) BWR-FLECHT runs with top, bottom, and combined top and bottom ECC injection, (b) GE proprietary hot and cold bundle tests, and (c) a TLTA test. (B) Independent Verification: (1) RELAP4 Mod 6 analysis results were compared with the following data: (a) pressurizer blowdown data from Semiscale and LOFT isothermal tests, (b) steam generator blowdown data from LOFT and Semiscale isothermal tests, (c) LOFT system blowdown test L1-4 as best estimate analysis of NRC Standard Problem 7 (also performed with RELAP4 Mod 5), and (d) PKL reflood tests K-5A and K-7A; and (2) RELAP4 Mod 6 analyses for comparison with data in progress are: (a) core responses in Semiscale and ONRL PWR-BDHT data, (b) system blowdown and reflood response in a Semiscale integral test, (c) core reflood response in Semiscale and FLECHT, for both forced feed and gravity feed ECC, and (d) isothermal system blowdown response in Semiscale and LOFT.
PROJECT MILESTONES: Project milestones under reevaluation.

ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Licensees, the NRC and the public differ in their assessment of the locations of the boundary of the New Madrid earthquake zone. New Madrid, Missouri, is the approximate location of the epicenters of the most severe earthquakes in recorded U.S. history. This earthquake potential affects parts of Illinois, Indiana, Kentucky, Tennessee, Missouri and Arkansas. The potential earthquake effects have significant impact on the design, siting and construction of nuclear power facilities in the region. Consequently, the issues are: (1) should the earthquake zone be confined to an area within about 100 miles of New Madrid, Missouri, or (2) does it cover an area within about 200 miles of New Madrid.
APPROACH: (1) Develop a detailed map of the vertical component of the earth's magnetic field in the Johnson County Area, Illinois. (2) Develop detailed profiles of the vertical component of the earth's magnetic field across known and suspected faults in the Johnson County Area, Illinois. (3) Develop a catalog of magnetic susceptibilities of rock types in and around the study area.
RESULTS: A detailed study of the structural framework of the Mississippi embayment of Southern Illinois. The

purpose of this relatively rapid and inexpensive study is to provide much-needed information concerning the structural fabric, depth to basement, and lithologic changes in the basement of this structural transition area. It is hoped that this type of high resolution survey will also provide a means of delineating possible igneous intrusives and faulting in the sedimentary rocks.

PROJECT DESCRIPTION: Licensees, the NRC and the public differ in their assessment of the location of the boundary of the New Madrid earthquake zone. New Madrid, Missouri, is the approximate location of the epicenters of the most severe earthquakes in recorded U.S. history. This earthquake potential affects parts of Illinois, Indiana, Kentucky, Tennessee, Missouri and Arkansas. The potential earthquake effects have significant impact on the design, siting and construction of nuclear power facilities in the region. Consequently, the issues are: (1) should the earthquake zone be confined to an area within 100 miles of New Madrid, Missouri, or (2) does it cover an area within about 200 miles of New Madrid.
APPROACH: A study area bounded by 85 degress West and 90 degrees West longitude and 36.5 degrees North and 39 degrees North latitude is proposed for which gravity and aeromagnetic data will be compiled, filled in with new observations where necessary, and interpreted. Also, a series of seismic refraction profiles will be recorded in order to delineate crustal structure variations associated with the 38th Parallel Lineament and the NMFZ. Basement geology and geochronology will also be investigated along with surficial and sedimentary geological relationships.
RESULTS: The scope of the proposed project to accomplish an integrated geological and geophysical study of the 38th Parallel Lineament and its intersection with the New Madrid Fault Zone (NMFZ) and to deduce the subsurface structural relationships and tectonic evolution of the region. We propose to concentrate our efforts in Phase One to preparation of a total magnetic intensity map of a portion of southeastern Illinois and an interpretation of this map with the available magnetic data in adjacent Indiana.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Two operating and four proposed nuclear power plants are located in Nebraska, Kansas, and Oklahoma. Three more are planned. All are within or adjacent to seismic risk zones having had earthquakes resulting in moderate damage. The historical record of seismicity is inadequate in areas of the Midcontinent. Thus delineation of tectonic provinces based regional geologic structure and associated seismicity is required. Delineation of tectonic provinces which accurately reflect the potential magnitude of seismic events is an important cost and risk factor in assigning design criteria for nuclear power plants. Earthquakes ascribed to crustal adjustment have occurred along the Nemaha Uplift. Little is known about the relationships of the Nemaha structure to the earthquakes. This project will be part of a larger study effort to investigate their possible relation.
APPROACH: (1) Delineate the Nemaha Uplift and associated structures. (2) Investigate the relationships between the Nemaha Uplift and the Keweenawan Mafic Belt. (3) Assign realistic values for maximum seismic magnitude in the region. Final results will be a series of maps, tables and explanatory text. These will outline the relative seismicity in the study area and attempt to correlate it with tectonic features known from surficial and subsurface geological and geophysical evidence.
RESULTS: The Oklahoma, Kansas and Nebraska Geological Surveys will study the regional tectonic framework and establish seismicity levels for the area of the Nemaha Uplift and its related structures. The principal goal is to provide fundamental data for design of nuclear installations and risk evaluation in nuclear power plant siting. A determination will be made as to whether this area can be separated from other tectonic components in the midcontinent region on the basis of its seismicity and geologic structure. A seismic network will be established in the area of the Nemaha Uplift. More detailed (limited) gravity and aeromagnetic studies will be performed, concentrating on Nemaha Uplift, to either augment existing information or fill in critical areas where information is lacking. In addition to the geophysical and seismological data, geologic and structural data will be compiled by the Kansas and Nebraska Geological

Surveys and forwarded to the Oklahoma Geological Survey where it will be correlated with that collected in Oklahcma. Current data will be added to that presently available and historic records, and all will be compiled on final maps. Interim results of the project will be maps to be produced by each State Survey on a scale of 1:500,000. The final maps will be on a scale of 1:1,000,000. They will be accompanied by explanatory text and a description of the data collection process. The

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Licensees, the NRC and the public differ in their assessment of the location of the boundary of the New Madrid earthquake zone. New Madrid, Missouri, is the approximate location of the epicenters of the most severe earthquakes in recorded U.S. history. This earthquake potential affects parts of Illinois, Indiana, Kentucky, Tennessee, Missouri and Arkansas. The potential earthquake effects have significant impact on the design, siting and construction of nuclear power facilities in the region. Consequently, the issues are: (1) should the earthquake zone be confined to an area within about 100 miles of New Madrid, Missouri, or (2) does it cover an area within about 200 miles of New Madrid.
APPROACH: Undertake seismic studies to provide data which will help to accurately delineate the boundary of the New Madrid earthquake zone and contiguous tectonic provinces; and to study and identify the structure and tectonics of the New Madrid area.
RESULTS: Install and operate a 16 station seismic network between Cairo, IL and Vincennes, IN will result in a seismological program that will contribute information directly bearing on past, current and future seismic conditions of the area within a 200 mile circle around New Madrid, Missouri.

PROJECT DESCRIPTION: At present there are two operating and four proposed nuclear power plants in Nebraska, Kansas, and Oklahoma. More are considered for this area. All existing and proposed plants are within or adjacent to an area having had earthquakes with resulting moderate damage. Existing historical record of seismicity is inadequate in the midcontinent. This has made it necessary to rely on the delineation of major tectonic and associated seismicity. The delineation of tectonic provinces which accurately reflect the potential magnitude of seismic events is an important cost and risk factor in assigning appropriate design criteria for nuclear power plants. Many earthquakes have occurred along the Nemaha Uplift. This project will be a part of a larger study to delineate tectonic provinces, identify earthquake mechanisms and relate them to structures.
APPROACH: Synthesize existing data and complete current studies for the east-central and southeastern portion of Nebraska during the initial year. Proposed products include the following maps at a scale of 1:500,000; (1) precambrian configuration; (2) aeromagnetic; (3) Bouguer gravity; (4) surface lineations; (5) bedrock geolcgy; (6) earthquake epicenter and intensity; (7) precambrian rock type; and (8) structural contour-base Kansas City (Pennsylvanian). All of these maps and possibly other maps and other areas will be reccmpiled and coordinated with adjoining areas at the completion of the total period of study.
RESULTS: During the initial year, sites for detailed investigation will be identified. Portions of these studies will be carried out in cooperation with adjoining states. These site studies will include detailed geophysical studies, laboratory analysis, age-dating of recent rock movement and core programs.

RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To conduct integrated experimental and analytical studies for the development and verification of structural analysis methods for single and multiple nozzle-to-pressure vessel attachments, and for piping systems. To develop design rules and data for codes and standards use.
APPROACH: Experimental pressure tests of vessels and nozzle attachments, as well as pipe sections, including cyclic tests and an analytic parameter study.
RESULTS: Design rules, flexibility factors, and backup information for isolated and closely-spaced nozzles in pressure vessels and for piping system components will continue to be developed for use in codes and standards, and for use in specifying dimensional controls. Eight backup data and interpretive reports including a dimensional study of piping components drafted in prior years will be completed and published. Operational status and checkout of existing finite-element computer program the analysis of isolated nozzles attached to cylindrical shells and for piping tees and branch connections will be completed, and a limited parameter study of approximately 20 isolated nozzle models loaded with internal pressure will be conducted. Finite-element analyses will also be conducted for two cylindrical pressure vessel models, each with two closely-spaced nozzles under internal pressure loading. Planning will be started for the study of three closely-spaced nozzles in cylindrical pressure vessels. A report will be prepared summarizing available information and data obtained through the PVRC on limit loads for branch connections and nozzles attached to cylindrical shells. An analytical parameter study on the effect of end restraint on piping elbows will be completed, and stress indices and flexibility factors to account for these end effects will be developed. A cyclic internal pressure
PROJECT MILESTONES: RPV = Reactor Pressure Vessel. (1) Document computer code for two closely-spaced RPV nozzles-internal pressure 9/15/77. (2) Document computer code for three closely-spaced RPV nozzles-internal pressure 12/31/77. (3) Complete parameter study and design rules for closely-spaced RPV nozzles 6/30/78.

ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To establish a crack arrest methodology for heavy-walled pressure vessels fabricated from nuclear grades of steel.
APPROACH: Development of dynamic analysis for test specimens and carry out experimental measurements to validate the analysis.
RESULTS: (1) Complete development of two-dimensional dynamic analysis for the specimen geometries used in the program including the beginning of a dynamic analysis for a model of a pressure vessel. To be included are the effects of load-system inertia and compliance, toughness gradients, and transient thermal stresses. (2) Perform testing required to distinguish among the arrest theories and verify the dynamic analyses. Experiment results will be coordinated with similar tests performed at the other facilities in the combined NRC/EPRI Program. Important highlights are the effects of loading and specimen compliance, specimen geometry, propagation history, and thermal stress. (3) Determine optimum specimen geometry and size, testing procedures for arrest toughness measure. Coordinate with the HSST Program at ORNL in the development of specimen design using an insert of irradiation material at the crack tip and in the crack line. (4) Initiate the development of a data base of the crack arrest toughness of A533-B1 and A508-2 steels. Recommend procedures for expeditiously determining statistically significant data.
PROJECT MILESTONES: (1) Dynamic analysis of pressurized cylinders under thermal stress 9/30/77. (2) Measurement of K/sub ID/ on 4 additional pressure vessel stress 9/30/77. (3) Measurement of K/sub ID/ on irradiated steels 9/30/77. (4) RIL to RES on unirradiated crack arrest toughness 9/1/77. (5) RIL-RES on unirradiated crack arrest to NRR 9/30/77. (6) Background report on ASTM Standard 12/31/77. (7) Weld procedures for weldments 9/30/78. (8) Numerical programming and program checkout for side wedge loading 9/30/77. (9) Analyze ORNL experiments 3/31/78.

TECHNOLOGY: NUCLEAR/Fission Converters (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Develop techniques to enhance the sensitivity of ultrasonic inspection of nuclear reactor components.
APPROACH: (1) Develop preliminary versions of instrumentation to increase the signal-to-random noise ratio of ultrasonic signals. This will be accomplished primarily through signal-averaging techniques. (2) Develop flaw-discrimination techniques based on spectral analysis of the ultrasonic signals. FY 76 efforts will emphasize development of two-frequency ultrasonic system, Fourier-transform techniques, and wideband contactless electromagnetic transducer. (3) Apply the improved techniques to detect flaws in nuclear reactor materials and components. Efforts in FY 76 will emphasize inspection of 4 in. diam. piping.
RESULTS: Improved methods having greater sensitivity for ultrasonic inspection of nuclear reactor components.
PROJECT MILESTONES: (1) Apply signal averaging and pulse comparison to detection of flaws in reactor pressure vessel and piping materials 9/30/77. (2) Field application of signal average and pulse compression and development of ultrasensitive UT system 9/30/78. (3) Complete Phase III of technique development and application program 9/30/78.

MONITOR: Lynn, E.K.
TELEPHONE: F427-4262
TYPE OF FUNDING: Contract No.-AT(49-24)1003
77 FUNDING: Nuclear Regulatory Commission FY77:$834,000
TECHNOLOGY: NUCLEAR/Fission Converters (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Assess materials behavior in relation to structural safety and reliability for pressure boundary components of light water reactors. Develop an understanding of fast fracture and low cycle fatigue phenomena in terms of continuum mechanics and metallurgical factors. Identify metallurgical factors and evolve guidelines for radiation resistant steels. Investigate procedures for periodic reduction of radiation induced property changes. Evolve engineering criteria for reliable structural performance and long term operation.
APPROACH: Task A: Develop techniques for experimental determination of dynamic K/sub ID/ for a three-point bend specimen; complete required modifications to testing apparatus. Define the K/sub ID/ vs temperature trends for A533-B, A508-2 and A302-B steels, the latter plate having a low upper shelf energy and being produced to simulate steel-making practices used for early reactor vessels. Characterize the K/sub ID/ behavior in terms of small size specimens (precracked Charpy-V and 1-in. bend specimens) as well as large specimens (4 and 6-in. thick) that provide plane strain constraint in the transition temperature regime. Investigate techniques for measuring dynamic J/sub ID/ in the elastic plastic regime. Develop an analytical model to predict the hammer force vs time behavior during impact and verify experimentally. Task B: Perfect test techniques and debug new testing systems for fatigue crack growth rate determinations in A533-B plate and A508-2 forging and weld metal. Define fatigue crack propagation rates at 550 degrees F in a reactor water environment for a specific loading pattern on unirradiated material. Obtain a new 4T autoclave system and suitably modify it to maintain water chemistry that is characteristic of both PWR and BWR environments. Task C: Undertake exploratory 550 degrees F irradiation - 650 degrees F anneal experiment on effect of impurity element content on upper shelf and transition temperature recovery; perform initial qualification of radiation embrittlement resistance of extra low copper content A533-B plate and weld heat affected zone from NRC-CE NRL
RESULTS: Accomplish objective stated above.
PROJECT MILESTONES: (1) Complete testing of NRC prelim matrix 12/31/77. (2) Complete main test program on CCGR 9/30/78. (3) RIL to RES on warm prestressing 9/23/77. (4) Recommend code revision to NRC 9/30/78. (5) RES-RIL to NRR on warming prestressing 9/30/77.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: (1) Determine tornado probability of occurrence geographically in terms of intensity and damage path. (2) Determine geographic distribution of maximum translational and rotational wind speeds. (3) Analyze the nature of pressure drop, rate of pressure drop (both across the tornado core and along the tornado path), and suction vortices.
APPROACH: (1) FPP assessment of tornadoes which occurred from 1930 to 1974 inclusive. (2) Prepare a detailed map of past tornado tracks taking into account F-scale intensity. (3) Describe the variation of tornado frequency and severity as a function of: (a) altitude and surface roughness; (b) real paths (damage widths versus diameter of maximum winds); (c) touch-down frequency 1930 to now; (d) total area of tornadoes per one degree square; (e) total path length within each one degree square; and (f) weighted path length.
RESULTS: Establish distribution probability of tornadoes.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Perform wind tunnel measurements of building wakes.
APPROACH: (1) Determine quantitatively the character and persistence of the wake and wind tunnel laboratory model of well documented prototype reactor complexes. (2) Develop appropriate empirical formulation of building wake diffusion, generalizing the results of the experimental analysis where possible. (3) STET (4) Determine the relationship between instantaneous (peak) and average concentration measurements in the vicinity of and downwind from buildings. (5) Characterize and attempt to quantify building wakes as they are affected or determined by (a) building size, shape, orientation; (b) atmospheric stability; (c) wind speed; (d) terrain roughness, both upwind and downwind of structures; and (e) source release point. (6) Compare wind tunnel test results with field results and reconcile differences.
RESULTS: Characterization of building wakes.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: (1) Assess tornado risk for nuclear power facilities. (2) Determine the near-ground windfield in tornadoes.
APPROACH: (A) Assemble a consistent set of tornado records from available sources. (B) Perform a critical evaluation of current approaches to tornado risk analysis. (C) Develop new set of regional tornado criteria based on the technical advances derived from I.B. (D) Describe the variation of tornado frequency and severity as a function of identifiable variables such as altitude, surface roughness, population distribution, etc.

RESULTS: (A) Assess critically the existing literature which addresses near-ground tornado windfields. (B) Review and synthesise published storm damage documentations for windspeed and windfield data. (C) If feasible, extend data on ground level windfield by examining existing high-quality motion picture films and determine a correlation between damaged structures and the motion picture record. (D) Conduct field investigations after significant tornado events and record systematically damage and debris patterns which indicate maximum windspeed and windfield patterns.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: (1) Perform a thorough and critical review of available theoretical models of geophysical vortices to assess the current state of knowledge regarding tornado vortex modeling. (2) Apply ARAP's second-order closure model of turbulence to an axisymmetric vortex driven by buoyancy in the presence of the ground boundary. (a) Define the upper bounds on the three-dimensional velocities and pressures which may exist in a tornado or waterspout, considered both separately and in combination. (b) Describe the radial (horizontal) and vertical profiles of meteorological parameters in tornadoes, such as windspeeds, pressures, densities and temperatures. (3) Perform a sensitivity study of the influence of such factors as atmospheric stability, terrain roughness, and ambient cloud circulation on the velocity and pressure distribution in a tornado.
APPROACH: Numerical modeling.
RESULTS: Evaluated tornado models.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Determine patterns and ages of post metamorphism faults in part of the Northern Piedmont.
APPROACH: (1) Conduct field investigations to determine location and geometry of faults; collect samples to isotopically determine the ages of rocks adjacent to the faults and of granulated materials within the zones of faults movement. (2) Conduct field investigations to determine the depth and local extent of saprolite zones. (3) Conduct mass spectrometric analyses and other laboratory analyses on appropriately prepared samples for the purpose of determining isotopic-ratio dates and discordancies of samples collected during field investigations. (4) Compile maps and photomaps of the study area to show pertinent geological features such as faults, lineations, and other geologic structures and contacts. (5) Conduct a strip-transverse for geologic study of rock exposures along the James River between Richmond and Columbia, Virginia.
RESULTS: A determination of patterns and ages of past metamorphism faults in part of the Northern Piedmont.

77 FUNDING: Nuclear Regulatory Commission FY77:$2,160,000
TECHNOLOGY: NUCLEAR/Fission Converters (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To develop and evaluate methods of fracture analysis of heavy section steel light water reactor pressure vessels for inclusion in codes and standards. The HSST program is organized under six major areas which are individually covered.
APPROACH: Methods of elastic-plastic fracture analyses will continue to be evaluated, developed and validated using experimental data obtained from small-scale models and the intermediate vessel tests. The fatigue crack growth rate studies to evaluate lower frequency, lower delta k, higher 'R' ratios and load follow tests will be continued. Additional material types will be screened to examine their susceptibility to corrosion fatigue and stress corrosion cracking. The testing of small irradiated specimens will be completed and additional irradiation experiments will be planned to validate irradiation effects on code rules. Intermediate test vessel summary reports will be written. Design of the thermal shock experiment will be completed and two small experiments performed. The effect of system energy content on fracture modes will be studied and an experimental program will be initiated. Metallographic examinations of re-heat cracking in heat affected zones will be performed.
RESULTS: Improved methods for the fracture analysis of heavy section steel light water reactor pressure vessels.
PROJECT MILESTONES: ITV = Intermediate Test Vessel, TSE = Thermal Shock Equipment, HAZ = Heat Effected Zone. (1) Issue report on ITV-7A 10-28-77. (2) Issue report ITV-7B 12-15-77. (3) Issue report TSE-3 and 4 10-30-77. (4) Issue report ITV-8 8-31-78. (5) Test ITV-10 7-1-78. (6) Issue ITV-10 11-1-78. (7) Issue significance report on nozzle corner flaws 2-1-79.

TECHNOLOGY: NUCLEAR/Fission Converters (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: A system is to be developed for reliably determining the size of flaw indications to within the limits set by the new ASME Boiler and Pressure Vessel Code requirements as published in the Summer 1973 Addenda. This is to be done by computer-processing of ultrasonic pulse-echo data from a phase-sensitive synthetic array of transducers. Feasibility of this concept is expected to be demonstrated within the first six months of the contract period using test specimens having machined discontinuities, which have been made from materials used in reactor pressure vessels. To be demonstrated is that the phase-sensitive array is superior to the conventional pulse-echo systems in determining the size, shape, and orientation of a discontinuity.
APPROACH: Perform preliminary work on establishing minimum detectable discontinuity sizes using machined discontinuities in both wrought and cast stainless steel test blocks. Evaluate proposed techniques for reducing noise caused by high attenuation and microstructure scattering. Extend current techniques to the evaluation of stainless steel pipe sections in an immersion system. Acquire RPV materials with natural discontinuities and cladded surfaces for evaluation of system capabilities. Design and construct two axes scanning immersion system to facilitate C-scan evaluation utilizing improved lateral resolution through synthetic array processing. Design and construct gray-scale display for real-time presentation of B-scan or C-scan data with improved longitudinal and lateral resolution.
RESULTS: A developed system for reliably determining flaw sizes within the limits set by the new ASME Boiler and Pressure Vessel Code requirements as published in the Summer 1973 Addenda.

PROJECT MILESTONES: Continue the evaluation of the test samples supplied by the reactor pressure vessel manufacturers. Compare the results with alternative testing methods. Section the test specimen and evaluate test results with respect to the requirements of Section XI of the ASME Code 9/30/77.

TITLE: Inspection of Nuclear Reactor Welding by Acoustic Emission
PROJECT NUMBER: A4052
PRINCIPAL INVESTIGATOR: Prine, D.W.
ADDRESS: General American Research Division, 7749 N. Natchez Avenue, Niles, IL 60648
AFFILIATION: General American Transportation Corp., Niles, Ill. General American Research Div.
MONITORING AGENCY: Nuclear Regulatory Commission, Washington, D.C. (USA)
DIVISION: Office of Nuclear Regulatory Research
MONITOR: Muscara, J.
TELEPHONE: C(301)427-4262
TYPE OF FUNDING: Contract No.
77 FUNDING: Nuclear Regulatory Commission FY77:$42,000
TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: A system is to be developed for in-process weld inspection for nuclear reactor components using acoustic emission for detection and location of weld microcracking.
APPROACH: The first phase of this research, to be conducted in the first year, will entail assembly of the appropriate equipment and its use in acoustic emission monitoring of several different welding techniques in use for nuclear power plant piping construction. Defects found will be cross-validated with other NDT techniques and metallograph analyses to determine the applicability of acoustic emission to find rejectable defects associated with nuclear welding. The feasibility of the system developed will be evaluated by (1) establishing the acoustic emission detection sensitivity, and (2) applicability to on-line inspection. Work in the second phase (year) of the contract will center upon completion of fabrication of the prototype pipe weld monitor and beginning of field evaluation aimed at gathering sufficient data to satisfy requirements for acceptance into the ASME Boiler and Pressure Vessel Code. Evaluations will also begin for in-process pressure vessel welding, employing the same procedures as used to validate the piping weld monitoring. Completion of the field testing of both the piping and pressure vessel monitoring will be accomplished in the third phase (year) of this study. Also, the prototype vessel weld monitor will also be constructed and proven under shop conditions. The primary effort in the last part of this phase will be the analysis of data and accumulated evidence to present to
RESULTS: The system is expected to produce more reliable (safer) welds and yet to lower costs by finding defects at the time of fabrication rather than at a later inspection period.
PROJECT MILESTONES: (1) Vessel weld monitor field trials, ''hands-off'' complete 9/1/77. (2) Complete data analysis and preparation of data for standards-report issued to RES 10/1/77.

DIVISION: Office of Nuclear Regulatory Research
MONITOR: Abbey, Robert F., Jr.
TELEPHONE: C(301)427-4373
TYPE OF FUNDING: Interagency agreement-US NRC
77 FUNDING: Energy Research and Development Administration FY77:$150,000
TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: HEAT, THERMAL (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Perform thermal performance experiments on heat sinks.
APPROACH: (1) Conduct a site survey of candidate hot ponds for field experiments. (2) Design field experiments for both spray ponds and cooling ponds. (3) Prepare integrated instrument system from proven hardware. (4) Conduct a proof test of entire system on BNW spray ponds. (5) Analyze data from proof test. (6) Review experimental design and measurement program.
RESULTS: Establish thermal characteristics of heat sinks, in the form of cooling ponds and spray ponds.
KEYWORDS: COOLING PONDS;PERFORMANCE;SITE SELECTION;SPRAYS;METEOROLOGY;WEATHER

TITLE: Evaluation of Atmospheric Dispersion Data
PROJECT NUMBER: B2086
PRINCIPAL INVESTIGATOR: Wendell, L.L.
ADDRESS: P.O. Box 999, Richland, WA 99352
AFFILIATION: Battelle Pacific Northwest Labs., Richland, Wash. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Office of Nuclear Regulatory Research
MONITOR: Abbey, Robert F., Jr.
TELEPHONE: C(301)427-4373
TYPE OF FUNDING: Interagency agreement-US NRC
77 FUNDING: Nuclear Regulatory Commission FY77:$80,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (50%);PARTICULATES (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT

PROJECT DESCRIPTION: (1) Identify potential sources of atmospheric diffusion data for neutrally-buoyant sources located in homogeneous terrain. (2) Evaluate data with respect to information content on surface roughness, wind speed, atmospheric stability, release time, and sampling time.
APPROACH: Analysis of experimental field dispersion data utilizing actual concentration measurements. Correlate measured concentration values with concurrently measured atmospheric variables, such as wind speed, stability, and terrain roughness.
RESULTS: Method for characterizing atmospheric dispersion utilizing known (measured) meteorological variables.
KEYWORDS: EARTH ATMOSPHERE;DIFFUSION;WIND;METEOROLOGY;SAMPLING;WEATHER

TITLE: Southern Piedmont Seismology
PROJECT NUMBER: A9028
PRINCIPAL INVESTIGATOR: Long, L.T.
ADDRESS: Georgia Tech. University, Atlanta, GA 30332
AFFILIATION: Georgia Inst. of Tech., Atlanta (USA)
MONITORING AGENCY: Nuclear Regulatory Commission, Washington, D.C. (USA)
DIVISION: Office of Nuclear Regulatory Research
MONITOR: Harbour, Jerry D.
TELEPHONE: C(301)427-4370
TYPE OF FUNDING: Contract No.
77 FUNDING: Nuclear Regulatory Commission FY77:$35,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Site specific Clark Hill, GA
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: A geophysical investigation of the seismicity in the Clark Hill Reservoir vicinity.
APPROACH: (1) Perform research to acquire instrumentally recorded data on local earthquakes and man-caused shocks in the Clark Hill Reservoir area and relate the physical parameters of these events to the structure of the earth's crust in the area. (2) Perform detailed geophysical surveys to delineate significant crustal units in the area and to determine crustal velocity structure of the region. (3) Install, operate, and maintain a short-period siesmograph network with a telemetry system for recording at a central location. (4) Investigate and report the relationships between earthquake activity, geology, and tectonic environment of the area. (5) Investigate the possible relationship between local seismicity and the history of water-level variations in the Clark Hill Reservoir.
RESULTS: Maps illustrating seismic character of the region and correlations to earthquake activity.
KEYWORDS: GEORGIA;WATER RESERVOIRS;EARTHQUAKES;SEISMIC SURVEYS;TECTONICS

TITLE: Geology and Seismology Siting Studies
PROJECT NUMBER: B5535
PRINCIPAL INVESTIGATOR: Houser, F.;Wentworth, C.
ADDRESS: State of Virginia, VA
AFFILIATION: Geological Survey, Reston, Va. (USA)
MONITORING AGENCY: Nuclear Regulatory Commission, Washington, D.C. (USA)
DIVISION: Office of Nuclear Regulatory Research
MONITOR: Harbour, Jerry D.
TELEPHONE: C(301)427-4370
TYPE OF FUNDING: Contract No.
77 FUNDING: Nuclear Regulatory Commission FY77:$1,255,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Site specific California, South Carolina
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: (1) Coastal California fault mapping (onshore and offshore). (2) Eastern Mojave Desert (geology, geophysics, seismology). (3) Charleston, SC, regional geology and seismology. (4) Activity on multiple fault strands. (5) Fault dating in continental interior.
RESULTS: Maps illustrating the seismic character of the area and correlations with earthquake activity.
KEYWORDS: GEOLOGICAL SURVEYS;SEISMIC SURVEYS;LAND POLLUTION ABATEMENT;CALIFORNIA;SOUTH CAROLINA;AGE ESTIMATION;REGIONAL ANALYSIS;EARTHQUAKES;SITE SELECTION;NUCLEAR ENERGY;GEOLOGIC FAULTS

TITLE: Connecticut Seismic Network Studies
PROJECT NUMBER: A4057
PRINCIPAL INVESTIGATOR: Chiburis, E.
ADDRESS: University of Connecticut, Storrs, CT 06268
AFFILIATION: Connecticut Univ., Storrs (USA)
MONITORING AGENCY: Nuclear Regulatory Commission, Washington, D.C. (USA)
DIVISION: Office of Nuclear Regulatory Research
MONITOR: Harbour, Jerry D.
TELEPHONE: C(301)427-4370
TYPE OF FUNDING: Contract No.
77 FUNDING: Nuclear Regulatory Commission FY77:$39,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Site specific Connecticut
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: (1) Establish the seismicity of Connecticut and southern New England in terms of epicentral location, focal depth, magnitude, frequency of occurrence, and recurrence relationships of earthquakes. (2) Continue to provide quantitative data on New England earthquakes to State, Federal, and local authorities, and to other research institutions engaged in similar research. (3) Determine the litholcgy and velocity structure of the earth's crust and upper mantle in the New England region. (4) Examine the correlation between seismicity and structural geology in Connecticut in particular and in New England in general. (5) Upgrade the capability of the Connecticut seismic network.
RESULTS: (1) Maps illustrating the seismic character of the region. (2) Correlations with earthquake activity.
KEYWORDS: CONNECTICUT;SEISMIC SURVEYS;EARTHQUAKES;EARTH CRUST;EARTH MANTLE;LITHOLOGY

TITLE: Effect of Liquid Pathways on RSS Consequence Calculations
PROJECT NUMBER: A1200
PRINCIPAL INVESTIGATOR: Wayland, J.R.
ADDRESS: Sandia Laboratories, Albuquerque, NM 87115
AFFILIATION: Sandia Labs., Albuquerque, N.Mex. (USA)
MONITORING AGENCY: Nuclear Regulatory Commission, Washington, D.C. (USA)
DIVISION: Office of Nuclear Regulatory Research
MONITOR: Murphy, Joseph A.
TELEPHONE: C(301)443-6947
TYPE OF FUNDING: Contract No.-A1200
77 FUNDING: Nuclear Regulatory Commission FY77:$77,000
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Miscellaneous (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECT;OS
PROJECT DESCRIPTION: Establish the degree of potential radiation exposure to the population from hypothetical accident sequences in which some, or all, of the LWR core has melted through the floor of the containment vessel.
APPROACH: Characterize radioactive sources for liquid pathways and develop and implement liquid pathway models for the hydrosphere and biosphere to calculate the movement and distribution of radionuclides in the environment and man.
RESULTS: A more realistic liquid pathway model for the assessment of accident risks in the U.S. commercial nuclear power reactors.
PROJECT MILESTONES: Provide monthly reports.
KEYWORDS: WATER COOLED REACTORS;MELTDOWN;MAXIMUM CREDIBLE ACCIDENT;RADIOACTIVE EFFLUENTS;ENVIRONMENTAL TRANSPORT;RADIONUCLIDE MIGRATION;SURFACE WATERS;SOILS;LIQUID WASTES;FOOD CHAINS;MAN;ENVIRONMENT;RADIATION DOSES;RADIATION HAZARDS;HUMAN POPULATIONS;BIOLOGICAL MODELS;MATHEMATICAL MODELS;TERRESTRIAL ECOSYSTEMS;AQUATIC ECOSYSTEMS

MONITOR: Cullingford, Michael C.
TELEPHONE: C(301)443-6947
TYPE OF FUNDING: Contract No.-B4147
77 FUNDING: Nuclear Regulatory Commission FY77:$226,000
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: PARTICULATES (10%);RADIATION (50%);HEAT, THERMAL (5%);SPECIFIED OTHER POLLUTANTS/Miscellaneous (35%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECT;OS
PROJECT DESCRIPTION: Develop a methodology applicable to the assessment of risk to the public from fuel reprocessing.
APPROACH: WASH-1400 methodology where applicable. Definition of a reference repository (to be used for the purposes of analysis only). Collection and analysis of reliability data presently existing in the US. Systems analysis and appropriate quantification techniques to develop a risk assessment methodology.
RESULTS: (1) Methodology appropriate to risk assessment of Fuel Reprocessing. (2) Definition of Fuel Reprocessing. (3) Insights into these systems, components or test and maintenance procedures which contribute significantly to the risk. (4) Areas where data is needed.
PROJECT MILESTONES: Phase I: Definition of Reference System 12/77. Phase II: Risk Assessment Methodology Development 12/79.
KEYWORDS: FUEL REPROCESSING PLANTS;NUCLEAR FACILITIES;HEALTH HAZARDS;HUMAN POPULATIONS;DATA COMPILATION;SAFETY;PLUTONIUM ISOTOPES;GAMMA SOURCES;IODINE ISOTOPES;COMPUTER CALCULATIONS;ENVIRONMENTAL TRANSPORT;RADIATION MONITORS;INFORMATION RETRIEVAL;COST BENEFIT ANALYSIS;SYSTEMS ANALYSIS

TITLE: Light Water Reactor Risk Assessment
PROJECT NUMBER: A3057
PRINCIPAL INVESTIGATOR: Hall, R.E.
ADDRESS: Brookhaven National Laboratories, Upton, NY 11973
AFFILIATION: Brookhaven National Lab., Upton, N.Y. (USA)
MONITORING AGENCY: Nuclear Regulatory Commission, Washington, D.C. (USA)
DIVISION: Office of Nuclear Regulatory Research
MONITOR: Murphy, Joseph A.
TELEPHONE: C(301)443-6947
TYPE OF FUNDING: Contract No.-A3057
77 FUNDING: Nuclear Regulatory Commission FY77:$250,000
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: PARTICULATES (50%);RADIATION (50%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECT;OS
PROJECT DESCRIPTION: Provide risk assessment for commercial nuclear reactor accidents (Class 3-8).
APPROACH: Use methodology similar to that used in WASH-1400. Use actual plant operating data where possible. Generate logic diagrams to identify accident sequences and use fault tree methodology to quantify the

results.
RESULTS: Provide techniques and data base to begin risk assessment for Surry and Peachbottom II Class 3-8 accidents.
PROJECT MILESTONES: Monthly letter reports plus final report.
KEYWORDS: WATER COOLED REACTORS;REACTOR ACCIDENTS;FAULT TREE ANALYSIS;DATA ANALYSIS;PROBABILITY

<150210>
TITLE: Effect of Scale on Two-Phase Countercurrent Flow Flooding in Vertical Tubes
PROJECT NUMBER: B5816
PRINCIPAL INVESTIGATOR: Richter, H.J.
ADDRESS: Thayer School of Engineering, Dartmouth College, Hanover, NH 03755
AFFILIATION: Dartmouth Coll., Hanover, N.H. (USA)
MONITORING AGENCY: Nuclear Regulatory Commission, Washington, D.C. (USA)
DIVISION: Division of Reactor Safety Research
MONITOR: Serkiz, Aleck W.
TELEPHONE: F427-4370
TYPE OF FUNDING: Contract No.-AT(49-24)-0329
77 FUNDING: Nuclear Regulatory Commission FY77:$41,000
TECHNOLOGY: NUCLEAR/Fission Converters (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: A series of air-water flooding experiments with countercurrent flow will be conducted in vertical tubes of various diameters to determine the scale effects and to investigate competing scaling theories. The tests will use water introduced into the top of the tube, followed by water injection into the side of the tube and then side injection into an annulus.
APPROACH: Perform flooding experiments in a series of vertical tubes with countercurrent air-water flow and different water injection points.
RESULTS: Experiments are designed to test the validity of competing scaling theories.
PROJECT MILESTONES: (1) Complete test loop design and construction 10-31-76. (2) Complete loop shakedown 11-30-70. (3) Complete testing with top water injection 5-15-77. (4) Report on top water injection 5-31-76. (5) Complete modification of test loop for side injection 9-1-77.
KEYWORDS: RADIATION PROTECTION;REACTOR SAFETY;DECONTAMINATION;RADIOACTIVE WASTE DISPOSAL;TUBES;REACTOR COOLING SYSTEMS;WATER;CORE FLOODING SYSTEMS;AIR POLLUTION;AIR;CONSTRUCTION;SCALING

TITLE: Core Meltdown Sensitivity Studies
PROJECT NUMBER: A4067
PRINCIPAL INVESTIGATOR: Denning, R.S.
ADDRESS: 505 King Avenue, Columbus, OH 43201
AFFILIATION: Battelle Columbus Labs., Ohio (USA)
MONITORING AGENCY: Nuclear Regulatory Commission, Washington, D.C. (USA)
DIVISION: Office of Nuclear Regulatory Research
MONITOR: Cunningham, Mark A.
TELEPHONE: C(301)443-6947
TYPE OF FUNDING: Contract No.-A4067
77 FUNDING: Nuclear Regulatory Commission FY77:$164,000
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To determine the sensitivity of LWR risk to uncertainties in the physical phenomena associated with a postulated core meltdown accident.
APPROACH: Response surface modeling of important postulated LWR core meltdown accident sequences (as assessed in Reactor Safety Study).
RESULTS: Ranking of relative sensitivities of LWR risk to uncertainties in various physical phenomena.
PROJECT MILESTONES: Estimated completion date 12/77.
KEYWORDS: RESPONSE SURFACE;WATER COOLED REACTORS;MELTDOWN;PROBABILITY;MATHEMATICAL MODELS;ACCURACY;SAFETY;REACTOR SAFETY
