<000001>
TITLE: Revegetation and Reclamation of Land Areas Disturbed by Mining
PROJECT NUMBER: EPA-IAG-D5-E763
PRINCIPAL INVESTIGATOR: Bennett, O.L.;Power, J.F.
ADDRESS: US Department of Agriculture, Agricultural Research Service, Morgantown, WV 26506
AFFILIATION: Agricultural Research Service, Morgantown, W. Va. (USA)
MONITORING AGENCY: Environmental Protection Agency, Washington, D.C. (USA)
DIVISION: Office of Energy, Minerals, and Industry
MONITOR: Hall, Clinton W.
TELEPHONE: C(202)426-4567
TYPE OF FUNDING: EPA pass-thru funding
77 FUNDING: Environmental Protection Agency FY77:$640,000
TECHNOLOGY: FOSSIL FUEL/Coal (90%);FOSSIL FUEL/Oil Shale (10%)
ENERGY CYCLE: WASTE MANAGEMENT (10%)
POLLUTANTS: METALS (5%);VISUAL AESTHETICS (5%)
CHARACTER OF STUDY: RESEARCH (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Middle Atlantic;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To develop the criteria for premining reclamation plans and methodology for utilizing reclaimed strip mine lands, and to determine the effects of strip mining and reclamation on quality and quantity of water leaving the area, and on the nutritional quality of forages and other crops. Investigation will include utilization of waste material in revegetation and reclamation. Methods will be developed for controlling instability of mined lands, stabilizing and restoring disturbed areas, and restoring and maintaining a favorable organic matter component in reclaimed areas.
APPROACH: Controlled experiments will be conducted in the field, laboratory, and greenhouse for those areas in the United States where strip mining is having a major impact on agriculture and/or land use. Data will be collected from these experiments and analyzed to build up a scientific base of data to be used in developing technically sound practices, methods, and recommendations to reclaim and revegetate strip-mined areas.
RESULTS: Results expected are those necessary to accomplish the objective. To develop the criteria for premining reclamation plans and methodology for utilizing reclaimed strip mine lands, and to determine the effects of strip mining and reclamation on quality and quantity of water leaving the area, and on the nutritional quality of forages and other crops. Investigation will include utilization of waste material in revegetation and reclamation. Methods will be developed for controlling instability of mined lands, stabilizing and restoring disturbed areas, and restoring and maintaining a favorable organic matter component in reclaimed areas. Interim and final reports will be developed from interpretation of the data collected in the field, laboratory, and greenhouse experiments.
PROJECT MILESTONES: To date, 15 milestones have been accomplished and all were on schedule. All of the milestones are associated with accomplishment of the objective. To develop the criteria for premining reclamation plans and methodology for utilizing reclaimed strip mine lands, and to determine the effects of strip mining and reclamation on quality and quantity of water leaving the area, and on the nutritional quality of forages and other crops. Investigation will include utilization of waste material in revegetation and reclamation. Methods will be developed for controlling instability of mined lands, stabilizing and restoring disturbed areas, and restoring and maintaining a favorable organic matter component in reclaimed areas. Additional milestones are scheduled to meet the objective.

<000002>
TITLE: Environmental Effects of Energy Mining
PROJECT NUMBER: D6-E762-FM
PRINCIPAL INVESTIGATOR: Miller, E.V.;Wilson, M.L.;Alorich, S.R.
ADDRESS: CSRS (Cooperative State Research Service), USDA, Washington, DC 20250
AFFILIATION: Department of Agriculture, Washington, D.C. (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service
MONITOR: Miller, Eilif V.
TELEPHONE: P447-0348
TYPE OF FUNDING: Contract No.-662526V88A;EPA pass-thru funding
77 FUNDING: Environmental Protection Agency FY77:$500,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: NOXIOUS GAS (10%);METALS (20%);PARTICULATES (20%);ORGANICS (10%);VISUAL AESTHETICS (20%);SPECIFIED OTHER POLLUTANTS/Salts (20%)
CHARACTER OF STUDY: RESEARCH/Applied (80%);DEVELOPMENT/Pilot plant (20%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Northwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine the effect of energy mining development on soils microorganisms vegetation and water quality
APPROACH: Analysis of soils, water and vegetation resources associated with mine development to detect the detrimental effects and to plan for their amelioration.
RESULTS: Selection and application of methods, techniques and plant species suitable for affected problem areas.
OJECT MILESTONES: Annual reports on accomplishment.
YWORDS: MINING;ENERGY SOURCES;ENVIRONMENTAL EFFECTS;SOILS;MICROORGANISMS;PLANTS;WATER QUALITY;WATER;CHEMICAL ANALYSIS;EARTH ATMOSPHERE;CHEMICAL EFFLUENTS;NITROGEN COMPOUNDS;REPRODUCTION

<000003>
TITLE: Control Technology for Mine Reclamation (Resource Extraction)
PROJECT NUMBER: D6-E762-ER
PRINCIPAL INVESTIGATOR: Miller, E.V.
ADDRESS: CSRS, USDA (Work in State Experiment Station), Washington, DC 20250
AFFILIATION: Food and Drug Administration, Washington, D.C. (USA)
MONITORING AGENCY: Food and Drug Administration, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service
MONITOR: Miller, Eilif V.
TELEPHONE: F447-4348
TYPE OF FUNDING: Contract No.-662326V88B;EPA pass-thru funding
77 FUNDING: Environmental Protection Agency FY77:$459,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: METALS (80%);VISUAL AESTHETICS (20%)
CHARACTER OF STUDY: RESEARCH/Applied (80%);DEVELOPMENT/Pilot plant (20%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/South;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Northwest
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To develop systems for the reclamation of land disturbed by mining of coal, lignite, and oil shale and to return the mined areas to productive uses.
APPROACH: Experimental work includes surface manipulations and vegetation trials related to the specific problems of reclamation sites. Non-mine waste and fertilizers are used as soil amendments for topsoils and overburden layers. Irrigation and drainage management systems are worked out in relation to water supplies and water quality available. Employment of mine spoils for agricultural and forest crops is planned.
RESULTS: Methods will be developed useable in all ecological regions of the continental U.S. for reclamation of surface mines spoils.
PROJECT MILESTONES: Annual reports of progress.
KEYWORDS: LAND RECLAMATION;COAL MINING;OIL SHALES;LIGNITE;ENVIRONMENTAL EFFECTS;PLANTS;FERTILIZERS;SOILS;IRRIGATION;CROPS;AGRICULTURE;ECONOMICS;FOOD;FORESTS;LAND USE;SOILS;SURFACE MINING;SPOIL BANKS;SEWAGE

<000004>
TITLE: Integrated Assessment; Social and Economic Consequences of Coal and Oil Shale Development
PROJECT NUMBER: EPA-IAG-D6-E766-EG
PRINCIPAL INVESTIGATOR: Davis, V.
ADDRESS: Room 420, GHI Building, US Department of Agriculture, Washington, DC 20250
AFFILIATION: Economic Research Service, Washington, D.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Washington, D.C. (USA)
DIVISION: Office of Energy, Minerals and Industry
MONITOR: Plotkin, Steve
TELEPHONE: C(202) 755-0646
TYPE OF FUNDING: EPA pass-thru funding;Interagency agreement
77 FUNDING: Environmental Protection Agency FY77:$396,000; Department of Agriculture FY77:$129,000
TECHNOLOGY: FOSSIL FUEL/Coal:Conversion liquefaction;FOSSIL FUEL/Coal:Conversion gasification (85%);FOSSIL FUEL/Oil Shale (15%)
ENERGY CYCLE: EXTRACTION (25%);COMBUSTION IN SITU (5%);TRANSPORTATION (10%);PROCESSING, CONVERSION (10%);COMBUSTION OR END USE (15%);ELECTRICITY GENERATION (20%);ELECTRICAL TRANSMISSION (5%);WASTE MANAGEMENT (10%)
POLLUTANTS: NOXIOUS GAS (20%);METALS (10%);PARTICULATES (20%);NOISE, VIBRATION (10%);HEAT, THERMAL (20%);VISUAL AESTHETICS (20%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Middle Atlantic;GEOGRAPHIC AREAS/South;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Far West;GEOGRAPHIC AREAS/Northwest;GEOGRAPHIC AREAS/Alaska;HYDROGRAPHIC AREAS/Other hydrographic areas:River basins
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Assess social and economic consequences likely from alternative patterns of coal and oil shale development.
APPROACH: Develop interregional analytical system to evaluate trade offs for different areas from different development patterns.
RESULTS: Series of reports in accord with milestones.
PROJECT MILESTONES: (1) Sept. 76-Feb. 78 7 reports, regional resource profiles: Great Plains, Rocky Mountains, interior, east, Gulf, Pacific, oil shale areas. (2) 1976-77 Reports on income, population, employment, government services effects. (3) 1978 Reclamation technologies, costs. (4) 1977 Water needs. (5) 1978 Interim report, interregional system. (6) 1980 Environmental cost-benefit report. (7) 1981 Final report.
KEYWORDS: COMMUNITIY IMPACT;DEVELOPMENT OPTIONS;COAL;OIL SHALES;SOCIO-ECONOMIC FACTORS;RESEARCH PROGRAMS;ENVIRONMENTAL EFFECTS;ECONOMICS;MINING;WATER;LAND RECLAMATION

<000005>
TITLE: Effects of Mining and Related Activities on the Forest and Range Environment and Users and Associated Communities
PROJECT NUMBER: 000020
PRINCIPAL INVESTIGATOR: Brown, H.E.
ADDRESS: 12th and Independence Ave., SW, Washington, DC 20250
AFFILIATION: Forest Service, Washington, D.C. (USA)
MONITORING AGENCY: Forest Service, Washington, D.C. (USA)
DIVISION: Forest Environment Research
MONITOR: Brown, Harry E.
TELEPHONE: F235-1071
TYPE OF FUNDING: Agency in-house effort;EPA pass-thru funding
77 FUNDING: Forest Service FY77:$817,000; Environmental Protection Agency FY77:$583,000
TECHNOLOGY: FOSSIL FUEL/General (90%);FOSSIL FUEL/Oil Shale (5%);NUCLEAR/General (5%)
ENERGY CYCLE: EXTRACTION (95%);TRANSPORTATION (5%)
POLLUTANTS: NOXIOUS GAS/SO/sub 2/ (25%);METALS/Copper;METALS/Iron (10%);PARTICULATES/Dust;PARTICULATES/Ash;PARTICULATES/Carbon (30%);ORGANICS (10%);HEAT, THERMAL (5%);VISUAL AESTHETICS (20%)

CHARACTER OF STUDY: RESEARCH/Applied (35%);DEVELOPMENT/Laboratory scale (35%);FULL SCALE DEMONSTRATION (30%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Middle Atlantic;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To assess the physical and socioeconomic impacts of mining on forest and related ecosystems. The assessments are needed for the timely formulation and implementation of policies and programs for extracting fuels in a manner that will maintain a quality environment and pertinent surface values.
APPROACH: Solutions to these mining-related problems will be achieved by a comprehensive R and D program undertaken on a national scale. The Forest Service research organization cooperating universities and other cooperators will address specific problems as they occur in affected areas of the nation.
RESULTS: The understanding and evaluation of potential mining effects so that the general health, safety, welfare, and environmental related to energy development may be protected and enhanced.
PROJECT MILESTONES: Assessment of potential impacts of mining activities by year 1990. Collect knowledge for the development of abatement measures by 1980.
KEYWORDS: FORESTS;SOCIO-ECONOMIC FACTORS;TERRESTRIAL ECOSYSTEMS;FUELS;RESEARCH PROGRAMS;MINING;ENVIRONMENTAL EFFECTS;ENERGY;EARTH ATMOSPHERE;LAND RECLAMATION;WATER POLLUTION ABATEMENT;WATER

<000006>
TITLE: Technologies for Controlling Effects of Mining on the Forest and Range Environment and on Users and Related Communities
PROJECT NUMBER: 000021
PRINCIPAL INVESTIGATOR: Brown, H.E.
ADDRESS: 12th and Independence Ave., SW, Washington, DC 20250
AFFILIATION: Forest Service, Washington, D.C. (USA)
MONITORING AGENCY: Forest Service, Washington, D.C. (USA)
DIVISION: Forest Environment Research
MONITOR: Brown, Harry E.
TELEPHONE: F235-1071
TYPE OF FUNDING: Agency in-house effort;EPA pass-thru funding
77 FUNDING: Forest Service FY77:$2,199,000; Environmental Protection Agency FY77:$539,000
TECHNOLOGY: FOSSIL FUEL/General (90%);FOSSIL FUEL/Oil Shale (5%);NUCLEAR/General (5%)
ENERGY CYCLE: EXTRACTION (95%);TRANSPORTATION (5%)
POLLUTANTS: NOXIOUS GAS/SO/sub 2/ (35%);METALS/Copper;METALS/Boron;METALS/Iron (10%);PARTICULATES/Dust;PARTICULATES/Ash;PARTICULATES/Carbon (35%);ORGANICS (10%);HEAT, THERMAL (5%);VISUAL AESTHETICS (5%)

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Middle Atlantic;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To develop technologies for controlling environmental and economic effects of mining on forest and range lands. These technologies are needed to protect and enhance the environment and to insure compliance with public health standards and social criteria.
APPROACH: A comprehensive national R and D program will be utilized to provide control technology for solutions to the mining related problems. The in-house research organization of the Forest Service and external organizations will be used to search problem solutions in all geographic areas of concern.
RESULTS: Development of technologies for extracting energy minerals, redepositing spoils, and revegetating or otherwise rehabilitating mined lands and maximize productivity and environmental quality.
PROJECT MILESTONES: Development of a broad range of control technology by 1990, with substantial development by 1980.
KEYWORDS: MINING;ENVIRONMENTAL EFFECTS;ECONOMICS;SOCIO-ECONOMIC FACTORS;PUBLIC HEALTH;STANDARDS;MINERALS;LAND USE;FORESTS;EARTH ATMOSPHERE;TERRESTRIAL ECOSYSTEMS;LAND RECLAMATION;WATER POLLUTION ABATEMENT

<000007>
TITLE: Plant Materials Studies to Improve Technologies of Surface Mine Land Reclamation
PROJECT NUMBER: EPA-IAG-D5-E765
PRINCIPAL INVESTIGATOR: MacLauchlan, R.S.
ADDRESS: U.S. Department of Agriculture, Soil Conservation Service, Washington, DC 20250
AFFILIATION: Department of Agriculture, Washington, D.C. (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Soil Conservation Service, Plant Sciences Division
MONITOR: MacLauchlan, Robert S.
TELEPHONE: F447-5667
TYPE OF FUNDING: Agency in-house effort;EPA pass-thru funding;Interagency agreement-EPA-IAG-D5-E765 Subagreement 77BEE
77 FUNDING: Department of Agriculture FY77:$400,000; Environmental Protection Agency FY77:$192,000
TECHNOLOGY: FOSSIL FUEL/Coal (90%);FOSSIL FUEL/Oil Shale (10%)
ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Soil sediment control (100%)
CHARACTER OF STUDY: RESEARCH/Applied (90%);FULL SCALE DEMONSTRATION (10%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To accelerate plant materials studies to improve technology of surface mine reclamation, to determine plant materials best suited for mine spoil reclamation under a wide range of site conditions, to develop techniques for their successful establishment and survival, and to determine the modification of equipment for seed collection, processing, and planting disturbed areas.
APPROACH: Assembling and testing large collections of native and introduced plant materials under a wide range of site and climatic conditions, selection of those found most suitable, modify conventional equipment to establish selected plants on disturbed areas, determine seed or plant production techniques, and work with commercial seed growers and nurserymen to assure an adequate commercial supply.

RESULTS: Knowledge of plants best suited for surface mine reclamation, recommendations on seeding and management of disturbed areas, and the commercial availability of needed seed and plants.
PROJECT MILESTONES: (1) Progress reports 6/76, 6/77, 6/78, and 6/79. (2) Final report 6/80.
KEYWORDS: PLANTS;COAL MINING;LAND RECLAMATION;SEEDS;AGRICULTURE;SURFACE MINING;ENVIRONMENTAL EFFECTS;TERRESTRIAL ECOSYSTEMS;FOOD;PREFERRED SPECIES;CULTIVATION TECHNIQUES;EROSION

<000008>
TITLE: Revegetation and Reclamation of Land Areas Disturbed by Mining
PROJECT NUMBER: 77BBO
PRINCIPAL INVESTIGATOR: Bennett, O.L.
ADDRESS: West Virginia University, Morgantown, WV 26506
AFFILIATION: West Virginia Univ., Morgantown (USA). Dept. of Agronomy
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Agricultural Research Service
MONITOR: Barrows, H.L.
TYPE OF FUNDING: EPA pass-thru funding
77 FUNDING: Environmental Protection Agency FY77:$330,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: EXTRACTION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Middle Atlantic;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) To develop technology required for preparing reclamation plans before mining operation begins. Approach: to characterize overburden material at several major mine sites; initiate research on weathering, leaching and other changes in mine spoils; and to screen, develop, select, and assemble laboratory procedures best adapted to characterize the chemical properties of mine spoil. (2) To study the effect of strip mining and reclamation processes on the quality and quantity of water leaving the area. Approach: predictive mathematical equations will be developed and then verified with data obtained from reclamation research plots. Management practices will be developed for restoring the hydrology of the mined area. (3) To evaluate the effect of utilizing reclaimed strip mined land for the production of specialty crops or other crops of economic importance. Approach: soil fertility management methods will be developed that will permit the production of specialty crops including buckwheat, alfalfa, clovers, grasses, and vegetables. (4) To evaluate the effect of strip mine reclamation practices on the nutritional quality of forages or other crops grown on the reclaimed area. Approach: forages and other crops will be grown on spoil material that has undergone various management methods in the reclamation process. Evaluation will be made through chemical analysis of plant material
KEYWORDS: COAL MINING;SURFACE MINING;LAND RECLAMATION;REVEGETATION;HYDROLOGY;CROPS;TECHNOLOGY ASSESSMENT;PLANTS;SOILS;SOIL CHEMISTRY;SOIL MECHANICS;CLIMATES;WATER QUALITY;WATER POLLUTION ABATEMENT;OVERBURDEN

<000009>
TITLE: Socio-Economic Analysis of Coal and Oil-Shale Development in Rural Areas
PROJECT NUMBER: EPA-1AG-D5-E766-EG
PRINCIPAL INVESTIGATOR: Schaub, J.R.
ADDRESS: 500 12th St., S.W., ERS/USDA, Washington, DC 20250
AFFILIATION: Department of Agriculture, Washington, D.C. (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: NRED, Economic Research Service
MONITOR: Schaub, John R.
TELEPHONE: C(202)447-8735
TYPE OF FUNDING: EPA pass-thru funding
77 FUNDING: Environmental Protection Agency FY77:$396,000
TECHNOLOGY: FOSSIL FUEL/Coal (50%);FOSSIL FUEL/Oil Shale (50%)
ENERGY CYCLE: EXTRACTION (50%);PROCESSING, CONVERSION (50%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) The study focuses on analyzing the primary and secondary socio-economic impacts of expanded surface mining of coal and the development of oil shale on agriculture, non-metro areas, rural people, rural communities, rural industries, and environmental quality. Significant aspects of the overall study include: assessing current resource use; estimating direct and secondary employment changes induced by energy development; analyzing population changes; estimating changes in community infra-structures, changes in demand for community services, and revenue needs and revenue potentials for impacted communities; evaluating reclamation costs and social and economic feasibility of alternative uses of reclaimed areas; appraising the effect of alternative development and processing activities on water demands and transfers; and the effect of institutions on coal and oil shale development. A major effort is to develop an analytical system to evaluate interregional economic and environmental implications and trade-offs for agricultural and rural areas. (2) Data will be collected primarily from secondary sources and analyzed using accepted procedures including partial budget analysis and linear programming. Some methodology development is required. (3) Research will be coordinated with other USDA agencies and with universities and other institutions. Cooperative relationships are to be established

<000011>
TITLE: Air Pollution--Fate and Effects Outdoor Atmosphere
PROJECT NUMBER: NJ00526-A
PRINCIPAL INVESTIGATOR: Lillian, D.
ADDRESS: Old Queens Building, New Brunswick, NJ 08903
AFFILIATION: Rutgers--the State Univ., New Brunswick, N.J. (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service New Jersey
77 FUNDING: Department of Agriculture
TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS (70%);PARTICULATES (30%)

PROJECT DESCRIPTION: To learn what happens to the pollutants after their emission to the atmosphere and to assess possible subsequent effects on various materials and surfaces.
APPROACH: The research will deal with the interactions of oxidizing pollutants with synthetic polymers. Interaction of atmospheric NO2 with water and subsequent influence on aqueous biological growth. Gas phase interactions of oxidizing compounds and Co.
RESULTS: Studied C2Cl4, Freon 11 and Freon 12. Only C2Cl4 decomposes under tropospheric simulations--all go under stratospheric. C2Cl4 gives CCl4--this may be a major source of the observed ambient CCl4 budget. Other products are COCl2 and trichloroacetylchloride. Investigated extent, nature and rate of heterogeneous reactions of primary species (SO2 and O2) to form secondary pollutants (SO4 and O3) on surface of metal oxide particulate matter. Both SO2 and O2 were chemisorbed at room temperature on the cadmium oxide. Some SO2 oxidized on surface to SO4. Rate of reaction was slow, but could be factor in long range transport. Two regimes of SO2 chemisorption: from 0 to 40% relative humidity and from 40% up to the point of condensation. In lower regime, SO2 was adsorbed directly onto CdO. In higher regime SO2 was sorbed into sheath of H2O vapor surrounding the particle. At higher humidities, more H2O vapor was adsorbed and resulted in increase in SO2 sorption and rate of SO4 formation. Larger submicron particles more effective catalysts than smaller ones. Evidence that chemisorbed O2 dissociated on the surface into atomic radicals. Some of these radicals escaped from the surface, reacted with oxygen and formed ozone.
KEYWORDS: AIR POLLUTION;FREONS;CHEMICAL REACTIONS;PHOTOCHEMICAL OXIDANTS;SULFUR OXIDES

<000012>
TITLE: Breeding and Evaluation of Kentucky Bluegrass for Turf
PROJECT NUMBER: MD-B-109
PRINCIPAL INVESTIGATOR: Hall, J.R.
ADDRESS: Agricultural Experiment Station, College Park, MD 20740
AFFILIATION: Maryland Univ., College Park (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service Maryland
77 FUNDING: Department of Agriculture
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
POLLUTANTS: NOXIOUS GAS/SOx;NOXIOUS GAS/O3 (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
PROJECT DESCRIPTION: Evaluate germplasm resources. Study the effect of different environmental factors, light intensity day length, management, humidity pollutants temperature and related environmental factors, on growth responses of turfgrass varieties and mixtures.
APPROACH: Valuable germplasm will be collected from old turf stands in Maryland. Kentucky bluegrass will be emphasized, however, other turfgrass species will not be passed over. Fumigation procedures with ozone and sulfur dioxide will be utilized to select bluegrass varieties that are least affected by these major pollutants. A study will be conducted to determine management factors that will increase resistance of varieties to air pollutants. The effect of air pollutants on varietal respiratory functions will be monitored with an infrared gas analyzer. Plots of several superior bluegrass varieties will be established separately and in combination with fine-textured ryegrasses. Combinations will be selected that give quick germination, minimum ryegrass competition and high quality turf.
RESULTS: Kentucky bluegrass cultivar testing continues intensively at two locations. Third year quality ratings indicate that the best cultivars in the metropolitan Washington, DC area under a 1 inch mowing height are: Sydsport, Brunswick, Adelphi, Plush, Warrens A-34, Vantage, Windsor, Parade and EVB391. A traffic machine with football cleats was run over one half of each cultivar entry in a split plot fashion to evalute cultivar traffic recuperative potential. Entries providing the highest quality turf under traffic during the month of August were: Ba62-55, Vantage, Brunswick, K1-155, NJE P-59, Adelphi, Parade, Enmundi, EVB 391 and Plush. Best performing cultivars over all three years at a one inch mowing height in the metropolitan Washington area are: Warrens A-34, Parade, Windsor, K1-155, NJE P-59 and a combination of Vantage and Victa. In a trial located on the Eastern Shore containing 100 entries the best performing cultivars and mixtures in 1975 were Windsor, USGA RAM No. 1, BA 61-91, Enmundi, NJE P-141, NJE P-57 + NJE P-59, NJE P-151 and NJE P-164.
KEYWORDS: GRASS;PLANT GROWTH;ENVIRONMENTAL EFFECTS;GENETIC VARIABILITY;PLANT BREEDING

<000013>
TITLE: Ecological Relationships of Pesticides, Radionuclides and Nutrients with Organisms in Aquatic Communities
PROJECT NUMBER: MICL00940
PRINCIPAL INVESTIGATOR: Kevern, N.R.
ADDRESS: New Administration Building, East Lansing, MI 48823
AFFILIATION: Michigan State Univ., East Lansing (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service Michigan
77 FUNDING: Department of Agriculture
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Pesticides (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
PROJECT DESCRIPTION: Evaluate amount, storage, build-up and releases of pesticides under varying biological and chemical conditions.
APPROACH: Studies on contamination and levels necessary to produce injury, debility, sterility or mortality will be conducted. The physiological effects of pesticides on energy exchange measured at the cellular level. Direct bioassay and gas chromatography employed to monitor the accumulation of pesticides in aquatic systems. Determine site of damage and identification of effects of detergents, metallic ions, BOD and other chemicals. Rate of transfer, buildup and exchange within the biota of aquatic systems will be determined.
RESULTS: We have collected data, from the shore waters of western Lake Erie, on the distribution of the stable element counterpart of radionuclides potentially available from nuclear power reactors. Compartments consist of sediments, water and biomass (fish and plankton). Concentrations of Cs, Co, Fe, Mn, Sr, and Zn, while varying in percent, were all concentrated mainly in the sediments. Concentrations were less in the water, but the water was most significant mass and thus accounts for a considerable portion of the elements. The biomass was insignificant in the budget of the elements but remains important as the link with humans through the food web. Analyses have been made for fall-out concentrations of 134 and 137 Cs, 57 and 60 Co, 54 Mn and 65 Zn. A mathematical model is being developed from these data that

will alloy prediction of the distribution of accidental or controlled releases of radionuclides from proposed nuclear-powered, electric generating plants on western Lake Erie.

<000014>
TITLE: Forest Tree Breeding
PROJECT NUMBER: TEN00271
PRINCIPAL INVESTIGATOR: Thor, E.
ADDRESS: W. Cumberland Avenue, SW, Knoxville, TN 37916
AFFILIATION: Tennessee Univ., Knoxville (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service Tennessee
77 FUNDING: Department of Agriculture
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS/SOx;NOXIOUS GAS/CO (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
PROJECT DESCRIPTION: Develop yellow-poplar, loblolly pine, Virginia pine, white pine and black walnut with superior quality for paper and lumber production. A Pinetum for testing of exotic pine species and production of interspecific hybrids.
APPROACH: Superior phenotypes of yellow-poplar, white pine and black walnut will be selected in Tennessee. Breeding orchards will be established by grafting of the superior phenotype material, except for Virginia pine which will be established by selection in open-pollinated progeny tests. Controlled pollinations will be carried out between clones. Progeny testing will be carried out with seed resulting from the controlled clones in order to determine general and specific combining ability. An area of approximately 60 acres will be cleared and laid out in one-acre plots. Seedlings of available pine species will be planted. Seed, both domestic and imported, will be purchased and seedlings grown for Pinetum. Periodic measurements for survival, growth, disease and insect damage and stem quality will be recorded. Controlled pollinations will be carried out to produce inter-specific hybrids. The progenies will be tested to determine hybrid vigor and adaptability.
RESULTS: Height and survival were measured in the Pinetum. Of the 39 species planted only 18 had acceptable survival after 10 growing seasons; the good survivors included all 11 species native to the Southeastern United States. None of the 16 pine species from the Western United States or Mexico survived. Of the seven surviving species exotic to the Southeast not a single species had a growth rate better than the poorest native species. About 2000 seedlings representing 10 open-pollinated families of eastern white pine have been grown for use in an experiment to measure the additive variation in depression of CO-assimilation when exposed to SO fumigation. Two growth chambers have been installed and an assimilation chamber has been constructed.

<000015>
TITLE: Action of Air Pollutants on Plants and Methods of Damage Control Especially Through Resistance
PROJECT NUMBER: 1103-14780-001
PRINCIPAL INVESTIGATOR: Heggestad, H.E.;Howell, R.K.;Bennett, J.H.
ADDRESS: Building 001, Room 206, Beltsville, MD 20705
AFFILIATION: Department of Agriculture, Beltsville, Md. (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Agricultural Research Service, Beltsville Agriculture Research Center
77 FUNDING: Department of Agriculture
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
PROJECT DESCRIPTION: Develop a better understanding of the effects of air polllution on agronomic, horticultural, and ornamental plants and develop technology for minimizing and preventing damage.
APPROACH: In greenhouse and field studies many species and varieties within species are evaluated after exposure to pollutants in ambient air, to filtered air, and to various dosages and mixtures of pollutants under controlled environment conditions. Variations in injuries, yield, quality and chemical composition are assessed and the physiological and biochemical basis of the effects determined. Technology for reducing damage will result from research to develop resistant varieties, chemical protectants, improved cultural practices, and mechanical filtering devices. Pollutants and environmental parameters are monitored.
RESULTS: Experiments were conducted to determine the effects of ambient oxidants, ozone, and sulfur dioxide on nutritional quality of forage. When Kenland red clover was grown from seed to bloom in unfiltered air of greenhouses, foliage was damaged about 60%, percent protein was decreased, percent carbohydrate and crude fiber was increased, but Vitamin A and percent lipid were unchanged. Clover plants exposed to 0.5, 1.0, and 1.5 ppM SO2 for 2 hrs developed about 10, 30, and 60% foliar injury. At the highest concentration of SO2 vitamin A was reduced. None of the treatments altered percent lipids, and the changes in other constituents were nonlinear. Exposure of Team alfalfa to either 20, 25, or 30 pphm ozone for 4 hrs caused about 20, 30, and 60% foliar injury. The 25 and 30 pphm concentrations reduced vitamin A content significantly, but the treatments did not significantly affect other quality factors. Microenvironmental conditions in open-top field chambers. During calm conditions, the interior ventilation of the chamber primarily resulted from the chamber blower although downdrafts into the chamber were common when winds were gusty. On a breezy day, oxidants were reduced about 50% in the chambers but under calm conditions they were reduced about 80%. In full sunlight the light on shaded areas was reduced as much as 50%.

TITLE: Relationship of Air Pollution to Forests in the Eastern United States
PROJECT NUMBER: NE-2208
PRINCIPAL INVESTIGATOR: Dochinger, L.S.
ADDRESS: Upper Darby, PA 19082
AFFILIATION: Northeastern Forest Experiment Station, Upper Darby, Pa. (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Forest Service, Northeast Forest Experiment Station
77 FUNDING: Department of Agriculture
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
PROJECT DESCRIPTION: Assess and predict losses due to air pollution, prevent or control air pollution effects on trees, and determine how trees can be used to cleanse pollutants from the air.
APPROACH: Studies will be made of the effect of air pollution on tree growth and mortality, the efficacy of protecting trees against air pollution by sprays, tree injections, site manipulation, and genetic resistance, and the ability of trees to remove gaseous and particulate pollutants.
RESULTS: An increasing global population and their demands for a better standard of living will assure the continuing presence of low level air pollution problems involving plant species. Cooperative research programs are needed for delineating the role of ozone and sulfur dioxide on woody vegetation. When the nature and extent of these aerial phytotoxicants on forests and trees are established, a realistic appraisal of the magnitude of air pollution incidences will be possible. As our research findings imply, these assessment data will thereby aid in defining forest economic losses, in determining pollution impact on forest resources, and in recommending control criteria for air quality conservation. Although tree species and varieties with improved tolerance to air pollution are vitally needed throughout the world, information is not available on the feasibility of developing such plant material. Significant variation in tolerance to ozone during several plant and leaf ontogenetic stages was expressed among red maple (Acer rubrum L.) progeny. The consistent exhibition in response signifies quantitative control and this genetic stability may facilitate the selection of ozone tolerant red maple seed sources and plants.

<000017>
TITLE: Influence of Environmental Parameters Upon Physiology of Avian Species
PROJECT NUMBER: TEX01604
PRINCIPAL INVESTIGATOR: Cain, J.R.;Suter, D.A.
ADDRESS: College Station, TX 77843
AFFILIATION: Texas A and M Univ., College Station (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service Texas
77 FUNDING: Department of Agriculture
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (50%);PARTICULATES (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
PROJECT DESCRIPTION: Investigate physiological responses of domestic birds to their environment; determine optimum conditions and effects of stressors. Establish relationships between air pollution and poultry production units.
APPROACH: Build and test bioclimatic chambers. Measure physiological responses of birds when subjected to controlled environmental variables; light, temperatuure, humidity, air flow rate, noxious gas level. Analyse discharge air for pollutants and evaluate methods to clean the air. Test environmental housing for practical application in the poultry industry.
RESULTS: Egg production from commercial broiler breeders during the summer was tested under four lighting regimes in 2/3 slat floor pens at a density of 1 sq. ft./bird. No difference in Hen Day Production (HDP) existed between hens beginning a day at 8:00 hrs (48.27%) and those beginning at 22:00 hrs (48.11%) despite cooler temperatures for the night lighted hens. Intermittent lighted hens receiving 1/2L:1/2D laid better (49.64%) than controls while those receiving 1/4L:3/4D laid poorer (42.11%) overall. Pertility was not affected by any treatment. Control and Night Light treatments consumed 1.13 times more kilowatt hours of energy than Long Intermittent and 1.75 times more than Short Intermittent treatments. Intermittent lighting schedules show promise for broiler breeders as improved egg production can be anticipated while saving electrical energy. Construction of bioclimatic chambers is currently progressing under the supervision of a new staff member, Mr. Larry Olson, agricultural engineer. Environmental-ovulatory control studies with coturnix were continued. Radioimmunoassay revealed peak progesterone levels (5 mg) 1 to 2 hrs prior to oviposition. Blood samples taken at 30 min. intervals showed progesterone levels rose about 6 hrs prior and continued through 1 hr prior to oviposition on days when an egg was laid the following day. This implies a somewhat different ovulatory control time sequence than that of the chicken.

TITLE: Factors Affecting Post-Harvest Market Quality of Processed Potatoes
PROJECT NUMBER: NYC-161414
PRINCIPAL INVESTIGATOR: Ewing, E.E.
ADDRESS: Ithaca, NY 14850
AFFILIATION: Cornell Univ., Ithaca, N.Y. (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service New York
77 FUNDING: Department of Agriculture
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Enzymes, exhaust fumes (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
PROJECT DESCRIPTION: Identify and quantify pre- and post-harvest conditions including storage and handling which affect the market quality of potatoes for processing.
APPROACH: Enzymes responsible for carbohydrate transformation in the potato, nucleic acid metabolism in relation to enzyme changes and chipping quality, and kinetics of carbohydrate changes in various genotypes during maturation and storage will be studied, with special attention to effects of temperature.
RESULTS: Investigations have been continued into the possible role of invertase and its endogenous inhibitor in the development of reducing sugars in potato tubers. For growing seasons, tubers have been harvested at

regular intervals from July to October. Invertase before harvest is most active at a neutral pH, whereas after harvest the optimum pH is acidic. The inhibitor seems to appear only after harvest. Two forms of invertase were separated from immature tubers, and five different forms of invertase were separated from mature tubers that had been stored. The multiple forms differ in the way that temperature affects the catalysis rate and in the binding rates between enzyme and endogenous inhibitor. They also appear to have different binding affinities toward the inhibitor. Experiments the last three storage seasons tested the effects of exhaust fumes from internal combustion engines on the incidence of sugar spot in processing potatoes. No evidence was found that either pure ethylene (a component of the fumes) or the fumes contributed to the disorder, the cause of which remains unknown.

TITLE: Effects of Pesticides and Other Environmental Pollutants on Honey Bees
PROJECT NUMBER: 1110-15560-002
PRINCIPAL INVESTIGATOR: Michael, A.S.;Shimanuki, H.;Lehnert, T.
ADDRESS: Beltsville, MD 20705
AFFILIATION: Department of Agriculture, Beltsville, Md. (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Agricultural Research Service, Beltsville Agriculture Research Center
77 FUNDING: Department of Agriculture
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS/SOx;NOXIOUS GAS/O3 (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
PROJECT DESCRIPTION: Measure and counter harmful effects of commonly used pesticides and other pollutants on honey bees.
APPROACH: Determine direct and indirect effect of sulfur dioxide and ozone on honey bee populations. Develop diagnostic methods for malathion, carbofuran, and diazinon in bees, honey and beeswax. Screen juvenile hormones as supplied by BEC Lab for effect on bees. Test pollen traps and other devices for protection of honey bee colonies against pesticides.
RESULTS: An undetermined number of post offices use dichlorvos strips for the control of insect pests. Package honey bees may be killed by this practice. The LD(50) of dichlorvos for honey bees in laboratory situations was 0.76 micrograms/l. However, when tests were conducted in rooms, dichlorvos levels of 0.05 to 0.15 micrograms/l resulted in nearly 100% mortality. In enclosed rooms, even 1/2 of the recommended levels of dichlorvos was sufficient to kill 100% of the adult bees. Recommendations made to the Postal Service based on this work have resulted in a major change in the use of dichlorvos strips. Laboratory tests with selected insect growth regulators indicated a need for further research on the potential hazard to nontarget insects. At a level of 0.1 microgram/larvae (4 to 5-day-old larvae), a reduction in emergence of honey bees was noted in some compounds. The significance of the levels in field conditions is not known at present.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS/O3;NOXIOUS GAS/SO2;NOXIOUS GAS/NH3 (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
PROJECT DESCRIPTION: Investigate: growth and physiological responses of selected crops to air pollutants (O3, SO2, NH3); dose-response relationships; effects of pollutant combinations; response of plants as affected by environmental and biotic factors; potential of plants as pollutant sinks; the economic impact.
APPROACH: Use phytotron, greenhouse and field exposure facilities for control and monitoring of pollutants. Plant responses include: pollutant uptake, net photosynthesis, transpiration (stomatal response), growth and yield parameters, nutrient ratios and visible injury. Exposures will be acute, acute-chronic and chronic. Response measures will be over time to permit generation of rate functions. Screening procedures permit cooperation with plant breeders. Field exposures will study ambient pollution effects.

TITLE: Physiological Response of Shade and Ornamental Trees to Environmental Stress
PROJECT NUMBER: 3306-16020-004
PRINCIPAL INVESTIGATOR: Roberts, B.R.;Townsend, A.M.
ADDRESS: P.O. Box 365, Delaware, OH 43015
AFFILIATION: Agricultural Research Service, Delaware, Ohio (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Agricultural Research Service, Illinois-Indiana-Ohio Area
77 FUNDING: Department of Agriculture
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS/SO2 (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
PROJECT DESCRIPTION: Develop fundamental information on the physiological interactions which occur in woody plants subjected to environmental stress, particularly air pollution. Study methods of modifying the plant or its environment to reduce stress injury.
APPROACH: Selected shade and ornamental tree species will be subjected to a variety of stress factors, singly and in combination, under controlled environmental conditions. Physiological and biochemical responses will be evaluated and comparisons made within and between species. Radiochemical procedures will be used to trace the absorption and distribution of SO2 in woody plants.
RESULTS: Foliar uptake of 1.0 ppM sulfur dioxide (SO2) was measured in a variety of shade and ornamental species. Red maple, white birch, and sweetgum showed appreciably greater vegetal sorption than comparable species of rhododendron, white ash, and azalea. There was no significant difference in the capacity of

foliage from white ash and azalea to remove SO2 from the air at concentrations of 1.0, 0.5, and 0.2 ppM. However, leaves of white birch and firethorn showed significantly less uptake at 0.2 ppM compared with uptake at the higher concentrations. Significant interspecific and intraspecific variation was demonstrated in the rate of foliar sorption of ozone (03) at a concentration of 0.2 ppM. White oak and white birch foliage removed the largest quantities of 03, while red maple and white ash were less efficient. Variation in tolerance to 03 (0.75 ppM) was also observed among red maple seedling progenies from seed sources in Alabama, Minnesota, Maine, and Pennsylvania. Differences in seedling response occurred in extent of injury but not in type of injury. The stability of 03 tolerance during several plant and leaf ontogenetic stages signifies strong genetic control.

TITLE: Economics of Coal and Oil Shale Development on Environmental Quality in Rural Areas
PROJECT NUMBER: NRE-42-309-11-00
PRINCIPAL INVESTIGATOR: Magleby, R.;Schaub, J.;Krause, O.
ADDRESS: 14th Street and Independence Avenue, SW, Washington, DC 20250
AFFILIATION: Department of Agriculture, Washington, D.C. (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Economic Research Service, Division of Natural Resource Economic
77 FUNDING: Department of Agriculture
TECHNOLOGY: FOSSIL FUEL/Coal (30%);FOSSIL FUEL/Oil and Gas (40%);FOSSIL FUEL/Oil Shale (30%)
ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Coal residues (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
PROJECT DESCRIPTION: Assess the economic implications of alternative coal and oil shale development and associated activities on environmental quality and the competition for resources in rural areas.
APPROACH: Develop regional reports on current land and water use, the economic implications for future resource use, resource competition, and environmental quality resulting from alternative levels of coal and oil shale development, and related activities. Develop an interregional linear program to evaluate conflicting reclamation budgets from available literature, cooperation with other agencies within and without USDA, and limited empirical studies. Budgeting techniques and linear programming will be used to estimate water demand and to appraise the economic and environmental implications of alternative water supplies.
RESULTS: The general objective of this project is to assess specific-socio-economic impacts and implications of coal and oil shale development and to integrate these separate assessments into an interregional analytical system. The system can then be used to make comparative assessments of alternative patterns of coal and oil shale development which might be chosen by private decisionmakers and public policymakers. The work is being performed partly with pass-through funds from EPA, under ERS-EPA/USDA-EPA interagency agreements. Research results from the project are not yet available. In accord with the research agreement with EPA, and the initial Accomplishment Plan with milestone dates for completing specific objectives, work began on the following tasks: (1) provide regional reports on resources available to meet alternative demands for new energy, land and water resources which would be affected, and economic implications for agriculture; (2) evaluate costs of reclaiming mined lands at specific sites; (3) develop an analytical system for evaluating interregional economic implications and tradeoffs for agriculture and rural areas resulting from coal development; (4) assess the demand for water for energy development and the competition for water between agriculture and energy use in coal mining and processing.

TECHNOLOGY: FOSSIL FUEL/Coal (30%);FOSSIL FUEL/Oil and Gas (30%);FOSSIL FUEL/Oil Shale (40%)
ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Coal residues (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
PROJECT DESCRIPTION: Assess the economic implications of alternative coal and oil shale development and associated activities on environmental quality and the competition for resources in rural areas.
APPROACH: Develop regional reports on current land and water use, the economic implications for future resource use, resource competition, and environmental quality resulting from alternative levels of coal and oil shale development, and related activities. Develop an interregional linear program to evaluate conflicting reclamation budgets from available literature, cooperation with other agencies within and without USDA, and limited empirical studies. Budgeting techniques and linear programming will be used to estimate water demand and to appraise the economic and environmental implications of alternative water supplies.
RESULTS: Major reserves for economical stripping are located in the northern half of the Appalachian Basin, the Illinois Basin and the Northern Great Plains regions. Major concern is with the socio-economic problems associated with coal development, problems which will result primarily from the thrusting of large numbers of people quickly into a sparsely populated rural area and impact of employment and wage rates, social costs and benefits, effects on other sectors of the economy and on government and questions of equity. The location and level of development activities will depend upon: energy prices; coal quality, depth of seam; water availability of the cost of extraction, transportation, and processing, air pollution laws; reclamation laws; severance taxes; and other factors. The national goal of increased energy self-sufficiency has placed major importance on increased coal production and potential oil shale

development. The economically attractive surface mined coal is expected to provide much of the increased output in the near future. The environmental impacts of surface mining, energy conversion, and urbanization are a major concern in coal and oil shale producing areas.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
PROJECT DESCRIPTION: Improve the understanding of mechanisms of resistance in trees and shrubs to sulfur dioxide and ozone so as to provide physiological indices for selecting woody plants for use in areas exposed to air pollutants.
APPROACH: Experimental trees and shrubs will be exposed in laboratory chambers to controlled dosages of sulfur dioxide and ozone. Included will be pines, oaks, ash, poplars, and shrubs of varying degrees of resistance to air pollutants. Photosynthesis and respiration will be monitored and cytochemical responses will be observed. Physiological responses will also be determined for plants in a carefully monitored field site with likely acute episodes of sulfur dioxide and ozone air pollution. Physiological indices to sulfur dioxide and ozone resistance will be formulated from resulting data.

TITLE: Monitoring and Assay of Phytotoxic Airborne Pesticides and Volatile Pollutants
PROJECT NUMBER: IOW01802
PRINCIPAL INVESTIGATOR: Sherwood, C.H.;Shaw, R.H.
ADDRESS: Beardshear Hall, Ames, IA 50010
AFFILIATION: Iowa State Univ. of Science and Technology, Ames (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service Iowa
77 FUNDING: Department of Agriculture
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (50%);PARTICULATES (50%)
CHARACTER OF STUDY: ANALYTICAL (100%)
PROJECT DESCRIPTION: Evaluating (uncontrolled) air pollution cases involving appreciable concern to the public or damage to crops. Detecting pollution incidence in representative Iowa rural and urban areas and improving use of instruments and biological tests. Relate damage potential to plant characteristics, pollutants, pollution patterns and environment. Provide concerned gardeners and commercial growers means for limiting damage from air pollution.
APPROACH: Obtain notification of pollution and other cooperation by extension personnel and state horticultural organizations. Monitor and assay representative rural and urban sites for pollution as related to environmental conditions, identifying advantages and disadvantages of instrumentation and biological tests and relating to sources and risks. Through controlled exposure patterns and pre- and post-exposure conditions improve diagnosis and prognosis procedures relating to 2,4-D, NH3, O3, SO2 and other pollutants, pollutant combinations and patterns. Test use of indicator plants and observation training for concerned gardeners. Test advantages of incorporating warning or marking agents in high risk home-use packaged pesticides and formulations of professional applicators. Develop use of protective or antagonistic materials such as organic irons, sequestrins and oxidation catalysts against known or expected pollutants.
RESULTS: Doubling plant content of treatment chambers increased time to attain 1 ppM O3 by 20%. Average person capable of smelling 0.1 ppM O3. Exposure to 0.1 to 1 ppb 2,4-D hastens germination by 48 hrs and recovery of plants; 0.1 to 1 ppM delays germination, kills radical tip and plants die. Pentachlorophenyl formulations insidious, differing in toxicity though labels similar. Of other penta forms tested, M-chlorcphenyl much more toxic than pentachlorophenyl. Drying time of formulations not major problem; Iowa home treated 3 yrs ago still toxic. No practical way to decontaminate treated homes found. Lab tests establishing the competence of XAD-2 as an absorber of trifluralin. Experiments on humidity dependence of XAD efficiency of absorption were initiated but need to be extended. Field samples of 2,4-D were taken at the pesticide circle at the horticulture farm, along with wind speed and direction and temperature.

AFFILIATION: Pennsylvania State Univ., University Park (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service Pennsylvania
77 FUNDING: Department of Agriculture
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS/SO2 (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
PROJECT DESCRIPTION: Develop new honey products; improve crown vetch pollination and relate to feeding behavior; study chronic and acute effects of SO2; study toxicity and immunogenicity of vespid venoms.
APPROACH: Various sources of fruit flavors will be tested in creamed honey and consumer acceptability determined. Colony arrangement in the field, effect of external and internal feeding on % crown vetch pollen collected, rotation of colonies and period of rotation, selectivity of honey bees for crown vetch genotypes will be determined. Fumigation with various concentrations of SO2 and monitoring flight activity, mortality, etc. will be bioassayed. Chronic toxicological studies on three animal species with vespid venoms will be done by noting behavioral and pathological changes.
RESULTS: Extensive progress has been made in the desensitization of individuals hypersensitive to insect venoms. Pure honey bee venom has been approved for sale by the Bureau of Biologics and should be on the open market by Spring 1976. Extensive human studies in conjunction with Johns Hopkins University are now being done with the vespid venoms. Preliminary indications are that they are just as therapeutically effective as honey bee venom.

TITLE: Carcinogen-DNA Complexes--Structure and Interactions
PROJECT NUMBER: R01 CA 17922-02
PRINCIPAL INVESTIGATOR: Clarke, R.H.
ADDRESS: 755 Commonwealth Ave., Boston, MA 02215
AFFILIATION: Boston Univ., Mass. (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$32,070
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The proposed research program seeks to detail the geometry of complexes of carcinogenic polycyclic hydrocarbons with DNA and chromatin and to elucidate the intermolecular interactions which stabilize them. Our approach will be through the utilization of magnetic properties in the excited triplet states of the carcinogen to probe the orientations and interactions within the complex, using newly developed methods of optical detection of magnetic resonance.
APPROACH: Our experiments will focus on complexes of nucleic acids with polycyclic hydrocarbons which have been postulated to be actively involved in carcinogenesis and which may be of importance in elaborating mechanisms of chemical carcinogenic activity at the molecular level.

<000031>
TITLE: Responses of Selected Southern Tree Species to Specific Environmental Contaminants
PROJECT NUMBER: LAZ00007
PRINCIPAL INVESTIGATOR: Garrett, H.E.
ADDRESS: School of Forestry, Ruston, LA 71270
AFFILIATION: Louisiana Tech Univ., Ruston (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (25%);METALS (25%);PARTICULATES (25%);ORGANICS (25%)
PROJECT DESCRIPTION: Evaluate the sensitivity of certain important Louisiana timber species to industrial contaminants. Relate the intensity of damage to combinations of environmental variables (i.e. temperature, light, and relative humidity), plant moisture relations, and to a range of concentrations of the specific contaminants (SO2,H2S, and O3). Determine maximal levels of the contaminants which are tolerable without producing serious physiological disorders in the selected species. Establish the effects of industrial air pollutants on the growth of important timber species under field conditions using the results of the laboratory studies as guidelines. Develop sound proposals to counteract observed effects of industrial air emissions on trees; establish criteria upon which more meaningful federal and state air pollution regulations could be founded.
APPROACH: Seedlings of selected tree species will be field-lifted, potted, and moved to laboratory facilities. Exposure to controlled concentrations of SO2, H2S, and O3, and regulated combinations of light, temperature, relative humidity, and plant moisture relations will occur. ''Apparent photosynthesis'' and chemical composition of plant materials will be monitored to determine the effects of contaminants on plant growth. Field observations in areas of high contaminant concentrations will be made using procedures developed in the laboratory. Comparisons between field and laboratory results will be done.
RESULTS: A screening program to determine the relative sensitivity of nine study species to SO2 and H2S has been completed.

<000032>
TITLE: Effect of Rainfall Acidity on Coniferous Trees
PROJECT NUMBER: COL00326
PRINCIPAL INVESTIGATOR: Marlatt, W.E.;Striffler, W.D.
ADDRESS: Agricultural Exeriment Station, Fort Collins, CO 80521
AFFILIATION: Colorado State Univ., Fort Collins (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: Determine the tolerance levels of native coniferous species to artificially applied acid precipitation. Determine the effects of artificially applied acid precipitation on the growth, vigor, and foliage characteristics of native coniferous seedlings.
APPROACH: Three species of native coniferous species will be subjected to acid precipitation applied at two levels of acidity plus a control. Test will be done on plot basis with approximately 3 year old seedlings as subjects. Seedlngs will be examined by color, needle length, bud formation, shoot elongation, etc.
RESULTS: Seven species of conifer seedlings were subjected to various concentrations of sulphuric acid spray, from pH 6 to pH 1. After 5 months no significant differences were observed except the pH 1 sulphuric acid solution spray treatment. After a year, the pH 6-pH 2 treatments showed no measurable treatment effects on the seedlings. The irrigated pH 2 and pH 3 treatments showed a significant increase in soil acidity. It appears for acid rainfall to cause direct damage to plant tissue it must be able to wet the surface and be sufficiently concentrated to burn the tissue.

<000033>
TITLE: Microspectrophotometric Analyses of Tissue Changes in Vertebrates Exposed to Water Pollutants
PROJECT NUMBER: PEN10921
PRINCIPAL INVESTIGATOR: Anthony, A.;Neff, W.
ADDRESS: 201 Shields Bldg., University Park, PA 16802
AFFILIATION: Pennsylvania State Univ., University Park (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: METALS (20%);PARTICULATES (30%);ORGANICS (50%)
PROJECT DESCRIPTION: Develop and evaluate short term methods for detecting (by means of quantitative histochemical bioassays) the presence of hazardous levels of specified toxicants in streams.
APPROACH: Tissue samples will be obtained from fish exposed to sublethal and lethal levels of metal toxicants and acidity simulating conditions found in waters polluted by acid mine drainage. Laboratory and field studies will be made on fish subjected to acute (1 to 7 days) and longer term (1 month) exposures to different concentrations of heavy metal ions in acidified water. Emphasis will be on histophysiological effects of single metallic ions, ion-ion interactions and ion-acid interactions. Quantitative cytophotometry will be used to assess toxicant induced aspects of tissue damage.
RESULTS: Both field collected and laboratory maintained fish were used in experiments validating the feasibility of employing histopathological changes in fish as indicators of stream or river pollution by industrial effluents. Field specimens consisted of white perch and tomcod collected from estuaries near a nuclear power plant and central sites of the Hudson River; laboratory specimens were brook trout maintained in acidified water to stimulate different severities of mine acid pollution. Histochemical analyses of respiratory, digestive and excretory organs include tests for nucleic acids, polysaccharides, lipids and proteins. Conventional and multiple differential staining methods were used for cytomorphological studies. It was established that Papanicolaou staining of microscopic sections is ideally suited for screening specimens and detecting the presence of pathology in specific organs. Histochemical studies, on the other hand, often provide clues regarding the etiological basis of metabolic disturbances in different organs.

<000034>
TITLE: Socio-Economic Analysis of Economic Development and Environmental Degradation--Four Corners Area
PROJECT NUMBER: NM00203
PRINCIPAL INVESTIGATOR: Randall, A.J.;Carruthers, C.E.;Eastman, C.E.
ADDRESS: University Park, Las Cruces, NM 88070
AFFILIATION: New Mexico State Univ., University Park (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: EXTRACTION (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: METALS (25%);PARTICULATES (25%);ORGANICS (25%);RADIATION (25%)
PROJECT DESCRIPTION: Calculate the social and economic benefits and costs of environmental degradation.
APPROACH: Methodology will be developed for measurement of social and economic costs of environmental degradation, demand curves will be fitted to the supply curve for abatement, and a regional input-output model will be developed to evaluate effects on employment and income.
RESULTS: An analysis of the impact of public policy upon the magnitude and timing of coal and oil shale development has been completed. The results indicate that reclamation requirements are an important determinant of development feasibility and that proposed alterations in federal lease terms may tend to reduce the rate of energy resource development. An atmospheric diffusion model was utilized to estimate the concentration and geographical distribution of pollutants emitted from the Four Corners Power Plant. The results indicate that the highest concentrations of pollutants occur east and west of the plant in the region's major centers of population and agricultural production. Concentrations are sufficient to produce odor and taste on occasion as far away as forty kilometers from the facility. A simulation study of the effects of atmospheric pollutants upon crops indicates that the current concentration is not sufficient to reduce yields. However, a comparison of the full social benefits of increased pollution control to the cost of control provides evidence that the environmental regulations adopted by the state of New Mexico are economically justified. Alternative projections of the demand for electricity in the southwest region have been developed. It is concluded that current planning procedures may result in an overinvestment in generating capacity and that internalization of environmental costs may result in a reduction of the

growth rate in demand.

MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: EXTRACTION (50%);COMBUSTION OR END USE (50%)
POLLUTANTS: NOXIOUS GAS (25%);PARTICULATES (25%);ORGANICS (50%)
PROJECT DESCRIPTION: Determine the chemical and physical factors governing the concentration in time and space of sulfur dioxide, oxidants, ozone, carbon oxides, carbonyls, organic acids, inorganic and organic nitrogen compounds, inorganic and organic aerosols. Study the effects of these materials on natural and anthropogenic material of construction, i.e., textiles, plastics, metals and alloys.
APPROACH: Source sink studies, capture atmosphere studies, reactor studies, and chamber studies will be conducted.
RESULTS: Laser light scattering determination of the growth of aerosolized saline droplets has been made. Preliminary computer analysis results indicate that submicron droplets complete about 90% of their growth in the first second after environmental exposure i.e. relative humidity. Cooling tower intake water was aerosolized under the same conditions with the results indicating a more complex growth mechanism, which limits the growth potential of the drops and alters the initial crystalline morphology. Note, the cooling tower operated with brackish intake water.

<000036>
TITLE: Ethical Choices in Environmental Decisions
PROJECT NUMBER: WIS01888
PRINCIPAL INVESTIGATOR: Heberlein, T.A.
ADDRESS: 116 Agriculture Hall, Madison, WI 53706
AFFILIATION: Wisconsin Univ., Madison (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: NOXIOUS GAS (33%);PARTICULATES (33%);ORGANICS (34%)
PROJECT DESCRIPTION: Determine conditions under which individuals and organizations make ethical choices about action which has environmental impact. Discover the attitudes values, and perceptions of those individuals who are influenced by environmental standards. Learn how decision makers in public utilities make trade offs between environmental and economic concerns in decisions involving power generation.
APPROACH: Observe actual behavior in a situation where the individual could choose to act consistently with an environmental standard at a high cost or to violate the standard by taking some cheaper or easier alternative ation. Mailed questionnaires will be used to assess attitudes, values, and perceptions of these groups. Several case studies of the decision making process involved in the development of electrical generating facilities.
RESULTS: Two-hundred and sixty-six Standard Oil dealers in the State of Wisconsin were asked to observe people who purchased lead-free gasoline, and a control group of those who purchased regular. From these license numbers, names and addresses of those to whom the car was registered were obtained. Of these 443, accurate questionnaire data was obtained from 305, or 68.8 percent. This questionnaire included measures of a number of attitudes, beliefs and other personality characteristics, as well as behavior reports and background variables. Analysis of the data suggest that less than 25 percent of the lead-free buyers are making a purely ethical choice. Most are making a choice based on economic rationality as well as a sense of personal obligation. Those who are making an ethical choice have less cognitive bolstering and are less committed to the behavior. The personal norm to purchase lead-free gasoline is weak, but noticeable and has a substantial effect on behavior. Ascription of responsibility and awareness of consequences also have an effect on behavior. There is a feedback between holding a personal norm and perceiving a social norm for the behavior. Economic rationality and social influence from the gasoline dealer and car seller also influence behavior. It was further found that as attitudes become more specific, they become better predictors of behavior.
KEYWORDS: HUMAN POPULATIONS;BEHAVIOR;DECISION MAKING;SOCIO-ECONOMIC FACTORS;PETROLEUM INDUSTRY;ELECTRIC POWER;PUBLIC UTILITIES;ENVIRONMENTAL EFFECTS;AUTOMOBILES;GASOLINE;FUEL CONSUMPTION

<000037>
TITLE: Impact of Sulfur Dioxide on Physiological Processes of Woody Plants
PROJECT NUMBER: IND059034
PRINCIPAL INVESTIGATOR: Chaney, W.R.
ADDRESS: Executive Bldg., Lafayette, IN 47907
AFFILIATION: Purdue Univ., Lafayette, Ind. (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS (33%);PARTICULATES (33%);ORGANICS (34%)
PROJECT DESCRIPTION: Determine the effects of sub-acute levels of sulfur dioxide on various aspects of growth of selected tree species. Measure the effects of sulfur dioxide on gas exchange phenomena of sensitive and non-sensitive individuals and species.
APPROACH: Selected branches and potted seedlings will be variously fumigated with low levels of sulfur dioxide in isolette chambers in the field and greenhouse. Effects of development of bud primordia, expansion of dormant buds, and leaf abscission will be quantified. Effect on gas exchange phenomena will

be determined in the laboratory with an infrared gas analyzer and thermocouple psychrometer.
RESULTS: Investigations of antagonism between sulfur dioxide and cadmium were continued. Red pine (Pinus resinosa Ait.) pollen was germinated in water cultures. Pollen germination in water of approximately 90% was reduced to 30% by CdCl concentrations of 250 ppB and to 10% by 500 ppB CdCl. The inhibitory effect of 250 ppB CdCl was reduced by 25 and 50 ppM NaHSO so that 70% of pollen germinated. The detrimental effect of 500 ppB CdCl could be partially overcome by NaHSO; 30% pollen germination with 25 ppM NAHSO and 50% germination with 50 ppM NaHSO. Antagonism between cadmium and other compounds was continued in greenhouse experiments involving soybeans (glycine max) in pots with acid washed quartz sand. Cadmium chloride conc. of 0 and 20 ppM were mixed with concentrations up to 500 ppM CaCO and Cd(OH) and added to the pots. Biomass of roots and shoots was reduced to about 10% of controls by 20 ppM CdCl alone or in combination wih all concentrations of CdCO. The detrimental effects of CdCl were more than 50% overcome by 40 ppM Ca(OH) and completely eliminated by 200 or 400 ppM Ca(OH). These results are significant because they demonstrate antagonism between two pollutants, Cd and SO, which often enter the environment from the same source. The environmental effects of these pollutants may be ameliorated when they occur together. These studies also suggest the possibility of reducing the impact of soil borne Cd by liming.

<000038>
TITLE: Air Pollution Interactions on Crop Plants
PROJECT NUMBER: WIS01947
PRINCIPAL INVESTIGATOR: Tibbitts, T.W.
ADDRESS: 116 Agriculture Hall, Madison, WI 53706
AFFILIATION: Wisconsin Univ., Madison (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS (33%);PARTICULATES (33%);ORGANICS (34%)
PROJECT DESCRIPTION: Determine sensitivity of selected crop cultivars to ozone, sulphur dioxide and nitrogen dioxide alone and in combination. Evaluation of symptomology and extent of damage to these crops around a coal fired power plant in Central Wisconsin.
APPROACH: Controlled fumigations will be undertaken in the Biotron under optimum growth conditions to determine minimum threshold dosages for fumigations of 1 to 8 hrs for carrots, mint, peas, turfgrass, and alfalfa. The threshhold levels for ozone, sulphur dioxide and nitrogen dioxide as separate pollutants and as mixed pollutants will be determined. Study of stomatal response of the separate cultivars during fumigations will be followed with porometer measurements and silicone rubber impressions. Crop injury around a new coal-fired power plant will be followed both through a series of 16 alfalfa plantings located in a uniform manner around the plant and through continuous monitoring of the atmospheric pollutants.
RESULTS: Alfalfa fields have been sampled at regular intervals in 1972, 1973, 1974 to establish the normal level of alfalfa yields and types of injury before the generating plant began operations and sampled during this summer of 1975 as partial operation was initiated. No evidence of air pollution injury was found in any season. Fumigations in controlled environments with SO2 and O3 upon the A1 sweet cultivar of peas have demonstrated that 2100 ug/m(3) of SO2 and 400 ug/m(3) of O are minimum critical levels and that a combination of these pollutants is damaging at 520 ug/m(3) SO2 and 260 ug/m(3) O. Procedures are being develcped to utilize the level of chlorophyll in the leaf tissue as the basis for determining accurately the degree of pollution injury to the leaves. A study of soil and foliar applications with an experimental compound, DPX 4891, from E.I. du Pont de Nemours and Co. was undertaken at Hancock, WI for protection of Norland potatoes from oxidant injury. No significant results were obtained for no evidence of pollution injury was observed in the control treatments. Oxidant data has been collected and analyzed during the past season from these instruments; one located near the Portage generating station, one at Madison, and one at Hancock. Similar oxidant levels were recorded at all sites with levels significantly greater than during the summer periods of 1972-74.

<000039>
TITLE: Change in Air Pollution and Noise Pollution After the Introduction of Plant Materials
PROJECT NUMBER: DEL.X-PR-0002-3234
PRINCIPAL INVESTIGATOR: Dill, N.H.;Helmy, E.;Howell, J.T.
ADDRESS: Undergraduate School, Dover, DE 19901
AFFILIATION: Delaware State Coll., Dover (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (50%);NOISE, VIBRATION (50%)
PROJECT DESCRIPTION: Discover improved methods of habitat modification through active environmental manipulation of selected habitats and through assessment of previous manipulation practices.
APPROACH: The interactions of man and environment are major concerns not only of the agriculturist, engineer, envircnmentalist, biologist, ecologist, and conservationist but also of the sociologist, psychologist, physician, and philosopher. The study of man in nature involves the study of the natural system and the nature of man himself. The program is divided into the following areas: The Human Habitat (Environmental Effects of Introducing Plants into a Designed Landscape), Wildlife Habitat Improvements, Agricultural Ecosystems (Agricultural Drainage), Fisheries Management.
RESULTS: Noise measurements on original sites continue: Grass campus area perpendicular to U.S. 13, 3-m white pines on 6-ft centers in 7-yr plantation, 10-m wide alleyway between pine plantations, 40-ft wide powerline shrub strip (mostly Clethra alnifola and ericads, 2-m max height) and dirt road adjacent to site No. 4. Two sites have been added: 2-m scotch pine and 3-m loblolly pine plantations. Attenuation per doubling of distance (March 75) on white, loblolly, and scotch pines and deciduous shrubs averaged 8 dbA with a range of 0 to 15 dbA. For same period, excess attenuation (open control areas minus plants) averaged over monitoring stations at 25, 50, 100, 200, and 400 ft are as follows--deciduous shrubs: 12 dbA at 250 H, 10 dbA at 500 H, 4 dbA at 1000 H; scotch pine: 7 dbA at 250 H, 1 dbA 500 H, dbA at 1000 H; white pine: 6 dbA at 250 H, 7 dbA at 500 H, 2 dbA at 1000 H; loblolly pine: 3 dbA at 250 H, 7 dbA at 500 H, 2 dbA at 1000 H. These averages assume attentuation is linear with distance. Noise source is placed at edge of vegetation. A more suitable speaker has been specially developed for our work; a monitoring technique

using six matched microphones has been devised. Further noise measurements will include extensive air temperature and humidity correlations. Averaged preliminary campus ozone measurements (75/9/1) are .043 ppM at highway and .021 ppM at campus interior.

<000040>
TITLE: Effects of an Altered Temperature Regime and Chemical Contaminants on the Aquatic Ecosytem
PROJECT NUMBER: M-000171
PRINCIPAL INVESTIGATOR: Witt, A.;Campbell, R.S.;Jones, J.R.
ADDRESS: 130 Jesse Hall, Columbia, MO 65201
AFFILIATION: Missouri Univ., Columbia (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: FOSSIL FUEL/General (50%);NUCLEAR/General (50%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: HEAT, THERMAL (100%)
PROJECT DESCRIPTION: Determine the effect of an altered thermal regime on reproduction in fishes. Determine the effect of an altered thermal regime on disease, and the growth of diseased fish and their resistance to thermal stress.
APPROACH: Control fish and fish in a thermal effluent will be caged and fed ad libitum. Time of reproduction and fecundity determined from gonads. Eggs and larvae raised in the laboratory; determine relation between thermal history of fish and mortality. Fish sampled from hot water outfall and rest of lake will indicate incidence of lymphocytis. Infected and healthy fish fed experimentally for differences in rate of growth and stress to high temperature.
RESULTS: The incidence of lymphocystis, a disease of fishes, in cooling reservoirs is being investigated. The maximum incidence of the disease in Pomoxis annularis, from a normal reservoir, was 10.7% in July. P. annularis in Thomas Hill, a cooling reservoir, was free of the disease (sample size 2500). Montrose Lake, a cooling reservoir, contains 17 species and 6000 fish were examined. The disease is prevalent in Lepomis humilis. Only 2 L. machrochirus were infected. The monthly incidence of the disease in L. humilis and mean temperature (c) follows: May, 1.8%, 25.5; June, 7.8%, 29.8; July, 10.7%, 31.5; August, 6.0%, 30.7; September, 15.2%, 17.7. Maximum incidence of the disease appears to occur at medial temperatures and not at highest temperatures. Diseased fish may be stressed at high temperature and die, thus reducing the apparent incidence of the disease. A breeding population of L. humilis was established to be used as a source of disease-free experimental fish. A $25,301 grant from the Manufacturing Chemists Association will enable a study of ''Interaction of Phthalic Acid Esters with Hydrosoil Communities'' in cooperation with the U.S. Fish Pesticide Research Laboratory. Problems are delineated, students selected, and literature review initiated.

MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS (33%);PARTICULATES (33%);ORGANICS (34%)
PROJECT DESCRIPTION: Study effects of acute and chronic SO2 levels on physiological processes of woody plants, primarily gymnosperms. Study effects of leaf structure, environmental changes, and protective films on SO2 effects on sensitive and tolerant species.
APPROACH: Fumigate plants with SO2 at Cotyledon and foliage-leaf stages. Determine chlorophyll content (spectronic colorimeter), photosynthesis and carbohydrate translocation (CO2 analyzer, CO2 fixation and liquid scintillation spectrometry), SO2 uptake and translocation (sulfur analyzer S uptake), transpiration (gravimetric method), water potential (pressure chamber), shoot and cambial growth (microscopy), extent of injury (light and electron microscopy), and dry weight increment. Determine effects of silicone emulsions, hexadecanal, and antitranspirants as protective films.
RESULTS: Seedlings of Quercus alba, Platanus occidentalis, Fraxinus pennsylvanica, and Acer saccharum were fumigated with ozone (10 pphm for 3 hrs) or SO (0.75 ppM for 3 hrs) at 0, 3, 5, and 7 days after soil irrigation. These pollutants affected stomatal aperture differently, with ozone inducing stomatal closure and SO suppressing it as soil dried. Soil moisture content decreased faster in SO-treated plants than in controls, reflecting prevention of stomatal closure by SO. Soil moisture content decreased more slowly in ozone-treated plants than in controls, reflecting the stomatal closing effect of ozone. Sulfur uptake by leaves and translocation to stems and roots generally was higher in species with low stomatal diffusion resistance (Fraxinus pennsylvanica) than species with high resistance (Acer saccharum). Species tolerance to pollution was related to stomatal diffusion resistance.

TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (33%);COMBUSTION OR END USE (33%);ELECTRICITY GENERATION (34%)
POLLUTANTS: NOXIOUS GAS (33%);PARTICULATES (33%);ORGANICS (34%)
PROJECT DESCRIPTION: Characterize the frequency, intensity and duration of low level radiation inversions at the Staton-Beulah, North Dakota area. Simulate the probable dispersion of waste effluents from various operational levels, areal distribution, and techniques of coal development at the Staton-Beulah, North

Dakota area.
APPROACH: Two towers at the study site will be equipped with meteorological instrumentation for continuous temperature and wind profile observations. Time-dependent occurrence of low level inversions will be analyzed and related to surface cover and weather conditions. Atmospheric diffusion models will be used to simulate the dispersion of probable air pollutants from a power plant in the study-area and from a simulated coal gasification plant around the Beulah area.
RESULTS: Eighteen months of continuous temperature and wind profile from a 350-foot and a 620-foot tower were processed and analyzed for information on the climatology of diurnal radiation inversions, and potential fumigation conditions. Preliminary analyses of data during the first year of a four-year study suggest that prolonged occurrence of radiational inversions lasting for as long as six hours in about 10 per cent of days in 1974. In about half of the number of days in the year the radiational inversions occur for one-hour or less. From among these inversion occurrences, potential fumigation conditions given hypothetical stack-height effluent releases are being analyzed.

POLLUTANTS: NOXIOUS GAS (33%);PARTICULATES (33%);ORGANICS (34%)
PROJECT DESCRIPTION: Determine the distribution and levels of polycyclic aromatic hydrocarbons in soil, water and plants in relation to point or diffuse sources of origin, e.g., from power plants, incinerators, oil refineries, and automobile or marine engine exhausts. Make recommendations for land or water use that will avoid health hazards due to elevated concentrations of carcinogenic or cocarcinogenic polynuclear aromatic hydrocarbons.
APPROACH: Samples of soils, water, and plant materials will be collected from areas where enrichment of polycyclic aromatic hydrocarbons might be expected, e.g., from fallout near incinerators or oil refineries, from automobile exhausts near highways and in metropolitan areas, or from marine engine exhausts near marinas, as well as from control areas where background levels can be established. The hydrocarbon mixtures will be extracted, separated by high-pressure liquid chromatography and/or gas chromatography, and assayed by fluorescence spectroscopy. Regions of enrichment of these hazardous chemicals will be identified. Recommendations for land and water use in these areas will be made which will minimize the health hazard for these compounds.
RESULTS: Methodology for isolation of polycyclic aromatic hydrocarbons (PAHs) from soils and their analysis has been improved: Air-dry soil samples are Soxhlet extracted with purified benzene; the extracts are concentrated and filtered through Millipore teflon filters to remove silt/fine soil particles; preparative thin-layer chromatography on silica gel using cyclohexane/carbon tetrachloride (19:1) separates polar soil organics from PAHs, which are eluted with benzene/dichloromethane; the eluate is treated with permanganate to convert unsaturated lipoid impurities to glycols and substituted aromatics to carboxylic acids; rechromatography on silica gel removes the oxidized contaminants from unchanged PAHs, which are extracted with dichloromethane; the PAH solution is concentrated to 1 ml for high-pressure liquid chromatography (HPLC) or gas chromatography. Pure PAHs have bee used as markers to quantify losses versus enrichment during isolation and analysis. Gas chromatography gives better separation and quantification of most PAHs than HPLC. PAH levels in various soil types have been compared using remote desert soil as a standard.

TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: EXTRACTION (25%);PROCESSING, CONVERSION (25%);COMBUSTION OR END USE (25%);ELECTRICITY GENERATION (25%)
POLLUTANTS: NOXIOUS GAS (25%);METALS (25%);PARTICULATES (25%);ORGANICS (25%)
PROJECT DESCRIPTION: Determine physiological and biochemical effects of mercury and lead in animals. Specifically, central nervous system effects (spike potentials), cardiovascular system (atherogenesis) and the endocrine system (adrenal steroidiogenesis). Determine the acute (LD50) and chronic (MED50) parameters of CO, SO2, and NOx. Determine these parameters in combination. Study the effects of these air pollutants on respiratory system (exchange), reticulo-endothelial system, central nervous system (spike potentials, synaptic activity, locomotion, taxia, and sensitivity), cardiovascular system (atherogenesis). Attempt to correlate any overt physiological response to a biochemical mechanism.
APPROACH: Mercury and lead compounds will be administered to rats, rabbits and chicks by oral and parental routes. Standard sampling and biochemical techniques will be used in analysis. The study of the physiology and biochemistry of air pollutants will utilize cages housed in plastic envelopes, CO, SO2 or NOx will be pumped in, under flow and pressure controls. Radioisotope tracer methodology will be utilized in mobilization and precursor studies. Quantitative statistical analyses will be run and extension to human levels made.
RESULTS: Ninety-day female rats were fed an 8000 ppM diet containing lead chloride, ad lib. Control animals were fed a regular rat diet (Purina). Both groups were housed in a brightly-lighted room for forty-three hrs and then placed in Whaman Activity Wheels, in a darkened room for five hrs. This regime tends to maximize running activity because of dark-activity cycle deprivation. Revolutions, body weight, and food consumption were recorded daily. Urinary increment-aminolevulinic acid (ALA) and porphyrobilinogen (PB) were analysed weekly. Test animals showed possible hypoactivity of 46% pre-lead levels increasing to 68% after eight months on the lead diet. Control activity remained constant. ALA levels increased dramatically

(1000%) compared to the test animals, reflecting their high level of lead intoxication. PBb levels remained at the same levels as the control. This indicates the lead rats are still producing ample precursor (PBb) to hemoglobin, avoiding anemia.

POLLUTANTS: NOXIOUS GAS (50%);ORGANICS (50%)
PROJECT DESCRIPTION: Examine the free radical damage of cell components which is caused by the aerobic oxidation of bisulfite, and the biochemical reactions by which bisulfite ions may inhibit enzymes and cause metabolic disturbance.
APPROACH: The first part consists of a study of the free radical damage of cell components caused by the aerobic oxidation of bisulfite or sulfite ions. The O2, OH, and SO3 radicals, which are generated during the aerobic oxidation of sulfite, are particularly suspect as toxic agents which may destroy amino acids, hormones, lipids and coenzymes. The second part is to examine the effect of sulfite ion on various enzyme and membrane systems and to characterize sulfite oxidase from plant sources. Sulfite oxidase has been suspected to be the key enzyme responsible for the detoxification of SO2. The third part will involve the in vivo effect of SO2 on metabolism of harvested fruits and the fate of SO2 in the fruit.
RESULTS: NADH and NADPH coenzymes are rapidly oxidized in presence of bisulfite, oxygen and peroxidase. Its reaction mechanism and oxidation products are investigated. Chlorophyll extracted from spinach leaves as well as purified chlorophyll in ethanolic solutions was rapidly destroyed, as measured by a decrease in absorbance, in the presence of sodium bisulfite, oxygen and light. Omission of sodium bisulfite, oxygen or light resulted in negligible destruction. The light requirement could be substituted by addition of manganous sulfate and destruction was further stimulated in the presence of linoleic acid. Hydroquinone, a free radical scavenger, inhibited both light and Mn(2+)-mediated (dark) destruction. These results suggest that free radicals produced during the aerobic oxidation of bisulfite are involved in the destruction of chlorophyll. Indole-3-acetic acid was rapidly destroyed in the presence of Mn(2+), oxygen and bisulfite into (2-sulfoindole)-3-acetic acid and dioxindole-3-acetic acid. A chemical mechanism accounting for the formation of the products is presented in which superoxide and hydroxyl radicals, produced during the aerobic oxidation of bisulfite, function as oxidizing agents.

TITLE: Poultry Production and Environmental Quality
PROJECT NUMBER: TEX-03368-RI
PRINCIPAL INVESTIGATOR: Cain, J.R.;Suter, D.A.
ADDRESS: Agricultural Experiment Station, College Station, TX 77843
AFFILIATION: Texas A and M Univ., College Station (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: NOXIOUS GAS (33%);PARTICULATES (33%);ORGANICS (34%)
PROJECT DESCRIPTION: Effects of poultry house environment and management practices on production efficiency and product quality. Effect of environmental pollutants of non-poultry enterprise origin on poultry production and product quality.
APPROACH: Develop a system in bioclimatic chambers whereby concentrations of gaseous components normally found in poultry production units can be controlled and measured accurately. Physiological responses of domestic birds to various concentrations of gases and dust will be evaluated. The interaction of gases such as CO2, NH3, CH4, and H2S with various air flow rates, temperatures and humidity levels will be studied. Investigate the interaction of poultry production and gases such as CO, H2S, SO2 and NO2 to ascerain the effect air pollution may have on food production and food quality.
RESULTS: A power failure of 14 minutes duration in an environmental broiler breeder house when ambient temperature was 96 F resulted in 112 F inside temperature and extreme concentrations of NH3, CO2 and moisture. Acute flock mortality of 6.2% occurred and egg production (HDP) dropped from 55% to 40% and remained there for three weeks before returning to previous levels. A power failure (1 hr duration) was simulated when ambient temperature was 64 F without ill effects on production. Inside temperatures reached 69 F, CO2 increased from 550 to 950 ppM and NH3 increased from 6 to 40 ppM during this power failure. Thus a winter power failure is probably of no economic consequence, but very brief losses of mechanical ventilation during the summer months can be devastating to both poultry and humans in the building. Diurnal samples of CO2, NH3 and dust were taken inside an environmental poultry facility at bird level where broiler breeders were housed at a density of 1 sq. ft./bird in 2/3 slat floors-1/3 litter floor pens. Samples were also taken at the exhaust effluents where air flow rates were either 9.5 or 13.5 cfm/bird.

TITLE: Energy Requirements of Environmentally Influenced Decisions Involving Water Development and Use
PROJECT NUMBER: CA-D-WSE-3351-H
PRINCIPAL INVESTIGATOR: Hagan, R.M.
ADDRESS: Agricultural Experiment Station, Davis, CA 95616
AFFILIATION: California Univ., Davis (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: PARTICULATES (33%);ORGANICS (33%);HEAT, THERMAL (34%)
PROJECT DESCRIPTION: Prepare a preliminary summary of energy requirements associated with alternative solutions to problems of water development and use; waste water disposal, reclamation, and re-use; water quality control including desalting; and drainage.
APPROACH: Energy requirements of proposed alternatives or decisions already made concerning water development and use will be analyzed using data from various agencies and numerous consultations with agencies and environmental groups. Use will be made of the working relations already established with the many water agencies, waste water services, environmental groups, and others.
RESULTS: A preliminary report has been prepared for publication examining direct energy requirements for a range of alternatives for water supply and use, waste-water treatment, and water reclamation and reuse. Municipal water supplies considered include surface storage and diversion projects, groundwater pumping, desalting, and waste-water reuse. Irrigation water supplies include groundwater pumping, delivery of water to major service areas through the Central Valley Project and State Water Project, and reuse of municipal waste water. Waste-water treatment methods include primary, secondary, and tertiary treatment, and land treatment. Methods used to estimate the amount of energy consumed indirectly for construction and maintenance of facilities are discussed. Estimates of indirect energy requirements are useful for comparing pumping plants powered by electricity, diesel, natural gas, etc. and for comparing energy costs of damage to household items by poor quality water with energy requirements for supplying water of improved quality. Net energy and total energy cost calculations (measurements of direct plus indirect energy requirements) are used to compare hydroelectric power plants with fosssil-fuel and nuclear plants.

<000048>
TITLE: Urban and Rural Environmental Quality Protection
PROJECT NUMBER: CA-D-LAW-2973-H
PRINCIPAL INVESTIGATOR: Myrup, L.O.
ADDRESS: Agricultural Experiment Station, Davis, CA 95616
AFFILIATION: California Univ., Davis (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
POLLUTANTS: NOXIOUS GAS (33%);PARTICULATES (33%);ORGANICS (34%)
PROJECT DESCRIPTION: Study the processes determining levels of air pollution. Develop mathematical models of various aspects of the air pollution regime. Improve means for measuring air pollution concentrations. Study the physical and chemical nature of particulates and their effect on atmospheric radiation. Quantify environmental parameters for introduction into the decision-making process.
APPROACH: The approach will be to make measurements of the amounts and properties of the various pollutants in the atmosphere, as well as their radiative effects, and to utilize these data in arriving at mathematical models of the processes involved.
RESULTS: Work on a new approach to modeling of diffusion of pollutants from a line source in the urban atmosphere was completed in this period. The model is based on similarity principles and is meant for practical calculations of the impact of highway emissions of primary pollutants on roadside air quality. Diffusion parameters in the model are calculated from readily available land-use information. Concentrations calculated with the model compare favorably with observations. An analysis was made of the three-dimensional meso-scale wind field over Sacramento, California. The data were gathered by means of a double theodolite pipal network. The measurements showed surprisingly high correlations between the stations to changes in time. Calculations of horizontal divergence indicated substantial subsidence for the summertime case considered. The calculated subsidence was large enough to constitute a significant source of clean air. Progress was made in a study of the relationships between land-use and emission of automotive air pollution. The analysis was based on data for Sacramento, California for the year 1971. It was found that the air quality of this particular city is dominated by freeways.

TITLE: Design and Management of Rural Ecosystems
PROJECT NUMBER: MICL-01202
PRINCIPAL INVESTIGATOR: Koenig, H.E.
ADDRESS: Engineering Building, East Lansing, MI 48824
AFFILIATION: Michigan State Univ., East Lansing (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: CONSERVATION/General (100%)
ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: Evaluate the economic trade-offs in production agriculture with the physical and human resource requirements of rural landscapes as a function of structural features such as production technologies, scale of operations, locations and ecological characteristics. Develop alternative institutional policies and mechanisms through which the various patterns of land use, scale of operations and technologies can be motivated as related to energy policy, environmental quality, rural development, agricultural production and recreation.
APPROACH: Firm level models have been developed to evaluate the effect of scale and diversification on physical and environmental resources. These models will be expanded and applied to the regional level. The technical findings of this effort (translated for appropriate user groups) will aid in the identification of policy options associated with various land use constraints and objectives.
RESULTS: Conservation of energy and soil can be achieved by: (1) increased technical efficiencies and (2) introduction of more efficient land-use patterns. Basic principles for managing renewable and

non-renewable resources and irreversible conversions of arable land to promote these efficiencies are formulated. Energy and monetary cost trade-offs associated with alternative production systems have been extended to dairying and cash crop production. While the total production cost differences are surprisingly small among different dairy production technologies, the external nutrient requirements can be reduced by improving the recycling of animal waste. The land requirements per unit of dairy product can be significantly reduced by using corn silage instead of alfalfa in meeting the animal's energy requirements. The short-run effect of fertilization intensity on yield was evaluated along with the long-run effects on soil carbon levels. Steady-state soil carbon and yield levels were estimated for alternative production systems. Preliminary results indicate that improper fertilization and cropping practices can have severe long-term impacts on soil carbon levels.

TITLE: Economic and Environmental Implications of Water and Related Natural Resource Uses
PROJECT NUMBER: CA-D-AEC-3387-H
PRINCIPAL INVESTIGATOR: Snyder, J.H.;Hansen, D.E.;Howitt, R.E.
ADDRESS: Agricultural Experiment Station, Davis, CA 95616
AFFILIATION: California Univ., Davis (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: Identify present and potential economic and environmental effects of alternative patterns or programs for natural resource development and use, including energy relationships. Evaluate resource requirements and development potential for water and related natural resources important to the agricultural and non-agricultural sectors of California. Appraise institutional, political and legal relationships and public policies associated with use and development of water and related natural resources.
APPROACH: Determine present economic activity in specific regions, basins, or other meaningful units relevant to current patterns of water and related natural resource use and development, including energy relationships. Identify and measure economic, environmental, and social impact of alternative patterns for resource use associated with changing markets, changing technology, energy sources and availability, etc. Analyse economic, environmental and social consequences--including measurement of trade-offs--of changes in resource use patterns needed to meet objectives of economic development and maintenance of environmental quality. Analyse effectiveness of institutional frameworks in attaining objectives of economic development and environmental quality.
RESULTS: Snyder--Journal papers in progress based on dissertation, ''An Economic Evaluation of Benefit Cost Analysis with Special Reference to the Derived Demand for Irrigation Water for Tree Fruits and Nuts, and Grapes in California.'' A San Joaquin Valley Basin study in progress, ''The Development of Investment Criteria fcr Installing Subsurface Drainage Systems.'' Paper being revised, an economic evaluation by project agencies based on benefit cost analysis. Paper discusses consistent economic analysis and provides an overall theory of resource planning. Hansen--Background study has been presented as a paper at a Conference on Agriculture in the Future and Its Implications for Land-Use Planning and published in the Proceedings. Work planned: Look at transferable development rights. Apply use to water as a means of allocating land along waterways. Johnston--Manuscript being revised, ''Remote Recreational Subdivision: Anticipated Rural Community Impacts in California's Northeastern Plateau'' based on purchaser characteristics.
KEYWORDS: CALIFORNIA;LAND USE;AGRICULTURE;SOCIO-ECONOMIC FACTORS;ENVIRONMENTAL EFFECTS;ENERGY SOURCES;ENERGY DEMAND;PUBLIC OPINION;WATER RESOURCES;REGIONAL ANALYSIS;COST BENEFIT ANALYSIS;IRRIGATION

<000051>
TITLE: Interactions of Chemical Pollutants and Microorganisms in the New Jersey Coastal Environment
PROJECT NUMBER: NJ-00507
PRINCIPAL INVESTIGATOR: Bartha, R.;Antoine, A.D.
ADDRESS: Old Queens Building, New Brunswick, NJ 08903
AFFILIATION: Rutgers--the State Univ., New Brunswick, N.J. (USA)
MONITORING AGENCY: Cooperative State Research Service, Washington, D.C. (USA)
77 FUNDING: Cooperative State Research Service
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: EXTRACTION (25%);PROCESSING, CONVERSION (25%);COMBUSTION OR END USE (25%);WASTE MANAGEMENT (25%)
POLLUTANTS: METALS (33%);PARTICULATES (33%);ORGANICS (34%)
PROJECT DESCRIPTION: Identify and assess specific pollution hazards that will suggest remedies or cleanup procedure.
APPROACH: The interaction of various chemical pollutants such as petroleum hydrocarbons, polychlorinated biophenyls, persistent pesticide residues, heavy metals, especially mercury, and of pollutants that give rise to eutrophication with estuarine microorganisms will be investigated in both laboratory and field experiments. The action of the pollutants on essential microbial processes such as organic matter degradation, nitrification, nitrogen fixation, etc., will be investigated. The concentration of pollutants in microorganisms and through them in higher members in estuarine food chains will be measured by radiometric techniques. Gas chromatography, mass spectrometry and atomic absorption spectrometry will be used in analysis for pollutants.
RESULTS: The biodegradation of South Louisiana (SL) crude oil, and the effects of nitrogen, phosphorus and iron supplements on this process were compared in a polluted and in a relatively clean littoral sea water sample taken along the New Jersey coast. Without supplements, the biodegradation of SL crude oil was negligible in both sea water samples. Addition of nitrogen and phosphorus allowed very rapid biodegradation (72% in 3 days) in polluted sea water. Total iron in this sea water sample was high (5.2 mu M), and the addition of iron did not increase the biodegradation rate further. In the less polluted and less iron-rich (1.2 mu M) sea water sample, biodegradation of SL crude oil was considerably slower (21% in 3 days) and the addition of chelated iron had a stimulating effect. Ferric octoate was shown to have a similar stimulating effect on SL crude oil biodegradation as chelated iron, and this oil-soluble compound, in combination with paraffinized urea and octylphosphate is suitable for treatment of floating oil slicks. We conclude that spills of SL crude oil can be cleaned up rapidly and efficiently by stimulated biodegradation, provided the water temperatures are favorable. The testing of microbiological denitrification by samples from the Cheesequake Park area salt marshes have indicated optimum conditions

for pH, temperature, nitrate-nitrogen concentration and inoculum levels. These results are being applied to the develcpment of a test procedure for monitoring denitrification in the field.

TITLE: Nitrogen and Sulfur Transformations in Soils Related to Fertilizer and Pollution Problems
PROJECT NUMBER: IOW02096
PRINCIPAL INVESTIGATOR: Bremner, J.M.
ADDRESS: Beardshear Hall, Ames, IO 50010
AFFILIATION: Iowa State Univ. of Science and Technology, Ames (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service Iowa
77 FUNDING: Department of Agriculture
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: EXTRACTION (50%);COMBUSTION OR END USE (50%)
POLLUTANTS: NOXIOUS GAS (33%);PARTICULATES (33%);ORGANICS (34%)
PROJECT DESCRIPTION: Obtain detailed information concerning nitrogen and sulfur transformations in soils related to fertilizer and pollution problems.
APPROACH: Processes responsible for volatilization of nitrogen and sulfur from soils, and factors affecting these processes, will be studied. The processes investigated will include denitrification, chemodenitrification, urea hydrolysis, sulfate reduction, and biodegradation of organic sulfur compounds. Methods of controlling nitrification, urea hydrolysis, and other nitrogen transformation processes in soils that affect crop utilization of nitrogen and contribute to air and water pollution problems will be evaluated, and factors influencing the effectiveness of nitrification and urease inhibitors will be determined. The fate of urease added to soils will be studied, and factors affecting urease activity and urease levels in soils and sorption of urea by soils will be investigated. The ability of soils to sorb sulfur and nitrogen gases identified as atmospheric pollutants, including NO, NO2, SO2, and H2S, will be studied, and the potential value of soils for purification of air polluted by these gases will be assessed.
RESULTS: Studies of factors affecting the production and persistence of urease activity in soils showed that treatment of soils with urea did not induce urease activity, but that production of urease activity occurred on addition of glucose and other materials that promote microbial activity. The persistence of the urease activity produced by addition of these materials varied with the soil, but, with each soil studied, the urease activity after addition of organic materials eventually was identical to that of the unamended soil. No increase or decrease in urease activity was observed when unamended soils were incubated under aerobic or waterlogged conditions for several months. This work and other studies performed indicate that soil constituents protect urease against microbial degradation and other processes leading to inactivation of enzymes and that every soil has a stable level of urease activity determined by the ability of its constituents to provide this protection. Studies of the relationship between soil urease activity and other soil properties suggest that organic soil constituents are largely responsible for the remarkable stability of native soil urease.

TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: METALS (33%);PARTICULATES (33%);ORGANICS (34%)
PROJECT DESCRIPTION: Estimate income and employment multipliers for the coal industry in eastern Kentucky. Analyze the economics of the coal mining industry, and hence, the relationship between the price of coal and the level of activity in the coal industry. Estimate the impact of the coal industry of local public sector revenues and the demand for local government services. Evaluate the potential impact of the coal industry on income, employment, local public sector finances and quality of life in eastern Kentucky.
APPROACH: The impact of potential changes in demand for coal, mining technology and policies (e.g., taxation, environmental, health and safety) on employment, income, local public finances and quality of life will be estimated. Tasks include input-output analysis of the eastern Kentucky regional economy, estimation of the supply and demand relationships for eastern Kentucky coal, flow of funds analysis of local government finances as impacted by the coal industry, and analysis of the impacts of alternative policies on the target variables.
RESULTS: Work initiated on coal supply response, income and employment multipliers for the coal sector, and fiscal impact of coal industry on local government.

ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: NOXIOUS GAS (33%);PARTICULATES (33%);ORGANICS (34%)
PROJECT DESCRIPTION: Determine acute injury symptoms of SO2 and other pollutants on various crop and native plants of Wyoming and in areas where such pollution is anticipated. Appraise factors which influence the amount of damage to plants by fumigation, i.e., temperature, relative humidity, presence of moisture, etc. Select indicator plants that show more susceptibility to injury in areas of the state as visual indicators of pollution damage.
APPROACH: Fumigation of many plant species will be made in both closed and open top chambers for various periods of times at varying measured rates of SO2 or other pollutants. Readings on symptoms of injury will be determined after fumigation to determine dose-response-time and recovery-time. Photographic records will be made of the vegetation and damage after exposure. Records will be kept on concentrations or amounts of gas or pollutants, time of exposure, species of plants, growth stage, temperature, humidity, available moisture, condition of plants and types of damage caused (symptoms). Fumigation will be made on both native species and many crop plants including introduced vegetables and ornamental plants to determine most susceptible and thus the best indicator plants in the area.

TITLE: Role of Microorganisms in Waste Disposal
PROJECT NUMBER: WVA00244
PRINCIPAL INVESTIGATOR: Hoe, P.G.;Bissonnette, G.K.
ADDRESS: Agricultural and Forestry Export Station, Morgantown, WV 26506
AFFILIATION: West Virginia Univ., Morgantown (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service West Virginia
77 FUNDING: Department of Agriculture
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
ENERGY CYCLE: COMBUSTION OR END USE (20%);ELECTRICITY GENERATION (20%);WASTE MANAGEMENT (60%)
POLLUTANTS: NOXIOUS GAS (25%);METALS (25%);PARTICULATES (25%);ORGANICS (25%)
PROJECT DESCRIPTION: Study: Anaerobic digestion for disposal of wastes generated in a family dwelling unit; disposal of effluent and sludge from community sewage disposal plants; generation of methane gas through the anaerobic digestion of animal manures; aerobic composting of manures; soil applications as a waste disposal system for industrial waste materials; disposal of acid mine drainage, and the disposal of industrial wastes in aquatic environments.
APPROACH: Laboratory and field experiments will be conducted of waste applications in aquatic and edaphic ecosystems. Systems will be evaluated for their microbiological populations and biological activity. Environmental factors will be manipulated to estimate optimum conditions for biological activity. Effects of toxicity, synergism and antagonism within the populations will be investigated.
KEYWORDS: WASTE DISPOSAL;MICROORGANISMS;ENVIRONMENTAL EFFECTS;BIODEGRADATION;SEWAGE;MUNICIPAL WASTES;METHANE;BIOSYNTHESIS;MANURES;ANAEROBIC CONDITIONS;AEROBIC CONDITIONS;INDUSTRIAL WASTES;AGRICULTURAL WASTES;ACID MINE DRAINAGE;AQUATIC ECOSYSTEMS;TOXICITY;SYNERGISM;PREFERRED SPECIES

TITLE: Biological Indicators of Environmental Quality in California Lakes and Streams
PROJECT NUMBER: CA-B-ENT-3806-H
PRINCIPAL INVESTIGATOR: Resh, V.H.
ADDRESS: Agric. Experiment Station, Berkeley, CA 94720
AFFILIATION: California Univ., Berkeley (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service California
77 FUNDING: Department of Agriculture
TECHNOLOGY: FOSSIL FUEL/General (50%);GEOTHERMAL/General (50%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: METALS (25%);PARTICULATES (25%);ORGANICS (25%);HEAT, THERMAL (25%)
PROJECT DESCRIPTION: Develop the concept of biological indicators of environmental quality as applied to California's lake and stream environments. Analyze the effect of potential impacting activities (e.g. geothermal energy development, organic and heavy metal effluents) on the energy transfer processes in aquatic ecosystems.
APPROACH: Streams and lakes throughout California will be selected for study. A statistically-sound sampling regime will be developed for quantitative biotic collections and measurements of key water chemistry and physical parameters. Diversity indices, production estimates, and bioassay procedures will be applied in specific cases. A matrix data arrangement will be developed in which biological information, water chemistry measurements, and physical parameters can be used in preparing predictive models of the dynamic interactions occurring in these environments.
KEYWORDS: BIOLOGICAL INDICATORS;WATER QUALITY;CALIFORNIA;LAKES;STREAMS;GEOTHERMAL ENERGY;ENVIRONMENTAL IMPACTS;ORGANIC COMPOUNDS;METALS;CHEMICAL EFFLUENTS;AQUATIC ECOSYSTEMS;AQUATIC ORGANISMS;BASELINE ECOLOGY

TITLE: Interrelationship Between Heavy Metals and Trees
PROJECT NUMBER: NJ00365
PRINCIPAL INVESTIGATOR: Brennan, E.
ADDRESS: Old Queens Building, New Brunswick, NJ 08903
AFFILIATION: Rutgers--the State Univ., New Brunswick, N.J. (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service New Jersey
77 FUNDING: Department of Agriculture
TECHNOLOGY: FOSSIL FUEL/General (100%)
POLLUTANTS: METALS/Heavy metals;lead;METALS/Calcium (100%)
PROJECT DESCRIPTION: Utilize trees as a model system for studying the behavior of heavy metals in biological systems. The objective will be to determine if lead follows the same pattern as cadmium in respect to uptake and accumulation by 15 selected species of trees.
APPROACH: With a view toward evaluating not only phytotoxicity but also the possible merit of trees as sinks, will examine the interaction between trees and Cd. Emphasis will be placed on controlled greenhouse experiments. With hybrid poplar clone as model will concentrate on obtaining dose response data. Using 4 concentrations of Cd and both root and shoot application, will particularly focus on: macroscopic systems of Cd toxicity, rate of Cd accumulation in foliage, rate of linear growth of shoots, rate of photosynthesis in leaves, partition of Cd into leaves, stems, and roots, recovery from Cd toxicity. Continue field study of 1974-75 at the sites involving varying volumes of vehicular traffic.
KEYWORDS: METALS;TREES;ENVIRONMENTAL EFFECTS;BIOLOGICAL MODELS;UPTAKE;CADMIUM;GREENHOUSES;ROOT ABSORPTION;TOXICITY;LEAD;CALCIUM

TITLE: Forest Ecosystems as Influenced by the Northwest Alloys Magnesium Plant
PROJECT NUMBER: WNP00231
PRINCIPAL INVESTIGATOR: Zamora, B.A.
ADDRESS: Pullman, WA 99163
AFFILIATION: Washington State Univ., Pullman (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service Washington
77 FUNDING: Department of Agriculture
TECHNOLOGY: FOSSIL FUEL/General (100%)
POLLUTANTS: NOXIOUS GAS/SO2 (70%);SPECIFIED OTHER POLLUTANTS/Multiple (30%)
PROJECT DESCRIPTION: Establish a data base on forest ecosystems prior to operation of the plant. Document atmospheric sulfur concentrations above the Addy Valley floor both prior to and after plant operations

begin. Determine changes in forest ecosystems within a 10-mile radius of the plant and determine if such changes are caused by increased atmospheric sulfur concentration. Record lateral air movement above the Addy Valley floor.
APPROACH: Normal ecosystem parameters including biological, atmospheric, and meteorologic factors, will be documented prior to operation of the magnesium plant. Subsequent measurements of the same factors will be made in successive years after the plant comes into operation, to determine the effect of emissions (primarily SO2) on surrounding forest ecosystems.
KEYWORDS: FORESTS;TERRESTRIAL ECOSYSTEMS;BIOLOGICAL MODELS;DATA ACQUISITION;SULFUR DIOXIDE;AIR QUALITY;ECOLOGICAL CONCENTRATION;ENVIRONMENTAL EFFECTS;MAGNESIUM;INDUSTRY;METEOROLOGY

<000062>
TITLE: Impacts of Coal-Energy Development in N.E. Wyoming on Agriculture and Related Environment Aspects
PROJECT NUMBER: WY000998-WS
PRINCIPAL INVESTIGATOR: Jacobs, J.J.;Vanvig, A.
ADDRESS: P.O. Box 3944, University Station, Laramie, WY 82071
AFFILIATION: Wyoming Univ., Laramie (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service Wyoming
77 FUNDING: Department of Agriculture
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: PARTICULATES/Coal residues (100%)
CHARACTER OF STUDY: RESEARCH/General (70%);ANALYTICAL (30%)
REGIONS OF INTEREST: BIOMES/Freshwater
PROJECT DESCRIPTION: Identify the nature and magnitude of land and water transfers associated with coal-energy development in northeastern Wyoming, quantify the benefits and costs of coal mineland reclamation, evaluate the potential impact of coal mines on the surrounding groundwater aquifer, and estimate the impact on agriculture of alternative levels and types of coal-energy development.
APPROACH: Data will be collected on land, water and mineral transfers and leases occurring between ranchers and coal development interests in northeastern Wyoming from public records, state agencies and personal interviews. Data on water demands, groundwater aquifers, and costs of mineland reclamation will be obtained from secondary sources. Productivity of reclaimed land will be determined from several reclaimed areas in the state. A linear programming model will be used to estimate the impact of coal developments on agriculture.
KEYWORDS: ENERGY SOURCE DEVELOPMENT;AGRICULTURE;LAND USE;LAND RECLAMATION;WYOMING;COAL INDUSTRY;ENVIRONMENTAL IMPACTS;COAL;DATA ACQUISITION;LINEAR PROGRAMMING;COMPUTER CALCULATIONS

<000063>
TITLE: Perceptions of Scarcity and Willingness to Alter Consumption Patterns in New Mexico
PROJECT NUMBER: NM00250
PRINCIPAL INVESTIGATOR: Eastman, C.;Stevens, T.
ADDRESS: University Park, Las Cruces, NM 88070
AFFILIATION: New Mexico State Univ., Las Cruces (USA)
MONITORING AGENCY: Department of Agriculture, Washington, D.C. (USA)
DIVISION: Cooperative State Research Service New Mexico
77 FUNDING: Department of Agriculture
TECHNOLOGY: CONSERVATION/General (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
PROJECT DESCRIPTION: Estimate future energy resource scarcity and identify associated environmental problems in New Mexico; determine citizens' perception of scarcity of energy resources and associated environmental problems; determine citizens' willingness to alter consumption patterns in response to No. 1; develop scenarios of alternative life styles on the basis of revealed preferences in No. 2; elaborate policy options.
APPROACH: Estimates of resources will be based on secondary data; perceptions and willingness to alter consumption will be determined by questionnaire survey; the scenarios and policy will be based on questionnaire results.
KEYWORDS: ENERGY SOURCES;ENERGY SUPPLIES;ENERGY CONSERVATION;PUBLIC OPINION;ENVIRONMENT;NEW MEXICO;ENERGY SHORTAGES;CONSUMPTION RATES;HUMAN POPULATIONS

TITLE: Design and Construction of a Prototype X-Ray Diffraction Instrument for Analysis of Asbestos Fibers in Air and Water
PROJECT NUMBER: G712B-BA-16
PRINCIPAL INVESTIGATOR: Birks, L.S.;Fatemi, M.;Johnson, E.T.;Whitlock, R.R.;Gilfrich, J.V.
AFFILIATION: Department of the Navy, Washington, D.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Environmental Sciences Research Laboratory
MONITOR: Wagman, J.
77 FUNDING: Environmental Protection Agency FY77:$95,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: This is a follow-up to an earlier study that demonstrated the feasibility of an x-ray diffraction measurement technique for asbestos involving prealignment of fibers and direct measurement of mass concentrations.
APPROACH: Additional effort will be devoted to optimizing the sample preparation procedure, including the following steps: (1) Separation of the sample from the collection substrate, (2) Removal of non-asbestos material, (3) Fiber pretreatment to facilitate alignment, and (4) The alignment procedure itself, e.g., alignment medium, grid voltage, etc. Finally, a specially-designed x-ray diffraction analyzer will be fabricated for use by ESRL/RTP.
PROJECT MILESTONES: (1) 06/77 Complete transfer of measurement technology to ESRL.
KEYWORDS: ASBESTOS;FIBERS;AIR;WATER;CHEMICAL ANALYSIS;SAMPLE PREPARATION;OPTIMIZATION;MEASURING INSTRUMENTS;DESIGN;X-RAY DIFFRACTION;FEASIBILITY STUDIES;DESIGN;X-RAY DIFFRACTOMETERS

TITLE: Environmental Energy Consumption of the Pulp and Paper Industry
PRINCIPAL INVESTIGATOR: Gillespie, W.J.
ADDRESS: Weston Way, West Chester, PA 19380
AFFILIATION: Weston (Roy F.), Inc., West Chester, Pa. (USA)
MONITORING AGENCY: Department of Commerce, Washington, D.C. (USA)
DIVISION: Office of Environmental Affairs
MONITOR: Grant, Robert B.
TELEPHONE: F377-2652
TYPE OF FUNDING: Contract No.-6-35537
77 FUNDING: Department of Commerce FY77:$61,700
TECHNOLOGY: CONSERVATION/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: PARTICULATES (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of the project titled Environmental Energy Consumption study in the Pulp and Paper Industry is to identify and quantify the energy requirements resulting from environmental controls for the various unit processes in the industry. Data will be developed on existing and projected pre-plant, and post-plant consumption of energy for attainment of existing Federal, State, and local air and water pollution control requirements. Alternative control options which would consume less energy while remaining consistent with the need to protect public health, in the case of air pollution under the Clean Air Act, and best practicable technology for water pollution as defined in Public Law 92-500 will be identified.
APPROACH: Review all state, local, and Federal laws and regulations with respect to air and water pollution control. Review and evaluate all available environmental energy consumption data with respect to existing plants. Supplement and project the known energy data with an appropriate survey, interviews, on-site visits together with the application of computer modeling techniques where necessary. Reevaluate and assess the data taking into account direct and indirect energy impacts and the identification of key variables to provide a total comprehensive environmental energy accounting system for the industry.
RESULTS: The results are twofold: (1) To show how and to what extent environmental requirements increase energy consumption, and (2) The potential savings in energy consumption that exists from lessening the stringency of environmental constraints, allowing the use of alternate technologies and reducing treatment requirements from present levels to requisite public health levels and best practicable control technology.
PROJECT MILESTONES: (1) April 1976 Award contract. (2) July 1976 Interim report. (3) September 1976 Draft report. (4) March 1977 Final report.

TECHNOLOGY: CONSERVATION/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this study is to investigate in detail the technological opportunities for reducing the amount of energy consumed in pollution control activities, and provide the relevant environmental energy, legal and economic information concerning alternative control options to the present mandated controls. This study will go beyond the study of energy costs to address the social and economic costs of environmental goals and the comparison of cost effectiveness (in economic and other measures) for various levels of goals.
APPROACH: Using the comprehensive environmental energy consumption data from the study prepared for the Office of Environmental Affairs integrate additional technological or procedural pollution control options of the following nature: (1) performance characteristics including pollutant removal efficiencies; (2) capital and operating costs, economic impacts including growth effects; (3) material resource requirements; (4) impact on product characteristics; together with other similar factors into an informational framework for presenting and evaluating control options for decisionmaking purposes.
RESULTS: The results of this study are to provide an informational basis for decisionmakers for the possible reformulation of Federal environmental policies, regulations, and legislation.
PROJECT MILESTONES: (1) September 1976 Award contract. (2) February 1977 Interim report. (3) December 1977 Final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To provide the means for the accurate measurement of sulfur dioxide, nitrogen dioxide, carbon monoxide, particulates and other pollutants likely to result from energy production.
APPROACH: Develop Standard Reference Materials (SRMs) for use in the validation of pollutant measurement methods and instruments. Develop SRMs characteristic of raw materials used in combustion processes in order to validate measurement methods used to analyze fuel prior to combustion. By assessing the perfcrmance of measurement methods on certified SRMs, whose properties are accurately known, sources of error in the measurement methods can be identified and the effects of error can be reduced.
RESULTS: Certification and issuance of Standard Reference Materials of SO/sub 2/ in nitrogen, O/sub 2/ in nitrogen, NO/sub 2/ in air, CO in air, airborne particulates, raw materials for combustion processes and associated fuels.
PROJECT MILESTONES: Major Milestones: (a) NO/sub 2/ in air gas blend SRM's at concentrations of 250 ppM, 500 ppM, 1,000 ppM, 2,500 ppM, 1/78 + 9 mos.; (b) O/sub 2/ in nitrogen gas blend at concentrations of 2% and 10%, 6/78; (c) H/sub 2/S in hydrocarbon gas blend SRM for refinery gas stream monitoring, 10/78 + 9 mos.; (d) Gas blend SRM's of 0.1 to 1 ppM concentrations of i) SO/sub 2/ in air, ii) NO/sub 2/ in air and iii) NO in N/sub 2/, 2/78 + 9 mos.; (e) Gas blend of 1 ppM of CO in air (9, 14 and 45 ppM on shelf), 1/78; (f) Standards for X-Ray fluorescence measurements of particulates collected on filter paper, 10/78; (g) Particulate Chemical and Physical Property Standards, 10/78; (h) Standards for raw materials analysis, complete; (i) Standards for products analysis, 6/78; (j) Standards for residue analysis. Evaluate methodology for the organic analysis of coal gas-liquid system products and residues and determine the standards requirements for such analyses, 12/78; (k) Standards for the analysis of oil shale, 10/77.

REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To provide the means for the accurate measurement of water pollutants likely to occur with energy production. The pollutants of concern include organic substances, suspended particulates and trace elements. Measurements include the determination of concentrations of pollutants in water, sediments and biota. The trace elements under consideration include Hg, Zn, Cu, Cd, Ag, Al, Be, As, Se, Cr, Co, Ba, Fe, Mn, Pb, Sr, and V. Organics include aliphatic and aromatic hydrocarbons and polar organic compounds.
APPROACH: The development of Standard Reference Materials (SRMs) certified for trace element and trace organic composition. These SRMs will be used for validation of existing measurement methods. A series of workshops have been held to determine the most useful SRMs associated with potentially polluting energy sources and production.
RESULTS: Certification and issuance of Standard Reference Materials.
PROJECT MILESTONES: (a) Issue proceedings of Offshore Oil Operations, Coal Conversion and Power Plant Workshops, 6/77; (b) Issue proceedings of Oil Shale Processing Workshop, 7/77; (c) Issue proceedings of Geothermal, Uranium Mining and Mine Drainage Workshops, 9/77; (d) Issue final summary report, 9/77; (e) Issue SRM of trace elements in water, 8/77; (f) Determine feasibility preconcentration, ion exchange filter technique as a potential saline water SRM, 12/77, (g) Determine feasibility of certifying anion concentrations in water SRMs, 3/78; (h) Determine feasibility of preparation, stabilization and analysis of saline water SRM, 3/78; (i) Determine feasibility of certifying trace element depth profiles in sediment particulates using ion microprobe analysis, 6/78; (j) Develop clean sediment SRM certified for trace element composition, 1/80; (k) Report on feasibility of using coated glass bead columns as generators of standard solutions of polynuclear aromatic hydrocarbons in water, 6/77; (l) Develop generator column for polynuclear aromatic hydrocarbons as SRM. (Applicable to coal conversion, shale oil, offshore oil), 1/79; (m) Characterize coal conversion liquids by liquid chromatography, gas chromatography and GC-mass spectroscopy, 7/79; (n) Develop SRM for phenols in a synthetic or natural byproduct water, 6/79; (o) Develop SRM for crude oil, shale oil and liquified coal with selected compounds certified, 1/80; (p) Develop SRM for petroleum in marine sediment and biota, 1/80.

REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To develop instrumental methods for the measurement of particulate sulfate. The sulfate analyzer is based upon a combination of electrostatic precipitator, mobility analyzer and flame photometric detector.
APPROACH: The fluorescence of sulfur dioxide when subjected to uv radiation is used as the basis for quantifying sulfur dioxide in the gas phase at concentrations down to 1 ppb. The quenching of the SO/sub 2/ fluorescence by other gases presents a negative interference. This quenching is being quantified. The effectiveness of using a tuneable dye laser as the uv exciting source is being investigated to improve sensitivity and to locate exciting wavelengths for which the quenching is minimized. The sulfate analyzer is based upon a combination of electrostatic precipitator, mobility analyzer and flame photometric detector.
RESULTS: An improved instrumental method for the measurement of sulfur dioxide and a new instrumental method for the measurement of particulate sulfate.
PROJECT MILESTONES: (a) Provide to EPA a report on the feasibility of producing a continuous, automatic total-particulate-sulfur measurement instrument, complete; (b) Provide to EPA a report on the characteristics of the developmental instrumentation for measuring particulate sulfur, 6/77; (c) Provide to EPA a detailed description of a prototype field instrument (including instrumentation manual) for measuring particulate sulfur, 7/78; (d) Provide to EPA a report on research on speciation of particulate sulfur compounds (with special emphasis on sulfuric acid) and the applicability of instrumental analysis to the measurement of individual species, 6/78.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;OS
PROJECT DESCRIPTION: The control rooms of atomic reactors are designed so that in case of emergency they can be shut off from their surroundings and operated completely with recirculated air. This air is filtered and purified within the control room enclosure. This project is set up to test the applicability of SF/sub 6/ tracer methodology to assess the leak tightness of control rooms.
APPROACH: (1) Tracer will be distributed in the control room and its associated zones (on same ventilation system), and the rate of decrease in concentration measured. (2) Tracer will be placed in the control room or in selected sites outside the control room and its migration detected.
RESULTS: (1) Air leakage rates. These should be zero for the ideal case. (2) In some cases, leakage patterns may be identified.
PROJECT MILESTONES: The control room zone of one nuclear power plant has already been measured for leakage and the results reported to NRC. Tracer measurements of air leakage have been made in two additional plants for a total of three. Reports on the latter two will be submitted. Fiscal 78 further work in this area will await evaluation by NRC of the results of these three tests.

PROJECT DESCRIPTION: The NBS will provide accurately calibrated neutron beams over the energy range from 2 keV to 14 MeV for calibration and other evaluation of personnel neutron dosimeters now in use or under development by ERDA. The NBS will assist ERDA scientists in design of experiments and in the use of these facilities.
APPROACH: The NBS will establish facilities specially suited to neutron monitoring for personnel protection purposes. These facilities will be referenced to more fundamental neutron standards established for the full spectrum of neutron technology. The facilities will be located on the NBS site and will be operated by NBS staff for visiting ERDA scientists. NBS will assist in all phases of experiments when requested and as commensurate with funding.

RESULTS: As a result of this program, the accuracy of existing neutron dosimeters should be improved significantly, particularly at lower neutron energies. In addition, advanced personnel dosimeters may be calibrated with future improvements in accuracy and convenience to the user. The result will be safer working conditions and better time management for personnel exposed to neutron fields.
)JECT MILESTONES: (1) Establish accelerator facility for MeV neutrons September 1977. (2) Establish improved accuracy in neutron beam measurements July 1978.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objective of this project is to monitor the needs of state radiation control programs with regard to achieving improved accuracy and uniformity in the measurement of ionizing radiation, and to develop an NBS program which will provide the standards and services required to satisfy the most urgent state needs.
APPROACH: Information regarding needs in state programs will be obtained continuously through interaction with a special task force of state representatives. Considerable effort will be devoted to investigation of alternative mechanisms for dissemination of standards and for measurement assurance. Specific pilot programs will be conducted. Institutional arrangements will be studied, and the most promising methods will be selected and tried. Various alternative sources of funding will also be explored. Regional calibration laboratories will be investigated as a possible method for dissemination of national standards.
RESULTS: This project will assist the states in developing their capability to make measurements of ionizing radiation that will be adequate for their responsibilities as regulatory agencies. Since the ultimate objective of the regulations is radiation safety, the beneficiaries will be radiation workers, licensees of nuclear facilities, and the general public. This project will enable NBS to fulfill its legislated responsibility to develop national standards of measurement and means for achieving national consistency with them, and for the investigation of radiation and means of protection of persons from its harmful effects.
PROJECT MILESTONES: Initiate development of a regional calibration laboratory in the State of Illinois April 1977. Initiate efforts to develop a uniform national system for reporting environmental radiation data June 1977. Initiate project to construct a distributed calibration source in the State of Florida May 1977. Complete a detailed study of accuracy requirements for the various types of measurements made in state programs February 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS;OS
PROJECT DESCRIPTION: To improve radiation meteorology, and to contribute to the safe and effective use of radiation in industry and medicine, by (a) developing a detailed theory and accurate calibration of the response of various radiation detectors (e.g., ionization chambers, thermoluminescent detectors, solid-state devices) to x- and gamma rays and to electrons; (b) to calculate absorbed-dose distributions in human beings (or representative phantoms) for the case of irradiation by x-ray and electron beams, radionuclide sources and environental radiation.
APPROACH: The research involves the following activities: (a) the evaluation, compilation and systematic preparation of scattering and absorption cross sections; (b) the development of mathematical transport theories, involving the numerical solution of the Boltzmann equation or the simulation of transport by random numbers (Monte Carlo); (c) the systematic large-scale calculation of transport problems with the use of computers; (d) organization and analysis of transport results, by scaling procedures and development of semi-empirical formulas.
RESULTS: Compilation and dissemination of critical radiation data, e.g., gamma-ray buildup factors; electron, neutron and x-ray depth-dose curves, gamma ray and electron transmission and reflection coefficients, detector response functions for sodium-iodide, germanium and silicon detectors, absorbed fractions for gamma rays, electrons and beta radiation from radionuclides.
OJECT MILESTONES: (1) Initial phase of critical analysis and new compilation of charged-particle stopping

power and range values for dosimetry. (2) Exploratory calculations of effect of beam-spreading foils on electron absorbed-dose distributions and ionization-to-dose conversion factors in water phantoms.

PROJECT DESCRIPTION: To obtain reliable data on the transfer of energy from radiation to biological matter via secondary electrons, in regard to the following aspects: (a) electron energy degradation spectra and yield of primary activations; (b) statistical fluctuations of energy depositions in small sites (e.g., genetic material in cell nuclei); (c) the development of an adequate electron cross-section data base to allow the above-mentioned calculations.
APPROACH: The approach used involved the following steps: (a) the evaluation and systematic compilation of scattering and absorption cross sections; (b) the development of mathematical transport theory methods, numerical as well as analytical; (c) execution of large-scale transport calculations with use of computers; (d) analysis and interpretation of computer results, with emphasis on the statistics of energy deposition and on the yield of various types of primary activations (determined through use of energy degradation spectra).
RESULTS: (a) Development of method for calculating fluctuations of energy deposition in small spherical volumes due to irradiation by electrons and by beta rays from tritium (environmental radiation) and by conversion and Auger electrons from iodine-125 (radiopharmaceutical). (b) Analysis and preparation of cross sections for transport studies, pertaining to differential electron-impact ionization of nitrogen, oxygen, and water vapor.
PROJECT MILESTONES: (a) Preparation of state-of-the-art set of electron interaction cross sections in water (March 1977). (b) Evaluation of electron energy degradation spectra using above-mentioned cross sections, for initial electron energy from 100 eV to 50 keV (July 1977). (c) Preparation of manuscript on fluctuations of energy deposited in small spherical sites by point and distributed electron sources with energies from 1 to 100 keV (September 1977).

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: To obtain information about neutron interactions with tissue through secondary charged particles using theoretical calculations whose input includes neutron cross section data; range, stopping power, and straggling information; and geometrical properties. This information is basic to radiological physics, radiation biology, neutron radiation protection, neutron therapy, and neutron dosimetry standards.
APPROACH: This program is aimed primarily at understanding the basic picture of the ''physical stage'' in the interaction of neutrons with tissue and biological materials. Quantitative description of the processes and spectra involved in the transfer of energy from neutron radiation to the biological material provides a useful input to the attempt to understand biological effects of neutron radiation. This is carried out through use of a number of computer calculations using nuclear data and stopping power data as input.
RESULTS: (1) Initial and slowing-down spectra of neutron-induced secondary charged particles. (2) Energy deposition distributions and microdosimetry parameters for neutrons. (3) Kerma-to-fluence factors for neutrons of energies up to 30 MeV. (4) Improved theoretical nuclear data for 15 to 60 MeV neutrons.
PROJECT MILESTONES: (1) Kerma-to-fluence factor tables for neutrons January 1977. (2) Initial and slowing-down spectra for neutrons, including multi-particle production cross sections December 1977. (3)

Microdosimetry parameters using new initial and slowing-down spectra June 1978. (4) Improved theoretical nuclear data for energies above 20 MeV December 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To provide the means for the accurate measurement of water pollutants likely to occur with energy production. The pollutants of concern include organic substances, suspended particulates and trace elements. Measurements include the determination of concentrations of pollutants in water, sediments, and biota. The trace elements under consideration include Hg, Zn, Cu, Cd, Ag, Al, Be, As, Se, Cr, Co, Ba, Fe, Mn, Pb, Sr, and V. Organics include aliphatic and aromatic hydrocarbons and polar organic compounds.
APPROACH: Marker compounds, organic compounds characteristic of particular sources, will be investigated as a means for characterizing and quantifying the pollution associated with particular sources. Liquid chromatography-mass spectrometry will be investigated as a means of quantifying polar organic pollutants. Ion microprobe techniques will be investigated for applicability to determine the elemental profile of individual suspended particulates.
RESULTS: Demonstration of liquid chromatography-mass spectrometry for the measurement of trace polar organic compounds, demonstration of the measurement of trace element profiles in suspended particulates by ion microprobe analysis, demonstration of techniques for quantifying the chemical species of elements in water.
PROJECT MILESTONES: (a) Determine feasibility of coupling liquid chromatography with electrochemical detection of organometallic compounds, 6/78; (b) determine feasibility of temperature programmed plasma flame emission detection for the determination of chemical species of Cr, As, and Hg in water and sediments, 6/78; (c) development of marker compounds to be used as internal standards for quantitative analysis of organic compounds in water, 1/80; (d) development of methods for coupling liquid-chromatography with mass spectroscopy for the analysis of polar and non-volatile organic compounds in water, 1/78; (e) application of selective detectors to the liquid chromatographic analysis of hydroxylated polynuclear aromatic hydrocarbons and other polar organics, 1/79.

PROJECT DESCRIPTION: Under the terms of the agreement with the Nuclear Regulatory Commission, NBS conducts a measurements assurance program with the Health Services Laboratory (US ERDA), Idaho Falls, to establish the traceability of that laboratory to the National Radioactivity Measurements System.
APPROACH: A formal agreement with the NRC titled ''Testing of NRC Reference Laboratory'' specifies that 13 test samples will be provided annually to HSL and their values determined for these 13 samples must be within predetermined limits of the NBS values.
RESULTS: This is a long-term project designed to insure that measurements by a major laboratory representing a regulatory agency are traceable to the National Measurements System.
PROJECT MILESTONES: The 13 tests required in FY 76 were successfully completed. Calibration standards and services were provided to HSL, and Xenon-133 and Xenon-127 gas standards were supplied to NRC-agreement-state radiological health laboratories.

PROJECT DESCRIPTION: The objective of this program is to apply modern electron-spectroscopic methods of surface analysis to determine the surface composition of particulate pollutants in the atmosphere and to determine the nature and rate of pollutant reactions and transformations that occur on particle surfaces.
APPROACH: We will use a scanning Auger-electron spectrometer system to determine the elements present on the surfaces of selected, individual particles. An x-ray photoelectron spectrometer will be used to determine the chemical environment (i.e., compounds). A gas analyzer will enable us to identify gaseous reaction products when gases are passed over the sample particles. This combination of measurement techniques will give us a unique opportunity to characterize pollutant particles and pollutant transformations.
RESULTS: (1) Determine elements present on the surfaces of individual representative particles and correlate surface composition with particle size. (2) Determine relative concentrations of elements as a function of depth from the surface. (3) Develop measurement procedures to obtain elemental concentrations from observed electron intensities. (4) Determine the solid and gaseous reaction or transformation products when gases such as H/sub 2/S, SO/sub 2/, NO, and NH/sub 3/ interact, singly or together, with well-characterized surfaces and representative particulates.
PROJECT MILESTONES: (1) September 1977 Assemble and test a Scanning Auger-electron Spectroscopy System. (2) March 1978 Install and test x-ray photoelectron spectroscopy components. (3) September 1978 Report measurements of surface compositions of representative particles.

REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Continental;COASTS/Other coasts U.S.;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The Bureau of Land Management is sponsoring environmental baseline studies in U.S. continental shelf regions where lease areas will be offered to private corporations for oil/gas exploration. Each of these studies is being managed by different federal or non-federal agencies. Besides Alaska, which is reported separately, these studies are presently in the mid-Atlantic, Eastern Gulf of Mexico, off Southeast Texas, off Southern California and the Georges Banks area. The Bureau of Land Management desires that the data from all the OCS studies be centrally archived in a standard fashion to facilitate data retrieval common to the whole program and have specified in each of their contracts that data will be submitted to the NODC in NODC acceptable formats.
APPROACH: NODC is maintaining close contact with the Project Managements in the several areas, distributing common formats to each Project Office, and negotiating new formats where required. In each of these areas there will be considerable biological data collected. Through a grant to the Biological Sorting Center of the University of Alaska, taxonomic coding for all the project data submissions will be controlled.
RESULTS: A common data archive for all OCS lease area baseline environmental data.
PROJECT MILESTONES: This is a continuing task governed by the time and rate of data submitted by the various projects. Milestones are, therefore, not meaningful.

TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
ENERGY CYCLE: EXTRACTION (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Marine;GEOGRAPHIC AREAS/Middle Atlantic;COASTS/Northeast;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To compile the historic meteorological and physical oceanographic data necessary to characterize the Mid-Atlantic region between the coast and the 2000m isobath, and between 36 degrees N and 41 degrees N for the purpose of developing offshore baseline information and to provide input to trajectory prediction models in conjunction with offshore oil and gas developments. To make recommendations for additional physical oceanographic and meteorological field measurements to remedy data deficiencies.
APPROACH: Design and produce required physical oceanographic and meteorological analysis products obtained from available federal sources, and from other selected institutional files. Evaluate the adequacy of

the available observational data base in meeting specific program requirements, such as trajectory predictions. Review on-going and planned observational programs, in light of the historic data base analysis. Formulate specific recommendations for the design and strategy of future observational sampling programs.
RESULTS: Statistics on data amount and distributions together with a statistical analysis of the data itself will be presented, with emphasis on the natural distribution and variability of relevant parameters. The data and analysis products will be given in formats most suitable for user application, such as monthly or seasonal tabulations, histograms, charts, contour plots, etc. Graphic and tabular presentations will be accompanied by interpretive discussions and conclusions, regarding, e.g., surface winds and waves, circulation patterns, and water column structure.
PROJECT MILESTONES: April 1, 1977 Draft final report. September 1977 Final report.
KEYWORDS: SUMMARIZATION;EVALUATION;ATLANTIC OCEAN;CONTINENTAL SHELF;METEOROLOGY;OCEANOGRAPHY;DATA COMPILATION;USA;MAPS;CLIMATES;CHEMICAL EFFLUENTS;OIL SPILLS

REGIONS OF INTEREST: BIOMES/Estuarine;GEOGRAPHIC AREAS/Northwest;COASTS/Northwest;HYDROGRAPHIC AREAS/Other hydrographic areas Puget Sound
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (A) Determine the existing distributions, sources, and rates of inputs of petroleum contaminants. (B) Describe the processes related to physical and biochemical transformations, fates and effects of petroleum hydrocarbons. (C) Characterize the major marine biological populations, and their role in major ecological processes, most subject to impact by petroleum contamination. (D) Prepare integrated assessment documents on potential petroleum problems in Puget Sound, including impact scenarios and discussion of how alternative strategies might ameliorate problems.
APPROACH: The effort funded by EPA takes advantage of the NOAA Marine Ecosystems Analysis Program in the Puget Sound region to carry out studies relevant to energy development; i.e., intensified transport and refining of petroleum in the Puget Sound region. The project will be implemented by a series of tasks over a five year period using a NOAA project management staff and researchers from NOAA, other Federal agencies, universities, and other private sector organizations.
RESULTS: Monographs, environmental inventories, mathematical models and final reports.
PROJECT MILESTONES: For the Strait of Juan de Fuca and the northern Puget Sound, (1) FY77: Characterize sources and distributions of suspended sediments and their interactions with petroleum. (2) FY78: Determine the hydrocarbon baseline levels in biota and sediments; Determine ability of microbes to degrade petroleum; Characterize planktonic communities; Determine major pathways within food webs. (3) FY79: Complete baseline inventory of biota at risk from oil development; Complete characterization of physical oceanography; Complete mathematical trajectory model for spilled oil; Publish final reports and disseminate information to users.

PROJECT DESCRIPTION: Through meteorological research, to understand and predict the atmospheric transport and diffusion of heat and other pollution products in the planetary atmospheric boundary layer.
APPROACH: Develop and test mathematical models to characterize momentum and energy exchange processes in the planetary atmospheric boundary layer including such processes as buoyant plume rise, urban pollution, and meteorological conditions in and above forested areas.
RESULTS: Calculation of air parcel trajectories from experimental data including balloon trajectories; prediction of mesoscale air trajectories of pollutant clouds subject to diffusion; development of a model for multiple plume rise and cloud growth for use in the study of the meteorological effects of power parks.

REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Alaska;COASTS/Alaska;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) Synthesize existing information and identify research gaps on the fate and effects of toxic metals and petroleum hydrocarbons on subarctic marine ecosystems. (2) Develop capability to standardize analytical techniques for hydrocarbons and toxic metals and to provide intercalibration and routine analytical services. (3) Study specific processes controlling the distribution, transport and effects (both physiological and ecological) of petroleum hydrocarbons and selected toxic metals in the subarctic coastal marine ecosystems as an input to the assessment of the impacts of petroleum releases into this type of ecosystem and to development of water quality standards.
APPROACH: In the context of the extensive environmental assessments of the OCS (particularly in Alaska) being conducted by NOAA for BLM, this effort is designed to study intensively those aspects of the marine ecosystem that are related to the responsibilities of EPA (regulation) and to NOAA (environmental monitoring and prediction). The existing capabilities within NOAA will be used primarily, but will be extended in the area of analytical techniques.
RESULTS: Workshops, ecosystem inventories, inputs to site selection policies, final report.
PROJECT MILESTONES: Install analytical equipment. Synthesize existing information and hold planning workshop. Develop site selection criteria and assess potential field site. Characterize baseline ecosystems in experimental and control sites. Conduct experiments and testing at field sites.
KEYWORDS: PETROLEUM;HYDROCARBONS;METALS;AQUATIC ECOSYSTEMS;TOXICITY;ENVIRONMENTAL EFFECTS;POLLUTION;ENVIRONMENTAL TRANSPORT;OIL SPILLS;BIOMASS;SITE SELECTION;BASELINE ECOLOGY

TECHNOLOGY: FOSSIL FUEL/Coal (65%);FOSSIL FUEL/Oil and Gas (35%)
ENERGY CYCLE: PROCESSING, CONVERSION (25%);ELECTRICITY GENERATION (75%)
POLLUTANTS: NOXIOUS GAS (50%);PARTICULATES (50%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Far West;GEOGRAPHIC AREAS/Site specific Semi-arid regions
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: (1) To develop criteria for assessing the impact on local and lower mesoscale weather of effluents from coal-fired power plants and petroleum refineries. (2) Based on criteria, to assess and recommend measures for minimizing adverse weather modification effects of power-generating and petroleum refining as input to guidelines and strategies for operational use by EPA.
APPROACH: The project consists of making in situ measurements as well as laboratory analyses of aerosols associated with power generating plants near Farmington, New Mexico and Colstrip, Montana and with the petroleum refineries in the Los Angeles, California, basin and of analyzing the effects on weather of the increased atmospheric aerosol content resulting from plant operation. The dispersion, coagulation, sedimentation, and washout determine the atmospheric residence times of the aerosols. The faster the gas-to-particle conversion rate, the shorter the residence times and the more efficiently the particles act as cloud forming nuclei. By combining an Aitken nucleus counter, a diffusion cloud chamber for counting cloud condensation nuclei (CCN), and an ice nucleus counter, it will be possible to determine what fraction of the total aerosol concentration is condensation nuclei and what fraction is ice nuclei. Elemental analysis with the x-ray spectrometer and size analysis with the scanning electron microscope relate the number of active condensation and ice nuclei to the abundance of specific c elements. We have shown that condensation nuclei are generated by means of a gas-to-particle conversion process in the plume for coal-fired powerplants; this process depends primarily upon the SO/sub 2/ to sulfate oxidation. A similar role for NOx in petroleum refinery plumes is postulated and is being investigated. Pollution plumes have been postulated to extend several hundred miles downwind over mostly unpopulated but agriculturally utilized areas. Ecosystems in these sometimes very arid areas would be subject to change if the precipitation pattern changes as a result of increased energy production. An aircraft is being used to trace vertically and horizontally the diffusing pollutants from the selected sources. Their atmospheric residence time and cloud modification potential will be evaluated in connection with the local climatology; namely, water vapor mixing ratio and temperature lapse rate. Cloud drop spectra and other microphysical parameters of clouds will be measured, and the influence of pollutant aerosols and gases appraised. The effects of the pollutants on shortwave and long wave radiation, hence their climatic impact, will be evaluated by absorption and scattering measurements, and calculations based on measured size distributions and elemental composition.
RESULTS: The criteria produced in this study should be available before the large scale increase in usage of fossil fuels. The output, e.g., aerosol concentrations and distributions, will be critical inputs to

ecological and health effects studies and to other weather and climate modification studies.
PROJECT MILESTONES: Complete interim reports on measurements at Colstrip, Farmington and Los Angeles. Complete technology assessment of effects of power plant effluents on weather and climate. Make recommendations on control measures for lessening effects on weather of power plant effluents.

PROJECT DESCRIPTION: To provide environmental information necessary to assess the potential impacts of petroleum exploration, development, and production on marine ecosystems of the Outer Continental Shelf of Alaska. This includes pre-developmental environmental characterization for comparison with post-developmental conditions, and characterization of potential sources, trajectories, transformations and effects of pollutants on organisms and ecosystems designed for prediction of impacts.
APPROACH: In-house and contract research projects are conducted on various aspects of chemical and physical oceanography, geological and seismic profiling, reconnaissance of populations of marine mammals, birds, fish, invertebrates, and microorganisms, and laboratory studies on transformations and effects of contaminants.
RESULTS: Knowledge of the nature and magnitudes of contaminant sources and other environmental alterations associated with OCS developments; of transport pathways and efficiencies for contaminants; of the distribution and vulnerability of critical habitats and organisms, seasonally; and of the sensitivity of these organisms and habitats to the projected impacts. These data products will be integrated to provide environmental impact assessments to influence decisions on OCS leasing and stipulations for OCS oil production.

PROJECT MILESTONES: Data reports to BLM for impact assessments in each of 9 Alaska OCS lease areas, and subsequently for design of operating regulations and stipulations.

PROJECT DESCRIPTION: To evaluate natural variability in community structure and flows of energy through coastal and estuarine ecosystems, and to develop a working knowledge of fisheries production in a variety of habitats to establish a data-base upon which to evaluate perturbations.
APPROACH: Microbes are estimated by ATP and acridine orange direct counts; benthic invertebrates from screened samples of sediment cores; nekton from a variety of gears plus estimates of precision and accuracy; and ichthyoplankton using horizontal and oblique bongo net tows. Food utilization is measured using /sup 14/C-labeled and unlabeled substrates and metabolism by respirometry techniques.
RESULTS: A mathematical model to predict impact of thermal discharges on eelgrass beds was completed. Response surfaces of sediment parameters were graphically plotted, thus providing a basis for examination of relationships between the biota and the substrate. Descriptive modeling of the biomass of plants, microbes, invertebrates and fish in eelgrass beds and the estuary was initiated.
PROJECT MILESTONES: (a) Determine seasonal distribution of microbes in estuarine water and sediments. Completion date July 1978. (b) Determine trophic structure of seagrass systems and impact of habitat alteration on system productivity. Completion date May 1979. (c) Evaluate distribution and abundance of fish eggs, larvae, juveniles and adults in estuarine and coastal waters. Completion date September 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this project is to characterize the pathways, rates of transport and fate of trace elements and radionuclides in coastal-plain estuaries and adjacent coastal waters of the southeastern United States.
APPROACH: The research approach is to (1) determine which estuarine components represent major biotic and abiotic reservoirs of individual trace elements and radionuclides, (2) determine the flux of these contaminants among the reservoirs, and (3) measure the effect of environmental variables on this flux. This information is then combined with energy flow data (e.g., biomass estimates, growth rates, feeding rates) obtained by other research programs in the laboratory to develop descriptive models of trace element flux within these ecosytems.
RESULTS: The expected results are a dynamic model of the distribution, chemical speciation, pathways and fate of trace elements in coastal-plain estuaries and adjacent coastal waters of the southeastern United States. An understanding of the flux of these materials will allow prediction of their fate and effects when introduced from anthropogenic sources.
PROJECT MILESTONES: (1) Describe partitioning of trace metals among estuarine food webs, including development of predictive models. Completion date: July 1978. (2) Determine distribution and movement of plutonium and tritium in selected estuaries in North Carolina and Georgia. Completion date: July 1979. (3) Determine turnover rates of trace metals in selected fishery organisms for inclusion into predictive models of trace metal cycling in coastal-plain estuaries. Completion date: July 1979.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of the research program are to expose large numbers of shellfish to arsenic, cadmium and copper to attain elevated levels of biologically incorporated metals, and to determine the physiological and biochemical effects of these metals on marine shellfish.
APPROACH: This research program is exposing oysters to copper, cadmium and arsenic to achieve high levels of biologically incorporated metals for use in mammalian toxicology programs. Research is also being conducted on the effects of these metals on shellfish survival, metabolism and growth. Tissue ultrastructural changes will be examined using electron microscopy.
RESULTS: Through cooperation with NIEHS, determinations of the toxicity of biologically incorporated metals in shellfish on mammals will be made. Uptake rates of copper, cadmium and arsenic by marine shellfish and the toxicity of these metals to the different developmental stages of the shellfish will be determined. Ability to predict the effect of heavy metal pollution on marine shellfish will be a basic output of this investigation.
PROJECT MILESTONES: (1) Label oyster meats with high concentrations of copper, cadmium and arsenic for use in pharmacokinetic and toxicity experiments at NIEHS. Completion date: July 1978. (2) Measure effects of copper, cadmium and arsenic on oxidative metabolism of molluscan or crustacean tissues. Completion date: July 1980. (3) Establish MATC (maximum acceptable toxicant concentration) for shellfish. Completion date: July 1980.

PROJECT DESCRIPTION: The long-range objectives of this research are to (1) develop a dynamic model of the cycling and fate of copper, nickel and zinc in coastal waters of North Carolina and (2) determine the effects of dissolved organic compounds originating from watersheds and salt marshes on the physical transport and biological availability of copper to marine organisms.
APPROACH: The spatial and temporal distribution of copper, nickel and zinc is being determined in sediments and water of coastal North Carolina. The chelation of copper to dissolved organic matter, including the effect of environmental factors such as salinity and pH on the chelation of copper to organic matter, is being determined in the Newport River and estuary using a specific ion electrode.
RESULTS: (1) An evaluation of the significance of dissolved organic compounds on the transport, biological availability and toxicity of copper to fishery organisms. (2) Development of a dynamic model of the cycling and fate of copper, nickel and zinc in coastal waters of North Carolina.
PROJECT MILESTONES: (1) Characterize role of dissolved organic compounds on the transport of copper through estuaries into coastal waters and determine effect of various salinities on bioavailability and toxicity of copper to biota. Completion date: July 1979. (2) Determine distribution and movement of nickel, copper and zinc in sediment, water and dominant food webs in coastal waters of North Carolina. Completion date: July 1979.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this research program is to determine the effects of natural and man-made stress on the metabolism, growth, survival and behavior of marine and estuarine organisms with particular emphasis on fish.
APPROACH: This research program is designed to provide baseline data on estuarine and marine organisms so that the impact on biological productivity of specific environmental alterations associated with increased energy development can be properly evaluated. Determinations of the effects of power plant related stresses, such as entrainment with temperature shock and chlorine exposure and the leaching out of copper, on metabolism and how changes in the thermal environment affects fish growth and feeding.
RESULTS: Describe the effects of temperature, chlorine and copper (including interactions) on fish eggs and larvae resulting from entrainment in power plant cooling systems and make recommendations for site selection and operating criteria that would minimize these effects. Assess importance of ecological factors (temperature, salinity, nutritional quality and availability of food and interspecific competition and predation) on the productivity of Atlantic menhaden in selected nursery habitats along the east coast of the United States.
PROJECT MILESTONES: (1) Determine both lethal and non-lethal effects of increased temperature during simulated entrainment in power plant cooling systems on eggs and larval stages of estuarine and marine fish. Completion date: July 1978. (2) Describe both the effects of chlorine and copper and their interactions with temperature on the growth, metabolism and growth of fish eggs and larvae. Completion date: July 1980. (3) Describe the effects of temperature and salinity on feeding and growth of larval and juvenile stages of fish. Completion date: July 1980.

POLLUTANTS: METALS/Trace and heavy metals (35%);PARTICULATES/Sedimentology (35%);ORGANICS/Hydrocarbons (30%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/South;COASTS/Gulf;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To identify, determine and document the extent and types of biological, chemical and physical alterations that occur in a marine ecosystem associated with an area in which an oil and gas field is developed and operated. To determine the specific pollutants, their quantity, and effect on various components of the marine ecosystem. To develop a capability to predict the impact of oil field exploration and development on specific marine ecosystems. To develop a suitable data management system.
APPROACH: To achieve the objective, a number of discrete investigations must be conducted. These investigations are in highly specialized technical fields. Those in which in-house expertise exists, and technically competent personnel can be made available, are being conducted by NMFS. The other investigations are being conducted by various universities under contract. The results will be presented in synthesized semi-annual and annual reports.
RESULTS: The ecosystem changes that occur in an active offshore oil field, in comparison to an undisturbed area, will be determined and documented. The variability, distribution, extent and effect of ecological conditions will be characterized. The type(s), rate and effect of pollutants will be defined. The effects of the structures themselves on the composition of the local biota will be studied. The results will be presented in synthesized reports and the results of individual studies may be published in scientific journals.
PROJECT MILESTONES: (1) Complete pilot study, select work areas, design sampling system. (2) Complete preparation of sediment-type charts. (3) Final summary report of sediment characteristics, distribution and comparison between study areas. (4) Semi-annual and annual summary reports on: benthic organisms and communities, demersal finfish and macro-crustaceans, pelagic and reef fishes, plankton, effects of structures, and hydrography of area.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/South;COASTS/Gulf;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Establish baseline data on the marine fauna and physical features of the waters overlying the continental shelf in the south Texas OCS study area. More specifically, this included determining seasonal variations in plankton, benthic (demersal) and pelagic fish and shellfish populations with particular emphasis on species of commercial and recreational importance; and documenting seasonal variations in temperature, salinity, and current regimes as related to meteorologic and other physical factors.
APPROACH: With one or two major exceptions, the method used has been that of collating and analyzing historical, biological, and physical data available from a variety of sources. Exceptions include the completion of a creel survey and hydroacoustical survey to identify species of recreational importance with their seasonal variations and assess the magnitude of pelagic fish populations.
RESULTS: Definition of plankton and finfish/shellfish communities in the study area and the seasonal and areal variations of the important components of the marine fauna as related to oceanographic and hydrographic features of the area. This information will be released in report form.
PROJECT MILESTONES: (1) Identify major components of the plankton communities from historical samples and document seasonal and areal variations in their distribution and abundance. (2) Determine species composition of the ichthyoplankton, with particular emphasis on king and Spanish mackerel, and their seasonal and areal variations therein. (3) Documentation of species entering the commercial and recreational fisheries and their respective values. (4) Identification of oceanographic features of the area, including extremes and seasonal variations.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Determine classes of metabolites formed in fish from salmon and flatfish; determine some factors that affect activity of aryl hydrocarbon hydroxylases after exposure to aromatics; determine physiological effects of petroleum hydrocarbons on fish and shellfish with emphasis on sensory systems and behavioral patterns.
APPROACH: Determine metabolites from aromatic compounds; effect of aromatics on larval forms; excretion and detoxification of aromatic compounds; evaluate effects of petroleum on chemoreception and concomitant behavioral responses.
RESULTS: Determine naphthalene metabolites in key tissues; determine uptake and depuration rates of naphthalene by larval spot shrimp; adapt methodology to assay livers for metabolizing enzymes in fish; obtain behavioral data for spot shrimp; obtain histopathological information from tissues of exposed fish and shellfish.
PROJECT MILESTONES: Publications on results from individual activities.

SEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
OJECT DESCRIPTION: The objective is to observe and quantify patterns of behavior in selected species of marine fishes and invertebrates to use in measuring the effects of sublethal thermal stress. Laboratory studies will concentrate on temperature effects on tautog reproduction; juvenile bluefish activity and feeding; chemosensory mechanisms in hake and blue crabs. Field studies define normal habits and requirements of young and juvenile cunner and tautog.
APPROACH: Establishment of normal activity, feeding, grouping, social behavior for study species at temperatures approximating natural conditions. Change temperature (rate dependent on species to be studied, monitoring behaviors indicated. If sublethal exposure, return temperature to pre-test levels. Field studies utilize SCUBA, tagging, ultrasonic monitoring to establish normal movements and habitat requirements.
RESULTS: (1) The effect of prolonged exposure to elevated, sublethal temperature on courtship and spawning behavior of adult tautog and the viability of eggs and embryological development. (2) Possible avoidance-escape response in juvenile bluefish (comparable to that exhibited by adults). (3) Description of normal chemosensory behavior in hake and blue crabs to use in assessing effects of varying thermal levels. (4) Determination of effects of temperature on normal activity and social behavior of blue crabs.

REGIONS OF INTEREST: BIOMES/Estuarine;BIOMES/Marine;HYDROGRAPHIC AREAS/Deep ocean;HYDROGRAPHIC AREAS/Continental shelf;HYDROGRAPHIC AREAS/Great Lakes
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To develop common techniques for the standardization and intercalibration of sampling and sample analysis in the marine environment; and to permit intercomparison of marine environmental samples and the pooling of data from several sources for more reliable predictions/assessments of energy production and its effects on the environment.
APPROACH: In providing a national capability for marine monitoring responsive to national energy needs and to local environmental constraints, a Federal involvement to develop appropriate methodologies is necessary. High priority effort will be expended to establish adequate instrumental evaluation techniques, standards, calibration procedures and methodologies, and intercomparison of measurement capabilities for quality assurance of monitoring instrument systems.
RESULTS: Instrumental and procedural standards for laboratory and field use; assessment and present quality status of methodologies used for characterizing the marine environment; and mechanisms for quantifying instrument and measurement performances.
)JECT MILESTONES: FY 76-FY 79: The prime milestones for the contractual efforts to develop standards, and

the assessment of water quality instrumental measurements are development of appropriate work statements; evaluation of proposals; technical monitoring of contract; evaluation and analyses of end product from contract.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The purpose of the Underway Water Sampling System development project is to provide an effective shipborne system to measure those physical and chemical parameters which determine the identity, concentration, transport, and distribution of pollutants arising from energy activities in the marine environment. The system will be used to characterize background or ambient levels of pollutants from sources such as offshore oil rigs and thermal power plants, as well as dredging or mining activities on the continental shelf.
APPROACH: The overall concept envisions a ship traveling at speeds up to 10 knots while continuously obtaining water samples and oceanographic measurements which are processed in real or quasi-real time. This four-year development effort includes: analysis, subsystem development, system integration, and at-sea testing. The elements or work packages of the program include: (1) The current/depth measurement subsystem; (2) The water sampling and measurement subsystem; (3) Data processing, display and navigation subsystem; (4) System integration, test and techniques development.
RESULTS: The project has been abbreviated as a result of budgetary constraints. Work on all subsystems has been curtailed except for the Development of the Current/Depth Measurement Subsystem. The delivered product will be an engineering model fully tested and evaluated to measure ocean currents to a depth of 100 meters from an underway vessel. This subsystem is expected to provide valuable input to many NOAA programs such as the verification of hydrodynamical numerical models.
PROJECT MILESTONES: (1) Current/depth measurement subsystem acceptance test 9/79. (2) Complete application study report on water sampling and measurement subsystem 9/77.

PROJECT DESCRIPTION: Produce bathymetric maps to support the Bureau of Land Management's Outer Continental Shelf Leasing Program. The area covered by these maps includes the southeast coast of the United States (Georgia Embayment).
APPROACH: Bathymetric contours were compiled from systematic hydrographic/bathymetric surveys. The surveys contained the latest available data of the area, and were collected by NOS or other reliable sources, such as DMAHC.
RESULTS: All 5 1:250,000-scale bathymetric maps were produced. Three maps were overprinted with the BLM Lease Blocks. The bathymetry was compiled with as much detail as the data would allow, in that significant underwater features are shown in detail. Above all, through the use of contours, 100% of the data was used. The basic contour interval was 2 meters to 200 meters; 10 meters to maximum depth, where applicable. Prominent underwater features were named.
PROJECT MILESTONES: FY 1975 10 maps produced. FY 1976 20 maps produced. FY 1977 5 maps produced.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objective of this program is to develop a numerical model which will predict the concentration of petroleum in the ocean as a function of space and time. Previous models have required the source of this petroleum to be single spill; however, in this model it may be continuous leakage from one or more points, one or more individual spills, or from a spill and a general background level of known variable concentrations. The program also includes provisions for forecasting the local current, wind, and wave fields, forecasts which have not been available previously. Forecasting techniques will be developed for these variables.
APPROACH: The program is divided into seven tasks (or subprograms): (1) surface wind field, (2) ocean currents, (3) direct wind drag effects, (4) wave transport, (5) sea-air pollutant transfer, (6) horizontal diffusion, and (7) model integration. All the tasks, except task 7, can be done concurrently. As soon as individual task results are available, the model integration task will begin. Tasks 1 and 7 are done in-house; all the other tasks will be contracted to universities and private companies. The general approach is to apply physical, statistical, dynamical, and numerical methods to develop a model to predict the dispersion and concentration of contaminants from available oceanographic and meteorological data.
RESULTS: The final product of the program is a comprehensive model to predict the dispersion and concentration of contaminants (oil). The model will be implemented for operational use, such as, forecasting or planning. The model will include techniques for predicting required meteorological variables, compilation of physical and oceanographic data, methods for computing ocean currents, and rate of weathering processes.
PROJECT MILESTONES: (1) Program: Ocean Oil Spill Concentration and Trajectory Forecast; Planning, coordination, and direction FY 75-FY 80. (2) Subprogram 1: Surface wind field; Develop and implement forecast method FY 75-FY 78. (3) Subprograms 2 to 6: Award contracts January 1976-June 1977; Monitor contracts July 1976-June 1979. (4) Subprogram 7: Model integration; Coordinate with related projects FY 75-FY 80; Model integration January 1978-FY 80; Model testing July 1978-FY 80.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To develop an automated meteorological/oceanographic observation system for ultimate use on board ships cooperating in the international marine environmental observation program.
APPROACH: (1) Develop an engineering model Shipboard Environmental Data Acquisition System (SEAS-1). Operationally test and evaluate SEAS-1 on the NOAA Ship RESEARCHER and a MARAD ship. Develop and integrate with SEAS-1 additional sensors, e.g., automatic expendable bathythermograph. (2) Build a breadboard prototype model, SEAS-2. Prepare procurement specifications for SEAS-2.
RESULTS: A fully automated environmental data observing system for shipboard use.
PROJECT MILESTONES: (1) SEAS-1 assembled June 1976. (2) SEAS-1 tests begin August 1976. (3) Automated XBT assembled July 1977. (4) SEAS-2 Breadboard completed December 1977. (5) SEAS-1 test completed January 1978. (6) SEAS-2 procurement specifications completed January 1979.

POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical (100%)
REGIONS OF INTEREST: BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Site specific Pacific Basin;COASTS/Other coasts Pacific Basin
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: (1) To analyze the behavior of multinational enterprise in oil exploitation and deep sea mining in the Pacific in order to develop an effective response in Hawaii. (2) To determine validity of the Craven-Gopalakrishnan hypothesis of ocean resource development. (3) To assess impact assessment procedures and their application to policy formulation and implementation in order to design a useful environmental legal regime for the state. (4) To use this program as a basis for the School of Law to develop ocean and Asian law programs. (5) To continue developing materials and publications in the area of law of the sea, non-living resources, and boundary questions. (6) To develop alternate legal regimes for coping with problems raised by multinational development of ocean resources.
RESULTS: Materials developed will (1) be introduced directly into teaching at Hawaii and Harvard Law Schools; (2) provide technical information for state and federal agencies responsible for developments in ocean law; (3) form the basis of a conference on these questions; and (4) be assembled into a volume of materials used by scholars in the U.S. and also other participant countries for advisory purposes.
PROJECT MILESTONES: The project has concentrated on legal regimes which would permit the state of Hawaii to manage conservation and exploitation of the resources of the Hawaiian Archipelago. A legal regime was postulated as a target for a summer study program. Results of the study program include: (1) A paper on the resources of the Hawaiian Archipelago as related to current legal regimes. (2) An extensive paper on the developing concept of the Archipelago. (3) A paper on criminal jurisdiction in the Hawaiian Archipelago. (4) An essay on community and government leader awareness of the legal problems of the Archipelago. As a result of these studies, the State has been able to formulate an appropriate position on its boundary determination. Also, a number of foreign scholars have been attracted to the project and will begin work this spring.

MONITOR: McLellan, Hugh
TELEPHONE: C(202)634-4125
TYPE OF FUNDING: Grant No.-04-6-158-44118
77 FUNDING: National Oceanic and Atmospheric Administration FY77:$29,700; University of Southern California FY77:$22,800
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Far West;COASTS/Far West;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: (1) The assessment of existing geologic and chemical information pertinent to seeps. (2) The use of chemical parameters including trace elements, sulfur and nitrogen content, carbon isotopic ratio, and volatile organic components to characterize oil and tar from natural seeps, offshore producing wells, and beaches. Comparisons will be made between these three sources. (3) The investigation of the geochemical breakdown or weathering of oil and tar from natural seeps as it moves in the marine environment. Emphasis will be placed on by-products and rates of chemical decomposition. (4) Relating characterization of oils and tars to the problems of source and the subsequent weathering in the marine environment. (5) The determination of the geologic, geophysical and oceanographic framework of selected oil and tar seeps in Santa Barbara Channel and Santa Monica Bay. Specifically, the relationships of seeps to faults and seismicity will be considered.
RESULTS: The results of this project will be directly applicable to the expressed needs of the State Lands Commission, Division of Mines and Geology, and the California Coastal Zone Conservation Commission in their endeavors to develop comprehensive strategies for the State of California. It will lead toward the establishment of fingerprinting techniques for sources of oil and tar in the marine environment and laboratory methodology for performing baseline studies relevant to petroleum exploitation of the OCS.
PROJECT MILESTONES: (1) Prepared an up-to-date active fault and seismicity map of the coastal zone from Pt. Conception to San Diego utilizing all available seismic data from 1932. (2) Established criteria for the recognition of natural oil and/or gas in Recent and Pleistocene sediments on the near-shore shelves from seismic profiling records. (3) Established that faults and beveled anticlines (in Miocene and Pliocene rocks) are responsible in large part for natural oil and gas seepage on the San Pedro, Santa Monica and Santa Barbara shelves. (4) Recognized an extensive, unreported gas seep province in northern Santa Monica Bay.

REGIONS OF INTEREST: BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/South;COASTS/Gulf;HYDROGRAPHIC AREAS/Other hydrographic areas Coastal
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) To elucidate and quantify the relationship between primary productivity and microbial nitrogen fixation, (2) to determine the effect of stress on the rate of nitrogen fixation, (3) to determine the effect of stress on the microbial types and numbers which fix nitrogen, (4) to determine the usefulness of nitrogen fixation and/or microbial nitrogen fixers distribution as indicator organisms for Louisiana's CZM effort, (5) to determine effect on uptake of plant nutrients by Spartina alterniflora, (6) to determine effect on the various components of the nitrogen cycle, etc., and (7) to determine the effect of crude oil on biological activity of soil as measured by CO/sub 2/ production.
RESULTS: Most of the primary production in Louisiana coastal marsh can be attributed to Spartina alterniflora. Knowing the effect of oil on the growth of Spartina alterniflora will help determine part of the overall effect of petroleum operations on the ecology and productivity of Louisiana's coastal area. This type of information is essential to agencies charged with decision-making responsibilities in coastal areas, especially the prospective coastal zone management agency. Information derived from this project will be integrated directly into the ecological indicator portion of the CZM program being developed by Sea Grant in Louisiana.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) Determine hydrocarbon (aliphatic and aromatic) concentrations in tissues of several resident marine organisms at different trophic levels in a chronically contaminated oil field environment; and (2) establish the geographic limits of petroleum contamination to resident marine organisms living in these environments, based upon levels of petroleum constituents in surrounding sediments and waters (extension of data from previous year's study).
RESULTS: This information will be used to update knowledge about the toxicity of crude marine environment. Understanding biological pathways of crude oil transport and degradation in coastal environments will enable future oil field production, drilling, etc., to minimize risk of environmental damage.
PROJECT MILESTONES: Seasonal and climatic concentrations of hydrocarbon-related compounds in the water bodies of natural and oil-contaminated areas have been determined. Oil field waters contain (yearly average) 30 to 50% more dissolved organic carbon than control sites. The alkane and aromatic fractions of surface sediments from the oil field stations indicate substantial petroleum derived compounds; other extractable sedimentary constituents show no quantitative or qualitative differences between oil field and natural sediments.

REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Global;COASTS/Far West;COASTS/Northwest;COASTS/Alaska
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: The objectives of this project are: (1) to develop an oil absorbing ferromagnetic sorbent product which can be used repeatedly through many cycles and (2) to develop a 24-foot companion magnetic recovery unit which is efficient and relatively free of complicated machinery. Together they will provide a useful and economically attractive new technique for rapid oil spill recovery.
RESULTS: The prototype recovery unit will be available locally for oil spill clean-up duty whenever its use is found feasible. The equipment and techniques developed during the course of this project and the data acquired during the final testing will be the subject of a paper to be presented at the next Oil Spill Conference now planned for 1977.
PROJECT MILESTONES: No major accomplishments. Design work and construction of the prototype recovery unit is underway and an optimization study of the ferrofoam product is in progress using available A.S.T.M. test procedures.

TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
ENERGY CYCLE: TRANSPORTATION (25%);STORAGE (25%);PROCESSING, CONVERSION (25%);WASTE MANAGEMENT (25%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Estuarine;GEOGRAPHIC AREAS/South;COASTS/Gulf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: (1) To investigate the role of clays and organic matter in oil adsorption and their subsequent precipitation, (2) to find the relative stability of adsorbed hydrocarbon with respect to chemical and biological degradation, (3) to find the level of inorganic nutrient requirements for biodegradation of adsorbed hydrocarbons, and (4) to monitor the secondary chemical changes in surface sediments as a result of chronic oil and waste water discharges.
RESULTS: Attention has been paid primarily in the past to major oil spills. The widespread chronic discharge of sublethal quantities of oils near tank farms, oil wells, ship ports and waste water from petroleum processes has been regarded as being non-significant and has been ignored. This may be true in the short-term, but may have severe effects in the long-term. This problem seems especially pertinent in light of increasing oil imports via the future superports, the possibly increasing number of oil wells in nearshore waters, the demand for new coastal refining capacity, etc. The information obtained in the proposed study would be useful to the superport authority, oil industry and other state agencies (e.g., La. Wildlife and Fisheries Comm.) for developing policies in order to control and/or reduce oil spills, large or small.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objectives of this proposal are: (1) To delineate via lab experiments the equilibrium oil thickness distribution of a retained slick in a current FY 76. (2) To characterize and quantify via both lab experiments and theoretical studies the instabilities at the oil/water interface of a slick in a current FY 76. (3) To check via lab experiments existing theories on the effect of surface waves on oil slick containment and collection FY 76. (4) To explore via lab experiments the relative importance of turbulence on formation of oil drops by tearing from an oil slick FY 77. (5) To devise system approaches to oil slick control for currents and waves typical of offshore environments FY 77.
RESULTS: This project will for the first time provide reliable data to establish the basis necessary to design effective, efficient oil-boom barriers for containment of oil spills at sea. The project will develop the data and methodology for effective nearshore and offshore clean-up systems. The project will perform a systems analysis to establish the parameters, organizational needs and decision criteria for a practical oil containment and clean-up logistic plan adaptable to any port or area.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Global;COASTS/Northeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine for adult and developing marine fish: (1) The nature and extent of effects of low levels of petroleum hydrocarbons on enzymatic processes related to drug or hydrocarbon, hormone, protein, carbohydrate and lipid metabolism. (2) The significance of related cellular and ultrastructural changes which can be detected by light and electron microscopic techniques. (3) How time-dosage relationships and routes of hydrocarbon introduction alter the above effects, and whether these can be reversed by transferring contaminated fish to uncontaminated water. (4) The characteristics of the hydrocarbon metabolizing system in marine fish.
RESULTS: (1) To use biochemical and histological methods for detection of effects of environmental levels of petroleum hydrocarbons in marine fish. (2) To evaluate potential physiological and biochemical effects on fish populations which may result from an increased input of petroleum where there presently is none, i.e., new offshore drilling, coastal refineries, and other industry. (3) To better understand and evaluate the effects of various environmental stresses on growth and reproduction in marine fishes. These data may be of value to aquaculture systems.
PROJECT MILESTONES: (1) We have shown, using in vitro techniques, that chronic and acute exposure to environmental levels of petroleum hydrocarbons alter carbohydrate and lipid metabolism in marine fish. (2) Demonstrated distinct differences in hepatic glucose and acetate metabolism as a function of exposure time to petroleum hydrocarbons. (3) Have shown the exposure to environmental levels of PHC resulted in hepatic ultrastructural changes, reflecting alterations in both protein synthesis and certain aspects of lipid metatclism, at the electron microscopic level.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/South;GEOGRAPHIC AREAS/Global;COASTS/Gulf
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: (1) To determine, through physical modelling, the effect of storm waves on buried pipelines approaching and crossing the shoreline. (2) To determine, through physical modelling, the depth of rock cover, size of rock cover, size of rock and type of inverse filter as a function of wave characteristics, water depth and pipe burial in both the two-dimensional wave tanks. (3) To continue collecting and evaluating data on offshore pipeline failures due to storms or hurricanes. (4) To develop new or improved design criteria to minimize the high failure rate of offshore pipelines.
RESULTS: Since crude oil is found under the continental shelf in the Gulf of Mexico, the study is of particular interest to the states of Texas and Louisiana. Municipalities and industry located in the coastal zone are faced with an increasing volume of waste disposal. Much of it is disposed offshore and the environmental considerations necessitate longer and longer pipelines. Those who will benefit directly are persons responsible for design, construction and operation of effluent outfalls for municipalities and industry, cooling pipes for steam and nuclear power stations, heating pipes for LNG installations and pipelines for transporting oil and gas.
PROJECT MILESTONES: (1) A major effort on the project consisted of a two-dimensional experimental study of scour of beaches above and around offshore pipelines approaching and crossing the shoreline: (a) the experimental study has been conducted in a glass-walled wave tank which is 120 feet long, 3 feet deep and 2 feet wide which permits visual observation of development of ripples and underwater bars and the mechanics of scour around the pipeline, (b) data were collected photographically and video-taped for subsequent analysis which revealed the relationships between scour depth and wave height; scour length and wave length; and wave height and wave length/water depth for a range of wave steepness values. (2) Several contacts were made with industry, notably with Houston and Texas Gas Transmission Corporation and Brown and Root Company which is setting up a committee to help disseminate our research efforts.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The overall objective of this research is to determine the current levels and compositions of organic pollutants in sea water. The immediate objectives are the following: (a) To determine seasonal variations in surface films and dissolved organics in sea water. (b) To determine the variations in surface films and dissolved organics in pleasure craft and commercial harbors, and in the open sea. (c) To determine those components of petroleum that dissolve sea water or are otherwise removed during weathering. (d) To explore new methods for identifying the source of petroleum on sea water.
RESULTS: Information will be given to cognizant state and federal regulatory agencies. Methods will be made available to those doing environmental impact statements. Technical aspects will be published in suitable media.
PROJECT MILESTONES: (1) The types and relative amounts of hydrocarbons have been determined for the following: (a) Beach sands from nine locations along the Rhode Island coast. (b) Over 50 samples of surface and subsurfaces water from a pleasure craft harbor. (c) Surface samples from a commercial fishing harbor and from Narragansett Bay. (2) A new method for fingerprinting petroleum has been developed. (3) Separation of hydrocarbon components in samples of weathered and unweathered petroleum has been initiated.

TECHNOLOGY: SOLAR/Ocean, wind (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (50%);DEVELOPMENT/Laboratory scale;DEVELOPMENT/Pilot plant (50%)
REGIONS OF INTEREST: BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/South;COASTS/Other coasts Virgin Islands;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objectives of this project are: (1) to study upwelling under controlled conditions; (2) to establish the most efficient means of protein production in the marine food chain using, as raw materials, sunlight and sea water from the nutrient maximum in the sea; (3) to examine the possibility of utilizing the cold temperature of deep-sea water for air conditioning and other cooling purposes such as its use in conventional desalination processes, etc.; (4) to examine the feasibility of utilizing the temperature differential between warm surface water and cold deep-sea water for the production of

electrical power.
RESULTS: The research will establish the technical feasibility and economic benefits of a combined sea-thermal power station and mariculture plant, leading to the construction and operation of a land-based pilot plant. It is hoped that before the end of 1975 firm plans for the commercial application of this concept will be completed.
PROJECT MILESTONES: Work during the past year centered on optimization of the system for producing food for bivalve molluscs; selection of bivalves with greatest economic importance; construction of a Hatchery Building; and studies of multiple uses of bivalve-tank effluent. The shellfish hatchery is complete and in operation; experimental shellfish area is under construction; pilot shellfish area being planned. Chaetoceros curvisetus maintained nearly unialgal cultures (in 13,000-gal. outdoor pools) for periods up to one month in unenriched deep-sea water from our offshore pipelines. Five species of shellfish were harvested, having achieved market size during the year. Nine species were evaluated for suitability in our St. Croix system.

TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Northwest;COASTS/Northwest;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: (1) To provide the National Oceanographic Data Center (NODC) with a magnetic tape of the calibrated continuous wave force data recorded during Hurricane Carla by Wave Force Project II (WPII). (2) To estimate the bispectra of hurricane-generated waves recorded during Hurricane Carla by WPII and determine the appropriate type of smoothing required for these bispectral estimates. (3) To compare the bispectral estimates from measured wave records with bispectral estimates computed from both linear and nonlinear simulations using two types of linear spectral inputs. (4) To compare the nonlinear self interactions with the nonlinear cross-product spectral interactions simulated from the ''raw'' and ''smoothed'' measured spectra and from the Bretschneider and Borgman design simulations. (5) To evaluate the spreading factor from the bispectral estimates of the measured and simulated realizations. (6) To provide training for a graduate student in the stochastic design and analysis of offshore structures for energy-recovery systems. (7) To publish an improved design procedure for the simulations of nonlinear stochastic wave forces needed for the dynamic analysis of offshore structures. (8) To generate nonlinear random waves in the OSU Ocean Wave Research Facility and compare measured realizations with predicted realizations.
RESULTS: Most offshore structures are designed for either linear random waves of nonlinear deterministic waves; however, neither of these wave combinations reflects the natural conditions at sea. Offshore structures should be designed for nonlinear random waves; these waves mimic waves at sea. The procedure for simulating nonlinear random seas in an ocean of finite depth will be used in the stochastic designs and analysis of offshore structures designed for energy-recovery systems. The results of this study will also enable the OSU Wave Research Facility to generate nonlinear random surface waves in an ocean of finite depth.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To complete the historic physical oceanographic, meteorological, bathymetric and ecological data necessary to characterize the western shelf waters of the Gulf of Mexico for the region from the coast to about 20 miles offshore along the Texas and Louisiana coast for the purpose of studying the effects of disposal of a saturated brine solution resulting from leaching out oil storage caverns. Also, to provide input to a transient plume pollutant model that would aid in making decisions concerning such a disposal of brine into coastal waters.
APPROACH: Provide a series of reports (5) that investigate various segments of the Texas/Louisiana coast with regard to the impact of brine disposal into coastal waters. List and summarize data sources of oceanographic, meteorological, ecological and bathymetric data. Develop a state-of-the-art model to predict movement of such a pollutant in coastal waters.
RESULTS: Types and sources of data and a data summary is presented along with typical model outputs.
PROJECT MILESTONES: February 1977 Report (1) Bryan Mound Site, March 1977 Report (2) West Hackberry Site, May 1977 Report (3) Capline Sector, July 1977 Report (4) Big Hill Region September 1977 Report (5) Offshore Regions.

TECHNOLOGY: SOLAR/Ocean, wind (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: METALS (10%);ORGANICS (40%);HEAT, THERMAL (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (60%);DEVELOPMENT/Laboratory scale (40%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Site specific Gulf of Mexico;COASTS/Gulf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The primary objective of the project is to determine the rate of biofouling and corrosion buildup on OTEC evaporator tube sections at a candidate OTEC site in the Gulf of Mexico and to assess the deterioration of heat transfer through the tube sections as a function of the biofouling and corrosion process. As a secondary objective, initial baseline environmental data will be collected.
APPROACH: A large deep ocean data buoy will be outfitted with experimental OTEC heat exchanger sections for evaluation of the buildup of corrosion and biofouling films in the tubes under various flow conditions of warm oceanic surface water at a candidate OTEC site in the Gulf of Mexico. In addition, monitoring of surface atmospheric conditions and water chemistry will be conducted through use of meteorological and water quality indicator instrument systems installed on the buoy. All data will be collected automatically and relayed ashore for analysis of heat transfer coefficients and assessments of fouling film developments. Macrofouling sample panels will be installed at all levels in the water column and recovered for toxonomy analysis ashore.
RESULTS: A definition of the biofouling and corrosion potential at a candidate OTEC site in the Gulf of Mexico will be obtained. Early testing of mechanisms for cleaning or control of film within the tubes will be possible. Initial data for long term environmental assessment program will be collected.
PROJECT MILESTONES: Completion of Data Buoy Integration, and deployment of Data Buoy at a candidate OTEC site in the Gulf of Mexico 11/77; Completion of first series of in situ biofouling, corrosion, and heat transfer experiments at candidate OTEC site in Gulf of Mexico 2/78; Completion of second series of in situ

biofouling, corrosion, and heat transfer experiments at candidate OTEC site in Gulf of Mexico 6/78; and submission of first year environmental assessment data for baseline study 10/78.

PROJECT DESCRIPTION: To coordinate existing facilities and manpower for the purpose of establishing a network with the capability of rapid and effective response to diving accidents. To train physicians in all aspects of the treatment of diving accidents. To provide specialized services, consultation, reports, and organizing and carrying out workshops which will be designed to address medical and physiological problems relating to diving and diver training.
APPROACH: Existing government and civilian facilities and manpower will be assessed as to their current capabilities and organized to the degree necessary to provide a nation-wide diving accident management network. Physicians will be trained in diving medicine. Workshops will be held and information relating to diving physiology and medicine will be consolidated and organized into a readily usable form.
RESULTS: A clear definition of current U.S. capability to respond to diving accidents on a national level and a plan for organizing a diving accident management network. Physicians trained in diving medicine at key positions throughout the U.S. Published material relating to diving physiology and medicine.
PROJECT MILESTONES: To train 8 physicians from key geographic locations in the U.S. in diving medicine-10/77; to have a working plan for a nationwide diving accident management network-4/78.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT;ECT;OS
PROJECT DESCRIPTION: To develop, implement, operate, and evaluate an automated system to predict boundary layer wind and turbulence parameters for an instrumented TV tower near the Savannah River Laboratory's nuclear reactor site.
APPROACH: Use the Model Output Statistics (MOS) technique to develop statistical regression equations to predict winds (u and v components and speed) and turbulence parameters for differing levels on the TV tower. These forecasts will be based on the output from a complicated numerical prediction model and surface weather reports.
RESULTS: Objective wind and turbulence forecasts are produced twice each day for periods of 6, 9, 12, 15, 18, 21, and 24 hours. These are then used at the Savannah River Laboratory to predict the transport of radiation in case of an accident.
PROJECT MILESTONES: (1) December 1977 Prediction equations for the cool season (October-March) are put into operation. (2) April 1978 Prediction equations for the warm season (April-September) are implemented. (3) May 1978 Cool season forecasts are verified. (4) November 1978 Warm season forecasts are verified.

ENERGY CYCLE: EXTRACTION (10%);COMBUSTION IN SITU (45%);TRANSPORTATION (10%);STORAGE (10%);PROCESSING, CONVERSION (25%)

POLLUTANTS: NOXIOUS GAS/H2S;NOXIOUS GAS/NH3;NOXIOUS GAS/CO and others (10%);METALS/Hg;METALS/As;METALS/F;METALS/Mo;METALS/Se;METALS/Te;METALS/Sb;METALS/Others (35%);ORGANICS/Toxic and carcinogenic (55%)
CHARACTER OF STUDY: RESEARCH/Applied (70%);DEVELOPMENT/Laboratory scale (30%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental;GEOGRAPHIC AREAS/Site specific Colorado, Utah and Wyoming
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: This study will identify potential pollutants which may reach the environment as a result of emissions from oil shale and tar sand retorting operations. Such a study is necessary at the present time because of currently vigorous interest in oil shale and tar sand technology being shown by both private and government sectors.
APPROACH: Effluents from both above-ground and in situ processes will be characterized for a wide spectrum of inorganic, metallorganic and organic compounds and species. A wide variety of analytical methods including gas chromatography-mass spectrometry, neutron activation, x-ray fluorescence, high pressure liquid chromatography, atomic absorption and plasma dc-emission spectroscopy will be used for the characterization measurements. Effluents to be characterized will include raw oil shale, spent shale, crude shale oil, various shale oil boiling fractions, upgraded shale oil, process water, off-gases, as well as tar sand and crude oil from the sand. Priority will be given to those processes which show promise of early commercialization. On analysis, priority will be given to compounds of elements known or suspected as being carcinogenic, toxic or otherwise harmful. A list of such compounds and elements to be looked for will be formulated and reported as part of the project. Source term calculations will be made for each process.
RESULTS: The outputs of this program will be detailed analyses of effluents from oil shale and tar sand pilot retorting operations for inorganic, metallorganic and organic species. The data will be used to make source term calculations. The characterization, data and calculations will be summarized in early reports for each pilot plant discussing the possible environmental problems associated with the commercial operation of each type of process and suggesting the need for abatement procedures where necessary.

REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Site specific Great Lakes;HYDROGRAPHIC AREAS/Great Lakes
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: (1) To compile a description of petroleum transport and spillage on the Great Lakes at U.S. and Canadian ports and assess the risks of spillage from tankers and from harbor terminals. (2) To estimate petroleum inputs to the Great Lakes. (3) To review the available literature on oil spill prevention and clean-up technology, case histories of oil spills and known environmental effects of oil. (4) To prepare recommendations for research on the effects of petroleum on the Great Lakes environment. (5) To recommend appropriate regulatory or legislative action regarding marine terminal, tanker and tank barge operations on the Great Lakes.
RESULTS: Information from this project will be of use to state and federal regulatory agencies, legislative committees and advisory groups concerned with pollution control and the management of the Great Lakes coastal zone. Preliminary information has been provided to the U.S. Army Corps of Engineers, Minnesota Pollution Control Agency and the Wisconsin Coastal Zone Coordinating and Advisory Council. Recommendations for research in this area will guide future research by the U.W. Sea Grant Program, as well as other state and federal agencies.
PROJECT MILESTONES: Although this is a new project, a case history study of a 1975 oil spill in Milwaukee Harbor was completed and a presentation was made to the Advisory Council of the Wisconsin Coastal Zone Management Development Program.

REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Global;COASTS/Gulf;HYDROGRAPHIC AREAS/Other hydrographic areas Gulf

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECT
PROJECT DESCRIPTION: (1) To develop a hierarchy of computerized mathematical models for the prediction of oil spill transport and diffusion in offshore areas. (2) To investigate various display techniques for the model outputs and to implement those deemed most effective. (3) To demonstrate the capabilities of the above models as a tool in predicting oil spill trajectories. (4) To document the above models and prepare the dissemination materials for distribution to requesting agencies.
RESULTS: (1) The capability to forecast the trajectory of an oil spill will afford offshore cleanup crews a better estimate of slick location than is now available. (2) The coastal area most likely to be affected by an oil spill can be determined probabilistically, thus more accurately positioning the onshore combative personnel. (3) User communities likely to benefit from the results of this project include federal, state and local government organizations involved in coastal and/or offshore environmental protection, petrochemical companies engaged in offshore drilling operations, and governmental and/or industrial groups concerned with deepwater port facilities.
PROJECT MILESTONES: New project.

PROJECT DESCRIPTION: (1) To describe procedures by which port commissions and pipeline companies interrelate with their traditional supporting/regulating agencies (COE, CG, BLM, FPC) and with environmental regulating agencies (EPA, CEQ, FWS, NMFS) in selecting sites for development projects; and (2) given current and potentially expanded public interest in land use and environmental management in Louisiana marshes, evaluate procedures for interaction between ports and pipeline companies, state and local interests, and federal supporting/regulating agencies to determine potential for: (a) early planning interaction on design and site selection criteria; (b) streamlining of permit procedures to avoid redundancy; and (c) establishing equitable compensatory/mitigation features as integral parts of project design to offset environmental and social costs attributable to project.
RESULTS: The Port of New Orleans (Pierre Reeh, Chief Planner; Herb Haar, Chief Port Development Officer) have pressing need for information as it is vital to future port development plans. State Planning Office, La. Wildlife and Fisheries Comm., La. Coastal Comm. have need for information as part of federal-state relations in Louisiana's developing coastal management program. Oil and gas pipeline industries need information as expanded OCS development off Louisiana will result in need for considerable transportation development.
PROJECT MILESTONES: This is a two-year project which commenced September 1, 1976. (1) Prepared two papers on the legal aspects of pipeline development in Louisiana. (2) Prepared a bibliography of legal material available for Port of New Orleans.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: The objective is to determine the effects of chronic oil pollution on marsh macroconsumers, especially juvenile fish and benthic invertebrates, in terms of species diversity and population density. Also, to identify groups which can serve as index organisms to discriminate between stressed and unstressed areas.
RESULTS: Information will contribute to the scientific basis for regulating activities that have a potential for spillage of oil and oil-soluble compounds.
PROJECT MILESTONES: New project.

TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
ENERGY CYCLE: EXTRACTION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Southwest;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECT;OS
PROJECT DESCRIPTION: The purpose of the proposed research is to study seismic hazards to offshore platforms, pipelines, and wells due to ongoing seismic activity and fault motion. These problems require bottom-mounted instruments close to the area under study. The technology required for these instruments has been developed by W. Prothero at Scripps Institution of Oceanography over the last several years. This work will concentrate initially on microseismicity studies of offshore lease areas. The seismic hazards to offshore oil development include shaking caused by moderate to large (M > 4) earthquakes, deformation of underwater pipelines due to fault motion, and slumping of sea bottom sediments initiated by seismic shaking. Offshore earthquakes have been observed and located with land stations. The first year's work will consist of constructing, testing, and deploying 3 ocean bottom seismometer capsules in the Tanner-Cortes Banks lease tract or (and) the tract south of Santa Rosa Island. The objectives are to (1) determine the level of microseismic activity in the area; (2) accurately locate microearthquakes and relate their locations to faults inferred from acoustic profiling; and (3) work toward a quick response capability for deploying capsules in aftershock zones of M > 5 offshore earthquakes.
RESULTS: The information acquired through this work will be invaluable in localizing zones of seismic risk to offshore oil production facilities. Microearthquake surveys will delineate currently active faults and thus identify areas where particular design constraints might be imposed on pipelines or platforms. State and federal agencies such as the USGS and State Lands Commission will use this work in evaluating possible environmental hazards which could be caused by earthquake damage to offshore facilities. The oil companies will make use of the data to design their structures for endurance and safety to personnel and the environment. If a large earthquake should occur, this work could be important in reducing potentially costly delays in offshore development due to the lack of seismic data in the region.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECT;OS
PROJECT DESCRIPTION: The preliminary analytic studies which have been performed on large gravity type offshore structures have indicated that earthquake excitation will be the controlling factor in many offshore areas along the coasts of California and Alaska. Some offshore areas of interest for petroleum resource development must expect earthquakes of magnitude 8.0 or greater during the working life of a structure. Little work has been done to correlate the results of the analytic models which are used to predict earthquake response with the results of physical measurements on gravity type offshore structures. This study will perform this comparison. In particular, it will attempt to define the frequency dependence of the added mass hydrodynamic coefficients in the range of earthquake excitation and to define the degree of coupling between the various coefficients in translation and rotation. The overall objective of this study is to provide the information with which rational designs of such structures as offshore oil storage tanks can be performed for high earthquake risk areas.
RESULTS: This information will be extremely useful to the designers and users of offshore oil storage facilities to those regulatory agencies which must pass judgment on the safety of such facilities.

TECHNOLOGY: SOLAR/Ocean, wind (100%)
ENERGY CYCLE: COMBUSTION IN SITU (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Global
PROJECT DESCRIPTION: The objective of the program is to develop a new and novel source of energy which exists at the interface between waters of differing salinity. This large untapped source of energy is particularly concentrated where rivers flow into the ocean and into hypersaline lakes and at the numerous salt pans along the semi-arid coasts. The energy is represented by the osmotic pressure difference between fresh and saline water. The extent and character of this energy source will be evaluated. Furthermore, several schemes will be researched. In the first year, we will initiate studies utilizing the direct osmotic pressure difference and vapor pressure difference between fresh and saline water. Other possible methods to be investigated include concentrating the free energy through intermediaries, so that useful heat can be generated.
RESULTS: Considering our present energy shortage, it is necessary to develop new sources of energy. Furthermore, for flexibility, a diversified approach seems to be best. Salinity gradient power is the most concentrated source of power from the oceans. Almost no research has been done on it. Yet it has considerable promise for helping to ease the energy squeeze. Money provided by Sea Grant will give the initial impetus to a line of research that may have important consequences for the state, nation and the planet.

REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Southwest;COASTS/Far West;HYDROGRAPHIC AREAS/Other hydrographic areas Coast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: One of the major stumbling blocks to planning progress under consideration in southern California is the imbalance in available knowledge concerning local economic impacts and location and land use impacts of pending offshore resource development. To rectify this situation, this project intends: (1) to develop and evaluate a framework for analyzing the metropolitan, region-wide economic impacts of offshore ocean resource activities and their onshore, ancillry facilities; (2) to itemize the nature of specific environmental/economic trade-offs; (3) to report on the background of these trade-offs and how they have been deduced; and (4) to make recommendations on offshore policies for the State; these recommendations will be in light of the impacts on income distribution questions and on the location of economic activities.
RESULTS: (1) Data generated by this project will be of benefit to local governments which must create either protective or developmental policy stances regarding offshore resource exploitation. (2) This, in turn, will benefit the affected publics, since decisions made on a broader information base are, hopefully, more realistic. (3) Based on the more informed decisions generated by the local governments, both the pending offshore industry and the established onshore ones will benefit, because clear and reasonable regulations tend to minimize potential areas of conflict.

REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Southeast;COASTS/Southeast;HYDROGRAPHIC AREAS/Other hydrographic areas Coast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: To gain predictive capability to estimate the probable impact of oil if it is released near coastal marshes. Specific questions asked include: (1) What are the exchange and diffusion rates of water between the near and offshore zones; (2) what are circulation characteristics of the Georgia estuaries; (3) what is the character and gradient of suspensoids in these zones; (4) what are the adsorptive characteristics of petroleum components to these particles; (5) what is the rate of microbial degradation of petroleum components in the water, sediments and biota of the nearshore zone; (6) what are the effects of petroleum components on phytoplankton and zooplankton in this zone; and (7) what are the effects of petroleum components on the flora and benthos in the shoreface, beach and marsh environments.
RESULTS: The information obtained will assist coastal zone management in the following ways: (1) to locate

pipeline corridors in areas of best probable impact if and when petroleum is transported from the OCS to onshore Georgia; (2) to judge maximum probable impacts and recovery times of coastal marshes and estuarine waters if spills occur; (3) to determine rates of natural degradation of petroleum and transport/exchange rates within estuaries and nearshore areas; and (4) to estimate the probability of offshore spills reaching coastal waters/marshes. The State of Georgia's Department of Natural Resources, Office of Planning and Budget and the U.S. Coastal Plains Regional Commission have repeatedly noted the need for the above information for management purposes.

ENERGY CYCLE: EXTRACTION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECT
PROJECT DESCRIPTION: The objectives of this project are to develop an analysis technique that can predict the dynamic response of offshore structures to random ocean waves. The proposed method highlights simply and quickly those aspects of a structural design most likely to need improvement in withstanding design loads, and furthermore, provides a tool for structural optimization. Experimental verification and generalization of the method to a number of structures are the goals of this research.
RESULTS: The development of this model will provide a working tool for the prediction of structural dynamic response to wave excitation. The principal advantages of the model are its very broad range of application, from fixed platforms to floating bodies and oceanographic moorings, and its simplicity of application. For example, valuable upper-bound estimates can be made with a knowledge of nothing more than estimated structural natural frequencies and the prescribed design sea state. Detailed features of the final design of a structure are not required. Therefore, at early design stages, this process will be valuable as a tool for structural optimization, identifying simply and inexpensively those aspects of dynamic response most likely to be important in withstanding design loads.

ENERGY CYCLE: EXTRACTION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Middle Atlantic;COASTS/Northeast;COASTS/Southeast;HYDROGRAPHIC AREAS/Other hydrographic areas Coast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) Provide an inventory and description of the governmental structure at local and regional levels for the regulation of development and/or provision of public goods and services required for onshore support systems for offshore activities. (2) Describe rules and procedures by which decisions are made by these public agents. (3) Assess the present excess capacity of public services in the major municipalities, coastal counties, and special districts and authorities of New Jersey, Delaware, and Maryland. (4) Develop a framework for analysis of response capacity of public agencies to make regulatory decisions. (5) Make an initial evaluation of present response capacities of public agencies to public and private needs in development of support systems. (6) Make recommendations concerning improvements of response capacity and additional research needs.
RESULTS: The process of OCS onshore impact allocation and minimization in the mid-Atlantic area will be facilitated by the information and recommendations. Local planning and management agencies may use the information in evaluating their own planning and managing capacities. This evaluation will also assist in the allocation of federal funds to support expanded local planning and managing capacities. Finally, the study will provide information that can be used by the responsible federal agency for the determination of net adverse impact.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The main purpose of the study is to complete a hydrodynamic study and an engineering evaluation of a promising wave energy conversion system, the Salter cam. In order to accomplish this objective it is proposed to carry out the following tasks: (1) review the experimental data on the device; (2) utilize hydrodynamic theory to predict optimum cam characteristics; (3) confirm and extend the experimental data on the Salter cam; (4) obtain engineering design data for the engineering synthesis using the experimental results and other sources; (5) investigate methods of converting the energy of the rocking motion of the cam into usable energy; (6) apply the engineering data to the synthesis of a range of sizes of wave energy converters; (7) estimate the costs of the systems; (8) conduct a preliminary study of the environmental impact of the system; and (9) indicate potentially useful sites for wave energy conversion systems.
RESULTS: The study will provide a theoretical and experimental determination of the technical feasibility of using floating devices to extract appreciable amounts of energy from ocean waves. In addition the economic evaluation of such methods will be available for comparison with conventional and other novel energy sources.

PROJECT DESCRIPTION: The objective of the continued project is to perform sensitivity analyses focussing on the interaction between the physical processes affecting the behavior of oil slicks and the probabilistic treatment of potential spills. In particular the study will determine the relative importance of wind field and ocean current variability, oil spreading and dispersion, and weathering rates on the magnitude of oil spill related impacts. The study will also determine modeling and data requirements as a function

of the overall probabilistic framework for oil spill risk assessment.
RESULTS: The information developed during the continued project will be used to (1) improve the design of data collection programs associated with environmental impact evaluations related to deepwater ports and offshore oil development and (2) to develop frameworks for expressing oil spill probabilities that are consistent with the stochastic nature of potential impacts.
PROJECT MILESTONES: A review and evaluation of existing techniques for modeling oil spill behavior was performed. A draft report describing the results of this work was prepared and distributed to outside experts in this field. A workshop was held at MIT to provide a critical evaluation of the report. A final report is currently in preparation.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: Overall objectives: (1) to understand more about the functional coupling of benthic and pelagic communities in coastal marine ecosystems; (2) to measure the rates and pathways of carbon flow in a heterotrophic subtidal marine bottom community that is common in the New England coastal region; (3) to explore the relationship between the amount and nature of organic input from the water column to the bottom and the production of animal biomass in the benthic community; and (4) to begin to understand some of the mechanisms coupling demersal fish production with events in the overlying water. Immediate objective: No. 2 above.
RESULTS: Knowledge of the rates and mechanisms of benthic community dynamics is essential for evaluating the response of bottom communities to perturbations such as dumping anoxic waters, and oil sludge. It is also a basic link in the trophic dynamics of bottom feeding fish and in relating this growth and production to primary productivity and other organic input in the water column.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: (1) Develop appropriate geologic-economic simulation models incorporating uncertainty to evaluate the impacts of public policy options designed to encourage the use of enhanced (secondary and tertiary) petroleum recovery methods on OCS reservoirs. (2) Collect production costs and geological and engineering data on enhanced petroleum recovery methods available to OCS producers, and utilize these data in conjunction with the simulation models to evaluate the impact of alternative public policy options (such as price subsidies, changes in tax regulations, and investment incentives) from the standpoint of both production profiles and present-value economic impacts. (3) Evaluate the potential costs and benefits of energy from enhanced recovery of known petroleum resources as compared with the costs and benefits of alternative new energy supply sources such as new oil discovery, coal production, and others.
RESULTS: Research results will produce computer techniques and policy-oriented research reports that should be immediately useful to Congress and the executive agencies in formulating a long-range policy regarding enhanced recovery. The implications for supply augmentation will be of special interest. The study will directly complement efforts currently underway in government and industry to research the technical and engineering aspects of the problem.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Northwest;COASTS/Northwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECT;OS
PROJECT DESCRIPTION: To train marine personnel in petroleum handling, environmental protection, fire fighting, and fire prevention. Various levels of training will be offered for prospective employees as well as for those persons already employed in the industry. This aspect is especially important due to the increase of oil drilling in the Gulf of Alaska, and projected expansion of oil tanker traffic on Puget Sound waters, and to the West Coast ports of the United States.
RESULTS: To expand our curriculum in Petroleum Handling to cover the fire prevention and fire fighting, safety and survival areas, and to offer as much ''hands-on'' practical training as possible.
PROJECT MILESTONES: We have developed curriculum for petroleum handling for barge tankermen, oil terminal operators, shipboard personnel. This program has received U.S. Coast Guard approval. Three classes in this subject have been offered. Almost all students have been able to qualify for U.S. Coast Guard Tankerman's endorsement. In addition, four pilot classes in fire prevention and fire fighting have been offered. More classes will be offered as needed. The college has acquired two surplus Navy vessels, the YO212, a small tanker, and the YTM764, a 100-foot tug for use in the above training program.

77 FUNDING: National Oceanic and Atmospheric Administration FY77:$24,600
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: TRANSPORTATION (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Port of Buffalo;COASTS/Northeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The major goal of the study for the first year is to develop investment formulae and strategies for consumers of coal in the upstate New York area in the development of the Port of Buffalo into a modern coal transshipment port. The specific objectives for achieving this goal are: (1) develop formulae for mixes of eastern and western coal (incorporating environmental constraints on the burning of coal); (2) estimate costs for the development of the Port of Buffalo to handle projected demand, rates of flow, and ship size; (3) develop price ranges for the delivered mix of coal to the users; and (4) develop investment strategies for the users based upon the percent of use by each user (i.e., level of demand), the overall demand by location within the area, and the anticipated long-term savings in energy costs by using such mixes.
RESULTS: Because of the demonstrated need for western coal by northeast states, this study will be significant for: (1) The ultimate user: It will provide estimated costs for delivered future coal mixes based on western coal, and show the rates at which increased demand may prove economic. (2) The Port of Buffalo: It will show what investment strategies may prove most desirable to the user and developer, and

give insight into the best rates of development. (3) The region: The multiplier effect of major development in the area will have a net positive economic effect. It should be noted, however, that the prime significance will be the answer to the problem of whether any investment strategy is agreeable to the users and developer and is developmentally feasible.
PROJECT MILESTONES: New project.

<020009>
TITLE: Effects of Power Plant Peaking on Commercial, Sport, and Indian Fisheries
PROJECT NUMBER: ZTK-827
PRINCIPAL INVESTIGATOR: Mains, E.M.;Gerlach, A.R.
ADDRESS: 210 Custom House, Portland, OR 97209
AFFILIATION: Department of the Army, Washington, D.C. (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: Army Corps of Engineers
77 FUNDING: Department of Defense
TECHNOLOGY: HYDROELECTRIC (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
PROJECT DESCRIPTION: The objectives are to determine the effects of power peaking on commercial, sport, and Indian fisheries. Information on the effects of power peaking on these fisheries is needed for environmental impact statements, litigation with Indian groups, and for a better understanding of these matters by the Corps, the fish and game agencies, the fishermen, and the general public. More specifically, we must determine the effects of power peaking on the availability of fish at existing sites, on gill net efficiency, on gill net dropout rates and related mortalities, on fishing costs, on sportsmen access to fishing locations, and on stranding fishermen.
APPROACH: These study needs are highly varied and are complex to study. The existing tagging programs described in the work unit on migration, collection, and passage deal directly with the following aspects of the work unit: (1) Effect of peaking on Indian set net efficiency. (2) Effect on peaking on Indian set net dropout rate. (3) Effect on peaking on sport fishing sites. The conventional, sonic, and radio tagging techniques and creel census and interviews will be utilized in studies of impacts of peaking on the fisheries. Effects of peaking on existing sportsmen access to the river, fishermen success, and on the possible stranding of sportsmen can be accomplished by mapping locations and elevations of areas utilized by sportsmen today and evaluating available tailwater and reservoir surface elevation and rate of change information for a range of future peaking operations. Effects of peaking on fishing costs would be evaluated by survey of specific fishermen after it had been determined if fishing sites, efficiency, or availability of fish had been affected at all.

<020010>
TITLE: Effect of Peaking on Specific Riparian Wildlife Habitat Areas Along the Snake and Columbia Rivers
PROJECT NUMBER: ZTK-802-1
PRINCIPAL INVESTIGATOR: Mains, E.M.;Gerlach, A.R.
ADDRESS: 210 Custom House, Portland, OR 97209
AFFILIATION: Department of the Army, Washington, D.C. (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: Army Corps of Engineers
77 FUNDING: Department of Defense
TECHNOLOGY: HYDROELECTRIC (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
PROJECT DESCRIPTION: To determine the impact of project power peaking operations on key wildlife habitat and populations along and in the Snake and Columbia Rivers that were identified in studies described in the work unit on Identification of Habitats and Wildlife Populations. Such habitat areas would include State and Federal wildlife areas and refuges and riparian and island habitats adjacent to the mainstem Columbia and Snake Rivers and key tributaries and aquatic habitats utilized by wildlife in the Columbia and Snake Rivers. Special attention would be devoted to the impact of peaking operations on rare, endangered, and unique species and their habitats.
APPROACH: The approach taken in this work unit will depend on the nature, extent, and location of the habitats and wildlife populations identified in the inventory described in another work unit. Where possible, topographic maps and aerial photographs will be utilized to predict inundations of habitats by peaking operations. Indicated areas of inundation will be identified by ground surveys and potential impacts assessed. In some instances, it may be necessary to employ standard survey instruments to determine elevations of habitat areas for impact assessment. Test peaking operations may also be possible with on-ground assessments of habitat inundation determinable by direct observation. This basic information on inundation, plus the previously collected inventory information on habitats, wildlife forms, and populations, coupled with Corps-provided data on magnitudes, frequencies, rates, and timing of anticipated project discharges and reservoir and tailwater elevation changes, will enable the study teams to determine the relative impact of such operations on the wildlife populations that depend on the riparian habitat.

<020011>
TITLE: Development of Field Data Collection Procedures/Manual for Reservoir/Watershed Ecosystem Modeling
PROJECT NUMBER: 31468
PRINCIPAL INVESTIGATOR: Eley, R.L.;Robey, D.L.
ADDRESS: P.O. Box 631, Vicksburg, MS 39180
AFFILIATION: Department of the Army, Washington, D.C. (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: Army Corps of Engineers
77 FUNDING: Department of Defense
TECHNOLOGY: HYDROELECTRIC (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
PROJECT DESCRIPTION: (a) To define field data requirements for mathematical reservoir/watershed ecosystem models. (b) To determine which of the ecosystem modeling data requirements should be incorporated into routine field data collection operations of District offices, and which of the modeling data requirements should be furnished to field offices in the form of an Engineering Manual (EM) of regionalized model coefficients and other data. (c) To develop and evaluate practical techniques and procedures for field office use in collecting data required for ecosystem models. (d) To provide a comprehensive ecosystem modeling data base for a large CE reservoir/watershed system to be used as a basis for developing and evaluating physical and mathematical modeling techniques suitable for use by field offices to address environmental quality problems. (e) To provide CE field offices with guidance in the form of EMs and Miscellaneous Papers (MPs) on recommended ecosystem modeling field data collection requirements and procedures.
APPROACH: During FY 73, the DeGray Lake and Caddo River drainage basin, Arkansas (Vicksburg District), was selected as the initial field prototype for the development, calibration, and verification of ecosystem models being developed by the WES as part of CWIS No. 31063. The DeGray/Caddo ecosystem was chosen because of the existence of good pre- and post-impoundment baseline data, the availability of competent local contractors for field data collection, the existence of an outlet structure allowing multilevel discharge of both base and flood flows, a pumped storage hydroelectric generation facility, and the opportunity for cooperative interagency funding of field data collection. An expanded field data collection effort involving the reservoir, river, and watershed was initiated in FY 74 and continued through FY 75 as part of CWIS No. 31063.

ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: PARTICULATES (60%);HEAT, THERMAL (40%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
PROJECT DESCRIPTION: The objectives of this work unit are to determine the effects of power plant peaking or daily, weekly, and seasonal flow regulation on the migration, collection, and passage of adult anadromous fish in the Columbia and Snake Rivers. The assumptions are that the effects may be negative, positive, or non-existent. Key items to be studied in making these determinations are migration rates; fish collection efficiency; turbine and spillway discharge distribution patterns; discharge, forebay, and tailwater

fluctuations and rates; fish fallback rates; night passage; survival rates between dams; conditions at the mouths of tributary streams and at artificial collection facilities; and hourly fish count data collected over a period of years.
APPROACH: At this time we are technically limited to essentially 4 methods or tools for making such studies: (1) Conventional tagging where fish are trapped, anesthetized, tagged with spaghetti flag tags, disc tags, or opercle tags, released in different locations, and ultimately recounted upstream and the numbers of various tagged groups compared, (2) Sonic tags where fish are trapped, anesthetized, tagged, released, and tracked with hydrophones through reservoirs and tributaries, (3) Radio tags for similar tracking in the vicinity of spillways and powerhouses where sonic tag signals cannot be heard, and (4) Electronic tunnels which operate on an electrical resistance principle and can be placed in the fishway entrances at dams to count fish as they leave the river.

MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: Army Corps of Engineers
77 FUNDING: Department of Defense
TECHNOLOGY: FOSSIL FUEL/General (70%);NUCLEAR/General (30%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: HEAT, THERMAL (100%)
PROJECT DESCRIPTION: To determine the influence of ice covers on the disposition of added heat to water bodies.
APPROACH: The initial effort will consist of analytical examination and identification of the major mechanisms by which an imposed heat supply is disposed, either to the atmosphere, the adjacent water body, or to the melting of the ice cover. Existing turbulent and convective theories will be modified to accommodate typical conditions in large water bodies and to assess the relative uncertainty of quantitative identification of the disposition of the imposed heat.
RESULTS: Studies were conducted on the effects of changing the thermal conditions of water bodies with primary concern related to the effects of ice. Development of a computer program to predict the ice effects has been started and will continue with emphasis on transverse dispersion of thermal effluents and unsteady effects. Data have been obtained of the thermal structure of a large lake during ice conditions. Evaluation of the influence and interaction of the ice cover on the budget of a lake is underway.

TITLE: Identification of Riparian and Island Habitats and Wildlife Populations on the Snake and Columbia Rivers
PROJECT NUMBER: ZTK-483-3
PRINCIPAL INVESTIGATOR: Mains, E.M.;Gerlach, A.R.
ADDRESS: 210 Custom House, Portland, OR 97209
AFFILIATION: Department of the Army, Washington, D.C. (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: Army Corps of Engineers
77 FUNDING: Department of Defense
TECHNOLOGY: FOSSIL FUEL/General (70%);NUCLEAR/General (30%)
PROJECT DESCRIPTION: The objective of this work unit is to survey the shorelines and islands of the Columbia River from the Canadian border to the Pacific Ocean and the Snake River from Hells Canyon to its confluence with the Columbia River. Riparian wildlife habitats in this area will be identified and described and the animal types and populations determined. Riparian shoreline areas rendered sterile for wildlife production by highway and railroad fills, rip-rap for protection, etc., will also be quantified.
APPROACH: The contractors will develop a plan of approach after collecting and reviewing available information from the files of Federal and State game agencies, Battelle Northwest, Corps of Engineers, and others; examining maps and aerial photos, etc. This plan of study completed in September 1973 detailed the extent of actual field studies and nature and methods of data collection to meet the stated objectives. A Wildlife Study Guidance Group composed of Corps and four Federal and state game agencies' representatives reviews the contractors' plans to assure achievement of goals and consistency of results from the three major sections of the system being independently studied by each university team.
RESULTS: Preliminary observations on obvious impacts of power peaking operations on habitats and wildlife forms will be made. Similar inventories of key tributary streams will be conducted if such streams are added to the Columbia River and Tributaries Study.
PROJECT MILESTONES: At the conclusion of the 2-1/2 year inventory study, a report detailing the findings will be prepared by each u (Text Truncated - Exceeds Capacity).

TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/SO/sub x/, NO/sub x/ (100%)
PROJECT DESCRIPTION: Analyze and recommend power systems to utilize coal as an energy source for Naval

facilities.
APPROACH: There are two problem areas associated with the use of coal; first, it is not clean burning and its use will often be at variance with environmental quality goals set forth by both EPA and NAVFAC; second, both fuel and ash handling require additional equipment and manpower as well as an incumbent increase in equipment maintenance efforts. Since Navy combustion hardware is generally both small and diverse, it represents an area where there is considerable potential for development. Emission reduction techniques for particulates, sulfur oxides and nitrogen oxides will be investigated. Advances in fluidized bed boiler technology will be monitored. Retrofitting existing oil and gas fired boilers by distributing clean burning low-BTU gas from a central gas producer will be evaluated. The economics of central steam and power generation will be examined.

ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: ORGANICS/Organics (100%)
PROJECT DESCRIPTION: Develop operating procedures and modifications to permit existing shore based steam generators to burn synthetic and waste fuels and improve thermal efficiency.
APPROACH: Open air and operational size boiler test facilities will be used to systematically test and evaluate synthetic (shale and coal derived) and waste (used lubricating, reclaimed, and contaminated fuel oils) fuels. To be determined are fuel and mixture properties, fuel handling and safety techniques, necessary modifications to boiler and fuel supply systems, multi-fuel capability requirements, long term effects, emission characteristics, operating procedure for maximum boiler efficiency at minimal pollutions. To be evaluated are boiler efficiency improvement devices, fuel oil additives, atomizing devices, boiler control schemes, and new-burner devices. Technical requirements and procedures will be established.

ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: ORGANICS/Organics;ORGANICS/Hydrazine;ORGANICS/UDMH;ORGANICS/Aerozine-50;ORGANICS/MMH (100%)
PROJECT DESCRIPTION: To determine the water pollution potential of aircraft fuels and lubricants, missile propellants and their exhaust products, and other Air Force materials that, if in sufficient quantity, could result in significant detrimental effects on the environment. Transient physiological changes in organisms and toxic effects up to ''fish kills'' can serve as indices of potential pollution of the aquatic environment.
APPROACH: The approach to this effort utilizes experimental concepts developed in water pollution technology and fisheries biology. The applied conditions of these operational AF compounds and the types of test organisms to be utilized determine the methodology for experimentation. Propellant bioassays accomplished with guppies will be repeated using the fathead minnow currently and other fish species subsequently. The acute toxicity of hydrazine, UDMH, aerozine-50 and MMH, respectively, will be determined. Following the determination of acute toxic levels of these important compounds, the efficacy of various chemicals will be evaluated relative to reversing or reducing the toxicity of fish life.
RESULTS: The results of these studies will serve as a data base upon which environmental impact statements and assessments can be made as they apply to weapon systems using these chemicals, especially where they may possibly enter an aquatic environment.

77 FUNDING: Department of Defense
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
POLLUTANTS: NOXIOUS GAS/Toxic gases (50%);PARTICULATES/Particulates (50%)
PROJECT DESCRIPTION: The efforts will provide baseline data for assessing the biomedical impact of air force aircraft operations, prior to the advent of regulatory restrictions. The information is required not only for assessing environmental impact but also for evaluating combustor design criteria, smoke suppression additives and engine operational cycles. The work is closely coupled and coordinated with on-going turbine engine emissions measurement at the AFWL and AFAPL.
APPROACH: Chemical characterization of the organic compounds present in turbine engine exhaust will be accomplished for both gaseous and particulate specie. Samples will be obtained from a variety of sources including AF and Navy operational engine test stands and the AFAPL single combustor test rig. Analysis will be performed by a coupled gas chromatograph-mass spectrometer-data system. Results will be screened by AMRL/TH for toxic hazard assessment. Prior progress in this effort has been documented under work unit 7164-16-13. This new work unit implements new technology planning objective alignment as directed by HQ Aerospace Medical Division.

TITLE: Fuel Dumping by USAF A/C
PROJECT NUMBER: DF407170
PRINCIPAL INVESTIGATOR: Ricco, E.
ADDRESS: Civil Engineering Center, Panama City, FL 32401
AFFILIATION: Department of the Air Force, Washington, D.C. (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: AF Civil Engineering Center EVC
77 FUNDING: Department of Defense
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
POLLUTANTS: NOXIOUS GAS/Hydrocarbons;NOXIOUS GAS/JP-4 (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
PROJECT DESCRIPTION: To assess the extent and the environmental impact of fuel dumping by USAF aircraft.
APPROACH: Major areas of study are quantification of AF fuel dumping and determination of environmental impact. Quantification will be accomplished by establishment of an AF-wide fuel dump reporting system and tabulation of reports. Impact will be studied in three aspects--chemical, physical, and biological. Chemical aspects--photochemical reactivity of JP-4 in the atmosphere, particularly in the presence of NOx from aircraft engine exhaust, also formation of polynuclear aromatic carcinogens from aromatics in fuel. Studies will be performed in a photochemical reaction chamber. Products will be analyzed by long path infrared absorption spectroscopy, with support from UV-visible spectroscopy, UV-visible fluorescence spectroscopy, gas chromatography, and mass spectrometry. Physical aspects--behavior of dumped fuel: droplet formation, mixing in aircraft wake, droplet fallout and evaporation, aerosol formation, settling to ground, effect of JP-4 and its photochemical products on atmospheric physical processes. Research will include wind tunnel modeling and computational simulation, as well as studies of real dumps if possible.

Biological aspects--effect of JP-4 and its photochemical products on living things.

POLLUTANTS: NOXIOUS GAS/Hydrocarbons (30%);SPECIFIED OTHER POLLUTANTS/Aircraft fuels, lubricants (70%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
PROJECT DESCRIPTION: To utilize microbial systems for evaluating the potential environmental impact of various materials used in Air Force operations, such as missile propellants, aircraft fuels and lubricants and other substances used in consequential amounts that could have acute and/or chronic environmental effects. Microbial cultures isolated from soil samples will be investigated concerning their responses to both acute and chronic exposure to potential environmental pollutants. Selection of species will be based upon: (1) applicability of physiological requirements to experimental procedures; (2) relationship of responses to pollutant exposure with ecosystem impact. Microbes will be studied under both closed (batch) system and open (steady-state growth) system conditions to ascertain acute and chronic effects. Responses to be evaluated will include growth kinetics, bacteriocidal/bacteriostatic effect, physiological changes, genetic (mutation) effects, pollutant degradation or accumulation.
RESULTS: The data derived from this effort are considered in conjunction with similar results obtained with other biological indicator and test systems to form a data base upon which scientifically valid environmental impact assessments and statements can be prepared. This effort will establish no-effect levels for single and multiple cultures and will serve as both a laboratory test system and a means of predicting potential environmental consequences of inadvertant intrusion in soil and water of Air Force materials.
KEYWORDS: MICROORGANISMS;BIOLOGICAL INDICATORS;ENVIRONMENTAL IMPACTS;AVIATION FUELS;LUBRICANTS;AIRCRAFT;MISSILES;PROPELLANTS;SOILS;BIOASSAY;PHYSIOLOGY;MUTATIONS;CHRONIC INTAKE;GENETIC EFFECTS;BIOLOGICAL ACCUMULATION;BIODEGRADATION;ENVIRONMENTAL TRANSPORT;HYDROCARBONS

TITLE: Sorbent Sampling Systems for N-Nitrosodimethylamine
PROJECT NUMBER: DF320220
PRINCIPAL INVESTIGATOR: Lackey, W.W.;Conkle, J.P.
ADDRESS: Brooks AFB, San Antonio, TX 78235
AFFILIATION: Department of the Air Force, Washington, D.C. (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: USAF School of Aerospace Medicine VN
77 FUNDING: Department of Defense
TECHNOLOGY: FOSSIL FUEL/General (40%);FOSSIL FUEL/Coal (30%);FOSSIL FUEL/Oil Shale (30%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Rocket fuel, NdMA (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
PROJECT DESCRIPTION: This work unit will develop, test and evaluate sorbent sampling systems for detection and quantitative measurement of N-nitrosodimethylamine (NDMA) in ambient air. NDMA is an intermediate compound in the industrial synthesis of unsymmetrical dimethyl hydrazine (UDMH) rocket fuel, and is one of the suspected carcinogenic compounds controlled by OSHA.
APPROACH: Several types of chromatographic packing materials will be evaluated for sorption effeciency and recovery using standard, NDMA gas mixtures at low concentrations. Breakthrough volumes will be determined for each material as a function of sample flow rate, temperature, and relative humidity. Comparative analyses will be conducted to standardize each material against a referee method involving cryogenic trapping, with GC-MS, and thermal energy analysis.
RESULTS: The development of a sorbent sampling tube for direct off-gas analysis by GC-MS is a cost-effective field replacement for cold trapping methods currently in use. This effort supports the AFLC (SAALC) directorate of energy management program for Air Force procurement of UDMH rocket fuel.
KEYWORDS: SAMPLING;HYDRAZINE;AVIATION FUELS;ROCKETS;ENVIRONMENTAL IMPACTS;ORGANIC NITROGEN COMPOUNDS;COAL INDUSTRY;OIL SHALE INDUSTRY;NITROSO COMPOUNDS;AIR POLLUTION;COLD TRAPS;ADSORBENTS;RECOVERY;EARTH ATMOSPHERE

TITLE: Comparison of Theoretical and Experimental Absorption of Radiofrequency Power
PROJECT NUMBER: DF-318700
PRINCIPAL INVESTIGATOR: Johnson, C.C.;Durney, C.
ADDRESS: 1400 East 2nd Street, Salt Lake City, UT 84112
AFFILIATION: Utah Univ., Salt Lake City (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: USAF School of Aerospace Medicine RA
TYPE OF FUNDING: Grant No.-F41609-76-C-0025
77 FUNDING: Department of Defense FY77:$41,300
TECHNOLOGY: CONSERVATION/General (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Magnetic fields, electric fields, radiofrequency (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
PROJECT DESCRIPTION: The highest priority task in the DOD Triservice Electromagnetic Radiation (EMR) Bioeffects Research Program is to develop better methodology for quantitating EMR energy distribution and measurement. Methods and data are critically needed to extrapolate (via appropriate scaling factors) animal data to man and thus to establish more realistic personnel safety exposure guidelines for AF operations. The specific objectives of this study are (1) to define adequate models, (2) to extend theoretical radiofrequency (RF) power absorption data to assess consequences of man's exposure to 10 khz to 1.5 ghz RF radiation fields, and (3) to develop methods, accounting for size and orientation effects, to extrapolate animal exposures to equivalent human exposures.
APPROACH: Twenty phantoms (models) will be constructed to best represent 3.5 kg monkeys. Absorbed power power

kg will be calculated utilizing this monkey model for exposures in free space, near field and on a ground plane. Experiments will be conducted to measure power absorbed in the phantom and in actual monkeys for six exposure orientations. The best model for man, monkey, rat and mouse will be developed and calculations performed to determine power density to which these animals should be exposed to produce the same average absorbed power as man when exposed to 10 mw/cm 2 at the same frequency. The exposure frequency for animals subjected to the same power density as man to accomplish equivalent average power absorption will also be calculated.
RESULTS: These data will be used to compile a handbook (researcher's guide) for use in selecting appropriate exposure parameters (frequency and power density) for animal studies to simulate bioeffects in man. Power absorption calculations for man and animals will be extended to 1.5 ghz using wave solution, numerical techniques, or other applicable methods.

TITLE: Transport of Water, Dissolved Substances, Heat and Electric Current Through Shales and Clay-Rich Sediments 14207-GS
PROJECT NUMBER: DAOE9254
PRINCIPAL INVESTIGATOR: Graf, D.L.
ADDRESS: School of Liberal Arts and Sciences, Urbana, IL 61801
AFFILIATION: Illinois Univ., Urbana (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: Darcom Army Research Office
TYPE OF FUNDING: Grant No.-DAAG29-77-G0011
77 FUNDING: Department of Defense FY77:$14,200
TECHNOLOGY: FOSSIL FUEL/General (30%);FOSSIL FUEL/Oil Shale (20%);GEOTHERMAL/General (50%)
POLLUTANTS: ORGANICS/Dissolved substances (30%);HEAT, THERMAL/Heat (40%);SPECIFIED OTHER POLLUTANTS/Electric current (30%)
CHARACTER OF STUDY: RESEARCH/Laboratory (70%);ANALYTICAL (30%)
PROJECT DESCRIPTION: Investigate the transport of water, dissolved substances, heat and electric current across clay membranes under a range of pressures and temperatures. The results of this research are expected to bear directly on Corps of Engineers problems of disposal of waste liquids into the ground, the occurrence of deep water supply, and on strength and expansion of clay shales.
APPROACH: Using specially designed hydraulic presses and temperature controls, two different classes of clays will be compacted into artificial shales, whose membrane transport properties for fluids, slats, heat and electric current will be measured. The laboratory data will be analyzed to determine the mechanisms involved and to provide the basis for a quantitative model.
KEYWORDS: CLAYS;MEMBRANES;SOIL MECHANICS;WASTE DISPOSAL;UNDERGROUND DISPOSAL;FLUID FLOW;LIQUID WASTES;LEACHING;HEAT TRANSFER;SHALES;ELECTRIC CURRENTS;PHYSICAL PROPERTIES;GEOTHERMAL ENERGY;FOSSIL FUELS;OIL SHALE INDUSTRY;WASTE MANAGEMENT

TITLE: Direct Exposure of Monolayers of Mammalian Cells to Airborne Pollutants in a Unique Culture System
PROJECT NUMBER: DF-048860
PRINCIPAL INVESTIGATOR: Rasmussen, R.E.
ADDRESS: School of Medicine, Irvine, CA 92664
AFFILIATION: California Univ., Irvine (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
TYPE OF FUNDING: Grant No.-AF-AFOSR-3343-77
77 FUNDING: Department of Defense FY77:$79,800
TECHNOLOGY: FOSSIL FUEL/Coal (60%);FOSSIL FUEL/Oil Shale (40%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS/NO2;NOXIOUS GAS/SO2;NOXIOUS GAS/CO;NOXIOUS GAS/O3 (40%);PARTICULATES/Mutagens (30%);ORGANICS/Vapors (30%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
PROJECT DESCRIPTION: This research will measure the cytotoxic effect on cultured mammalian cells of pollutant gases (NO2, SO2, CO, O3) and mixtures of such gases, estimate the mutagenic effect of such gases and mixtures and their comutagenic effect when cells are treated with a known chemical mutagen, determine the effects of gas exposure on subcellular activities such as enzyme induction or inhibition, chromosomal damage and repair, and DNA synthesis and repair, develop methodology for generation and monitoring of mixtures of volatile organic pollutants with the above gases for use in the cell exposure system, develop methodology for generation and monitoring of particulate aerosols and for measurement of the interaction of such aerosols with mammalian cells in vitro.
APPROACH: Biological effects of air pollutants will be measured under conditions which heretofore have not been available which allow direct access of the pollutants to target cells as occurs in vivo. The project may lead to the development of a cell culture exposure system which will have general application to the assessment of potential toxic effects of airborne pollutants and mixtures of such pollutants which may be encountered in the workplace of urban environments.
KEYWORDS: AIR POLLUTION;GASEOUS WASTES;NITROGEN DIOXIDE;SULFUR DIOXIDE;CARBON MONOXIDE;OZONE;BIOLOGICAL EFFECTS;TOXICITY;MUTAGENESIS;ANIMAL CELLS;CELL CULTURES;BIOCHEMICAL REACTION KINETICS;ENZYMES;CHROMOSOMAL ABERRATIONS;BIOLOGICAL REPAIR;DNA;BIOSYNTHESIS;STRAND BREAKS

TITLE: Effects of DU on Aquatic Foodchain Base
PROJECT NUMBER: DF-638800
PRINCIPAL INVESTIGATOR: Okelley, J.C.
ADDRESS: Box 1937, University, AL 35486
AFFILIATION: Alabama Univ., University (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
TYPE OF FUNDING: Grant No.-F08635-75-C-0039
77 FUNDING: Department of Defense FY77:$9,300
TECHNOLOGY: NUCLEAR/General (100-Nuclear%)
POLLUTANTS: RADIATION/Radionuclides;RADIATION/Uranium (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
PROJECT DESCRIPTION: The objective is to provide experimental data concerning the effects on the aquatic envircnment caused by the residue left when a depleted uranium (DU) munition functions. This information is in direct support of near- and long-term assessments required for the RDT and E of the GAU-8 Gun System

and any future munitions which require the use of DU. The data will be used throughout DU munition programs of the Air Force, Army, and Navy.
APPROACH: The approach will be to take water samples from streams draining test sites used in testing DU munitions and a control site, and to determine qualitatively and quantitatively the populations of green algae (the base of the aquatic foodchain). This will provide the baseline for later comparisons after the test sites have been in use for various periods of time. Also, the more important species will be subjected to varying concentrations of DU residue under laboratory conditions to ascertain tolerance thresholds.
RESULTS: As this information becomes available it will be used in preparing environmental assessments for the various programs.
KEYWORDS: DEPLETED URANIUM;ENVIRONMENTAL EFFECTS;AQUATIC ECOSYSTEMS;WATER QUALITY;ALGAE;BIOMASS;POPULATION DYNAMICS;BIOLOGICAL EFFECTS;TOXICITY;WATER POLLUTION

TITLE: Effects of Depleted Uranium (DU) Testing on Microorganisms
PROJECT NUMBER: DF-641510
PRINCIPAL INVESTIGATOR: Deason, T.R.
ADDRESS: Box 1937, University, AL 35486
AFFILIATION: Alabama Univ., University (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: AF Armament Laboratory
TYPE OF FUNDING: Contract No.-F08635-77-C-0047
77 FUNDING: Department of Defense FY77:$6,000
TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: The objective is to characterize the algal community of a stream draining a depleted uranium (DU) munitions test site. Information concerning the effects of DU residues from munitions testing on the aquatic environment will be obtained. This information is in support of near- and long-term assessments required for RDT and E of the GAU-8 gun system and any future munitions using DU.
APPROACH: The approach will be to examine algal samples collected from a stream draining a DU munitions test area. The algae will be identified to a meaningful taxon and the populations will be quantified. General physiology of the algae cells will be determined through productivity studies.
KEYWORDS: DEPLETED URANIUM;ENVIRONMENTAL EFFECTS;AQUATIC ECOSYSTEMS;WATER QUALITY;WATER POLLUTION;ALGAE;BIOMASS;POPULATION DYNAMICS;GENETIC VARIABILITY;BIOLOGICAL EFFECTS;TOXICITY

TITLE: Navy Environment: Bacterial Chemotaxis and Marine Pollution
PROJECT NUMBER: DN-923411;N00014-76-C-0262
PRINCIPAL INVESTIGATOR: Mitchell, R.;McKay, G.
ADDRESS: Cambridge Station, Cambridge, MA 02138
AFFILIATION: Harvard Univ., Cambridge, Mass. (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: Office of Naval Research
77 FUNDING: Department of Defense FY77:$24,000
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);WASTE MANAGEMENT (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: This research is concerned with the subtle effects of marine pollutants on marine microorganisms. Recent observations indicate that crude oil possesses some limited solubility in seawater and may have an inhibitory effect on chemoreception in marine bacteria.
APPROACH: Laboratory and field studies are being carried out to determine the effect of sub-lethal concentrations of pollutants on marine microbial processes. Inhibition of bacterial chemotaxis by chloramines is being investigated. The relationship between chemoreceptor blockage by pollutants and retardation of organic matter decomposition is being studied. Current field studies are concerned with pollution induced microbial diseases of coral.

TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: RADIATION (60%);HEAT, THERMAL (40%)
PROJECT DESCRIPTION: The objective of this work unit is to conduct studies to identify DOD land based applications where the use of atomic energy as an energy source would be advantageous to the military and to develop atomic energy devices for those applications that are cost effective, conserve natural resources, reduce environmental pollution or provide a capability not achievable with other forms of energy.
APPROACH: Work will be accomplished by following technological advances and research and development programs in nuclear energy and energy conversion systems being conducted by industry and government. Current Army requirements, prognosis of future Army requirements, and DOD requirements for power will be reviewed to identify power needs and trends for future power requirements. Areas where nuclear energy can be beneficial to the army will be investigated to determine feasibility and cost effectiveness.

TITLE: Lead as an Indicator of Environmental Quality in Airport Environs
PROJECT NUMBER: DF-281680
PRINCIPAL INVESTIGATOR: Thalken, C.E.;Moran, M.J.
ADDRESS: Chemistry and Biology Science Department, Air Force Academy, Colorado Springs, CO 80840
AFFILIATION: Department of the Air Force, Washington, D.C. (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: Frank J. Seiler Research Laboratory, USAF Academy
77 FUNDING: Department of Defense
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: METALS/Lead (100%)
PROJECT DESCRIPTION: AF function--environmental support of base operations (environmental impact of aircraft operations).
APPROACH: Deficiency--no data are available on the concentrations, accumulation rates, or effects of many aircraft-generated pollutants in the environs in and around military installations and air strips. Specifically, there is no data available on the build-up of lead in the air installation compatibility use zone (AICUZ). Build-up of lead and other toxic compounds is under close scrutiny by the EPA and their standards are becoming increasingly more stringent. These standards will limit the boundaries of AICUZs and limit their industrial and agricultural use. Research--techniques will be developed for assaying lead concentrations in the soil, fauna, and flora of the AICUZ of Peterson Field, Colorado Springs, Colo. Data obtained will be correlated to uncontaminated areas (control) to a highly contaminated fossil-fuel-burning power plant area, and to all available EPA standards. How research contributes--techniques developed will allow evaluation of aircraft-generated lead pollution on USAF installations. Data generated from the Peterson Field environ will allow evaluation of possible health problems from lead contamination in and around AICUZ.
RESULTS: Extrapolation of the data can be used to predict lead concentrations on other USAF installations to predict the effects of lead accumulation in the future, and as a management tool for environmental planning.
KEYWORDS: AIR POLLUTION;AIRCRAFT;GASEOUS WASTES;EXHAUST GASES;CHEMICAL EFFLUENTS;AIRPORTS;ENVIRONMENTAL EFFECTS;MONITORING;LEAD;ENVIRONMENTAL TRANSPORT;QUANTITATIVE CHEMICAL ANALYSIS;AEROSOL MONITORING

TITLE: Wind Generator Systems
PROJECT NUMBER: DN687066
PRINCIPAL INVESTIGATOR: Pal, D.
ADDRESS: Civil Engineering Lab., Point Mugu, Port Hueneme, CA 93041
AFFILIATION: Department of the Navy, Washington, D.C. (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: Naval Facilities Engineering Command
77 FUNDING: Department of Defense
TECHNOLOGY: SOLAR/Ocean, wind (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: NOISE, VIBRATION (100%)
PROJECT DESCRIPTION: Evaluate wind power generation systems integrated with building environmental systems or electrical power grids at Navy bases.
APPROACH: Demonstration of commercial and ERDA developed wind generators ranging from 5 to 500 kw is planned over the next ten-year period for Naval sites determined to have the potential for cost effective wind power. The demonstrations will concentrate on developing and demonstrating hardware for converting wind machines shaft or electrical output to either heat for buildings environmental control or a 60 hz constant voltage electricity. Small wind machines less than 20 kw capacity will generally be dispersed, serving individual buildings. Larger wind machines will be used for demonstrating central base power.
RESULTS: Comprehensive test data and analysis will be used for preparing a handbook on the application of wind power at Naval installations. Economics, reliability, operational data, and noise levels will be carefully documented in the handbook.
KEYWORDS: ELECTRIC GENERATORS;WIND TURBINES;EVALUATION;POWER GENERATION;MANUALS;NOISE POLLUTION;PLANNING;DEMONSTRATION PROGRAMS;COMMERCIALIZATION;COST BENEFIT ANALYSIS;BUILDINGS;SPACE HEATING;ECONOMICS;RELIABILITY;OPERATION;USA;MILITARY FACILITIES;USES

PROJECT NUMBER: Descriptive Toxicology of JP-5 Fuel Derived From Oil Shale
PRINCIPAL INVESTIGATOR: Jenkins, L.J.;Jones, R.A.
ADDRESS: Toxicology Division, Bethesda, MD 20014
AFFILIATION: Department of the Navy, Washington, D.C. (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: Naval Medical Research Institute, National Naval Medical Center
77 FUNDING: Department of Defense
TECHNOLOGY: FOSSIL FUEL/Oil Shale (100%)
ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: NOXIOUS GAS (50%);ORGANICS (50%)
PROJECT DESCRIPTION: Substance produced by the extraction of petroleum products from shale may cause serious disease. One of the major health hazards associated with shale oil recovery technology is in the exposure incurred from the use of these shale products. Since the U.S. Navy is a predictable user of large quantities of JP-5 aviation fuel obtained from shale, this work unit proposes to determine in suitable animal models the acute and chronic toxicology of these fuels.
APPROACH: Determine in suitable animal models the oral, ocular, and dermal toxicity, and both the acute and chronic (120 day) inhalation toxicity of JP-5 aviation fuel. By biochemical and histopathological analysis of tissues from one-half of the animals exposed to JP-5 determine the target organs(s) of JP-5 and the mechanisms which are responsible for the expression of JP-5 toxicity. Retain the other half of the animals surviving the chronic exposure for lifetime observation to determine if JP-5 causes long-term irreversible effects (significantly decreased life expectancy or carcinogenicity).
KEYWORDS: PETROLEUM PRODUCTS;OIL SHALES;TOXICITY;SHALE OIL FRACTIONS;OIL SHALE INDUSTRY;HEALTH HAZARDS;LABORATORY ANIMALS;TESTING

TITLE: Evaluation of Efficiency of Juvenile Bypass Systems
PROJECT NUMBER: 31458
PRINCIPAL INVESTIGATOR: Smith, H.;Mains, E.M.
ADDRESS: 210 Custom House, Portland, OR 97209
AFFILIATION: Department of the Army, Washington, D.C. (USA)
MONITORING AGENCY: Department of Defense, Washington, D.C. (USA)
DIVISION: Army Corps of Engineers
77 FUNDING: Department of Defense
TECHNOLOGY: HYDROELECTRIC (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: NOXIOUS GAS (50%);HEAT, THERMAL (50%)
PROJECT DESCRIPTION: To evaluate effectiveness of turbine-gatewell juvenile bypass systems completed and operating at existing projects. Develop criteria for new bypass systems (Bonneville 2nd powerhouse and McNary 2nd powerhouse).
APPROACH: At the Dallas, McNary, and Ice Harbor projects, holes have been drilled between the turbine intake gatewell slots and the ice-trash sluiceway to permit trapped juvenile salmonids to escape and be passed around the project. At John Day, Lower Monumental, Little Goose, and Lower Granite projects, special conduit systems have been installed to accomplish this same purpose. Evaluation of these systems is required to assure that fish are not retained in them for extended periods and exposed to high concentrations of supersaturated gases and to determine the relative safety of such system to fish passing through them. Work would be accomplished with fin-marked or freeze-branded groups of juvenile salmonids being exposed to various segments of each type of system and compared with a control group that would be exposed only to the recovery trap or gear. This work will often be accomplished in concert with other work unit elements associated with the efforts to improve juvenile survival. In addition to evaluation of the physical aspects of the bypass system, it is most important to determine if the existing location of the outfall of the bypass provides optimum survival.
KEYWORDS: FISHES;JUVENILES;THERMAL POWER PLANTS;COOLING SYSTEMS;AQUATIC ECOSYSTEMS;COLUMBIA RIVER;SURFACE WATERS;WASHINGTON;ENTRAINMENT;IMPINGEMENT;ENVIRONMENTAL EFFECTS;SALMON;SURVIVAL TIME

TITLE: Skin Metabolism of Drugs, Carcinogens and the PCB's
PROJECT NUMBER: ES CA 01586-01
PRINCIPAL INVESTIGATOR: Bickers, D.R.
ADDRESS: 1230 York Avenue, New York, NY 10021
AFFILIATION: Rockefeller Univ., New York (USA)
MONITORING AGENCY: Georgia Univ., Athens (USA)
TYPE OF FUNDING: Grant No.-ES CA 01586-01
77 FUNDING: Rockefeller Univ. FY77:$62,000
TECHNOLOGY: FOSSIL FUEL/General (100%);GENERAL SCIENCE (100%)
POLLUTANTS: METALS (50%);ORGANICS (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: These studies are designed to evaluate the metabolic response of the skin to environmental agents; and to assess the role of cutaneous enzymes in the activation of carcinogens to mutagens and in the binding of carcinogens to DNA.
APPROACH: The effect of skin applications of typical inducers of hepatic drug metabolism such as phenobarbital (PB), 3-methylcholanthrene (3-MC) and a polychlorinated-bipheynl (PCB), Aroclor 1254, on cutaneous drug metabolizing enzymes in rats will be studied. The enzyme aryl hydrocarbon hydroxylase (AHH) will be used as a prototype and it is planned to determine the tissue and subcellular localization of cutaneous AHH and to develop techniques to accurately quantitate the hemeprotein cytochrome P-450 in the skin. In addition, cutaneous ethylmorphine N-demethylase and aniline hydroxylase activity will be evaluated. The effects of selected cutaneous doses of PB, 3-MC, and the PCB on enzymes in skin and other tissues including liver, kidney, lungs and gastrointestinal tract will be compared to ascertain the relative importance of skin as a site of drug metabolism and as a portal-of-entry for environmental inducing agents. The effects of oral and systemic administration of the chemicals on enzyme activity in the skin will be studied to determine the cutaneous enzyme induction response following non-cutaneous exposure to such agents. Using skin AHH preparations, it is planned to assess the possibility that inducible cutaneous AHH may be related to the activation of carcinogens into mutagens and to the binding of carcinogens to DNA. The Ames tester strains of Salmonella typhimurium will be used for mutagenesis studies; calf-thymus DNA in vitro, and skin (epidermal) DNA in vivo will be used for the assessment of AHH-enhanced binding of carcinogens to this macromolecule.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Coal liquefaction and gasification is an alternate energy technology which is currently being explored and discussed for possible future use. The technology has been developed and tested in several pilot plant operations within the last twenty years. The health effect on workers from exposures found in this technology have not been well defined, although coal gasification processes involve many of the polycyclic hydrocarbons known to be carcinogenic. These environmental contaminants are closely related to those from coke oven emissions where exposed workers have been shown to have significantly increased risk of lung cancer. Coal liquefaction processes involve pulverization of coal into fine dust; worker exposure to which may result in coal worker's pneumoconiosis or related chest diseases. The purpose of this project is to conduct an epidemiological study of coal liquefaction and gasification workers to identify health risks associated with the multitude of exposures found in the industry.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: In view of the vast quantity of health data demonstrating the carcinogenicity of asbestos fibers, insulation manufacturers and other industries have begun searching for substitute materials to replace asbestos. However, the fibers constituting these substitute materials may be similar in shape and size to that of asbestos. It is felt by many researchers that the morphology of the fibers is the most important factor in the development of malignant and nonmalignant respiratory disease. Little is known of the health effects to man of respirable fibers other than asbestos. It is incumbent upon the National Institute for Occupational Safety and Health to investigate epidemiologically the health consequences to man of respirable fiber exposures and other insulation materials. The study will be approached through environmental surveys and mortality and morbidity studies designed to quantify the risk of exposure to each of the materials used as well as determine the presence of other substances that may promote the development of adverse health effects or act in a synergistic manner.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: EPA in its CHESS report (1970-71) studied seven cities for community exposure to different air contaminants. One community had a primary exposure to sulfur oxides and particulates. EPA's epidemiological study has indicated that soluble and insoluble sulfates have a more adverse effect on human health than particulates or SO/sub 2/. The National Air Quality Advisory Committee has suggested that particulates be studied not as total suspended particulate but according to particle size distribution. The findings of the CHESS study strongly suggest that occupational exposures to sulfates and sulfuric acid need further study in terms of exposure levels and mortality experience. The study proposed by FY 76 will determine exposures to a variety of soluble and insoluble sulfates and sulfuric acid in a number of industries. These data will be used to choose populations for mortality studies beginning in FY 77.

PROJECT DESCRIPTION: The objective of this project is to develop criteria which will permit safe recirculation of exhaust air from industrial processes.
APPROACH: The parameters associated with industrial process contaminant generation, capture, and removal from the exhaust air stream will be identified and quantified with respect to their effect on recirculated air. Criteria will be developed which describe recirculation systems and will provide the necessary analytical tools to evaluate such systems.

RESULTS: The recirculation criteria will be used by industrial personnel to evaluate and quantify contaminant discharges from recirculation systems. This evaluation will permit a decision regarding the suitability of the system for recirculation.

CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Guidelines for good work practices and recommended occupational safety and health standards are being developed for coal gasification pilot plants. Similar guidelines and recommendations will be developed for demonstration and commercial scale coal gasification plants.
APPROACH: Pilot plant guidelines will be based on available world-wide literature, and data that have been generated by federal agencies (EPA, ERDA). Guidelines for larger scale plants will be based on field data collected by NIOSH and extrapolations/predictions from the data used in developing the pilot plant guidelines. If implemented, these guidelines will provide some measure of worker protection from hazardous exposures until such time when formal standards may be developed.
RESULTS: A follow-on document studying the safety problems encountered in pilot plant operation and the transition to commercial production will be required.

ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: PARTICULATES/Fibrous aerosols (100%)
CHARACTER OF STUDY: DEVELOPMENT (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Occupational Safety and Health Administration standards presently require assessment of worker exposure to asbestos aerosol. Exposure to fibrous glass and other fibrous aerosols will have to be monitored in the future. These materials are widely used in the insulation industry and with the current push for energy conservation will be used more extensively. At this time, there is no instrument available to rapidly measure the concentration of fibrous dust in the air. The development of a fibrous aerosol monitor would allow real time measurement of fibrous aerosols for the purpose of accurately detecting areas in the workplace that contain potentially dangerous concentrations of fibrous aerosols. The development of the monitor will be a one year contract effort after which it will be necessary to comprehensively test the monitor for accuracy and suitability under a wide range of field and laboratory conditions. The results of these tests will be used in further development of the fibrous aerosol monitor as a rugged, portable and accurate field survey instrument for the assessment of worker exposure to fibrous aerosols. Laboratory and field testing is continuing.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Pulmonary disease problems, particularly pneumoconioses and airway obstructive diseases, could arise from exposure to pollutant gas emissions such as SO/sub 2/ and NO/sub 2/ from coal burned as fuel for steam-powered electricity generating plants. Pneumoconioses could develop from years of exposures to coal dusts in coal-loading areas or to asbestos fibers in linings of steam pipes. The primary purpose of this study is to measure specified effects (decreased longevity, ''premature'' deaths from pulmonary diseases, and early retirement due to disability attributed to such diseases) on high risk workers in coal-fired steam electricity generating plants who have had exposures to these pollutants that varied in duration and intensity. In the process of collecting information on early disability and on mortality of employees exposed to these air pollutants, data will also be obtained on neoplasms of the respiratory system and on diseases of the heart. This evidence can be analyzed in relation to some hypotheses about carcinogenic effects of pollutants and effects on the heart of lung impairments.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Site specific Rifle, CO
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: This project is a study of approximately 230 persons who worked in a pilot oil shale operation in Rifle, Colorado, through a retrospective mortality study combined with cross-sectional morbidity examination to evaluate the several morbidity aspects that may be associated with oil shale occupations. Mortality due to 21 specific causes of death will be determined after an extensive follow-up effort and the obtaining of death certificates of those determined to be deceased. Observed deaths will be compared to expected deaths to uncover excess deaths due to a particular cause. Numerous indices of health will be assessed through the physical examinations and health questionnaires administered to the living members of the cohort. Further activities tentatively include environmental exposure and medical assessments of workers entering the industry.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: While hyperbaric medical research has a history of over 100 years, the recent global energy crisis has added a note of urgency to the need for further research. Since 1954, ten million acres of sea floor have been leased for fossil fuel exploration. Plans are now under way to lease an equivalent amount of acreage in the next 1-3 years. Not only will such plans require a very large increase in the number of divers but the depths of planned leased areas are approaching 2000 feet. The capability to operate safely at such depths exceeds our medical knowledge and at the same time requires the presence of divers to execute tasks which are essential to the recovery of fossil fuels and minerals located on and

beneath the sea floor. Energy-related development of deep-water (super tanker) ports and offshore power plants will also require the extensive use of divers. Other nations have already recognized the need for identifying national priorities, and regulations are currently in effect in the United Kingdom, Australia, and Japan. It is clear that the expanding Federal sea floor leasing program obligates the government to protect the health and safety of divers to the same extent as workers in other occupations. Extensive discussions and communication with representatives of the major diving companies have revealed their interest in cooperating with NIOSH in solving the problems facing the

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The purpose of this research proposal is to evaluate the existing experimental animal models of pulmonary emphysema with respect to the hypothesis of proteolytic antiproteolytic imbalance as the mechanism for production of pulmonary tissue destruction and emphysema. The papain model will be analyzed by first developing a dose-response relationship. The amount of papain delivered will be quantitated by radioactivity labeling the papain molecule. The amount delivered to the lung will be related to the extent of tissue destruction measured by use of quantitative morphometry. This will be done by application of certain principles of Weibel and the use of the semi-automated image analyzing techniques. The effects of variation in dosage of papain controlled by titration of its ''active site'' for proteolysis alteration of its molecular conformation and variation in activity dependent upon complexing with inhibitor substances from serum, from plant or other sources will be evaluated for their potential in producing quantitatively determined emphysema. Elastase will be similarly studied. The combined effects of prolonged nitrogen dioxide (NO/sub 2/) inhalation and papain aerosol exposures will be studied in cats, and physiologic tests performed in an attempt to separate the components which contribute to the physiologically determined airways obstruction. The (NO/sub 2/) induced lesion will be

PROJECT DESCRIPTION: To evaluate the genetic hazard of chemicals in our environment and understand their mode of action, it is necessary to place chemical mutagenesis on a quantitative basis in an eukaryote organism that can be thoroughly and economically analyzed genetically. Ethyl methanesulfonate (EMS) was selected as the mutagen for developing a model test system because of its known mutagenic effectiveness and its simple chemical structure which makes it relatively easy to synthesize with radionuclides having high specific activity. The mutagenic action of EMS is considered due to its alkylation of DNA, a point of view supported by previous work on this project using Drosophila in a bioassay of blood plasma from hamsters that had been previously injected with EMS. To place the dosage of EMS on a quantitative basis, total alkylation of DNA in Drosophila melanogaster spermatozoa is measured on a per sperm cell basis and then further divided into alkylation at specific sites such as the 7 position guanine. This dosimetry will then permit the construction of dosage response curves with the dose in terms of alkylation and the response in terms of the extensive mutational spectrum developed with Drosophila. This project differs from previous work with alkylation in that we are studying both alkylation and the genetic consequence within the same germinal tissue of an eukaryote. Results of these tests would

POLLUTANTS: ORGANICS/Benzene (100%)
CHARACTER OF STUDY: RESEARCH (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: It is our aim to study the biochemical events that lead to the functional and morphological changes characteristic of benzene toxicity and to determine how benzene toxicity might be prevented or alleviated. We will study the metabolic pathway of C-14-benzene in vitro and in vivo and quantitate the metabolites produced, locate them in the animal, and determine to what extent the metabolites are responsible for toxicity. The biochemical studies will be correlated with evaluations of bone marrow function both before and during the appearance of bone marrow disfunction. Erythrocyte and white cell counts, total counts and differential counting of white blood cells will be done as well as reticulocyte counts, Fe-59 uptakes into marrow and circulating RBC's and serum Fe determinations as parameters for monitoring benzene toxicity. At the earliest stage of toxicity we intend to look for interaction between benzene and/or its metabolites with nucleic acids. We will attempt to prevent benzene toxicity by inhibiting its metabolism and will study the role of nutrition in resistance to benzene toxicity.

PROJECT DESCRIPTION: Aromatic hydrocarbons constitute a major source of raw material for the production of fuels, industrial solvents, drugs, herbicides, pesticides and plasticisers. The parent hydrocarbons are toxic to most forms of life. In several cases it is known that oxygenated products formed enzymatically

from the aromatic hydrocarbon are more harmful than the unsubstituted substrate. Little evidence is available that describes the enzymatic reactions involved in such transformations. The objectives of this research project are to elucidate the mechanisms of oxygen fixation into aromatic hydrocarbons and to define some parameters of biodegradability that relate to the effects of substituents on the benzene nucleus. Pseudomonas putida grows on toluene as sole source of carbon. The enzyme catalyzing the initial oxidation of toluene incorporates two atoms of molecular oxygen into the substrate with the formation of cis-2,3-dihydroxy-1-methylcyclohexa-4,6-diene. This reaction will be investigated in two ways: (1) The enzyme will be purified and the mechansims of substrate-oxygen-enzyme interaction determined. Techniques to be used include salt and solvent fractionation, column chromatography, electrophoresis, electron spin resonance, and spectrophotometry. (2) The enzyme is known to oxidize azulene, a model substrate in which electron densities at different positions of the ring are known. Identification

PROJECT DESCRIPTION: Our overall objective is to understand better how the lung responds to inhaled particles. Since clearance of particles and pathogens from the non-ciliated parenchyma of the lungs is the primary function of the alveolar macrophages and since their migratory pathways and behavior may be pivotal events in the pathogenesis of pulmonary disease, we plan to focus our attention on these cells. This investigation has three distinct purposes: We propose (1) to investigate the origin and differentiation of alveolar macrophages. Using the techniques of histochemistry, autoradiography, and organ culture, we hope to trace the movement of macrophages into and/or through the interstitium and to document their differentiation. We also plan (2) to investigate the consequences of particle ingestion by alveolar macrophages. Whether particle ingestion leads to activation of hydrolytic enzymes and to extracellular enzyme release will be investigated as will the migratory behavior of particle-containing macrophages. Finally, we plan (3) to investigate the importance of competitive phenomena following particle challenge using both in vivo and in vitro test systems. Since inhalation is the primary entry route for agents that cause environmental, occupational, and infectious diseases, it is of clear importance to clarify the roles of the macrophages in alveolar defense and identify environmental and

PROJECT DESCRIPTION: The project concerns the perception of odor intensity. It seeks primarily to specify how odor intensity, and in particular the psychophysical function that relates perceived intensity to concentration, depends upon the physicochemical nature of odorous stimuli and upon various conditions of odor masking and adaptation. The odor stimuli will include odorous pollutants, irritants, and masking agents. Psychophysical procedures to be used are ratio scaling methods such as magnitude estimation (assignment of numbers to reflect ratio relations among perceived magnitudes), magnitude production, and cross-modality matching. Particular experiments aim: (1) to obtain psychophysical functions for various odorous substances and to relate the parameters (e.g., growth rate) of the functions to the physicochemical properties and perceived qualities of the substances; (2) to study observers who lack common chemical sensitivity in one nasal passage in order to isolate thereby the contribution of trigeminal stimulation to overall odor intensity; (3) to formulate a quantitative description of how various masking odors modify the psychophysical function; to specify in particular the masking ability of ozone; (4) to determine how adaptation alters the psychophysical function; to specify the trading relation between intensity and duration of adapting stimuli; and to test further an hypothesis that

PROJECT DESCRIPTION: Inhaled sulfur dioxide as well as injected or ingested sulfite reacts with certain disulfides in mammalian plasma cleaving S-S bonds and producing S-sulfonate groups. The kinetics of the formation and clearance of plasma S-sulfonate in laboratory primate species will be studied and compared with similar studies on rabbits, mice, and rats. A major aim of the proposed research is to elucidate the mechanism of clearance of protein S-sulfonate from the plasma, especially with regard to the function of diffusible thiol groups. The importance of cysteine S-sulfonate in plasma S-sulfonate clearance and the potential of this system (cysteine + protein S-sulfonate reversible cysteine S-sulfonate) for functional sulfite transport to tissues outside of the blood stream will be investigated by various techniques including the use of S-35 tracer. Identification of plasma proteins affected by in vivo sulfitolysis will be undertaken with the aid of S-35 O/sub 3//sup 2-/. The ultimate objective is the detection of toxic effects due to structural alteration of proteins and possible resultant functional changes. Sulfite oxidase, an enzyme which detoxifies sulfite by oxidation to sulfate, is especially rich in mammalian liver. This enzyme should play a major role in the determination of the availability of sulfite for reacting with disulfide bonds in plasma and other tissues. The correlation between

PROJECT DESCRIPTION: The use of organic mercurial compounds in industry and agriculture has increased the possibility of human toxicity. The primary aim of our research program in this renewal application is the elucidation of the molecular biochemical defect(s) and accompanying changes in morphology occurring in the central nervous system after experimental intoxication with organic mercurial compounds. Our earlier studies have revealed a progressive inhibition of protein synthesis in brain slices and subcellular (synaptosome) fractions isolated from the cerebellum of animals showing early mercurial intoxication. The earliest proximate effect of methyl mercury on synaptosome protein synthesis in vitro seems coupled to the inner mitochondrial membrane where methyl mercury promotes rapid cation translocation with accompanying stimulation of respiration prior to inhibition of oxidative phosphorylation or electron transport. We propose to characterize the cation/anion translocation system across the energy conserving mitochondrial membrane by the use of ion sensitive electrodes, correlate changes in synaptosome respiration with protein synthesis as a function of ionic species, ionophoretic antibiotics, and inhibition of mitochondrial function, and evaluate the role of other partial reactions, including amino acid uptake and divalent cation (Ca/sup ++/) uptake in isolated synaptosome fractions as a function

JECT DESCRIPTION: This study will evaluate the effects of inhalation of the oxidant air pollutant ozone on rat and rabbit lung subcellular fractions utilizing a number of potentially sensitive parameters of toxicity. These parameters include: (1) lipid peroxidation; (2) microsomal cytochrome P-450 and benzpyrene hydroxylase levels; (3) protein sulfhydryl levels; (4) native protein fluorescence; and (5) response of 1-anilino-8-naphthalene sulfonic acid fluorescence to divalent cations. Additional studies will assess the biochemical basis for the observed effects and will evaluate the combined effect of ozone and nitrogen dioxide on these parameters. The experimental design will include dose response studies aimed at obtaining information of use in determining appropriate air quality standards for humans breathing these pollutants.

PROJECT DESCRIPTION: There is a progressive increase in the general background level of mercury in our North American environment. Inorganic mercury in the environment can be converted to organic mercurials in the biological food chain and accumulate in food stuffs, principally as methylmercury. Man may directly consume methylmercury as an occupational hazard or may indirectly acquire chronic intoxication as the final predator in the biological chain. Methylmercury in man, unlike inorganic and some other organic mercurials, widely distributed in body tissues, producing a different pattern of clinical findings than inorganic or elemental mercury. The cerebrum and cerebellum are principally altered. Methylmercury freely passes through the placental barrier of man and some experimental animals. In addition to the neurolysis seen in the adult, the fetal brain injury is diffuse. A generalized hypoplasia of the brain and other viscera is seen. Excessive defective mitoses and chromosome breakage has been found in human lymphocytes cultured from patients with methylmercury poisoning. Beyond this fragmentary evidence little is known about the teratogenic effects of mercury on the primate. The investigation is designed to uncover deleterious effects on the fetus at the level of human ''subclinical'' exposure as well as at higher dosage levels. The purpose of this experiment is to determine the threshold level of chronic exposure of

PROJECT DESCRIPTION: We have identified all intermediates formed in the microbial degradation of catechols by meta-fission, and studies of the purified enzymes of this pathway will be continued. The evidence for two types of meta-pyrocatechase will be examined after screening soil organisms that contain the enzyme. Alkyl-substituted phenols were found to be metabolized through alkylgentisic acids by a sequence of reactions of probable general importance in the area of aromatic catabolism. These enzymes, some of which had not been previously reported, will also be purified and their modes of action studied. Methods of purification will involve column chromatography and preparative electrophoresis; and criteria of purity and data for molecular weight and subunit structure will be supplied by the analytical ultracentrifuge and gel electrophoresis. The enzymic degradation of halogen-substituted gentisates and phenylacetates will be studied with special attention to those enzymes that release halogens during the course of the reaction. The hydroxylation of p-hydroxyphenylacetic acid, which appears to involve an ''N.I.H. shift'' will be investigated. Studies of the enzymes that degrade tropic acid and tropine will be completed. We have isolated soil organisms that grow with biphenylmethane and other compounds containing two free benzene rings. We shall investigate the enzymology of the pathways used in

PROJECT DESCRIPTION: The central concern of this research program is the effect of biologically non-essential heavy metals on mammalian embryonic development. Certain of these metals (lead, cadmium, arsenic, indium) already are known to exert teratogenic effects on the developing hamster embryo when administered via the maternal system early in gestation. We plan to investigate further these effects by four different but complementary experimental approaches. First, in addition to supplementary studies on those heavy metals which we have previously shown to be teratogenic, we shall investigate the teratogenic potential of mercury compounds, including some commonly used pesticides which contain this metal. As part of this approach we shall also investigate the interaction of several heavy metal combinations (lead-mercury, cadmium-mercury, cadmium-arsenic) on the developing embryo. A second line of approach will be an attempt to detect by electron microscopy and related techniques small concentrations of teratogenic heavy metals within early placental and embryonic tissues. This approach will allow us to identify sites of localization as well as specific cytopathic effects of the heavy metals in these tissues. Thirdly, we shall make comparative studies on limb bud malformations induced by acetazolamide, an inhibitor of carbonic anhydrase, and certain heavy metals which may exert their teratogenic action by

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this study are to investigate the interaction of some important airborne environmental pollutants with selected areas of liver metabolism in different species of animals. The first pollutant to be studied will be carbon monoxide. The experiments will be designed to see whether inhaled carbon monoxide can affect the heme containing hepatic cytochrome P-450 and if so whether a correlation with blood COHb can be made. Consequent to an alteration in cytochrome P-450, an alteration in the activities of the cytochrome P-450 dependent microsomal enzymes can be expected. The effects of carbon monoxide will be compared to the effects of lowered blood pO/sub 2/ equivalent to that produced by CO. If changes following acute exposure to CO are observed, then experiments will be designed to study the effect of chronic exposure to see if adaptation takes place. Adaptation as demonstrated by an increase in blood hemoglobin and hematocrit will be expected and will be compared with cytochrome P-450 levels and microsomal activities. The development of a model system showing the interaction of inhaled CO with drug metabolism lends itself to a variety of physiologic conditions from which it can be studied. These may include the effects of exposure to CO under hypoxic conditions (altitude), exposure of the pregnant animal and the subsequent effect on the fetus, and exposure of the newborn.

PROJECT DESCRIPTION: This investigation is principally aimed at studying the exchange reactions of organomercurials. Particular emphasis will be placed upon methylmercury compounds that are bonded to sulfur. The relative rate of alkyl and ligand exchange for R-Hg-SR derivatives will be studied. The study will be extended to include biologically important compounds that contain the -SH and -S-S- functional groups. The mode of reaction of these compounds with RHgX and HgX/sub 2/ will be studied. The relative reactivity of CH/sub 3/Hg/sup +/ to a series of ligands containing /sup -/CR/sub 3/, /sup -/NR/sub 2/, /sup -/OR and /sup -/SR will be determined by nmr and chromatography techniques. The experimental data will te supplemented by theoretical calculations. We will also continue our studies on the cleavage reactions of the C-Hg bond. Our conclusions will be related to the existing ecological problems associated with mercury contamination of the environment.

PROJECT DESCRIPTION: The relationship of graded, dietary cadmium intake levels to biochemical parameters associated with cadmium toxicity will be determined in rats and chicks. Cadmium uptake, calcium, copper and zinc concentration changes and enzyme activities will be investigated as a function of dose level in numerous tissues and will be correlated to the degree of toxicity. The mechanisms and factors influencing the synthesis of cadmium binding protein in liver and kidney will be investigated in detail. The mechanisms and factors involved in intestinal cadmium absorption will be studied, in vivo. The influence of calcium and vitamin D at various dietary intake levels will be investigated. The functional significance of cadmium binding to intestinal mucosal cell proteins will be investigated as well. The effect of cadmium on calcium and bone metabolism will be extensively investigated. The intestinal absorption of calcium will be investigated with in situ duodenal loops. The influence of cadmium on the renal mitochondrial enzyme 25-hydroxycholecalciferol-1-hydroxylase and 1.25-dihydroxycholecalciferol synthesis will be extensively investigated.

PROJECT DESCRIPTION: The proposed research is intended to investigate the in vivo stability of the carbon-fluorine bond as it occurs in various organic fluoro compounds. Initial emphasis will be placed on a study of aliphatic fluoro compounds, using fluoroacetate as the prototype. The extent to which fluoroacetate given in the drinking water is defluorinated by rats will be assayed by measuring the uptake by the bone of the released fluoride. The question of whether this defluorination, which our pilot experiments have shown does occur, takes place through the agency of microsomal enzymes or through enzymes of the intestinal flora, will be explored. The distribution of fluoride between organic and inorganic forms in the bone, blood and urine will be investigated, making use of gas chromatographic analyses and the fluoride ion-specific electrode. Finally, the course of development of the biochemical and morphological effects of fluoroacetate on the testes and the kidney will be determined, as will also the course of recovery from these effects.

PROJECT DESCRIPTION: Vitamin E appears to protect the rat from NO/sub 2/ and O/sub 3/. Exposure to these oxidant gases probably results in the oxidation of lung polyunsaturate fatty acids (PUFA), in the same manner as found in thin films or emulsions of PUFA. Phenolic antioxidants such as vitamin E retard this reaction in vitro. The more unsaturated the PUFA the more readily it is oxidized. Can dietary alterations of the lung PUFA or lipid antioxidants (vitamin E or synthetic phenolic antioxidants) ameliorate or enhance the deliterious effects of oxidant gases. Based upon experiments in rats, a second species, mice will be fed chemically defined diets that either increase or decrease the ease of oxidation of the lung lipids. Vitamin E will be absent, present at vitamin levels or present at pharmacological levels. The survival, morphological and biochemical alterations of lung on oxidant exposure will be determined to establish if oxidant gases degrade the lung by fatty acid oxidation. The rate of metabolism of vitamin E in the lung, and by autoradiography in endothelial and epithelial cells of the lung, will be assessed to determine if lack of cellular vitamin E results in the susceptibility of lung endothelial cells over epithelial cells. These two cell types will also be selectively removed, and analyzed for lipid contents to determine their relative ease of oxidation. The role of oxidant exposure and

PROJECT DESCRIPTION: Metals can produce varied effects on biochemical processes and it now appears that induction of (metal binding) proteins should be included among the diversity of responses multivalent metal ions elicit in biochemical systems. The induction of a great many proteins (enzymes) has been studied, yet the mechanisms by which this phenomenon is produced in mammalian systems remain obscure. The proposed study is designed to further ellucidate the induction process initiated by cadmium, copper and mercury (known to bind to metallothionein) and to characterize the proteins induced in response to high levels of the respective metals. Mice will be challenged with chloride salts of copper, cadmium and mercury in drinking water; at specific time intervals following ingestion of metals, tissues will be excised and analyzed by centrifugation, gel filtration, electrophoresis, liquid scintillation, immunological and tissue culture techniques. Highly purified metal binding proteins will be characterized by spectrophotometry, amino acid composition, molecular weight analysis, metal analysis, electrophoretic properties and other parameters. In addition, the mechanism of induction will be explored by analysis of chromosomal material and tissue culture experiments. Hopefully, the study should give insight into molecular events which determine biological tolerance as opposed to toxicity and should contribute to our understanding of the regulation of specific gene expression.

PROJECT DESCRIPTION: Because a selenium-accumulating plant, Neptunia amplexicaulis, excludes selenium from its proteins, it has been suggested that altered aminoacyl-tRNA synthetases from accumulators are unable to utilize the selenium analogs of the normal substrates, methionine and cysteine. Therefore, to test this hypothesis, plant species (mainly from the genus Astragalus) known to accumulate selenium from seleniferous soils will be treated with 75-Se-labeled selenium compounds and examined to see if they also exclude selenium from their proteins. Methionyl-tRNA synthetases will be isolated and purified from accumulator species and from related species that not only are unable to accumulate the element but are inhibited by traces of selenium compounds. Methionine and selenium methionine will be tested to determine if methionyl-tRNA synthetases from accumulator species differ in their substrate specificities from those

of nonaccumulator species. To characterize the synthetases from the two types of plants, K/sub m/, K/sub i/, and V/sub max/ values will be calculated from Michaelis-Menten kinetic data. Heat stabilities will be studied as well as the influence of substrate and analog on heat inactivation of the synthetases.

PROJECT DESCRIPTION: Increasing levels of organic mercury in the environment, and consequently in food, could be approaching hazardous levels for human beings in certain locations, especially during fetal life or infancy, since mercury apparently interferes with normal differentiation of the central nervous system. Body burdens of mercury will be estimated from mercury determinations performed on fluid and tissue samples derived from human fetuses, newborns, and mothers. Organic mercury will be measured by means of gas chromatography and total mercury by atomic absorption spectrophotometry during chronic and acute administration of methylmercury. The macaque pregnancy will be used as a model system in which to determine neurotoxic levels and the extent of tissue retention of mercury for the fetus and neonate. Possible pathological effects of mercury upon maturation of the cerebellum and cerebrum will receive close attention. The half-life of methylmercury-203 will be measured in the adult, the fetal and infant monkey. The extent of transmission of methylmercury-203 from mother to fetus via the placenta and from mother to infant monkey by means of suckling will be assayed. Finally, behavioral development of infant monkeys exposed to the methylmercury in utero or during lactation will be assessed.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The effect of the nephrotoxic metals cadmium, uranium, lead, copper and mercury, on the immature kidney will be evaluated by administering each metal to rats and rabbits at various ages beginning in the newborn period, and analyzing the functional effects and the changes in the enzyme distribution and content and the morphology of the nephron using tubules isolated by microdissection after collagenase treatment. The studies will used to compare the effects of each metal on the immature and mature nephron to determine whether the developing nephron is more susceptible than the mature nephron and to correlate such susceptibility with alterations in enzyme activity and morphology of the proximal tubule. The expected higher susceptibility of the immature nephron may allow detection of an effect of heavy metals which would be missed in the mature animal. The location of enzymes along the proximal tubule will be determined by histochemical staining reactions of dissected nephrons. This should make it possitle to detect both changes in the site or relative concentration of enzymes in various portions of the proximal tubule. The qualitative histochemical changes will be corroborated by quantitative biochemical analysis of both dissected nephrons and homogenates of renal cortex. Electron microscopy will be used to detect structural alterations of the proximal tubule cell produced by each

REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The work proposed is part of a long-term program of study of the irritant potency of compounds of interest as contaminants of urban and industrial environments. The unifying thread of the program has been, and will continue to be, the correlation of physical or chemical factors of the exposure environment with observed biological response. Priority is given to two general areas: the effect of particle size on the irritant potency of aerosols and the possible potentiation of irritant gases by aerosols. The biological assay method used is the measurement of the mechanics of respiration of unanesthetized guinea pigs before, during and after exposure to the material or materials being studied. For a certain group of irritants, including sulfur dioxide and sulfuric acid, the increase in flow-resistance is the most sensitive criterion of response and can be related to the concentration of irritant present. Specific areas of investigation will include biological and chemical studies of the conversion of sulfur dioxide to sulfuric acid by oxidizing aerosols and studies of the joint toxic action of sulfur dioxide and sulfuric acid for a range of particle sizes of sulfuric acid. Plans are also being made to study nitrogen dioxide alone and in combination with aerosols and in combination with sulfur dioxide.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This research is planned to study the metabolic interrelationships between three toxic environmental pollutants: cadmium, mercury and lead, along with two essential trace metals, zinc and copper. In the organism all five trace metals are bound to metallothionein, which in turn is synthesized in specific response to cadmium challenge. It is proposed to elucidate the physiological role of this protein; primarily, emphasis will be given to investigate the probable role of metallothionein in the detoxification of cadmium, mercury and lead. Exposure to cadmium is suspected of causing hypertension. The validity of this concept will be tested in animals as well as in human subjects.

REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: While the causes and cure of lead poisoning are well known, early detection before effects become irreversible remains one of two major stumbling blocks to eradication of this environmental disease. Diagnostic tests so far devised have limitations and there is need for a practical, reliable and definitive test. We propose to determine whether our quantitative computer/scanner system for rapid screening of radiographs can effectively detect lead poisoning in its early stages. We also intend to evaluate the usefulness of our system in measuring the extraction of lead from bones during treatment. Because of our capability for objective measurement we should be able to detect lead deposits in bones even when they are not visible in radiographs. Our computerized system is wholly independent of subjective visual evidence and largely independent of film taking and processing variables, thus overcoming the drawbacks of traditional radiographic screening methods. We intend to analyze some 300 radiographs of known lead-poisoning cases by two of our standard methods for determining skeletal status: (1) measurement of radiographic bone size, weight and density combined with comparison of findings to normal values; (2) line-scanning of selected bones to establish a mineral distribution profile which may pinpoint dense deposits in growing ends of bones. If, as we expect, definitive patterns

PROJECT DESCRIPTION: The purpose of this study is to provide detailed information on regional particle deposition in the human respiratory tract, and to determine the effects of particle size, respiratory parameters, route of entry, and constitutional variables on the deposition efficiency at the various deposition sites. Ferric oxide microspheres tagged with gamma-emitting isotopes will be inhaled by human adult volunteer normals. Measurements of particle retention in the head and thorax will be made immediately after the exposure, and also 24 hours later, using external collimated scintillation detectors within a low-background chamber. The initial activity in the thorax includes both tracheo-bronchial (T-B) and alvelor deposits, while the 24-hour measurement includes only alveolar. Thus, the inhaled aerosol can be divided into the following components: exhaled, head, T-B and alveolar. The intra-bronchial deposition patterns will be studied using gamma-tagged aerosols deposited in hollow bronchial casts, where deposition can be measured as a function of branching level, and in excised whole lungs, which will be dissected for determining the patterns of deposition within the airways. The correspondence of the cast and excised lung data to the in-vivo situation will be tested by performing cast and excised lung inhalations on specimens taken from donkeys whose in-vivo deposition patterns have previously been tested with the same inhaled aerosols.

SEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS
PROJECT DESCRIPTION: Arsenates and vanadates are poisons which are thought to operate in some instances by mimicking phosphate in biochemical processes. Arsenate has been extensively used to study the sequence of reactions in the process of oxidative phosphorylation, both to gain further insight into the normal mechanisms and to understand the means by which arsenates uncouple the process. Mechanistic models which have been proposed usually involve arsenate esters and arsenatophosphates, but there has been no chemical study of such species under conditions approaching a biological environment. We propose to study the rates

of hydrolysis of arsenate and vanadate esters and of condensed arsenates and vanadates and arsenatophosphates as well as the rates of oxygen exchange of arsenate and vanadate with water. We also plan to investigate the nature of phosphate-vanadate solutions to examine the possibility of vanadatophosphates. Because of the possible role of V(IV), we hope to characterize V(IV) species in neutral and basic solutions, and also to study V(IV,V) mixed valence species and V(IV)-phosphate species in solution. The results of these studies should be of fundamental importance to biochemists concerned with poisoning by arsenates and vanadates and with the mechanism of oxidative phosphorylation.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global;COASTS/Other coasts Unspecified
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The long-range objective of the proposed research is to elucidate the chemical basis for the toxicity of oxidant air pollutants, ozone and peroxyacetyl nitrate. The specific objectives in the case of ozone are to examine the reactions with glycerolipids which form biological membranes. These studies will be linked to experiments with artificial membranes and to studies of the capability of lungs to repair the damage done by ozone. Another objective will be to discover the effect of ozone on the proteolytic enzymes of lungs under the supposition that release of these enzymes from macrophage to the alveolar sacs may cause autolysis and eventually emphysema. Specific objectives for the study of peroxyacetyl nitrates includes assay of the reaction with sulfur containing amino acids, cysteine, cystine, and methionine both as free amino acids and in proteins. In addition, the basis for differences in toxicity of peroxyacetyl nitrate, peroxypropionyl nitrate, peroxybutyryl nitrate, and peroxybenzoyl nitrate will be studied from three viewpoints: half-life of the pollutants in aqueous environments, penetration of biological membranes, and reversal of toxicity by thioesterase action.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: It is proposed to determine whether certain common air pollutants, such as excited singlet molecular oxygen, be involved in the oxidation of membrane-bound cholesterol in select biological membranes and in model systems. Analysis of the cholesterol hydroperoxides initially formed in such systems upon exposure to the air pollutants can be used to determine whether excited singlet molecular oxygen or ground-state triplet oxygen are involved. The sterol hydroperoxides will be analyzed by means of thin-layer and gas chromatographic methods already developed and by gas chromatography-mass spectral methods to be developed during the study. The nature of the hydroperoxides formed will disclose the nature of the primary oxidant, certain cholesterol hydroperoxides being formed from excited singlet oxygen, certain other hydroperoxides being formed from ground-state oxygen in radical chain reactions. A fundamental study of membrane-bound cholesterol oxidation by other common air pollutants, including ozone, nitrogen dioxide, peroxy-acetyl nitrate, etc., as well as excited singlet oxygen and ground-state oxygen (for control comparisons) will be made. The thermal decomposition and enzymic alteration products of the sterol hydroperoxides will also be analyzed in order to identify the initially formed hydroperoxides with more certainty. Means of controlling or moderating cellular membrane damage from such oxidations will be sought using the fundamental analytical results obtained. Specific human tissues and cell lines most sensitive to air pollutant-moderated oxidations will be determined, and specific cause-and-effect relationships between the primary oxidative events and recognized human disorders will be sought after.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Combinations of non-traumatic impulse and continuous noise can produce unusually severe changes in hearing sensitivity and cochlear integrity. The extent of this noise-induced trauma cannot be explained on the basis of addition of the acoustic power of the two noises. The purpose of the proposed research is to systematically study the effects of combined impulse and continuous noise exposure on hearing sensitivity and cochlear anatomy. Three impulses, of variable intensity spanning a temporal range from 40 mu sec to .3 sec will be individually studied in combination with various intensities and band widths of a background continuous noise. Chinchilla will be used as the experimental animal. Noise-induced temporary and permanent threshold shifts will be measured at regular intervals after exposure using the auditory evoked response measure. At thirty days after exposure, the chinchilla will be sacrificed, their cochleas will be infused with Araldite and flat preparations will be dissected. Analysis of the cochlear cell populations will be accomplished using phase microscopy and thin sectioning techniques. At interesting locations, the tissue will be analyzed with the electron-microscope. The final evaluation of the particular noise exposure will depend on a correlation of the noise parameters with the audiological

and histological changes. These data are a necessary prerequisite for the ultimate objective of this research project, namely, the establishment of a Damage Risk Criteria for impulse-continuous noise combinations.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This grant proposal is concerned primarily with the extent of renal damage induced in young animals by the ingestion of lead diets. We are particularly interested in the effects of lead on the maturation of renal function in the newborn dog. Maturation of glomerular function, tubular function, and renal hemodynamics will be assessed. Another area to be investigated will be the effects of lead exposure during early development on renal function in adult rats. Finally, blood and kidney levels of lead will be correlated with renal dysfunction as determined from the above experiments.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The problem of human exposure to methyl mercury will continue as long as mercury is found in our lakes and streams. Recent evidence has indicated that there is potential danger to humans exposed to subtoxic amounts of methyl mercury. A new compound, dehydrodithizone, is proposed for study as a new treatment to clear methyl mercury from the body because of its selectivity for mercury and its having other advantageous properties. Systematic evaluation of present treatments is also proposed with the hope that drugs can be combined to give more effective therapy when their mechanisms of action on methyl mercury toxicity are understood. Study of some of the biochemical actions of methyl mercury on liver microsomes and the developing blood-brain barrier is proposed.

PROJECT DESCRIPTION: The overall objective is to define more precisely how various factors affect the patterns of particle deposition which occur during inhalation. Specifically we propose (1) to investigate how gravity and pleural pressure gradients influence alveolar deposition. By analyzing small samples of dried or frozen lungs, we plan to measure the amount of alveolar deposition in different lung regions. We also plan (2) to investigate how the various breathing patterns influence the distribution of particle deposition. A servo-pressure control system will be used to produce any desired breathing pattern at any specified lung volume. Finally, we plan (3) to investigate species differences in regard to aerosol deposition and to attempt to apply principles of scaling to our experimental data with the goal of

develcping predictive powers. Since inhalation is the primary entry route for agents that cause environmental, occupational, and infectious disease, it is of clear importance to understand better how and where particles deposit in the lungs. This information will be of value in understanding and controlling environmental hazards.

REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The overall objective of the research is to define the kinetics of uptake, distribution, metabolism, and excretion of inhaled lipid soluble vapors in man, by a set of differential equations, using predictable constants. The physical, chemical, and biological constants needed will be determined by simple experiments. Solution of the equations will be facilitated by a program for large digital computer. To verify the pharmacokinetic model, the experimental conditions of suitable published studies in man will be simulated, and their results compared with the calculated data. Further verification will be done by animal experiments. The pharmacokinetic model for the rat will be elaborated, and the predicted concentrations of noxious compounds in the tissue compared with the concentrations in rats sacrificed at selected time intervals following exposure. The described pharmacokinetic model will be used to design the proper monitoring of industrial data; to predict the cumulation of inhaled compounds and their metabolites in the body; to explain the role of certain physiological factors (body build, pulmonary ventilation, tissue perfusion); and to formulate guidelines for the prediction of the uptake, distribution, metabolism, and excretion of new noxious compounds introduced in industry. Initial plans are to use toluene, trichloroethylene, carbon disulfide, and methylene chloride in the study.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Bisulfite ion (the aqueous form of the atmospheric pollutant, sulfur dioxide) has three reaction pathways with the major pyrimidine components of nucleic acids: (1) reversible saturation of uracil, (2) deamination of cytosine to uracil, and (3) transamination of cytosine to N-4-substituted cytosine derivatives (leading to protein-nucleic acid crosslinking). We propose that one or more of these reactions constitute the principal biochemical lesions inflicted by environmental sulfur dioxide, leading to the adverse effects on health associated with this pollutant. To test this hypothesis, we are investigating these reactions at four distinct levels: (a) mechanistic studies with nucleosides; (b) studies on the relation of reactivity to conformation at the polynucleoside level; (c) the effect of bisulfite modification of RNA on protein synthesis, using synthetic messengers, MS2 RNA, and the E. Coli cell-free protein synthesizing systems; and (d) in vivo studies with bacteria, mammalian cells, and eventually mammals, to measure the extent of nucleic acid modification by bisulfite, and its consequences in terms of inhibition of protein synthesis and killing of cells. We hope that this study will provide concrete data as to the adverse biochemical effects of varying degrees of exposure to sulfur dioxide, and that this will be useful in setting rational guidelines for the control of atmospheric levels of sulfur dioxide.

PROJECT DESCRIPTION: Adverse cutaneous photosensitivity reactions following exposure to environmental chemicals and light have been reported with increasing frequency during recent years. The broad objectives of the proposed project are to define more precisely the mechanisms of action of these adverse photoresponses as well as the influence of environmental factors and the biologic differences between individuals which affect these reactions. Our approach to these objectives places particular emphasis on relatively unexplored aspects of this problem. Specifically, we are concerned with the role of temperature and humidity as they relate to photosensitivity reactions and the role of biologic factors of the host resulting in endogenously produced photosensitizers such as porphyrins. Although exogenous photosensitizing substances are well recognized causes of occupational dermatoses due to their primary irritant (''phototoxic'') or allergic (''photoallergic'') properties, little is known regarding the mechanisms of their photosensitizing properties on a molecular and submolecular biologic level. In addition, there presently exists no laboratory model for the study of the disabling photosensitivity in man known as persistent-light-reactors. The development of an experimental laboratory animal model for study of these reactions is a highly desirable goal in order to determine the specific role of light in the

PROJECT DESCRIPTION: The research program has the objective of elucidating the primary responses of bacterial cells to lead in an attempt to define trace mechanisms of action. The bacterial study will be used as a model for studying the specific effects of lead on unaltered and unpropagated rabbit alveolar cells. The proposed study is an extension of a recently completed pilot program on the effects of lead on bacterial cells. Lead infected cells result in osmotically sensitive cells with greatly reduced membrane lipid contents. The proposed program concentrates on the effects of lead on lipid metabolism, cellular respiratory pigments, and the creation of cellular leakage. X-ray diffraction and electron probe studies will be conducted to determine the chemical composition of lead-containing aggregates observed in membranes of bacteria. This program will provide valuable information for establishing the physical-chemical modifications of cellular membranes and a reference source of information on the molecular basis of the action of lead.

PROJECT DESCRIPTION: Unilateral pneumonectomy in laboratory animals induces a stimulus to the growth of the remaining lung such that lung volume greatly increases above normal. It is proposed to locate the sites at which new growth occurs and compare newly formed tissue with preexisting ''mature'' tissue. The main thrust of the research is to ascertain the effects of air pollutant gases on this accelerated lung development and to determine whether growth is impaired on exposure to pollutants in concentrations found in urban environments. The characterization of this ''stimulated'' lung growth and development in control and in animals exposed to ozone, and other oxidants, will derive from measurements of pulmonary function, from quantitative morphometry and light and electron microscopy and from biochemical analyses. The experimental design offers the advantage of investigating the effects of environmental stress on a

compromised organ that consists of both mature tissue and tissue in a state of development. In this respect, the findings may have particular significance in the areas of neo-natal development and pneumonectomy in the human.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The studies proposed examine the nature, mechanisms and consequences of the interactions of two major environmental pollutants, lead and polychlorinated biphenyls (PCBs), on the heme pathway, and on cytochrome P-450 and the mixed function oxidase system coupled to this heme-protein. Heme and P-450 play a central role in detoxification mechanisms for drugs, hormones, carcinogens and many chemically diverse substances derived from the environment. Lead and PCBs are ubiquitously distributed in the ecosystem of man; produce acute and chronic human diseases; and have potent interactions with the heme-P-450 systems. These interactions are of an inhibitory nature with respect to lead; and of a stimulatory nature with respect to the PCBs. Thus, lead and PCBs serve as excellent model substances for defining in chemical terms, the biological impact of many environmental pollutants which inhibit or induce the heme-P-450 complex. Lead and PCB-induced alterations in heme synthesis and in the activities of P-450 coupled enzymes can be expected to have major pharmacological and toxicological consequences, since the biological actions of drugs, hormones, carcinogens and other chemicals are determined to a significant degree by the rates at which they are metabolized. These effects of lead and PCBs on the heme-P-450 systems will be explored in detail, utilizing tissue culture techniques, whole animal preparations

PROJECT DESCRIPTION: The central purpose of this research plan is to define further the dynamics of lead transport in children. To this end, the primary focus is to clarify factors that determine the movement of lead into and out of bone, where over 90% of endogenous lead is stored. This cardinal phase of the research plan will be carried out in bone organ culture, a convenient and precise way to study the effects of the ionic milieu and hormonal peptides that regulate lead's efflux from bone. Complementary in vitro experiments will examine: (1) the role of chick calcium-binding protein in the intestinal absorption of lead, and (2) the effects of ionized calcium (Ca/sup ++/) and lanthanum (La) on the mechanisms of lead movement from red cell to plasma. Integration of data obtained from in vitro studies will be applied to construct different chelation regimens, for the treatment of lead-intoxicated rats, by adding to such therapy combinations of Ca/sup ++/, calcitonin (CT), and parathyroid hormone (PTH). This comprehensive research plan, focusing on the skeletal metabolism of lead, presumably, will define more clearly the kinetics of lead transport. By so doing, the potential hazards of ''subtoxic'' doses of lead may be understood, and more effective therapy may evolve for the treatment of childhood lead intoxication.

PROJECT DESCRIPTION: The major objective of the proposed research is to determine the residual effects of low level lead exposure on the fetal and infant rhesus monkey. Pregnant rhesus monkeys will be fed low levels of lead throughout gestation and their infants evaluated biologically and behaviorally during infancy, adolescence, and early adulthood. Similar studies will also be conducted on infant monkeys that are exposed to low levels of lead during the initial year of life. These studies will help to clarify the effects of lead exposure during early life on the subsequent development of the infant. In addition, maximum tolerable levels of lead administered over a given period to fetal (via the mother) and infant monkeys will be established. The methods that will be employed in evaluating these animals will include behavioral studies that will enphasize social interaction and learning capabilities of these animals from birth to adulthood. The clinical studies conducted will be systematic hematological, radiological, and biochemical determinations throughout infancy, adolescence, and adulthood. After the completion of the clinical and behavioral studies histological and ultrastructural studies will be conducted on all of the major organs. In addition, total concentrations of lead in various tissues of the body will be determined.

PROJECT DESCRIPTION: Early observations that X-irradiation and nitrogen mustard were mutagenic first raised the concern of geneticists to the potential dangers of physical and chemical agents in the environment and sparked intensive inquiries into the nature of the mutagenesis process. Recent studies of this phenomenon have relied heavily on microbial systems but have been very successful in detailing both the molecular nature of alterations to the genetic material and the enzymatic nature of the genetic control of DNA repair mechanisms. These latter observations have, in large measure, depended upon the use of genetically-altered mutagen-sensitive strains and recent observations with eucaryotes suggest that mutagen-sensitive strains will be similarly useful in advancing our knowledge of these processes in higher organisms. This proposal describes studies aimed at developing and testing new genetic strains of the complex multicellular eucaryote, Drosophila melanogaster, which will be useful tools in the evaluation of environmental chemicals for potential mutagenic activity. The experiments have been designed to assay the entire Drosophila genome in order to isolate mutant strains which exhibit sensitivity or resistance to particular chemical agents, especially mutagens. Such strains will undergo genetic and biochemical characterizations for deficiencies in DNA repair to determine their feasibility as

PROJECT DESCRIPTION: The object of this research is to measure the detailed size-chemical nature of atmospheric particulates. These data are desired to evaluate the toxicity of atmospheric particulates which depends on both their inhalability (aerodynamic size) and their chemical composition. The data will be obtained in an aerosol beam device which (1) measures the aerodynamic size or mass of a particle by measuring its time of flight between two focused light beams in a vacuum chamber and (2) measures, by surface ionization mass spectrometry, the abundance of various charge to mass species present in individual particles. The measurements will therefore provide information about the chemical composition of the size subranges of atmospheric particulates. The data of particular interest concern toxic species such as 1,2-benzopyrene, asbestos, and UO/sub 2/, among others. If these data can be obtained in

sufficient detail, it should be possible to identify the major sources of toxic atmospheric particulates. The instrument will be calibrated and the data will be collected and searched with the view of finding unique features of toxic and other aerosols which may serve to specifically identify their sources.

REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Proposed studies are designed to investigate the toxicological effects of an organomercurial, for instance, methylmercuric hydroxide, on cells and subcellular components. It is hoped that these studies will contribute to a better understanding of the action of certain environmental pollutants at the molecular level: for instance, provide a rationale for the fact that methylmercury has been observed to cause C-mitosis as well as C-meiosis in a variety of plants, mammals, and insects. Specifically, the proposed studies will be concerned (1) with the investigation of the methylmercury-induced inhibition of mitosis in tissue cultures of mammalian cells using cytological characterization techniques with regard to chromosome variations as well as biochemical fractionation and isolation procedures in the case of subcellular components in an attempt to obtain information concerning the ''target'' of the action of the organomercurial; and (2) with the study of the physical and chemical properties of the methylmercury complexes of chromatin and its associated histones using physico-chemical methods such as analytical ultracentrifugation, viscosity measurements, circular dichroism measurements, and other spectrophotometric techniques. The interphage chromosomes serve hereby as models of possible ''target'' molecules of the action of organomercurials at the molecular level. These studies constitute

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The purpose of this study is to provide detailed dose estimates to the critical cells in tumor formation from the important radionuclides expected to be prevalent in our environment within the next decade. Two groups of nuclides are to be studied, the alpha emitters which predominate in spent nuclear fuel, namely Pu-238, Pu-241, Am-241, Cm-242, Cm-244 and the beta emitting fission product Kr-85. Estimates are that by 1985 4 x 10 to the 9 power Curies of the transuranics will be reprocessed per year, while atmospheric Kr-85 levels could be as high as 10 to the 4 power pCi/m-cubed by the turn of the century. Release of transuranics to the environment can result in human exposures by ingestion or inhalation. Soluble forms of these nuclides are bone seekers and critical cells on bone surfaces are irradiated. Inhalation of less soluble particulates irradiates critical cells in the lower lung over long time intervals. Krypton-85 is very soluble in body fat and 13% of body storage fat is located in yellow bone marrow in bone shafts. It is thus capable of producing an important beta dose to bone cells adjacent to bone marrow as well as a dose to critical basal cells in bronchial epithelium upon inhalation. There is no human experience with high levels of these emitters to indicate their absolute toxicity. Whether the exposure is from inhaled or ingested material, the distribution of the transuranic nuclides in the

PROJECT DESCRIPTION: Although exposure to asbestos has been definitely associated with the development of lung cancer, the magnitude of the risk has not been defined in persons who are exposed to relatively minute doses of asbestos. Even small amounts of asbestos together with cigarette smoking, have been shown to have a synergistic effect in producing lung cancer (1). In a preliminary study, we have found large numbers of asbestos bodies more frequently in our lung cancer patients than in a control population without cancer. This occurs in cases where asbestos bodies are easily overlooked on routine histologic sections. We now propose to confirm this finding by quantitating the number of asbestos fibers in the lungs of more patients with and without lung cancer in a population with low asbestos exposure. Quantitation of fibers will be performed at both light and electron microscopic levels, and specific identification of fibers as asbestos will be carried out by morphology, electron diffraction, and microprobe analysis. It is hoped that quantitative criteria of ''significant'' exposure to asbestos can be determined, and the magnitude of the problem of increasing evidence of asbestos in the environment clarified.

PROJECT DESCRIPTION: Environmental contamination with cadmium (Cd) represents a potential health hazard. While this metal is accepted as being extremely toxic in cases of acute exposure, little is known of the potential consequences of chronic exposures to low levels. Cadmium is known to accumulate in several organs of mammals, including the pancreas. Further, decreased pancreatic function has been reported to be a feature of chronic Cd intoxication in humans. The objective of the proposed research will be to extend our preliminary studies on the influence of Cd on carbohydrate metabolism. Earlier results of these laboratories have shown that Cd inhibits insulin secretion from the rat pancreas (in vivo and in vitro). The results of these studies suggest that inhibition of calcium uptake by the pancreatic beta cell may play a part in this inhibition. Isolated pancreatic islets will be employed to assess the effects of Cd on ion fluxes across the pancretic beta cell membrane. Also, the effects of Cd on beta cell uptake and metabolism of glucose will be studied. A chronic feeding study will be conducted to determine the sensitivity of rat carbohydrate metabolism to dietary Cd. Rats will be fed Cd-containing diets for up to

24 months. Parameters of carbohydrate metabolism, accumulation of Cd in tissues and histopathological changes will be assessed in members of each treatment group at three month intervals. Studies will also be conducted to determine means of

REGIONS OF INTEREST: BIOMES/Freshwater
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this research is to isolate and identify chemical species containing arsenic, as they occur in living organisms. Initially, algae and crayfish will be used as the experimental organisms from which arsenic compounds will be isolated. This is because techniques have already been developed for the separation of arsenic-containing compounds from these organisms. As knowledge concerning the chemical nature of the arsenic species is aquired, it will become feasible to extend this study to include higher animals. The ultimate goal of this work is to determine the manner in which arsenic becomes incorporated in the mammal. Such knowledge may make it possible to begin to learn about the true toxicity of arsenic and its compounds, and whether arsenic may, in fact, be an essential trace element. Initially, crayfish and algae will be cultivated in an environment which contains arsenate and/or arsonite traced with As-74 (t/sub 1/2/ 18d). The cells will be homogenized and subjected to classical biochemical separation procedures. Protein, lipid, carbohydrate and nucleic acid fractions will be separated. The fractions will be subjected to chromatographic purification. Arsenic rich fractions will be identified by way of their As-74 activity. The arsenic-containing fractions will be subjected to additional chromatographic and electrophoretic methods. Initial characterization of the arsenic compounds will utilize mass spectroscopy, as well as Laser Raman, infrared, photoelectron spectroscopy, and gas chromatography. This will be followed by proof-of-structure studies by chemical means.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of this proposal is to utilize the recently developed ''Giemsa-trypsin'' chromosome banding procedure for enhanced resolution and characterization of chemically induced chromosome aberrations in the newborn offspring of experimental rats and mice. This will be accomplished by the injection of known doses of clastogenic compounds such as Mitomycin-C, triethylenemelamine or 2,3,5-triethylene-iminobenzoquinone-1,4(t) into both male and female rats and mice prior to mating with untreated control animals of the opposite sex. The effects of both drug and sham treatments on the banded chromosomes of offspring will be compared with the sensitive ''translocation heterozygote screening procedure'' in order to evaluate the relative merits of the two techniques as in vivo assays for the detection of permanent genetic damage to the offspring of animals exposed to chemical agents. Should the chromosome banding assay prove to be both effective and efficient it would serve as a basis for similar testing of additional chemical compounds and also for the investigation of the role of biologicals and viruses in the production of heritable genetic defects.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The over-all purpose is to elucidate interactions between lead and renal function in terms of three questions: what are the mechanisms and determinants of renal lead excretion; what is the effect of chronic lead poisoning on renal sodium handling, and the renin-angiotensin system; and what is the effect of chronic lead-poisoning on plasma concentration of erythropoietin. Experiments will be performed on normal and chronically lead-poisoned dogs and rats, using renal clearance techniques and stop-flow analysis. We will determine how much plasma lead is ultrafilterable, and what combination of glomerular filtration, tubular reabsorption, and secretion account for lead excretion. We will determine whether the pattern changes with the degree and duration of lead-poisoning, and how it is changed by alterations of dietary calcium, parathormone, thyrocalcitonin, and vitamin D. The effect of lead on tubular sodium reabsorption during low-sodium and normal diets and during a saline load will be measured. The responses of renin secretion, various components of the renin-angiotensin-aldosterone system, and plasma erythropoietin to a variety of stresses (Sodium depletion, hypotension, hypoxia) will be evaluated in chronically lead-poisoned animals. We hope to establish the minimal dose-time required for the appearance of observable changes in these parameters.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Cadmium is an environmental pollutant which has been shown to be toxic to a number of tissues in mammalian systems. These studies will make clear what dose is necessary to produce injury to the various tissues, which tissue is most sensitive to cadmium, and if there is a marked difference in the toxic sign between animals that receive one high single dose and those that receive multiple low doses over a long time. Information will be gained on the importance of metallothionein on the toxicity of cadmium. Does metallothionein alter the distribution of cadmium. Do metallothionein and cadmium levels in the tissues continue to rise with prolonged administration at different doses, or is a plateau achieved. What is the mechanism by which cadmium is excreted into the bile. Can it be enhanced by treatment with microsomal enzyme inducers. Will interruption of the enterohepatic circulation increase the elimination of cadmium from the body. If we can answer these very basic questions, then we should be able to treat cadmium poisoning on a more informed basis.

PROJECT DESCRIPTION: Previous studies on carbon monoxide have shown that both physiologic and psychophysiologic effects occur consequent to exposure to even low levels of this contaminant of our environment. Suggestive information that ozone also has the potentialities of producing similar complex responses in man forms the basis of this proposed investigation. It is proposed to expose subjects to increasing levels of ambient ozone and at different levels of ventilation (induced by different levels of exercise) resulting in increased dosages of ozone for similar time units. The resultant functional changes being measured (physiological and psychophysiological) will be quantified in relation to the dosage of ozone and used to empirically derive a dose response nomogram (as was done for carbon monoxide). Ultimately is is hoped to more clearly delineate the physiological responses and adaptations of man to ozone. On the practical side, the data and evaluations of the processes involved in the responses to this substance may lead to more precise delineation of air quality standards and threshold limit values.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This proposal is concerned with the study of the metabolism of the carcinogens vinyl chloride (VC) and trichloroethylene (TCE). The primary objective is to isolate and characterize the activated carcinogenic intermediates of these two compounds, to determine the carcinogenic activity of such intermediates, and to study their covalent binding to tissue constituents. It is suggested that epoxide intermediates of both compounds are the activated carcinogens. These epoxide intermediates are alpha-chloro ethers; compounds of the latter type are known to be potent carcinogens. Studies on the metabolism of VC and TCE will be conducted on rat liver homogenates and intracellular fractions and components derived from it. The malignant transformation of primary rat embryo cells in vitro by the parent compounds, their epoxides and their rearrangement products will be studied. The carcinogenic activity of the activated intermediates will be determined by rat feeding experiments and by cocarcinogenesis experiments on mouse skin. These studies will lead to new insights concerning occupational and environmental carcinogens and their mechanism of action in animals and man.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Factors regulating the entry and distribution of inorganic lead in the nervous system will be studied under control and selected abnormal conditions. In the guinea pig, in vivo CSF perfusion will quantitate the disappearance rate of Pb-210 and Ca-45 across the blood-CSF barrier. The uptake of Pb-210 and Ca-45 across the blood-brain barrier will be measured by an indicator dilution technique. These measurements will be correlated with levels of lead and calcium attained in brain, meninges, choroid plexus and ependyma. These indices will be determined for control animals and for animals acutely and chronically lead-poisoned, and for calcium deficient animals. The affinity of the neural tissues for lead and calcium in the absence of an intact barrier will be assessed by measuring in vitro uptake and release of Pb-210 and Ca-45. This will be determined under control conditions; after inhibition of general, oxidative and glycolytic metabolism; after changes in medium electrolyte composition and after exposure to reagents that act as ligands. An effort will be made to distinguish solute accumulation due to binding within neural tissue from that due to movement across the tissue using excised bullfrog choroid plexus and meninges which can be mounted as ''polar'' membranes, allowing direct measurements of transepithelial flux. This parameter will be studied in control and acutely poisoned frogs and contrasted with

PROJECT DESCRIPTION: Lead is a ubiquitous toxic pollutant. The most serious manifestation of pediatric lead poisoning is an acute encephalopathy. In addition, the rising burden of environmental lead may be

producing significant brain damage, without overt encephalopathy, in young children, in the unborn fetus, and the neonate. Pathologic studies suggest that lead produces edema and capillary changes at a ''critical'' time in the immature brain of the human and in a rat model of lead encephalopathy. This ''critical'' period in the rat contains many age-dependent changes in energy metabolism including activities of the electron transport chain (ETC) as described by this investigator and others. Lead does act on the ETC in other tissues. However, there are no studies in immature brain of lead effects on the ETC, a probable basic step in the pathogenesis of lead encephalopathy. Preliminary results are presented on effects of lead on oxidative phosphorylation in immature rat brain mitochondria. Within 2 days of feeding lead to 2-week old animals, respiration with NAD-linked substrates is uncoupled, reflecting an increased state 4 rate. During the subsequent 2 week pre-encephalitic period of lead feedings, both state 3 and 4 rates become increasingly dpressed. Cytochrome oxidase activity shows the same changes. These effects are more significant in cerebellar than in cerebral hemisphere mitochondria. Importantly,

PROJECT DESCRIPTION: A three year program of research is proposed to elucidate the primary biochemical and biophysical causes for cellular injury resulting from the photooxidant ozone. The basic hypothesis to be tested is that the primary point of oxidant attacks is the cellular plasma membrane and that a loss of critical ions, particularly K/sup +/, alters the metabolism of the cell and destroys cellular homostasis. Two membrane components, sulfhydryls and unsaturated fatty acids, are highly probable sites of ozone attack and alterations in these molecules would undoubtedly lead to gross changes in permeability and transport properties of the membrane. These studies will utilize two model biological systems. (1) The unicellular alga Chlorella sorokiniana will be subjected to ozone under two regions: (a) high levels for short durations and (b) continuous low levels. K/sup +/ levels, specific permeability indicators, level of pertinent enzymes, lipid composition changes, and sulfhydryl alterations will be assayed. (2) Membrane fragments of Red Blood Cells will be subjected to ozone to ascertain which biochemicals in the membrane are altered first.

PROJECT DESCRIPTION: The goals of this study are (1) to determine what environmental factors are associated with ''somatic mutations'' as manifested in chromosome breakage and other evidence of chromosome damage which occurs in those with evidence of embryotoxicity and (2) to investigate the feasibility of a new method of evaluation of chromatid interchanges (using Hoechst 33258 binding) and its applicability to the determination of chromosome damage in the population under study; and, in so doing, to assess the more general applicability of this approach to the monitoring of populations ''at risk'' which are known to be exposed to possible environmental hazards such as X-irradiation, pesticides, etc. Chromatid interchanges as detected with this method will be correlated with the frequency of chromosome breakage in the population under study as well as with history of exposure to radiation, among other factors.

HARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (100%)
EGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: It is often possible to model the body burden of pollutants as a mixed exponential moving average of the external pollutant dosage. This model fails: (a) when the pollutant occupies a significant fraction of a system e.g., carbon monoxide; and (b) when an appreciable fraction of pollutant is retained in long-lived components, e.g., bone-seekers such as lead. A semi-Markov model for physiological kinetics generalizes this model. By representing body burden as a stochastic integral of external dosage, it is often possible to estimate the frequency, duration, and parameters of other integral exceedance measures for body burden, thus to estimate the effects of environmental quality standards on body burden variation. Physiological kinetic models for carbon monoxide, for the lead-calcium system, and for cadmium-zinc, will be estimated using non-linear regression techniques for experiments (as reported in the literature) on uptake and elimination in constant environments. Stochastic models will be developed for external dosage of CO and lead, and the parameters of the exceedance measures of body burden estimated. In this way it may prove possible to establish a better rationale for environmental standards setting.

PROJECT DESCRIPTION: Mathematical models are to be developed for theoretical prediction of particle deposition and distribution along the respiratory tract system. Specifically, the following tasks are to be undertaken during the period of requested support: (1) Develop a mathematical model for deposition in man at nose-breathing. (2) Recommend figures for the regional deposition in the human lung at nose and mouth-breathing under various working conditions. Emphasis will be given to fine particles which are difficult to be removed from power plant emissions. (3) Develop a mathematical model for deposition in smokers and patients with chronic obstructive pulmonary disease. (4) Develop a mathematical model for deposition in experimental animals. The basic method to be used is the one previously developed by the principal investigator and his faculty associate.

PROJECT DESCRIPTION: We intend to determine the extent to which DNA of chromosomes binds alkyl and aryl mercury in living cells. Also, we wish to obtain information on the molecular level concerning the nature of the complexes. The method to be used is a spectroscopic one, optical detection of magnetic resonance, odmr, by means of which magnetic resonance transitions in photoexcited triplet states are detected optically. A heavy atom effect caused by mercury binding to an aromatic chromophore such as a heterocyclic base of DNA makes the resulting triplet state a highly radiative trap which is especially sensitive to odmr. The odmr method thus selects the mercury-perturbed chromophore which then can be identified by the magnetic resonance frequencies, and other properties of the phosphorescent state. Selectivity by the heavy atom effect is especially good in DNA which normally is not highly luminescent. As a major system for study, we intend to use Allium cepa for which cytological data of chromosomal aberrations of root cells caused by mercurial treatment exists.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The nation's response to the needs for energy self-sufficiency could increase the number of hazardous agents that are released into man's daily environment. Efficient and economical systems are needed to predict human susceptibility to hazardous agents and to monitor human populations for adverse genetic effects which may be caused by unforeseen mutagens. There is a high probability that these needs could be met by further development of DNA repair synthesis. The utility of the present in vitro DNA repair synthesis tests can be enhanced by developing in vivo DNA repair synthesis to measure organ and tissue specificities of responses to hazardous agents and by using these same tissues as the sources of metabolic activation enzymes for in vitro DNA repair synthesis assays. The significance of DNA repair synthesis will be further enhanced by examinations of DNA repair in prematurely condensed chromosomes and by correlations of the extent of DNA repair with measurements of cytogenetic aberrations, with mutagenesis of mammalian cells, and with carcinogenesis as measured by cell transformation.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: It is our intention to develop a new system for testing the mutagenic potential of various environmental agents on mammalian somatic cells. The basis of the procedure is to expose cells to mutagen and plate out single cell clones. Clonal isolates, after being grown up to 40 x 10 to the sixth power cells, are then screened for electrophoretic variation of the products of over 40 genetic loci. Where a clonal variant is detected, it is isolated and its heritability determined by subcloning and subsequent electrophoresis. The procedure avoids many of the problems associated with the detection on selective systems of recessive mutations (auxotrophic, drug resistant, and temperature sensitive) in diploid mammalian cells since electrophoretic mutations are co-dominant. Lack of enrichment for mutants by selection is also compensated for by the increased probability of obtaining an electrophoretic shift in a protein as the result of a single nucleotide substitution in its gene as opposed to the complete loss of function by such an event, and the study of the products of a large number of loci. Additional attributes of the procedure are that each variant may be associated with a specific genetic locus, mutations in a wide range of genetic loci may be studied, the system requires no change in the medium limiting the cause of any observed variation to intracellular events, and mutations in both

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The low molecular weight, cysteine rich protein, methallothionein will be studied under a variety of conditions in order to elucidate its function in heavy metal metabolism. Its involvement in the mechanisms of incorporation, metabolism, deposition and turnover of hazardous toxic metals, which are becoming increasingly prevalent in the environment as byproducts associated with various energy related technologies, will be elucidated. Specifically, the focus of these studies will be on the mechanisms of action and sites of localization and transfer of heavy metals in perfused rat lungs, and possibly livers

and kidneys, (both in vivo and ex vivo) and in rats (both adults and neonates). The heavy metals of interest in this study are zinc, copper, cadmium, mercury, nickel, and thallium. Initially, these will be studied individually as a preliminary to more important experiments which will involve the study of interactions of two or more of these metals, e.g., a situation which is more likely to occur under environmental conditions. The goal of these studies is to establish whether methallothionein is functioning in detoxification of toxic heavy metals or has another role in the normal metabolism of essential heavy metals, the presence of toxic heavy metals serving to interfere with these normal processes.

PROJECT DESCRIPTION: The purpose of this proposal is to develop a modified host-mediated assay system by using cultured human lymphoid cells as target cells for screening chemical mutagens and carcinogens. Induction of chromosome damage will be used as an indicator of possible mutagenicity or carcinogenicity of a given compound. First, the growth and cytogenetic characteristics of several selected human lymphoid cell lines will be studied in vitro and after inoculation of such cells in heterologous hosts, second, effects on chromosomes of human lymphoid cells in host by several known mutagens and carcinogens will be tested in this modified host-mediated system and third, the mutagenicity and carcinogenicity of several pesticides in common use will be evaluated by using the modifed host-mediated assay developed.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project involves the development of mammalian lymphoid culture systems to test for the mutagenicity of environmental agents. Compounds which are known mutagens (such as alkylating agents, and frameshift mutagens) will be tested in human and lymphoid cell lines for the induction of mutations at the hypoxanthine-guanine phosphoribosyl transferase and the argininosuccinic acid synthetase loci, and in murine lymphoid cells for the induction of altered immunoglobulin. The induction of chromosomal breakage in these cell lines will be studied using the G and H banding techniques. In addition, the research will utilize bacterial test systems to determine the relationship between mutagenicity in simpler organisms and in more complex, differentiated mammalian cells.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: It is intended to work on the development of statistical and probabilistic subdisciplines particularly important in the studies of biology and health problems. Whenever possible, such studies will be conducted in conjunction with substantive biological studies. To facilitate the

establishment of the relevant contacts, seminar meetings with substantive speakers will be used, once a week during the academic year and more frequently during summer. Many problems contemplated for the immediate future are suggested by the current energy crisis. The broad, say, ultimate statistical problem connected with this crisis can be stated as follows: given that in a locality a new energy producing plant is to be constructed, with a specified additional environmental pollution, to estimate the consequent changes in the selected parameters of public health. It is proposed to study a number of subproblems of this ''ultimate'' problem. These include: (1) the use of Markov chains to study ''competing risks'', (2) methodology of treating factorial experiments, and (3) construction of stochastic models of biological phenomena like carcinogenesis and mutagenesis. Some relevant mathematical problems will also be studied.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOISE, VIBRATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;OS
PROJECT DESCRIPTION: The major objective is to specify the quantitative and qualitative relations between physical characteristics of noise and the temporary hearing losses produced by the noise. Knowledge of these relations for human observers will permit the specification of levels of noise that will not injure the inner ear, will not produce a temporary hearing loss, and will not delay the decay of an existing hearing loss. In addition, these relations will provide a scientific basis for the development of noise standards and criteria. Human observers will be exposed to low levels of continuous and intermittent noises for periods of up to 48 to 60 hrs. Auditory sensitivity for pure tones as well as other tests of auditory function will be measured before an exposure, during quiet periods interspersed within an exposure, and after an exposure. Results will be evaluated with respect to previous human and sub-human data, a predictive model (the equivalent power model), and current noise standards and criteria. Collectively, the proposed experiments will provide a parallel to earlier and current animal experiments and aid in elucidating the mechanisms of hearing and hearing loss.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: There is an urgent need for devising and standardizing procedures for monitoring the effects of environmental mutagens on the genetic systems of higher animals. For practical purposes, these procedures should be relatively inexpensive, not laborious, easily quantitated, and the test objects should be related to the genetic system of man and other mammals. Chromosomes of cells in culture fulfill all these criteria and should be one of the most suitable testing materials. Since most mutagens induce chromosome damage (hence they are also clastogens), chromosome damage should serve as a conservative indicator of gene damage. However, investigators in the past used various test objects (many were poor materials) and test systems (many haphazardly designed), so their data are incomplete and are not strictly comparable. This project is designed to systematically test several cytologically advantageous materials and to determine the most efficient, economical and information-yielding protocol for future screening of environmental mutagens. Our test materials include, in addition to diploid human fibroblasts, cells of the Chinese hamster (for its fast growth rate and good chromosomes), the Indian muntjac (for its very low diploid number, 2n = 6), two species of the deer mice (differing drastically in the amount of constitutive heterochromatin and repetitive DNA content), the laboratory mouse,

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: The response to inhalation of ambient aerosol particles from indoor and selected outdoor environments will be investigated using high sensitivity elemental analysis by proton induced X-ray emission, PIXE. The response may include both deposition of particles in the respiratory tract and growth in particle size due to exposure to high relative humidity during breathing. Both responses may depend on particle size and on chemical composition of the particles and may be different for different component particles in a mixed aerosol. The different components may be distinguished by their different elemental composition, and the respiratory response of each may be determined in a single experiment. Samples will be taken by 5 stage cascade impactor with fine particle filter and will provide resolution of particles < 0.25 to > 4 mu m equivalent aerodynamic diameter. Each size range is analyzed for its elemental constituents by PIXE, including S, Cl, K, Ca, Ti, V, Cr, Mn, Fe, Ni, Cu, Zn, Br, Pb, Zr, Cd, and additional heavy metals if present in the aerosol. The nanogram sensitivity of the PIXE technique permits fine particle size resolution at a sampling rate of 1 liter/minute and requires of human subjects only 10 minutes or less of breathing time per sample. Experiments are carried out using ambient aerosol from different actual environments and do not require the use of special tracer

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives are to study the effects of certain environmental pollutants and hepatotoxins with the retrograde intrabiliary injection (RII) technique and gain some insight into how these agents produce effects on the liver. Some studies have already been initiated using CCl/sub 4/ as a model compound to produce liver damage. We have found that CCl/sub 4/ liver damage produces a ''dicrotic notch'' in the recollection curve for the retrogradely injected compounds. Several approaches are proposed to investigate this finding based on the proposition that this effect of CCl/sub 4/ is on duct and ductular sites in the biliary tree. Ability to detect functional damage at such sites is a new finding for CCl/sub 4/. For obvious reasons, we will broaden the study to include other hepatotoxins and environmental pollutants. CO in initial trials, by virtue of its effect to depress bile flow, produces changes in the shape of the recollection curves for the compounds given by retrograde intrabiliary injection. Attempts will be made to differentiate effects of hypoxia from those of CO. Because dichloromethane type compounds are converted by metabolism to CO, possible intrahepatic release of CO and effects of this release will be evaluated. A study of selected compounds which produce liver damage will be made. Allylisopropylacetamide will be studied for hepatic porphyric effects. Liver damage and

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Lead poisoning remains a major health problem in the United States. Up to 19% of the children from a recent series of screening programs from 1969-1971 had lead blood levels of 60 mu g/100 ml or higher, concentrations that are generally accepted as severe enough to require medical treatment. Lead is known to be toxic to the erythropoietic system, producing anemia. A possible explanation for this anemia is inhibition of heme biosynthesis in erythropoietic tissue. The goal of the research proposed in this project is to elucidate the role of a dialyzable, protective factor against lead inhibition of uroporphyrinogen I synthetase, an enzyme midway along the heme synthetic pathway. Results of preliminary experiments have demonstrated that this factor is present in the liver and offers complete protection against lead inhibition of hepatic uroporphyrinogen I synthetase activity. However, this factor is

evidently not present in the erythrocyte, or is present at a lower concentration, since lead is a potent inhibitor of hemolysate enzyme. The results of studies directed towards understanding this protection against lead inhibition of this enzymatic step of heme biosynthesis by this dialyzable factor will provide valuable information on mechanisms of lead toxicity and new information on the possible treatment of lead intoxication.

TECHNOLOGY: FOSSIL FUEL/General (33%);SOLAR/General (33%);SPECIFIED OTHER TECHNOLOGIES/Methanol (34%)
ENERGY CYCLE: TRANSPORTATION (33%);STORAGE (33%);COMBUSTION OR END USE (34%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The project develops and utilizes a variety of modes of preventive surveillance appropriate to NIEHS in the attempt to minimize possible toxic events in specific or general populations. The information developed relates, first to the compounds or physical agents being considered, and then as much as possible to related chemical, physical, or biological systems.
APPROACH: The biologic hazards of methanol were reviewed including its context in the many proposed uses in the future. Participation on the IMOS (Inadvertent Modification of the Stratosphere) Task Force of the Council on Environmental Quality and the Federal Council for Science and Technology, and one of its subcommittees resulted in a report entitled, ''Fluorocarbons and the Environment'' and in a proposal for short- and long-term research on the biologic and climatic effects of potential ozone reduction in the stratosphere.

POLLUTANTS: SPECIFIED OTHER POLLUTANTS/As identified (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To determine whether exposure to a large variety of chemical agents from both existing and developing technologies may result in long-term neurological and behavioral consequences. (2) To assess the availability, validity, and utility of animal test systems which are used to reveal such neurobehavioral toxicity. (3) To evaluate methods for monitoring neurobehavioral effects in exposed humans. (4) To suggest research programs necessary to establish a firm scientific basis for using neurophysiological and behavioral tests as early warning indicators of toxicity.
APPROACH: Literature review aimed at integrating the available information on neurobehavioral toxicity. Attendance at meetings and membership on committees concerned with the neurological and behavioral effects of various agents. Reviews of documents and manuscripts; preparation of reports; and consultations with scientists from other Government agencies, industry, and academia.
RESULTS: The long-range objectives of this project are to (1) provide information on the neurological and behavioral effects of chemicals that may accumulate to critical levels following long-term low-level exposure and (2) to assess the practicality and validity of using neurobehavioral tests as early indicators of toxicity and surveillance ''tools.''

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
OJECT DESCRIPTION: The objectives of this project are to assess the cardiac effects from exposure to various environmental agents. At the present time studies will be performed using isolated perfused small animal hearts. Compounds of current interest include low molecular weight halogenated alkanes such as anesthetics, fluorocarbons, and brominated compounds as well as some of the energy-related pollutants. In the future we would like to be able to compare in vitro vs. in vivo preparations using surgically implanted energy transducers and detectors. This project is directed toward the detection of functional changes in the cardiovascular system associated with the inhalation of anesthetics, fluorocarbons, and brominated compounds as well as energy-related pollutants. The function of isolated, perfused rabbit, rat, and guinea pig hearts will be monitored. Animals may be previously exposed to contaminants followed by excision and perfusion of hearts or the hearts may be exposed acutely in vitro. Myocardial mechanical, electrical, and metabolic activity may be monitored concurrently.
APPROACH: Two model systems are employed: (1) the perfused, isolated, Langendorff heart preparation; and (2) the superfused isolated papillary muscle preparation. Mechanical activity in the whole heart is monitored using an intraventricular balloon connected to a pressure transducer, and in the papillary muscle using a force transducer. Electrical activity is assessed using surface electrograms or microelectrode recordings. Metabclic activity of the whole heart is determined by monitoring perfusate pH, PCO/sub 2/, and PO/sub 2/ as it enters the aorta and as it exits the coronary sinus.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The purpose of this project is to understand the mechanisms which determine the disposition of environmental chemicals in various animal species and to develop pharmacokinetic models for these chemicals. After developing pharmacokinetic models in several species, it may be possible to extrapolate disposition of chemicals to other species, and, ultimately, to man. The prediction of the accumulation in man after low-level chronic exposure could then be done. Pharmacokinetic information (models) can be very useful in the design and interpretation of toxicity studies. The topics of present interest are: (1) disposition of several polychlorinated biphenyl isomers in the rat, mouse, dog, and monkey; and (2) development of pharmacokinetic models in these species.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: It is the objective of this project to develop exposure systems for bioeffects research and to develop and test techniques for measuring energy absorption. During the past year components have been obtained to develop waveguide exposure systems which will be used to expose cell systems and isolated neurons. The fabrication and calibration of the system will be accomplished during the next fiscal year.
APPROACH: The pressure transducer-capillary temperature detector was tested. The detector did not have the necessary stability at the desired sensitivity range. The response time of the instrument was slower than desired. As a result of these studies, this detector proved unsatisfactory for microwave energy absorption measurements at the levels associated with microwave hazards. A liquid crystal-optic fiber (LCOF) temperature measurement probe was obtained from the Office of Naval Research. This probe does not interact with the microwave field and provides a technique for measuring energy absorption. We used the probe to test the thermistor which we have been using for energy absorption measurements. Excellent agreement between the two detectors was obtained and verifies our techniques as being accurate.

PROJECT DESCRIPTION: The objective of this project is to determine the effect of microwave radiation on neurological response. Isolated neurons such as the abdominal ganglion of the Aplysia, the sciatic nerves of frogs and the saphenous nerves of cats will be exposed to CW and modulated microwave radiation in the power density range of 1-10 mW/square cm. The effects of the microwave radiation on the strength-duration of a stimulus to produce an action potential, amplitude of the response, and conductive velocity will be investigated.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this project are to determine how 2450 MHz microwave radiation interacts with biological material at the cellular and macromolecular level, to observe any effects of this interaction and to relate the amount of microwave energy absorbed to the effects. Biological systems employed in the study are bacteria and bacteriophage, solutions of DNA, 2-4 cell stage embryos from mice, rabbit erythrocytes and rat lymphocytes. In these experiments, the temperature, humidity, and other various growth conditions have been carefully monitored in order to eliminate any effects not intrinsically caused by the microwave radiation. Results have shown very few differences between exposed and control samples that could not be explained by the thermal heating of the microwave radiation.

PROJECT DESCRIPTION: The objectives of this project are to determine the effects of 2450 MHz CW microwave radiation on the embryological development of Japanese quail and the subsequent growth, reproduction, and immunological response of the mature quail which had been exposed during the developmental period.
APPROACH: Fertilized Japanese quail eggs were exposed to 2450 MHz CW microwave for various periods of embryonic development at power densities of 30 mW/square cm and 5 mW/square cm. The effects of exposure on hatchability, gross deformities and hematological parameters were measured in the 2 day old quail. Fertilized eggs were also exposed to 5 mW/square cm for the first 12 days of development. The quail were kept to maturity and growth rates, egg production, fertility and immunological response were measured.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Recent studies on the mutagenicity of chemical carcinogens in various systems have shown that there is a positive correlation between mutagenicity and carcinogenicity. Our previous studies with chemical carcinogens in Neurospora crassa not only show a positive correlation, but also indicate that potent chemical carcinogens induce predominantly base-pair substitution mutations. It is necessary to extend our studies to other carcinogenic compounds and to determine whether those compounds are also mutagenic in Neurospora and to determine whether those compounds induce bse-pair substitution mutations. The ad-3 test system of N. crassa developed by de Serres is used in this study. Conidia are treated with chemical carcinogens. Treated and untreated conidia are assayed for the presence of ad-3 mutants by the direct method. The isolated mutants are analyzed by complementation, dikaryon and trikaryon tests.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Development of a spot test will provide a simple, economical and quick system in eukaryotes for the detection and evaluation of the mutagenic activity of chemical carcinogens and environmental agents. We have established optimal conditions for the spot test and have selected four strains from hundreds of mutants as tester strains. Conidia from 7-day-old vegetative cultures of testers are harvested and 2 x 10 to the 7 power conidia in 1 ml saline are added to 2 ml of cover medium. The mixture of conidia and cover medium is poured onto a plate containing 20 ml of Fries' minimal medium. Samples of an environmental agent are placed on the center of the plate. After 7 days' incubation at 30 degrees C, revertants from each plate are recorded. The results of our studies show that the spot test system of Neurospora can be used for screening the mutagenicity of environmental agents. We are in the process of improving our spot test system by introducing UV sensitive markers into tester strains. We are also in the process of developing a forward mutation spot test system.

PROJECT DESCRIPTION: Many studies, in bacteria as well as in other microbial organisms, have shown that some of the repair-deficient strains are more mutable than the wild type. In studies with the ad-3 test system of Neurospora crassa, F.J. de Serres and his co-workers showed that repair-deficient strains, upr-1 and uvs-2, are more mutable than wild type after UV or gamma-ray irradiations. It has also been shown by de Serres that the spectra of genetic alterations caused by UV in repair-deficient strains are different from that caused by UV in the wild type. It is of interest to study and compare the mutagenic sensitivity of repair-deficient and wild-type strains to various chemical carcinogens and to compare the spectra of genetic alterations caused by these carcinogenic agents in the UV-sensitive and the wild-type strains.

PROJECT DESCRIPTION: The aim of this project is to develop systems for measuring the frequency of point mutations and DNA loss in male germinal tissue. These systems would have the advantage of testing the human population by means of readily available samples, i.e., spermatozoa. At present enzyme histochemical methods are being developed to detect point mutations in male mice and three enzymes and their inhibitors have been characterized. These enzymes are alpha-glycerophosphate dehydrogenase, lactate dehydrogenase and succinate dehydrogenase. Preliminary work has started with the FACS-1 cell sorter to determine its usefulness in measuring the distribution of DNA content in a population of sperm. It is hoped that this instrument may prove useful in showing changes in the distribution pattern in sperm populations derived from mice treated or untreated with known mutagens.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: At present there is no system which can simultaneously detect both forward mutation and chromosome aberrations. This program is designed to fill this lacuna, such that at least 50 plus genetic events can be detected in one organism, Aspergillus nidulans, medium system. The objectives are to construct a diploid strain of Aspergillus heterozygous for various loci and to elucidate the types of induced mutagenic events induced in this strain by various standard mutagens.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: "Low, repeated doses of such commonplace pollutants as fumes in the air and chemicals in drinking water are increasing risks of cancer, heart disease and genetic mutations," according to a Library of Congress report. This report also indicates that the existing testing methods are expensive, arduous and not sensitive enough to detect polluting agents. The primary aim of this project is to attempt to develop inexpensive biomonitors to detect these hazardous environmental agents and compare the results obtained with these systems with the work already in progress at Brookhaven using Tradescantia.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: It should be possible to increase the sensitivity of the yeast strain D4 by (1) including the UV sensitive gene rad/sub 18/ in the strain. From the results of other workers it is known that a strain possessing this gene will be more sensitive than wild-type to a variety of mutagens. (2) Increasing the permeability of the strain D4 to mutagens. When the yeast cell is grown anaerobically the lipids become depleted. Since lipids are components of the outer membrane the permeability of this membrane may change. Although many systems are available for monitoring mutation or gene conversion, there is no simple method for detecting changes involving whole chromosomes. It is proposed to develop a method for monitoring non-disjunction in yeast by constructing a diploid strain heterozygous for two linked recessive resistance genes.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Aflatoxin B/sub 1/ is known to be one of the most potent chemical carcinogens ever found in the human environment. This and other aflatoxins, unfortunately, are common contaminants in agricultural products. Studies on the carcinogenicity of aflatoxins in rats have shown that aflatoxin B/sub 1/ is more tumorgenic than aflatoxin G/sub 1/ in liver. The latter compound, however, induces more tumor formation than the former compound in male kidney. Neither aflatoxin B/sub 1/ or G/sub 1/ are carcinogenic in the kidney of female rats. It would be of interest, therefore, to see (1) are more mutagenic metabolites being converted from aflatoxin B/sub 1/ than aflatoxin G/sub 1/ by rats liver homogenates; (2) are more mutagenic metabolites being converted from aflatoxin G/sub 1/ than aflatoxin B/sub 1/ by kidney homogenates of male rats; (3) are kidney homogenates from female rats failing to convert aflatoxins B/sub 1/ and G/sub 1/ to mutagenic metabolites; (4) does epoxy hydrase affect the presence of mutagenic metabolites; and (5) is 2,3 epoxide an active form of aflatoxin metabolites. Conidia are treated with aflatoxin B/sub 1/ or G/sub 1/, rat liver or kidney homogenates and a NADPH generating system at 37 degrees C for 2 hours. Epoxy hydrase or epoxy hydrase inhibitor might also be added to the treatment solution. At the end of the treatment conidia are washed. Treated and untreated conidia are assayed for the presence of ad-3 mutants by the direct method.

PROJECT DESCRIPTION: These studies seek to assess the effects of environmental agents on spermatogenesis. Environmental chemicals are tested, test systems validated and new approaches to toxicity testing proposed. To date, alkylating agents and selected trace metals have been studied. The DNA repair system in mouse germ cells appears useful as a predictor of toxicity. Biochemical and toxic effects of environmental agents on rodent spermatogenesis are also studied using velocity sedimentation cell separation and serial mating techniques. Enzyme development during spermatogenesis and "marker" enzymes have been defined which indicate normal cellular differentiation as well as toxic effects of chemicals. The nature of the blood-testis barrier and the penetration of environmental chemicals from blood to spermatogenesis cells have been reported. These studies contribute to an improved understanding of the reliability of laboratory animal toxicity tests for reproductive effects and the validity of their extrapolation to humans.

PROJECT DESCRIPTION: When animals are chronically exposed to different trace metals, each metal produces an enzymatic response profile which specifically characterizes exposure to that metal. It is the objective of these studies to assess and characterize response profiles resulting from exposure to various environmentally important toxic metals and apply knowledge of their response profiles to the design of

tests (such as the ALA test currently available for the detection of lead) for use among human populations in detecting pre-clinical, i.e., pre-toxic, exposure to a given metal. Specific metals and areas of interest include the biochemical effects of methyl mercury, arsenic, lead, and lead plus fluoride on mitochondrial structure and function. Enzyme activities associated with mitochondrial membranes have been found to show early and pronounced changes in mitochondria of rats and mice following chronic exposure to methyl mercury and arsenic. Further development of these biochemical response profiles should permit development of metal-specific biochemical testing procedures which accurately assess a biological response to exposure from these agents.

PROJECT DESCRIPTION: The effects of lead on the behavior and development of offspring exposed chronically before and after birth is being studied. A broad battery of observations of physical developmental milestones, reflex ontogeny, and behavioral functions is being employed to determine the full range of neurotoxic potential of lead. These observations are being related to the teratogenic activity and body burden of lead as estimated from levels found in blood, brain, and bone at various times throughout the exposure period and to neurochemical parameters which indicate changes in developing brain chemistry. The value of this multidisciplinary approach will be evaluated in terms of its usefulness for routine evaluation of compounds with unknown neurotoxic potential.

PROJECT DESCRIPTION: The long range purpose of this project is to study the effects of environmental pollutants such as heavy metals, pesticides, and carcinogenic polycyclic hydrocarbons on the biological functions of the intestine. In past years, the emphasis was on studying the factors influencing the toxication-detoxication of foreign chemicals by intestinal mucosa. Other intestinal functions such as digestion, absorption, and metabolism of nutrients which may be affected adversely by the presence of environmental pollutants in food are under initial stages of investigation.
APPROACH: There are three subprojects currently under study: (1) comprehensive studies of xenobiotic

metabolizing enzyme systems in rabbit small intestine and comparison with similar systems in liver and effects of environmental pollutants on these systems; (2) genetic regulation of induction of xenobiotic metabolizing enzymes in various strains of mice; and (3) study of effects of pollutants such as lead and dioxins on the intestinal absorption of amino acids and carbohydrates.

PROJECT DESCRIPTION: (1) To compare hepatic and extrahepatic microsomal xenobiotic oxidative metabolism in several vertebrate and invertebrate marine species. (2) To characterize the hepatic mixed-function oxidase system of the little skate, Raja erinacea, since it possesses relatively high enzyme activity. (3) To investigate some xenobiotic conjugating enzymes in marine vertebrates and invertebrates. (4) To study the effects of environmental contaminant administration on in vitro xenobiotic mixed-function oxidation and conjugation by tissues from marine elasmobranchs and teleosts.
APPROACH: We are investigating the biotransformation of foreign organic compounds in hepatic and extrahepatic tissues of vertebrate and invertebrate marine species from coastal Maine and Florida. Both cytochrome P-450-dependent microsomal mixed-function oxidases and epoxide or arene oxide metabolizing enzymes (epoxide hydrase and glutathione S-transferases) are being characterized in control fish and in fish pre-exposed to environmental contaminants such as polycyclic aromatic hydrocarbons or dioxins.

PROJECT DESCRIPTION: The goal of this project is to examine pharmacokinetic functions of the lung with regard to both endogenous and exogenous chemicals. The pharmacokinetics of these chemicals will be related to

environmentally induced pulmonary damage. An isolated perfused lung is used which permits examination of the pharmacokinetics of chemicals reaching the lungs both from the circulatory system and from the inhaled air.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The goal of this project is to study the biosynthesis, release, and metabolism of prostaglandins (PG) by pulmonary tissue and to relate altered PG biosynthesis, release, or metabolism to pulmonary diseases. Also of interest is to study prostaglandins as early indicators of pulmonary damage induced by exposure to environmental agents. Emphasis is being placed on studying the biochemical mechanisms that control the release of PG precursors, unsaturated fatty acids, from lung phospholipids and, thus, partially controlling PG biosynthesis. This is a continuing project directed toward obtaining a better understanding of lung function. The primary objectives are to investigate the biosynthesis, release, and metabolism of prostaglandins by the lung and to relate changes in steady-state concentrations of the various prostaglandins to biological effects. In addition, the effects of various environmental agents (SO/sub 2/, O/sub 3/, NO/sub 2/, O/sub 2/, etc.) on the ability of the lung to synthesize, release, and degrade prostaglandins (PG) will be investigated. Attempts will be made to correlate the biological effect of pollutants and modulation of PG levels with human pulmonary diseases. Altered PG biosynthesis and release in pathologic states will be examined as potential markers for pulmonary damage.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) Determine if pretreatment of animals with compounds which modify hepatic and/or pulmonary microsomal enzymes will alter the acute and chronic toxicity of selected environmental agents including benzene, xylene, vinyl chloride and vinyl bromide. (2) Determine whether inhalation of common solvents affects their enzymatic degradation in lung and liver. (3) Identify the various metabolic pathways involved in the enzymatic degradation of p-xylene and vinyl bromide, and determine whether pretreatment by known inducers stimulates different pathways. (4) Develop systems for assaying the in vitro metabolism of these solvents and investigate the variables which alter the rate of metabolism of these compounds. (5) Investigate the uptake oxidation and incorporation of glucose, amino acids and fatty acids by lung tissue and evaluate the relationship between metabolic changes and functional changes occurring after exposure to toxicants, inhibitors, uncouplers or metal ions. (6) Continue the development of the inhalation facility with automated monitoring systems and the capability of handling hazardous materials.
APPROACH: In this long term project the effects of inhaled solvents are being investigated. Biochemical indices of pulmonary and hepatic injury are being studied using serum enzymes as well as pulmonary and hepatic microsomal enzymes. Oxygen consumption of lung slices is being used to assess toxicity of these agents. Previous compounds investigated include benzene and dichloromethane. Agents presently being studied include xylene, vinyl chloride and vinyl bromide.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Our objectives are to develop the technology necessary to monitor classical indices of pulmonary function in small animals and to develop more sensitive indicators of pulmonary disease. Changes in pulmonary function caused by inhalation of various environmental agents are of specific interest. These functional changes will be correlated with changes in heart rate and in pulmonary morphology. Compounds of current interest are H/sub 2/SO/sub 4/ mist, ozone, a combination of the two, aluminum dusts, and an aerosol of the toxin produced by Gymnodinium breve, a dynoflagellate which causes the Florida Red Tide.
APPROACH: Changes in pulmonary function resulting from inhalation of airborne pollutants are being estimated using a whole body pressure plethysmograph constructed for use with small animals. Both acute and chronic exposure to oxidants, singly and in combination with other compounds result in functional changes. Changes in pulmonary mechanics (e.g. resistance, compliance), spirometry (e.g., lung volumes, frequency of breathing), heart rate, and pulmonary morphology will be estimated.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Numerous chemical analyses of the acellular lung lining layer have been made and there is little doubt concerning the identity of the surfactant material obligatory for normal lung function. However, the acellular layer is also a barrier to the environment and consequently may be one of the first sites subject to attack by inhaled toxic agents. Unfortunately, apart from its lipid composition very little is known about the acellular lining layer. The objectives of this investigation are as follows: (1) to determine the enzymatic and protein composition of the lung lining; (2) to determine the origin of these activities, and (3) to investigate compositional variations of the lining under the influence of drugs, disease, and airborne pollutants.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The proposed investigations will aim at determining, by means of radiotracers and advanced chemical analytical techniques, the fate of agriculturally important metals in soils, in soil microorganisms, and in representative grass and broadleafed plants grown on treated soil. The rate and extent of uptake and translocation and the sites of deposition of metallic compounds within the plant will be measured. In microbial and plant tissues in which radioactivity is accumulated, investigations will be directed toward determining the bond types and the chemical forms of the metabolites. Establishment of the deposition locations of metals and metal transformation products will allow both the reaction pathway to be estimated and the rate-limiting reactions to be studied in depth. The results of the fundamental investigations will be utilized to devise recommendations for chemical treatments and soil-crop management practices which may serve as remedial or preventive measures to minimize health hazards arising from the accumulation of metals or their metabolites.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The primary objective of this contract is the genetic characterization of presumptive adenine-3 (ad-3) mutants of Neurospora crassa derived from forward-mutation experiments at the Institute and at Illinois State University (under contract with the Institute) with various environmental chemicals as well as chemical carcinogens.
APPROACH: Stock cultures of presumptive ad-3 mutants have been characterized by a series of heterokaryon tests with various standard tester sets which determine the genotypes of the mutants, the complementation pattern of ad-3B mutants showing allelic complementation and also distinguishes point mutations from chromosome deletions. The contract also includes making mutants homokaryotic and preparing silica gel stock cultures.

PROJECT DESCRIPTION: The scope of this contract is to develop an understanding of the mutagenic effects in mice of some known mutagens, as measured by mean and variance changes in polygenic characters.
APPROACH: The contractor proposes to investigate the cumulative effects of multiple mutagen-induced polygenic mutations on a series of traits on F/sub 1/ and F/sub 2/ generation progenies descended from mutagenized males of an inbred strain of mice. F/sub 1/ and F/sub 2/ progeny will be examined for a series of traits including: age of eruption of incisors, mean and variance of body weight at weaning, sex ratio at weaning, serum cholesterol level at weaning, and hematocrit at weaning. The contractor proposes to study at least two different mutagens in two strains of mice.

POLLUTANTS: NOXIOUS GAS (25%);PARTICULATES (25%);ORGANICS (25%);RADIATION (25%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: It is likely that an increase in the mutation rate in the human population would be detrimental, yet there is no system developed to monitor the human population for point mutations. The purpose of this investigation is to develop a simple system to measure point mutations in readily accessible human somatic cells. It is likely that the somatic cell mutation rate would reflect the germ cell mutation rate, and the rate of introduction of genetic defects into the human population.
APPROACH: Many different types of hemoglobin mutations exist in the human population. Some of these are point mutations in the alpha and beta chain. Since such mutations occur in the germinal tissue, it is reasonable to assume that they also occur in the stem cells for the red blood cells (RBC). This type of mutation should result in an RBC which would contain an aberrant hemoglobin. By using a monospecific antibody to a number of aberrant hemoglobin types, such cells should be detected in samples from normal individuals after reaction of the antibodies with various fluorescent dyes. Antibodies are being produced against Hb-Wayne, Hb-Cranston, Hb-C and Hb-S.
KEYWORDS: HUMAN POPULATIONS;SOMATIC CELLS;MUTATION FREQUENCY;HEMOGLOBIN;GENETICS;IMMUNOLOGY;MUTAGENESIS

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (25%);PARTICULATES (25%);ORGANICS (25%);RADIATION (25%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: At present no efficient test system exists for detection of point mutations in mammals. The aim of the contract is to develop strains of mice, carrying marked inversions, which may be used in studies of induction of point mutations. Theoretically these tests will be comparable to the system presently used in Drosophila. The prime goal is to induce inversions in as many chromosomes of the mouse as possible and combine them in a number of strains to be used as tester stocks.
APPROACH: The contractor induces chromosome breaks and inversions by means of radiation and/or chemical agents. He mates the treated animals and in the P/sub 1/ does cytological analysis of one testis of each individual male. If a significant increase in anaphase bridges appears, this is taken as an indication that the animal may carry an inversion; and he is mated to get offspring for further study. Following cytolcgical and linkage studies to characterize the aberration, decision is made as to the utility of the inversion and appropriate marker genes are induced into the stock.
KEYWORDS: MUTATIONS;TESTING;MICE;CHROMOSOMAL ABERRATIONS;MUTAGENS;DNA;GENETICS;MUTAGENESIS

<033191>
TITLE: Development of a New Mouse Strain to Maximize the Sensitivity of a Point Mutation Assay
PROJECT NUMBER: N01-ES-4-2159 (ERR-1.75.3)

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (25%);PARTICULATES (25%);ORGANICS (25%);RADIATION (25%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The sensitivity of a point mutational assay system is directly related to the number of loci that can be tested in each individual. In the present system in our laboratory, nine loci are sampled. Other inbred strains of mice possess enzyme variants which can possibly be incorporated into one of our present strains. This contract seeks to fully identify these additional variants (at least 13) and then by repeated backcrossing to incorporate them into the C57BL/6J genome.
APPROACH: Starch gel electrophoresis is used to determine whether a strain carries an allele that is not

found in either the DBA/2J or C57BL/6J strains. When such a variant is found, the strain is backcrossed repeatedly to C57BL/6J for 8-10 generations to develop a new strain which will be homozygous with C57BL/6J. Electrophoresis tests will be performed on progeny in each generation to insure that the allelic differences already present in the C57BL/6J line are maintained.

TECHNOLOGY: FOSSIL FUEL/General (50%);NUCLEAR/General (50%)
ENERGY CYCLE: ELECTRICITY GENERATION (10%);ELECTRICAL TRANSMISSION (90%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this research are to determine the effects of 60 Hz fields from high voltage transmission lines on the central nervous system of mammals.
APPROACH: Environmental field conditions similar to those found in the vicinity of high voltage transmission lines will be simulated. These field gradients will range from 1 to 2000 volts/meter. The effects of these fields on the biological rhythms in rats and conditional behavior in monkeys will be evaluated. The effects on the neuroendocrine mechanism in rats and primates will be examined by using 17-hydroxysteroids, calcium, phosphorus, vanilmandelic acid and other urinary indicators of biorhythmicity. Changes in the neurochemistry of brain tissue of cats will be studied. These studies will include the measurement of both Ca and amino acid effluxes from the cerebral cortex of the cat.
KEYWORDS: POWER TRANSMISSION LINES;ELECTROMAGNETIC RADIATION;BIOLOGICAL EFFECTS;CENTRAL NERVOUS SYSTEM;RATS;MONKEYS;PHYSIOLOGY;MICROWAVE RADIATION;NEUROLOGY;PATHOGENESIS

TYPE OF FUNDING: Contract No.-E(30-1)-16;EPA pass-thru funding;Interagency agreement-NIEHS
77 FUNDING: National Inst. of Environmental Health Sciences FY77:$182,000; Environmental Protection Agency FY77:$150,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);WASTE MANAGEMENT (25%)
POLLUTANTS: NOXIOUS GAS (75%);PARTICULATES (25%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of the proposed research are: (1) to demonstrate the usefulness of and further develop the Tradescantia somatic mutation test system as a quantitative monitor in environments containing known or suspected mutagens; (2) to use special genetic clones of Tradescantia to establish the relative mutagenicity of a limited number of mutagens (primarily in gaseous form), as to magnitude of the effect, specificity of action and possibility of synergism; (3) to look for evidence of genetic repair of DNA injury produced by chemical mutagens and to determine lowest effective concentrations; (4) to determine in greater detail the time and dose response for several loci for one selected gaseous mutagen,

comparing these with presently available radiation data and with results observed in animal cells; and (5) to develop and validate the mobile laboratory to use this assay system to evaluate mutagenicity of air pollutants (gases and particulates) in geographical areas with high atmospheric pollution.
APPROACH: Two different clones of Tradescantia (clone 02 and clone 4430), which are heterozygous for a flower petal color mutation were used to determine the mutagenicity of exposure under various experimental conditions. Refinements in chemical mutagen exposure techniques were made to establish 1,3-dibromoethanol (DBE) as the mutagen standard in these studies rather than ethylmethane sulfonate (EMS) and this work has continued using tritium labeled DBE. Plant breeding and new clone selection have also been continued to obtain more sensitive clones which might provide better indicators of weak mutagens and chronic levels of exposure. New clones with a wider range of spontaneous mutation rates at each of three loci are being used along with existing mutable clones to develop methods for studying repair. Genetic effects of air pollutants with the mobile laboratory concept are being studied in various U.S. cities on a monthly basis in collaboration with NERC-EPA.

PROJECT DESCRIPTION: The mission of the Environmental Mutagen Information Center (EMIC) is to collect, organize and disseminate chemical mutagenesis information.
APPROACH: The tasks the Environmental Mutagen Information Center will carry out are to compile the past and present literature on mutagenesis testing of energy related pollutants. This information will then be processed into EMIC's data bank noting bibliographic details, and keywording of chemicals, organisms, and system studied. A special tabular abstract of the papers containing original test data will be made. This table will have the same format as the tabular abstract made for the Food and Drug Administration on a selected series of food additives. In order to make these data easily available, bibliographies containing agent, organism, test object, chemical abstract services (CAS), registry number and a KWIL index will be printed and distributed to interested individuals.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Rats and monkeys will be chronically exposed to oxidant air pollutants, primarily ozone, at concentrations approximating high ambient levels (0.2 to 0.5 ppM). A multidisciplinary group will make integrated biochemical, microbiological, physiological and morphological evaluations of effects. The findings will have relevance to the specific problem of air pollution and to a general understanding of pulmonary pathobiology. By plotting the relative levels of sensitivity of the various parameters studied and the effects observed, a basis will be provided for making predictions of possible long-term consequences of photochemical smog on man. Comparison of effects in rats and monkeys should provide for more confident extrapolation to man and hence enable the setting of rational air quality criteria. A primary goal is to test critical hypotheses concerning biochemical, immunological and cellular mechanisms responsible for the deleterious effects of the pollutants. Major pathogenetic and modifying factors of interest are: the role of lipid peroxidation in initiating damage; the induction of antioxidant defense mechanisms by continued exposure and the general phenomenon of adaptation; the sites of impairment in pulmonary alveolar macrophages and components of the immune system in the lung; the sequence and nature of lesions resulting in the development of chronic obstructive lung disease

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Small airborne industrial chemicals (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The guinea pig will be developed as an animal model of pulmonary hypersensitivity to small airborne industrial chemicals. To define the conditions providing maximum sensitization, small chemicals (haptens) will be covalently linked to carrier protein molecules, and the resulting

hapten-protein conjugates used as antigens. Hapten-specific respiratory hypersensitivity occurring either immediately or several hours following exposure (delayed onset) to the allergen will be assessed by analysis of pulmonary functions. For these determinations, the hapten will be coupled to a heterologous carrier. The influence of the following factors upon induction of hapten-specific pulmonary hypersensitivity will be determined: (a) dose of allergen; (b) number and length of daily exposures; and (c) interval between exposures. Using the conditions producing optimum hapten-specific hypersensitivity, various industrial chemicals will be aerosolized. Determination and comparison of the allergenic capabilities of the chemicals using dose-response and threshold concentration studies should allow prediction of safe levels for industrial workers. Histopathological examination of the sensitized respiratory tissue and skin test sites will provide indications of cell-mediated immunity. Serological evaluations will be routinely performed. Local and circulating hapten-specific antibodies will be assayed by the following techniques: radioimmunoelectrophoresis, enzyme-linked immunosorbent assay, passive cutaneous anaphylaxis, and passive leukocyte sensitization. In this way a possible relationship between an in vitro immunological assay and the state of pulmonary hypersensitivity as ascertained by bronchial provocation should become apparent.

REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: An interdisciplinary effort is proposed to study the interaction between inhaled aerosols and the respiratory system. Project 1 seeks to determine the influence of the hygroscopic growth of aerosols on deposition; whether supersaturation of aerosols occurs and its implications for deposition; and the influence of altered respiratory mechanics on deposition. Project 2 examines the importance of the pH and molecular composition of sulfate/sulfite aerosols in causing pulmonary functional changes in guinea pigs; and whether the NH3 excreted into alveoli modifies the chemistry and effect of acid aerosols. Project 3 extends the observations of Project 2 to healthy subjects and to adolescent asthmatic patients with exposures during rest and exercise. Project 4 examines the role of the alveolar wall in determining whether insoluble particles that deposit locally are cleared along the muco-ciliary system or enter the tissue compartment.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: METALS/Miscellaneous (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The purpose of this project is to examine whether during heavy metal toxication mistakes are made in the synthesis of cytochromes so that the porphyrin does contain iron. Animals will be exposed to high concentrations of metals either through diets or through the atmosphere. Because porphyrins containing closed metals, unlike iron porphyrins, are fluorescent, incorporation of metals such as zinc can be detected in low levels by examining the luminescence of tissues as lung or liver, or tissue fragments such as mitochondria or endoplasmic reticulum. The incorporation of metals into cytochromes will be considered as a possibility of a cause of metal toxicosis and may provide a means to diagnose metal toxication caused by environmental pollution. Finally, the role of enzymes, in inserting the metal into the porphyrin will be examined in-vitro the results compared with the in-vivo findings.

PROJECT DESCRIPTION: The technique of holography has provided a new method for study of environmental situations which heretofore could not be approached. In particular, the possibility of studying the dynamics of particles and fibers in the atmosphere or in a duct by direct observation without the intrusion of measuring devices, now exists. The combination of pulsed lasers with the holographic method will permit a ''stopping'' or ''freezing'' of the motion of possible dust pollutants in space, such that their flow patterns can be observed both qualitatively and quantitatively. We propose to use this methodology to attain the following objectives: (1) Determine the speed and mode of fall of fiberous and platy materials (e.g., asbestos, glass fibers, talc, etc.) as they move through space. (does an asbestos fiber 2 mum in diameter and 20 mum long move perpendicular to its long axis, parallel to it, or does it tumble.) Establish how the rate and type of movement varies with size, shape, and concentration of particles per unit volume; and compare this with the values obtained using mathematical formulas and experimental data developed previously by others for the movement of particulate matter. (2) Determine the action of fiberous and platy materials as they move or are drawn to the face of filters of various types at various speeds. What can be done by varying the rate of air flow through the filter to change this mode of motion for a more efficient collection. (3) Determine the effect of a surface on the same types of dusts as they move toward the face of a filter.

POLLUTANTS: METALS/Pb;METALS/Mercury;METALS/Cadmium (75%);ORGANICS/PCB (25%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The proposed study will determine the effects selected environmental contaminants have on the immune response of mice to a growing tumor and the effects of contaminant-induced immune alteration on the incidence and growth rate of tumors in intoxicated animals. Several parameters of immunity will be assessed at various times after tumor inoculation. Assays will include lymphocyte-mediated cytotoxicity, serum blocking activity, lymphokine production, and lymphocyte blastogenesis. In addition, contaminant-exposed animals will be monitored for changes in in vivo tumor growth rate parameters (regression, progression, metastases formation). Contaminants (lead, cadmium, arsenic, PCBs) will be administered in the drinking water or in food for 15 weeks prior to tumor inoculation and immune testing. Subclinical doses of the contaminants will be included. Two tumor systems, the B16 melanoma and MSV-induced sarcoma, will be utilized to compare the differences in immune function between a progressive and a regressive tumor in the presence of environmental contaminants.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: METALS/Lead (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Previous reports from a variety of sources have associated a number of factors with the absorption, excretion, and total body burden of lead. An animal model system has been developed which permits studies of the absorption, excretion, and body distribution of lead. This will be utilized to confirm or deny older reports and then to investigate the mechanism by which these factors influence the absorption or excretion of lead. Substances shown to exert an intraluminal effect which enhance or diminish the absorption of lead will be investigated to characterize the physiochemical changes which occur with lead in the lumen of the small intestine. Factors identified as producing either a mucosal or corporeal effect will be investigated and an effort will be made to identify common sites in the pathway for the absorption and excretion of lead and the competitive or facilitating substance. The effects of total body burden of lead upon the subsequent absorption of dietary lead will be studied to ascertain if there is an inhibitory feedback mechanism. If the latter can be identified, the importance of lead in various body pools in contributing to this effect will be studied and a search will be undertaken for

other substances which exert a similar inhibitory effect. It is postulated that these studies will provide a rational understanding of factors associated with acute and chronic lead intoxication and basic information related to the pathways regulating the absorption and excretion of lead.

POLLUTANTS: ORGANICS/TEM (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: We propose a 3-year project to develop and characterize a mutagenic test system in the frog, Rana pipiens, and to compare the results obtained with those from other mutagenic test systems. In its simplest terms the test system will consist of administration of mutagenic chemical to male frog, recovery of the treated animal's sperm, fertilization of eggs with the sperm, and analysis of the developing embryos for mutagenic changes. We will establish a dose response relationship for both chromosome aberrations and abnormal morphology of developing embryos for the known mutagen, triethylenemelamine (TEM), we will compare somatic vs. gametic chromosomal changes within the same animal, and we will confirm the genetic nature of induced changes by amphibian nuclear transplantation (cloning). The usefulness for mutagenesis screening of androgenetic haploid embryos will be studied. We will test the effects on frogs of different routes of administration of test chemicals. The mutagenic potential of varying classes of known chemical mutagens will be studied.

POLLUTANTS: ORGANICS/Chlorinated hyrocarbon (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Increasingly greater numbers of women of child-bearing age are entering the work force where they are exposed to agents of unknown teratogenic potential. Chlorinated hydrocarbon solvents are widely used in industry, and preliminary studies have indicated they could have a detrimental effect on the developing fetus. These preliminary studies were not performed with reference to pregnant women workers in that inhalation exposure occurred only from days 6 to 15 of gestation in rats, and teratogenic analyses were conducted on term fetuses alone. We propose to examine the teratogenicity and/or embryotoxicity, transplacental carcinogenicity and behavioral effects of methyl chloroform, methylene chloride, trichloroethylene and tetrachloroethylene with reference to working populations of women. Adult female rats will be pretreated with ethanol or phenobarbital, exposed to high and low concentrations of solvents by inhalation for two weeks prior to gestation. After breeding, the dams will be exposed from days 0 to 16 of gestation, which approximates the first two trimesters of human development. Fetuses will be analyzed at term for embryotoxic and/or teratogenic effects, postnatally for behavioral alterations, and at 18 months for carcinogenic lesions.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: METALS/Mercury (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Na+,K+-ATPase, an enzyme of the plasma membrane, is involved in the regulation of the internal ionic environment of most mammalian cells. Previous work has suggested that the inhibition of

this enzyme by methylmercury may be related to the neurological abnormalities and the embryotoxic effects produced by this environmental poison. Our recent work shows that the interaction of methylmercury and other short-chain alkylmercury compounds with Na+,K+-ATPase leads to a unique mode of modification of this enzyme. While the overall Na+,K+-dependent ATPase activity of the mercurial-modified enzyme is inhibited, none of the partial reactions of the enzyme seem to be affected. In view of this, the goals of this project are: (1) to study in detail the mechanism of modifying effects of these mercurials on the isolated Na+,K+-ATPase; (2) to determine the functional consequences of the mercurial-induced modification of the enzyme; (3) to determine if the toxic effects of methylmercury in the intact animal are related to this unique type of modification of the enzyme. The purified dog kidney enzyme will be used to study the effects of mercurials on the kinetics of the partial reactions of the enzyme, and to identify the site of the reaction of the mercurials within the enzyme complex. Intact human red cells, and phospholipid vesicles containing the purified enzyme will be used to study the effects of mercurials on the Na+,K+-translocations that are mediated by the enzyme. Methylmercury-poisoned pregnant mice will be used to determine if the brain enzyme obtained from the mother and the fetus are affected in the same way that the purified enzyme is modified by methylmercury in vitro.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Carbon monoxide (CO) has long been recognized as an environmental hazard and standards for acute exposure have been established. Little attention has been focused, however, upon the effects that chronic exposures to this gas might have although such exposure is relatively common. Cigarette smoking is the major source of carboxyhemoglobin (HbCO) and smokers on the average maintain HbCO levels of 5%. The fetus of a smoking mother carries similar burdens of CO in blood. The proposed research is designed to assess the effects of chronic prenatal CO exposures on the development of the neonatal organism, to determine the permanence of such changes through longitudinal studies, and to determine threshold values below which such effects do not occur. The principal levels of analysis include spontaneous behavioral assessments as well as responses to centrally acting drugs, brain and organ development through protein and DNA analyses, and neurochemical studies designed to measure perturbations in monoamine systems resulting from prenatal hypoxia.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: METALS/Mercury (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of this proposal is to investigate the molecular mechanisms by which heavy metals damage nervous tissue.
APPROACH: The specific aim of this project is to study the effect of methyl mercury on the nervous tissue, using mouse neuroblastoma and rat glioma cells in culture as experimental models. We propose to perform the following studies: (a) to establish the dose-response relationships for methyl mercury effects upon growth rate and differentiation; (b) to establish the dose-response relationships for methyl mercury effects upon neurotransmitter metabolism; and (c) to establish dose-response relationships for methyl mercury effects upon cyclic nucleotide metabolism. Data may be useful in estimating the relative sensitivity of dividing nerve and glial cells to methyl mercury using the above criteria.
RESULTS: Results obtained from this study will show to what extent mercury-induced damage to these cellular functions can be reversed and at what stage these damages become irreversible. The data may also be useful in estimating the maximum permissible concentrations of mercury for the nervous tissue especially in the fetus.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The research program is designed to study the nature of the lesions which nitrogen dioxide induces in the pulmonary cell populations involved in the immune response.
APPROACH: The following topics will be investigated: (1) Compare the effect of NO2 the viral and nonviral-induced production of interferon by lung monocytes; the cytotoxic activity of these preparations will be evaluated. Following exposure to NO2, the capacity of pulmonary cells lavaged from rabbits to produce interferon will be studied. The virus model will involve the use of Newcastle disease virus as the inducing agent and vesicular stomatitis as the challenge virus; poly I.poly C will be used as a nonviral inducer. (2) Determine the effect of NO2 on the mycobacterium bovis (BCG)-induced cell-mediated immune response in the lung. The effect of NO2 on the quantity and functions of cells recruited into the lung following BCG vaccination will be examined. In particular, the generation of migration inhibitory factor (MIF), macrophage agglutinating factor (MAgF), cytotoxic activity, and immune interferon will be studied. (3) Determine the effect of NO2 on alveolar macrophage membrane receptors involved in the immune response. Experiments will be performed in vitro to study the effect of NO2/sup -/ on alveolar macrophage receptors for macrophage agglutinating factor, migration inhibitory factor, interferon, lymphocytes, immunoglobulin and complement.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: It is clear that certain environmental agents with little known toxicity of their own can greatly enhance the lethal and mutagenic action of other physical and chemical agents. An example of this is the effect of caffeine and related compounds on the lethal action of uv and X-irradiation and on the action of certain alkylating agents. Inhibition of purine biosynthesis has also been shown to cause serious damage, mainly embryotoxicity and teratogenicity. The interrelationship of these phenomena will be studied by examining the metabolism of caffeine in Chinese hamster ovary cells (CHO-K1/pro-) and mutant cells defective in purine, pyrimidine, and amino acid metabolism grown in culture. Methods will include assessment of caffeine metabolism by high pressure liquid chromatography, the effect of caffeine on

nucleotide biosynthesis, and the analysis of genetic repair processes in selected mutants under various experimental conditions.

POLLUTANTS: METALS/Pb;METALS/Mercury (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Unspecified
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The major objectives of this study are to determine the nature of proteins forming intracellular complexes with potentially toxic metals, particularly lead and mercury. Both of these metals are known to bind intracellularly with acid nuclear proteins. It is not known whether these proteins are synthesized specifically for binding with these metals.
APPROACH: Experiments are planned to determine the role of de novo synthesis on the availability of the proteins. Rats exposed to excessive amounts of lead and mercury will be treated with metabolic inhibitors of protein synthesis and acidic nuclear protein-metal complexes will be isolated and compared quantitatively with intoxicated rats not treated with metabolic inhibitors. If it is found that treatment by inhibitors of protein synthesis (e.g., cycloheximide and/or actinomycn D) inhibits lead protein formation, the toxic effects of the same amounts of metal will be compared in treated and untreated rats. If protein-metal complexing is desirable, as suspected from studies to date, possible induction of lead and/or mercury binding acidic nuclear proteins will be studied by prior exposure to less toxic essential metals, zinc and/or copper.
RESULTS: These studies should contribute toward understanding (1) variation in susceptibility of different individuals in the population to the toxic effects of metals encountered in industrial exposure or in the ambient environment and (2) may determine possible ways of inducing protective metal-binding proteins by administration of less toxic metals.

POLLUTANTS: NOXIOUS GAS (50%);RADIATION (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Polonium-210 is found in mainstream cigarette smoke and it has been suggested that the alpha radiation from the Po-210 deposited in the lung is etiologically related to bronchogenic carcinoma. Reported average concentrations of Po-210 in human lung are significantly higher in smokers than in non-smokers. The concentration is thought to be non-uniform on the bronchial epithelium.
APPROACH: The study in this application will establish the concentration of Po-210 in lungs of smokers and non-smokers and will focus on determining the microdistribution of this radionuclide on the bronchial epithelium.
RESULTS: The study will establish the radiation dose to the critical basal cells of the bronchial epithelium. It should then be possible to determine whether or not this dose could be carcinogenic in view of the past human experience with alpha-emitting radionuclides in the lung.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: ORGANICS/PCB (100%)

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The polychlorinated biphenyls (PCBs) are found universally as toxic environmental pollutants. The objectives of the proposed research program are to determine the mechanisms of hepatic microsomal metabolism of selected individual PCBs and to relate this metabolism to the toxicity of the corresponding PCB.
APPROACH: The role of the number and position of chlorine substituents on the PCBs in controlling metabolite patterns and toxicity will be determined and used to predict the toxicity of untested PCBs. The inductive effects of PCBs on hepatic microsomal mixed function oxidases and the consequences of such induction for hepatic drug and xenobiotic metabolism will also be investigated. Mechanisms of PCB metabolism will be investigated by (1) the determination of binding constants for PCB-hepatic cytochrome P-450 interactions in rat and monkey microsomes using difference spectral techniques; (2) isolation, using high pressure liquid chromatography, and identification, using mass spectrometry and NMR, of the metabolic products of the in vitro metabolism of selected PCBs by hepatic microsomes; (3) molecular orbital calculations of PCBs and theoretical reactive intermediate metabolites (e.g., arene oxides) using extended Huckel and CNDO/2 calculations; (4) the study of the covalent binding of C-14 labeled PCB metabolites to microsomal macromolecules; and (5) the investigation of the effect of epoxide hydrase and glutathione S-epoxide transferase on the in vitro metabolism of PCBs by microsomal and solubilized rat enzyme systems. The acute and chronic inductive effects of PCBs will be probed in rats using quantitative assays of hepatic microsomal enzyme levels and determinations of drug metabolism activities.
RESULTS: The results of these studies will be used to estimate safe levels of PCBs of differing chlorine contents. A number of the metabolic studies will be repeated using chlorinated dibenzofurans as substrates. These compounds frequently occur as impurities in PCBs and these studies should resolve the possibility of dibenzofurans being the source of toxic effects normally attributed to PCBs.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The estimation of health hazards due to inhaled atmospheric pollutants depends on knowledge of the amount and location of material retained in the lungs. In order to provide the information on which these estimates can be based, we are proposing an experimental program for the measurement of the distribution and clearance of inhaled radiolabeled aerosols over a wide range of particle sizes and breathing patterns. Three factors have come together to make such an investigation particularly appropriate at this time: (1) The technological advances in recording and analyzing radioactive tracer data that have been made over the past 5 years can greatly improve the quality of the fundamental information to be gained; (2) Considerable experience has been gained in generating controlled aerosols; (3) As the nation faces the possibility of considerable expansion of nuclear and coal-fired power plants, more information is needed in order to judge the relative health hazards of alternative sources of energy.

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Unspecified
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The relation between radiation-induced mutations and chromosome breaks is not understood at the present time; a new hypothesis of the whole animal from only one of the first two cleavage products appears to resolve some of the problems.
APPROACH: The research will focus on the study of the production of mosaics in Drosophila melanogaster as a function both of X-ray dose and chemical treatment, and the computer analysis of genetic data on chromosome loss and dominant lethal production in view of this hypothesis.

REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Marine;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Environmental chemicals, particularly hydrocarbons, cause disease themselves and may make organisms more susceptible to infectious disease as well. It is proposed to study 3 animal species as models and show how hydrocarbons adversely affect defense mechanisms.
APPROACH: The hard clam (Mercenaria mercenaria), blue crab (Callinectes sapidus), and mummichog (Fundulus heteroclitus) will be exposed chronically to nonlethal concentrations of phenol, naphthalenes, and water soluble petroleum extracts. In the clam effects on epithelial surfaces will be examined histologically (including ultrastructure), phagocytosis by hemocytes and intracellular digestion will be measured as will changes in hemolymph protein. In the crab damage to gills will be assessed by light and electron microscopy, hemocyte function assayed and hemolymph protein assayed by electrophoresis. These two species lack the ability to form immunoglobulins, thus offering unique opportunities to study the effect of chemicals on nonspecific defense mechanisms. Treated fish will be assayed for their ability to reject scale transplants and to form immunoglobulins. Other physiological parameters to be measured include blood cortisol concentrations, hematocrit, blood cell and protein composition.
RESULTS: The relative importance of epithelia, phagocytes, and nonspecific humoral factors and how they may be repressed by hydrocarbons will be clarified. Mechanisms of nonspecific as well as specific humoral and cellular immunity in fish will be clarified.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The Adh-gene-enzyme system may be used to study the mechanism of action of chemical mutagens in a higher organism. This system is unique for this purpose because (1) chemical methods have been developed to detect forward mutations, (2) chemical procedures have been developed to detect reverse mutations, and (3) the product of the gene, alcohol dehydrogenase (ADH) has been purified and chemically characterized, and will soon be sequenced.
APPROACH: This project involves 4 separate steps: (1) we will generate Adh-negative mutants with five interesting chemical mutagens; (2) we will characterize these mutants with regard to whether they yield ADH-like cross-reacting material (CRM); and (3) for those mutants that are CRM-negative, we will carry out reversion analysis and examine their polytene chromosomes.
RESULTS: The data generated from these experiments will yield important information concerning (1) the mutation rate of a given mutagen at a well defined locus, (2) the rate at which CRM-positive mutants are generated relative to the total rate, and (3) the changes at the nucleotide level which the particular mutagen generates.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Marine;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This investigation is designed to determine the interaction between Polychlorinated

Biphenyls (PCB) and naturally occurring microbial communities.
APPROACH: The direct objectives of the proposed investigation are fourfold: (1) to determine the environmental rate of PCB degradation in aquatic habitats; (2) to assess the potential for bioamplification of PCB residues in aquatic food chains; (3) to determine the mutagenic potential of PCB and its metabolites in aquatic environments; (4) to elucidate the effect of PCB contamination and potential metabolites on the structure and function of aquatic heterotrophic bacterial communities. Gas chromatography and radioisotope assays will be employed to assess microbial PCB degradation and bioaccumulation. Auxotrophic bacterial mutants will be used as test organisms in screening experimentally degraded samples for the presence of microbially produced mutagenic PCB metabolites. The impact of PCB contamination on the microbial ecology of selected freshwater habitats will be determined by comparing heterotrophic respiration rates, radioisotopic substrate decomposition rates, heterotrophic uptake kinetics, and generic composition of natural microbial populations in control and PCB dose environments.
RESULTS: Fulfillment of these objectives will aid in predicting the residence time of PCB in the environment and the potential ecological effects and environmental health hazards posed by acute or chronic PCB contamination.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The purpose of these studies is to evaluate the effects of marginal and excess nutrient intakes on susceptibility to lead toxicity under conditions of low lead exposure. The influence of nutrient intake on lead detoxification will also be investigated and compared with chelation therapy.
APPROACH: In a series of studies, nutrient-lead interactions will be investigated to elucidate their mechanisms.
RESULTS: The aim of the studies is to define the optimum dietary conditions which afford the greatest resistance to lead exposure.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: METALS/Cd (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The role of the cadmium binding protein, metallothionein, in the pathology of environmental cadmium exposure is a question of prime importance. Although some properties of the protein are known, in depth studies have not been done to define the metal-ligand structure and dynamics of this protein, their possible role in cadmium movements and deposition in cells, and the actual, quantitative relationship of cadmium binding in the metallothionein to cellular and organismic toxicity from the metal.
APPROACH: The present research sets forth a series of experiments which will address these areas of needed inquiry: (1) a variety of physico-chemical techniques including laser Raman and atsup 13atC NMR spectroscopy, amperometric titrimetry, and functional group modification will be used to examine the structure of the metal binding sites in metallothionein; (2) kinetic studies will determine rates of metal exchange between metallothionein and metal complexes and ligands; (3) quantitative analysis of cadmium distribution between metallothionein and other cellular constituents will be undertaken under controlled conditions of exposure of rats to toxic and essential metals which produce definite toxic effects; (4) antibodies to metallothionein and thionein will be developed which will be used for the sensitive immunodetection of these proteins in rat tissues; (5) model kinetic studies of metal exchange between metallcthionein and rat liver mitochondria will be used to investigate the distribution of cadmium among cellular components; (6) a line of Ehrlich ascites cells resistant to cadmium will be developed so that biochemical aspects of cadmium toxicity and resistance to cadmium may be examined in vitro.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: We propose to develop a system which can be used to study the ability of environmental pollutants to induce somatic mutagenesis at different loci in animal and plant cells. The methods used to develop this system will be applicable to development of a similar system in other animal or plant cell lines.
APPROACH: A series of conditional lethal mutants will be prepared. In the heterozygous form these will appear as pseudo dominant with incomplete penetrance. Inactivation of such mutant loci will result in reversion of the heterozygote to wild type. Such reversions will detect point, deletion, and frameshift mutations. As a result, the mutant strains will provide a sensitive system for the detection of environmentally induced mutations. In such strains somatic crossing-over also should be readily detected, thus allowing a test for agents which increase cross-over rate. The project will approach (a) induction of mutants and thir selection in heterozygotes, (b) conversion of heterozygotes to mutant homozygotes, (c) marker rescue incorporation of mutant loci from these homozygotes into a non-mutagenized background, to produce ''clean'' heterozygotes, (d) tests for reversion of the heterozygotes. Initially, a model system (HGPRTase) will be used to test predicted characteristics of heterozygotes containing dominant alleles with partial penetrance.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The studies are designed as a coordinated effort to define the behavioral and neurophysiological effects of acute and chronic cadmium administration, the sensitivity of the rat to cadmium at major developmental stages, and the potential interrelations between essential trace metal balance and cadmium toxicity.
APPROACH: In the studies of chronic Cd exposure we will (a) assess the effects on selected behavioral and neurophysiological parameters such as spontaneous locomotor activity, motor coordination, aggressiveness, learning, peripheral nerve conduction velocity, visual evoked response and skeletal muscle contractile force; (b) determine the relative effects of Cd exposure during the pre-gestational, gestational, neonatal, and adult periods, and (c) determine the concentration of Cd, Fe, Zn, and Cu in selected tissues to ascertain whether changes in trace metal balance may be associated with the occurrence of signs of neurotoxicity. In the acute exposures and in vitro work our objectives are to (a) elucidate the mechanism of action of Cd as a synaptic blocking agent and (b) determine the effects of localized brain injections of Cd and whether particular brain loci are more sensitive than others.
RESULTS: These studies will provide a comprehensive assessment of the neurotoxic effects of cadmium, including the possibly crucial role that essential trace metals may have in determining toxicity.

POLLUTANTS: ORGANICS/Hydrocarbon solvents (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This research has a goal of defining the relationship between chronic progressive renal disease and exposure to environmental hydrocarbon solvents. Clinical studies have established a relationship between human glomerulonephritis and hydrocarbon solvent exposure, in addition to the well known acute renal tubular toxicity of many of these agents.

APPROACH: This study will attempt to produce an animal model of hydrocarbon-induced glomerulonephritis in rats by chronic intraperitoneal administration of common petroleum distillates and hydrocarbon solvents. Gasoline, carbon tetrachloride, toluene, trichloroethylene and a degreasing solvent, stanisol, will be studied regarding their glomerulotoxic and nephrotoxic potential. The mechanism of induced injury will be studied by examining tissue with light, immunofluorescence and electron microscopy.
N,N-diacetylbenzidine has been shown to produce a proliferative glomerulonephritis in rats. We propose to study the pathogenesis of this glomerulonephritis which is morphologically similar to a form of human glomerulonephritis mediated by immune mechanisms. The role of the immune system in potentiating this toxin-induced glomerulonephritis will be studied by light, immunofluorescence and electron microscopy of renal tissue, as well as by a search for serum anti-kidney antibodies.
RESULTS: If immunologic mechanisms are involved in perpetuating glomerulonephritis, this would explain why many cases of human glomerulonephritis are apparently mediated by immune mechanisms, but the antigens stimulating the immune response are unknown.

PROJECT DESCRIPTION: Respiratory disease is the major cause of human death. SO2 is a universal air pollutant, the nasal mucosa is the first site of impact of airborne viruses and toxins, and epithelial sloughing is a primary response to both. The most important single mechanism for maintaining nasal mucociliary clearance during exposure to daily fluctuating doses of toxins and viruses is mucociliary homeostasis.
APPROACH: New techniques will be used to monitor nasal homeostatic mechanisms sequentially in individual living chickens during exposure to combined effects of acute and chronic viral infections and graded levels of SO2. Immunopathology and nasal histopathology will be followed during all phases of the interactions between viruses and pollutant gas. An added study will evaluate effects of continuous low level exposure to SO2 during the first three weeks of life on cell dynamics, on nasal and sinus transport rates, and on development of organized lymphoid cell systems in nasal and paranasal tissues and in the thymus and bursa.

CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This is a proposal to perform longitudinal studies on three already established population-based cohorts in areas exposed to (1) moderate levels of photochemicaloxidant pollutants, (2) combined reductant, oxidant and hydrocarbon pollutants, (3) minimal levels of chemical pollutants, and a cohort to be established in an area chronically exposed to high levels of oxidant-type pollutants. The objectives of the proposal are to (1) observe the natural history of chronic obstructive respiratory disease (CORD) and functional respiratory impairment, (2) identify environmental factors including chronic exposure to specific air pollutants which play a role in the evolution, exacerbation and rate of progression of CORD and/or functional impairment, (3) identify as yet unsuspected demographic, familial and constitutional characteristics of individuals who go on to develop irreversible CORD and/or functional impairment, (4) identify those parameters of expiratory flow, and the flow-volume curve derived from spirometry; the alveolar plateau, closing volume fraction and residual volume derived by the single-breath nitrogen test (SBNT); airway resistance, functional residual capacity, and specific conductants derived from body plethysmography; x-ray and reported symptoms which can best predict impending CORD and/or functional impairment at a still reversible stage in susceptible individuals, (5) provide information on the variability (a) of individual performance and subgroup performance for each of these tests of lung function and (b) associated with seasonal factors or other factors present at the time of testing.
APPROACH: The more than 15,000 individuals in the cohorts who have been characterized by baseline lung function studies will be followed annually for reported changes in respiratory health, changes of address, etc. On the fifth anniversary of the baseline studies tests of lung function will be administered to members of the cohort. Variability will be evaluated by immediate retesting of a probability sample of individuals completing lung function at the Mobile Lung Function Laboratory, retesting a probability

sample of individuals in the cohort at three-month intervals in each of the four seasons, and reexamining a probability sample of residents at the UCLA Pulmonary Function Laboratory using the same and more sophisticated tests of lung function.

PROJECT DESCRIPTION: Mercury compounds, especially alkyl mercurials, are extremely toxic to living organisms. The ability of bacteria to transform mercury compounds from the organic to the inorganic form and vice versa has been examined in freshwater sediment systems, saltwater sediment systems, and in the laboratory. We propose to study, in experimental animals, whether the presence in the intestine of bacteria that can reduce mercury compounds alters their toxicity, distribution in the body, or rate of elimination. The effect of ingestion of mercury compounds on the survival of mercury resistant bacteria in the mouse gut will also be investigated.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project deals with the metabolism of a toxic element cadmium in an animal model. The absorption, tissue distribution and excretion of an orally administered isotope of cadmium will be followed in rats. The biological half-life of cadmium in the rat in general, and in the critical organs liver and kidney in particular, will be determined. Retention of cadmium in the critical organs is brought about by metallothionein. The mechanism by which cadmium stimulates protein synthesis in these organs will be investigated. Cadmium is bound to metallothionein not only in liver and kidney, but also in other tissues like pancreas, spleen and placenta. The proteins from these organs will be isolated and purified and their properties will be compared with the hepatic protein. A radioimmunoassay procedure will be developed to measure metallothionein in tissues and biological fluids. It is postulated that intestinal absorption of cadmium and the passage of the element from the mother to fetus and newborn may be restricted by the presence of metallothionein and other metal-binding proteins in intestinal mucosa, placenta and mammary gland. The validity of this concept will be tested in animals experimentally exposed to cadmium. Involvement of cadmium in renal tubular dysfunction and hypertension has been suggested. The role of metallothionein in etiology of these diseases will be evaluated.

PROJECT DESCRIPTION: In 1972 Perino and Ernhart tested 80 black preschool children and related these intelligence test scores to subclinical levels of blood lead obtained in the screening program of the Department of Health, New York City. Children of moderate lead level (.04 to .07 mg. lead per 100 ml. of whole blood) performed more poorly than those of lower lead values on general cognitive, verbal, and perceptual scales. The correlation of parent-child intelligence was significantly attenuated in the moderate lead group. The objective of the proposed research is to determine if these effects persist four years later in a reevaluation of the same 80 children. Intelligence, perceptual motor skills, behavior ratings and school achievement will be related to preschool blood lead levels, current blood lead levels, erythrocyte protoporphyrin and to the retrospective cumulative index of stored lead in shed deciduous teeth.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Organometallic derivatives of transition metals are finding increasing use in numerous applications, particularly as additives in fuels and petroleum products, yet the biological properties of this class of compounds are virtually unknown. We propose a systematic investigation of the toxicity, pharmacological properties, and metabolism of a set of organometallic compounds of chromium, manganese, and iron. The compounds to be studied are analogs of simple organic compounds whose toxicity, pharmacology, and metabolism are very well known (e.g. benzene, toluene, styrene; amphetamine, ephedrine, diphenhydramine). The analogy is simply based upon replacement of a phenyl group by an aromatic organometallic equivalent such as (C5H5)FeC5H4/sup -/, (CO)3CrC6H5/sup -/, or (CO)3MnC5H4/sup -/. Both acute and prolonged toxicity will be evaluated using histological as well as biochemical techniques. Pharmacological studies as well as metabolism studies will be performed in vivo as well as in vitro, and any metabolites with an intact organometallic moiety will be isolated and fully characterized.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objectives are to determine the following effects of exposure of an insect species to 4 consistent levels of a complex mixture of air pollutants: (1) the effects on growth rate, reproduction, survivorship, and life span over 12 successive generations; (2) the effects of air pollutants on animals exposed only at certain stages of the life cycle; (3) possible synergistic actions of air pollutants and stress factors; and (4) the pathway or mechanism of action of the pollutants. Only two possible pathways will be investigated during the time of this study: effects on hormones controlling growth and development in insects and effects on metabolic rates.
APPROACH: The pollutants will be SO2, NO, NO2, CH4, CO, and (NH4)2SO4. The levels of the gases in the mixture will be approximately those found in a typical urban environment, those found under high or episodic conditions, and those found under emergency conditions. The levels of pollutants are maintained by a programmed monitoring system with feedback control.
RESULTS: These experiments will give us data which will allow predictions about certain effects of pollutants before those levels of pollutants actually have to be coped with.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Renal toxicity and gouty arthritis are two of the multiple results of lead poisoning. In addition, lead causes degradation of nucleic acids and a study of the effects of lead on the enzymes of purine metabolism has been started in order to correlate the clinical observations with biochemical events. These preliminary studies showed that the enzyme, guanine aminohydrolase (guanase), was inhibited by Pb/sup 2+/ at 10/sup -7/M. The role of guanase is to convert guanine to xanthine. Since guanine is very insoluble, lead poisoning might lead to accumulation of guanine precipitates in vivo. Indeed, elevated levels of guanine have been found in lead-poisoned rabbits. These preliminary studies have shown that Hg/sup 2+/ and Ag/sup +/, but not Cd/sup 2+/ or any other metal tested, was inhibitory to guanase. This proposal, therefore, is to study the effects of these heavy metal pollutants at low levels (sub clinical) and at high levels characteristic of acute poisoning in vitro on the enzyme and in vivo on the metabolism of guanine. The study would also include administration of 14C guanine to poisoned and normal animals to determine in which organs free guanine accumulates. Another goal of this proposal will be to examine the deposits (accumulated in the joints) of patients with saturnine and normal gout in order to determine if guanine is present in the precipitates. Lead and mercury are volatile components of coal, and lead is an

atmospheric contaminant due to its continued use in gasoline. Mercury is also a water contaminant. Therefore, this study would give an indication of the extent to which these pollutants give rise to renal and metabolic problems related to the accumulation of the highly insoluble metabolite guanine.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Bacteria of the genus Bacillus are among the most ubiquitous of microorganisms, being principal components of the microflora of most soil and water environments. It is imperative that microbial ecologists better understand the capabilities and limitations of this important microbial group in degrading the myriad of aromatic compounds being continually microbial introduced into the biosphere. The objective of the proposed research is to discover the major patterns by which Bacillus species dissimilate aromatic molecules. The range of aromatic compounds degraded by bacilli will be determined. The catabolic pathways for degradation of selected aromatic compounds will be delineated, and certain of the pathway enzymes will be purified and characterized. Compiled data will also be used to clarify the taxoncmic arrangement of certain species of Bacillus.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;OS
PROJECT DESCRIPTION: This series of experiments seeks to determine the necessary and sufficient factors in the etiology of pica (the consumption of seemingly non-nutritive substances) and to validate the utility of pica as a behavioral assay of toxicosis. A variety of toxic substances have been shown to cause laboratory rats to engage in geophagia (earth eating). Moreover, rats poisoned with logarithmic doses of toxic substances consume amounts of non-nutritive substances proportionate to the amount of poisoned administered. Other factors demonstrated to be involved in the etiology of pica include gastrointestinal malaise and the acquisition of a conditioned illness. The objectives of this research are (1) to investigate the etiology of pica, (2) to evaluate pica as a behavioral assay of toxicosis in the rat, and (3) to assess the functional utility of pica during poison-induced illness.
APPROACH: Rats are maintained with food, water, and a non-nutritive mixture of pharmaceutical grade kaolin (hydrated aluminum silicate) and 1% acacia (Gum Arabic) ad libitum. After a period of adaptation to this

regimen, the animals are subject to a variety of illness-inducing treatments including motion sickness, and the administration of toxic substances such as cyclophosphamide, lithium chloride, and methyl mercury. In some cases the treatments are restricted to single acute exposures; in others repeated chronic exposures are employed. Following treatment the subsequent changes, if any, in food, water and kaolin consumption are recorded. Variations in this basic procedure include monitoring the temporal parameters of the various consummatory behaviors, adulteration of the kaolin with various concentrations of lead acetate, and the use of conditioning procedures during treatment.
RESULTS: In a continuing series of experiments it has been determined that simple gastrointestinal malaise in the absence of a deficiency state or acute toxemia will elicit pica, that different strains of both laboratory and wild rats show behavioral variation in their propensity to engage in pica, and that a variety of toxic substances (methyl mercury, cyclophosphamide, alcohol, lithium chloride, and various cardiac glycosides) administered either acutely or chronically will reliably cause laboratory rats to engage in a specific form of pica--geophagia or earth-eating. It has also been determined that in some cases the acquisition of a conditioned illness can be a mechanism whereby the habit of pica is maintained in the absence of a demonstrable physiological cause.
PROJECT MILESTONES: The potential significance of this research lies in three major areas: As a behavioral assay of toxicosis, as a laboratory model of pica, and as a strategy in rodent control. Knowledge of the rat's naturally occurring illness-response behaviors such as pica could suggest new techniques and enhance existent species-relevant behavioral assays of illness in the rat. The development of a laboratory model will not only clarify various aspects of the etiology of pica but hopefully reveal methods of mitigating its harmful effects, such as the lead poisoning which is often associated with pica among human infants. Finally, a knowledge of the naturally occurring illness related behaviors of the rat should enable one to devise control methods that circumvent the effectiveness of these behaviors in protecting the animal from poisoning and enhance the effectiveness of control strategies.

PROJECT DESCRIPTION: The purpose of this project is to determine, as quantitatively as possible, the effects of oral, subacute doses of firemaster (a mixture of polybrominated biphenyls, PPBs) and 2,2', 4,4', 5,5'-hexabromobiphenyl (HBB) in a battery of simple, diagnostic tests designed to detect changes in various functions of the central nervous system (CNS).
APPROACH: Male and female albino rats are being given daily, oral doses of 0.03, 0.3, 3, or 30 mg/kg of firemaster, HBB, or vehicle for at least 60 days. The rats and those mice receiving 30 mg/kg/day of either compound or vehicle will be evaluated in a battery of tests of days 28 and 29 of dosing and then retested 30 days later. The test battery will measure drug-related changes in autonomic-parasympathetic nerve function, sensorimotor function and CNS excitability and emotionality.
RESULTS: It is expected that the test battery will reveal in animals the types of neurological effects which have been reported in humans.
PROJECT MILESTONES: Results from this project will be used in the development of appropriate methods to screen for neurotoxic effects following chronic low-level exposures to environmental agents (both energy related and non-energy related).

POLLUTANTS: METALS (50%);SPECIFIED OTHER POLLUTANTS/Miscellaneous (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: In order to obtain a better understanding of the neurochemical bases for behavior modification resulting from environmental stresses, we have undertaken studies concerned with (a) alterations in levels and characteristics of enzymes which, because they are rate limiting, may provide critical regulation of neurotransmitter levels (e.g. monoamine oxidase, tyrosine hydroxylase, etc.) and (b) the extents to which neurotransmitter concentrations may be modulated or altered in those parts of the central nervous system which are thought to be involved in behavior regulation. In the studies involving monoamine oxidase (MAO), we are investigating the behavioral consequences of inhibiting MAO types A and B as well as several of the characteristics of MAO types A and/or B responsiveness to various substrates and inhibitors.

APPROACH: Behavioral testing (i.e. locomotor activity in an open field) is performed prior to, then after, administration of type-specific monoamine oxidase (MAO) inhibitors to rats. Subsequently, levels of types A and B of MAO are determined in brain, heart, liver and kidney from the animals. MAO types A and B are determined in tissues by using a radioisotope technique. Additional techniques--namely, UV-spectrometry and fluorescence spectrometry--are employed to confirm the radioisotope technique and to establish kinetic characteristics of MAO in the presence of various substrates and inhibitors.
RESULTS: Our in vitro studies have permitted the following: (a) development of the first real separate quantitative determination of MAO types A and B in a single tissue analysis; (b) recognition of a technique which may permit activation of MAO activity; (c) accumulation of kinetic data which supports the hypothesis that the main difference between MAO types A and B concerns the geometry of the enzyme's binding sites. At present, efforts are underway to determine whether dimunition in brain MAO activity might lead to a transitory modification of locomotor activity for which compensatory alternate metabolic pathways might emerge and come into prominence.
PROJECT MILESTONES: Neurotoxic and behavioral effects may be associated with the alteration of cerebral biogenic amines, or their metabolism, or the disposition of their metabolites. This conclusion is based (1) on the wide occurrence of biogenic amines in the CNS, (2) on the transmitter function of several amines, and (3) on the clinical and pharmacological experience that modulations of the aminergic systems may lead to serious changes in the affective state and to neurologic and psychiatric disorders. The investigation cf aminergic systems, therefore, appears to be a promising approach to the elucidation of some phenomena of behavioral toxicology.

TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: ELECTRICAL TRANSMISSION (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of this project is to determine the effects of long-term, low-level, exposure to 2450 MHz microwave radiation on the central nervous system and behavior.
APPROACH: Rats will be exposed to 2450 MHz plane wave microwave fields at a power density of 500 uW/cm/sup 2/. The exposures will be for 8 hours per day for 3 months. The following indicators of biological effects will be made: (1) Biochemistry--Serum content for sodium, calcium, phosphorus, PTH, SH groups and cholorinesterase activity of the blood and 17-ketosteriods in urine will be measured. (2) Behavior--Animals will be evaluated for free-operant and free-repertoire behavior. Animals will be observed in the irradiation chambers and their specific orientation to the field, sleep, grooming, sniffing, rearing, drinking, eating, etc., will be recorded. (3) Electroencephalography--EEG recordings will be made on the animals following the four month irradiation period.
RESULTS: The effects of long-term, low-level microwave exposure on the nervous system will be measured. A duplicate project is being done in the Soviet Union. A comparison of the results obtained in the U.S. with results of the Soviet Union will be made. This project will assist in the validation of a large volume of Soviet literature which is a significant part of the data base for microwave bioeffects.
PROJECT MILESTONES: The microwave exposure system has been completed and dosimetric measurements have been made using thermographic techniques. The rats are presently being exposed to the microwave fields according to the protocol listed in the above approach section.

PROJECT DESCRIPTION: The objective of this project is to obtain sufficient information on the disposition of polychlorinated biphenyls (PCBs) in dogs and monkeys and to use this knowledge in the further development of a pharmacokinetic model which will predict for a number of species the distribution, accumulation, and excretion of PCBs and other chlorinated xenobiotics after different dose levels and routes of exposure.
PROACH: The distribution, accumulation, metabolism, and excretion of /sup 14/C-labeled PCBs (4,4'-dichloro-, 2,4,5,2',4',5'-hexachlora-, 2,3,6,2',3',6'-hexachloro-biphenyl) will be studied in Beagle dog and Fasciculous monkey. All major tissue and excreta (urine and feces) are sampled at various times after administration of the PCB. Biliary studies are also to be conducted to determine the necessary pharmacokinetic parameters needed for modeling. Flow rate to the major organ will be determined in the monkey by means of microsphere technique.
RESULTS: The contract has just been awarded and the reports are not in. Our proposed course is as follows:

(1) Determine the flow rates to the organs in the monkey, (2) determine the half-lives of the PCBs in dog and monkey, (3) examine the distribution of the PCBs and metabolites in various tissues in dog and monkey, (4) investigate the biliary clearance of PCBs, and (5) elucidate structures of PCB metabolites.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To establish a contracted research capability to assess the postnatal toxic effects of gestation chemical exposure.
APPROACH: Scientific teams are being sought who are broadly familiar with chemically-induced biochemical, physiologic, and histologic effects for the toxicologic evaluation of gestationally exposed offspring. Emphasis is placed on physiological and biochemical functions associated with various organs and tissues. The Fischer rat will be the test animal for routine studies. Other species such as mice, hamsters, guinea pigs, or rabbits might be used also in future attempts to define species variability. Female rats will be exposed to the test chemical for a defined period either prior to breeding or following conception. Chemical exposure will continue during gestation and will be discontinued one day prior to expected parturition.
RESULTS: Offspring will be examined for signs of toxicity at five defined postnatal periods. At each test period, various gross, chemical, hematological, and functional tests will be performed. Special emphasis should be directed to the following systems (or functions): bone marrow and blood; motor and sensory function of the nervous system (including pain, taste, olefaction, audition, and vision); behavior and ''memory''; cardiovascular responses; respiration; renal function and body fluid balance; digestive system; metabolism (energy exchange); endocrinology; reproduction; immunologic capacity; and pathology. Tests of overall hemostatis, physical endurance, and adaptation to stress are also desired.
PROJECT MILESTONES: This contracted research activity should be established during the next few months.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of this project is the search or evidence of early toxic lung injury that may shed light on subsequent events.
APPROACH: Animals will be exposed to gases and fibers that may be found as environmental contaminants. Exposures are carried out in dynamic flow through chambers of two types. One type provides whole body exposure and the other is a nose exposure unit. Pulmonary lavages are obtained and the cellular, lipoprotein and lipid components are isolated by differential centrifugation. The /sup 125/I-Wheat Germ Agglutinin binding to alveolar macrophages will be used as a probe of alteration in alveolar macrophage membrane structure. The lipids (those associated with surfactants and those that are free) will be separated into classes by T.L.C. and column chromatography and their fatty acid composition determined by G.L.C.
RESULTS: This is a new study. Activities to this date have been devoted to assembling the necessary equipment, organizing the laboratories, and establishing basic methodology. We propose to begin this project with a study of two types of gaseous materials: (1) nonrespiratory irritants such as organic solvent vapors, and (2) respiratory irritants such as nitrogen dioxide. As the project gets underway we hope to extend these studies to particulates. We have an interest in respirable glass fibers and asbestos. Some asbestos preparations are known to be cytolytic because of the relatively high ratio of magnesium to silica at the surface of the fibers. The amount of magnesium on the surface can be reduced by prewashing the fibers with oxalate solutions. Changes of the magnesium to silica ratio on the surfaces of asbestos fibers greatly reduces its cytolytic effect. A preliminary study will involve exposure of groups of rats to oxalate washed and unwashed respirable asbestos particles. Pulmonary lavages will be examined for evidence of early lung injury vis-a-vis the presence of the surface magnesium.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The teratocarcinoma system has been described as a model system for the study of embryogenesis and neoplasia. A knowledge of the molecular species involved at the level of gene expression during differentiation or transformation would provide a rational basis for understanding those processes involved in preneoplastic transformation or events which interfere with the normal program of differentiation processes at the genomic level. The ability to detect those proteins which are responsible for the alteration of the normal program of differentiation may enable the development of sensitive and inexpensive assays for molecules having teratogenic potential.
APPROACH: Isolation of chromatin from 2.3 M sucrose, purified nuclei by washing nuclei in buffers of successively lower ionic strength, isoelectric focusing and subsequent SDS gel electrophoresis in a high resolution 2 dimensional gel system, autoradiography of S/sup 35/ methionine labeled nonhistone proteins, reconstitution of chromatin from high salt and urea buffers by direct dialysis to low ionic strength with subsequent removal of urea to physiological conditions, in vitro RNA transcription of various chromatin templates using mercurated nucleotides and subsequent sulfhydrylsepharose chromatography to isolate in vitro synthesized RNA transcripts, RNA-DNA hybridization of in vitro transcripts to probe c-DNA made from most abundant poly(A) RNA sequence classes in teratocarcinoma and embryoid body cells.
RESULTS: The differentiative transition of embryonal carcinoma to endoderm can be studied when well-defined marker gene products are obtained such as the c-DNA to alpha fetoprotein mRNA. We propose to utilize the technique of chromatin reconstitution in order to identify the class of proteins in teratocarcinoma chromatin and teratocarcinoma derived endoderm chromatin which control the expression of the alpha fetoprotein gene in the endodermal derivative.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: An expanded knowledge of how normal and cancer cells function can hopefully in the future be used to apply to the more practical aspects of curing disease and evaluating the effect of the environmental factors on human health.
APPROACH: Embryoid bodies and teratomas were grown, collected and transferred into 129 Sy-Sl mouse peritoneal cavities every 2 to 3 weeks. Total nucleic acid extracts were prepared by phenol/chloroform SDS method. Poly(A)-containing RNA was prepared by affinity chromatography using oligo-dT cellulose. Poly(A) content was determined by hybridization with excess /sup 3/H-poly(dT) with known standards and determination of amount of hybrid using the Sl nuclease assay. The size of the poly(A)-containing RNA was determined on 70% formamide sucrose gradients by hybridization across the gradient with the /sup 3/H poly(dT). By RNaseA and T-1 treatment of the RNA preparations and native polyacrylamide gel electrophoresis with known standards, the length of the A tract was determined. /sup 3/H-complementary DNA was synthesized using reverse transcriptase, sized and fractionated on alkaline sucose gradients. Nucleic acid hybridizations were carried out under standard conditions. The hybridization curves were resolved into a number of first order reactions (RNA excess).
RESULTS: The poly(A)-RNA preparation contains 2.5 to 3% poly(A), a number average size of 1800 to 2100 nucleotides and a poly(A) tract length of 60 nucleotides (NT). The /sup 3/H-complementary DNA synthesized was about 350 NT for both preparations, and a cut was taken from the alkaline gradient of material 400-600NT. These /sup 3/H-C-DNAs were then used in the hybridization analysis. The embryoid body hybridization curve was resolved by computer into 3 classes of sequences. The first or most abundant class represented 10% of the total sequences and from its rate of hybridization is only one or two sequences (of approximate complexity of 2,000NT). The second or middle class represents 60% of the total sequences and is some 100 different 2,000NT long sequences. Finally, the last or most complex class represents about 25% of the total hybridization and some 3,000 different RNA sequences. A similar analysis of the terotoma total poly(A)-containing RNA hybridization curve indicated again three major classes of sequences: (1) first class representing 20% and containing 2 different sequences; (2) middle class representing 54% and some 300 different sequences; and (3) the high complexity class representing some 7,000 different sequences and about 20% of the total sequences expressed.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: An understanding of the mechanisms controlling the ability of marine organisms to eliminate the many foreign compounds reaching the marine environment is vital in predicting the hazards of subsequent consumption of the species by man. Special objectives follow: (1) To examine the importance of renal and hepatic organic anion transport in the rate of elimination of xenobiotics or their metabolites; (2) to assess the role of intracellular binding proteins, such as glutathione S-transferases, in transport and toxicity of organic ions; and (3) to evaluate membrane transport-related cellular accumulation in the development of the xenobiotic toxicity in target organs.
APPROACH: Transport of organic ions is measured in vitro using the isolated renal tubules of winter flounder and slices of rat and rabbit kidney or liver. Intracellular compartmentalization and binding are determined from efflux studies on the isolated tissue preparations after loading in vitro or in vivo. These studies are complemented by clearance measurements in the intact animals. The binding properties of glutathione S-transferases isolated according to published procedures are determined in vitro for comparison with the intact cell data generated above. The isolated rabbit choroid plexus is used to examine the interaction of xenobiotics with the transport of endogenous and exogenous compounds from the brain.
RESULTS: (1) Studies in winter flounder, rat, and rabbit demonstrate that organic anion transport, an active membrane process, plays a major role in the elimination of DDA, 2,4-D, and similar compounds from the organism. In addition, both DDA and 2,4-D show competition in vitro and in vivo with other organic anions known to be carried by this system. Sites of such interaction include kidney, liver, and choroid plexus (see below). (2) Autoradiography shows that this transport leads to extensive intracellular accumulation of these compounds, suggesting the potential for both competition with the normal handling of other endogenous organic acids and direct cellular toxicity by the accumulated xenobiotic. (3) Efflux studies show that for the model compound DDA most of the xenobiotic (85%) is bound to cellular components. The role of such binding in determining the transcellular transport of the compound and in reducing its toxicity during transport are under investigation. Initial attention is focused upon the cytoplasmic binding proteins, such as ligandin (glutathione S-transferases). (4) Cellular effects of accumulated DDA upon the respiration of slices and isolated mitochondria from rat kidney were measured. Concentrations of 0.1 mM and above caused uncoupling of mitochondria and the appearance of negative acceptor control ratios. Accompanying the respiratory changes were altered ATPase activities

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: We hypothesize the acylation is a mechanism of chemical teratogenesis; to test this idea, the teratogenicity of selected anhydrides and imides is being studied. If acylation is a mechanism of teratogenicity, then acylating agents such as anhydrides (and imides) should be teratogenic. Additionally, their teratogenicity should correlate with their spontaneous reactivity; covalent binding of anhydrides (and imides) to fetal macromolecules should be demonstrated. Our preliminary results suggest that this hypothesis is valid and could become an important factor in defining chemicals which have a teratogenic potential. These studies also contribute greatly to an understanding of molecular mechanisms which account for birth defects.
APPROACH: Pregnant CD-1 mice received selected anhydrides or imides by i.p. injection on either days 8, 9, and 10 or days 11, 12, and 13 of gestation. The chemicals were suspended on 0.5% methylcellulose and administered soon after preparation. Controls received only the vehicle. Mice were sacrificed by cervical dislocation on day 18 of gestation (copulatory plugs being Day 1). The young were delivered by Cesarean section, designations made between live and dead fetuses, and resorptions counted. All live young were weighed and examined for grossly observable malformations. The viscera of each were examined by a soft tissue visceral technique described by Staples and the sex noted. The heads were fixed in Bouins for examination by Wilson's free hand slicing. Some fetuses were then cleared and stained by the KOH-Alizarin Red S method for skeletal examination.
RESULTS: The embryotoxicity and teratogenicity of a variety of anhydrides (acetic, propionic, succinic, maleic, and phthalic) were evaluated following intraperitoneal administration on gestation days 8, 9, and 10 or 11, 12, and 13. Each anhydride tested was both embryotoxic and teratogenic. The most common congenital abnormalities induced by treatment on days 8, 9, and 10 were rib and vertebral malformations. Treatment on gestational days 11, 12, and 13 produced predominantly cleft palate. Succinimide was also demonstrated to be embryotoxic and teratogenic. Binding of the test chemicals to macromolecules was studied in vivo and in vitro. In vitro studies demonstrated covalent binding to various purified proteins.

In vivo studies indicated that phthalic anhydride was bound to macromolecules of maternal liver, lung, kidney, and spleen as well as the uterus, placenta and fetuses. These results suggest a correlation between these acylating reagents, teratogenic potential and chemicobiological interactions.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The research is important to the understanding of the molecular events during differentiation and understanding of the mechanism of gene expression in normal, damaged, and cancerous tissues.
APPROACH: Lysates of wheat germ and rabbit reticulocytes will be used to translate mRNA in vitro. O'Farrell gels will be used to analyze the protein products of translation. Scintillation fluorography and radioautography will be used to analyze the protein products synthesized both in vitro and in vivo.
RESULTS: We have completed a preliminary analysis of the in vivo pattern of protein synthesis in embryoid bodies and teratomas. We have determined that the wheat germ translation system has difficulty synthesizing proteins greater than 20,000 mol. wt. We have partially purified alpha-feto protein from rat aminiotic fluid and we have begun the characterization of fetal rat liver total poly(A)-containing mRNA. This research plan will be continued. Plans include production of antibody to rat AFP and isolation of teratcma specific protein called glial fibrillar acidic protein (GFA) and production of GFA antibodies. These antibodies will then be used in the in vitro translation system for detection of specific protein synthesis and for purification of these proteins associated with specific messenger RNAs.

PROJECT DESCRIPTION: The association of in utero DES exposure and reproductive tract cancer in human subjects is well documented. Recent development of a mouse model to study these same effects will allow us to investigate this problem more fully in the laboratory. The objectives of this laboratory are to investigate the role of receptor protein-chemical interactions and the biochemical mechanisms associated with the toxicologic responses observed in the reproductive tract following in utero exposure to hormonally active environmental chemicals.
APPROACH: Hormonal effects were studied with receptor binding techniques including saturation binding, competition studies, Scathard plot analysis, sucrose gradient centrifugation, glucose oxidation/utilization, polyacrylamide gel electrophoresis, dual isotope labeling and protamine sulfate precipitation. Biochemical studies employed spectrophotometric enzyme assays and routine chemical isolation and extraction techniques.
RESULTS: Female offspring given prenatal injections of DES result in two distinct groups: those with hormonally nonresponsive uteri and those that are hyperstimulated. To understand why some uteri were not hormonally responsive, we first examined the concentration of estrogen receptors in these animals. Results from our laboratory have shown that those animals in the non-responsive group have significantly lower levels of estrogen receptor than controls. Cytosol receptor concentrations in vaginal tissue were not significantly different from controls. Further experiments with the uterus and vagina from DES exposed mice will be continued to determine which step in the mechanism of hormone action is altered.

PROJECT DESCRIPTION: Certain arene oxides are known to bind covalently to nucleic acids, and they have been implicated as carcinogens and mutagens which can be derived from the parent compounds. The abundant detoxifying glutathione S-transferase enzyme system is also likely to covalently bind these oxides. Mechanistic elaboration of the process will aid in understanding, preventing, and predicting the mechanism(s) of action of these compounds.
APPROACH: Fourier transform 13C and 1H nuclear magnetic resonance (NMR) spectroscopy; organic syntheses, in vitro biological experiments.
RESULTS: Several benzo[a]pyrene derivatives of high purity and definition including two oxides labeled at specific positions and known enrichments with non-radioactive 13C have been obtained. Studies with benzo[a]pyrene-4,5-oxide-4,5-13C2 have been initiated to determine the preferred position of attack on the arene oxide by glutathione and the stereospecificity of the addition product. The detoxifying glutathione S-transferase enzyme system previously shown to covalently bind certain epoxides will be used. Future studies should include competition experiments to determine which biological nucleophiles are most reactive and the enzymatic versus non-enzymatic nature of the ring opening process and, if possible, elucidation of the required microenvironment for the covalent binding of such arene oxides. 13C-NMR spectra of the various oxygenated derivatives will be recorded routinely for reference purposes.

PROJECT DESCRIPTION: A large number of chemical mutagens require mammalian activation in order to be mutagenic for bacteria. The primary way of looking at this metabolism at present is by the use of liver homogenates in vitro. However, there are a number of chemicals which do not appear to be activated in vitro but are activated in vivo. Also, there is concern that in vitro metabolism does not always mimic in vivo metabolism, and results obtained in vitro may not give a true indication of what is happening in the intact animal. This program is designed to see whether the intrasanguinous host-mediated assay can be used for routine mutagen testing and to examine the correlation between in vitro and in vivo results.
APPROACH: Salmonella typhimurium strains are being used in an intrasanguinous host-mediated assay in mice to see if this in vivo system is capable of detecting a wide variety of chemical mutagens which require metabolic activation for their genetic activity. The effective dose ranges of the chemicals will be determined and compared with results obtained using in vitro activation techniques.
RESULTS: This project has been recently initiated and chemical testing has not yet begun. Preliminary studies have shown that if 10/sup 9/ cells are injected, 10 to 30% recovery can be obtained in one hour. Chemicals belonging to different classes of known mutagens - polycyclic aromatic hydrocarbons, aromatic amines, nitro and nitroso compounds, mycotoxins, and chlorinated hydrocarbons, which have been previously tested using an in vitro metabolic activation system, will be tested in this in vivo system. Additionally, a number of chemical carcinogens which are not mutagenic in vitro will be tested to see if the in vivo system can detect them.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: It has been well documented that different organs are capable of metabolizing different chemicals at different rates. Using this system the organ specific metabolism of mutagens can be determined in vivo and possibly have predictive value for other in vivo toxic effects. Also, it is hoped that this procedure would be useful for routine assay of potential mutagens.
APPROACH: Yeast suspensions (0.2 ml of 3 x 10/sup 8/ cells/ml) are injected into the tail vein of mice and the chemical to be tested is given orally. The yeast is retained in the liver, lungs, kidneys, and testes. At selected times, the mice are sacrificed and the organs removed and homogenized in a tissue grinder to free the yeast from the tissue. Mutation and mitotic gene conversion and recombination can then be determined using routine procedures.
RESULTS: Mice of strain CD-1 appear to be the most resistant to the stress of the procedure. The distribution

of the cells in the various organs is time-dependent. Right after the injection, most of the cells are found in the lungs; after 10 minutes an increasing number of cells are found in the liver and the spleen, and finally up to 40% of the total injected number of cells can be recovered from the liver. The mouse does not appear to have any pathological reaction toward the presence of the yeast in the body. The recovery of cells from liver, kidneys, and lungs is sufficient to perform mutagenesis tests with Saccharomyces cerevisiae strains as D4 and D5 up to 18 hours after the injection. We will begin testing specific chemicals of different chemical classes whose organ distribution is known in order to determine the sensitivity of the system. In addition the results will be compared to results in an in vitro metabolic activation system to see if the types of genetic activity obtained varies between the in vivo and in vitro systems.

PROJECT DESCRIPTION: The importance of asbestos dust and submicroscopic materials has become widely recognized. These submicroscopic particles might be an important dimension in the carcinogenesis by asbestos. In contrast with the abundant literatures on the carcinogenicity of asbestos in both men and animals, there are virtually no reported studies on its mutagenicity. The study of the genetic effects of asbestos will help explicate the relationship between mutagenesis and carcinogenesis.
APPROACH: The methodologies of culturing mammalian cells, cytological preparations, electron microscopic slide preparations and induction of 6-thioguanine resistance were used.
RESULTS: Chinese hamster lung cells cultured in the presence of crocidolite asbestos displayed inhibition of cell growth. Cell death was directly associated with the phagocytosis of larger fibres. Water soluble components of asbestos did not appear to inhibit cell growth. Chromosomal aberrations were induced and were confined mainly to structural aberrations--breaks and fragments. Electron microscopic preparation indicated that asbestoses were readily contained in phagosomes. Phagocytosed asbestos did not appear to induce gene mutation at the hypoxanthine-guanine phosphoribosyl transferase locus. The evidence of the induction of gene mutation was rather weak. We propose to continue our study with other species of asbestos.

PROJECT DESCRIPTION: This study will demonstrate whether mutagenicity in the Salmonella plate test can be used as reliable correlate of liver enzyme activity. Also, it will provide us with data on strain differences in mutagen metabolism and responses to Arochlor 1254 induction.
APPROACH: This project is designed to measure the effects of Arochlor-1254 induction of Sprague-Dawley and Fisher 344 rats. A 9000 x g post mitochondrial supernatant of livers from these rats is used to activate benzo(a)pyrene (BP), dimethyl-nitrosamine (DMN), and 2-amino anthracene (2AA) to mutagens in the Ames Salmonella plate test. Simultaneously, BP hydroxylase and DMN demethylase activities are being measured, as well as Cytochrome P448/450, aminopyrine demethylase, and analine hydroxylase. An attempt is being made to see if mutagenicity is an accurate correlate of microsomal enzyme activity.
RESULTS: This project has been recently initiated and definitive results are not yet available. The future plans include completing the study of the effects of Arochlor 1254. We expect to expand the study to study other inducers such as phenobarbital and 3-methylcholanthrene, alone, and in combination to see how their effects compare with the effects of Arochlor-1254.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The induction of 8-azaguanine and 6-thioguanine resistant mutants in cultured mammalian cells is now well established, and there are indications that the system may prove useful as a screening test for environmental mutagens. There are, however, variations in the response of the system. Any of these variations, if not properly overcome, will influence the estimation of mutation frequencies, and at worse could lead to a false negative determination of the mutagenicity of an agent. It is our objective to identify and elucidate the sources of variation in this genetic testing system.
APPROACH: The methodologies of culturing mammalian cells, drug-resistant selective systems, enzyme assays, protein determination, and population genetics were used.
RESULTS: Over a range of doses, a longer expression time is required for mutant cells from a more damaged population to reach their maximum frequency. Diminution in the level of HGPRTase was considered to be a major factor for the recovery of mutants in the selective medium. None of a large number of mutants sampled from those isolated had HGPRT activity. It is suggested that this cell line is suitable for mutagenicity testing in the induction of mutation in the screening of environmental mutagens and carcinogens. We propose to characterize this system further with regard to other agents and the nature of the genetic lesions.

PROJECT DESCRIPTION: It is the intention of this work to examine the phenomenon of programming (imprinting) steroid metabolizing enzymes in the rat in an effort to determine the role of the endocrine system in this process.
APPROACH: Initial studies examine the ontogenesis of selected steroid metabolizing enzymes (i.e., 5 alpha-reductase and 16 alpha-hydroxylase), noting in particular the programmed divergence in these enzyme activities in the male and female after puberty. Studies will then be performed to determine whether exposure to various hormonally-active xenobiotics can alter the normal process of hepatic and gonadal enzyme programming. The critical period of development will be determined by exposing animals to the xenobiotics either prenatally or postnatally. Particular attention will be given to the enzyme 5 alpha-reductase, which has a dual localization, i.e. in the endoplasmic reticulum and the nucleus. The programming studies on this enzyme are conducted in both subcellular fractions to determine if enzyme localization alters the sensitivity to the programming process. The hormonally-active agents of interest include DES, various PCB isomers, zearanol, and the normal endogenous steroids.
RESULTS: These studies attempt to characterize how xenobiotics affect normal neonatal hepatic or testicular enzyme programming mechanisms, to define what role such alterations play in developmental toxicity, and to determine whether such a system can be used as a model for predicting development toxicity.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The use of sensitive organisms may permit identification of systems particularly prone to disruption by environmental contaminants. Such studies may then (a) point to systems which might also be particularly prone to damage in man and (b) serve as indicators or warning systems to the accumulation of contaminants in the environment, particularly the marine environment which serves as a sink for persistent pollutants.
APPROACH: Na,K-ATPase is measured in freeze-dried, reconstituted homogenates of gill tissue. Ion fluxes are determined in isolated gill filaments using isotopic techniques. Hemolymph osmolarity is measured by vapor pressure osmometry and ion content determined by flame photometry.
RESULTS: (1) Optimum conditions for blue crab gill Na,K-ATPase have been determined (pH 7.4, 100 mM Na/sup +/, 10 mM K/sup +/, 6 mM Mg/sup ++/). Under these conditions the K/sub m/ for ATP is 0.133 mM. In addition, a phase transition in membrane lipids at 22 degrees is suggested by the Arrhenius plot of the temperature sensitivity of the enzyme. (2) Na,K-ATPase activity varies from gill pair to gill pair, with pairs 6 and 7 most active in both sexes. After acclimation to full-strength seawater, the specific activity of Na,K-ATPase was nearly twice as high in these gill pairs from female crabs. (3) When exposed to DDT in vitro, significant inhibition of Na,K-ATPase was seen at 1 ppM. Peak inhibition was reached by 9 ppM. There was little sex difference in sensitivity to DDT. Greater inhibition was observed at 19 degrees (i.e., below the phase transition) than at 30 degrees.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Many xenobiotics are thought to exert their toxicity by means of reactive metabolites which are generated in vivo with very short half-lives. These reactive metabolites react with tissue macromolecules to produce toxicity such as carcinogenesis, mutagenesis, teratogenesis, etc. The prostaglandin synthetase system is found in most mammalian tissues and has particularly high levels of activity in the lung and kidney. Moreover, arachidonic acid can be released from its phospholipid storage sites by various types of stimulation, for example, irritation of lung tissue by inhaled pollutants. The subsequent metabolism of arachidonic acid by prostaglandin synthetase and the simultaneous co-oxygenation of xenobiotics could produce toxic metabolites of xenobiotics. It is the long-range goal of this project to study the co-oxygenation of xenobiotics by prostaglandin synthetase, particularly the pulmonary prostaglandin synthetase. The generation of toxic intermediates, carcinogens, mutagens, etc., during the co-oxygenation of benzopyrene during the metabolism of arachidonic acid by guinea pig lung and ram seminal vesicle microsomes. The involvement of cytochrome P-450 in this process is also under investigation.
APPROACH: Microsomal preparations of various tissues, such as guinea pig lung and ram seminal vesicles, were used to examine the co-oxygenation of xenobiotics during prostaglandin synthesis. The xenobiotic metabolites were isolated from the incubation medium by extraction and by a preliminary separation by thin-layer chromatography techniques. Prostaglandin and thromboxane products were also isolated. The effect of substrate concentration, cofactors, and time on the co-oxygenation was investigated. The carcinogen benzopyrene is oxygenated during the conversion of arachidonic acid to prostaglandins and thromboxanes by guinea pig lung and ram seminal vesicle microsomes. This co-oxygenation is particularly interesting in lung since this carcinogen enters the lung via the airways, and the release and subsequent metabolism of arachidonic acid by lung tissue is produced by numerous stimuli. Thus, exposure to benzopyrene coupled with the stimulation of prostaglandin synthesis, for example, by irritation of lung tissue, could result in the formation of toxic benzopyrene metabolites.
RESULTS: Preliminary identification of the metabolites suggests that quinones are the major type of products

produced from benzopyrene during its co-oxygenation by prostaglandin synthetase. The metabolites appear to be qualitatively similar but quantitatively different from those generated from benzopyrene by NADPH-dependent cytochrome P-450.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The primary focus of this contract is on the quantitative extrapolation between various animal species (including man) for which reliable carcinogenesis data exists (in the literature) attempting to account for factors modifying the effect of dose in cases where substantial species differences have been reported.
APPROACH: The published carcinogenesis literature is being searched in order to construct a data summary. Initial attention is being restricted to 6 compounds that have been identified as potentially carcinogenic in man and at least on other species. (aflatoxin B1, diethylstilbesterol, chlornaphazine, benzidine, vinyl chloride, and dimethylnitrosamine.)
RESULTS: By evaluating factors other than species that are known to affect carcinogenicity (e.g., age, sex, diet, absorption, distribution, metabolism, and clearance, etc.). The contractors hope to conclude definitely whether or not there are data explaining species differences in risk. Such data could provide very useful insight into the general problem of extrapolation.
PROJECT MILESTONES: The literature search discussed above has been completed, and the 6-month progress report (containing a detailed review for aflatoxin B1) has been submitted.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: There are literally thousands of chemicals in use and the number is ever increasing. The majority of these substances has not been evaluated for the potential to induced heritable genetic alterations; and, hence, the possible risk to future human generations is unknown. This program will develop an efficient coordinated system for mutagenesis testing and should serve as a model system. The data obtained from this program will be useful for decision making on the safety of various classes of chemicals to which man is exposed.
APPROACH: The primary objective of this effort is to develop a program which will have the ultimate capability of testing 1000 chemicals per year using microbial systems, and as-yet-undetermined smaller numbers of chemicals in higher in vitro and in vivo test systems. With this level of testing, it will be necessary to develop the ability for chemical management and analyses of compounds tested. A computerized system for data handling and statistical analysis will also be developed. Substances which are mutagenic in the microbial tests will be tested further using higher systems which serve to affirm or refute the microbial data and more precisely define the types of mutagenic events induced.
RESULTS: This program is a new effort and will be conducted utilizing the contract mechanism. The staff to develop these contracts is currently being recruited. It is anticipated that the chemical repository will be operational and will develop an efficient inventory and chemical management system. Tier-1 microbial testing will begin with 150 chemicals in early FY78. Test systems for Tiers 2 and 3 will be selected. Additionally, an on-line computerized data handling system will be developed.

SEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
OJECT DESCRIPTION: The purpose of this study is to conduct a model study to differentiate the enzyme variants in mice by simple biochemical assays.
APPROACH: For the purification of the enzymes, a two-step procedure has been employed, involving affinity chromatography as a major step in the purification. The purified enzymes have been characterized biochemically and the kinetics of inactivation under several experimental conditions have been studied.
RESULTS: Two isozymes of phosphoglycerate kinase and isocitrate dehydrogenase have been characterized by kinetic studies, thermal and urea denaturation and iodoacetate inactivation. The conditions to find maximum difference by thermal and urea denaturation were established. Two genetic variants of cytoplasmic isocitrate dehydrogenase and 3-phosphoglycerate kinase-2 were also compared biochemically in details. Differential thermal stability was also observed for each pair of enzyme variants under certain temperatures and pH's. From this model study we think that relative thermostability of enzyme variants could be a useful tool for the detection of mutant enzymes in mutagen-treated mouse population.

TECHNOLOGY: NUCLEAR/Fusion (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Tritium (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Tritium, in the form of tritiated water, is one of the primary pollutants resulting from nuclear power production. It is difficult and expensive to contain. Since it is unimpeded by biological barriers, tritiated water rapidly achieves an equilibrium concentration in living organisms that is equal to that in the environment. Genetic analysis of induced mutants will make possible a qualitative as well as quantitative characterization of tritiated water mutagenicity.
APPROACH: The biological effectiveness of the tritium beta-particle is the primary consideration in hazard evaluation. This beta-particle is emitted at a very low energy by tritium decay, the average track length being only 0.9 mu in biological materials. As a consequence of its very short track length, the energy is expended in a very localized region. The tritium decay product is, therefore, a weakly penetrating but high linear energy transfer radiation.
RESULTS: Only pilot experiments have been completed to date. However, preliminary data tend to indicate that the relative biological efficiency of tritiated water for inactivation is rather high, and that the relative efficiency for ad-3 forward-mutation induction may approximate unity. Additional experiments will be conducted to determine the relative biological efficiencies of tritiated water for the induction of a variety of genetic lesions within the same test organism.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The project is designed to study the effects of chromosomal aberrations on fetal mortality and development. Comparisons will be made between in vivo effects and effects on mouse embryos grown in culture. Chemical mutagens are known to be capable of inducing chromosomal aberrations such as translocations which may be transmitted to the next generation. Increased rates of fetal death are usually observed among offspring to translocation heterozygotes. It is our purpose to investigate the rates of transmission of such aberrations, and the processes of fetal mortality by direct observation of the development of embryos.
APPROACH: Known translocation bearing mice are mated and the F1 sons studied to determine the frequency of translocation heterozygotes. In other matings the females are killed shortly after fertilization and two cell embryos are retrieved from the oviducts and established in culture. Stage of development arrest is determined.
RESULTS: F1 males are currently being analyzed to determine whether they are translocation heterozygotes. Cytogenetic analysis will be conducted in attempts to correlate the nature of the aberration and the effect on embryonic development.

PROJECT DESCRIPTION: After apes, the Macaques are among man's closest relatives. The chimpanzee is more than 99% related to man on the molecular level, while Macaques follow closely. Therefore, non-human primates should provide the most relevant animal model when the genetic safety of environmental contaminants, drugs, and food additives is evaluated. Due to limitations of animal availability and cost, genetic safety evaluation of chemical substances in monkeys is necessarily limited to special cases when a large body of information is already available from traditional animal tests. The present experiments have established methodology which can be used if the evaluation of a chemical's genetic safety is of great human importance.
APPROACH: For the intrasanguineous HMA inject i.v. approximately 10 to the 9th power E. coli per ml blood. Inject animals i.m. with MC in saline or with saline. Recover cells from liver or testes. For in vitro blood assay incubate 10 to the 9th power cells/ml blood with or without MC for 30 minutes. Recover cells. For intraperitoneal HMA enclose 3 to 5 ml of 10 to the 9th power cells/ml Nutrient Broth in dialyzing tubing and implant in intraperitoneal cavity. Inject with MC. Recover cells 3 hours later. For all methods the recovered cells were plated on selective media to determine mutation frequency to arginine and galactose prototrophy. Appropriate in vitro experiments with E. coli and MC were performed.
RESULTS: In the Rhesus monkey intrasanguineous HMA and blood-mediated assay is impossible due to the

immediate and strong immune response of the host against E. coli. The number of cells that could be recovered from either liver, blood or testicular tissues was so low after 30 minutes exposure that determination of mutation frequencies was not possible. This difficulty was overcome when cells were enclosed in diffusion bags made from dialyzing tubing (cut off of 6000 to 8000 MW). In the HMA significant increase in mutation frequency was observed at 0.5 mg/kg b.w. (lower doses were not tested). Mutation frequencies were higher at 1.5 mg/kg, but further increase in dose resulted in a slight decrease in mutation frequency. Ten times higher in vivo doses over in vitro doses induced similar mutation frequencies. The same animals used for the HMA have also been used in cytogenetic experiments reported on elsewhere in the annual report. No further experiments are planned since the feasibility of using monkeys in mutagenicity testing with the HMA has been demonstrated.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Molecular and cytogenetic research of the past 25 years revealed that non-human primates and man show greater evolutionary relatedness than was suggested by earlier morphologic and paleontologic evidence. Therefore, it appears self evident that non-human primates need to be used in research which intends to determine the genetic safety of environmental contaminants, drugs and food additives to man. We believe that with the methods developed for monkeys in this investigation we will be able to provide genetic safety evaluation of chemicals to man more accurately than would be possible with animals less closely related to man.
APPROACH: Mitotic metaphase spreads from blood and bone-marrow or meiotic and spermatogonial metaphases from testes biopsy samples were made following standard procedures. Samples from the same animals were collected 14 days before and 1, 2, 14, 16, 17, 18 days and 3 and 5 months after treatment with Mitomycin C. The micronucleus test was also performed with methods developed for rodents by others.
RESULTS: When the sensitivities of the three cytogenetic methods applicable to somatic cells in vivo were compared, we found that the bone-marrow cytogenetic test and the micronucleus test were about equally sensitive, and were also comparable in sensitivity to the host-mediated assay. That the lymphocyte cytogenetic test failed to detect chromosome aberrations was attributed to the known dependence of MC-mutagenesis on DNA replication. In a more general testing scheme, which includes chemicals or physical agents that are not dependent on DNA replication for mutagenesis, we still recommend the use of lymphocyte cytogenetics since blood can be readily obtained with minor disturbance to the animals or from humans. On the other hand we have reservations about the applicability of the micronucleus test in an experimental situation when it is highly desirable to keep the animals alive following sample taking. When we attempted to analyze bone marrow obtained from live animals the scoring of micronuclei was impossible due to excessive invasion by mature erythrocytes from blood. Bone-marrow cytogenetics suffered from none of the short-comings of the other somatic cell based cytogenetic tests we performed.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of the proposed study is to determine the differential effect of environmental chemicals on the reproductive capacity of male and female mice. Reproductive capacity is to be evaluated by the repetitive forced breeding method for females and by a serial mating technique for males. These studies are done in such a way as to support existing programs in the Laboratory of Environmental Toxicology concerned with developmental toxicity and transplacental toxicity. The purpose of the contract is two-fold; to identify environmental chemicals that have potential developmental toxicity emphasizing reproductive tract lesions; and to identify chemicals to Intramural scientists that are toxic and need to be studied from a mechanistic viewpoint.
APPROACH: In females the contractor will primarily evaluate the effect of each compound on: the length of the estrous cycle, number of matings and litters per reproductive lifetime, number of young per litter, number of abnormal young produced, average weight of young. Secondary information which will be collected and evaluated will be levels of reproductive hormone and pathologic condition and neoplastic changes in affected animals. In males the contractor primarily evaluates the effect of prenatal treatment effect of each compound on: number of successful matings, number of successful litters sired, number of young per

litter sired, number of abnormal young sired. Secondary information collected and evaluated will be levels of reproductive hormones and pathologic conditions in affected male animals.
RESULTS: Completed protocols are not available for any compound since these are lifetime (18 month) studies and the contract was initiated 12 months ago.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: A large number of chemicals are not mutagenic unless they are converted enzymatically to active metabolites. The host-mediated assay is a useful and versatile tool for determining whether chemical agents are being converted to mutagenic metabolites by the host animals. This assay has been well established and employed extensively with indicator organisms such as bacteria and yeast. In Neurospora crassa, the host-mediated system has also been developed. However, no extensive studies have been carried out. It is, therefore, necessary to extend the host-mediated assay system using Neurospora as an indicator organism to different animal species, different organs and different procarcinogens.
APPROACH: For increasing sensitivity to chemicals, an excision-repair deficient strain of N. crassa (H-59) was employed as an indicator organism. 0.2 ml of the conidial suspension (2 x 10/sup 9/ conidia/ml for rats, 10/sup 9/ conidia/ml for mice) was injected into the tail vein of each animal. The chemical solution was administered into animals by intramuscular injection. The animals were sacrificed after 16 hours of treatment. Conidia were harvested from different organs of the host. The ad-3 forward-mutation frequency of N. crassa was measured by the direct method of F.J. de Serres.
RESULTS: In mice, dimethylnitrosamine (DMNA) appears to be converted to highly mutagenic metabolites in liver. This is in agreement with that of Malling's finding. A significant increase in mutation frequency was also found among the conidia recovered from the lung of DMNA-treated mice. In the liver of rats, DMNA is also converted to highly mutagenic in Neurospora. Studies will be extended to (1) different animal species, (2) other organs (kidney, lung and testis) and (3) other procarcinogens from different chemical classes.

PROJECT DESCRIPTION: Amino acid sequence differences among different isozymes of lactate dehydrogenases from mouse will be correlated with their antigenic properties. This is a part of the program to evaluate the molecular events which result in mutations in mammals.
APPROACH: Muscular lactate dehydrogenase from mouse is purified by affinity chromatography. Peptides of this protein derived from enzymatic and chemical cleavage will be purified by gel filtration and ion-exchange chromatography. Amino acid sequences of these peptides will be determined by automatic Edman degradation.
RESULTS: A large quantity (1.5 g) of muscular lactate dehydrogenase from mouse has been purified, and the primary structure of this enzyme based on peptide sequences will be compared with that of sperm-specific lactate dehydrogenase from mouse.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of this project is to determine the effects of long-term, low-level exposure to 915 and 2450 MHz microwave radiation on the central nervous system and behavior.
APPROACH: Long Evans male rats will be exposed to a CW plane wave microwave field at frequencies of 915 and 2450 MHz and power density of 5 mW/sq. cm. The animals will be exposed for 8 hours a day, 5 days a week for 16 weeks. An eight week recovery period will follow the exposure period. The following measurements will be made: (1) Biochemistry - biochemical analysis of the cholinesterase activity of the blood, the SH group in the blood, and ketosteroids in the urine will be measured. (2) Behavior - rodent activity will be measured using a rodent activity wheel. Water and food intake will be measured. Rats will be trained to lever press for food reward on a FR-DRL multiple schedule. Total response and reinforcement for each schedule component as well as response during time out between each component will be recorded. Interresponse times on each schedule component will be recorded. (3) EEG - EEG will be recorded biweekly using epidural removable stainless steel electrodes. These recordings will be made while the microwave radiation is turned off.
RESULTS: Construction of radiation chambers and microwave field distributions have been measured and determined to be no greater than 10 percent. Training of ten rats on the multiple fixed-ratio-differential reinforcement at low rates (FR-DRL) schedule has been completed. Activity chambers have been built and tested and baseline data obtained. Problems with EEG recording cannula implants were initially encountered but have been standardized and is now functional. Bioassays for cholinesterase, sulfhydryl groups, and corticosterone have been tested giving satisfactory results.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The by-products of fossil fuel combustion are a complex mixture of compounds which include polycyclic aromatic hydrocarbons (PAHs). Many of these PAHs (for example benzo(a)pyrene) are known to be potent carcinogens. When complex mixtures of PAHs are assayed for carcinogenic activity, they are highly active. In fact, the activity of the mixture often greatly exceeds the activity of each of the isolated components. This suggests that certain non-carcinogenic or weakly carcinogenic compounds in the mixture act to enhance or to promote the activity of the carcinogenic agents. In an effort to assess the hazard of fossil fuel combustion products, one must therefore consider not only the carcinogenic factors in the by-products, but also their interaction with other by-products.
APPROACH: A theoretical basis for this interaction is lacking and a better understanding of the basic mechanisms of carcinogenesis is required. Our studies on this problem are centered on two levels. The first level is the initiation of carcinogenesis, while the second level is how the initiated cell develops into a malignant cancer and what factors modulate this development. An understanding of this entire process will allow a better assessment of how to eliminate factors which induce cancer. Our approach to these problems has been to study the effect of carcinogens and promoters of carcinogenesis on cells grown in culture. By studying the interaction of chemicals and cells in culture rather than in animals, we temporarily ignore the in vivo factors influencing carcinogenesis and focus on the problem as a cellular event. This enables us to understand the molecular and cellular mechanisms involved. Specifically, we are interested in: (1) how chemicals such as benzo(a)pyrene initiate carcinogenesis and whether this initiation is analogous to other biological responses such as mutation; (2) how initiated cells develop as malignant cells; and (3) how do normal cells differ from malignant cells.
RESULTS: The development of malignant cells from normal cells following initiation with carcinogens is known

to proceed as a progressive phenomenon through many qualitatively different stages. These different stages can be promoted by non-carcinogenic compounds. Understanding the mechanisms of this progression will allow identification of compounds which enhance the activity of carcinogens as well as offer a potential means for development of chemo-preventive drugs which might modulate or prevent this development.

POLLUTANTS: ORGANICS (50%);RADIATION (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Many genetic factors are involved in the responses of an organism to pre-lethal and pre-mutagenic lesions. Earlier studies have shown that the presence of repair deficiencies in test organisms alters the effects of lethal and mutagenic agents both quantitatively and qualitatively. In order to understand the complex biological processes involved in DNA repair and mutagenesis, it is important to consider the interactions of these gene products. The types of interactions of multiple repair deficiencies within the cell indicate the role and significance of particular gene products in the various repair pathways that are available in response to lesions in the DNA.
APPROACH: We have constructed homokaryotic double-mutant strains of N. crassa which bear in various pair-wise combinations the radiation sensitive mutant alleles: upr-1, uvs-2, uvs-3, and uvs-6. Inactivation and forward-mutation induction at two loci by UV and x-ray irradiation have been determined by use of the ad-3 system.
RESULTS: Our data for the double-mutant strain bearing the two excision repair deficient alleles, upr-1, and uvs-2, have shown that these interact epistatically with respect to the lethal and mutagenic effects of UV irradiation. However, they show an additive type of interaction for both inactivation and mutagenesis by ionizing irradiation. This additive interaction indicates that, in response to the lesions induced by ionizing irradiation, the gene products from the wild type upr-1(+) and uvs-2(+) alleles are involved in repair processes that are to some extent independent. The uvs-2, uvs-6 combination of mutant alleles results in an increased sensitivity to inactivation by both UV and x-ray irradiation. We have determined that the interaction of the uvs-2 and uvs-6 alleles results in a reduction in the frequencies of ad-3 mutants (forward-mutation frequency per survivor, relative to the frequencies obtained for the more sensitive of the two single-mutant parental strains) for both UV and x-ray irradiation. The combination of the uvs-3 and uvs-6 mutant alleles has been shown by tetrad analysis to be inviable.

PROJECT DESCRIPTION: Although in theory alkylating agents such as TEM should be capable of inducing gene mutations in mammals, only a relatively small amount of data are available supporting this hypothesis. The objective of this study was to test the effectiveness of a chemical mutagen in inducing mutations at a number of different enzyme loci in the mouse. Strain DBA/2J male mice were exposed to triethylenemelimine (TEM) by i.p. injection. Control males were injected with the carrier (HBSS). Males were mated to C57BL/6J females. Kidneys and blood were obtained from all F1 offspring and said tissues were analyzed by starch gel electrophoresis for the occurrence of mutations at the various enzyme loci. A number of putative mutants have been identified in this experiment and progeny testing is underway to confirm these mutations.
APPROACH: DBA/2J male mice were treated by i.p. injection with TEM. Control males were treated with HBSS. All males were mated to C57BL/6J females. Tissues (kidneys and blood) were sampled from all F1 offspring of the abcve matings. Using standard gel electrophoresis techniques, all samples were electrophoresed and the gels analyzed for the occurrence of aberrant zymogram patterns. Such aberrant patterns were considered indicative of putative mutations. Animals bearing putative mutations will be studied by standard progeny testing techniques.
RESULTS: Several putative mutations have been recovered at the following loci, Es-1, PGM-1, LDH, Es-3. Animals bearing the suspect mutations are presently undergoing progeny testing. This experiment will be completed shortly.
PROJECT MILESTONES: A knowledge and understanding of the types of genetic lesions induced in mammals by chemical mutagen and the relationship between the genetic effects of known mutagens and environmental agents which are potentially mutagenic is vital to our understanding of the risk posed to humans by such

environmental agents. This study will aid in our understanding these genetic effects and will provide basic information regarding the mechanism of action of a known potent chemical mutagen.

PROJECT DESCRIPTION: The objective of this project is to develop a system to detect induced mutations in mice by using high speed rate analyzers to monitor the thermal stability of enzymes. Pilot experiments are in progress to determine the biochemical conditions necessary to screen crude homogenates of mouse tissues for thermal stabiliy mutants of 20 enzymes. Preliminary results indicate that enzyme heat denaturation is closely correlated to pH, ionic strength, and endogenous concentrations of substrates and cofactors. In addition naturally occurring variants of isocitrate dehydrogenase and phosphoglucose isomerase have been found to be detectable with heat stability techniques.
APPROACH: The thermal stabilities or purified enzymes and enzymes in crudely homogenized tissues are being comparatively studied to understand the relationship that exists between thermal stability of an enzyme based upon structure alone and thermal stability of the enzyme as a function of physiological environment and method of preparation. The knowledge of these relationships will be applied to defining a limited number of conditions that are feasible for use in a large scale experiment. The major premise of this methodology is that for a given inbred mouse population, these exists a normal relative thermal stability for a given set of experimental conditions for each enzyme. Data on control and mutagen-treated mice could be accumulated with the Miniature Centrifugal Past Analyzer and integral PDP11 Computer, then transferred to the Institute's computer. In-depth statistical analysis could be accomplished through the Statistical Analysis System in Washington, DC.
RESULTS: Conditions such as pH, ionic strength and substrate concentration have been found to alter thermal stability of mouse kidney enzymes at constant time and temperature in both crudely homogenized and purified enzymes. Homogenates of naturally occurring electrophoretic variants that are indistinguishable by thermal stability at neutral pH (7.5) may be resolved at a lower pH (6.0); the resolution can be improved by variation of ionic strength. Model studies to demonstrate these effects are being completed and 20 enzymes are being tested to establish the best conditions for subsequent studies. Computer programs to complement this methodology are being developed. Relative thermal stability will be determined for individual mice within and between litters for a selected number of kidney enzymes. The system will then be tested on a mutagen-treated population to evaluate its capacity to quantitate the frequency of mutation induction. Development of an analytical system based on the erythrocyte will be concurrent.
PROJECT MILESTONES: Development of this system is important because it could provide a rapid means to screen mammalian populations for mutational events at many loci. In addition, measurements of enzyme thermal stability can potentially distinguish regulatory variations as changes in specific activity and structural variations as changes in relative thermal stability.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this project are to: (1) study the role of free radical intermediates formed during the metabolism of polynuclear hydrocarbons in the toxicity of these agents; (2) study the mechanisms by which light (UV and visible) synergizes the tumorigenicity of polynuclear hydrocarbons on skin; and (3) study the binding of heavy metal ions to plasma and tissue proteins on the body distribution of the metal ions.
APPROACH: The formation and characterization of free radical intermediates will be done using electron spin resonance (ESR) spectroscopy. ESR spectroscopy can detect unpaired electrons present both in free radicals (organic or inorganic) and in paramagnetic metals. In some cases, spin trapping techniques will be used to transform reactive free radical intermediates to form stable radicals which can then be identified.
RESULTS: (1) The project will attempt to detect and quantify free radical intermediates of polynuclear hydrocarbon metabolism, and hopefully, provide information on the mechanisms involved. (2) Studies on the binding of metals to protein should provide information on the nature of the functional groups to which

the metal is coordinated, as well as the binding parameters for the metal-protein interactions.

PROJECT DESCRIPTION: The objective of this project is to examine the effects of NO2 on model membranes, e.g., liposcmes, lecithin multilayers; biological membranes, e.g., those from a alveolar macrophages or erythrocytes; and the lung surfactant lipoprotein.
APPROACH: The electron spin resonance (ESR) spectrometer will be used to detect free radical intermediates formed as a result of reactions with NO2. If such intermediates are not detected, the effect of NO2 on membrane structure would be ascertained with the aid of spin-labeled analogs of steroids, fatty acids and phospholipids.
RESULTS: Several of the biochemical changes found in lung following exposure to NO2 may result from lipid peroxidation. Since NO2 itself is paramagnetic and has been shown to produce free radical intermediates when reacted with unsaturated lipids, we would expect ESR spectroscopy should confirm this effect in biological membranes and provide information as to the mechanism of toxicity.
PROJECT MILESTONES: Interim report expected.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This investigation reflects an overall interest in the interactions of carcinogenic agents with DNA in vitro, including mechanisms of damage and repair. The time-course of DNA repair synthesis induced by ultraviolet irradiation has been extensively studied in several cell lines, however, data on the duration of DNA repair synthesis induced by chemical carcinogens is not so complete. These studies were designed to compare the kinetics of DNA repair synthesis induced by ultraviolet irradiation (UV, 254 nm) and N-acetoxy-2-acetylaminofluorene (NA-AAF) in human diploid fibroblasts (WI-38) over a time course of 76 hr after damage.
APPROACH: Confluent WI-38 cells, given 10/sup -2/ M Hydroxyurea (HU) to suppress any remaining DNA replicative synthesis, were damaged with either 45 erg/mm/sup 2/ UV or 10/sup -5/ M NA-AAF and allowed to repair in the presence of /sup 3/H-TdR. Specific activities of the repaired DNAs were obtained after CsCl buoyant density gradient centrifugation. Unscheduled DNA synthesis was also determined by autoradiography. Cell survival was studied by cloning and trypan blue dye exclusion.
RESULTS: Up to 4 hr after damage the UV-treated cells showed an almost linear increase in repair synthesis, while the NA-AAF-treated cells showed a lag from 0 to 1/2 hr, followed by linear incorporation from 1/2 to 4 hr with a slope steeper than that for UV. Thus, in WI-38 cells, DNA repair synthesis after NA-AAF damage starts more slowly and continues for a longer time than after UV damage.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To develop model systems which can be utilized to study cellular events which occur during stages of chemical carcinogenesis. Systems studied are directed to give both general information regarding malignant transformation within a mammalian cell and specific requirements of specialized cells which might shed light on events necessary for tumor development in a particular organ.
APPROACH: Cell culture systems have been developed for studying mechanisms involved in chemical carcinogenesis in epithelial cells. A model system of mouse epidermal cell culture, which closely parallels the in vivo model of skin carcinogenesis, has been most intensively studied. WI-38 cells, a diploid human fibroblast line, has been used to study DNA repair after damage with chemical carcinogens and UV light. Repair synthesis and specificity of carcinogen-nucleic acid interaction are also being studied utilizing an immunological approach.
RESULTS: A comparison of the kinetics of DNA repair synthesis induced by NA-AAF and ultraviolet light in human WI-38 cells has revealed the following. When doses of each agent were chosen to give equal repair incorporation of /sup 3/H-TdR after 4 hours, NA-AAF induced repair continued at a high rate 72 to 76 hours after damage while UV-induced repair was complete 24 to 28 hours after damage. At time points up to 4 hours NA-AAF-induced repair reached linearity after a 1/2 hour lag while UV repair was linear immediately.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To optimize culture conditions for growth differentiation and maintenance of epidermal cells; to examine chemical carcinogen-induced repair of DNA.
APPROACH: In most experiments, primary cultures of epidermis from newborn BALB/c mice were grown in Medium 199 supplemented with 11% fetal bovine serum (FBS). In repair experiments, the cells were lysed in 1% sarkosyl, homogenized, and centrifuged in a cesium chloride-cesium sulfate gradient in a Beckman L2-65B ultracentrifuge to separate DNA from RNA and protein. In experiments in which the rate of DNA synthesis was estimated by thymidine-/sup 3/H incorporation into DNA, a nucleic acid hydrolysate was prepared by cold perchloric acid (PCA) precipitation of macromolecules and hot PCA hydrolysis.
RESULTS: Primary cultures of newborn mouse epidermal cells have been grown at 37 degrees in Medium 199 supplemented with 11% fetal bovine serum (FBS). Guanine-specific repair of DNA was found previously in mixed epidermal cell-fibroblast cultures treated with the skin carcinogens beta-propiolacetone and N-methyl-N'-nitro-N-nitrosoguanidine (MNNG). This type of repair is characterized by the incorporation of deoxyguanosine-/sup 3/H, but not thymidine-/sup 3/H, into non-replicating DNA after treatment with low, relatively non-toxic doses of the carcinogens.

PROJECT DESCRIPTION: To study the metabolic pathways of chemical carcinogens in human target tissues.
APPROACH: Explant culture of human tissues; quantitative high-resolution light microscopic autoradiography; isolation of cellular macromolecules; high-pressure liquid chromatography; enzyme assays.
RESULTS: In the initial studies cultured human bronchial mucosa explants were found to be capable of metabolizing carcinogenic polynuclear aromatic hydrocarbons, (PAH) including 7,12-dimethylbenz[a]anthracene, 3-methylcholanthrene, benzo[a]pyrene, and dibenz[a,h]anthracene, into forms that tightly bind to DNA and other macromolecules. The binding of benzo[a]pyrene (BP) to DNA in cultured human bronchus was measured in specimens from 38 patients. The binding values ranged from 2 to 151 pmole BP per mg DNA with an overall mean +- S.E. of 34.2 +- 5.2. This 75-fold interindividual variation in binding of BP to DNA is similar in magnitude to that found in pharmacogenetic studies of drug metabolism.

OBJECT DESCRIPTION: To elucidate the mechanism of the induction of aryl hydrocarbon hydroxylase activity in rat liver and cultured rat liver cells by carcinogens.
APPROACH: Currently, the multiple forms of cytochrome P-450 in rat liver are being separated by electrophoretic techniques.
RESULTS: Clear differences in the composition of liver microsomal proteins from carcinogen-treated and untreated rats have been distinguished. It is proposed to investigate whether the increased accumulation of a particular P-450 species is the rate-limiting event in the induction of aryl hydrocarbon hydroxylase activity, and whether such accumulation is the result of an increase in the net rate of de novo synthesis of this species or due to the metabolic-conversion of a pre-existing P-450 species.

PROJECT DESCRIPTION: To examine the DNA repair capacities of cell lines derived from persons with various genetic diseases which have a high probability for cancer. Specifically, to measure repair synthesis in these cells after treatment with a variety of chemical carcinogens.
APPROACH: A simple methodology utilizing benzoylated naphthoylated DEAE cellulose chromatography (BND-cellulose) for the rapid quantitative estimation of excision repair and the rigorous separation of repair synthesis from semi-conservative replicative synthesis has recently been developed.
RESULTS: Repair synthesis has also been measured in KD cells following treatment with mitomycin C and methyl methanesulfonate. Similar experiments are now being initiated with cell lines derived from patients with ataxia telangiectasia, Fanconi's anemia, and Downs syndrome, all diseases with an enhanced frequency of malignancy.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To learn more about the mechanisms involved in the malignant transformation of cells. In particular, to clarify the relation of the DNA repair efficiency of various cell strains to their property of undergoing malignant transformation in vitro in response to various chemical and physical agents.
APPROACH: Our previously developed method (based on the alkaline sucrose gradient technique) of measuring the size of the single-strands of DNA is used to assess DNA repair, particularly, DNA strand incision and its rejoining. The cells used were various human cells obtained from normal or patients genetically predisposed to higher cancer incidence and mouse cell lines which have been found to differ in the ease which they can be transformed with chemicals in vitro. They were examined for DNA repair activity in response to UV-irradiation or treatment with chemical carcinogens.
RESULTS: The analysis on the average molecular size of a single-strand DNA from unirradiated and UV-irradiated BALB/3T3, A31-714, normal human and the cells derived from xeroderma pigmentosum (XP) patient of complementation group A, B, C, D, E and variant revealed that UV-irradiation to the cells caused single-strand DNA breaks in all the cells tested. Furthermore, knowledge of the relationship between the probability of malignant transformation in various kinds of cells and the qualitative and quantitative difference in DNA repair activity in these cells will provide: (1) Information about the involvement of DNA repair mechanism in chemical carcinogenesis. (2) Basic information needed to develop assay for chemical carcinogens using mammalian cells including human cells.

PROJECT DESCRIPTION: To develop and test compounds that will selectively induce or inhibit different forms of

microsomal mono-oxygenases involved in carcinogenic polycyclic hydrocarbon metabolism and to assess their effect in polycyclic aromatic hydrocarbon tumorigenesis.
APPROACH: Cell culture techniques, spectrophotofluorometry, high pressure liquid chromatography.
RESULTS: Feeding of butylated hydroxytoluene and anisole to male rats for several days induced the oxidative metabclism of benzo(a)pyrene in liver microsomes but decreased the metabolism in lung in vitro. Butylated hydroxytoluene was tested as potential radical scavenger during the inactivation of adenovirus by 6-hydroxy-benzo(a)pyrene. The presence of the antioxidant did not reduce the inactivation rate of adenovirus by the hydrocarbon.

PROJECT DESCRIPTION: To investigate the role of BPO hydratase in the in vitro and in vivo metabolism of carcinogenic polycyclic aromatic hydrocarbons. To purify BPO hydratase. To measure BPO hydratase activity in mouse target tissue and in human tissues and to relate this activity to the mixed-function oxygenase aryl hydrocarbon (benzo[a]pyrene) hydroxylase (AHH).
APPROACH: Thin layer, column and high-pressure liquid chromatography, UV spectroscopy, and spectrofluorometry.
RESULTS: Rat liver microsomal BPO hydratase has been purified eleven-fold. The purified enzyme is free of AHH activity. BPO hydratase and AHH have been measured in liver, lung, and skin of five strains of mice and in human liver microsomes and in cultured bronchial explants. In liver BPO hydratase activity is ten-fold higher than AHH activity and in both lung and skin it is 100-fold higher. The AHH inhibitor 7,8-benzoflavone stimulates BPO hydratase.

PROJECT DESCRIPTION: The aim of this research is to gather data relevant to the etiology of neoplasia at the molecular level. To this end chemical carcinogens, especially those of the aromatic amine type, are being utilized. Their metabolism and interaction with host tissues and specific targets are studied.
APPROACH: Biochemical and pharmacological techniques are applied to determine the metabolism of N-hydroxy-N-2-fluorenylacetamide and related compounds in various animal species. This includes study of the enzyme systems concerned with certain metabolic steps.
RESULTS: (1) Metabolism of 2-fluorenylacetamide (FAA) in resistant and susceptible mice. Despite their resistance to the carcinogenic action of FAA, the X/Gf strain of mouse excretes a level of the activated metabolite, N-hydroxy-2-fluorenylacetamide (N-OH-FAA) comparable to that excreted by the susceptible Swiss mouse. The metabolism of FAA by liver microsomes from X/Gf mice is being studied in order to explore further the differences between the strains.

PROJECT DESCRIPTION: Successful culture of epithelial-like cells derived from livers of 8 to 10 day old Fischer strain 344 rats and malignant transformation of such cultured cells by a variety of chemical carcinogens has been achieved. Our principal aim is to further determine the potential of in vitro epithelial systems for use in rapid bioassay procedures for chemical carcinogens and in examining the biochemical mechanisms of carcinogenesis.
APPROACH: Cell culture methods designed for selection of epithelial cells were employed to initiate cell cultures from livers of 8 to 10 day old Fischer rats. The method for selection of epithelial cells developed in this laboratory was modified by detaching and transferring islands of epithelial cells so that many homogenous sublines could be cultured from one primary culture.
RESULTS: These epithelial cells will be carefully examined for suitability as a carcinogen screening system. The relevant morphological properties in both normal and carcinogen treated cells will be investigated thoroughly. Extensive efforts will deal with the biochemical properties of both the normal and the transformed cells in culture. Basic biochemical mechanisms of the system will be investigated.

77 FUNDING: National Cancer Inst.
TECHNOLOGY: FOSSIL FUEL/General (100%)
POLLUTANTS: ORGANICS (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To learn more about DNA repair mechanisms in human cells and about their role in carcinogenesis. In particular, to determine the nature of the biochemical defects in human cell strains grown from biopsies taken from persons having extreme susceptibility to carcinogenesis, and to determine the biological consequences of the repair defects of these cells.
APPROACH: The difference in survival of treated virus measured using normal cells (proficient in repair of DNA damage due to 254nm ultraviolet irradiation) from that measured using cells from patients having xeroderma pigmentosum (deficient in such repair) is used as our index of the amount of repairable DNA damage produced by the physical or chemical treatments.
RESULTS: Preliminary studies concerning the inactivation of adenovirus 5 by 7,8-diol-9, 10 epoxy benzo[a]pyrene (the most mutagenic of all benzo[a]pyrene metabolites so far studied by others) show that this compound kills the virus by a mechanism that produces DNA damage that is repaired in a manner very similar to that by which DNA damage produced by 254nm UV is repaired.

POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To apply the mass spectrometry method for the analysis and identification of metabolites in carcinogen activation and metabolism studies. (2) To study in some detail the mass spectra of carcinogens and of some of their possible metabolites, such as aromatic hydrocarbons and N-nitroso compounds, with the aim of applying this knowledge to develop appropriate analytical methods.
APPROACH: A high resolution double focusing mass spectrometer system was used, interfaced with a gas chromatograph, and run in the electron impact ionization mode. A number of synthetic and metabolic samples were also prepurified by collaborators using high pressure liquid chromatography. In some cases suitable chemical characterizations were necessary.
RESULTS: In collaboration with Midwest Research Institute (J.F. Engel, NCI Contract No. N01-CP-33387), the laboratory has been involved in mass spectral analysis of synthetic polycyclic aromatic hydrocarbons (35 of them to date). Also, in collaboration with the chemistry branch of our division, mass spectral analysis has been put to valuable use in characterizing metabolic products of benzo(a)pyrene and of trans-7,8-dihydrobenzo(a)pyrene. (Project No. Z01-CP-04597-01-CH)

TECHNOLOGY: FOSSIL FUEL/General (100%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To investigate mechanisms by which metal ions might promote the formation of N-nitroso compounds in the environment. (2) To study mechanisms of metabolism and carcinogenesis by N-nitroso compounds using the deuterium isotope effect. (3) To synthesize possible metabolites of certain N-nitroso compounds for comparisons of their physical, chemical, and biological properties with those of the parent procarcinogens. (4) To elucidate mass spectrometric fragmentation mechanisms for N-nitroso compounds, especially by study of selectively deuterated substrates. (5) To study the circular dichroism of optically active nitrosamines with the goal of clarifying the sector rule for this series of compounds.
APPROACH: In addition to the standard methods of synthetic and mechanistic chemistry, considerable use has been made of the deuterium isotope effect as a pharmacological probe. This method has not been widely exploited elsewhere, and it is possible that this project may in the long run demonstrate the technique's general utility in pharmacological investigations.
RESULTS: Metallic species can serve as effective promoters of N-nitrosation reactions. Specifically, ferricyanide ion is catalytic for the reaction of secondary amines with nitrite. Also, a variety of metals at high oxidation states, which have been reported in the earlier literature to promote nitrosation of

amines by nitric oxide, are being reinvestigated with an eye toward assessing the potential environmental/biological significance of this reaction pathway. Finally, theoretical considerations have been advanced and documented from the literature to suggest that a wide variety of nitrogen oxidation states must be considered possible precursors for N-nitroso compounds.

PROJECT DESCRIPTION: To confirm that aryl hydrocarbon hydroxylase (AHH) inducibility is a common polymorphism inherited as a single gene and that persons with intermediate or high inducibility have a higher risk of lung cancer.
APPROACH: AHH inducibility will be determined in patients with lung cancer and their progeny.
RESULTS: Aryl hydrocarbon hydroxylase inducibility was found to be highly heritable (H = .7) in a study of 48 pairs of monozygotic and dizygotic twins. Moreover the data from the twin study suggest that AHH inducibility is most likely determined by a single gene. AHH inducibility cannot be determined in a population of lung cancer patients because the lymphocytes of 60 percent of these patients die during the three-day culture period. Thus AHH inducibility in lung cancer patients will have to be inferred by determining the inducibility in the progeny of lung cancer patients and an appropriately matched control population. This study is underway.

PROJECT DESCRIPTION: To define the chemically reactive positions of polycyclic hydrocarbons and to determine the interaction of the reactive intermediates with cell macromolecules and the nature of interaction with oncogenic viruses.
APPROACH: The kinetics of the toxicity of benzo[alpha]pyrene (BP) to a liver epithelial cell line (NMuLi) derived from Namru mice has been studied. The covalently linked BP to poly G has also been characterized. BP was covalently linked to poly G with liver microsomes from rats pre-treated with 3-methylcholanthrene.
RESULTS: Growth curves of NMuLi in BP showed that the carcinogen markedly depressed the saturation density and growth rate of the cells. These effects were dose-dependent. Absorption and fluorescence excitation and emission spectra (corrected for artifacts due to excitation source, monochromators and detectors) of the digests fit that of a red-shifted pyrene aromatic system and is, therefore, consistent with metabolism occurring at the 7, 8, 9, 10-positions of BP.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: It is believed that the chemistry of the in vivo reaction of the potent carcinogen BP and DNA is the initiating event leading to cancer induction. The knowledge of the nature of the ultimate carcinogen and the mechanism of its metabolic generation will suggest possibilities for inhibiting this sequence of events.
APPROACH: To understand the chemistry of the reaction between carcinogenic hydrocarbons and the DNA of mammalian cells which results when these compounds are metabolized by the cells. Furthermore, since it now seems probable that more than one reaction product is present in the DNA, the significance of each reaction will be considered in relation to mutagenesis and transformation.
RESULTS: It was established that rat liver microsomal metabolism of 7,8-dihydroxy-7,8-dihydro-benzo[alpha]pyrene (BP-7,8-diol) in the presence of added DNA yields the same product as obtained when BP was bound to the DNA of tissues to which this carcinogen was applied. The implication that this ''in vivo product,'' (i.v.p.) which is thought to be responsible for the

carcinogenic event, results from reaction with DNA of BP-7,8-diol,9,10-epoxide has been fully established. It has also been shown that the i.v.p. is predominantly a guanine derivative probably involving attachment of the hydrocarbon moiety through the 10-position to the 2-amino group of guanine. The question as to which of the geometrical isomers of BP-trans-7,8-diol-9,10-epoxide is involved in the formation of the i.v.p. in cells is under investigation.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project concerns three aspects related to research and control of cancer: (1) it provides basic knowledge and techniques for the establishment of in vitro neoplastic transformation assay and somatic mutation assay which may be useful in the detection and investigation of environmental and industrial carcinogens; and (2) this project will provide the basic understanding concerning the structure and function of the genetic apparatus as related to somatic mutation and to malignant transformation.
APPROACH: (1) To develop the necessary techniques and an understanding of the in vitro neoplastic transformation system and somatic mutation system, employing a single cell type (Syrian embryonic fibroblasts) so that both systems can be investigated concurrently using the same cell and with the same perturbation (carcinogens, mutagens, etc.), if needed. (2) To study the mutagenic and the transformation effects of the environmental carcinogens (benzo(alpha)pyrene (BP) and its metabolites), laboratory carcinogens (MNNG), and a perturbation specifically toward cellular DNA (incorporation of 5-bromodeoxyuridine followed by near UV irradiation. (3) To investigate the relationship between neoplastic transformation and somatic mutation.
RESULTS: The first major achievement is the establishment of a cellular system through which both the neoplastic transformation and the somatic mutation can be measured concurrently under the same perturbation or stimulus. Such a system has been established for the early passage Syrian hamster embryo cells, which can be cloned in the absence of a feeder layer for both morphological transformation and somatic mutation studies. In somatic mutation studies the 8-azaguanine (40 mu g/ml) resistant clones were selected. Comparison of the morphological transformation frequency and the somatic mutation frequency which is based on the number of 8-azaguanine resistant (40 mu g/ml) clones indicates that the mutation frequency (approximately 10/sup -2/) is 2-3 orders lower than the morphological transformation frequency (approximately 10/sup -2/), as induced by BP or MNNG.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Recent animal studies continue to indicate a relationship between high AHH inducibility and susceptibility to cancer caused by polycyclic hydrocarbons. The establishment of similar findings in a human cell system may help to identify those individuals at high risk to certain cancers and may point to directions for specific preventive procedures.
APPROACH: (1) To improve the reproducibility of the assay for measuring aryl hydrocarbon hydroxylase (AHH) in human lymphocytes; (2) to determine the activity and inducibility of AHH in a normal population and in cancer patients, particularly those with bronchogenic carcinoma; and (3) to measure AHH levels in families in an effort to understand the control of this enzyme.
RESULTS: The levels of AHH activity and inducibility were measured in approximately 500 normal individuals and included over 100 separate assay determinations. Frequency distribution of inducibility resembled a unimodal curve, skewed to the low inducible end. In addition, over 350 cancer patients were tested, of whom approximately 100 were diagnosed as having some form of lung cancer. At this point differences between lung cancer and normal populations are not significant. However, even under strictly controlled culture and assay conditions some individuals continued to vary more than others. This may be a reflection of the heterogeneity in the lymphocyte population itself. Of the two major subpopulations of lymphocytes, T cells appeared to have a higher AHH level of activity than B cells.

ROJECT DESCRIPTION: An understanding of these biochemical processes is necessary to understand carcinogenesis in humans.
APPROACH: To clarify the role of polycyclic metabolism in carcinogenesis.
RESULTS: (1) Regulation of Aryl Hydrocarbon (Benzo(a)pyrene) Hydroxylase Activity in Mammalian Cells. Aryl hydrocarbon (benzo(a) pyrene) hydroxylase is important in chemical carcinogenesis, since this enzyme metabolically activates chemically-inert carcinogens into metabolites that can be mutagenic and carcinogenic. It has been found that induction of aryl hydrocarbon hydroxylase can be mediated by cAMP. (2) Mutability of Different Genetic Loci in Mammalian Cells by Metabolically-Activated Carcinogenic Polycyclic Hydrocarbons. The relationship between carcinogenesis and mutagenesis in mammalian cells has been determined with 10 polycyclic hydrocarbons with different degrees of carcinogenicity.

PROJECT DESCRIPTION: The objectives of this project are twofold: (1) to test environmental compounds for carcinogenic activity using the strain A mouse pulmonary tumor-induction-technique and (2) to evaluate the effect of virus infections on the chemical induction of pulmonary tumors in strain A mice.
APPROACH: Bioassay - The strain A mouse lung tumor system was applied to the bioassay of 13 metals.
RESULTS: The tumor response of chemically treated mice was compared to that of the appropriate controls with the following results: Metals, 4 of the 13 metal salts tested were carcinogenic and these and the doses of the compounds required for 1 lung tumor per mouse are: lead subacetate, 0.13 mmol/kg; nickelous acetate, 1.15 mmol/kg; manganous sulfate, 3.3 mmol/kg; and molybdenum trioxide, 29 mmol/kg. The metal compounds which were not carcinogenic in this bioassay system are: cadmium acetate, calcium acetate, chromium sulfate, cobalt acetate, cupric acetate, iron(II),2,4-pentanedione, stannous chloride, 2,4-pentanedione vanadium(III) complex and zinc acetate.

PROJECT DESCRIPTION: To determine the feasibility of devising in vitro immunologic tests for the detection of prior exposure to known chemical carcinogens.
APPROACH: To date three chemical carcinogens, producing immunological specific percutaneous reactions, are being evaluated, namely, dimethylbenz[a]anthracene (DMBA), methylcholanthrene (MCA), and benzpyrene (BP). These carcinogens behave as haptens and an antigenic structure that shows in vitro reactivity can be provided by a carcinogen-protein carrier complex. Three systems are being studied in parallel to couple carcinogens with carrier proteins.
RESULTS: (1) Multiple carriers bind carcinogen including albumin, transferrin, immunoglobulins and skin proteins to represent approximately 60% of protein bound carrier while to date, 40% of carrier proteins remain unidentified. (2) In vitro complexes are obtained by an induced and isolated liver microsomal aryl hydrocarbon hydroxylase enzyme system. Multiple carcinogen-protein carrier conjugates are necessary in vitro to stimulate reactions. Using cavine whole serum for in vitro carrier-coupling, our data shows specific MIF indexes of 60+-8 vs controls 90+-9 for DMBA and only 78+-7 for the promimal carcinogen, MCA in DMBA immunized guinea pigs. (3) Basic in vitro complexes may be formed by the addition of carcinogen (DMBA in DMSO) to Human AB serum.

TECHNOLOGY: FOSSIL FUEL/General (10%);GENERAL SCIENCE (90%)
POLLUTANTS: ORGANICS (10%)

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To obtain antibodies that react specifically with chemical carcinogens and other small molecules of interest in cancer research. The antibodies will be used as reagents to develop immunoassays capable of detecting the corresponding haptens in body fluids and tissues. Haptens attached to appropriate carriers will be used as antigens to detect presence of antibodies in the serum of animals and humans. These reagents will be tested for their suitability to detect exposure to environmental agents that may be related to cancer causation.
APPROACH: This work may provide a way to determine the degree to which individuals in different environments have been exposed to known chemical carcinogens. The immunologic approach does not require that the carcinogen be present in the individual at the time of testing. A metabolite, which is longer lived in physiological fluids than the parent compound and/or which may be responsible for the biological effect, may provide a more reliable base for epidemiological studies. Demonstration that different groups are at risk may provide the impetus to remove certain agents from the environment.
RESULTS: Polycyclic aromatic hydrocarbons: Two differently substituted derivatives of BP and a 7,12-DMBA derivative were used to prepare conjugates for immunization. While the antibodies react more effectively with the homologous haptens, they cross react to varying degrees with structurally related compounds. Analyses of sera indicate that BP and DMBA, if they occur at all, are present in concentrations of less than 500 pg/ml. If immunoassays which depend upon the host's cellular responses are required to monitor populations for exposure to PCHs, the serological activities described may serve as a guide for evaluating the specificities of such responses. Also, multivalent conjugates, such as those prepared for this study, may be necessary to elicit such responses in sensitized animals.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The specific objective of this contract is to study the process whereby chemical carcinogens promote viral oncogenesis and to determine if oncogenic and non-oncogenic viruses may similarly promote oncogenesis by known chemical carcinogens. This contract is part of a program to develop in vitro screening methods for detection of potential carcinogenic hazards, either viral or chemical.
APPROACH: This study has established that treatmnt of cells with chemical carcinogens will increase the frequency of viral transformation in vitro. A total of 83 chemicals including polycyclic hydrocarbons, aromatic amines, alkylating agents, metal salts, drugs, certain fuel or food additives, pesticides, herbicides, organic solvents, and other industrial chemicals are being tested for toxicity on human and hamster cells and for their capacity to enhance viral transformation, induce breaks in cell DNA, stimulate unscheduled DNA (repair) synthesis, induce mutations in Chinese hamster cells, and transform Syrian hamster cells in vitro.
RESULTS: Carcinogenic polycyclic hydrocarbons and alkylating agents enhanced transformation of hamster cells by a simian adenovirus, SA7, but non-carcinogens did not. The sequence of addition of virus and chemical was found to be a critical factor for enhancement to occur. Pretreatment of cells for 18 hours with salts of arsenic, beryllium, cadmium, chromium, lead and nickel enhanced viral transformation, but treatment with manganous chloride, mercuric chloride, or titanic oxide did not enhance transformation.

POLLUTANTS: ORGANICS (10%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The goal of this research activity is to develop objective criteria for the extrapolation of animal data to the human situation. This would allow for the identification in a straightforward manner of those chemical exposures in the environment of man for which substantive risk exists. Only in such a context can meaningful risk-benefit evaluations be carried out. To assess the significance of experimental data to man, the research focuses on three major topics: (1) comparative metabolism of carcinogens in human and animal systems; (2) chemical carcinogenesis in vitro; and (3) mutagenesis testing.
RESULTS: In a study on polycyclic aromatic hydrocarbon carcinogenesis, the mutagenic effects of a series of metabolites or synthesized intermediates of benz(a)anthracene, benzo(a)pyrene, 7-methylbenz(a)anthracene and 7,12-dimethylbenz(a)anthracene were investigated. With S. typhimurium strain TA100, non-K-region dihydrodiol epoxides of benzo(a)pyrene and benz(a)anthracene were found to be only slightly less active than the corresponding K-region epoxides. These data support the hypothesis that, for the hydrocarbons

studied, non-K-region dihydrodiols may be converted through epoxidation of the adjacent olefinic double bond into non-K-region dihydrodiol epoxides which are mutagenic for S. tryphimurium TA100.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The bioassay of suspected chemical carcinogens, definition of the biological and chemical mechanisms of the carcinogenesis process and the analysis of trace levels of environmental carcinogens are three principal research aims under this contract.
RESULTS: Polycyclic Aromatic Hydrocarbon Carcinogenesis: Evidence for the involvement of one-electron oxidation in polycyclic hydrocarbon carcinogenesis is steadily amassing. It is suggested that the radical cations formed by one-electron oxidation may be among the intermediates concerned in initiation of the carcinogenic process. The evidence for this hypothesis is: (1) the existence of inducible cytochrome P-450-linked nuclear monooxygenase, which catalyzes the covalent binding of carcinogenic hydrocarbons to DNA under conditions where oxygenation of the hydrocarbon cannot occur; (2) mechanistic details pertaining to nucleophile trapping of PAH radical cations, which suggest possible binding site(s) of hydrocarbons in biological systems; (3) the loss of (H-3) in 3-methylcholanthrene (3-MC) specifically tritiated at C-1 after binding to DNA in rat liver nuclei which indicates ca. 95% of the hydrocarbon bound to that position; (4) the quantitative skin tumorigenesis of 3-MC and its oxygenated derivatives at the 1- and 2-position, which implies C-1 as the critical binding site; and (5) the quantitative skin tumorigenesis of several 6-substituted benzpyrenes in relation to the parent compound, which suggests involvement of the 6-position as the critical binding site.

TITLE: Carcinogenesis and Control of the Cell Cycle
PROJECT NUMBER: N01-CP-33405
PRINCIPAL INVESTIGATOR: Holley, R.
AFFILIATION: Salk Inst. for Biological Studies, San Diego, Calif. (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
MONITOR: Peacock, Andrew
TYPE OF FUNDING: Contract No.
77 FUNDING: National Cancer Inst.
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Carcinogenesis changes the relationship between the cell and the extracellular agents such that growth rates greater than normal occur. However, it has been found that some regulations of growth still remain in chemically-induced tumor cells and the residual controls in these malignant cells are the subject of the present study. The overall objective of this study is to determine the kinds of changes that accompany chemical transformation of cells. The present project contributes to that goal but focuses on mechanisms whereby the growth rate in chemically-induced tumors might be checked.
RESULTS: Major efforts during the last year have been directed toward understanding the changes in growth control that take place when 3T3 cells are transformed by benzpyrene. The work has been carried out with two clones of benzpyrene-transformed 3T3 cells. Major findings can be summarized as follows. Benzpyrene-transformed 3T3 cells (BP3T3) have growth behavior very similar to that of viral-transformed 3T3 cells when cultured under the usual laboratory conditions in medium with 10% serum. The two transformed cell lines have similar, low serum requirements. Both transformed cell lines are tumorigenic. However, the growth of BP3T3 cells still shows ''normal'' controls. Except for a decrease to one-tenth in the serum requirement, growth controls are very similar to those seen in normal 3T3 cells.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To investigate interaction or synergism of radiation and hormones in the induction of mammary tumors.
APPROACH: Both irradiation and ovarian hormones, given individually in large dose, have been implicated in causing an increase in breast cancer of both laboratory animals and women. It has been speculated that x-rays, routinely used for diagnosis and radiotherapy, plus estrogens and progesterones, now being widely used in birth control pills or for post menopausal therapy, may interact synergistically and be

contributing to the alarming rise in the incidence of breast cancer.
RESULTS: The contractor has been able to show that a single dose of x-ray delivered to one mammary chain of AxC inbred rats which had also received a continuous exogenous source of diethylstilbestrol (DES) resulted in a significant increase in mammary tumors over that resulting from the estrogen alone. None of the non-estrogen treated control animals developed cancers. Those which were irradiated alone developed cancers at a much later time. There is a dosage response between radiation in the range used (50, 150 or 450 r) and tumor induction in the DES-treated rats. The greatest synergism was attained with 150 r.

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine if the synergistic interaction between x-irradiation and estrogen on mammary gland carcinogenesis in the female AxC rat can also be observed for neutron radiation; and to understand the mechanism of such synergism.
APPROACH: Because it has been reported that women exposed to repeated fluoroscopic examinations, women survivors of atomic bombings and possibly women treated with x-ray for acute postpartum mastitis, all have an increased risk of developing breast cancer, radiation exposure is now associated with breast cancer of the human female. This project is an attempt to develop an animal model, and to understand the model itself, so that the qualitative aspects of mammary carcinogenesis in man may be evaluated in terms of cause and prevention of breast cancer.
RESULTS: A synergistic interaction between diethylstilbestrol (DES) and x-rays on mammary adenocarcinoma formation in AxC female rats has been reported. This synergism was found to obtain also for DES and neutron radiation in AxC female rats. In female rats of the Sprague-Dawley strain, no such synergism was found. DES has been found to induce much higher levels of serum prolactin in AxC rats than in Sprague-Dawley rats. Thus prolactin is implicated in the synergistic interaction of DES and radiation on mammary adenocarcinoma formation. As the dose of DES is lowered in AxC rats synergism with radiation is delayed and may even be absent. Prolactin levels will be correlated with DES dose and carcinogenic response. When the time between neutron radiation and DES treatment is lengthened synergism of mammary adenocarcinoma formation is maintained suggesting that there is little or no recovery or repair of radiation injury.

TECHNOLOGY: FOSSIL FUEL/General (100%)
POLLUTANTS: PARTICULATES (20%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To analyze cocarcinogenic effects of physical and chemical agents in the induction of lung cancer. (2) Identification and study of those environmental agents (e.g., irritant gases and dusts, infectious microbes) which may increase the susceptibility of respiratory tissues to normally ineffective doses of carcinogen or which may alter the ''effective'' tumorigenic dose by affecting distribution, deposition and/or clearance of inhaled carcinogenic particulates. (3) To study host factors, which affect tumor induction and tumor progression. (4) To identify the major steps in the morphogenesis of lung cancer on the histological and cytological level. (5) To develop new experimental models for co-factor studies.
APPROACH: Epidemiologic data indicate a multifactorial etiology in human lung cancer. This work is a study, using animal models, of the role of inhaled chemicals and of physical and biological agents influencing the respiratory tract in the development of lung cancer. It is expected that this approach will help to define the decisive environmental and host factors in the pathogenesis of lung cancer.
RESULTS: An inhalation carcinogenesis study is underway to determine whether reactive gases produced during combustion of fossil fuels, namely nitrogen dioxide, formaldehyde, and acrolein, enhance the carcinogenic potency of benzo(a)pyrene given by intratracheal injection. The time relationship. Studies on clearance of benzo(a)pyrene attached to carbon particles from the respiratory tract were carried out using radioactively tagged carbon. It was found that, in vivo, the BaP is quickly eluted from the surface of small carbon particles (1 to 5 mu), but only very slowly from the surface of large carbon particles (20 mu). In the latter case, the carcinogen is cleared at the same rate as the carrier particles. This finding elucidates an important role of carrier particles in respiratory carcinogenesis studies.

77 FUNDING: National Cancer Inst. FY77:$113,200
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The major objectives are to define and characterize the various kinds of DNA repair that occur in human cells after treatment with representative carcinogens and metabolites of carcinogens, in an effort to understand the relationship between the lesions induced in DNA, their alteration by repair enzymes, and the ultimate consequences of these events.
APPROACH: In all experiments involving the treatment of cells or organisms with chemical carcinogens, repair of the lesions induced by the agents is a significant chemical event and should be investigated. It is conceivable that carcinogenesis may occur as a result of residual, i.e., unrepaired lesions, in the DNA. Thus it is most essential that there be, as an integrated part of this program, a laboratory working exclusively on DNA repair after treatment with chemical carcinogens.
RESULTS: Using the bromodeoxyuridine photolysis assay, two modes of DNA repair in human cells have been described; the short, or ionizing, type repair and the long, or UV, type repair. These two repair modes are observed in human cells after treatment with a variety of chemical carcinogens. In further experiments DNA damage and repair has been examined with 1,1-bis(phenyl)-2-proponyl-N-cyclohexylcarbamate and 1'acetoxy safrole. The diaryl carbamate is a long repair inducing agent with defective repair in xeroderma pigmentosum (X.P. cells). The safrole is a classical short repair agent, with repair patterns identical to normal and X.P. cells even at long time, i.e., 18 hours after treatment. The 4,5 epoxide of benzo(a)pyrene induces short repair while the non-K region, 7,8 epoxide, appears to induce cross links in DNA upon irradiation with the 313 nm light used in our assay. Further results suggest that while patch size may be similar for different carcinogens, some chemical agents may induce UV-endonuclease sensitive sites (and show defective repair in X.P. cells) while others do not.

POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: Develop, evaluate, standardize, and apply in vitro systems for studying the effects of known and suspected carcinogens in the environment.
APPROACH: Define the events, with special emphasis on the role of endogenous type C RNA viral genomes, associated with activation of viruses in tissue culture by chemicals, DNA, viruses, or spontaneously, and characterization of endogenous viral isolates. Utilize cell systems to study potential anticancer products, including viral vaccines, viral inhibitors, interferons, etc. Utilize and adapt subhuman mammalian transformation and viral induction procedures to studies of human tumor and transformed cell lines for assaying suspected environmental carcinogens, and in efforts to detect and ''rescue'' human type C RNA viruses or viral genomes. Study the effect of viral vaccines, viral inhibitors, interferon, etc., on naturally occurring and chemically induced tumors. Study the role of the enzyme aryl hydrocarbon hydroxylase (AHH) in chemical carcinogenesis.

ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: Propylene (C50077 in the Carcinogenesis Bioassay Data System) will be tested for two years by inhalation in the Fischer 344 rat and the B6C3F1 mouse. Prechronic testing, already underway, will determine the maximum tolerated dose (MTD). During the chronic phase, 50 animals/species/sex/dose level will be exposed to the MTD and 1/2 MTD.
APPROACH: Controls will be pooled with those for two other chemicals being tested under the subcontract. Assignment of pooling partners has not yet been made. For each group of three chemicals, there will be a positive chemical control to test the species and strain for sensitivity to a known carcinogen--dimethylnitrosamine. Fifty animals/species/sex/dose level will be used in the positive chemical control test. All animals will be sacrificed at the end of the chronic test for histopathological evaluation; no clinical chemistry, teratogenesis, or mutagenesis evaluations will be undertaken.

POLLUTANTS: ORGANICS (50%);RADIATION (50%)
PROJECT DESCRIPTION: We propose an approach to studies of cell survival, mutagenesis, DNA replication, repair replication, and the assessment of DNA damage in mammalian cells as they relate to the cell cycle. Our objective is to compare these parameters and develop appropriate hypotheses concerning the relationships between the cell cycle and cellular responses to radiation and chemicals.
APPROACH: Specifically, we will compare the survival and mutagenic responses as a function of the cell cycle phase in response to UVL, UVL-like chemicals, x-rays, and x-ray-like chemicals; determine the cell cycle dependence of radiation and chemical DNA-damage recognized by damage specific enzymes; and investigate ultraviolet light-irradiated G1-phase cells for UVL-specific DNA synthesis that may be involved in the bypass of DNA damage and to compare the UVL-specific synthesis with that induced by selected chemicals.
KEYWORDS: ANIMAL CELLS;CELL CYCLE;SURVIVAL TIME;DNA REPLICATION;MUTAGENS;X RADIATION;ULTRAVIOLET RADIATION;DNA;STRAND BREAKS;BIOLOGICAL REPAIR;ENZYMES;BIOCHEMICAL REACTION KINETICS;BIOLOGICAL RADIATION EFFECTS;CELL CULTURES;RESPONSE MODIFYING FACTORS;RADIOSENSITIVITY EFFECTS;BIOLOGICAL EFFECTS;MUTAGENS

TITLE: Response of Pigment Cells to X- and UV-Radiations
PROJECT NUMBER: R01-CA-06097-15S1
PRINCIPAL INVESTIGATOR: Quevedo, W.C.
ADDRESS: University Hall, Box 1867, Providence, RI 02912
AFFILIATION: Brown Univ., Providence, R.I. (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$12,200
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: The proposed project is directed at determining the extent to which the responses of mammalian pigment cells to UV- and x-radiations arise from direct modification of the irradiated cell or

are dependent on events initiated within the particular cellular community of which it is a part.
APPROACH: The problem of pigment cell niche and radiosensitivity is examined and is subjected to experimental analysis. The significance of melanin pigment as a radioprotective agent is evaluated in the case of epidermal melanocytes. Particular emphasis is placed on determining the consequences of the proposal that the epidermal melanin unit, consisting of a melanocyte together with its constellation of associated epidermal cells (keratinocytes), is the fundamental integrated unit of pigmentary function in the epidermis of vertebrates. The functional and morphological properties of the epidermal melanin unit are examined in the skin of vertebrates representative of each of the major classes. Particular attention is given to the roles that genes and hormones play in modifying the responses of mammalian melanocytes to ionizing and ultraviolet radiations. The cellular basis for radiation-induced changes in melanocyte populations and the nature of cellular interactions during pigmentation of skin and hair are also examined.
KEYWORDS: ANIMAL CELLS;CELL CULTURES;RADIOSENSITIVITY;PIGMENTS;RESPONSE MODIFYING FACTORS;BIOCHEMICAL REACTION KINETICS;BIOLOGICAL RADIATION EFFECTS;MELANIN;RADIOSENSITIVITY EFFECTS;ULTRAVIOLET RADIATION;X RADIATION

TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: The purpose of this research is to prepare oxygenated derivatives of 7,12-Dimenthylbenz(a)anthracene, DMBA, to aid in the identification of metabolic products of DMBA which might be important in finding out what role DMBA plays in the initiation of cancer.
APPROACH: The 1-, 2-, 3-, 4-, 8-, 9-, 10-, and 11-hydroxy derivatives of DMBA are the primary targets. Each may exist as the corresponding keto derivatives. The relative reactivity of these keto forms will be assessed as they may be involved in reactions with DNA or proteins. We also hope to make selected derivatives of methylcholanthrene to learn how similar its metabolism might be to that of DMBA. Sufficient of all of the compounds envisioned are to be made so that interested investigators may obtain samples for their research.

TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: Genome size (amount of chromosomal protein plus DNA, per cell) and radiosensitivity for mutation induction and for cell killing will be measured in different species and in different tumor cell culture lines, and correlations tested. Genome size is a good predictor of relative radiosensitivity.
APPROACH: Several human and animal tumor cell lines of different radiosensitivities will be examined for their genome size and cytological characteristics, to see if these differences account for their different sensitivities. The same tumor lines will also be grown in tissue culture as solid microsphere colonies, to test the effect of solid vs. single-cell growth on radiosensitivity. Microsphere colonies simulate in vivo solid tumors.

TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: The objective of this proposal is to gain some understanding of the mechanisms of hydrocarbon-induced carcinogenesis by measuring in a model system, hamster embryo cell cultures, specific biological changes produced by the hydrocarbons and the various aspects of cell-carcinogen interaction that led to these changes.
APPROACH: The levels of aryl hydrocarbon hydroxylase activity, the extent of hydrocarbon metabolism, the metabolite profiles, and the amounts and types of hydrocarbon DNA-bound products, under different experimental conditions, will be compared to the frequencies of hydrocarbon-induced transformation, mutation and cytotoxicity.
RESULTS: Those aspects of cell-carcinogen interaction that are related to the induction of each of the biological effects in these cells will be defined.

TITLE: Effects of Radiation on Stationary Cells
PROJECT NUMBER: R01-CA-11751-08
PRINCIPAL INVESTIGATOR: Little, J.B.;Williams, J.R.;Selsky, C.A.;Nagasawa, H.
ADDRESS: 55 Shattuck St., Boston, MA 02115
AFFILIATION: Harvard Univ., Boston, Mass. (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$131,600
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: The long-term goal of this research is to gain knowledge about mechanisms which determine the radiosensitivity of mammalian cells, particularly those involved in the response of stationary or very slowly proliferating cells to x-irradiation.
APPROACH: We will utilize density-inhibited plateau phase cultures of several different cell strains including 10T-1/2 mouse embryo cells, human diploid cells and human tumor cells. Three endpoints will be studied in parallel: cell survival; malignant transformation in vitro; and mutation rate. We will investigate the relationships between these cellular effects and try to correlate them with molecular DNA repair processes.
RESULTS: Understand and correlate events such as repair at the molecular level with cellular effects such as survival and malignant transformation.
KEYWORDS: ANIMAL CELLS;RADIOSENSITIVITY;X RADIATION;RESPONSE MODIFYING FACTORS;CELL CYCLE;CELL CULTURES;EMBRYOS;MICE;TUMOR CELLS;DIPLOIDY;SURVIVAL TIME;RADIOBIOLOGY

TITLE: Unsaturated Polyolefins and Hydrocarbon Carcinogenesis
PROJECT NUMBER: R01-CA-12115-07
PRINCIPAL INVESTIGATOR: Paquette, L.A.;Liotta, D.;Wallis, T.G.;Burson, R.L.;Fristad, W.E.;Park, H.
ADDRESS: 164 W. 17th Ave., 102 Administration Bldg., Columbus, OH 43210
AFFILIATION: Ohio State Univ., Columbus (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$74,300
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: The project is geared to providing fundamental information as to whether such structural modifications of polycyclic aromatic hydrocarbons as perturbed delocalization, three-dimensional characteristics, and other electronic features are crucial to maintenance of carcinogenic reactivity.
APPROACH: Certain benzenoid hydrocarbons and heterocycles are known to be potent carcinogens. This proposal describes the synthesis of new types of potentially delocalized nonbenzenoid systems which have in common the size, shape, and reactivity conceivably necessary for carcinogenic reactivity. Knowledge of the reactivity and carcinogenicity of these inherently novel molecules is important because of the possible insight which may be gained into the chemical basis for carcinogenesis. Specifically, the target compounds are in certain cases expected to possess homoaromatic character, in other cases to exhibit rapid valence tautomerism, and in still other instances to possess fixed double bonds. Accordingly, a wide range of structural types are to be made available. All stable target compounds prepared in this work are to be evaluated for possible carcinogenicity.
RESULTS: Synthesis of the parent target molecules has been successfully achieved. However, it has proven to be unstable in air, decomposing readily to a tarry substance. Attention was then directed to substituted derivatives and especially to benzo fused analogs in an effort to enhance stability. The syntheses of two benzolcgs are nearing completion.

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: This research is aimed at assessing comparatively the potential carcinogenic potency of tritiated water versus tritiated DNA, RNA and protein precursors, namely thymidine, uridine, or leucine, in relation to their specific patterns and sites of incorporation in C57 Black/6N mice.
APPROACH: For this purpose the basic (spontaneous) tumor spectrum in control animals will be defined as a multiple competitive tumor model, from which the variation in the tumor spectra possibly associated with exposure to various tritiated compounds will be evaluated, both quantitatively and qualitatively. In addition, it is planned to investigate the potential cumulative genetic injury resulting from exposure of male mice to tritiated water or tritiated thymidine, prior to sibling mating, during 25 successive generations. The incorporation patterns of tritiated precursors of DNA, RNA and proteins versus tritiated water in selected target organs have been investigated, in an attempt to correlate the possibly induced tumor spectra with various sites of tritium incorporation.

TITLE: Radiation In Vitro and Mammary Cell Survival and Neoplasia
PROJECT NUMBER: R01-CA-13881-05
PRINCIPAL INVESTIGATOR: Clifton, K.H.;Sridharan, B.N.;Gould, M.N.
ADDRESS: 307 N. Charter St., Madison, WI 53706
AFFILIATION: Wisconsin Univ., Madison (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$124,400
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: The goal of this project is to gain quantitative information on the number, nature, and acute radiation response of the cells involved in initiation of the neoplastic process which leads to mammary tumors following exposure of mammary cells to ionizing radiation in vitro, and how this process is related to the type of radiation, the dose, and the hormonal exposure of the cells before and after irradiation.
APPROACH: The project is divided into short-term studies devoted to development and application of a radiation dose-mammary cell survival assay, and to long-term carcinogenesis experiments. The former will be based on grafting of monodispersed mammary cell suspensions into the mammary tissue-free fat pads of rats which are primed with injected hormones and/or grafted with mammotropin-secreting pituitary tumors. Long-term studies will involve irradiation of mammary cell suspensions in vitro, which will then be grafted in similar animals and observed for tumor development. By these methods we hope to: (1) determine the total number of cells of the type from which the malignancy is derived and which survive exposure; (2) minimize the abscopal effects of irradiation; and (3) develop a system in which both physical and hormonal factors can be manipulated, before and after exposure, for study of cell survival, repair and neoplasia in a quantitative fashion.

TECHNOLOGY: FOSSIL FUEL/General (100%)

ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: The ultimate goal of this program is to obtain data which can be used to evaluate the present or potential role of inhibitors of environmental chemical carcinogens.
APPROACH: The first part of this renewal is a continuation of efforts at determining the mechanism of inhibition of polycyclic hydrocarbon carcinogenesis by antioxidants. The mechanism by which butylated hydroxyanisole (BHA) causes decreased binding of benzo(a)pyrene (BP) metabolites to DNA in a microsomal system (previously observed) will be studied. BP metabolite patterns produced by incubation of BP with microsomes from normal and BHA fed mice will be determined as will be the activities of enzyme reactions potentially affecting these metabolite patterns.
RESULTS: This consists of efforts at demonstrating a direct interaction of BHA with BP metabolites. The second part of the proposal will be aimed at inhibiting carcinogenesis due to malonaldehyde and glycialdehyde.
KEYWORDS: CARCINOGENESIS;BIOLOGICAL MODELS;CHEMICAL EFFLUENTS;INHIBITION;BENZOPYRENE;METABOLISM;BIOCHEMICAL REACTION KINETICS;POLYCYCLIC AROMATIC HYDROCARBONS;TOXICITY;ALDEHYDES;CARCINOGENS;SACCHARIDES

TITLE: Tritium Damaged Mammalian Cells In Vitro
PROJECT NUMBER: R01-CA-14310-05
PRINCIPAL INVESTIGATOR: Burki, H.J.
ADDRESS: School of Letters and Science, Berkeley, CA 94720
AFFILIATION: California Univ., Berkeley (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$56,600
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: These experiments are designed to further explore regions within the mammalian cell nucleus where isotopic decay appears to be most critical in the induction of reproductive death and chromosome damage.
APPROACH: Mouse leukemic cells (L5178Y), human cells (HeLa), and several types of Chinese hamster cells from different tissue sources (V79 lung, M3-1 bone marrow, CHO ovary), will be labeled with precursors of DNA containing tritium, C14, and I125, or tritiated precursors of protein and RNA. After being synchronized by various methods, these cells will then be cooled to 4 degrees C or frozen to -196 degrees C to accumulate damage due to tritium and other isotope disintegration. After suitable time intervals the cells will be thawed out and the reproductive ability and chromosome damage will be determined. The efficiency of cellular inactivation and induction of genetic damage will be compared for damage accumulated in various subcellular regions.
RESULTS: The results of these studies may provide information of two general types: (1) information on the basic mechanisms which lead to the inactivation of proliferative ability of mammalian cells and the induction of chromosome aberrations, and (2) quantitative estimates of the relative hazards to the population from environmental tritium released to the biosphere as a by-product of nuclear power production.

TITLE: Hydrocarbon-Induced Malignant Transformation In Vitro
PROJECT NUMBER: R01-CA-15205-04
PRINCIPAL INVESTIGATOR: Marquardt, H.W.
ADDRESS: 410 E. 68th Street, New York, NY 10021
AFFILIATION: Sloan-Kettering Inst. for Cancer Research, New York (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$23,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: Mechanisms involved in hydrocarbon-induced malignant transformation will be studied in an in vitro model system for chemical carcinogenesis which employs fibroblasts from mouse prostate.
APPROACH: Our studies on the metabolic activation of polycyclic aromatic hydrocarbons will be continued, especially the biologic activity of diol-epoxides will be investigated: recent findings suggest such derivatives to be ultimate carcinogens in the case of some, if not all, hydrocarbons. Our studies on the binding of hydrocarbons and their derivatives to DNA and on the capacity of these compounds to induce DNA-repair will be continued. Our studies led us to suggest that reverse transcriptase may play a role in chemical transformation, too; we will continue to study the effect of inhibitors of this enzyme activity on chemically induced transformation and to investigate whether the activity of this enzyme changes during the course of transformation-induction. Moreover, we will further explore the suitability of our in vitro model system to predict the oncogenic potential of environmental chemicals. For instance, in such an effort we had seen that the radical-scavenger, cysteamine, inhibits tumorigenesis in vivo and malignant transformation in vitro induced by chemicals, and we had observed a good correlation between in vivo tumorigenesis and in vitro oncogenesis with the anthracycline antitumor antibiotics, adriamycin and daunomycin.

TITLE: Radiation-Induced Modifications in Protein Synthesis
PROJECT NUMBER: R01-CA-15378-04
PRINCIPAL INVESTIGATOR: Oleinick, N.L.;Biaglow, J.E.
ADDRESS: 2109 Adelbert Road, Cleveland, OH 44106
AFFILIATION: Case Western Reserve Univ., Cleveland, Ohio (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$96,900
TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: The objectives of the proposed research are to relate (a) the molecular damage produced by ionizing radiation in DNA to the impairment of function of the DNA, and (b) the removal of that damage and the subsequent recovery of functions to metabolic repair systems dependent upon protein synthesis.
APPROACH: We have already determined that rRNA synthesis is inhibited by gamma-radiation and subsequently recovers. The rDNA will be isolated from the irradiated cells during and after the period of inhibition, and strand-breaks, alkali-labile sites, enzyme-sensitive sites, and base damage measured. The kinetics of the repair or removal of each type of damage will be determined and compared to the kinetics of transcription, processing, and transport of rRNA.
RESULTS: A detailed understanding of these radiation-induced modifications in transcription and translation should provide a conceptual framework for evaluating the roles of protein synthesis in the induction of and/or recovery from mitotic delay, chromosome aberrations, premutational damage, and sublethal and potentially lethal damage, and for manipulating the radiation sensitivity of normal and cancerous cells in order to enhance or prevent radiation damage and improve the treatment of human tumors.

TITLE: Mutants and Altered Radioresponse of Cells and Tumors
PROJECT NUMBER: R01-CA-15901-04
PRINCIPAL INVESTIGATOR: Gregg, E.C.;Nygaard, O.F.;Rustad, R.C.;Biaglow, J.E.;Rosenberg, H.M.;Yau, T.M.;Adams, R.B.;Robinson, J.K.;Voelker, W.H.;Kim, S.C.
ADDRESS: 2109 Adelbert Road, Cleveland, OH 44106
AFFILIATION: Case Western Reserve Univ., Cleveland, Ohio (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$126,000
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: Our objectives are several fold: (1) To produce radiation resistant mutants from a stable strain of mammalian cells growing in various environments of radiation and in combination with various carcinogens and chemotherapeutic agents. Radiations of differing LET are also to be used. (2) To quantitate the overall mutation rate for radiation resistance as a function of LET and dose rate including the simulation of a fractionated radiation therapy regimen. (3) To elicit the basic mechanism of the induction of mutants by radiation and to investigate the possibility of synergism with other mutagenic agents. (4) To identify, describe and assess biochemical, biophysical and cytological differences between the mutants and the parent strain.
RESULTS: The attainment of these primary objectives will sharply extend our understanding of radiation resistance and perhaps lead to new radiation modifiers in cancer radiotherapy. Further, quantitative information on the production of radioresistant mutants as a function of dose delivery could lead to new fractionation schedules designed to minimize radioresistant tumor regrowth during and after therapy. Lastly, quantitation of mutation rates due to radiation in conjunction with other agents could have impact in both radiotherapy and regulation of environmental contaminants.

TITLE: Cytochrome P450, Chemical Carcinogenesis Benzo(a)pyrene
PROJECT NUMBER: R01-CA-16265-03
PRINCIPAL INVESTIGATOR: Jefcoate, C.R.;Shinnick, F.;Fahl, W.E.;Wrighton, S.A.
ADDRESS: 307 N. Charter Street, Madison, WI 53706
AFFILIATION: Wisconsin Univ., Madison (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$41,500
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: The project will focus on the biochemical mechanisms which determine the combination of benzo(a)pyrene metabolites with cellular DNA and which lead to gene mutations.
APPROACH: The metabolism of benzo(a)pyrene will be studied in liposomes reconstituted from purified P450 cytochromes, P450 reductase, oxide-hydrase and selected lipids, with rat liver microsomes or nuclear envelope after induction by various agents. The biophysical characteristics, particularly fluidity, of these membrane preparations will be investigated and related to benzo(a)pyrene metabolism. The conjugation of benzo(a)pyrene metabolites with various DNA molecules will be examined in these systems. Analytical techniques will be established to identify and quantitate nucleoside-metabolite conjugates obtained by hydrolysis of metabolite-modified DNA. The production of benzo(a)pyrene metabolites and the formation of metabolite nucleoside conjugates will be examined in isolated nuclei and whole cells from rat liver and lung. The modification of DNA in these systems will be examined in terms of parental DNA, newly synthesized DNA, euchromatin, heterochromatin and the production of DNA breaks. These parameters will be examined to explain the sensitivity of lung cells but not hepatocytes to oncogenic transformation by benzo(a)pyrene.

TITLE: Repair and Survival in Irradiated Cells
PROJECT NUMBER: R 01 CA 16579-03
PRINCIPAL INVESTIGATOR: Yatvin, M.B.;Gipp, J.;Hafeman, D.;Sacks, H.
ADDRESS: 307 N. Charter Street, Madison, WI 53706
AFFILIATION: Wisconsin Univ., Madison (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$29,000
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: The aim of this proposal is to resolve, if possible, the discrepancies between biophysical and biochemical evidence of repair and ultimate survival in irradiated cells.
APPROACH: Because of its unique role in controlling cell function, many recent studies have focused on DNA and the results of alkaline sucrose gradient analysis of DNA from irradiated cells. These studies have been interpreted to indicate that there is extensive repair of single strand breaks. Recent experiments in our laboratory suggest that alternative mechanisms may play an important role. Because of the close association between DNA and the plasma membrane in E. coli, preliminary studies of bacterial cell membrane changes after irradiation will be extended. Studies on the effect of radiation on cell membranes may have relevance to the clinical treatment of malignant disease in that they may provide a better rationale for the use of combined radiation and chemotherapy.

TECHNOLOGY: FOSSIL FUEL/General (50%);NUCLEAR/General (50%)
POLLUTANTS: ORGANICS (50%);RADIATION (50%)
PROJECT DESCRIPTION: We plan to study the effects of carcinogenic chemicals on DNA and RNA in living cells and in particular to test for the formation of similar complexes in vivo and to study means of elimination of such structures from the injured tissue. In parallel, our present studies on the effects of carcinogens on biologically active (transforming) DNA will be continued. We also plan further practical applications of our observations on the increased cellular attachment of nucleic acids exposed to carcinogens and mutagens. Our survey of several agents suggests that this technique may be used as a very simple and inexpensive means of detection of carcinogenic agents in our environment.

TITLE: Mutagenic Action of Cancer Therapy on Testis Cells
PROJECT NUMBER: R01 CA 17364-03
PRINCIPAL INVESTIGATOR: Meistrich, M.L.;Brock, W.A.;Lu, C.
ADDRESS: P.O. Box 20036, Houston, TX 77030
AFFILIATION: Texas Univ., Houston (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$42,000
TECHNOLOGY: FOSSIL FUEL/General (50%);NUCLEAR/General (50%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (50%);RADIATION (50%)
PROJECT DESCRIPTION: The ultimate objectives of this study are, using mice treated with radiation and mutagenic chemicals, to (1) understand the biochemical mechanisms underlying mutagenesis, and (2) quantitate survival of testicular stem cells and its relation to fertility in order to extrapolate these data to man.
APPROACH: The effects of mutagens, such as radiation or chemotherapeutic agents, on the survival of spermatogenic cells of mouse testes and the damage produced in their DNA will be studied. Biochemical alterations in testicular cell DNA produced by mutagen treatment will be assayed in cells at each stage of spermatogenesis. The different stages can be studied by separation of cells and nuclei from the testis using velocity sedimentation and equilibrium density centrifugation. In addition, effects on cells at different stages may be studied by analyzing the DNA of sperm collected from the epididymis at various times after treatment. Direct damage to the DNA and repair will be assayed by measuring strand breaks, alkaline-labile bonds and endonuclease-sensitive sites by sucrose gradient centrifugation. Alterations of the DNA content of individual cells can be measured by flow microfluorometry.

TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: Photoaffinity labeling is used to covalently attach selected fluorene to DNA in vitro and to macromolecular targets in vivo.
APPROACH: This direct attachment circumvents the requirements for metabolic activation. This attachment leads to frameshift reversions in the Ames system; no mutations are observed in the dark or in strains possessing DNA repair. 2-azidofluorene has been applied to the backs of sheared Balb/c and C57/BL/6J mice. Sections of skin and viscera were taken from sacrificed animals. After two months no differences were observed among the treated mice in the dark, treated mice in the light and control animals. In vitro labeling on calf thymus DNA occurs on both purines and pyrimidines and probably on the sugar phosphate backbone also.

ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: Cytochrome P-448 in animals treated with arylhydrocarbons (AH) differs from cytochrome P-450 in control or phenobarbitol (PB) treated animals with respect to several parameters including CO difference spectra, ethyl isocyanide difference spectra, substrate specificity, molecular and immunological properties. During the tenure of this grant the additional properties of the low affinity to halothane, metopirone and CO of the reduced form of AH induced P-448 as compared with control and PB

induced P-450 have been explored. Our studies for the next year will concentrate on localizing more precisely the bases for these alterations in biophsical and biochemical properties of the multi-enzyme systems induced by AH and PB.
APPROACH: The available methods for resolving these systems and purifying their components will be evaluated and compared with the procedures we have developed for purification of the steroid hydroxylase system of adrenal mitochondria. The methods to be applied for studying the interaction of P-450 with other enzymatic components of the system and with various substrates and ligands will include optical spectrophotometry and electron paramagnetic resonance spectroscopy.

PROJECT DESCRIPTION: We propose to continue to attempt to separate, purify, and identify the several oxidation products formed from benz(a)pyrene and from pyrene and other related polycyclic aromatic hydrocarbons in radiation-induced air oxidations.
APPROACH: We shall be applying high-pressure liquid column chromatography, thin-layer chromatography, etc., and a variety of spectral methods for these studies, including mass spectra. Radiation-induced oxidations will be made using either cobalt-60 gamma radiation of 254 nm ultraviolet light, with pure crystalline substrates or substrates adsorbed onto silica gel. All oxidation product mixtures and all resolved pure oxidation products will be evaluated for their putative mutagenicity using test strains of Salmonella typhimurium bacteria.

TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: The proposed research program seeks to detail the geometry of complexes of carcinogenic polycyclic hydrocarbons with DNA and chromatin and to elucidate the intermolecular interactions which stabilize them.
APPROACH: Our approach will be through the utilization of magnetic properties in the excited triplet states of the carcinogen to probe the orientations and interactions within the complex, using newly developed methods of optical detection of magnetic resonance.
RESULTS: Our experiments will focus on complexes of nucleic acids with polycyclic hydrocarbons which have been postulated to be actively involved in carcinogenesis and which may be of importance in elaborating mechanisms of chemical carcinogenic activity at the molecular level.

ADDRESS: 333 Ravenswood Avenue, Menlo Park, CA 94025
AFFILIATION: Stanford Research Inst., Menlo Park, Calif. (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$39,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: The purpose of this proposed research is to study epithelial tumor formation in the terminal bronchioles and alveoli of the rat lung.
APPROACH: The studies will entail exposing animals to nitrogen dioxide (NO2) and to a chemical carcinogen benzo(a)pyrene (BP). NO2 exposure results in tissue injury followed by proliferation of two epithelial cell types in the lung (nonciliated cells in the terminal bronchioles and Type 2 cells in the alveoli). We will introduce the carcinogen at specific times during the proliferative phase of repair to determine if it will alter this response and cause an increased incidence of tumor formation. Specifically, we will study the effects of BP on (1) the duration of cell proliferation and (2) the transition of nonciliated cells to ciliated cells and of Type 2 cells to Type 1 cells.
RESULTS: These studies results then will be related to the incidence and types of tumors formed.

MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$86,200
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: The immediate objectives of the proposed study are: (1) to measure the induced AHH activity in cultured lymphocytes from the peripheral blood of adult patients with head and neck cancer, and from healthy control subjects; (2) to determine the rates of proliferation of the above lymphocyte cultures systems; and (3) to isolate and identify the T and B lymphocytes from healthy and cancer subjects, and compare the AHH activity in both cell populations. The long range goal of this study is to develop a reproducible cell culture system to determine man's potential susceptibility to toxic and carcinogenic environmental chemicals.
APPROACH: To test this hypothesis, we will determine whether culture lymphocytes derived from adult patients with demonstrated carcinoma of the head and neck region have statistically higher levels of AHH than

lymphocytes from healthy controls. This type of malignancy was chosen for the proposed study because of its cellular origin, which in some cases is respiratory epithelium; it is one of the first tissues exposed to inhaled or ingested environmental carcinogenic chemicals; and because this tumor is usually detected as primary.
RESULTS: Establish a relationship between lymphocyte AHH activity and other types which might arise from respiratory epithelium.
KEYWORDS: POLYCYCLIC AROMATIC HYDROCARBONS;METABOLISM;CARCINOGENESIS;MICE;MAN;BIOLOGICAL ACCUMULATION;NEOPLASMS;HEAD;NECK;HYDROXYLASE;ENZYMES;CHEMICAL EFFLUENTS;CARCINOGENS;INHALATION;INGESTION

TITLE: 3-D Fluorometric Analysis of Hydrocarbon Metabolites
PROJECT NUMBER: R01-CA-19974-01A1
PRINCIPAL INVESTIGATOR: Rho, J.H.
ADDRESS: 2025 Zonal Avenue, Los Angeles, CA 90033
AFFILIATION: University of Southern California, Los Angeles (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$29,800
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: The major objectives of this project are: (1) determine qualitatively and quantitatively the nature of the products formed through the activity of aryl hydrocarbon hydroxylase with polycyclic hydrocarbons; (2) correlate the relative abundance of each metabolite with the functional state of the microsomal enzymes by use of various enzyme inhibitors and different cell lines, some highly sensitive to, and the other less susceptible to chemical carcinogens; (3) evaluate the relevance of basal and induced levels of functioning of the enzymes to the induction of cancer in experimental animals; and (4) evaluate the functional state of the enzymes in the polycyclic hydrocarbon binding in vitro to biological macromolecules.
APPROACH: The three-dimensional fluorometry recently developed in our laboratory delineates not only the excitation and emission wavelengths but also emission intensity for each peak. This permits us, therefore, to characterize even very closely related structures of the polycyclic hydrocarbon metabolites. Computer enhancement technique for fluorescence spectra will make posssible the detection of polycyclic hydrocarbons in extremely minute amounts.

TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: The synthesis and chemistry of a variety of reactive heterocycles will be studied. Part I--Nucleophilic additions to reactive epoxides will be studied in relation to the carcinogenic activation of polycyclic aromatic hydrocarbons, and in relation to the total synthesis of antiviral agents potentially useful in the treatment of viral caused cancer. Part II--Model systems will be studied to mimic the mechanism of carcinogenic activation of polycyclic aromatic hydrocarbons by the flavin cofactored monooxygenases. Part III--Reactive crown ethers, macrocyclic reagents capable of both complexing and reacting selectively with substrates in nonpolar media, will be used in mechanistic and synthetic studies. These will include further studies of the mechanism of action of flavins in enzyme oxidation systems (see Part II) and the development of an efficient and general macrolide synthesis.

TITLE: Role of Mutagenesis in Chemical Carcinogenesis
PROJECT NUMBER: R01-CA-21247-02
PRINCIPAL INVESTIGATOR: Maher, V.M.;McCormick, J.J.;Heflich, R.H.;Levinson, W.
ADDRESS: Soil Science Building, East Lansing, MI 48823
AFFILIATION: Michigan State Univ., East Lansing (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$100,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: Since this points to the involvement of different kinds of DNA repair defects in enhancing the cytotoxic and mutagenic action of carcinogens, we will investigate the question using, in addition to our XP cells, cells derived from persons with two other forms of genetic pre-disposition to cancer, viz., ataxia telangiectasia (AT) (sensitive to x-rays) and Fanconi's anemia (FA) (sensitive to mitomycin C). With such cells we will: (1) investigate the effect of DNA excision repair replication on the mutagenicity of carcinogens; and (2) investigate the effect of post-replication repair on such action.
APPROACH: For these studies we will utilize, where applicable, radioactively-labeled carcinogens to determine the number and kinds of DNA-carcinogen adducts which corollate with the induction of mutations in these human cells.
KEYWORDS: CARCINOGENESIS;BIOCHEMICAL REACTION KINETICS;BIOLOGICAL MODELS;MUTAGENESIS;DNA;SOLAR FLUX;ULTRAVIOLET RADIATION;GENETIC VARIABILITY;BIOLOGICAL REPAIR;REPRODUCTION;CARCINOGENS;ANIMAL CELLS;MAN;LABELLED COMPOUNDS;HYDROCARBONS

<034092>
TITLE: Intracellular Enzyme Kinetics and Carcinogens
PROJECT NUMBER: R01 CA 21153-01
PRINCIPAL INVESTIGATOR: Kohen, E.;Viallet, P.;Salmon, J.
ADDRESS: 1155 14th Street, NW, Box 6188, Miami, FL 33136
AFFILIATION: Papanicolaou Cancer Research Inst., Miami, Fla. (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$56,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: Changes in intracellular enzyme kinetics and metabolic compartmentation associated with carcinogen treatment and spontaneously or chemically induced neoplastic transformation will be investigated by microspectrofluorometry. The intracellular binding, accumulation and metabolites of recently synthesized carcinogens (of the chrysene or benzanthracene series) will be investigated. Studies will be carried out in E12, L, NCTC 8739 cells, paired lines of normal vs. spontaneously transformed cells, hepatomas of graded malignancy, neuroblastoma).
APPROACH: The living cell represents an organizational complex with a delicate control of simultaneously operative pathways, and compartments. On this basis, topographic analysis of fluorescence transients (e.g., NAD(P) yields (reversibly) NAD(P)H) will be carried out on 50 to 100 cell sites simultaneously (following intracellular electrophoretic injection of metabolites), in reference to microchondrial-extramitochondrial dehydrogenase and shuttle pathways; regional asynchronicities. The cell fluorescence spectrum will be resolved in free vs. bound NAD(P)H, flavoproteins, and correlated to distribution or induction of dehydrogenases. The living cell will be submitted to challenges which may alter the regulation of intracellular pathways or organelles, e.g., carcinogens, growth with various substrates, agents affecting mitochondrial-cytoplasmic-nuclear exchanges or organelle biogenesis. Fluorescence spectra of carcinogen (or metabolite) treated cells using a high temporal and spectral resolution microspectrofluorometer may lead to in situ detection of carcinogen interactions and metabolites in localized cell regions. Via the intracellular assay of carcinogens, carcinogen-metabolizing activity and definition of metabolic aberrations (promoting the action of carcinogens or carcinogen-induced) ultimately methods may be developed for predicting the susceptibility of cell lines to malignant growth or recognizing early metabolic criteria of malignant transformation.

TITLE: Modification of X-Ray Induced Damages in Phages T4
PROJECT NUMBER: R01-CA-21342-02
PRINCIPAL INVESTIGATOR: Wallace, S.S.
ADDRESS: NY, NY 10029
AFFILIATION: New York Medical Coll., N.Y. (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$59,000
TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: The general goal of this research project is to elucidate the molecular mechanisms involved in the repair of ionizing radiation damage using T4 bacteriophage and its Escherichia coli host as model systems.
APPROACH: To this end, this laboratory is proceeding to purify the products of the T4 x and y genes as well as the Escherichia coli x-ray endonuclease. In addition, in vitro repair studies will be carried out on damaged DNA substrates using purified enzymes of known specificity.

TITLE: Carcinogenic, Mutagenic and Cytotoxic Mechanism--(DMBA)
PROJECT NUMBER: R01-CA-21371-01
PRINCIPAL INVESTIGATOR: Witiak, D.T.;Hart, R.W.;Cazer, F.D.;Daniel, F.B.
ADDRESS: 190 N. Oval Drive, 102 Administration Building, Columbus, OH 43210
AFFILIATION: Ohio State Univ., Columbus (USA)
MONITORING AGENCY: National Cancer Inst., Bethesda, Md. (USA)
77 FUNDING: National Cancer Inst. FY77:$64,500
TECHNOLOGY: FOSSIL FUEL/General (50%);NUCLEAR/General (50%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (50%);RADIATION (50%)
PROJECT DESCRIPTION: It is our primary goal to combine the cellular, molecular, and radiochemical capabilities of our laboratories in order to elucidate the specific deoxynucleoside-hydrocarbons responsible for the biological (cytotoxic, mutagenic, carcinogenic) effects of 7,12-dimethylbenz(a)anthracene (DMBA) and selected DMBA derivatives.
APPROACH: Utilizing 14C labeled DMBA and related derivatives of high specific activity (synthesized in our laboratories) we will compare the DN-HC profile of each of these compounds with one another. The differential rate of removal of the various DN-HC compounds will be determined and compared with their respective biological effects. Non-label derivatives will be utilized to access the ability of these compounds to induced DNA damage (as measured by unscheduled DNA synthesis, BUdR photolysis and alkaline sucrose sedimentation). We will further utilize selected repair deficient mutants human fibroblast cell cultures in order to characterize these mutants and the forms of repair involved in removal of DMBA induced DNA damage. Based upon the assumption that rapidly removed DN-HC(s) compound(s) have no biological effect, we will characterize the chemical nature of not only removed DN-HC(s) but also those not removed by DNA repair processes prior to DNA replication. In order to perform these studies it is necessary that we be able to detect one molecule in 20,000 and for these reasons it is of major importance that radiolabeled DMBA (14C) of high specific activity (described in this proposal) be employed.

TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: To gain additional insight into the mechanism of activation of PAH's through study of the metabolism of 3-methylcholanthrene (3-MC).
APPROACH: The aims of the proposed research are to: (1) identify all primary metabolites of 3-MC; (2) compare the primary metabolites of 3-MC to the known metabolities of other carcinogenic hydrocarbons and determine if a common pathway for activation exists; (3) compare the levels of the primary metabolites of 3-MC from the livers and lungs of susceptible and resistant strains of mice to establish if the formation of a certain metabolite is related to susceptibility; and (4) determine if there is a relationship between lung epoxide hydrase levels and susceptibility to lung tumor formation.
RESULTS: Preliminary studies show that high pressure liquid chromatography provides an effective means of separating the metabolites of 3-MC. These investigations are designed to increase our understanding of the mechanism of metabolic activation in relation to chemical carcinogenesis.

TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: The purpose of this program is to determine the risks of development of tumors in

irradiated populations and to evaluate alternatives in diagnosis and treatment of the tumors.
APPROACH: The study populations have been followed for 15 to more than 20 years and are at high risk of developing tumors of the thyroid gland (Populations A and C) and breast (Population B). Thyroid palpation and technetium scan will be performed on Population A and Subgroup I or Population C. Follow-up scans using I131 will be performed on those with abnormal screening scans. Population B will undergo mammographic-thermographic studies.
RESULTS: The prevalence of cold nodules will be described and the response to treatment with thyroid suppressive drugs will be monitored. The efficacy of repetitive thermographic-mammographic examination of women at high risk of development of breast cancer will be determined.

TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: The major objective of this research proposal is to study radiation-induced thyroid cancer by a coordinated program of clinical and basic endocrinological investigations. The clinical studies are designed to determine the current risk and continuing incidence of radiation-induced thyroid cancer and to evaluate methods of diagnosis and medical and surgical approaches to treatment.
APPROACH: This will be accomplished by a longitudinal study of patients who have been evaluated at Michael Reese Hospital because of a history of childhood head or neck irradiation. Of 5,200 patients who were so treated, 1,500 already have been examined and another 1,000 have been contacted by mail. Follow-up examinations of these patients will provide the information necessary to develop clinical guidelines for the care of persons with a history of head or neck irradiation. Laboratory studies will focus on the role of plasma thyroglobulin in the diagnosis of thyroid tumors. In addition, an in vitro system will be used to determine at what point thyroglobulin is released from the thyroid into the circulation.

TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: The influence of two known carcinogens, beta-propiolactone and benzo(a)pyrene diol epoxide on DNA replication will initially be studied using the partially purified system responsible for catalyzing the three stages of phi X174 DNA replication. These include reactions in which phi X174 DNA is converted to the RFII form; the second step involves the replication of superhelical phi X RFI leading to the formation of phi X RFI and the third step is the process in which phi X RFI is used to prime the synthesis of phi X174 DNA (the plus progeny viral strand).
APPROACH: We shall examine the influence of these compounds on (a) the structure of the DNA; (b) the ability of complexed DNA carcinogen to be utilized in DNA replication; and (c) whether biologically active DNA products are formed or if specific errors can accumulate which alters the biologically active circular DNA.

77 FUNDING: National Inst. of Dental Research FY77:$10,200
TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: The proposed study would examine the effects of concurrent, repeated exposures to low doses of x-radiation on tumor induction by repeated, low dose applications of a chemical carcinogen (DMBA), in established carcinogenic amounts, on an in vivo mammalian oral epithelial cell renewal system.
APPROACH: Young adult male Syrian golden hamsters receive multiple applications of 0.1% DMBA in mineral oil to the right cheek pouch, 20R x-radiation to the head and neck, or both agents simultaneously. Tumor incidence, onset latency, histopathology, cytokinetics, and hemodynamics are evaluated.
RESULTS: Results thus far have suggested synergy between the two agents. It is anticipated that the results of these experiments will provide information leading to some clarification of mechanisms involved in the interaction between concurrent exposures to low levels of x-radiation and chemical carcinogens, as well as provide a useful model system and preliminary data for more detailed quantitative studies of low level exposures to multiple carcinogens and factors which modify host responses to these exposures.

PROJECT DESCRIPTION: To characterize the physical and chemical events leading to the expression of radiation-induced damage at the cellular level.
APPROACH: The above objective has been approached mainly through the use of the spores of Bacillus megaterium as the test organism. Other systems have and will be used such as Phage 77 (used in the past) and transforming DNA (currently in use). Both x-rays and UV have been used. Pulse radiolysis studies at the Center for Fast Kinetics Research are now beginning to obtain chemical data relative to biological data.
RESULTS: The relationship to water (H2O or D2O) and water structure to radiation sensitivity has been clarified through experiments in dry systems and damage in dry systems compartmentalized into several types whose characteristics have been defined. A proposed model of radiation sensitization in solution has been presented involving the OH radical and H2O2. The sensitizing action of many metal ions including Fe, Co, Pt and Ag has been studied biologically and chemistry studies relative to these biological results are now underway so as to understand the mechanisms involved in radiation sensitization. Mechanisms involving organic sensitizers such as PNAP and diacetyl have been studied. The effect of nitrate in radiation sensitization of the bacterial spore has been reported and the effects of nitrate concentration on radical

yields chemically has been reported. Initial results have been obtained on the effects of radiation on transforming DNA.

TITLE: Bone Seeking Internal Alpha-Ray Emitters (Human)
PROJECT NUMBER: M01-RR-00088-140053
PRINCIPAL INVESTIGATOR: Evans, R.D.
ADDRESS: 77 Massachusetts Avenue, Cambridge, MA 02139
AFFILIATION: Massachusetts Inst. of Tech., Cambridge (USA)
MONITORING AGENCY: National Institutes of Health, Bethesda, Md. (USA)
77 FUNDING: National Institutes of Health
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The purpose of these studies is to survey the nutritional status of patients in a variety of hospital environments, and to develop more sensitive and functional measures or protein depletion, such as adaptation of the creatinine height index to adults and assessment of the host defense system in adult malnutrition (B and T lymphocyte number and function, leukocyte function, and complement levels and activity). A second series of studies will attempt to manipulate the semistarved state by dietary means so as to minimize the contribution of endogenous protein to energy needs. In contrast to routine protein-sparing therapy with small amounts of carbohydrate, modification of a total fast with small amounts of protein allows better nitrogen economy. Protein-sparing, modified fast will be applied to treatment of other adolescent obese and adult onset obese diabetics, and to minimize the catabolic response to clinically controlled infection (yellow fever vaccine).

TITLE: Radiation Induced Changes in Neonatal Nervous System
PROJECT NUMBER: R01-NS-04761-14
PRINCIPAL INVESTIGATOR: Gilmore, S.A.
ADDRESS: 4301 W. Markham Street, Litte Rock, AR 72201
AFFILIATION: Arkansas Univ., Little Rock (USA)
MONITORING AGENCY: National Inst. of Neurological Diseases and Stroke, Bethesda, Md. (USA)
77 FUNDING: National Inst. of Neurological Diseases and Stroke FY77:$32,300
TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: The objectives of this research are to investigate (1) effects of ionizing radiation on the immature spinal cord, (2) the reparative and regenerative capacities of the immature nervous system, and (3) the manner in which ionizing radiation alters these capacities.
APPROACH: All experiments are carried out in rats because the developmental state of these animals at birth makes it possible to study the immature nervous system ex utero. Neurologic, histopathologic and autoradiographic methods are used in this research. The responses of the immature nervous system to injury are compared and contrasted with those reported by others in the adult nervous system/ this, perhaps, will provide some insight into the reactions and limitations occurring in the mature state. In addition to the experimental data, the information derived from intact, control animals will contribute to the understanding of normal maturation of the nervous system.

TITLE: Developmental Effects of Low Level Lead Exposure
PROJECT NUMBER: P01-HD-08945-03
PRINCIPAL INVESTIGATOR: Needleman, H.L.;Gunnoe, C.E.;Lorenzo, A.;Averill, D.;Maher, C.
ADDRESS: 300 Longwood Avenue, Boston, MA 02115
AFFILIATION: Children's Hospital Medical Center, Boston, Mass. (USA)

MONITORING AGENCY: National Inst. of Child Health and Human Development, Bethesda, Md. (USA)
77 FUNDING: National Inst. of Child Health and Human Development FY77:$210,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: METALS (100%)
PROJECT DESCRIPTION: This program project is studying the effects of lead at doses less than those associated with clinical symptoms on the development of school age children and experimental organisms.
APPROACH: Lead burden is measured in children in the first two grades, and neuropsychologic function is measured in high and low exposure groups. The relationship of confounding covariates to outcome is controlled in the analysis. Transport of aminoacids into the brain, synaptogenesis and dentritic complexity is being studied in the rabbit and rodent at controlled doses of lead lower than those which produce frank encephalopathy.

TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: ORGANICS (100%)
PROJECT DESCRIPTION: Our first objective is to utilize cyclophosphamide as a model compound to evolve procedures necessary to achieve cytochrome P-450 metabolism in vitro and delivery of metabolites to the developing limb. These procedures will be used to elucidate the mechanism of cyclophosphamide-induced teratogenesis, as well as the conditions related to maternal and fetal metabolism of cyclophosphamide. Our second objective is to apply the model system to environmentally-related compounds such as benzo(a)pyrene, diethylstylbesterol, and tap water concentrates to investigate the influence of P-450 metabolism on their teratogenic activity.

PROJECT DESCRIPTION: This project is part of a broader program (HL 15061-06) whose summary states: A proposal is made for a supplement to the Specialized Center of Research (SCOR) at the University of Pennsylvania. As in the original proposal, the topic is The Response of the Lung to Injury. Six additional programs are outlined and described either as extensions of work currently in progress or as direct off-shoots of current research. The particular components are as follows: Metabolism of Lipoproteins by Lung--Julian

Marsh, et al. Studies of Lipids and Basement Membrane of Endothelial Cells--Barbara Howard, et al. Immune Response of Pulmonary Lymphocytes to Influenza Virus--Normal Klinman, et al. Immunocompetent Cells of the Lung--Ronald Daniele, and David Rowlands. Molecular mechanisms of hyperbaric oxygen, carbon monoxide, and ozone or peroxide toxicity evaluated at the subcellular and organ levels--Britton Chance. Mitochondrial respiratory activity in fetus and newborn--Robert Forster and Maria Delivoria. The proposal not only describes these projects separately but also demonstrates their relationship to existing projects.

ENERGY CYCLE: EXTRACTION (33%);PROCESSING, CONVERSION (33%);COMBUSTION OR END USE (34%)
POLLUTANTS: NOXIOUS GAS (25%);METALS (25%);PARTICULATES (25%);ORGANICS (25%)
PROJECT DESCRIPTION: This project is part of a broader program (HL 15092-06) whose summary states: The goal of this SCOR program is to provide the scientific basis for the prevention of fibrotic and immunologic lung diseases which are related to the occupational environment. A multidisciplinary approach is utilized in order to establish causal relationships, dose-response curves, and threshold levels of exposure in lung disorders which are related to the inhalation of mineral and organic dusts, and chemical vapors and gases. Disciplines incorporated in this Center include pulmonary physiology, epidemiology, biostatistics, immunology, chest roentgenography, bioengineering, environmental chemistry and industrial hygiene. Significant emphasis is placed on newer methods of characterizing the inhaled environment which should lead to establishment of those methods which relate best to the indexes of an altered biologic response, and therefore most closely estimate the true exposure dose. The overall significance of this program lies in the fact that these occupational lung disorders are potentially completely preventable, and data from these studies should lead to the establishment of rational occupational environmental standards for hazardous inhalants.

<035457>
TITLE: Tolerance to Respiratory Gases in Health and Disease
PROJECT NUMBER: P01-HL-08899-13
PRINCIPAL INVESTIGATOR: Lambertsen, C.J.;Abraham, A.;Clark, J.M.;Cowley, J.R.;Fink, L.
ADDRESS: 36th and Hamilton Walk, Philadelphia, PA 19104
AFFILIATION: Pennsylvania Univ., Philadelphia (USA)
MONITORING AGENCY: National Heart, Lung, and Blood Inst., Bethesda, Md. (USA)
77 FUNDING: National Heart FY77:$798,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS (100%)
APPROACH: Investigations of the biological effects of metabolically active and inert respiratory gases were performed by dose-response methods to elaborate limits of tolerance to increasing partial pressures or density. Adaptations and deteriorations of sensory, cognitive, neuromuscular, pulmonary, respiratory, cardiovascular and exercise functions were determined to provide bases both for elucidating mechanisms of gas effects and predicting the consequences of complex exposures. Investigation of inert gas exchange in organs and tissues provided the basis for systems of decompression and aids understanding of biophysical factors in bubble formation and resolution. A major area of investigation concerns oxygenation and oxygen tolerance. Within the narrow range of oxygen pressures tolerated by living cells, the processes of cellular oxidation and energy metabolism depend upon effective delivery of oxygen to the metabolic site and the balance of oxidant-antioxidant processes. Inadequate tissue oxygenation limits the ultimate oxidation process. Excessive oxygenation, as in therapeutic or other use of high oxygen pressures, disrupts the enzyme activity upon which oxidation itself depends. Both oxygenation and oxidation processes, and even the poisoning by hypoxia, are affected by exposures to extreme alterations of carbon dioxide, inert gases, and certain respired toxic gases.

POLLUTANTS: NOXIOUS GAS (25%);METALS (25%);PARTICULATES (25%);ORGANICS (25%)
PROJECT DESCRIPTION: Our SCOR program concerns the highly prevalent groups of diseases--termed ''chronic airway diseases'' in this proposal--which have as common features: (1) the presence of wheezing, sputum production, or cough, or a combination of these, often combined with shortness of breath, as principal symptoms; (2) the presence of airway obstruction as defined by lung function tests, varying in degree, duration, age of onset and amenability to drug treatment; (3) airway smooth muscle contraction, secretion of mucus in the bronchial tree, inflammation of the airway mucosa, or loss of structural support of the

airways or any combination of these, are the main underlying pathological processes; and (4) an increased susceptibility--specific or nonspecific--to inhaled irritants, air pollutants and infectious agents affecting the respiratory tract.

TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
POLLUTANTS: NOXIOUS GAS (50%);METALS (10%);PARTICULATES (10%);ORGANICS (30%)
PROJECT DESCRIPTION: We propose to continue our study of the reactions of the airborne pollutants ozone, nitrogen dioxide, and cigarette smoke. All of these toxic pollutants either are free radicals or cause the formation of free radicals when they react with organic materials.
APPROACH: We have chosen initially to concentrate our study on the reactions of these toxic agents with polyunsaturated fatty acids (PUFA) in a series of model systems of increasing complexity, starting with simple chemical model systems such as PUFA esters and lipids, then to aqueous systems such as liposome, and finally to biological membranes, in pulmonary alveolar macrophages.
RESULTS: We have established that both ozone and nitrogen dioxide initiate the destructive autoxidation of PUFA both in lipophilic and hydrophilic systems. The lierature clearly establishes that this destructive autoxidation causes damage to membranes, occurs in vivo, and can cause cell death. It is the aim of our research to provide a continuum in understanding between the chemical events that occur when PUFA are exposed to ozone or nitrogen dioxide and the biological damage that these agents cause. We have shown that autoxidation of PUFA produces prostaglandins. This suggests that the bioorganic chemistry of endoperoxides and cyclic peroxides related to those in prostaglandin biosynthesis is of considerable importance in free radical biology. In our study of cigarette smoke, we have identified and quantified the radicals present in filtered smoke by the technique of spin traps and electron spin resonance (ESR). We are investigating the reactions of radicals in smoke with biologically important molecules. For example, we have shown that smoke radicals react with the tar produced by cigarettes; we believe that these reactions are involved in the carcinogenicity of smoke.

ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS (100%)
PROJECT DESCRIPTION: The proposed research is a continuation of ongoing studies concerning pulmonary cell renewal as related to tissue injury and repair.
APPROACH: Three areas of study are proposed. In the first, we will determine if the proliferative response following injury is a quantitative measure of the amount of injury. This will be accomplished by correlating the proliferative response with morphometric measurements of the amount of tissue damage following exposure to NO2. In the second area, we will test the ability of dietary vitamin E and selenium to alter the amount of lung damage. This will be accomplished by quantitating the amount of injury following exposure to NO2 of rats with diets supplemented and deficient in these antioxidants. In the third area, we will determine if tolerance in the epithelium of rats exposed to NO2 is associated with

increased turnover or accumulation of cells. This will be accomplished by measuring the proliferative response and differentiation of Type 2 cells to Type 1 cells and nonciliated bronchiolar cells to ciliated cells in the epithelium tolerant to NO2.

TITLE: Airborne Metals and Lung Permeability
PROJECT NUMBER: R01-HL-16674-04
PRINCIPAL INVESTIGATOR: Gatzy, J.T.
ADDRESS: Manning Drive, Chapel Hill, NC 27514
AFFILIATION: North Carolina Univ., Chapel Hill (USA). School of Medicine
MONITORING AGENCY: National Heart, Lung, and Blood Inst., Bethesda, Md. (USA)
77 FUNDING: National Heart FY77:$42,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: EXTRACTION (33%);PROCESSING, CONVERSION (33%);COMBUSTION OR END USE (34%)
POLLUTANTS: NOXIOUS GAS (30%);METALS (40%);PARTICULATES (15%);ORGANICS (15%)
PROJECT DESCRIPTION: The objectives of this project are twofold: (1) to determine the factors that control the movement of solute and water across the lung epithelium; and (2) to elucidate the effects of airborne metals such as mercury and cadmium and of air pollutants such as ozone, sulfates, nitrates, and cigarette smcke on these control mechanisms.
APPROACH: Two biolcgical preparations, the amphibian lung and the perfused, microlavaged, mammalian alveolar sac, will be utilized to pursue the objectives. Fluxes of ions, water and heavy metals across the entire lung wall and luminal membrane of the alveolar epithelial cells will be measured in the excised bullfrog lung mounted as a planar sheet or as a sac. The effect of sulfhydryl compounds, EDTA, imidazoles and antioxidants on metal binding and on metal and ozone induced permeability changes will be measured in the intact, excised lung and in epithelial cells separated by enzymatic procedures. Similar measurements will be made by micropuncture techniques on the mammalian alveolar sac. Differences in the patterns of heavy metal protection afforded by luminal and blood-borne complexing agents may make it possible to differentiate between vascular and epithelial sites of metal action. In addition, changes in the pattern of response to heavy metals in lungs from animals with a surfeit of deficit of essential substances such as zinc, selenium and vitamin E may help identify cellular constituents that protect against lung damage.

AFFILIATION: Mount Sinai Medical Center, Miami Beach, Fla. (USA)
MONITORING AGENCY: National Heart, Lung, and Blood Inst., Bethesda, Md. (USA)
77 FUNDING: National Heart FY77:$90,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: EXTRACTION (33%);PROCESSING, CONVERSION (33%);COMBUSTION OR END USE (34%)
POLLUTANTS: NOXIOUS GAS (25%);METALS (25%);PARTICULATES (25%);ORGANICS (25%)
PROJECT DESCRIPTION: This study will extend observations made with a roentgenographic technique for measuring tracheal mucous velocity in unanesthetized sheep, normal humans and patients with chronic obstructive lung disease. Investigations will be made of the effects of environmental pollutants, drugs, and cigarette smoking on tracheal mucous velocity. The recovery of tracheal mucous velocity from oxygen suppression will also be determined.
APPROACH: An in vivo technique for measuring rheology of mucus will be applied to the study of pathologic conditions. Modifications by pharmacologic agents and air pollutants of tracheal mucous velocity will be investigated.

TITLE: Evaluation of Anti-Fibrotic Agents in Pulmonary Fibrosis
PROJECT NUMBER: R01-HL-19720-02
PRINCIPAL INVESTIGATOR: Giri, S.N.
ADDRESS: School of Veterinary Medicine, Davis, CA 95616
AFFILIATION: California Univ., Davis (USA). School of Veterinary Medicine
MONITORING AGENCY: National Heart, Lung, and Blood Inst., Bethesda, Md. (USA)
77 FUNDING: National Heart FY77:$70,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: EXTRACTION (33%);PROCESSING, CONVERSION (33%);COMBUSTION OR END USE (34%)
POLLUTANTS: NOXIOUS GAS (25%);METALS (25%);PARTICULATES (25%);ORGANICS (25%)
PROJECT DESCRIPTION: The aim of the proposed investigation is to develop a scientific basis for screening a potentially desirable antifibrotic agent which could be of therapeutic value against the pulmonary fibrotic lesions.
APPROACH: In this regard, first, attempts will be made to develop an acceptable model of pulmonary fibrosis in rats similar to humans by administering the herbicide paraquat. Thereafter, the effectiveness of anticollagenous agents such as zinc, beta-amino propionitrile and D-penicillamine against the pulmonary fibrosis will be tested. The ability of each antifibrotic agents to prevent and/or reverse the lung fibrosis will be evaluated by histopathological, biochemical and pulmonary function test studies.
RESULTS: We believe that this type of multidisciplinary approach will not only provide a better understanding for the pathophysiological mechanism responsible for the genesis of lung fibrosis, but will also help us to search for a better therapeutically efficacious anti-fibrotic compound.

TITLE: Effect of Pollutants on Organotypic Lung Cultures
PROJECT NUMBER: R01-HL-21008-01
PRINCIPAL INVESTIGATOR: Douglas, W.H.;Delvecchio, P.;Laduke, M.
ADDRESS: Box 631, Lake Placid, NY 12946
AFFILIATION: Jones (W.Alton) Cell Science Center, Lake Placid, N.Y. (USA)
MONITORING AGENCY: National Heart, Lung, and Blood Inst., Bethesda, Md. (USA)
77 FUNDING: National Heart FY77:$28,800
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: EXTRACTION (33%);PROCESSING, CONVERSION (33%);COMBUSTION OR END USE (34%)
POLLUTANTS: NOXIOUS GAS (25%);METALS (25%);PARTICULATES (25%);ORGANICS (25%)
PROJECT DESCRIPTION: Utilizing an organotypic in vitro system, which shares many characteristics with lungs in whole animals, we plan to examine the toxicity of various gaseous and particulate air pollutants on the histotypic organization of the cultures and on the synthesis, storage and secretion of the pulmonary surfactant by the type II alveolar pneumonocytes.
APPROACH: After demonstrating that certain ultrastructural, cytochemical and biochemical characteristics found in whole lung are also present in our organotypic systems, we will subject the system to pollutants and observe the changes. More specifically, we will monitor the effects of pollutants on surfactant production by determining the rates of incorporation of 14C-choline into saturated lecithin and the cytochemical distribution of esterases. Fine structure analysis will be by transmission and scanning electron microscopy.

TITLE: Effects of Air Pollutants on Lung Cells in Culture
PROJECT NUMBER: R01-HL-21009-01
PRINCIPAL INVESTIGATOR: Smith, J.R.;Douglas, W.H.;Hospelhorn, V.D.;Farrell, P.M.
ADDRESS: Box 631, Lake Placid, NY 12946
AFFILIATION: Jones (W.Alton) Cell Science Center, Lake Placid, N.Y. (USA)
MONITORING AGENCY: National Heart, Lung, and Blood Inst., Bethesda, Md. (USA)
77 FUNDING: National Heart FY77:$95,500
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS (100%)
PROJECT DESCRIPTION: We plan to develop an in vitro system (which is relevant to an in vivo situation) for assessing the toxicity of oxidant air pollutants and to utilize this system to learn more about the effects of air pollutants at the cellular and subcellular level.
APPROACH: The L-2 rat lung cell strain will be used in the study. It retains differentiated characteristics possessed by the type II alveolar epithelial cells present in whole lung. Like their in vivo counterparts, L-2 cells synthesize a highly saturated lecithin which is the major component of environmental pollutants on surfactant production by type II alveolar epithelial cell in whole lung. To this end we will employ a range of assays to detect degrees of damage ranging from very subtle changes in cell function to outright cell death and determine the degree of toxicity of various doses of different pollutants and various oxygen concentrations. We will also investigate the feasibility of utilizing antioxidants as protection against the deleterious effects of those agents. A wide range of antioxidants will be tested including d1-a-tocopherol.

<035551>
TITLE: Relationships of Diet and Air Pollutants to Aging
PROJECT NUMBER: R01-AG-00174-03
PRINCIPAL INVESTIGATOR: Privett, O.S.
ADDRESS: 801 16th Avenue NE, Austin, MN 55912
AFFILIATION: Minnesota Univ., Austin (USA)
77 FUNDING: FY77:$57,600
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (100%)
PROJECT DESCRIPTION: The overall objective of this research is to gain an insight into metabolic-structural effects and interrelationships of dietary and environmental factors that influence lipid composition and underlying enzyme reactions associated with aging and related metabolic disorders. It is proposed to study the accumulation of the aging pigment in rats of different ages fed diets containing fats of low, high and medium degrees of unsaturation. Another objective will be to define more clearly the influence of aging on the isoenzyme pattern of lactate dehydrogenase of serum and tissues, relative to dietary and environmental factors. It is also proposed to study the effect of ozone in the atmosphere in lipids and lipid-protein interactions in lung surfactant, and the reactions that underlie the accelerating effects of x-irradiation on aging using rats as the animal model. Biochemical changes will be correlated with histologic studies of the same tissues.
KEYWORDS: RATS;DIET;AIR POLLUTION;BIOLOGICAL EFFECTS;BIOLOGICAL RADIATION EFFECTS;SYNERGISM;AGE DEPENDENCE;PATHOLOGICAL CHANGES;BIOCHEMICAL REACTION KINETICS;HAIR;PIGMENTS;BLOOD SERUM;TISSUES;LACTATE DEHYDROGENASE;X RADIATION;METABOLISM

FUNDING: National Inst. of Arthritis FY77:$31,200
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: RADIATION (100%)
PROJECT DESCRIPTION: The role of bile salts in the intestinal radiation syndrome will be delineated so that practical measures to prevent or ameliorate the syndrome can be recommended.
APPROACH: Bile acid composition, concentration and turnover will be measured in irradiated rats. Effects of bile salts, bile diversion and irradiation on intestinal transport of nutrients and electrolytes via transmucosal and shunt pathways will be measured. Electrophysiological studies of voltage clamping, input resistance and cable properties will characterize intestinal mucosal function in irradiated rats and delineated effects of bile salts and bile diversion. These data should support or refute the hypothesis that the intestinal radiation syndrome is a form of choleraic enteropathy, responsive to treatment. Basic physiologic information will be obtained concerning intestinal cellular function and the role of bile salts.

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Far West;GEOGRAPHIC AREAS/Site specific Upper Colorado River;HYDROGRAPHIC AREAS/Other hydrographic areas Rivers
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: An issue of particular importance regarding the development of western energy resources is its impact on the water resources of the region, water quality as well as water supply, and the subsequent impact on fish, wildlife, and vegetation. The Forum will concentrate on these impacts in the Upper Colorado Basin which is located in parts of Wyoming, Utah, Colorado, New Mexico, and Arizona. The intent of the Forum is to bring together the results of the most recent research on the energy-related impacts, and to identify specific potential fish and wildlife related problems and delineate research needs.
APPROACH: Relevant questions to be addressed by the Forum include: What impact will the inevitable changes in the hydrologic regime of this region, both surface waters and groundwaters, have on fish, wildlife, and vegetation. How is the existing riparian habitat of this basin likely to change with energy development, and what impact will these changes have on the fish and wildlife of the region. How can the region best be managed to provide a suitable environment for fish and wildlife, with particular consideration given to the need for, and establishment of, maintenance flows. More broadly, what are the future ecological implications of developing the energy resources of the Upper Colorado River Basin.
RESULTS: Final report expected by September 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: These investigations will identify and demonstrate a rapid cost effective reliable method of inventorying characterizing wildlife habitat. Emphasis will be given to habitat requirements of wildlife species for food, cover, breeding, and other critical factors and the relationship for these factors, the surface resources and events. Emphasis is given to a determination of how various coal related activities, particularly processing and population growth, will impact wildlife and the magnitude of that impact. Results will consist of interim and final reports of field laboratory work and an interagency workshop. Studies will be conducted on designated areas where coal development is or will be taking place.

REGIONS OF INTEREST: BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Middle Atlantic;COASTS/Northeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To test and adapt analytical methods for identification of oil in tissues and eggs. Evaluate the effects of oil on viability of eggs and on survival. To assess the prevalence of oil ingestion by wild birds and relate tissue levels of oil to damage and to assess the joint effects of oil

and chemicals on survival.
APPROACH: Realistic dietary dosage with measurements of egg production, fertility, hatchability, and survival of chicks using ducks. Adult male and female ducks will be fed sublethal and lethal dosages of oil, with measurements of mortality, pathology, and blood enzymes. Oil will be introduced artificially and also by light oiling of the incubating hen. Kinetics of oil will be followed when oil is ingested directly and when it is obtained secondarily through food items. Top priorities for assessment of joint oil and chemical action would be: polychlorinated biphenyls, DDE, nickel, and vanadium. A three year study program is anticipated with funding beginning in Fiscal Year 75 and major implementation in Fiscal Years 76, 77, and 78.

REGIONS OF INTEREST: BIOMES/Estuarine;GEOGRAPHIC AREAS/South;GEOGRAPHIC AREAS/Site specific Louisiana, Southeast Texas;COASTS/Gulf;HYDROGRAPHIC AREAS/Other hydrographic areas Coast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Development of an ecological characterization of Chenier Plain in the coastal regions of southwestern Louisiana and Southeastern Texas with a predictive potential, evaluate methodology used for characterization, and synthesize and disseminate information obtained. The preliminary work will involve a determination of information needs, preparation of tentative methodology, and segmentation of the characterization into workable study units. Study units will focus on geomorphology, economics and sociolcgy, biology, and ecology of the coastal ecosystem. Once study units have been formulated and defined, a plan will be devised for accomplishing the objectives as detailed under each study unit. A deterministic simulation model will be developed as a part of the characterization to provide predictive potential. Data assembled by the various study units will provide input for the model. The simulation model will provide to decision-makers an instrument with which impacts can be quickly tested and evaluated. The model will also provide a system for identifying areas with data deficiences. A manual will be published in popular form from the characterization studies and serve as an atlas for users or decision-makers with interests in the particular coastal ecosystem studied. The model will be continuously updated as additional information is supplied by special studies or from other sources.

ENERGY CYCLE: COMBUSTION OR END USE (30%);ELECTRICITY GENERATION (70%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Site specific Four Corners
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) To assess the impact of continued energy development in the Four Corners Region on fish and wildlife resources by investigating the implications of increased population resulting from southwestern energy resource development. (2) To examine the institutional and substantive problems associated with managing these impacts and provide management alternatives under various southwestern energy development scenarios.
APPROACH: The basic methodological problem in this research is the development of a plan integrating biology and economics. Economic analysis of energy development in the southwest will be translated into biological impacts on fish and wildlife. Research output will identify potential problem areas in overall management of energy development resulting from encroachment of human population in presently remote areas of the southwest.
RESULTS: A report including: (a) methodology for the measurement of the environmental impact of energy development on fish and wildlife; (b) an evaluation of innovative policy and management options; and (c) specific management and policy recommendations.
PROJECT MILESTONES: Details of proposal under discussion, contract by October 1, 1975.

TITLE: Crucial Decision Processes that Affect the Development of Western Energy Resources
PROJECT NUMBER: 14-16-0008-2103
PRINCIPAL INVESTIGATOR: Graves, F.
ADDRESS: 1619 Massachusetts Avenue N.W., Washington, DC 20036
AFFILIATION: Institute of Public Administration, Washington, D.C. (USA)
MONITORING AGENCY: Fish and Wildlife Service, Washington, D.C. (USA). Office of Biological Services
DIVISION: Office of Biological Services
MONITOR: Doerksen, Harvey R.
TELEPHONE: C(303)221-2040
TYPE OF FUNDING: Contract No.-2103
77 FUNDING: Fish and Wildlife Service FY77:$65,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) Identify processes and points at which decisions concerning energy development are made. (2) Determine the information most important to the proper evaluation of fish and wildlife resources as a part of those decision-making processes.
APPROACH: A primary way of reducing the cost of information gathering, while at the same time increasing the effectiveness of that information, is to orient the gathering of data toward requirements articulated by the decision-making process.

RESULTS: (1) Identify the relevant government decision-making processes. (2) Describe the decision points. (3) Determine information requirements. Publication OBS 77/04: Energy--Public Choices and Environmental Needs.

TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Overburden (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) To provide ''state-of-the-art'' literature on rehabilitation and reclamation of wildlife habitats. (2) Be aware of current and planned research. (3) Identify research needs and establish priorities. (4) Provide guidelines and recommendations to agencies.
APPROACH: Western energy development will continue at a rapid rate for the foreseeable future due to the nation's need for oil, coal, and natural gas, and other energy resources. This study will collate information on ''state-of-the-art,'' review it in a workshop, and prepare useful documents as guides for people in field and management positions.
RESULTS: (1) Workshop to bring together knowledgeable people of ''state-of-the-art.'' (2) Final report on the literature. (3) Handbook to guide field personnel and operational managers.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) Produce a computer-accessible information bank on the known or suspected adverse effect on wildlife of toxic elements. (2) To collect information on the occurrence, distribution and food habits and major food chains of the fauna occupying the various ecological units of the oil shale region. (3) To produce baseline information on the natural levels of potentially toxic elements in plant parts. (4) To produce similar information for fauna.
APPROACH: The development of an oil shale inustry to its full potential may result in large quantities of contaminant into the environment. This study focuses on the trace substances that occupy the food chains related to the Wildlife in the Piceance Basin.
RESULTS: Interim and final reports.
KEYWORDS: TERRESTRIAL ECOSYSTEMS;BIOLOGICAL MODELS;CHEMICAL EFFLUENTS;FOSSIL FUELS;COMBUSTION PRODUCTS;FOOD CHAINS;BIOLOGICAL EFFECTS;OIL SHALE INDUSTRY;ENVIRONMENTAL EFFECTS;TRANSLOCATION;COLORADO;WATER POLLUTION;WASTE MANAGEMENT;WILD ANIMALS;PLANTS;MINING

ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Develop a model to predict the numbers of organisms and the proportion of the populations of these organisms that will be withdrawn by power plants.
APPROACH: Entrainment, impingement, and entrapment losses cannot be adequately predicted prior to operation of power plants utilizing existing analytical techniques. Such losses are considered to be the most

serious impact by power plants on fishery resources.
RESULTS: (1) A report presenting a synthesis of the literature on existing methodologies and models relating to the development of this model. (2) A report presenting the models with documentation. (3) A document presenting techniques for obtaining model input.
KEYWORDS: MODELING;POWER PLANTS;COOLING SYSTEMS;IMPINGEMENT;FISHES;FORECASTING;ENTRAINMENT;ENVIRONMENTAL EFFECTS;COMPUTER CODES;AQUATIC ORGANISMS;WATER;DATA ACQUISITION;BIOLOGICAL MODELS

TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Estuarine
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) Summarize, analyze, and evaluate existing evidence of compensation in fish populations. (2) Provide a list of all known forms of density-dependent mechanisms in fish populations and determine how these mechanisms could interact singly or in combination to offset power plant induced stresses on fish populations. (3) Present scientifically and statistically reliable guidelines for measurement of compensation in fish populations.
APPROACH: Utility companies currently assume that the operation of density-dependent processes will offset or compensate for the increases in mortality rates in aquatic populations that result from entrainment and impingement at power plants. For the most part, regulatory agencies cannot evaluate the degree to which such processes may offset power plant induced mortalities because the operation of such mechanisms is not supported by documentation in the field or literature.
RESULTS: (1) Evaluation of literature report. (2) Computer simulation of compensatory mechanisms. (3) Preparation of compensation workbook. (4) Development of Sampling Strategies manual.
KEYWORDS: FISHES;POPULATION DYNAMICS;MORTALITY;ENTRAINMENT;POWER PLANTS;ENVIRONMENTAL EFFECTS;COOLING SYSTEMS;THERMAL EFFLUENTS;AQUATIC ECOSYSTEMS

REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Estuarine;GEOGRAPHIC AREAS/Site specific Chesapeake Bay;COASTS/Other coasts Chesapeake Bay
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To study the toxicity of chlorine to estuarine fishes in early life stages.
APPROACH: Chlorination is currently used on a regular basis by most steam electric power plants as an effective means of controlling biofouling of cooling water systems. Subsequent appearance of chlorine and its derivatives in discharge plumes has caused great concern by ecologists over its possible toxic effects on aquatic organisms.
RESULTS: A report will be prepared presenting chlorine dose-response functions of other models which will allow computations of percent mortality as a function of time of exposure and concentration for the early developmental stages of striped bass, white perch and blueback herring in the Chesapeake estuarine system.

TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: ELECTRICAL TRANSMISSION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Prepare a technical assistance manual which integrates fish and wildlife management techniques and special problems in transmission line ROW management into comprehensive management strategies for land used as ROW by electric utilities throughout the United States.
APPROACH: Utilities presently own or control vast acreages of land as a result of the production, transformation, and transmission of energy resources. Electric utilities operate over 300,000 miles of overhead electric transmission lines which require an estimated 4 million acres of land for rights-of-way (ROW). For the most part these lands represent potential fish and wildlife habitats that are not being fully utilized because of a lack of comprehensive fish and wildlife resources management plans.
RESULTS: (1) A report presenting a classification of transmission line ROW lands based upon biological provinces and communities, and ownership, and associated lists of species and essential habitat components. (2) A report presenting state-of-the-art management, techniques and approaches to mitigation or special consideration for some species. (3) A technical assistance manual for management of transmission line ROW. (4) Other study reports and bibliography.
KEYWORDS: TERRESTRIAL ECOSYSTEMS;AQUATIC ECOSYSTEMS;WILD ANIMALS;FISHES;ELECTRIC POWER;POWER TRANSMISSION LINES;ENVIRONMENTAL EFFECTS;SOILS;ELECTROMAGNETIC RADIATION;BIOLOGICAL EFFECTS

ENERGY CYCLE: ELECTRICITY GENERATION (50%);ELECTRICAL TRANSMISSION (50%)
CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To compile several bibliographies of technical information pertaining to environmental impacts of electric power generation and transmission.
APPROACH: The environmental impacts of power plants are of concern to the Fish and Wildlife Service and the biological effects of an electric power generation and transmission are not fully known. In an attempt to gain more knowledge on the subject, information will be gathered on selected aspects, such as energy parks and floating power plants. This information will lead to what additional studies may be needed to fully evaluate the potential impacts of power plants.
RESULTS: (1) Camera-ready manuscripts of bibliographies. (2) Copies of each document cited in the bibliographies for National Power Plant Team. (3) Magnetic tapes of the bibliographies suitable for a computer retrievable system.
KEYWORDS: POWER GENERATION;POWER TRANSMISSION;ENVIRONMENTAL EFFECTS;ELECTRIC POWER;BIBLIOGRAPHIES;DATA COMPILATION;FISHES;POWER PLANTS;INFORMATION RETRIEVAL;COMPUTER CODES;ELECTROMAGNETIC RADIATION;BIOLOGICAL EFFECTS;AQUATIC ECOSYSTEMS;TERRESTRIAL ECOSYSTEMS;WILD ANIMALS

77 FUNDING: Department of the Interior FY77:$8,900
TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: HEAT, THERMAL (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Estuarine
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) Determine what biological and physical features of aquatic ecosystems affect obtaining accurate samples of fish eggs and larvae. (2) List the types of gear currently employed in fish egg and larvae sampling and provide an assessment as to their accuracy in obtaining representative samples of fish eggs and larvae. (3) Compile a list of those factors which need to be maximized in gear for adequately sampling various ecological categories of fish eggs and larvae under various physical conditions.
APPROACH: Withdrawal of large volumes of water by power plants for cooling purposes usually means withdrawal of those life stages of aquatic organisms unable to actively escape from the intakes, such as fish eggs and larvae. These life stages suffer high mortality rates and they pass through condenser cooling systems. Predicting the impact requires accurate sampling of fish eggs and larvae in the affected water.
RESULTS: A document discussing what biological and physical features of aquatic ecosystems affect attainment of representative samples of fish egg and larvae populations. It will also include an assessment of how gear currently used overcomes or succumbs to sampling problems.
KEYWORDS: INSTRUMENTATION;AQUATIC ECOSYSTEMS;FISHES;EGGS;LARVAE;SAMPLING;POPULATION DYNAMICS;BIOLOGICAL MODELS;POWER PLANTS;COOLING SYSTEMS;MORTALITY

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To develop a report which describes and documents the management of oil and gas development on wildlife refuges along the Louisiana and Texas coasts through an analysis of guidelines, standards and stipulations imposed on development activities in these areas.
APPROACH: The work will consist of a series of case study surveys comparing the effects of oil and gas operations on fish and wildlife on Gulf coastal refuges where regulations and stipulations are in effect, with selected comparable Gulf coastal areas where oil and gas activities are conducted under less regulated conditions.
RESULTS: (1) An illustrated handbook of methods and standards for the protection of fish and wildlife and habitat on wildlife refuges and other wildlife areas during oil and gas operations. (2) A comprehensive technical report containing descriptions and evaluations of former and present practices on wildlife refuges to prevent, alleviate or mitigate adverse impact of oil and gas operations.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Research is directed toward determining the effects of fluctuating water levels from pumped-storage powerplant operations on the ecology and limnology of Twin Lakes Reservoir. Baseline data are being established on the heat budget, bottom sediments, chemical and physical limnology, and aquatic microbiological populations during the preconstruction phase of the project. These data will be used for comparative analysis of conditions in the lake when the project becomes operational.
APPROACH: Present (preoperational) environmental conditions within the reservoir are being determined to provide base data against which future comparisons can be made, and from which sensitive and possibly critical situations can be identified so mitigating steps can be taken. The physical, chemical, and biological parameters will be monitored throughout construction and through several years of operation.
RESULTS: The ability to describe the impacts of operation of a pumped-storage project on a mountain lake.
PROJECT MILESTONES: (1) July 1, 1971 Project began. (2) September 1978 Preoperational phase completed-baseline established. (3) October 1978 Project monitoring phase begins. (4) September 1981 Estimated project completion date.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Assess the effects on Banks Lake sport fish population due to entrainment and pass through during pumped-storage operations. Will provide information necessary to identify and minimize potential adverse effects on the Banks Lake fish populations.
APPROACH: Comprehensive approach designed to establish baseline data about the limnology, fish populations, and entrainment in Banks Lake prior to startup of pump-generation units 7 and 8 at Grand Coulee.
RESULTS: Results will be reflected in the baseline data for Banks Lake as an operational reservoir and delineate more closely the effects of an operational pump-storage system on the ecology of Banks Lake. Will also relate the operating of the pumped storage and irrigation systems and their interaction to the ecology of Banks Lake.
PROJECT MILESTONES: (1) 7/1/73 Project began. (2) 7/1/75 Acquisition of baseline data to include 1 year of normal irrigation drawdown. (3) 7/1/76 Kokanee salmon sampling, nutrient and plankton interchange and additional entrainment studies. (4) 9/30/77 Completion of project. (5) 4/21/77 Letter Contract No. 7-07-10-S0023, University of Washington Fisheries Research Institute for fish-net barrier study involving Kokanee migration from Banks Lake, period of performance 11 months, FY 77 funds $70,000, FY 78 funds $40,000.

CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Southwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The present investigation consists of two parts: a geothermal appraisal investigation of the thermal spring systems of Arizona and a compilation of existing gravity magnetic, and heat flow data for the state. The objectives of the thermal springs study are to: (1) inventory the thermal spring systems of Arizona with respect to temperature, discharge, and water chemistry to determine their origin, history, and potential for pollution; (2) apply known chemical geothermometers to the thermal waters to determine whether or not these areas have a sufficiently high base temperature for economic geothermal development; (3) make a preliminary assessment of the hydrology of the thermal spring systems and make predictions regarding the size and production potential of the resource; and (4) conduct a site evaluation to determine the nature of problems that may result during more detailed geophysical studies and/or eventual production. The objectives of the compilation study are to use existing geophysical data to outline broad regions (i.e., the boundary between the Basin and Range and the Colorado plateau physiographic provinces) which have high geothermal activity and correlate geophysical data and thermal spring locations with areas of known tertiary and quaternary volcanic and plutonic igneous activity.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Northeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Purpose is to establish baseline conditions on soil, overburden, coal resource, surface and ground water quantity and quality, vegetation and sedimentation on a 5,000-acre site being considered for mining. From these data guidance for preparation of stipulations in future leases will be prepared. Alternative reclamation techniques and vegetation types will be described. Water monitors will remain on site until baseline conditions are established or until no further changes are anticipated if the area is mined and reclaimed. Chemical and physical data obtained on all geologic strata to a depth of approximately 200'. The project is located at T4N, R93W, Sections 33 and 34 and T3N, R93W, Sections 2, 3, 4, 5, 8, 9 and 10.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental;COASTS/Northeast;COASTS/Southeast;COASTS/Gulf;COASTS/Far West;COASTS/Northwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;OS
PROJECT DESCRIPTION: U.S. Lineaments visible in Landsat images and mosaics are being analyzed for the following reasons and objectives: (1) Some have been found to be related to the location of energy resources (oil, gas and geothermal) and a better understanding of such features and determination of their geologic significance can lead to definition of new areas where such resources can be found. (2) Others may be determined to be faults along which seismic activity is recent enough to preclude an area as a site for reactor or hydroelectric installation.
APPROACH: Use of Landsat images and mosaics at various scales. Statistical analysis of frequency and trends of lineaments detected. Determine relationship to known geologic structures and define areas where additional field work is needed. Study relationship of lineaments to known energy sources and project trends into less well explored regions. Determine by comparison with seismic activity maps which lineaments may be related to active faulting and which, therefore, may constitute a potential hazard for sites being considered for energy installations.
RESULTS: Map at scale of 1:2,500,000 showing lineaments of the Conterminous United States. Report describing methods used, meaning of map, analytical results showing frequency and orientation of lineaments by 1 degree cells, relationships with known structures, resource and hazard implications.

PROJECT MILESTONES: (1) Detailed study of Landsat Mosaic of the Conterminous United States has been completed by 3 separate geologists and combined into a composite display at 1:1,000,000 scale. This has been reduced to 1:2,500,000 scale compatible with the Tectonic Map of the United States. It is now possible to compare what was previously known with what has been defined from satellite data. (2) Map and report are now in final review prior to publication. (3) Project completion date of 6/78 expected to be reached.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Far West;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECT
PROJECT DESCRIPTION: To demonstrate the usefulness of remote sensing data and effectiveness of remote sensing data analysis techniques for: (1) targeting of areas for mineral exploration effort; (2) development of exploration strategies; and (3) rating and evaluating the development of successfully targeted mineral deposits in the light of environmental factors.
APPROACH: Sites are to be selected in different geographic settings where petroleum and ore deposits have already been defined by ground exploration effort. Existing multispectral remotely sensed data (including airborne geophysical data) will be evaluated at different scales, accuracies, and format using different data analysis techniques. Conceptual geologic exploration models will be developed that will enable the known deposits to be targeted from remote sensor information. Areas where mineral deposits are suspected will then be targeted using developed techniques. Success of the targeting procedure will be demonstrated through the ground investigations conducted in the public domain.
RESULTS: (1) Publication of briefing aids, workshop exercises, and applications examples by FY 77. (2) Development of a complete documented application package by June 1977. This will be a complete stepwise procedure for targeting of mineral exploration effort and development of exploration strategy based on remotely sensed data. (3) Several technical publications in professional journals planned.

PROJECT DESCRIPTION: Identify and discriminate selected natural resources and environmental pollutants through the use of an airborne Fraunhofer line discriminator (FLD) which measures solar stimulated luminescence. A supporting laboratory program uses a fluorescence spectrometer to quantify the luminescence of materials of interest and to predict the detectivity of such materials with the FLD.
RESULTS: The luminescence of oils (crude and refined), oil shales, industrial and residential wastes (including phosphate plant and paper mill effluent), phosphate and gypsum outcrops, and geochemically stressed vegetation was quantified in terms of a known standard rhodamine WT. Results were used to predict the detectivity of these materials with an airborne FLD. Measurements of luminescence with the FLD proved the validity of the predictive technique. Application of the FLD measurements to the environmental impact of phosphate plant effluent at Lakeland, Florida, and paper mill effluent at Perry, Florida, were made in cooperation with the Environmental Protection Agency. In addition, geochemically stressed vegetation was detected at Malachite Mine, Colorado, and Pine Mt., Nevada; also the FLD was used in cooperation with the Army Corps of Engineers to measure longshore currents in Lake Michigan by using fluorescent dyes as tracers. The instrument is now operating in an imaging mode from a fixed wing aircraft. Marked success has been shown in imaging oil seeps in the Santa Barbara Channel, California, and fluorescent rocks associated with uranium mineralization in New Mexico.

PROJECT DESCRIPTION: To demonstrate for areas of diverse geologic and hydrologic conditions the application of earth-sciences data to the material benefit of urban land-use planning and decisionmaking; provide land-resource and hazard data and relate to decisions on facility siting and other on-shore effects of oil and gas importation in a form directly usable by land-use planners and decisionmakers. Study areas (Fairfax County, Colorado Front Range, and Puget Sound) cover a broad range of geologic and hydrologic conditions in critical urban areas.
APPROACH: Compilation and analysis of file data; field measurement of hydrologic properties and conditions of aquifers; analysis of streamflow and infiltration characteristics; geophysical and geologic mapping; direct and indirect field measurements of floods; engineering soils tests; horizontal level control surveys; various remote sensing techniques where appropriate; publication mainly as single purpose, individual maps or folio with text, designed for the land-use planner/decisionmaker.
RESULTS: Regional topographic maps at 1:100,000 and 1:125,000 scales, orthophoto quadrangles at a variety of scales. Basic data maps, such as those describing geology slopes and land forms and interpretive maps delineating potential hazards such as floods, active faults, landslides, and mine subsidence. Also included: mineral and construction resource maps including mapping of coal beds, and land capability studies.
PROJECT MILESTONES: (1) Completion of Colorado Front Range and Fairfax County urban area studies in FY 1978. (2) Completion of Puget Sound Earth Sciences Applications Study in FY 1982.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: Based on literature review and study of representative field conditions, to prepare a report which summarizes, for the land and resource planner, the processes, methodologies, and alternate choices that arise as land is converted to surface mining and is later reconverted into an asset or is left as a liability. To develop and compile a methodology to integrate land use plans with mining and reclamation plans.
APPROACH: Bibliographic review, case study analyses, field surveys, state-of-the-art surveys, and an interpretation for land use planners, on how to accomplish integrated mine, reclamation, and end-state land planning.
RESULTS: (1) Publication: Chap. A--A Guide to the Reclamation of Mined Areas for Land Resource Planners; Chap. B--Annotated Bibliography of Research, Programs, and Systems Relating to the Reclamation of Mined Areas; Chap. C--A Guide to the Technology of Reclamation of Mined Areas; Chap. D--A Guide to Integrated Land Use, Mining, and Reclamation Planning; and Chap. E--Case Studies in Mined Area Reclamation and Related Land Use Planning. (2) User oriented workshops for state and local officials will be conducted at 6 to 8 locations from September 1977 to June 1978.

CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (10%);ANALYTICAL (90%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Alaska;COASTS/Alaska
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To obtain geologic data needed for the planning, construction, and operation of the TransAlaska Pipeline (TAPS). In particular (1) to prepare for the Technical Advisory Board to the Department of Interior Task Force on Oil Development and for the Federal Task Force on Alaskan Oil Development an environmental impact statement, and prepare and review technical stipulations on the alignment, construction, and operation of TAPS, and (2) obtain geologic and engineering-geologic data needed for development of TAPS.
APPROACH: Geologic and engineering-geologic mapping, modelling of heat flow from a pipeline in permafrost, measurements of seismicity, studies of the permafrost, and synthesis of borehole data from surficial deposits. Evaluate new techniques, such as remote sensing, that will aid in the rapid determination and distribution and character of permafrost and other geologic-environmental features and consequently will facilitate solving engineering-geologic problems.
RESULTS: Most of the objectives of this project have been accomplished. More than 50 reports have been published, including environmental and technical stipulations and data resulting from geologic, seismic, and engineering-geologic studies. Current activities emphasize the collection of basic geologic, seismic, and hydrologic data important to the construction and safe operation of the pipeline.
PROJECT MILESTONES: (1) Completion of collection and synthesis of geotechnical data continuing. (2) Completion of collection and synthesis of seismic data continuing. (3) Completion of collection and synthesis of hydrologic data continuing.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To assess the impact of geothermal development and utilization on the subsurface environment in terms of the possibilities of increased seismic activity, and subsidence, and changes in ground water flow and quality.
APPROACH: (1) Establish vertical and horizontal control nets for monitoring subsidence associated with subsurface fluid withdrawal. (2) Establish seismic nets for monitoring induced microearthquake activity. (3) Collect hydrologic data in order to establish baseline standards for the quality and flow of ground water.
RESULTS: (1) Reports of land subsidence and earthquake activity in the Imperial Valley and The Geysers, California. (2) Preliminary assessments of ground deformation and seismic activity in the Gulf Coast; Long Valley, California; and the Raft River and Bruneau-Grandview areas, Idaho. (3) Hydrologic data from Long Valley, Imperial Valley, and Raft River area.
PROJECT MILESTONES: (1) Subsidence monitoring: Start Imperial Valley, FY 76; continuing surveillance, FY 77,

FY 78, and FY 79. (2) Earthquake monitoring: Start preliminary risk assessment, Imperial Valley, FY 76; continuing surveillance, FY 77, FY 78, and FY 79. (3) Baseline ground water studies: Start Imperial Valley, FY 76; continuing surveillance, FY 77, FY 78, and FY 79.

TITLE: Arctic Environmental Studies Program
PROJECT NUMBER: 9310-01546
PRINCIPAL INVESTIGATOR: Ferrians, O.J. Jr.
ADDRESS: U.S. Geological Survey, 345 Middlefield Road, Menlo Park, CA 94025
AFFILIATION: Geological Survey, Menlo Park, Calif. (USA)
MONITORING AGENCY: Geological Survey, Washington, D.C. (USA)
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Geological Survey FY77:$407,000
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
ENERGY CYCLE: TRANSPORTATION (100%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (90%);ANALYTICAL (10%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Alaska;COASTS/Alaska
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECT
PROJECT DESCRIPTION: To investigate energy-related transportation corridors and other areas of development in Alaska in order to obtain base-line geotechnical data needed to aid in (1) planning, designing, operating, and maintaining engineering structures, (2) minimizing adverse environmental impacts of construction and operation of engineering projects, and (3) evaluating the feasibility of proposed engineering projects.
APPROACH: (1) Map and study the major surficial geologic units in transportation corridors and make interpretations of the potential engineering problems and availability of construction materials. (2) Collect and synthesize seismic data. (3) Study geologic processes that are especially active in Alaska. (4) Observe environmental problems that arise during construction and operation of the TransAlaska oil pipeline in order to evaluate methods for controlling adverse environmental impacts.
RESULTS: (1) Reports and maps on the engineering geology, permafrost, Pleistocene and Holocene stratigraphy, seismicity, and glacial geology of the transportation corridors and other areas. (2) Reports synthesizing engineering-geologic data made available during construction of the TransAlaska oil pipeline. (3) Environmental impact statements. (4) Recommendations for minimizing adverse environmental impacts in the operation and maintenance of oil and gas pipelines.
PROJECT MILESTONES: (1) Complete geologic studies in Central Brooks Range June 1978. (2) Complete seismic studies June 1977. (3) Complete engineering-geologic studies of Arctic Coastal Plain February 1978. (4) Complete collection and synthesis of TAPS geotechnical data December 1982.

TITLE: Hydrology of the Oil Shale Area, Uinta Basin, Utah
PROJECT NUMBER: UT-75-113
PRINCIPAL INVESTIGATOR: Norvitch, R.F.
ADDRESS: U.S. Geological Survey, 8002 Federal Building, 125 South State St., Salt Lake City, UT 84138
AFFILIATION: Geological Survey, Salt Lake City, Utah (USA). Water Resources Div.
MONITORING AGENCY: Geological Survey, Lakewood, Colo. (USA)
DIVISION: Water Resources Division
MONITOR: Arnow, Theodore
TELEPHONE: F234-4118
TYPE OF FUNDING: Agency in-house effort;EPA pass-thru funding
77 FUNDING: Geological Survey FY77:$660,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Site specific Upper Colo. River;HYDROGRAPHIC AREAS/Other hydrographic areas Rocky Mt. States
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: A study of the hydrology of oil shale in the Uinta Basin is being initiated that will be comprehensive, span several years, produce about 30 reports, require several million dollars, and must yield results applicable to water supply and environmental problems. Existing data are minimal and the anticipated problems diverse. The problem is to design and conduct an efficient hydrology study that will provide a scientific basis for water supply and other development decisions within not more than 6 years. Design the investigation so that the objectives, individually and collectively, may be attained within about 5 years, with a minimum expenditure of funds and efficient use of manpower. Identify each project objective and document each project schedule, estimated costs, manpower requirement, data requirement, and report products. Provide a series of data and interpretive reports that will provide a comprehensive analysis of the hydrology of the oil shale area, oriented toward problems of water supply and the impacts of oil shale development.
APPROACH: Design the data collection system including preliminary locations and depths of proposed test holes, streamflow sites, parameters and frequencies of observations. Develop preliminary drilling specifications. Initiate data collection where baseline and project information are known to be required. Develop plan of study that documents objectives, approaches, schedules, and costs of each component of the comprehensive study. Produce the planned series of reports identified in plan of study during following 5 years.
RESULTS: Information is being collected to define the hydrologic system. A drilling contract for $341,000 was accepted to define the lithology and water bearing zones of the Green River formation. The work is 80% complete. Four artificial controls were installed at stream gaging sites. Thirty shallow wells were drilled in the alluvial valleys that are tributaries to the White and Green Rivers.
PROJECT MILESTONES: Two more artificial controls will be installed. Six data collection platforms will be installed as early flood warning devices. Eight pumping sediment samplers will be installed at existing gaging stations. Surveys of accumulated sediment in old BLM reservoirs will be made to estimate sediment yield from the area.

TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Geological Survey FY77:$1,706,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Site specific Northern Great Plains;HYDROGRAPHIC AREAS/Other hydrographic areas Upper Missouri River Basin
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Major development of coal within the area will place a heavy demand on the area's limited water resources. Surface water is poorly distributed in time and space. It is fully appropriated in part of the area, and in the rest its use will require storage reservoirs and distribution systems. Preliminary studies indicate that the Madison limestone and associated rocks might provide a significant percentage of the total water requirements for coal development. However, the effects of large sustained withdrawals of water from these rocks on the hydrologic system are not known. Evaluate quantity of water that may be available from the Madison, define chemical and physical properties of the water, determine effects of existing developments on potentiometric head, storage, recharge and discharge, spring flow and streamflow, and pattern of ground-water flow, predict possible hydrologic effects of proposed withdrawals of water for large-scale developments at selected rates and locations, determine the better locations for wells and the type of construction and development of deep wells to obtain optimum yields, and design network of observation wells and streamflow gages to monitor effects of additional developments on the hydrolcgic system.
APPROACH: Assemble, review, and assess available geologic and hydrologic data, prior studies, and oil company information. Purchase borehole and surface geophysical information and other pertinent data from oil companies. Define structure and stratigraphy; determine aquifer boundaries and geologic parameters that control permeability. Translate these parameters into hydrologic terms. Design test-drilling program; drill and test aquifer. Refine preliminary digital simulation model of system, and design monitoring network. Predict effects of various patterns of water-supply development on potentiometric surface, recharge, discharge, springs, streamflow, and water quality that could result from these developments. Operate monitoring network and refine predictions.
RESULTS: A model of the Madison aquifer will be developed and calibrated to permit planners to ascertain the water supply available, and impacts of various levels of withdrawal.
PROJECT MILESTONES: Compile and further evaluate available data, purchase and analyze surface and borehole geophysical data to extend point data between wells, delineate permeable zones, collect and analyze water samples, construct additional gaging and climatological stations, evaluate existing wells for monitoring network, collect available data from current test drilling by oil and coal industries, begin petrologic studies, refine and extend existing geohydrologic maps, prepare drilling specifications, begin test drilling and aquifer testing, refine preliminary digital simulation model, and use model to estimate range of possible effects that anticipated water developments of the Madison might impose on hydrologic system.

TITLE: Water and Its Relation to Economic Development in the Green River and Great Divide Basins, Wyoming
PROJECT NUMBER: WY-75-030
PRINCIPAL INVESTIGATOR: Lowman, H.W.
ADDRESS: U.S. Geological Survey, Water Resources Division, 4015 Warren Avenue, Cheyenne, WY 82001
AFFILIATION: Geological Survey, Cheyenne, Wyo. (USA). Water Resources Div.
MONITORING AGENCY: Geological Survey, Cheyenne, Wyo. (USA). Water Resources Div.
DIVISION: Water Resources Division
MONITOR: West, Samuel W.
TELEPHONE: F328-2111
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Geological Survey FY77:$267,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Site specific Rocky Mountain and northern Great Plains;HYDROGRAPHIC AREAS/Other hydrographic areas Upper Colorado River and Upper Missouri River Basin
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Development of extensive coal, oil, gas, trona, and oil-shale resources in the project area will require a projected increase in water consumption of 480,000 acre-feet per year by 1990. Development of energy resources in other parts of the state also will require large amounts of water; transbasin diversion of Green River water to other areas could total an additional 270,000 acre-feet per year. Water planners and managers need much more information about available ground and surface water, present quality of the waters, and the impacts on water supply and quality caused by development of energy resources. The study will be designed to gather information and make available to interested industrial, agricultural, and governmental people interpretive reports that describe: (1) the distribution and quality of surface water in space and time; (2) relationships between surface water and ground water, (3) the distribution, quantity, and quality of ground water, and (4) hydrology-related aspects of the environment. Efforts of the study will be directed towards: (1) describing the water resources and hydrologic relationships that presently exist; (2) developing predictive methods that may be used to describe future conditions, including reactions to increased water development; (3) establishing monitoring programs for detecting possible changes in water parameters.
APPROACH: Compile and evaluate existing water data, conduct literature search for present hydrologic knowledge of the area. Prepare planning report during first year of project, outlining the specific techniques to be used in subsequent phases. Regarding water quality, particular attention will be given to trace metals, biological parameters, and trend analysis. Channel-geometry techniques, erts imagery, and detailed statistical analyses will be applied to surface-water studies. Aquifer tests and bore hole and surface geophysical surveys will be used in ground-water studies. Digital models will be developed for chemical-quality and surface-water systems.
RESULTS: During the 15-month period ending September 1976, a comprehensive planning report was completed that

summarizes the project study plan and outlines particular methods of approach to be utilized in the study. An interdisciplinary approach was used to collect data and prepare the hydrology sections of four interagency reports on reclamation and environmental impact. A helicopter was used advantageously to visit a large number of ephemeral streams during snow-melt runoff in 1976. At each site, the discharge and channel features were measured and samples of water were collected for chemical, sediment, and biologic analyses. Analyses of existing data on stream temperature, dissolved solids, and suspended sediment were completed and reports were begun for these items. A three-variable regression model for dissolved solids was developed that is much more descriptive than existing two-variable models. Flood-plain surveys were completed of most of the area's streams. A large number of observation wells were completed in the coal and oil-shale areas.
PROJECT MILESTONES: A helicopter will be used to aid data collection of a large number of springs and streams. Two different sampling schemes, once during base flow and again during snowmelt runoff, are planned. Interpretive reports concerning hydraulic characteristics, stream temperature, dissolved solids, suspended sediment, travel time, biology, and ground-water supply will be completed. Models of streamflow and water quality will be investigated and developed for small basins in oil-shale and coal areas. Several small basins will be instrumented for collection of weather and streamflow data for calibration of the model.

TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Geological Survey FY77:$299,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Site specific Rocky Mt. states;HYDROGRAPHIC AREAS/Other hydrographic areas Upper Missouri River Basin
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Strip mining and the related aspects of coal development can be expected to cause ground-water levels and ground-water quality to change. The public, industry, and government need to know the extent of change in order to take and enforce mitigating measures. Water availability and water quality need to be known in order for other agencies to evaluate alternate sources of water. Define and understand the regional and local flow systems in aquifers above the Pierre shale. Develop a semi-quantitative conceptual model as a basis for predictive models. Develop predictive models to assess the effects of mining on water levels and the yield of wells and springs. Develop ''first estimate'' water-quality models to predict rate and direction of movement of poor quality water from spoil banks and other sources. Utilize all of the models to evaluate and revise the data collection program. Assure that the data collection and interpretation (modeling) programs meet the needs of other Federal and State agencies.
APPROACH: Combine the accumulated geologic and hydrologic information to develop conceptual models of the hydrolcgic system on both large and small scales. Collect additional data needed for more complete understanding of the hydrologic system. Develop digital models, first, to test and modify the concepts and evaluate the data-collection network then to predict the effects of mining and related activities on ground-water levels and the discharge of springs. Using the hydraulic models, try to develop water-quality models to determine or predict leachate migration and the movement of other poor quality water.
RESULTS: Inventoried about 450 wells in the field. Collected about 180 water samples for chemical analyses. Cased test holes for aquifer testing and water-level monitoring. Completed geologic map for entire study area. Selected wells for observation well network for overall study area. Completed structure contour map of the top of the Beardam shale. Initiated compilation of sand-shale ratio, isopach, transmissivity, and potentiometric-surface maps of the Tongue River and Lebo members of the Fort Union Formation and a structure contour map of the top of the Lebo member.
PROJECT MILESTONES: Complete sand-shale ratio, isopach, transmissivity, and potentiometric-surface maps of the Tongue River and Lebo members of the Fort Union Formation and the structure contour map of the top of the Lebo member. Complete well inventory. Continue water-quality sampling. Install recorders for monitoring of water levels. Run aquifer tests. Make low-flow investigations of streams. Enter data into system 2000. Case test holes drilled by government and industry on areas of government minerals, if available.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Problem: Evaluation and prediction of the impact of oil-shale development on the water resources of the Piceance Basin requires a knowledge of the transmissive and storage properties of the aquifer. Existing data are inadequate to reliably define the regional variations in aquifer properties and the vertical permeability of the confining layer, which separates the aquifers, has only been estimated. During previous studies in the Piceance Basin, the USGS accepted responsibility for plugging wells left open for hydrologic study. These wells need to be plugged to prevent the flow of water between aquifers. Objective is to define the regional variation of transmissivity and storage coefficient of the two principal aquifers and the leakage of the confining layer. The data will be used to update the data used in the existing digital model of ground-water flow which can be used to evaluate the impact of oil-shale develcpment on the hydrology of the Piceance Basin. Plug or complete existing wells to prevent the flow of water through the well bore between aquifers.
APPROACH: Aquifer test data collected by private companies will be analyzed and used to improve the definition of aquifer properties in the Piceance Basin. About twenty wells which are open to more than one aquifer will be plugged or partially plugged and completed as observation wells.
RESULTS: Results last year: aquifer test data were collected at 3 sites utilizing the observation wells drilled by contract under project CO 75-061. Aquifer test results reported by private development were compiled. Leaky-aquifer tests conducted by private companies indicate that it may not be feasible to determine the leakage of the Mahogany Zone confining layers. Consequently, contract specifications were prepared for the rehabilitation of 8 wells and the contract ($35,610 plus reimbursibles) was awarded and completed. The reconditioned wells will be used as observation wells for project CO 75-061.
PROJECT MILESTONES: Plans next year: (1) evaluate the feasibility of conducting leaky-aquifer tests; and (2) prepare a contract for either leak-aquifer or conventional aquifer testing.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Northeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Problem: Continuous burial of ''low level'' radioactive wastes has been taking place at Maxey Flats, KY, from 1963 to the present. Although the geology has been well-defined, little is known about the hydrology of the site. Moving water would be the principal transport mechanism for isotopes to offsite areas. Further definition and quantification of the various flow systems, at and around the site, need to be done. Knowledge of the hydrology of the site is needed in determining the ramifications involved in establishing other sites in similar hydrogeologic terrains. Objectives: (1) to further describe and define the various units which may transit water in the area; (2) to define and quantify the flow systems in these units; (3) to define the inorganic (non-isotopic) quality of water in the hydrologic units; and (4) to investigate the inorganic (non-isotopic) and organic character of the leachates in the disposal-pit water.
APPROACH: (1) Drill at least one piezometer nest of four tubes to obtain cores and data on zones of saturation, hydraulic heat distribution, and water quality. (2) Continue water level and conductivity measurements on some wells existing on site, as has been done during the past year. (3) Aquitard - test piezometer tubes.
RESULTS: Results last year: (1) routine water level, pH, and conductivity measurements made on all existing wells at the burial site; (2) four wells were drilled in June and July 1976 to depths of 53, 84, 138, and 323 ft.; (3) the well to 323 ft. was cored from top to bottom and cores have been sent for hydrologic and radiochemical analyses; (4) six trench water samples have been analyzed by Oak Ridge National Laboratory; and (5) 16 trench water samples were obtained for analysis by Brookhaven National Laboratory.

PROJECT MILESTONES: Plans next year: (1) 4 additional test holes, including one corehole, will be drilled in the spring of 1977; these holes will be located approximately in the center of the ''old'' trench area; (2) Racker tests will be conducted on all wells drilled in 1976 and 1977; and (3) chemical analyses will be done on water from these wells.

ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Northeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Problem: Site near Sheffield, IL, is being used to bury ''low level'' radioactive wastes. Site has been in operation since August 1967. Although the gross geology has been well defined, hydrologic knowledge of the site is inadequate. Moving water (essentially ground water) would be the principal transport mechanism for isotopes to off site areas. Definition and quantification of the various flow systems in and around the site are necessary for determining the containment or rate of movement of radioisotopes with the ground water from the sites. Knowledge gained from the study of the microhydrology of this site will be applied to the problem of developing criteria to be used in establishing future sites. Objective is to describe and define in detail the hydrogeologic units which may or do transmit water in and adjacent to the site. The flow systems in these units will be defined and quantified. The water in the various units will be sampled and analyzed to determine the inorganic (non-isotopic) quality of the water. In addition, the water samples will be checked for the presence of radionuclides. The inorganic, organic, and radionuclide character of the leachates in the disposal-pit water will be determined. The possibility of developing a predictive digital waste transport model of the glacial till on which the site is located will be explored.
APPROACH: (1) It will require definition of microhydrology and distribution of radioisotopes. (2) Existing data will be reviewed. (3) Existing observation wells will be tested and logged, and additional wells will be installed to base of till. (4) Piezometers will be installed at various depths in till and in any sand lenses that have either been previously located or are encountered in new drilling. (5) Obtain undisturbed cores from drilled wells; obtain cores below refuse trenches; analyze cores for ions contained in the pore water and absorbed by the till minerals. (6) Install control wells in nearby areas. (7) Measure and sample small streams; look for springs and storm runoff from site. (8) Sample stream sediment for possible absorbed ions. (9) Evaluate hydrologic relationship of dissected till plain at site with adjacent disturbed strip mined areas.
RESULTS: Results last year: (1) Initial test drilling program has been completed. (2) Twenty-four wells were drilled, each well penetrated the glacial materials overlying the Pennsylvanian shale bedrock. (3) Shelby tube and/or split spoon samples were collected from land surface to bedrock. (4) Gamma ray logs were run on 5 existing monitor wells. (5) These logs were used to select points for collecting gamma spectral data. (6) Based on a qualitative evaluation of these logs there were no radionuclides present above the normal background nuclides present in the rock.
PROJECT MILESTONES: Plans next year: (1) complete analysis of test drilling data; (2) prepare hydrogeologic framework of site for purpose of planning additional test drilling and data collection needs; (3) complete field evaluation of coefficients of storage and transmissivity of most permeable zone in glacial material; and (4) prepare preliminary basis of a flow model to evaluate areal extent of sand lense, rates of flow, and coefficients of leakage of impermeable rocks which overlies the sand lense and underlies the floor of burial trenches.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Problem: need to obtain a better understanding for predicting evaporation. The objective of this project is to improve current methods for prediction of water temperature and evaporation under both natural and altered conditions.
APPROACH: Models will be developed for the following categories: (1) cases where the vertical temperature stratification is an important factor; (2) cases where the lateral temperature gradient dominates the process; and (3) cases where the water is mixed. In developing these models studies will be conducted on

energy transfer processes such as evaporation, conduction and radiation and sensitivity analysis will be performed on model parameters such as net absorbed radiation, air temperature, and wind speed.
ULTS: Results last year: the data collection phase of a field project to study temperature variations in a well mixed open channel has been completed and the data processed into engineering units. One hundred forty of the 365 days of data have been selected for detailed modeling. Any missing data for these days have been interpolated from other sources. Analysis of the radiation data indicate that different types of instruments give different values of longwave radiation, especially during the daylight hours.
PROJECT MILESTONES: Plans next year: (1) modeling of the 140 days of data will be completed in order to (A) verify the one-dimensional stream temperature model and (B) to determine the variation of the surface heat exchange coefficient with meteorologic and hydraulic variables; and (2) a IWRI manual on energy budget studies will be written and the Salton Sea report completed.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Low-level solid radioactive waste has been buried at a site near Beatty, Nevada, from 1962 to the present. Geology and hydrology of the site is poorly known. The net downward soil moisture flux is unknown; consequently the potential rate of downward movement of radioactive solutes cannot be determined for present climatic conditions. Objectives: Estimate average potential rate of soil moisture flux and downward transport of radioactive solutes or leachates in the unsaturated zone beneath the burial site, and of the lateral movement of radioactive solutes or leachates in the regional aquifer. Attempt to determine if radionuclides from buried waste have migrated into the unsaturated zone beneath the burial trenches. Assess the geologic and geohydrologic suitability of the site for low-level radioactive solid waste burial. Contribute to the development of guidelines and criteria for selecting new burial sites.
APPROACH: Calculate soil moisture flux from measurements of matric potential, soil moisture, and unsaturated conductivity. Determine infiltration indirectly by measuring evaporation and surface runoff. Obtain new data on regional ground-water system by drilling several deep wells. Drill beneath waste burial trenches and sample for radioactive contamination. Conduct detailed geologic and hydrologic evaluation of burial site area.
PROJECT MILESTONES: (1) Preliminary analysis of soil moisture flux. (2) Preliminary analysis of radionuclide migration. (3) Project report. (4) Case history-suggested site selection criteria.

TITLE: Water Resources of the Powder River Structural Basin in Wyoming in Relation to Energy Development
PROJECT NUMBER: WY-75-032
PRINCIPAL INVESTIGATOR: Lowry, M.E.
ADDRESS: USGS, P.O. Box 1125, Cheyenne, WY 82001
AFFILIATION: Geological Survey, Cheyenne, Wyo. (USA). Water Resources Div.
MONITORING AGENCY: Geological Survey, Washington, D.C. (USA)
DIVISION: Water Resources Division
MONITOR: West, Samuel W.
TELEPHONE: F328-2111
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Geological Survey FY77:$182,000
TECHNOLOGY: FOSSIL FUEL/Coal (90%);FOSSIL FUEL/Oil Shale (10%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The problems are those related to large water requirements for development of energy resources in the water-short Powder River and the impacts resulting from such development. An average annual requirement of 250,000 acre-feet of water per year is projected by 1990. Part of the initial demand could be supplied by surface water and/or ground water from aquifers of upper cretaceous or tertiary age. The impacts of mining, reclamation, transbasin diversions, off-channel and other reservoirs on the shallow aquifers, stream systems, and quality of water is not known. The objectives of the first phase will be to determine the adequacy of existing data to describe water availability and assess possible impact of the pending development, and to identify specific subjects that should be studied by the district. The findings of the first phase will be used to identify major thrusts for the second phase, which will constitute district's program in the basin during the succedding four years. A data-collection system will be designed, based on findings of the first phase, to meet data needs for thrusts and obtain benchmark information.
APPROACH: The existing data and data-collection program will be evaluated and a data-collection program, which is coordinated with other governmental and industrial programs, will be implemented. Various study techniques including those for determination of aquifer properties, streamflow analysis, channel geometry, isotope study, biological assay, water budgets, modeling, and geophysics will be explored and those that have merit will be pursued in the second phase of the study.
RESULTS: Results last year: during the 15-month period ending September 1976, the second year of the study, emphasis continued to be on data collection and construction. Three new gages were installed and six coal-test holes were completed as observation wells. The Emria site was instrumented with 2 SR recorders, 3 rainfall recorders, and two water-level recorders. Wells in the recluse model mine area were sampled

under a program with the EPA. Water resource sections for three coal EIS were written. Statistical and storage analyses for the North Platte River system were started. A comprehensive planning report for the project was prepared but not released.
PROJECT MILESTONES: Plans next year: (1) emphasis on data collection and construction will contnue; however, increased time will be spent on interpretation and reports; (2) only one new gage will be constructed, but there are tentative plans for completion of 15 coal test holes as observation wells; and (3) data collection at 3 of 10 intensive study sites is nearly complete, except for monitoring; emphasis on data collection will shift to other intensive study sites and to the basin reconnaissance.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Applied (60%);ANALYTICAL (40%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To acquire, interpret, and disseminate geologic, hydrologic, geochemical, and related information that will assist in analyzing and solving environmental problems associated with energy resource extraction and utilization; and planning, siting, and construction of energy conversion and distribution facilities.
APPROACH: The programs assemble basic geologic, geochemical, engineering, and interpretive earth-science investigations into the environmental aspects of energy resource recovery, transmission, and conversion.
RESULTS: Maps and reports characterizing environmental earth science aspects are being prepared for areas of Montana, North Dakota, Wyoming, Utah, Colorado, New Mexico, Arizona, Oklahoma, Kansas, and Texas.
PROJECT MILESTONES: (1) Complete surficial geologic mapping in the eastern Powder River Basin, Wyoming. (2) Complete compilation of remote sensing techniques of land use, landform, and vegetation maps of Sheridan County, Wyoming. (3) Continue engineering-geologic studies in the western Powder River Basin, Wyoming. (4) Continue investigations into the rates of erosion and surficial and bedrock geologic mapping in northwest Colorado. (5) Complete environmental studies of the Texas Lignite Belt and continue them into Oklahoma and Kansas. (6) Continue baseline geochemistry studies.

TITLE: Remote Sensing of High Temperature Geothermal Areas of Iceland (Task within larger project: Geological and Geophysical Remote Sensing of Iceland)
PROJECT NUMBER: 6-7030-24006
PRINCIPAL INVESTIGATOR: Williams, R.S. Jr.
ADDRESS: USGS, EROS/LIA MS730, Reston, VA 22092
AFFILIATION: Geological Survey, Reston, Va. (USA)
MONITORING AGENCY: Geological Survey, Reston, Va. (USA)
DIVISION: Land Information and Analysis Office
MONITOR: Williams, Richard S., Jr.
TELEPHONE: F928-7873
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Geological Survey FY77:$30,000
TECHNOLOGY: GEOTHERMAL/General (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Site specific Iceland;HYDROGRAPHIC AREAS/Other hydrographic areas Mid-Atlantic Ridge
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The overall objective of the binational cooperative research project in Iceland is to determine the scientific and operational use of aerial and satellite photography and/or imagery to monitor and to study the dynamic geological and geophysical environment of Iceland. The geothermal studies, a task of the project, involve, for the next 3 years, the preparation of a professional paper on aerial photographic, aerial thermographic, and satellite imagery studies of the 17 high-temperature areas of Iceland.
APPROACH: All aerial photography and thermography has been acquired during aerial surveys: ca. 1945, ca. 1960, 1968, and 1973, for the former; and 1966, 1968, and 1973 for the latter. Preparation of the text will be a binational endeavor, with the USGS supporting its personnel. Each high-temperature geothermal area will be treated as a separate chapter in the monograph and will be well illustrated. This is the concluding phase of the geothermal project in Iceland.
RESULTS: The primary product will be a comprehensive monograph on the use of remotely-sensed data in the analysis of high-temperature geothermal areas in Iceland. Aerial photography and thermography will be correlated with ground-based geological and geophysical data to provide a complete reference work to Iceland's high-temperature geothermal areas. The monograph should aid in the exploration for exploitable high-temperature geothermal areas in the U.S. and other areas.
PROJECT MILESTONES: (1) FY 1976 and 1977 Bibliographic search of Iceland's geothermal literature. (2) Transitional Quarter Collation of all aerial and satellite data of Iceland. (3) FY 1978 Research analysis and preparation of text. (4) FY 1979 and FY 1980 Publication.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Compilation of a directory of national environmental statistics to cover such areas as air/water quality, land use, mineral resources, energy, food/fiber, and others. Presentation of these statistics in graphical form in a publication on environmental indicators.
APPROACH: Statistics will be assembled largely from Federal sources, e.g., land use and minerals data from USGS, food/fiber data from USDA, and so forth for each statistical area. Interpretive analyses will be prepared to evaluate the data for significance and probable trends in each subject area. A contract will be let by CEQ with CEQ, GS, and EPA, the sponsors of the activity, providing program direction, guidance and review. In addition, the Federal Project managers will arrange for advice and review by experts in the various categories covered. The statistics will be periodically updated and published, when significant changes warrant.
RESULTS: Two reports will be pubished: The Compendium of Environmental Statistics and Presentation of Environmental Indicators. Selected tables and graphs will appear in the CEQ annual report.

PROJECT DESCRIPTION: Construction of alternative scenarios to describe possibilities for development of western coal in the Powder River Basin, and the consequences of such development in terms of environmental, socio-economic, and land-use variables. Transfer of this technology to the in-place planning community in states such as Wyoming and Montana.
APPROACH: Scenarios will be constructed to show the interrelationships among amount of coal produced, mine mouth power generation, coal gasification, slurry pipelines, and unit trains. Scenarios will be interfaced with environmental assessment model to forecast the secondary and higher order impacts of each alternative.
RESULTS: Report describing project, methodology, and application will be produced for NSF as project sponsor. This report will be transferred to the planning community to increase their capabilities to cope with coal develcpment.

PROJECT DESCRIPTION: Demonstrate the on-project usefullness of a planning methodology which optimizes transmission corridors based upon resource/environmental considerations in conjunction with other factors comprising BPAs facility siting process.
APPROACH: Natural resource and socio-economic information is inventoried and given relative importance ratings; this data is then processed with a computer to optimize a transmission corridor in the context of minimizing interactions with constraints or problem areas.
RESULTS: This demonstration is expected to show that the use of the PERMITS methodology on selected complex projects will provide the decisionmaker with resource-responsive optimized corridors which will enhance his opportunity for balancing environmental and non-environmental factors.
PROJECT MILESTONES: This project is to be phased with BPAs siting/EIS program and is expected to terminate in 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine the status of raptor (hawks, eagles, osprey) nesting on BPA transmission

line towers and to study birds living in high electric, magnetic field, and corona noise environments.
APPROACH: BPA helicopter patrol observers were given training in collection of information on nesting raptors. Such information will be collected on all routine helicopter patrol flights beginning in the spring of 1977. Measurements of electric fields in transmission towers where birds nest will be made. Estimates will be made as to the amount of raptor production occurring on BPA transmission structures. A small number of raptor nest platforms will be installed where maintenance problems exist.
RESULTS: The results are expected to show that transmission lines are a positive factor for many kinds of birds because they provide nesting habitats in tree-less areas.
PROJECT MILESTONES: Four raptor nest platforms were installed during early spring of 1977 and two of the platforms were utilized by raptors.
KEYWORDS: RAPTORS ;POWER TRANSMISSION LINES;ENVIRONMENTAL IMPACTS;BIRDS;REPRODUCTION;MAINTENANCE;ELECTROMAGNETIC FIELDS;BIOLOGICAL EFFECTS

PROJECT DESCRIPTION: To determine what, if any, effects the +- 400 kV Celilo-Sylmar d-c transmission line has on crops, natural vegetation, wildlife, and domestic animals, which are detectable by field investigations.
APPROACH: Two primary study areas were established along the Oregon portion of the d-c line. Within these areas plants and animals are systematically sampled on the right-of-way and in nearby control areas off the right-of-way. Parameters studied include species diversity and relative abundance. Observations of animal behavior on and near the right-of-way are also included.
RESULTS: Results of the study are expected to be the first reported biologic effect of a HVdc transmission line. The results will provide data for an environmental statement being prepared for a proposed second d-c line.
PROJECT MILESTONES: Final report for the study is expected to be completed by July 15, 1977.
KEYWORDS: ELECTROMAGNETIC FIELDS;BIOLOGICAL EFFECTS;POWER TRANSMISSION LINES;ENVIRONMENTAL IMPACTS;NOISE;TERRESTRIAL ECOSYSTEMS;WILD ANIMALS;PLANTS;DOMESTIC ANIMALS

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Northwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine what, if any, short-term effects a prototype 1100/1200 kV ac transmission line has on natural vegetation, crops, wildlife, cattle, and honey bees. Of primary interest are possible effects on animal behavior and the vigor and growth of plants.
APPROACH: Beginning one growing season before energization of the prototype line plants and animals were systematically sampled on the right-of-way and in nearby control areas of the right-of-way. Sampling will continue for two growing seasons following energization and comparisons will be made between right-of-way and control areas. During the summers of 1977 and 1978, cattle and honey bee colonies will be studied. Data being developed by laboratory studies being conducted elsewhere by others on biologic effects of electric fields will supplement results of the 1100/1200 kV study.
RESULTS: A final report is expected on the project in October 1978. Results of the biological study along with engineering and economic studies will determine the desirability of constructing 1100/1200 kV transmission lines in the BPA service area.
PROJECT MILESTONES: All three phases of the 1100/1200 kV test line were energized on May 10, 1977 and the biological study is now in the post-energization phase.

77 FUNDING: Department of Transportation FY77:$9,200
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objective calls for software development and air pollution dispersion model testing and evaluation.
APPROACH: A FORTRAN computer program will be written to model the dispersion of pollutants from one or more moving point sources. The TSC/EPA highway air pollution dispersion model will be reprogrammed to incorporate new features such as a new integration method and new conversion criteria to improve computer efficiency. A comparison will be made of predictions of five highway air pollution dispersion models. Model validation experiments will be conducted using two highway air pollution data samples to compute model performance measures.

CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The purpose of the workshop is to assist DOT to identify and assess the requirements for research and development in the area of the impacts on health of pollutants emitted into the atmosphere by all types of transportation vehicles.
APPROACH: DOT and EPA will jointly convene the workshop on this subject. This workshop is envisioned as a two-day session in which expertise will be applied to the question of health effects of both primary and secondary pollutants associated with highway vehicles (i.e., NOx, SO2, HC, CO, Pb, Mn, H2SO4, O3, PAN, etc.). Individuals with a particular knowledge of various aspects of the subject area (including toxicological testing systems, atmospheric chemistry, and characterization of mobile sources of pollutants) will be invited to participate.

TITLE: Development of Model to Assess Environmental Effect of Commercial Aviations High Altitude Cruise Operations
PROJECT NUMBER: 59977
ADDRESS: Washington, DC
AFFILIATION: Space and Missile Systems Organization, Washington, D.C. (USA)
MONITORING AGENCY: Department of Transportation, Washington, D.C. (USA)
DIVISION: Federal Aviation Administration
MONITOR: Broderick, A.J.
TELEPHONE: C(202)755-8933
TYPE OF FUNDING: Contract No.-DOT-FA77WAI-720
77 FUNDING: Department of Transportation FY77:$118,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Aircraft exhausts (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objective is to develop a model for use in assessing the environmental effect of commercial aviations high altitude cruise operations. Since present fleets are too small, it is impossible to measure the environmental effects of aircraft exhaust products. Therefore, it is necessary to use mathematical models of atmospheric transport and chemistry to derive the required understanding.
KEYWORDS: AIRCRAFT;EXHAUST GASES;ENVIRONMENTAL IMPACTS;MATHEMATICAL MODELS;ENVIRONMENTAL TRANSPORT;COST BENEFIT ANALYSIS;DECISION MAKING;EARTH ATMOSPHERE;CHEMICAL PROPERTIES;AIR POLLUTION;STRATOSPHERE;MONITORING

<062023>
TITLE: Analysis of Aircraft Effects
PROJECT NUMBER: 160071
ADDRESS: Arlington, VA 22204
AFFILIATION: Institute for Defense Analyses, Arlington, Va. (USA)
MONITORING AGENCY: Department of Transportation, Washington, D.C. (USA)
DIVISION: Federal Aviation Administration
TYPE OF FUNDING: Grant No.-DOT-FA77WA-3965
77 FUNDING: Department of Transportation FY77:$250,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Aircraft pollutants (100%)
PROJECT DESCRIPTION: Objectives are to: (1) summarize the status of research, in the U.S. and abroad, on the effects of high altitude aircraft operations on the stratosphere, with particular attention to effects on total-ozone column and climate; (2) undertake a review of the status of coupled chemistry-transport models of the effects of high altitude aircraft operations on climate; (3) summarize the state of knowledge with respect to the relationship between decreased ozone amount and changes in skin cancer incidence rates; and (4) summarize data on the location, nature and amount of each natural atmospheric perturbation which has occurred over the last 20 years.
KEYWORDS: AIRCRAFT;EXHAUST GASES;ENVIRONMENTAL IMPACTS;AIR POLLUTION;METEOROLOGY;STRATOSPHERE;MONITORING;ENVIRONMENTAL TRANSPORT;OZONE;CLIMATES;DATA ACQUISITION;NEOPLASMS;SKIN;MATHEMATICAL MODELS;EARTH ATMOSPHERE

<062024>
TITLE: Effects of Supersonic Transport on Air Quality
PROJECT NUMBER: 160072
ADDRESS: Argonne, IL 60439
AFFILIATION: Energy Research and Development Administration, Argonne, Ill. (USA). New Brunswick Lab.
MONITORING AGENCY: Department of Transportation, Washington, D.C. (USA)
DIVISION: Federal Aviation Administration
TYPE OF FUNDING: Grant No.-DOT-FA77WAI-736
77 FUNDING: Department of Transportation FY77:$20,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Aircraft pollutants (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
APPROACH: Tasks are: (1) adapt the airport vicinity air pollution (AVAP) model to accommodate the measurements data of the Concorde; (2) determine new estimates of air quality values and compare with values computed from the unadjusted model; and (3) determine effects of additional supersonic transport on air quality by use of measurement data and a real world airplane activity forecast.
KEYWORDS: CONCORDE;SUPERSONIC TRANSPORT;ENVIRONMENTAL IMPACTS;AIR QUALITY;AIRPORTS;MONITORING;EXHAUST GASES;EARTH ATMOSPHERE;MATHEMATICAL MODELS;FORECASTING;DATA PROCESSING;COMPUTER CALCULATIONS

<062025>
TITLE: Assessment of the Irritating/Debilitation Effects of Environmental Agents on Railroad Operating Crews
PROJECT NUMBER: 160255
PRINCIPAL INVESTIGATOR: Peay, J.
ADDRESS: Crane, IN 47522
AFFILIATION: Naval Weapons Support Center, Crane, Ind. (USA)
MONITORING AGENCY: Department of Transportation, Washington, D.C. (USA)
DIVISION: Federal Aviation Administration
TYPE OF FUNDING: Grant No.-DOT-AR-74312
77 FUNDING: Department of Transportation FY77:$53,500
POLLUTANTS: NOXIOUS GAS (50%);NOISE, VIBRATION (50%)
CHARACTER OF STUDY: RESEARCH/Applied (80%);ANALYTICAL (20%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS;OS
PROJECT DESCRIPTION: Studies of crew exposure to gaseous agents and in-cab noise have been undertaken with a view towards determining whether or not previously established maximum permissible dose levels of these agents are exceeded during routine operations. Preliminary indications are that, except in isolated, non-typical cases, these maximum permissible dose levels generally are not exceeded. The FRA continues to annually receive a limited number of reports of acute cases of nausea, discomfort, irritation and perceived annoyance due to exposure to environmental agents--especially diesel exhaust fumes. While exposure to these agents may not constitute an innate health hazard in the medical sense, their presence in the work environment may contribute to degraded job performance which in turn could lead to unsafe behavior.
KEYWORDS: RAILWAYS;PERSONNEL;OCCUPATIONAL DISEASES;DIESEL FUELS;EXHAUST GASES;HEALTH HAZARDS;NOISE POLLUTION;BEHAVIOR;AIR POLLUTION

<062026>
TITLE: Reanalysis of FAA/NASA Test Data to Yield Ground Impedance Data
PROJECT NUMBER: 160339
ADDRESS: Seattle, WA 98103
AFFILIATION: Man-Acoustics and Noise, Inc., Seattle, Wash. (USA)
MONITORING AGENCY: Department of Transportation, Washington, D.C. (USA)
DIVISION: Federal Aviation Administration
TYPE OF FUNDING: Grant No.-DOT-FA77WAI-766
77 FUNDING: Department of Transportation FY77:$45,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOISE, VIBRATION (100%)
APPROACH: The contractor shall use government furnished data to (1) select a minimum of five test runs which most clearly exhibit the effects of variations in ground impedance and (2) study meteorological, operational, and acoustic data to select tapes for further narrow band analysis. Selection criteria shall include the following: (1) meteorological stability; (2) aircraft altitude; and (3) surface condition

variability. Based on the results of Task I, a narrow ban analysis of the tape recorded noise data for each selected test run from microphones 1.2 meters above the concrete taxiway and the surface shall be conducted.
KEYWORDS: METEOROLOGY;ACOUSTIC MONITORING;OPERATION;AIRCRAFT;STABILITY;AIRPORTS;SITE SELECTION;DATA PROCESSING;TESTING;NOISE POLLUTION ABATEMENT;GOVERNMENT POLICIES;ENVIRONMENTAL ENGINEERING;TOPOGRAPHY

TITLE: Study Characteristics of Sonic Booms and Stratospheric Winds
PROJECT NUMBER: 160341
ADDRESS: New York, NY 10027
AFFILIATION: Columbia Univ., New York (USA)
MONITORING AGENCY: Department of Transportation, Washington, D.C. (USA)
DIVISION: Federal Aviation Administration
MONITOR: Sellman, E.W.
TELEPHONE: C(202)426-3396
TYPE OF FUNDING: Grant No.-DOT-FA77WA-3997
77 FUNDING: Department of Transportation FY77:$50,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOISE, VIBRATION/Sonic boom (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Conduct a study of the characteristics of sonic booms and stratospheric winds.
APPROACH: The work shall include the following: (1) sonic booms on Long Island - calibrated instruments shall be installed at two locations toward the north shore to provide information on the strength of the signal at the closest point to the flight path to detect the decay of the signal with distance; and (2) stratospheric winds - determine the feasibility of using long-range sound from the Concorde of the analysis of data from the tripartite array of detectors and from this single station determine whether additional stations properly placed can give more precise information on stratospheric winds.
KEYWORDS: CONCORDE;SUPERSONIC TRANSPORT;ENVIRONMENTAL IMPACTS;WIND;ACOUSTIC MEASUREMENTS;STRATOSPHERE;MONITORING;MEASURING INSTRUMENTS;FEASIBILITY STUDIES;REMOTE SENSING;NOISE POLLUTION;AIRCRAFT

ADDRESS: Hartford, CT 06120
AFFILIATION: Center for the Environment and Man, Inc., Hartford, Conn. (USA)
MONITORING AGENCY: Department of Transportation, Washington, D.C. (USA)
DIVISION: Federal Aviation Administration
TYPE OF FUNDING: Contract No.-DOT-FA77WA-4055
77 FUNDING: Department of Transportation FY77:$85,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS (25%);METALS (25%);PARTICULATES (25%);ORGANICS (25%)
CHARACTER OF STUDY: RESEARCH/General (50%);ANALYTICAL (50%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Perform a study of atmospheric mechanisms and accomplish the following tasks: (1) exhaust trail diffusion and chemistry; (2) distribution of trace constitutents; and (3) meteorological considerations.
KEYWORDS: EARTH ATMOSPHERE;CHEMICAL REACTION KINETICS;EXHAUST GASES;DIFFUSION;ENVIRONMENTAL TRANSPORT;TRACE AMOUNTS;CHEMICAL COMPOSITION;METEOROLOGY;AIRCRAFT;ENVIRONMENTAL IMPACTS;AIR;HYDROCARBONS

<062029>
TITLE: Report on Present State of Knowledge of Neurological/Neurosurgical Conditions
PROJECT NUMBER: 160418
ADDRESS: Chicago, IL 60610
AFFILIATION: American Medical Association, Chicago, Ill.
MONITORING AGENCY: Department of Transportation, Washington, D.C. (USA)
DIVISION: Federal Aviation Administration
TYPE OF FUNDING: Grant No.-DOT-FA77WA-4076
77 FUNDING: Department of Transportation FY77:$74,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The Office of Aviation Medicine has determined that it needs an authoritative statement concerning the current state of knowledge regarding selected neurological/neurosurgical conditions. This information is required in connection with a continuing review of regulatory standards, examination procedures, and airman certification decisions involving neurological/neurosurgical conditions in airman applicants.
KEYWORDS: AIRCRAFT;PERSONNEL;BEHAVIOR;NEUROLOGY;MEDICAL SURVEILLANCE;SAFETY;HUMAN POPULATIONS

<062030>
TITLE: Define and Develop a Combined Hazard Index
PROJECT NUMBER: 160426
ADDRESS: Long Beach, CA 90846
AFFILIATION: Douglas Aircraft Co., Inc., Long Beach, Calif. (USA)
MONITORING AGENCY: Department of Transportation, Washington, D.C. (USA)
DIVISION: Federal Aviation Administration
TYPE OF FUNDING: Contract No.-DOT-FA77WA-4019
77 FUNDING: Department of Transportation FY77:$58,800
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: FULL SCALE DEMONSTRATION (50%);ANALYTICAL (50%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
APPROACH: The combined hazard index shall be time scaled against a specific postcrash cabin fire environment

and cover an assumed maximum emergency evacuation period of five minutes. If a specific combustion hazard becomes critical within the five minute limit, it shall be identified and accounted for in the combined hazard ranking. The cabin fire environment shall be simulated by full-scale tests representative of an actual post-crash accident scenario and fire.
KEYWORDS: AIRCRAFT;SAFETY;ACCIDENTS;HAZARDS;EMERGENCY PLAN;FIRES;PROBABILITY

CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Site specific Dulles Airport, National Airport, BWI Airport
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Preparation of a draft and final Environmental Impact Statement (EIS) for the existing operation of and the aircraft allocation policies proposed for National and Dulles airports. The documents will be responsive to the Order of the United States Court of Appeals for the Fourth Circuit in the case of Virginians for Dulles, et al. vs. John Volpe, individually and as Secretary of Transportation, et al.
APPROACH: In addition, the report will be prepared in compliance with the National Environmental Policy Act, other related Federal legislation, Council on Environmental Quality (CEQ) guidelines and applicable DOT and FAA Orders. In order to fully assess the regional impacts, the secondary effects of the policy alternatives in terms of its impact on Baltimore-Washington International (BWI) Airport will also be considered.

REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To improve methods for C-14 by utilizing absorbents compatible to liquid scintillation counting by determining the optimum condition required for the adsorption of a maximum volume of CO2 into an organic amine liquid scintillation counting solution for C-14 analysis.
APPROACH: Carbon dioxide gas obtained from controlled combustion of environmental and biological samples is carefully absorbed under controlled conditions in a mixture of organic amine and a compatible liquid scintillation solution. Approximately 2 to 3 liters of CO2 must be adsorbed in enough solution to be counted in an ordinary scintillation vial. This solution containing 1.7 g carbon will give approximately 20 counts/min. For a 1000 min counting time, a counting error less than 3% dpm/g 18 +- 0.6 for environmental carbon is anticipated.
RESULTS: Establish optimum conditions for this study.
PROJECT MILESTONES: (1) 10/75 Report-Analysis of C-14 and H-3 in Reactor Stack Gas. (2) 12/77 Complete Methodology for C-14 Using Compatible Absorbents.

<070507>
TITLE: Provide Methods for Measuring Radionuclides Needed to Gather Data on Non-regulated Pollutants Warranting Concern by EPA
PROJECT NUMBER: A-621-A-2
PRINCIPAL INVESTIGATOR: Krieger, H.L.
ADDRESS: 26 West St. Clair Avenue, Cincinnati, OH 45268
AFFILIATION: Environmental Protection Agency, Cincinnati, Ohio (USA). Environmental Monitoring and Support Lab.
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Krieger, Herman L.
TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Environmental Protection Agency FY77:$140,000
TECHNOLOGY: FOSSIL FUEL/Coal (50%);NUCLEAR/General (50%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: DEVELOPMENT/Pilot plant (50%);ANALYTICAL (50%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Develop methods for 226-Ra in coal, slag, fly ash and scrubber sludge at coal-fired power plants, and determine any potential radiation hazard. Develop and test methodology to quantify discharges from nuclear medicine facilities, and determine any potential radiation hazard.
APPROACH: Each 1000 megawatt plant burns 10 to the 6th tons of coal annually. With 226Ra levels averaging 1.0 pCi/gm, a significant activity could be discharged with particulates in stack effluent. Samples of coal and by-products from operating plants are being analyzed for 226Ra to ascertain whether 226Ra could be present in stack effluent. Normal treatment processes do not remove radiopharmaceuticals that are discharged into the sewer. Tertiary treated sewage effluent will be utilized in power plant coolant operations and present a potential radiation hazard. Methodology for those radiopharmaceuticals discharged from hospitals is being developed and tested.
RESULTS: The sensitivity and validity of the methodology has to be improved, and air samplers will be installed in the stacks to corroborate activity discharge calculations. Procedures for 131-I, 51-Cr and 57-Co have been tested, and procedures for 75Se and 99Tc are in process. Upon completion, the methods will be tested at plants that utilize tertiary treated sewage in their operations.
PROJECT MILESTONES: (1) 3/76 Report--Interim Radiochemical Methodology for Drinking Water. (2) 3/78 Modify Methods for 210-Po and 210-Pb in Mill Tailings. (3) 9/78 Report--Hazard from 226-Ra from Fossil Fuel lants. (4) 12/78 Complete Methodology for Nuclides in Tertiary Treated Sewage.

TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To develop an automatic on-line Total Organic Carbon (TOC)/Chemical Oxygen Demand (COD) Analyzer which is less costly to operate than conventional measurement systems and avoids use of environmental polluting reagents.
APPROACH: A ''bread board'' TOC/COD Analyzer will be assembled to measure TOC and COD in samples after manual addition of reagents. The pCO2 sensor, developed for this project, ultraviolet reactor and coulometric persulfate sensor will be incorporated into this ''breadboard'' system.
RESULTS: This development phase of the project will demonstrate the feasibility of providing a reliable on-line monitoring instrument.
PROJECT MILESTONES: (1) 2/77 Design, fabricate or assemble TSA. (2) 9/77 Design, fabricate and assemble persulfate cell. (3) 9/77 Design, fabricate and assemble persulfate sensor. (4) 9/77 Design, fabricate and assemble CO2 sensor.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Prepare and periodically update a manual describing recommended methods for field and laboratory studies of aquatic organisms.
APPROACH: A national committee of senior EPA biologists screens, selects, and describes methodology which is incorporated into a unified manual describing techniques for the collection and analysis of plankton, periphyton, macrophyton, macroinvertebrates, and fish. The methods are compiled, edited and printed by the staff of the Aquatic Biology Section, Environmental Monitoring and Support Laboratory, USEPA, Cincinnati, Ohio. The manual is revised periodically, as required, to keep it current.
RESULTS: Agency Methods Manual
PROJECT MILESTONES: (1) 12/73 Published 1st edition of Aquatic Biology Methods Manual. (2) 12/77 Published 2nd edition of Aquatic Biology Methods Manual. (3) 12/80 Published 3rd edition of Aquatic Biology Methods Manual.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: This research comprises a comparative study of a number of leading methods for the

determination of arsenic and selenium, and serves to demonstrate the applicability of each for complex matrices that exist for samples such as industrial and domestic effluents.
APPROACH: By utilizing the techniques of flame and flameless atomic absorption spectrophotometry it should be possible to effect the appraisal of various sample pretreatment procedures including the Parr Acid Digestion Bomb Technique for the determination of total arsenic and selenium in effluents charged with a variety of their organic and inorganic species.
RESULTS: At the conclusion of this investigation the most applicable hydride generation-flame atomic absorption spectrophotometric method for determining organic and inorganic arsenic and selenium in an industrial domestic-effluent matrix will have been identified. In addition the advantages of this method and the graphite furnace method, when employed for routine determination of total arsenic and selenium in effluents, will have been determined and compared.

PROJECT DESCRIPTION: To develop quality assurance procedures and reference materials, and carry out interlaboratory evaluation and validation of aquatic biology methods considered potentially suitable for routine use by Agency field and laboratory personnel.
APPROACH: The studies are carried out jointly with personnel in the Quality Assurance Branch, EMSL. Descriptions of the methods are prepared and reference samples are developed and distributed to participating laboratories. The results are evaluated and reported jointly with the QA Branch. Methods which meet the established criteria are included in the Biological Methods Manual. Reference materials currently under development include: standard toxicants for bioassays; Sedgwick-Rafter plankton and periphyton counting and identification; chlorophyll determination ATP measurement; diatom identification; and macroinvertebrate identification.
RESULTS: Quality assurance procedures, biological reference materials, and data on the accuracy and precision of biological methods.
PROJECT MILESTONES: (1) 1/69 Develop plankton counting reference sample. (2) 1/73 Develop spectrophotometric chlorophyll reference sample. (3) 12/76 Develop fluorometric chlorophyll reference sample. (4) 12/77 Develop ATP reference sample. (5) 12/78 Develop standard toxicant reference samples. (6) 12/78 Develop plankton and periphyton identification samples. (7) 12/78 Develop macroinvertebrate counting, sorting, and identification samples. (7) 12/79 Develop diatom identification reference samples.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To develop, evaluate and standardize field and laboratory methods for biomonitoring programs to measure the biological properties and ecological effects of effluents, and to determine the biological integrity of surface waters.
APPROACH: Projects include studies of methods for sample collection and preparation; organism counts and identification; measurements of biomass and metabolic rates; effluent bioassay; bioaccumulation of toxic substances; and data handling and interpretation. Methods are developed for all communities of aquatic organisms, including: phytoplankton, zooplankton, periphyton, macrophyton and macroalgae, macroinvertebrates, and fish. Research projects are carried out inhouse and under grant and contract.
RESULTS: Output includes methods which are included in the EPA Aquatic Biology Methods Manual, manuals for the identification of aquatic organisms, reports on the environmental requirements and pollution tolerance of aquatic organisms, computer systems for data storage and retrieval, and guidelines for biomonitoring programs.
PROJECT MILESTONES: (1) 7/73 Report on artificial substrate performance. (2) 7/73 Report on plankton and periphyton methodology. (3) 7/74 Identification manual for Stenonema mayflies. (4) 7/76 Implement computerized biological data handling system (BIO-STORET). (5) 12/77 Report on environmental requirement and pollution tolerance of Midges. (6) 12/77 Revised identification manual for centric diatoms. (7) 7/78 New methods for chlorophyll measurements. (8) 12/78 Sediment oxygen demand method. (9) 12/79 Methods for measuring bioaccumulation of toxic substances. (10) 12/79 Develop models of diatom communities.

PROJECT DESCRIPTION: To provide the Quality Assurance Branch, EMSL-Cincinnati with technical support services.
APPROACH: A fully equipped water chemistry laboratory and equipment to produce Quality Control Samples was set up and staffed by contractor personnel.
RESULTS: The Technical Service laboratory has finalized the setting up of all instruments and associated equipment to make the laboratory functional. Technical Service personnel are currently developing turbidity and suspended solid QC samples. Other activities include the distribution of quality control samples throughout the country and the development of an EPA manual on Sampling and Sample Preservation of Waters/Wastewaters. Upon concluding the development of the QC samples, new directives will be given for the development of additional QC samples. Output: Turbidity Quality Control Sample, Suspended Solids QC Sample, and Handbook for Sampling and Sample Preservation of Waters/Wastewaters.
PROJECT MILESTONES: (1) 1/78 Development of a Suspended Solid QC Sample. (2) 8/77 Development of a Handbook for Sampling and Sample Preservation of Waters/Wastewaters. (3) 8/77 Development of Turbidity QC Sample.

TITLE: Calibration of 90 Degrees V-Notch Weirs Using Parameters Other than Weir Head
PROJECT NUMBER: A-621-C-26
PRINCIPAL INVESTIGATOR: Eli, R.N.
ADDRESS: Department of Civil Engineering, Morgantown, WV 26506
AFFILIATION: West Virginia Univ., Morgantown (USA). Dept. of Civil Engineering
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA). Environmental Monitoring and Support Lab.
MONITOR: Berg, Ed
TELEPHONE: C(513)684-7326
TYPE OF FUNDING: Grant No.-R-80531201
77 FUNDING: Environmental Protection Agency FY77:$23,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of the proposed research is to develop, by means of a laboratory investigation, a less cumbersome and more accurate means of determining discharge over a 90 degree V-notch weir by taking direct measurements at the weir plate.
APPROACH: Compliance monitoring in connection with NPDES permits requires a procedure that can be easily applied in the field with a minimum of tools or instrumentation. Weir head, the level pool head above the weir crest, is a difficult measurement to make since it must be made some distance upstream of the crest. Therefore, the main thrust of the investigation will be to select a new parameter that can be measured in the vicinity of the weir plate.
RESULTS: The new parameter is to be related to discharge by defining an empirical relationship by means of calibration tests to be conducted over the discharge range of approximately 0 to 5 cubic feet per second. Drawdown of the water surface in the vicinity of the weir plate will require careful definition of the new measurement parameter.
PROJECT MILESTONES: 10/78 Report on New Parameters for Measuring Flow Through a 90 Degree V-Notch Weir.
KEYWORDS: WATER;FLOW RATE;MEASURING INSTRUMENTS;CALIBRATION;DAMS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Quality Control Samples are designed, developed, and prepared by the Quality Assurance Branch or by a contract laboratory according to exact instructions. Whatever the production source, the samples must be analyzed by independent analytical laboratories to assure that the samples were prepared according to instructions. Encotec is one of two independent laboratories who analyze and report the results back to the Quality Assurance Branch, EMSL-Cin.
PROJECT MILESTONES: 9/77 Complete Analytical Verification of QC Samples produced on contract and inhouse.
KEYWORDS: QUANTITATIVE CHEMICAL ANALYSIS;QUALITY ASSURANCE;WASTE MANAGEMENT;WATER POLLUTION;MONITORING;SAMPLING;POLLUTION CONTROL EQUIPMENT;TECHNOLOGY ASSESSMENT;STANDARDIZATION

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (a) The program is divided into two phases, the first phase is to develop and standardize a method (including cultural conditions, lyophilization, and rehydration) designed to yield stable qualitative and quantitative sets of known numbers of freeze-dried preparations of Escherichia coli, Klebsiella pneumoniae, Enterobacter aerogenes, Streptococcus faecalis, and Pseudomonas aeruginosa.

(b) Phase II: To prepare a pre-arranged number of quantitative test units suitably labelled and a set of qualitative cultures to include the following microorganisms: Streptococcus faecalis var. liquefaciens; Streptococcus bovis; Streptococcus equinus; Streptococcus salivarius; Salmonella typhi; Salmonella enteritidis; Salmonella choleraesuis; Providencia; Citrobacter freundii; Proteus morganii; Arizona.
APPROACH: After standardization of the counts, a shelf life study will be done for one year on the test units in order to determine the reduction in numbers, if any, over a given period of time. A small number of replicate quantitative test units will be provided to EPA for evaluation.
PROJECT MILESTONES: 6/78 Production of 25,000 microbiological QC samples.
KEYWORDS: MICROORGANISMS;SAMPLERS;PERFORMANCE TESTING;QUALITY ASSURANCE;STANDARDIZATION;MEASURING METHODS;STANDARDIZATION;QUANTITATIVE CHEMICAL ANALYSIS;QUALITATIVE CHEMICAL ANALYSIS;LABELLED COMPOUNDS;WATER QUALITY;MONITORING;BACTERIA;BIOCHEMISTRY;WASTES

REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Estuarine;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The general objective is to employ the transport, enrichment, and exclusion capabilities of ion exchange membranes as new tools in water analysis. There are two specific objectives. (1) A cation exchange membrane envelope for sampling and enrichment of trace cations in a water sample will be

designed, constructed, and studied. In principle, for water samples of low or moderate ionic strengths, enrichments of two orders of magnitude should be achievable by transport of the trace cations from the water sample through the membrane into a small volume of an acceptor solution of controlled composition. The acceptor solution would then be used for measurement of the trace ion concentrations, at higher levels, and more easily than the original water sample. (2) A copper ion-selective electrode will be covered with a cation exchange membrane, trapping a small volume of an acceptor solution of controlled composition in between. Upon immersion in a water sample, any trace Cu(II) in the water sample should be enriched in the acceptor solution, to levels that can be more easily measured by the copper ion-selective electrode.
RESULTS: The enrichment factors for both of these devices are in principle independent of the properties of the membrane and of all of the properties of the trace cation except the charge. With proper design, these devices should operate in the nanomolar concentration region (down to about 0.1 ppb), and they should be capable of on-site use.
KEYWORDS: ION EXCHANGE MATERIALS;SEPARATION PROCESSES;MEMBRANES;SAMPLING;WATER QUALITY;METALS;MONITORING;MEASURING INSTRUMENTS;COPPER IONS;SAMPLERS;CATIONS;TRACE AMOUNTS;DESIGN;MONITORING;ION EXCHANGE;ENRICHMENT

TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: ORGANICS (30%);SPECIFIED OTHER POLLUTANTS/Nutrients, multiple (70%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The overall objective of the three year study is to devise a new, more effective and pollution-free method of preservation of water and wastewater samples. Approaches such as the use of antibiotics and bacteriolytic enzymes for controlling microorganisms may offer a distinct possibility and an improvement over existing procedures.
APPROACH: The second year of the project will be devoted to determination of the relative effectiveness of the preservatives selected for further study, in preventing alteration in sample test parameters. The effect of water parameters such as PH, particulate matter, industrial contaminant, etc. on the preservation method will also be ascertained. Studies will also be initiated to study the effectiveness of the preservation method as a function of storage parameters and sample handling.
RESULTS: The first year of the project was devoted to evaluation of the effectiveness of several antibiotics/antibiotics mixtures and bacteriolytic enzymes in controlling microorganisms in water and wastewater samples as revealed by viable cell count and oxygen consumption rates. After testing a large number of antibiotics singly and in mixture of 2-4, 5-7 antibiotic mixtures have been selected based on their effectiveness in controlling microorganisms in wastewater and natural water samples. Commercially available lysozyme preparations failed to control microorganisms when added with or without EDTA and Tris. Analysis of nutrients in the presence of antibiotics has revealed that the combinations which include erythromycin or ampicillin cause interference in some analytical determinations.
PROJECT MILESTONES: (1) 9/77 Evaluation of the effectiveness of several antibiotics in controlling water/wastewater samples. (2) 9/78 Evaluate the effectiveness of preservatives selected in the first year of study in detail and under various experimental conditions similar to the environment.

TITLE: Develop Quality Assurance Procedures and Reference Samples for Aquatic Biology
PROJECT NUMBER: A612A-08
PRINCIPAL INVESTIGATOR: Weber, C.I.;Collins, G.B.;Klemm, D.J.;Lewis, P.A.;McFarland, B.H.
AFFILIATION: Environmental Protection Agency, Cincinnati, Ohio (USA). Environmental Monitoring and Support Lab.
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Weber, C.I.
77 FUNDING: Environmental Protection Agency FY77:$30,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: To develop quality assurance procedures and reference materials, and carry out interlaboratory evaluation and validation of aquatic biology methods considered potentially suitable for routine use by Agency field and laboratory personnel.
APPROACH: The studies are carried out jointly with personnel in the Quality Assurance Branch, EMSL. Descriptions of the methods are prepared and reference samples are developed and distributed to participating laboratories. The results are evaluated and reported jointly with the QA Branch. Methods which meet the established criteria are included in the Biological Methods Manual. Reference materials currently under development include: standard toxicants for bioassays; Sedgwick-Rafter plankton and periphyton counting and identification; chlorophyll determination ATP measurement; diatom identification; and macroinvertebrate identification.
RESULTS: Quality assurance procedures, biological reference materials, and data on the accuracy and precision of biological methods.
PROJECT MILESTONES: 01/69-Develop plankton counting reference sample; 01/73-Develop spectrophotometric chlorophyll reference sample; 12/76-Develop fluorometric chlorophyll reference sample; 12/77-Develop ATP reference sample; 12/78-Develop standard toxicant reference samples; 12/78-Develop plankton and periphyton identification samples; 12/78-Develop macroinvertebrate counting, sorting, and identifying; 12/79-Develop diatom identification reference samples.
KEYWORDS: AQUATIC ECOSYSTEMS;SAMPLING;QUALITY ASSURANCE;STANDARDIZATION;BIOASSAY;HAZARDOUS MATERIALS;PLANKTON;PROTOZOA;CHLOROPHYLL;CHEMICAL ANALYSIS;SURFACE WATERS;AQUATIC ORGANISMS;INVERTEBRATES;WATER POLLUTION;BIOLOGICAL EFFECTS

TITLE: Standardize Field and Laboratory Methods for Biomonitoring
)JECT NUMBER: A612A-10
[NCIPAL INVESTIGATOR: Weber, C.I.;Collins, G.B.;Klemm, D.J.;Lewis, P.A.;McFarland, B.H.
AFFILIATION: Environmental Protection Agency, Cincinnati, Ohio (USA). Environmental Monitoring and Support Lab.
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Weber, C.I.
77 FUNDING: Environmental Protection Agency FY77:$150,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: To develop, evaluate and standardize field and laboratory methods for biomonitoring programs to measure the biological properties and ecological effects of effluents, and to determine the biological integrity of surface waters.
APPROACH: Projects include studies of methods for sample collection and preparation; organism counts and identification; measurements of biomass and metabolic rates; effluent bioassay; bioaccumulation of toxic substances; and data handling and interpretation. Methods are developed for all communities of aquatic organisms, including: phytoplankton, zooplankton, periphyton, macrophyton and macroalgae, macroinvertebrates, and fish. Research projects are carried out inhouse and under grant and contract.
RESULTS: Output includes methods which are included in the EPA Aquatic Biology Methods Manual, manuals for the identification of aquatic organisms, report on the environmental requirements and pollution tolerance of aquatic organisms, computer systems for data storage and retrieval, and guidelines for biomonitoring programs.
PROJECT MILESTONES: 07/73-Report on artificial substrate performance; 07/73-Report on plankton and periphyton methodology; 07/74-Identification manual for Stenonema mayflies; 07/76-Implement computerized biological data handling system (BIO-STORE); 12/77-Report on environmental requirement and pollution tolerance; 12/77-Revised identification manual for centric diatoms; 07/78-New methods for chlorophyll measurements; 12/78-Sediment oxygen demand method.

TITLE: Technical Services to Support the Quality Assurance Program
PROJECT NUMBER: A612A-26
PRINCIPAL INVESTIGATOR: Kovalski, V.
AFFILIATION: Bionetics, Inc., Cincinnati, Ohio (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Berg, E.L.
77 FUNDING: Environmental Protection Agency FY77:$188,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: To provide the Quality Assurance Branch, EMSL-Cincinnati with technical support services.
APPROACH: A fully equipped water chemistry laboratory and equipment to produce Quality Control samples was set up and staffed by contractor personnel.
RESULTS: The Technical Service laboratory has finalized the setting up of all instruments and associated equipment to make the laboratory functional. Technical Service personnel are currently developing turbidity and suspended solid QC samples. Other activities include the distribution of quality control samples throughout the country and the development of an EPA manual on Sampling and Sample Preservation of Waters/Wastewaters. Upon concluding the development of the QC samples, new directives will be given for the development of additional QC samples.
PROJECT MILESTONES: 01/78-Development of a suspended solid QC sample; 08/77-Development of a handbook for sampling and sample preservation of waters/wastewaters; 08/77-Development of turbidity QC sample.
KEYWORDS: WATER QUALITY;SURFACE WATERS;SAMPLING;CHEMICAL ANALYSIS;HAZARDOUS MATERIALS;QUALITY ASSURANCE;WATER POLLUTION

<070534>
TITLE: Parametric Assessment and Optimization of Volatile Organic Analysis Methods
PROJECT NUMBER: A614E-16
PRINCIPAL INVESTIGATOR: Hoehn, R.C.;Randall, C.W.
AFFILIATION: Virginia Polytechnic Inst. and State Univ., Blacksburg (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Lichtenberg, J.J.
77 FUNDING: Environmental Protection Agency FY77:$77,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The objectives of this project are (1) to determine the applicability of the Bellar-Lichtenberg methods for volatile organics analysis (VOA) in water to a variety of types of compounds and (2) to investigate the variations in analytical precision that are induced by modifications in the hardware, software, and sample-handling procedures. Variables to be investigated include: (1) sample size, container type, and the presence of heat space; (2) temperatures and times of storage; (3) methods of sparging samples, trapping efficiencies, and desorption methods; and (4) instrumentation variables such as column packing, column geometry, heating rate, and gas flow rate.
APPROACH: Once an optimum procedure for sampling, handling, and analysis has been devised, its applicability to a variety of types of organic compounds will be investigated. Groups of compounds to be studied include ethers, alcohols, mercaptans, amines, esters, nitriles, and a variety of aromatics, including simple, complex, halogenated, and conjugated types.
RESULTS: The project is to be developmental in nature and is designed for a one-year period. The work will be entirely bench-scale experimentation, and the results will be statistically analyzed in an attempt to identify those variables that significantly affect the results of the VOA. This work will identify areas requiring additional research, and hopefully be instrumental in devising a standard method for the sampling, handling and analysis of volatile organic compounds that may possibly be in drinking water.

TITLE: Development and Application of an Ozone Voltammetric Membrane Electrode
PROJECT NUMBER: A614E-18
PRINCIPAL INVESTIGATOR: Mancy, K.H.;Wise, K.D.
AFFILIATION: Michigan Univ., Ann Arbor (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Kopp, J.F.
77 FUNDING: Environmental Protection Agency FY77:$50,000
PROJECT DESCRIPTION: The purpose of this project is the development and application of a membrane electrode system capable of in situ measurement of dissolved ozone. There is a pressing need for such a sensor system, especially in view of recent interest in the utilization of ozone as an alternative to chlorine in water and wastewater treatment processes.
APPROACH: An inherent part of this study is the development of a process controlled ozonator for water treatment applications in which the rate of ozone generation is controlled by membrane electrode measurement. This system will be tested on a pilot plant scale and in water supply and waste treatment plants. Furthermore, the membrane electrode under investigation is inherently capable of measurement of ozone in gaseous and nonaqueous media. The feasibility of these particular applications will also be investigated.

DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Krieger, H.L.
77 FUNDING: Environmental Protection Agency FY77:$83,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: To improve methods for C14 by utilizing absorbents compatible to liquid scintillation counting by determining the optimum condition required for the adsorption of a maximum volume of CO2 into an organic amine liquid scintillation counting solution for C14 analysis.
APPROACH: Carbon dioxide gas obtained from controlled combustion of environmental and biological samples is carefully absorbed under controlled conditions in a mixture of organic amine and a compatible liquid scintillation solution. Approximately 2 to 3 liters of CO2 must be adsorbed in enough solution to be counted in an ordinary scintillation vial. This solution containing 1.7 g carbon will give approximately 20 counts/min. For a 1000 min counting, a counting error less than 3 percent dpm/g 18 plus or minus 0.6 for environmental carbon is anticipated.
RESULTS: Establish optimum conditions for this study.
PROJECT MILESTONES: 10/75-Report-Analysis of C14 and H3 in reactor stack gas; 12/77-Complete methodology for C14 using compatible absorbents.

AFFILIATION: Environmental Protection Agency, Cincinnati, Ohio (USA). Environmental Monitoring and Support Lab.
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Krieger, H.L.
77 FUNDING: Environmental Protection Agency FY77:$140,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: (1) Develop methods for Ra226 in coal, slag, fly ash and scrubber sludge at coal-fired power plants, and determine any potential radiation hazard. (2) Develop and test methodology to quantify discharges from nuclear medicine facilities, and determine any potential radiation hazard.
APPROACH: (1) Each 1000 megawatt plant burns 10 to the 6th power tons of coal annually. With Ra226 levels averaging 1.0 pCi/gm, a significant activity could be discharged with particulates in stack effluent. Samples of coal and by-products from operating plants are being analyzed for Ra226 to ascertain whether Ra226 could be present in stack effluent. (2) Normal treatment processes do not remove radiopharmaceuticals that are discharged into the sewer. Tertiary treated sewage effluent will be utilized in power plant coolant operations and present a potential radiation hazard. Methodology for those radiopharmaceuticals discharged from hospitals is being developed and tested.

RESULTS: (1) The sensitivity and validity of the methodology has to be improved, and air samplers will be installed in the stacks to corroborate activity discharge calculations. (2) Procedures for I-131, Cr-51 and Co-57 have been tested, and procedures for Se-75 and Tc-99 are in process. Upon completion, the methods will be tested at plants that utilize tertiary treated sewage in their operations.
PROJECT MILESTONES: 03/76-Report-Interim radiochemical methodology for drinking water; 03/78-Modify methods for Pc-210 and Pb-210 in mill tailings; 09/78-Report-Hazard from Ra-226 from fossil fuel plants; 12/78-Complete methodology for nuclides in tertiary treated sewage.

PROJECT NUMBER: A622B-2
PRINCIPAL INVESTIGATOR: Wilson, R.F.
AFFILIATION: Texas Southern Univ., Houston (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Gales, M.
77 FUNDING: Environmental Protection Agency FY77:$48,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The primary objective of this proposed study is to evaluate the selectivity of the nitrogen oxide and the nitrate ion selective electrodes by investigating potential interferences of other ions.
APPROACH: The data and percentage efficiency obtained using the nitrogen oxide selective electrode, after a cadmium reduction of nitrate to nitrite, will be compared with those obtained using the nitrate ion selective electrode for water and wastewater samples. Upon completion of the comparative study of the experimental variables that affect the electrodes, a method for the determination of nitrate using the electrode that gives the best accuracy will be proposed and its validity tested on water and wastewater samples.
RESULTS: The successful completion of this project should provide a reservoir of useful data on the quantitative determination nitrate nitrogen values.
PROJECT MILESTONES: 07/78-Complete evaluation of nitrogen oxide and solid state nitrate electrode; 12/78-Complete environmental sample analysis; 12/79-Final report.
KEYWORDS: WATER POLLUTION;MONITORING;NITRATES;QUANTITATIVE CHEMICAL ANALYSIS

TITLE: Arsenic and Selenium in Industrial and Domestic Effluents-Applicability of the Parr Acid Digestion Bomb Technique for Sample Pretreatment
PROJECT NUMBER: A622B-3
PRINCIPAL INVESTIGATOR: Kinard, J.T.
AFFILIATION: Benedict Coll., Columbia, S.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Environmental Monitoring and Support Laboratory
MONITOR: Gales, M.
77 FUNDING: Environmental Protection Agency FY77:$44,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: This research comprises a comparative study of a number of leading methods for the determination of arsenic and selenium, and serves to demonstrate the applicability of each for complex matrices that exist for samples such as industrial and domestic effluent.
APPROACH: By utilizing the techniques of flame and flameless atomic adsorption spectrophotometry it should be possible to effect the appraisal of various sample pretreatment procedures including the Parr Acid Digestion Bomb technique for the determination of total arsenic and selenium in effluents charged with a variety of their organic and inorganic species.
RESULTS: At the conclusion of this investigation the most applicable hydride generation-flame atomic absorption spectrophotometric method for determining organic and inorganic arsenic and selenium in an industrial domestic-effluent matrix will have been identified. In addition, the advantages of this method and the graphite furnace method, when employed for routine determination of total arsenic and selenium in effluents, will have been determined and compared. Although this investigation is highly specific, it addresses the determination of two elements that have toxicological and perhaps carcinogenic characteristics, and exist in forms that have eluded total analytical characterization.
PROJECT MILESTONES: 09/78-Evaluate five methods for arsenic and selenium; 06/79-Test selected and modified method on industrial samples; 08/79-Draft final report; 09/79-Final report.
KEYWORDS: WATER POLLUTION;MONITORING;ARSENIC;SELENIUM;LIQUID WASTES;SAMPLE PREPARATION;CHEMICAL EFFLUENTS;QUANTITATIVE CHEMICAL ANALYSIS;CHEMICAL COMPOSITION

CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The detection and location of water levels, water pockets, voids and various other discontinuities between different layers of earth or rock is critical in insuring the performance and safety of earth dams. Such underground anomalies are particularly undesirable in the earth dams and dikes that contain hazardous materials since these relatively small embankments are generally not engineered or constructed in a rigorous and professional manner.
APPROACH: One possible technique for detecting and monitoring such faults and weak areas is the use of microwaves. By beaming continuous or pulsed microwaves at the dike and recording the return signal as it is reflected from the anomaly, the location, type and depth of faults can be determined. A literature search (technical, equipment, legal and safety) will be undertaken and a number of laboratory experiments will be performed to assess the practicality of using microwaves for the non-destructive assessment of dike stability. Basic soil properties such as dielectric constant, conductivity, attenuation, phase shift, and velocity, will also be determined.
RESULTS: The final result of this project will be the detailed specification for an inexpensive, mobile, microwave unit (with known limitations) to determine underground water, irregularities, and discontinuities in small earthen dikes.
PROJECT MILESTONES: (1) 7/76 Funding package submitted. (2) 9/76 Award funds for project. (3) 9/77 Decision point, funding increment. (4) 9/78 Funding increment. (5) 7/79 Complete project. (6) 7/79 Final report received.

RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The objective of this project is to design and demonstrate in actual use a transfer line system that will shut off automatically in the even of a line break or significant leak. The primary application of this system is for the loading and unloading of liquid hazardous materials from truck tankers, tank care, barges, etc.
APPROACH: The transfer line system consists of the line and a pneumatically operated shut-off valve at the inlet, which is activated by any abnormal flow difference between transfer line inlet and outlet, such as would result from a break or leak. The air supply for the pneumatic valve drive is controlled by a solenoid valve, which, when de-energized, vents the valve drive and closes the shut-off valve. The inlet and outlet flows are continuously sensed and compared electronically; any significant difference in flow causes a logic circuit to de-energize the solenoid valve. An alarm to warn the attendant is also activated. The system is fail-safe in that the loss of electric power and/or air pressure for the system will result in closure of the shut-off valve.
RESULTS: The transfer line will be designed and evaluated under laboratory conditions using water as the fluid being transferred. Subsequently, the system will be installed in a chemical plant and used under actual operating conditions for about a year.
PROJECT MILESTONES: (1) 2/79 Funding package submitted. (2) 6/74 Award funds for project. (3) 1/77 Funding increment. (4) 8/78 Final report received.

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objective of this research project is to identify and evaluate pure culture strains of fungi, yeasts or bacteria which will biodegrade various organic hazardous waste materials. In the event of a spill, the selected organisms could be added to the spilled material and metabolically detoxify the hazardous compounds.
APPROACH: The program consists of two phases: a laboratory feasibility study and a pilot plant demonstration phase. The laboratory phase, to be conducted during the first six months, will consist of screening tests. Various cultures will be exposed to a hazardous material spill to determine the qualitative ability to assimilate and/or degrade the material. The best candidates will be selected for further parametric tests. The pilot plant demonstration phase will be conducted during a nine-month period. A pilot system will be designed, tested and evaluated to determine actual conditions and process parameters of the biodegradation system. Each pilot plant will have a capacity of about 10 lb (5 Kg) per batch or 2 lb (1 Kg) per hour of continuous operation.
RESULTS: Identification of organisms that will biodegrade organic hazardous waste materials.
PROJECT MILESTONES: (1) 1/76 FUNDING PACKAGE SUBMITTED. (2) 5/76 AWARD FUNDS FOR PROJECT. (3) FUNDING INCREMENT AWARDED. (4) 12/78 FINAL REPORT RECEIVED.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The principal objective of this project is to compile and assess information generated in previous studies concerning fugitive and process particulate matter emissions in the nonferrous smelting industry. In addition to existing control systems, process modifications and systems in the demonstration stage will also be examined. Foreign control technologies will be reviewed. Performance evaluations will be conducted to determine the ability of certain control systems to meet existing Federal and State regulations.
APPROACH: Four Project task areas are delineated in the project work scope: (1) Conduct an in-depth study of existing and proposed control systems and process modifications for controlling fugitive emissions of hazardous particulate and SO2. (2) Revise and edit the three environmental assessment reports of the nonferrous metals industry prepared by PEDCO, Battelle, and Radian to provide a reference for State and local control agencies and industry. (3) Evaluate the results of demonstration testing of the Teller baghouse, a dry control technique for acid gas and particulate emissions from secondary aluminum smelters. (4) Evaluate all data generated under three PL-480 programs in Poland and Yugoslavia concerning the control of particulate and SO2 emissions from nonferrous smelters.

PROJECT MILESTONES: (1) 3/77 Funding package submitted. (2) 5/77 Award funds for project. (3) 11/77 Final report received.

PROJECT DESCRIPTION: The objective is to evaluate a full sized recycle system for liquid wastes from a wood preserving plant where the wastes are concentrated by ultrafiltration and reverse osmosis with the concentrate incinerated and the permeate consumed as boiler feed water.
APPROACH: The approach consists of collecting data on the feed, reject, and product and maintaining a log of system performance, quantities processed, operating and maintenance expense, and operating problems.
RESULTS: The data will be tabulated and published in the American Wood Preservers Assn. (AWPA) proceedings. Also the results will be published in EPA Technical Report Series. The physical facility is under construction as of this date. Start-up is scheduled for April, 1977.

CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Marine;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The primary objective of this project is to determine whether or not ultrafiltration can be used as a color removing tool from NSSC effluents. The secondary objective will be to define future work in the area of color removal technology.
APPROACH: Individual stream(s) in a selected NSSC mill will be chosen for this study. Ultrafiltration tubular modular design will be used at high velocities to prevent gel formation and suspended solids plugging. Laboratory experiments will be done to determine flux rates and color rejections as a function of concentration, time, applied pressure, and average velocity through the module. Samples will be analyzed for color, BOD5, TOC, carbohydrates and lignin. Limited analysis for potential toxicants will also be carried out before and after ultrafiltration.
RESULTS: A final report will be issued detailing project findings. If so indicated, the bench-scale research project will be moved to a mill site for additional on site research dependent on availability of funds at this point in time.
PROJECT MILESTONES: (1) 8/77 Funding Package Submitted. (2) 8/77 Award Funds for Project. (3) 6/78 Final Report Received.

PROJECT DESCRIPTION: To evaluate the effectiveness of sediment ponds in reducing suspended solids in the runoff from surface mining activities.
APPROACH: An in-field evaluation of the effectiveness of sediment ponds in reducing suspended solids in the runoff from surface mining activities was performed. Nine selected sedimentation ponds in the three eastern coal-mining states of Pennsylvania, West Virginia, and Kentucky were sampled under two different

operating conditions--a baseline and a rainfall event. Their theoretical and actual efficiency of removal of suspended solids were computed and compared.
RESULTS: In general, poor construction and inadequate maintenance of these ponds were found to be the major problem areas. The ponds had generally higher removal efficiencies during the baseline sampling period and much lower efficiencies during the storm event. The theoretically predicted efficiency of the ponds was essentially the same as the actual efficiency under baseline conditions. During the rainfall event, there was generally little or no correlation between the theoretical and actual efficiencies. The predicted efficiencies were found to be much higher than the actual efficiencies during the rainfall event in most cases.

PROJECT DESCRIPTION: The objective is to provide easy accessibility to the specific literature on the environmental problems related to coal production. The problems covered are coal mine drainage, disposal of the refuse material generated by coal mines and coal cleaning plants, and surface mine reclamation.
APPROACH: This objective will be attained by collecting all relevant information and preparing, on an annual rotating basis, abstract bibliographies of the literature for each subject area.
RESULTS: The refuse bibliography will be available early in 1978 and the reclamation bibliography early in 1979. Each bibliography will contain a listing of references to the mine drainage bibliography published in 1976.
PROJECT MILESTONES: (1) 5/77 Funding Package Submitted. (2) 6/77 Award Funds for Project. (3) 10/78 Final Report Received.

PROJECT DESCRIPTION: Develop guidelines for construction of coal refuse piles and slurry ponds with emphasis on environmental protection of both air and water while maintaining structural stability of the material.
APPROACH: Review current literature and interview key government and industrial personnel for information on proper design of refuse disposal facilities. Evaluate in the field, coal refuse disposal sites and slurry pond installations. The study sites will be in the eastern U.S. and will be in both flat and more rugged terrains. Any water emanating from the disposal sites will be sampled four times, twice each in the wet and dry seasons. Various physical and water quality determinations will be made on each sample series.
RESULTS: A set of construction guidelines will be developed which will address haulage, compaction, layering, soil covering, preparation plant procedures, reclamation planning, and structural material stability. The guidelines will be based in part on the field studies and the literature search, and will conform to current MESA requirements.
PROJECT MILESTONES: (1) 3/75 Funding Package Submitted. (2) 12/75 Award Funds for Project. (3) 6/77 Funding Increment. (4) 9/77 Final Report Received.

PROJECT DESCRIPTION: Major objective of this project is to identify possible impacts of coal mining and development in the Northern Great Plains on the surface and ground water systems of the surrounding area. Specific objectives are: (1) obtain an equation of balance for all water inflow and outflow in each of three study sites, one each in Montana, North Dakota and Wyoming; (2) characterize the overburden from a physical and chemical point of view as well as determine its relationship to the water coming to the surface; (3) determine hydrologic character of spoils at active mine sites in Montana; (4) characterize the chemical features of the mined sites.
APPROACH: The proposed work is a key effort in the EPA program to assess the surface and ground water problems associated with western coal. Three sites are being studied comprehensively. Each site is just commencing to have impact. Base line data were obtained before impacts began. In addition to the site-specific work, some data are being collected at two active mining sites in Montana to provide additional data for the analyses.
RESULTS: Characterization of several parameters that would support assessing possible impacts of coal mining development on surface and ground water systems of the surrounding area.
PROJECT MILESTONES: (1) 5/75 Funding Package Submitted. (2) 6/75 Award Funds for Project. (3) 7/76 Funding Increment. (4) 7/77 Funding Increment. (5) 6/78 Final Report Received.

PROJECT DESCRIPTION: To investigate surface stability and salt movement in spent oil shales and soil-covered spent shales after a cover of native vegetation has been established by intensive treatments and then left under natural precipitation conditions.
PROACH: The study is being carried out on two different spent oil shales. ''Soil'' treatments are plant establishment on: (1) directly on leached and fertilized spent shales; (2) six inches of soil over leached spent shale; (3) one foot of soil over unleached spent shale; (4) soil. Plots have been established on 25 percent north and south slopes at altitudes of 5700 and 7200 feet in or near the Piceance Basin of Northwestern Colorado. Each plot (28 per site) is bordered with wood to form individual runoff plots 11 feet wide and 22 feet long. Sediment and runoff catchments have yet to be installed. One site (5700') has been instrumented for soil salinity and soil moisture measurements. A cover of native plant species has been established on the lower altitude site and will be established on the higher site.
RESULTS: Measurements on vegetation including frequency, density and vegetative ground cover.
PROJECT MILESTONES: (1) 8/76 Funding package submitted. (2) 9/76 Award funds for project. (3) 9/77 Amendment. (4) Final report received.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this research project is to study surface stability and water movement in and through the Paraho spent oil shales. In addition to the vegetative stabilization studies, the distributions of water and salts in the plots will be monitored with the objective of quantifying the potential salt pollution from shale residues.
APPROACH: It is not possible to experimentally model the actual prototype disposal. For this reason, data from plot studies will be used to develop and verify a mathematical model of salt and water transport.
RESULTS: This model will be used to estimate the long term water quality aspects of large scale disposal of spent shale residues.
PROJECT MILESTONES: (1) 3/75 Funding package submitted. (2) 7/75 Award funds for project. (3) 7/76 Annual report. (4) 9/76 Continuation awarded. (5) 12/76 Amendment. (6) 8/77 Final report received.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of the project is to develop a manual of procedures for quantitatively assessing the impact of individual surface mining projects on the water resources in the affected watershed.
APPROACH: One approach is to gather all pertinent data that are available and determine the required parameters by fitting the model to the data. The second approach is to use a watershed model to generate ''field'' data for a wide variety of hypothetical situations and determine the required parameters for the simpler model. A correlation between the parameters and conditions simulated by the watershed model will be made.
RESULTS: The core of the manual will be a water quality hydrology model developed in a previous project. This model has been tested successfully on four watersheds previously and will be further tested using data now being collected at many locations in the Rocky Mountain region. Detailed procedures for translating basic watershed observations into the appropriate model parameters will be given.
PROJECT MILESTONES: (1) 9/76 Funding Package Submitted. (2) 10/76 Award Funds for Project. (3) 10/77 Continuation. (4) 9/78 Final Report Received.

POLLUTANTS: METALS (33%);PARTICULATES (33%);ORGANICS (34%)
CHARACTER OF STUDY: DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Middle Atlantic
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Develop a corehole spacing program that will allow defining the potentially toxic soil materials in advance of surface mining.
APPROACH: By associating 28 standard rock types with their geochemical and weathering characteristics, the toxicity potential of each lithology is appraised and potential problem rock types are isolated. Using these results as a base, it is proposed to determine the shape, thickness, and lateral extent of the potentially toxic rock types with the view that, if dimensions of some of these rock bodies are known, core hole spacing required to delineate the dimensions of other similar bodies can be determined. Knowledge of this type will aid in the planning for hydraulic manipulations and segregation and burial of potentially toxic materials during overburden handling in surface mines.
RESULTS: Models will be developed to evaluate the ideal core hole spacing in advance of mining that is necessary to delineate potentially toxic lithologies.
PROJECT MILESTONES: (1) 1/77 Funding Package Submitted. (2) 2/77 Award Funds for Project. (3) 10/78 Final Draft Report. (4) 2/79 Final Report. (5) 3/79 Final Report Received.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Primary objective of the project is to demonstrate the technical, the economic and environmental feasibility of using a vegetative filter zone to assist in controlling fine-grained sediments originating from surface mining activities. Specific objectives include: (1) Examine sediment trapping efficiency of the filter zone, (2) Examine suitability of various types of vegetation to use in the filter zone, (3) Evaluate the filter's usefulness in improving water quality, and (4) Determine the cost feasibility of using the filter on surface mines in eastern Kentucky.
APPROACH: Basically, the project will entail the diversion of surface runoff water, which has been collected at a particular point on the mining site, down a riprap lined channel and through a vegetative filter zone approximately 20 feet wide and 200 feet long. In order to assure that runoff is accurately monitored, a berm will be constructed around the project site. A flow distribution area and a level spreader will be installed below the riprap lined channel and above the filter zone. The project will include four tasks: (1) Planning and Feasibility Study, (2) Sediment and Water Quality Monitoring, (3) Construction and Demonstration, and (4) Project Management.
RESULTS: Prove the feasibility of using a vegetative filter zone to assist in controlling fine-grained sediments.
PROJECT MILESTONES: (1) 8/77 Funding package submitted. (2) 9/77 Award funds for project. (3) 1/78 Planning and feasibility study. (4) 4/79 Construction and data collection. (5) 5/79 Final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECT
PROJECT DESCRIPTION: The objective of the proposed research project is to determine if modern regulations and practices governing handling of toxic strip mine spoil materials have been effective in controlling acid mine drainage after mining and reclamation have been completed.
APPROACH: The project will include the evaluation of sixteen strip mines in the Commonwealth of Pennsylvania. These mines will have been reclaimed following laws and regulations which required that toxic spoil materials be segregated during mining and that the toxic material be backfilled in accordance with specifications designed to prevent residual acid mine drainage. Spoil samples will be obtained from a test boring program. The potential toxicity of the spoil samples will be determined by laboratory analysis. Statistical methods will be used to determine the relation between acid mine drainage production and the presence of toxic strip mine spoils, their configuration within the reclaimed strip mine, and the location of ground water with respect to the toxic materials.
RESULTS: Prove the adequacy of or identify the deficiencies of regulations and practices for controlling acid mine drainage.
PROJECT MILESTONES: (1) 8/77 Funding package submitted. (2) 9/77 Award funds for project. (3) 9/78 Award continuation. (4) 3/79 Final report received.

REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The project is concerned with evaluating the ferrous (FeII) iron oxidizing capacity of the rotating biological contactor in the treatment of acid mine drainage. The process is dependent upon the lithotrophic capacity of iron-oxidizing bacteria which colonize the available surface area of rotating discs immersed in acid mine water flowing through the RBC unit. The oxidation of the ferrous iron to the ferric state reduces the pollution potential of the drainage. The specific objectives of the project are to determine the treatment of mine drainages of differing chemical nature and the requirements for treatment of certain specific drainages by the unit to accomplish desired effluent quality.
APPROACH: A full size RBC treatment unit, with 2 meter diameter discs, will be specially modified for demonstration purposes and operated at three ferrous iron-containing acid mine drainage locations. These locations are in Pennsylvania and West Virginia and include one active and two abandoned coal mines.
RESULTS: Pertinent water quality parameters will be analyzed to determine the effectiveness of the unit. Particular attention will be paid to the population dynamics of the iron oxidizing organisms at various stages of treatment. Analytical data will be utilized to aid in the design of other units and the assessment of capital and operating costs. Economics of the unit will be compared to those of other iron oxidizing processes in use or planned.
PROJECT MILESTONES: (1) 3/77 Funding package submitted. (2) 4/77 Award funds for project. (3) 4/78 Final report received.

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Northwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: (1) To define the mechanisms involved in the hydrology of the alluvial system. (2) To investigate the stratigraphic relationship of the stream deposits. (3) To identify the soil types represented. (4) To determine productivity of the native plant community. (5) To provide information relevant for state and federal regulatory agencies.
APPROACH: After an extensive literature review, three sites in Montana and Wyoming will be selected for field study.
RESULTS: It is intended that this study delineate the problems, mineability, treatability, etc. of potential alluvial valley mine sites and to define the critically important physical features of alluvial valleys which have major impacts to the hydrologic cycle.
PROJECT MILESTONES: (1) 6/77 Funding Package Submitted. (2) 7/77 Award Funds for Project. (3) 3/78 Award Continuation. (4) 2/80 Final Report Received.

TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: METALS (33%);PARTICULATES (33%);ORGANICS (34%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)

REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
OJECT DESCRIPTION: The objective of this research project will be to qualify and quantify any contamination of water used as a transport media in coal-slurry pipelines.
APPROACH: A slurry of water and coal will be pumped continuously for several days around a 2,400 foot, closed loop pipeline. Samples will be drawn off periodically and analysis will be performed on the water phase for various dissolved and suspended materials. Test parameters will be determined by prior analysis of the coal and water used to make up the slurry. It is anticipated that these parameters will include several metals as well as several organic carbon compounds. Both fresh water and saline water will be used as a transport media. Some organic analysis of water which has contracted coal has already been done at M.S.U. This work indicates that dissolved organic carbon of up to 100 ppM can result under some conditions.
RESULTS: Determination of the type and degree of contamination to water used for coal-slurry transport.
PROJECT MILESTONES: (1) 3/77 Funding Package Submitted. (2) 4/77 Award Funds for Project. (3) 8/77 Complete First Pump Tests. (4) 4/78 Final Report Received.

TITLE: Predicting Acid Pollution Potential from Coal Strip Mines
PROJECT NUMBER: B623-606
PRINCIPAL INVESTIGATOR: Caruccio, F.T.
ADDRESS: University of South Carolina, Columbia, SC 29208
AFFILIATION: South Carolina Univ., Columbia (USA). Dept. of Geology
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Newport, T.G.
TYPE OF FUNDING: Grant No.-R805116-01
77 FUNDING: Environmental Protection Agency FY77:$86,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: EXTRACTION (40%);TRANSPORTATION (20%);WASTE MANAGEMENT (40%)
POLLUTANTS: METALS (33%);PARTICULATES (33%);ORGANICS (34%)
CHARACTER OF STUDY: DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Middle Atlantic
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: If an acidity index can be developed with a reasonable degree of precision, the information will be very valuable to mining operators and regulatory officials in that they will have a tool which can be used to accurately predict the amount of acid pollution to be expected from a site proposed for surface mining. This will be useful in determining whether a mine permit should be issued and in reviewing the proposed mining operation to see if proper reclamation practices are employed.
APPROACH: Six proposed strip mines underlain by different geologies in the bituminous coal field of western Pennsylvania will be core drilled to provide fresh rock samples, detailed geology and ground water sampling points. The rocks will be related to their acid-alkalinity production potentials through laboratory simulated weathering conditions and petrographic analyses. The leachates will be analyzed for specific ionic species indicative of particular chemical reactions. A regional aqueous geochemical survey will be completed to evaluate the natural system's neutralizing and buffering capacities. During the backfilling phase of mining operation, water collectors will be buried in the backfill and mine drainage characteristics monitored. The chemical characteristics of the mine drainage will then be related to those of the leachates to ascertain the chemical reactions taking place. Further identification with the petrographic analyses and pyrite types of the rocks occupying the mine site and noted to produce particular acid-alkaline loads, permits the extension of this pollution predictive technique to other areas.
PROJECT MILESTONES: (1) 4/77 Funding Package Submitted. (2) 5/77 Award Funds for Project. (3) 2/79 Final Report.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Research is to be conducted on the land disposal of tank bottom and API separator wastes.
APPROACH: The investigation will utilize three diverse wastes, and tests will be conducted on several soils representing a range of characteristics. The investigation will begin with characterization of the wastes. This data will be used to decide on the application rates to be used in the studies. Measurements will be made of the deccmposition rate of the wastes, the influence of applications on plant survival and growth, and the concentrations of potential pollutants in runoff and leachate water. The fate and mobility of the wastes in the soil will be investigated in the laboratory, in greenhouse tests, and, ultimately, in field tests.
RESULTS: The research should provide insight into the feasibility of land disposal of this class of waste, and the results will be used to develop criteria to be used in the design, management, and monitoring of oily waste disposal operations.
PROJECT MILESTONES: (1) 7/77 Funding Package Submitted. (2) 8/77 Award Funds for Project. (3) 6/78 Final Report Received.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The potential environmental impact of advanced energy conversion technologies will be assessed in a 3 phase program over a 30 month period in order to avoid the need for retrofitting control equipment when these plants are a commercial reality. The advanced cycles to be considered in this program include: open and closed cycle magnetohydrodynamics (MHD), open and closed cycle high temperature gas turbines, liquid metal topping cycles, supercritical C0/sub 2/ cycles (feher), thermionics, fuel cells, advanced steam cycles (Field), and bottoming cycles.
APPROACH: The Phase I effort will consolidate the available information on the potential pollutants as well as the current state of development of advanced conversion technologies. The objective of Phase II will be to develop realistic and practical analytical models in order to estimate effluents, pollutants, and waste energy. These models will be employed to provide parametric analyses of emission levels related to cycle characteristics and efficiency. The cost/effectiveness of existing pollution control technologies for each cycle will then be determined. Phase III of the program will use all the information and data generated in the program to identify the critical R and D needed to make these technologies environmentally acceptable. The impact of pollution control on energy conversion efficiency will be stressed in the recommendation. This planning effort will include alternate R and D strategies and priorities based on anticipated ranges of available funding.
PROJECT MILESTONES: (1) 3/75 Funding package submitted. (2) 4/76 Award funds for project. (3) 2/78 Preliminary analysis report. (4) 3/79 Final report received.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To develop models relating fraction of fuel products (gas, liquid, solid) produced in pyrolysis of various types of solid wastes as function of pyrolyzed conditions. Solid wastes include mixed municipal, agricultural, and industrial wastes. An investigation of chemical conversions including steam gasification, partial oxidiation, and catalytic effects of bed materials, as well as detailed analysis and characterization of pyrolysis products including char and oil, will be conducted.
APPROACH: Experimental study using small batch pyrolyzer and pilot size (200 kg/hr) fluidized bed pyrolyzer to produce data for model development and verification. Statistical and semi-empirical models will be examined for the normal fluidized bed pyrolytic reaction as well as for steam gasification and partial oxidation. Several char and oil samples will be analyzed in detail to evaluate the acceptability of fuel products.
RESULTS: Status: Fabrication of the test units is completed. Test runs are underway to accumulate data for model verification.
PROJECT MILESTONES: (1) 3/75 Funding package submitted. (2) 6/75 Award funds for project. (3) 12/76 Grant modification No. 1. (4) 4/77 Grant modification No. 2. (5) 12/77 Final report received.

PROJECT DESCRIPTION: The environmental problems caused by 200 million tires discarded annually in the United States are well documented. At present there is no good way of disposing of scrap tires or of recovering the valuable carbon materials which they contain. The chief objective of this project is to complete bench scale engineering research on a process which converts scrap rubber to a mixture of hydrocarbon gases, a low sulfur oil, and carbon black.
APPROACH: This will involve identification and solution of technical problems--for example, separation of the catalyst and carbon black. It will include a complete economic evaluation of the process. Quantities of the products will be produced for evaluation by potential customers.
RESULTS: The data necessary for the design of a pilot plant will be obtained.
PROJECT MILESTONES: (1) 10/76 Funding package submitted. (2) 1/77 Award funds for project. (3) 12/77 Draft final report. (4) 3/78 Final report received.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this study is to identify sources of feedstocks (wastes) compatible with existing waste-as-fuel processes and ''product'' fuel users.
APPROACH: This effort calls for a national identification of waste sources (municipal, industrial, agricultural/quantities and locations by counties) and current fuel users (residential, utility boilers, etc. and locations by counties).
RESULTS: It is envisioned that the results of this effort will be displayed in a tabular form according to geographic areas as well as displayed on one or a series of maps.
PROJECT MILESTONES: (1) 8/77 Funding Package Submitted. (2) 10/77 Award Funds for Project, Draft Final Report. (3) 11/77 Final Report Received.

CHARACTER OF STUDY: DEVELOPMENT/Pilot plant (50%);FULL SCALE DEMONSTRATION (50%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objective of this program is to demonstrate the use of densified Refuse Derived Fuel (d-RDF) as a coal supplement in stoker-equipped boilers and to assess the environmental impact of widespread implementation of the concept.
APPROACH: The questions are to be answered by burning pelletized, cubetted and briquetted d-RDF and coal in spreader stoker-equipped boilers. The coal: d-RDF ratio will be varied to establish the impact of substitution ratio on boiler performance and the environment. After initial testing is complete, a demonstration burn will occur to assess the impact of sustained firing. Each fuel-boiler combination will be approached in a three step sequence: (1) a field trial will establish the processability of the fuel by the boiler and the maximum substitution ratios usable without boiler problems; (2) a field test will quantify environmental, energy and boiler impacts of the fuel system over a range of boiler conditions; (3) a demonstration will be performed.
RESULTS: Demonstration of feasibility and acquisition of parametric data.
PROJECT MILESTONES: (1) 10/76 Funding Package Submitted. (2) 11/76 Award Funds for Project. (3) 3/77 Preliminary Performance Evaluation of Short Burns. (4) 6/77 Final Report Received.

!ACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: A program to investigate the pyrolysis of agricultural residues and feedlot wastes in a steam atmosphere is to be done. The program is motivated by the evident need to upgrade the energy value of organic wastes for them to become a nationally significant fuel resource. Hydrogen produced from solid wastes by steam pyrolysis could be used to meet a portion of the Nation's natural gas demand. Experimental work on the kinetics of steam pyrolysis is needed to design a practical reactor system and to establish the regimes where minimum levels of environmental pollutants are produced.
APPROACH: The research program outlined in this effort will investigate at the bench the effects of diverse parameters, e.g., heating rate and ultimate temperature, particle size, reactor residence time and pressure on steam pyrolysis. In addition, catalysis of the pyrolysis reactions and effects of trace constituents of the waste on catalysis will also be studied. Mathematical models based on differential equations describing the rate processes will be developed when appropriate. The research program is aimed at determining the optimal conditions for the production of a synthesis gas (composed primarily of H2, CO, and CO2) from organic wastes by steam pyrolysis. In order to achieve this goal, yields of char and liquid products will be minimized. Ultimate pyrolysis temperatures will also be kept as low as possible, but other conditions will be treated as true variables in the optimization process.
RESULTS: Results from this research will facilitate the design of a continuous, small-scale chemical reactor primarily for waste gasification, though some waste liquefaction information will also result.

POLLUTANTS: METALS (50%);PARTICULATES (50%)
CHARACTER OF STUDY: DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objective of this project is to investigate the benefits to the environment resulting from the utilization of solid waste as a supplementary fuel in existing coal-fired power plants.
APPROACH: The approach is to evaluate the gaseous and particulate emission plus the corrosiveness of combustion products as a function of refuse-coal ratio and as a function of sulfur content of the coal. Experiments will be conducted in an operating power station through cooperation of the City of Columbus, Ohio, and at the Harrisburg (Pa.) Waterwall Co. Incineration Plant. Furnace and stack gas and particulate samples will be collected throughout the periods that corrosion probes are inserted at several locaticns in the heat-recovery passes. These probes will be examined for corrosion attack and deposit

composition for various gas and metal temperatures.
RESULTS: Provide guidance in future utilization of solid waste as a supplementary fuel.
PROJECT MILESTONES: (1) 8/77 Funding Supplement. (2) 10/78 Final Report.

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The grantee has proposed a two-phase effort to design, develop, test, and evaluate a remotely piloted, centrifugal fan thrust propelled, jet skirt nozzle forward/side motion controlled, moderate weight, hovercraft-type of vehicle for moving into a hazardous spill contaminated area over rough terrain and pipe runs (as well as over flat land) to carry an on-board TV camera and one or more remotely operated devices for plugging leaks, crimping pipes, turning valves, etc. close to the site or origin of the spill and thereby to reduce the risk to response personnel in acquiring factual data on the spill or in undertaking control measures.
APPROACH: In Phase A (Design and Pilot Model), a thorough evaluation of the propulsion options and capability trade-offs will be undertaken, followed by the fabrication and testing of either a pilot model or a stripped-down full-scale system. In Phase B (Engineering Prototype Construction and Evaluation), a full-scale system--equipped not only with a TV camera but with one or more control devices (plug, crimper)--will be constructed, evaluated, demonstrated, and delivered.
PROJECT MILESTONES: (1) 6/77 FUNDING PACKAGE SUBMITTED. (2) 7/77 AWARD FUNDS FOR PROJECT. (3) 10/77 APPLY INCREMENTAL FUNDS FOR PHASE A. (4) 5/78 COMPLETE PHASE A. PROJECT DESCRIPTION: The objectives of this project are to provide from efficient action to minimize damage o shorelines from oil and hazardous substance discharges including containment, dispersal and removal. PA headquarters has specifically expressed the need for, and given the highest priority to, Manuals of Practice (MOP) to meet the operational needs of field personnel during spill response actions to protect and restore threatened and contaminated shore areas. The projects associated with the milestone will satisfy the need by supplying Manuals of Practice which will be utilized by on-the-scene field personnel.
APPROACH: For the accomplishment of this milestone, the approach or methodology is to evaluate and select from the currently practiced state-of-the-art those field relevant methods and techniques for reduction to concise descriptive handbook format on-the-scene use by field personnel. The manuals will emphasize the decision process through which the field personnel must progress in order to arrive at the proper recommendation. For example, in protecting a marsh area, some questions that should be answered may include the type of marsh grasses, the inhabitants of the marsh, the time of year, expected weather conditions and the ecological, recreational, commercial and aesthetic value of the marsh.
RESULTS: Field procedures will be appended for utilizing products, equipment and supplies. These procedures will outline in concise descriptive format the step-by-step approach for implementation by the on-the-scene field personnel.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To carry out a series of workshops for State and local planning officials to provide them with methodologies and information pertaining to the identification of the onshore impact of outer continental shelf petroleum development and the siting of facilities associated with that development.
APPROACH: Retain the American Society of Planning Officials (ASPO) to set up the meetings, arrange for curricula and facility, prepare preprints and proceedings, and present a final report both on the content and on the success of this means of rapid dissemination of information. Use the results of USGC-funded ($450K) New England River Basins Commission (NERBC) methodology and development for the New England OCS frontier as a basis for the first series of workshops (held in 5 locations around the coastal U.S.). Involve State and local planners from the region where each workshop is held to the maximum extent possible in preparation and in execution to enrich the total content, to ensure useful feedback to NERBC, and to guarantee a nationally useful body of information and methods.
RESULTS: IAG with USGS signed; ASPO contract signed; Federal and regional advisory committees being formed; first workshops tentatively scheduled for January 1977.

POLLUTANTS: METALS (50%);ORGANICS/Pesticides (50%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS
PROJECT DESCRIPTION: The primary objectives of this program are to evaluate existing technology for the treatment and disposal of wastes generated from hazardous material spill cleanup and to identify novel treatment and disposal techniques that show the greatest potential for substantial improvement over present technology.
APPROACH: Spill incidences occurring in recent years will be investigated to gain better knowledge of waste disposal needs and a literature search will be conducted to review present practices for the disposal of these wastes and to identify novel techniques. In addition, responsible parties within Federal and State agencies and industrial organizations will be contacted to supplement the information obtained from the open literature.
RESULTS: Hazardous materials identified in the proposed hazardous material designation regulations (Federal Register, Volume 40, No. 250, December 20, 1975), the materials cited in the U.S. Coast Guard's ''CHRIS'' list (CG-446-2), pesticides produced in large quantities, and various other materials (paint, ink, processing sludges, off-spec products) will be grouped according to their physical-chemical properties to facilitate evaluation of treatment and disposal options. An annotated matrix will be prepared, which will include a brief description of the preferred disposal options in priority order for each material or class of materials. The annotation will characterize the options according to strengths and limitations, as well as to applicability to types of spill situations. Special consideration will be given to spills of small quantities of highly toxic and hazardous materials. An amended matrix of hazardous materials and disposal options will also be prepared by taking into consideration the potential use of novel processes that are being developed under other current projects. Wherever possible, additional novel techniques will be identified.
PROJECT MILESTONES: (1) 2/76 FUNDING PACKAGE SUBMITTED. (2) 11/76 AWARD FUNDS FOR PROJECT. (3) 2/77 FUNDING INCREMENT AWARDED. (4) 11/77 FINAL REPORT RECEIVED.

POLLUTANTS: METALS (50%);ORGANICS/Pesticides (50%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale;DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The disposal of collected spilled hazardous materials can pose significant difficulty in assuring that such disposal is complete and that the material cannot enter the ecosystem in its hazardous form. This program will assess two techniques to provide ultimate disposal of those chemicals that are not generally amenable to existing disposal techniques such as incineration, landfill, etc.
APPROACH: The first task will evaluate the ability of a liquid alkali metal to degrade organic compounds to elements or simple innocuous compounds (hydrogen, nitrogen, carbon, NaCI) or to compounds which can be treated by conventional techniques (Na2, Na2S, C2H2). The liquid metal system will be designed along lines of current heat transfer equipment and will use technology derived from inert gas cleaning units. The second task will evaluate glass encapsulation of essentially nonvolatile materials. In this technique, the material to be disposed of will be blended with glass-forming materials. In-situ glass formation will be effected using either external heating or pyrochemical reaction within the mass. Accelerated leaching tests will be run to determine the stability of the resulting glasses. Careful attention will be paid to the control of reaction-generated vapors.
RESULTS: Rather than restricting the project to work on only pure chemicals, both techniques will be developed for processing spilled hazardous materials contaminated with typical spilled debris (earth, sand, flora, water, etc.). A full analysis will be made of the fate of the reacted materials after disposal to the environment. Pilot scale units will be built and operated for those processes that are successful on a laboratory scale.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To study the feasibility and effectiveness of using gravity connector wells to improve stream quality by reducing drainage from abandoned deep coal mines.
APPROACH: Select the best site for demonstrating the effectiveness of gravity connector wells for reducing drainage from abandoned deep coal mines. Determine optimum number and location of gravity drainage wells and estimate the quantity of drainage that will be abated.
RESULTS: Current plans are for conducting Feasibility Study of an optimum demonstration site and develop plans and specifications for a full scale field demonstration of the technique. The site will be studied to determine its hydrogeologic and mining conditions affecting gravity drainage of related aquifers that will significantly reduce deep mine drainage. The study will capitalize on available data, but also include limited drilling and testing to determine aquifer flow characteristics. Following evaluation of the demonstration site, continuous monitoring of quantity and quality of deep mine discharges will commence. Detailed design plans for the gravity drainage wells will be determined based on the hydrogeology and aquifer flow characteristics of the site. The optimum location of the wells will be determined by studying fracture trace patterns as related to aquifer flow characteristics and hydrogeology. Based on the above, a determination will be made of the number and locations for constructing the required gravity drainage wells. As many as four connector wells will be constructed to study the mine drainage reduction possible from this technique.
PROJECT MILESTONES: (1) 5/74 Funding package submitted. (2) 6/74 Award funds for Project. (3) 5/77 Amendment to grant. (4) 11/79 Final report received.

ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: METALS (33%);PARTICULATES (33%);ORGANICS (34%)
CHARACTER OF STUDY: FULL SCALE DEMONSTRATION (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The Northern Cheyenne Tribe, via the Northern Cheyenne Research Project, desires to develop an in-depth knowledge of the chemical and physical character of the reservation water resources, and the interrelation of water to other resources, so that the tribe can make formal choices in planning coal development. A three-year study plan has begun to: (1) gather and interpret baseline data concerning the water resources and the interrelationships of these data to land, biocommunity, supply needs, and energy resources of the reservation; (2) ascertain potential adverse chemical, physical, and economic impacts to reservation water resources from coal development; and (3) develop a comprehensive water resources management plan that will aid present and future planning for resources exploitation.
APPROACH: Standard field and laboratory methodology are being employed in assessing the geology, surface water, and ground water of reservation lands. Baseline discharge and water quality data collection has begun for six reservation streams. Well inventories, a basic ground water monitoring program, and collection of ground water quality data has begun.
RESULTS: Stratigraphic correlation of the regional and local geology is completed and potential development priority areas have been selected. During the third budget period a description of potential impacts to the surface and ground water resources from mining and a reservation water resource management plan will be prepared.
PROJECT MILESTONES: (1) 5/75 FUNDING PACKAGE SUBMITTED. (2) 6/75 AWARD FUNDS FOR PROJECT. (3) 4/76 FUNDING INCREMENT. (4) 3/77 FUNDING INCREMENT. (5) 9/78 FINAL REPORT RECEIVED.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The main objective of this research is to develop for ''real World'' situations an amine carbamate gelation technique to facilitate the removal of petroleum derived oil spilled on ocean or inland waters. The specific objectives are: (a) determination of physical properties of a selected gelling agent (dehydroabietyl amine), including solubility and detergency determinations of the agent in water/oil matrices; (b) development of carbamating agents other than carbon dioxide; (3) determine the feasibility of oil and agent recovery by centrifugation; (d) pilot studies of gelation technique in large laboratory wave tanks; (e) field tests of gelation techniques at EPA test facilities; (f) preliminary evaluation of agent for gelling non-petroleum hazardous materials; (g) preliminary evaluation of the gelation

technique's utility in the prophylactic treatment of beach fronts.

REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/South
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objectives of this project are to demonstrate the economic and technical advantages to a full scale reverse osmosis (hyperfiltration) system for closed cycle operation of a textile dying and finishing plant.
APPROACH: Involved is the design, installation, and twelve-month operation of a reverse osmosis treatment system for the hot wastewater from either a continuous dye range or a group of ten atmospheric dye becks. The two types of equipment are typical of the two broad categories of textile processing: continuous and batch. A conceptual design will be developed for each process and the one appearing to he the most economically viable will be demonstrated.
RESULTS: Outputs from this program consist of: a detailed design for textile wastewater treatment by reverse osmosis, detailed operations and capital costs, documentation of energy savings of the reverse osmosis system compared to conventional waste treatment methods and evaluation of chemical (dyes, salt) recycle in the dying process.
PROJECT MILESTONES: (1) 5/77 Funding Package Submitted. (2) 9/77 Award Funds for Project. (3) 9/79 Complete Construction and Begin Operation. (4) 9/80 Operation Complete. (5) 12/80 Draft Report. (6) 4/81 Final Report Received.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: One of the project objectives (Phase I) is to summarize and analyze the adequacy of federal, state and local environmental laws applicable to geothermal energy development. Another objective (Phase II) is to examine the characteristics and potential uses of the known Geothermal Resource Areas, potential pollution problems, control technologies, and pollution control research needs.
APPROACH: The approach has been to examine and analyze existing information from many sources.
RESULTS: The output is two reports, Phase I (regulations) and Phase II (geothermal resource area characteristics and potential problems). These two documents should be useful to those engaged in preparing impact statements, to regulators, to legislative bodies, and to geothermal area decision-makers.
PROJECT MILESTONES: (1) 11/75 FUNDING PACKAGE SUBMITTED. (2) 11/75 AWARD FUNDS FOR PROJECT. (3) 4/76 INTERIM DRAFT REPORT ON REGULATIONS. (4) 3/77 DRAFT FINAL REPORT. (5) 6/77 FINAL REPORT RECEIVED.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective was to provide a preliminary environmental assessment of solar energy power generation systems and flat plate collectors for heating, and define areas requiring pollution control research.
APPROACH: The approach was to evaluate existing information and solar development programs.
RESULTS: The output is a report in line with the objectives. Solar systems are environmentally superior to their conventional alternatives. Land area requirements for central station power plants will be large but not so destructive as coal stripping. Visual effects can be extensive. Indirect effects of producing large quantities of solar cell materials could be environmentally harmful. EPA should encourage solar technologies as environmentally preferable to conventional technologies.
PROJECT MILESTONES: (1) 12/75 FUNDING PACKAGE SUBMITTED. (2) 1/76 AWARD FUNDS FOR PROJECT. (3) 4/76 DRAFT FINAL REPORT. (4) 1/77 FUNDING INCREMENT FOR FINAL REPORT. (5) 2/77 FINAL REPORT RECEIVED.

PROJECT DESCRIPTION: The objective of this project was to produce an example environmental impact statement for a hypothetical solar electric power generating plant.
APPROACH: The approach was to select a site where appropriate data were available and to impose the hypothetical situation upon it.
RESULTS: The output is a report simulating the environmental impact of a hypothetical 1000 MWe solar-electric plant in the desert of southeastern Nevada. Results indicate the principal impacts would be the destruction of soil and vegetation on 52 square km of desert terrain and the displacement of the animal population. There would be no effects on ground water, no thermal pollution, no surface water pollution, and nc noise pollution. The visual impact would be extensive.
PROJECT MILESTONES: (1) 3/76 FUNDING PACKAGE SUBMITTED. (2) 4/76 AWARD FUNDS FOR PROJECT. (3) 8/76 DRAFT FINAL REPORT. (4) 1/77 FUNDING INCREMENT FOR FINAL REPORT. (5) 2/77 FINAL REPORT RECEIVED.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objective of this project is to characterize the liquid, gaseous, and solid emission from various waste to energy systems.
APPROACH: The characterization will be based on actual data obtained from on-site sampling operations. The first report from this project was distributed in July '77; it represented a collection of previously obtained data and was called a "Source Assessment Document for Waste-As-Fuel Processes."
RESULTS: A co-firing of wood waste with coal process has been characterized for environmental emissions, as has a waste pre-processing (shredder/air classification) plant in Houston, Texas. Characterization of several waste pyrolysis plants is envisioned, in addition to that of waterwall incineration plants.
PROJECT MILESTONES: (1) 7/77 Funding Package Submitted. (2) 8/77 Award Funds for Project. (3) 1/77 Define Gaps in Literature. (4) 2/77 Recommend Preliminary Std. S and A Techs. (5) 3/77 Environmental Characterization of One Major Process. (6) 3/77 Final Report Received.

POLLUTANTS: METALS (33%);PARTICULATES (33%);ORGANICS (34%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To determine the feasibility, both technical and economic, of pyrolyzing the organic fraction of municipal solid waste to sufficient quantity of hydrocarbon gases (ethylene, ethane, etc.) to produce chemical intermediates. Phase I of subsequent studies are directed towards the polymerization of hydrocarbon fraction to liquid fuel (polymer gasoline) suitable for internal combustion engine operation.
APPROACH: (1) An existing pyrolysis unit will be operated under various conditions to maximize the production of unsaturated hydrocarbons. (2) A polymerization unit will be designed, fabricated and added to the pyrolysis unit. (3) Data will be obtained over a wide variety of conditions using the combined pyrolysis and polymerization units. Compositional analysis of pyrolysis and polymerization products will be performed for each test condition. (4) Preliminary design of a scaled-up pilot plant will be developed.
RESULTS: Studies have been conducted with the pyrolyis unit to optimize the unsaturated hydrocarbons in the off-gases. Separate studies have been made on a gas cleaning system and a thermal polymerization unit. Polymer gasoline has been produced from the polymerization unit using a combination of bottle gases simulating the gas mixture from the pyrolysis unit. Future tests involve using gases from the pyrolysis unit in the gas cleaning system and the polymerization unit and again optimize operating parameters.

PROJECT DESCRIPTION: The objective of this task is to identify the points, quantity, and quality of heat discharged from: (1) established industrial technologies now discharging substantial amounts of waste heat to the environment and (2) emerging technologies for energy development, conversion and utilization.
APPROACH: In order to accomplish this objective the following sub-task will be performed: (1) identification of waste heat discharging industries and technologies; (2) determination of the main processes in use; (3) establishment of industrial or technological sub-categories; (4) preparation of heat flow charts and diagrams; (5) determination of annual waste heat discharge of each sub-category; (6) categorize types of waste heat discharged according to quality, quantity, and potential of utilization; (7) present total waste heat discharged of each waste heat category; (a) as a percentage of the total industrial consumption of energy, (b) as a percentage of each SIC group, (c) according to geographical distribution; (8) identify further R and D needs.
RESULTS: The purpose of this study is to present detailed data on heat and water discharged from industries and emerging technologies for energy development, which are discharging substantial quantities of waste heat to the environment, in such a manner that it may be effectively used to: (1) assess the relative economic and environmental effects of utilizing waste heat and (2) assure the development of environmentally compatible control technology necessary for efficient waste heat utilization.

POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Multiple pollutants (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The purpose of this program is to provide EPA and other decision makers with information necessary (1) to foresee the effects of regulatory policies upon future energy development in Appalachia and (2) to determine areas requiring research emphasis in preparation for monitoring and controlling the impacts of new or expanded energy technologies. This regional study of energy development in Appalachia will focus on environmental, social, and economic impacts, both beneficial and adverse, associated with alternative energy policies and practices. Although the emphasis will be on the development of Appalachian coal resources, other energy resources will also be examined.
APPROACH: The first year technology assessment will begin by reviewing existing literature on Appalachian energy development. Energy development scenarios will be formulated based on (1) national energy policy as it relates to Appalachia and (2) existing energy production technology that is expected to be used to 1985 (near-term development) as well as existing and new technology which can be expected to be available for use between 1985 and 2000 (mid-term development). Next the direct and higher order impacts from the implementation of this technology will be examined. Concurrently, policy options available for controlling the impacts will be investigated along with issues that impacts raise. Emphasis will be placed on investigating the impacts from current plans for energy development under existing or proposed environmental protection policies. The second phase will expand upon and refine the work of the first year technology assessment. Emphasis will be placed upon identifying and analyzing alternative strategies for managing the rate and pattern of energy development in Appalachia.
PROJECT MILESTONES: (1) 3/77 Funding Package Submitted. (2) 6/77 Contract Awarded. (3) 8/78 Report of First Phase I. (4) 11/78 Work Plan for Phase II. (5) 7/80 Final Report Received.

TECHNOLOGY: FOSSIL FUEL/Coal (100%)
PROJECT DESCRIPTION: This program is to develop assessment and guideline reports for coal mining in both the humid eastern states and the arid and semi-arid western states.
APPROACH: The work is divided into four tasks undertaken by Forest Service personnel in Kentucky, Logan, Utah, and Albuquerque, N.M. The tasks are as follows: (1) develop guidelines and criteria for overburden drilling, analysis, and placement as related to growth supporting media; (2) prepare technical handbook on revegetation methods for mined lands in eastern U.S., including recommendations for new research; (3) develop guidelines and criteria for the use of non-mine wastes as soil amendments on coal and oil shale spoils; (4) develop recommendations, guidelines, and criteria, based on new research, for revegetation following coal and oil shale mining.
PROJECT MILESTONES: 01/75 Funding package submitted and funds awarded. 12/77 Technical handbook on eastern U.S. revegetation. 06/78 Guidelines on overburden drilling. 06/80 Final report on revegetation guidelines--semi-arid. 06/80 Final report on revegetation guidelines--arid. 06/80 Report: effects transportation systems. 06/79 Report: effects quality water in strip mines. 06/79 Report: assess technologies for redepositing and stabilizing. 06/80 Report: criteria use nonmine waste.

TITLE: Removal of Toxic Material From Mine Drainage
PROJECT NUMBER: B623B-T71
PRINCIPAL INVESTIGATOR: Zeitoun, M.A.
AFFILIATION: Dow Chemical Co., Midland, Mich. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Wilmoth, R.C.
77 FUNDING: Environmental Protection Agency FY77:$50,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of the project is to study removal of toxic materials from acid mine drainage by three processes: reverse osmosis, ion exchange, and lime neutralization.
APPROACH: The anticipated approach is to inject specified toxic materials from a bulk solution into an AMD process stream at the EPA Crown Field Site near Morgantown, West Virginia. The toxic materials to be used for the study are arsenic, boron, cadmium, chromium, copper, lead, mercury, nickel, phosphorus, selenium, and zinc.
PROJECT MILESTONES: (1) 08/77 Funding package submitted; (2) 08/77 award funds for project; (3) 08/77 begin on site investigation; (4) 10/77 complete on site work; (5) 01/78 draft final report; (6) 01/78 executive summary; (7) 02/78 revise report; (8) 03/78 final report received.

<070772>
TITLE: Effects of Surface Configuration in Water Pollution Control on Semi-Arid Mined Lands
PROJECT NUMBER: B623B-353
PRINCIPAL INVESTIGATOR: Hodder, J.F.;Jensen, L.B.;Dollhopf, D.;Halk, D.;Olson, J.;VanVoast, W.
AFFILIATION: Montana State Univ., Bozeman (USA); Montana Bureau of Mines and Geology, Billings (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Martin, J.F.
77 FUNDING: Environmental Protection Agency FY77:$200,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: Objectives of this study are to demonstrate the effectiveness of several surface configurations in controlling erosion, runoff, sedimentation and pollution of adjacent drainages; quickly producing a desirable stabilizing vegetative cover; creating an equilibrium between precipitation absorbed and soil moisture evaporated and transpired so that ground water pollution will remain minimal; producing an overall desirable reclamation design providing effective drainage, esthetics productiveness and use. Demonstration areas approximately 16 hectares in size were located on reshaped spoils of strip mined coal mines near Colstrip, MT; Savage, MT; Beulah, ND; Hanna, WY; and Glenrock, WY. Five treatments evaluated include deep chiseling in topsoil, deep chiseling no topsoil, gouging in topsoil, gouging no topsoil and dozer basins in topsoil. Five 0.21 hectare microwatersheds have been constructed at each area to aid in intensively evaluating each treatment. Treatment evaluation at each area include meteorological monitoring, surface runoff water quality, soil moisture, evapotranspiration rate, water aquifer levels. Implementation of the five areas has been completed and data is being collected and processed. The first report will be published during 1977. Treatment evaluations are scheduled through September 12, 1978.
PROJECT MILESTONES: (1) 00/74 Funding package submitted; (2) 00/74 award funds; (3) 11/78 final report received.

<070773>
TITLE: Environmental Monitoring and Assessment of Coal Strip Mining and Reclamation in The Four Corner Area
PROJECT NUMBER: B623B-418
PRINCIPAL INVESTIGATOR: Fogel, M.M.;Thames, J.L.;Verma, T.R.;Hekman, L.H.;Duckstein, L.
AFFILIATION: Arizona Univ., Tucson (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Martin, J.F.
77 FUNDING: Environmental Protection Agency FY77:$145,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
PROJECT DESCRIPTION: The overall objective of the project is to develop criteria for the optimal management of land that has been distributed by coal strip mining activities.
APPROACH: The criteria will be based on minimizing air and water pollution. Specifically, the second phase of the project will be devoted principally to monitoring (1) two selected groundwater basins, (2) three surface water sites and (3) three air quality sites to determine the effects of strip mining on the environment. Several holes will be drilled, cased and monitored for each of the shallow groundwater basins.
RESULTS: Infiltration studies will be used to ascertain the mobility of pollutants from the land surface to groundwater. The surface water sites will involve both mined and undisturbed areas as well as revegetated areas which are either irrigated or rainfed. High volume air samplers will be used to monitor particulate concentrations before, during and after mining development.
PROJECT MILESTONES: (1) 08/77 Funding package submitted; (2) 09/77 award funded; (3) 09/78 award continuation; (4) 10/79 final report received.

TITLE: Trace and Potentially Toxic Elements Associated with Uranium Deposits in South Texas
PROJECT NUMBER: B623B-523
PRINCIPAL INVESTIGATOR: Henry, C.D.;Groat, C.C.
AFFILIATION: Texas Univ., Austin (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Hubbard, S.J.
77 FUNDING: Environmental Protection Agency FY77:$60,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
PROJECT DESCRIPTION: The objective of this study is to evaluate potential problems of toxic elements associated with uranium mineralization and mining in South Texas.
APPROACH: Sampling of soils and vegetation in (1) areas that are within or immediately adjacent to mining areas or have had ore stored on them; (2) areas underlain by identified uranium mineralization but which have not been mined; and (3) areas of similar substrate and soils away from any known mineralization or previous mining will accomplish this objective.
RESULTS: The third locality will establish background levels: the first two would indicate the extent of man-caused or ''natural'' contamination. Sampling will begin early in 1977.
PROJECT MILESTONES: (1) 04/77 Funding package submitted; (2) 05/77 award funds; (3) 07/78 final report received.

TITLE: Evaluation of 3 Permeable Limestone Seals Via Construction of 3 Earthen Dams
PROJECT NUMBER: B623B-574
PRINCIPAL INVESTIGATOR: Scott, R.B.
AFFILIATION: Environmental Protection Agency, Cincinnati, Ohio (USA). Industrial Environmental Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Scott, R.B.
77 FUNDING: Environmental Protection Agency FY77:$19,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of this project is to demonstrate mine sealing by pneumatically injecting limestone (1/2'' x 5'') into abandoned drift mine portals.
APPROACH: The limestone (CaCO3) in the seal will react with the acid water to neutralize acidity and precipitate ferric and aluminum hydroxides that will tend to plug the voids between the stones and prevent water flow from the mine.
RESULTS: The current phase of the project involves evaluation of the mine seals by external flooding. Extensive monitoring is being conducted to determine the extent of flooding inside the mine area, and the volume of water percolating through the limestone seals.
PROJECT MILESTONES: (1) 11/76 Funding package submitted; (2) 11/76 award funds; (3) 11/80 final report received.

TITLE: Geochemistry of Cadmium and Other Selected Heavy Metals as Related to Coal Strip Mining
PROJECT NUMBER: B623B-633
PRINCIPAL INVESTIGATOR: Hood, W.;Robinson, P.
AFFILIATION: Southern Illinois Univ., Carbondale (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Wilmoth, R.C.
77 FUNDING: Environmental Protection Agency FY77:$27,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
PROJECT DESCRIPTION: This investigation is concerned with the potential release of cadmium and other toxic heavy elements (arsenic, antimony, nickel, cobalt, zinc, and chromium) to southern Illinois streams as a result of the strip mining of coal. Preliminary data indicate that significant amounts of toxic heavy elements can be leached by acid mine water but the fate of these elements after they enter the aquatic

environment is not known. However, preliminary information indicates that dangerous concentrations of these elements may possibly be transported downstream as part of the bedload, perhaps to be again released when favorable conditions arise. Our study site will be a six-county area in southern Illinois, one of the ost extensively strip-mined areas in the world.
OACH: Our proposed study will be divided into three separate parts: (1) regional and stratigraphic aistribution of the elements in mine overburden materials, (2) leaching studies on the removal of the elements from overburden rocks and (3) distribution of the elements in selected streams and stream sediments in the area.
RESULTS: Our results will establish the extent of cadmium and other heavy element pollution resulting from southern Illinois coal strip mining operations, establish the causes, and provide the information needed for its prevention.
PROJECT MILESTONES: (1) 08/77 Funding package submitted; (2) 09/77 award funds; (3) 12/77 review sampling and analysis plan; (4) 01/78 award continuation; (5) 09/79 final report received.

TITLE: Major Inorganic Manufacturing Industrial Segments
PROJECT NUMBER: B604B-030
PRINCIPAL INVESTIGATOR: Sawyer, C.
AFFILIATION: PEDCO-Environmental Specialists, Inc., Cincinnati, Ohio (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Stinson, M.
77 FUNDING: Environmental Protection Agency FY77:$17,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of the project is to assess the major inorganic manufacturing industry segments.
APPROACH: The project will be approached by the following phases: Phase I: An in-depth source assessment studying the qualitative and quantitative aspects of all pollutant emissions, as well as available technology and pollutant effects of major manufacturing industrial segments. This source assessment will provide the information necessary to determine the immediate impact of emissions. Phase II: A comprehensive study to assess and prioritorize the multimedia pollution problems of the major inorganic manufacturing industrial segments. This study will prioritorize the multimedia pollution problems to establish a direction for technology, development and demonstration efforts.
RESULTS: The data obtained from this project will be computerized to form a data base for the inorganic chemicals industry.
PROJECT MILESTONES: (1) 01/76 Funding package submitted; (2) 12/76 award funds for project; (3) 12/76 funding increment; (4) 10/77 final report received.

77 FUNDING: Environmental Protection Agency FY77:$25,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of this project is to develop recommendations for the minimum protective equipment requirements for those individuals who have responsibility for the investigation, inspection and supervision of operations involving the cleanup of spills of a broad range of hazardous materials.
APPROACH: An ensemble of the best available equipment will be assembled and 11 prototypes delivered to EPA for use testing. Included in the ensemble will be a body and head cooling system, a lightweight self-contained breathing apparatus and a chemically resistant suit, gloves and boots.
RESULTS: The output of this work will be a comprehensive categorization of hazardous materials (or classes/groupings of these materials) with corresponding recommendations for minimum protective clothing and breathing apparatus along with respective sources of supply and performance profiles for the equipment.
PROJECT MILESTONES: 03/75 Funding package submitted. 05/75 Award funds for project. 12/75 Funding increment. 02/77 Change in scope submitted. 03/77 Change in scope awarded. 03/78 Final report received.

TITLE: Pilot Scale Testing of Activated Carbon Treatment of Hazardous MAterials Spills
PROJECT NUMBER: B610A-229
PRINCIPAL INVESTIGATOR: Lafornara, J.P.;Gruenfeld, M.;Freestone, F.J.;Urban, M.
AFFILIATION: Environmental Protection Agency, Washington, D.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Lafornara, J.P.
77 FUNDING: Environmental Protection Agency FY77:$50,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of this program is to define the extent to which selected hazardous materials can be removed from water by the activated carbon columns of the Mobile Physical/Chemical Treatment Trailer (Contract No. 68-01-0099).
APPROACH: A pilot scale model of the trailer's columns will be designed, fabricated, and operated at various loading rates to determine which of the chemicals about to be designated as hazardous in response to Section 311 of Public Law 92-500, can be removed by this technique. A performance matrix will be developed so that high priority materials will be tested first. Individual experiments will be designed so as to allow rapid determination of parameters such as minimum carbon contact time, adsorption capability of the carbon, and rate of movement of the adsorption front.
RESULTS: Emergency activation of the pilot plant will be possible for hazardous materials incidents such as spills, etc. which require the rapid generation of carbon treatment data so that an effective can be made.
PROJECT MILESTONES: (1) 10/76 Initiate project. (2) 03/77 Complete pilot plant fabrication. (3) 09/77 Complete pilot plant shakedown. (4) 09/78 Publish data for first year. (5) 09/79 Publish data for second year. (6) 09/80 Publish data for third year.

TITLE: Hazardous Material Spill Ultimate Disposal--Lab/Pilot Demonstration Sodium Fluxing and Glassification
PROJECT NUMBER: B610A-579
PRINCIPAL INVESTIGATOR: Hiltz, R.H.;Griwatz, G.H.;Gross, S.
AFFILIATION: Mine Safety Appliances Co., Pittsburgh, Pa. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Brugger, J.
77 FUNDING: Environmental Protection Agency FY77:$34,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: This program will assess two techniques to provide ultimate disposal of those chemicals that are not generally amenable to existing disposal techniques such as incineration, landfill, etc.
APPROACH: The first task will evaluate the ability of a liquid alkali metal to degrade organic compounds to elements or simple innocuous compounds (hydrogen, nitrogen, carbon, NaCl) or to compounds which can be treated by conventional techniques (Na2O, Na2S, C2H2). The liquid metal system will be designed along lines of current heat transfer equipment and will use technology derived from inert gas cleaning units. The second task will evaluate glass encapsulation of essentially nonvolatile materials. In this technique, the material to be disposed of will be blended with glass-forming materials. In-situ glass formation will be effected using either external heating or pyrochemical reaction within the mass. Accelerated leaching tests will be run to determine the stability of the resulting glasses. Careful attention will be paid to the control of reaction-generated vapors.
RESULTS: Rather than restricting the project to work on only pure chemicals, both techniques will be developed for processing spilled hazardous materials contaminated with typical spilled debris (earth, sand, flora, water, etc.). A full analysis will be made of the fate of the reacted materials after disposal to the environment. Pilot scale units will be built and operated for those processes that are successful on a laboratory scale.
PROJECT MILESTONES: 02/76 Funding package submitted. 11/76 Award funds for project. 02/77 Funding increment. 06/79 Final report received.

TITLE: Measurement of Volatile Chemical Emissions from Wastewater Basins
PROJECT NUMBER: B610B-618
PRINCIPAL INVESTIGATOR: Thibodeaux, L.J.;Parker, D.G.
AFFILIATION: Arkansas Univ., Fayetteville (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Dallons, V.
77 FUNDING: Environmental Protection Agency FY77:$94,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of this study is to determine the magnitude of both sulfur and organic compounds that escape into the air from wastewater treatment facilities at pulp and paper mills. The results of this study will help to establish whether wastewater treatment facilities are a significant secondary emission source of sulfur and organic compounds. The results can also be used to establish baseline quantities and to suggest possible control methods, if required.
APPROACH: Both laboratory and field investigations will be conducted. The laboratory study will be designed primarily to perfect appropriate water and air sampling techniques. This phase will consist of running a laboratory scale biological reactor and samling both the liquid and air phases. The methods developed during this study will then be used to conduct field investigations. Both phases of this project will take approximately one year to complete. The field sampling will consist of both water and air sampling at actual wastewater treatment facilities. Liquid samples will be collected at the influent and effluent locations of the treatment reactors as well as in the reactors themselves. Air samples will be collected at strategic points upwind and downwind from the biological reactors and possibly above the reactors themselves. Air samples will be collected at different elevations so that the vertical distribution of pollutants can be established.

RESULTS: The results will be published in EPA Technical Report Series.
PROJECT MILESTONES: 08/77 Funding package submitted. 10/77 Award funds for project. 08/79 Final draft report. 10/79 Final report received.

TITLE: Sulfide Precipitation of Heavy Metals
PROJECT NUMBER: B610C-567
PRINCIPAL INVESTIGATOR: Robinson, S.;Terhune, C.
AFFILIATION: Boeing Co., Seattle, Wash. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Wilson, D.
77 FUNDING: Environmental Protection Agency FY77:$97,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: To compare the sulfide and hydroxide precipitation processes for the removal of heavy metals, including copper, chromium, zinc, iron, cadmium and nickel, from industrial wastewater streams. The comparison will include: the completeness of removal, the full scale installation and operating costs, and a 12-month exposure study of the leaching characteristics of the sludges, both raw and admixed with binding materials.
APPROACH: Pilot scale plants will process up to 190 liter (50 gallon) samples of wastewaters in the sulfide, hydroxide, and combined sulfide--hydroxide processes. Samples of sludge will be collected from the pilot scale plants, and from industrial treatment plants using the processes. The sludge samples will be exposed in small roof-pack lysimeters, and in 0-76 cubic meter (1 cubic year) landfill-type lysimeters. Heavy metal concentrations will be determined in the pilot scale plant streams and in the sludge leachates principally by flameless atomic absorption spectroscopy.

TITLE: Methods Manual for Oil Spill Source Identification
PROJECT NUMBER: B623C-275
PRINCIPAL INVESTIGATOR: Gruenfeld, M.
AFFILIATION: Environmental Protection Agency, Cincinnati, Ohio (USA). Industrial Environmental Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Gruenfeld, M.
77 FUNDING: Environmental Protection Agency FY77:$18,000
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
PROJECT DESCRIPTION: The objective of this project is to develop a comprehensive manual of proven analytical methods for the quantitation, characterization, and source identification of petroleum oils that are spilled into the environment.
APPROACH: A manual of reliable analytical methods will be prepared in order to monitor oil pollution in the vicinity of oil spills, oil production platforms, tanker routes, industrial and municipal outfalls, et al. Although methods for analyzing oils in water, sediments, and biological tissues are currently proliferating, they generally lack sensitivity, specificity and adequate validation. This project will review the available methods, and consolidate the most appropriate ones within the context of a state-of-the-art EPA oil spill methods manual.
PROJECT MILESTONES: 01/76 Initiate project. 04/76 Complete literature review. 09/77 Complete methods evaluation. 12/77 Draft manual. 03/78 Final manual.
KEYWORDS: OIL SPILLS;AQUATIC ECOSYSTEMS;LOCALITY;MONITORING;PETROLEUM PRODUCTS;CHEMICAL ANALYSIS;SPATIAL DISTRIBUTION;WATER POLLUTION

TITLE: System Concept Evaluation--Densified Refuse--Derived Fuels
PROJECT NUMBER: B624B-T72
PRINCIPAL INVESTIGATOR: Zeitoun, M.
AFFILIATION: Dow Chemical Co., Midland, Mich. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Olexsey, R.A.
77 FUNDING: Environmental Protection Agency FY77:$21,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: This task calls for an economic and technical feasibility study of the concept of central station production of densified refuse derived fuel (DRDF), marketing, and delivery of the fuel product to industrial, institutional, and utility boilers within the local vicinity of the central station plant.
APPROACH: Costs and the feasibility of the DRDF system concept will be compared/contrasted with those of the more conventional concept of the production of ''fluff'' refuse derived fuel (RDF) for sale to an adjacent utility. The contractor will use his experience, the literature, and existing data supplied by system developers and EPA through contractors and grantees working on the subject area.
PROJECT MILESTONES: 04/78 Final report.
KEYWORDS: REFUSE DERIVED FUELS;FABRICATION;FEASIBILITY STUDIES;COMBUSTION;BOILER FUEL;COST;COMPARATIVE EVALUATIONS;TECHNOLOGY ASSESSMENT;ECONOMICS;FOSSIL-FUEL POWER PLANTS

<070791>
TITLE: Energy Consumption from Present Pollution Control Technology
PROJECT NUMBER: B624B-386
PRINCIPAL INVESTIGATOR: Hockett, R.S.
AFFILIATION: Monsanto Research Corp., St. Louis, Mo. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Lee, C.C.
77 FUNDING: Environmental Protection Agency FY77:$5,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objectives of this task are: (1) to assess the existence of and accuracy of pollution control energy cost estimates, and (2) to assess, in the light of shortages and increasing cost of energy, the need for modification of present approaches to pollution control. Within the time constraints of the project, the object is to obtain as broad a perspective as possible on the problem area for EPA program planning purposes.
APPROACH: The two objectives for this project will be met by the following two subtasks: Subtask 1--Survey the open literature and make personal contacts to identify previous efforts and success in determining the energy costs of pollution control. Interest is in industrial and utility stationary point sources and in the related air, water, and solids pollution control throughout the U.S. economy. Analyze the deficiences and assumptions in previous work. Suggest alternative approaches to obtaining better cost data (125 manhours); Subtask 2--Identify the relative energy uses of various pollution control strategies now in use to determine the most important areas for reducing energy consumption. The basis should be present industry production capacity, but with anticipated pollution control assumed to be installed to satisfy present regulations. It may be appropriate to consider categories of pollutants, i.e., NOx, SO2, hydrocarbons, BOD, COD, trace organics in water, etc., rather than industry categories, in making comparisons. Alternatives to pollution control that are less energy intensive should be identified and prioritized. Emphasis should be placed on modifications of existing processes rather than on totally new approaches (375 manhours).
PROJECT MILESTONES: (1) 07/75 Funding package submitted. (2) 04/76 Award funds for project. (3) 01/78 Final report received.
KEYWORDS: ENERGY SOURCES;POLLUTION CONTROL EQUIPMENT;COST BENEFIT ANALYSIS;POLLUTION REGULATIONS

TITLE: Environmental, Economic, and Conservation Aspects of Integrated Energy Use Applications
PROJECT NUMBER: B624B-531
PRINCIPAL INVESTIGATOR: Zimmer, R.P.
AFFILIATION: Georgia Inst. of Tech., Atlanta (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Lee, C.C.
77 FUNDING: Environmental Protection Agency FY77:$50,000
TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: The purpose of this project is to provide up-to-date analyses of the environmental, economic and technical feasibility of alternatives for supplying total energy needs, to assess various integrated energy system concepts for supplying multipurpose energy for utility and industrial needs, to identify the technical feasibility of matching industrial processes to thermal outputs of power plants, to analyze extensively several final concepts selected for their potential for future environmentally sound developments, and to make recommendations about future environmental research and development activities based on the project results.
APPROACH: This research study will follow a phase-oriented program to achieve its objectives. Five phases have been identified and are listed below: Phase 1: Project management, Phase 2: Environmental, economic and technological overview and preliminary concept identification, Phase 3: Methodology development and final concept selection, Phase 4: Concept analysis and evaluation, Phase 5: Conclusion and recommendation.
PROJECT MILESTONES: (1) 07/75 Funding package submitted. (2) 03/76 Award funds for project. (3) 01/78 Final report received.

TITLE: Assessment of Large-Scale Photovoltaic Materials Production
PROJECT NUMBER: B624B-536
PRINCIPAL INVESTIGATOR: Sears, D.R.
AFFILIATION: Lockheed Missiles and Space Co., Palo Alto, Calif. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Hartley, R.
77 FUNDING: Environmental Protection Agency FY77:$5,000
TECHNOLOGY: SOLAR/General (100%)
PROJECT DESCRIPTION: The objectives of this study were to assess the environmental impact of large increases in the production of solar cell materials assuming that photovoltaics would provide 1 percent of the national electrical energy requirement.
APPROACH: Three types of cell production--silicon, cadmium sulfide, and gallium arsenide--were examined. The approach was to investigate the existing and developing production methods and to calculate potential pollution discharge and emission loadings.
RESULTS: The final report is complete. For silicon production, the necessary power consumption produces indirect air emissions over half as large as the coal-burning plants that the silicon cells might replace. For the others, atmospheric cadmium releases and potential cadmium and arsenic spills are the major potential problem areas.
PROJECT MILESTONES: (1) 11/76 Funding package submitted. (2) 11/76 Award funds for project. (3) 11/76 Draft final report. (4) 04/77 Final report received.
KEYWORDS: SOLAR CELLS;PRODUCTION;ENERGY DEMAND;SILICON SOLAR CELLS;AIR POLLUTION;CADMIUM;ARSENIC;ENVIRONMENTAL EFFECTS

TITLE: Environmental Assessment of Oil Shale Processes
PROJECT NUMBER: B623A-365
PRINCIPAL INVESTIGATOR: Cotter, J.;Prien, C.
AFFILIATION: Thompson Ramo Wooldridge, Inc., Inglewood, Calif. (USA); Denver Univ., Colo. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Powers, T.J.
77 FUNDING: Environmental Protection Agency FY77:$413,000
TECHNOLOGY: FOSSIL FUEL/Oil Shale (100%)
PROJECT DESCRIPTION: The major objectives of this project include the acquisition of the necessary background data on the principal industrial shale recovery processes and U.S. shale resource, a comparative assessment of their environmental acceptability and an evaluation of technologies available for the control of air, water, and solid waste emissions.
APPROACH: Shale oil production requires cheap, large-scale materials handling methods at all stages of mining, retorting, and retorted shale disposal; maximum heat economy in retorting and upgrading; and minimum water and power consumption. A number of processing sequences are available, each with its own accompanying environmental impacts. The evaluation and assessment program involves six tasks: (1) Project Management; (2) Oil Shale and Recovery Process Characterization; (3) Engineering Analysis and Problem Definition; (4) Field Testing and Laboratory Analysis; (5) Environmental Evaluation; (6) Evaluation of Existing Environmental Control Technology.
RESULTS: This project will provide a basis for the establishment of rational design, management, and monitoring procedures to mitigate unavoidable adverse environmental impacts. The type and magnitude of these impacts should be determined prior to the development of a full-scale oil shale industry.
PROJECT MILESTONES: (1) 01/75 Funding package submitted. (2) 01/76 Award funds for project. (3) 10/76 Funding increment. (4) 12/76 Funding increment. (5) 05/78 Final report received.

TITLE: Environmental Effects and Control of Various Flue Gas Cleaning (FGC) Sludge Disposal Options
PROJECT NUMBER: C618A-7207
PRINCIPAL INVESTIGATOR: Schmidt, C.J.;Weaver, D.E.;Woodyard, H.P.;Nishel, H.L.;Pifer, H.W.;Chen, K.Y.
AFFILIATION: Stearns, Conrad, and Schmidt Consulting Engineers, Inc., Long Beach, Calif. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Municipal Environmental Research Laboratory
MONITOR: Sanning, D.E.
77 FUNDING: Environmental Protection Agency FY77:$99,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The primary objectives of this project are: (1) to develop a better understanding of the thermodynamics and kinetics of chemical speciation in FGC sludge and sludge liquors; (2) to assess the economic impact of various FGC sludge disposal regulatory approaches on the utility industry.
APPROACH: The project is to be performed in two separate phases. Phase I involves the preparation and implementation of a thermodynamic and kinetic model of chemical speciation in FGC sludge and sludge liquors. This subject, identified as an area of needed research in previous studies, is important when assessing the impact of sludge leachate on the ecosystem. Constituents of particular interest to this study are mercury, fluoride, selenium, arsenic, and sulfite ion. Data developed using this model will define what chemical species exist in sludge liquors or leachate for a given set of sludge characteristics. Phase II of the project will involve the development of a detailed economic impact document. In addition to updating the FGC sludge treatment disposal cost data base, the study will review performance of the treatment/disposal alternatives to determine what level of pollutant control is technologically feasible.
RESULTS: A family of cost curves will be developed relating disposal cost to the ''goal'' of the ultimate disposal operation (e.g., reduced permeability, increased load bearing strength, etc.). These costs will be exemplified through the designation of several model power plants and a subsequent analysis of regulatory impact of FGC sludge disposal operations.
PROJECT MILESTONES: 02/79 Final report available.

TITLE: Evaluation of Fixation of Arsenic Bearing Wastes
PROJECT NUMBER: C618A-7208
PRINCIPAL INVESTIGATOR: Johnson, J.;Pojasek, R.;Greene, S.;Gallant, R.
AFFILIATION: JBF Scientific Corp., Burlington, Mass. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Municipal Environmental Research Laboratory
MONITOR: Sanning, D.E.
77 FUNDING: Environmental Protection Agency FY77:$11,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: This study will evaluate the effectiveness of a number of proprietary and generic processes for the fixation of arsenic in arsenic bearing wastes. These wastes are presently being stored as they are generated, because of their potential hazard to the environment. Among the major generators of such wastes are copper smelters and pesticide manufacturers. The principal objectives are to identify those fixation methods which most severely restrict the leaching potential of arsenic, and to identify potential markets for the wastes.
APPROACH: The work will consist primarily of the following tasks: (1) fixing wastes, using generic methods in the laboratory and arranging for proprietory processes by vendors; (2) leaching studies, including column and elutriate tests, to establish effectiveness of fixation; (3) market studies for both raw and treated wastes.
PROJECT MILESTONES: 03/79 Final report available.

<070905>
TITLE: Role of Aquatic Communities in Evaluating Strategies, Establishing Standards and Monitoring Programs for Water Quality Management
PROJECT NUMBER: C619A-7116
PRINCIPAL INVESTIGATOR: Brigham, W.U.
AFFILIATION: Illinois Univ., Urbana (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Municipal Environmental Research Laboratory
MONITOR: Oppelt, E.T.
77 FUNDING: Environmental Protection Agency FY77:$160,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The purposes of this investigation are to investigate the role of aquatic communities in evaluating strategies for water quality management; to define the term fishable in light of non-steady-state environmental effects; to explore and recommend appropriate standards which account for these effects, and; to design and test a responsive monitoring program.
APPROACH: The project will be conducted in three phases: Phase I will elucidate the interrelationship among abiotic and biotic factors. Phase II will demonstrate the use of these interrelationships as guidelines for the establishment of standards, using existing chemical, physical and biological community data from the DuPage (Illinois) and Enoree (N. Carolina) River basins in conjunction with water quality modelling. Phase III will consider the nature of the monitoring program necessary to develop the phase-II standards (using the DuPage River as an example case.)
RESULTS: In pursuing these objectives, the relationship between aquatic biological communities and their physical and chemical environment will be explored. The survival or demise of communities will be related to spatial and temporal patterns of physical and chemical events. If possible, survival will be related to such statistical measures as expected magnitude, duration, and recurrence of critical chemical

characteristics and will be related to natural and man-induced effects so that, in the end, causes and effects of management control can be assessed.
---JECT MILESTONES: (1) 10/77 Project begins; (2) 05/78 complete Phase I concepts and procedures; (3) 10/78 omplete Phase II standards; (4) 10/79 complete Phase III monitoring; and (5) 04/80 final report.

PROJECT NUMBER: C619A-7117
PRINCIPAL INVESTIGATOR: Thurston, R.V.;Russo, R.
AFFILIATION: Montana State Univ., Bozeman (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Municipal Environmental Research Laboratory
MONITOR: Brunas, W.
77 FUNDING: Environmental Protection Agency FY77:$50,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of this research is to determine the effect on fish of exposures to fluctuating concentrations of ammonia above the proposed EPA criterion level of 0.02 mg/liter NH3 but below acute toxicity levels.
APPROACH: This will be accomplished through a series of laboratory flow-through bioassays in which rainbow trout and fathead minnows will be exposed to fluctuating concentrations of ammonia. Two different fluctuation regimes will be studied: (1) diurnal fluctuations typical of those which might be caused by wastewater treatment plant discharges, and (2) intermittent fluctuations as might be caused by ''slug'' discharges. Experiments to investigate the effect of fluctuations under stressful conditions of temperature and dissolved oxygen will also be examined in an exploratory fashion.
PROJECT MILESTONES: (1) 10/77 Project start; (2) 09/78 project completion; and (3) 03/79 final report.

<070907>
TITLE: Laboratory and Field Evaluation of Chemically Stabilized Sludges
PROJECT NUMBER: C624A-7017
PRINCIPAL INVESTIGATOR: Mahloch, J.L.
AFFILIATION: Department of the Army, Washington, D.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Municipal Environmental Research Laboratory
MONITOR: Landreth, R.E.
77 FUNDING: Environmental Protection Agency FY77:$150,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: To assess on a laboratory scale the pollution potential of selected hazardous raw solid/liquid waste streams and sludges, residues resulting from air-pollution-abatement devices, and sludges and residues that have been chemically/physically fixed to eliminate or substantially reduce their pollution potential. To validate by field studies the information obtained from the laboratory study.
APPROACH: WES has obtained selected sludges and residues from hazardous waste streams and selected power plants. After having these residues chemically stabilized by different processors, an extensive leachability and durability evaluation is being carried out. The leaching rate and pollutant leachability from raw and fixed sludges using two leach solutions are being determined. The stability and weatherability of the sludges are being determined under the durability testing phase of the project. A field evaluation using surface plots and lysimeters will extend the laboratory study to conditions that might be expected in the field environment.
RESULTS: Test results show that fixing can cause significant changes in the properties of sludge, that fixed sludges are similar to soil, soil-cement, or low-strength concrete, and that properties are process-dependent.
PROJECT MILESTONES: (1) 06/74 IAG award; (2) 01/75 interim report-lab design for sludge analysis; (3) 09/76 interim report-leachability and durability studies; (4) 09/77 interim report-engineering properties; (5) 10/77 final report-leachability and durability; (6) 02/78 final report-site evaluation; (7) 01/81 project completed; and (8) 06/81 final report.

77 FUNDING: Environmental Protection Agency FY77:$100,000
TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: (1) To determine the feasibility of using municipal sewage sludge to reclaim and vegetate land disturbed by mining activities; (2) to evaluate methods for the processing, transportation, spreading and incorporation of the sludge into the land; (3) to demonstrate application rates that will maximize benefits to soils, improve water quality, and make lands agriculturally productive; (4) to evaluate the effect of varied sludge applications on vegetation establishment and growth (grass, legume and tree species), including foliar analysis to determine nutrient uptake and potential heavy metal toxicity; (5) to evaluate the effect of the sludge applications on the chemical quality of percolating recharge water; (6) to determine the degree of site amelioration resulting from the sludge application by monitoring physical and chemical changes of the surface spoil or refuse material; and (7) to evaluate the effect of the sludge application on the quality of the groundwater and/or the quality of the nearest receiving stream and/or surface water runoff by a monitoring program. The proposed project contains three phases. Phase I is concerned with the processing of sewage sludge at the sewage treatment plant an its transport to and delivery at the strip mine sites. Phase II concerns the application of the sludge to the land and the revegetation measures necessary to return the land to productive use. Phase III is project evaluation.
PROJECT MILESTONES: (1) 07/76 Project start and (2) 11/79 Final report published.

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: A technical and economic feasibility of disinfecting liquid municipal wastewater residuals with high energy electrons is being evaluated at the Deer Island Wastewater Plant of the Metropolitan District Commission (Boston). The objectives of the overall research program at Deer Island with supporting laboratory studies at MIT is not only the evaluation of the technical and economic feasibility of disinfecting liquid waste residuals but also the investigation of high energy electrons for modifying dewaterability and oxidation state of metals in the liquid waste residuals. The specific research supported by EPA is the chemical studies involving the influence of high energy electron irradiation treatment of sludges for: (1) sedimentation and dewatering effects, (2) effect on metals and (3) inactivation of toxic materials.

TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: This study is a task under Contract 14-12-150 with the Country Sanitation Districts of Los Angeles County. Dr. Irvin Kugelman is Project Officer for the contract. The first part of the study was the evaluation of windrow sludge composting of anaerobically digested sludge cake after solid bowl centrifugation. The objective of the study was to determine the following: (1) decrease in pathogen organisms after composting, (2) decrease in moisture content after composting, (3) additional stabilization of the sludge cake and (4) the turning frequency needed to achieve the most optimum effect for (1), (2), and (3). In February 1977, second stage basket-type centrifuges were put on stream to further centrifuge (increase total solids capture) the centrate from the solid bowl centrifuge. The study was expanded to include the effect of the 2-stage centrifuge sludge cake on windrow sludge composting efficiency.
PROJECT MILESTONES: (1) 03/76 Project start. (2) 03/78 Project completed. (3) 07/78 Final report published.

TITLE: Thermoradiation Treatment of Sewage Sludge Using Reactor Waste Fission Products (Updated NRP)
PROJECT NUMBER: C611B-7081
PRINCIPAL INVESTIGATOR: Sivinski, H.D.
AFFILIATION: Energy Research and Development Administration, Washington, D.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Municipal Environmental Research Laboratory
MONITOR: Stern, G.
77 FUNDING: Environmental Protection Agency FY77:$85,000
TECHNOLOGY: FOSSIL FUEL/General (50%);NUCLEAR/Fission (50%)
PROJECT DESCRIPTION: The objective of the research program is to constructively couple two environmental problems, disinfection and treatment of sewage sludge and disposal of nuclear waste materials. Successful coupling could lead to a mutually beneficial solution, the utilization of nuclear waste products in the disinfection and treatment of digested municipal sewage sludge, sludge cake and sludge compost.
APPROACH: Experimental studies are being conducted on a 160 ml batch basis with Co60 and Cs137 and also on a 1 to 2 liter dynamic system (heat and radiation pulse in a single flow-thru system) on thermoradiation and irradiation disinfection of liquid digested sludge.
RESULTS: The end result of this phase of study will be the design of a 40,000 gpd pilot unit. Preliminary cost studies show that the cost of gamma irradiation significantly decreases as the solid content of the sludge increases. Thus, batch type studies are being conducted on gamma irradiation of sludge cake and sludge compost. A pilot unit for gamma irradiation of sludge cake and sludge compost is currently being constructed.
PROJECT MILESTONES: (1) 03/75 Project start. (2) 12/76 Continuation funding. (3) 12/77 Continuation funding. (4) 02/78 Completion of study.

DIVISION: Municipal Environmental Research Laboratory
MONITOR: Clark, R.M.
77 FUNDING: Environmental Protection Agency FY77:$50,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The object of this research is to carefully explore costs associated with water supply and water utility management on a case study basis.
APPROACH: In the first phase of the effort, data were collected from 12 water utilities (at last one in each EPA region) over a period of two years. These data have been analyzed and a report developed. Most of the utilities investigated during the first phase were large water producers (85 mgd). It was decided to specifically investigate costs associated with small water supplies and the project was extended to examine (on the same basis) 30 small water utilities located in EPA regions III, V, and VI. These data are currently being analyzed.
RESULTS: A draft report has been prepared on the first phase of this project.
PROJECT MILESTONES: 11/77 Publish report on the cost of water supply utility management basis.

TITLE: Chlorination of Aquatic Humic Substances
PROJECT NUMBER: C614-7173
PRINCIPAL INVESTIGATOR: Christman, R.F.
AFFILIATION: North Carolina Univ., Chapel Hill (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Municipal Environmental Research Laboratory
MONITOR: Stevens, A.A.
77 FUNDING: Environmental Protection Agency FY77:$112,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The objectives of this research project are to (a) establish the relative contribution to total trihalomethane production of natural aqueous humic material in waters from different sources, (b) characterize the chemical nature of the reactions that occur between aqueous humic materials and chlorine, and (c) assess the water treatment implications of prechlorination of humic-containing waters with respect to the formation of trihalomethanes and other chlorinated organic species.
APPROACH: The experimental approach includes laboratory studies and GC/MS identification of reaction products with different natural humic waters and various model humic structures. A wide range of model organic compounds representative of natural humic material will be chlorinated over a range of pH, chlorine to carbon ratios, and temperatures representative of conditions in water treatment plant operations. Trihalomethanes and total organic chlorine concentrations will be measured. Humic fractions extracted from raw water supplies will also be chlorinated, in the presence and absence of surfaces and treated in the same manner as the model compounds.
PROJECT MILESTONES: (1) 06/76 Grant awarded; (2) 07/77 interim report; (3) 07/78 interim report; (4) 04/79 project completed; and (5) 10/79 final report published.

TITLE: Neutralization of Inoperative Waste Disposal Sites
PROJECT NUMBER: C618A-7016
PRINCIPAL INVESTIGATOR: Emrich, G.H.
AFFILIATION: Martin (A.W.) Associates, Inc., King of Prussia, Pa. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Municipal Environmental Research Laboratory
MONITOR: Sanning, D.A.
77 FUNDING: Environmental Protection Agency FY77:$190,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: The objective of the proposed study is to verify the effectiveness of existing technologies to neutralize/deactivate an industrial, hazardous and/or municipal solid waste disposal site. This study, to develop and implement a neutralization system at an inoperative waste disposal site, will be conducted in three phases.
APPROACH: In Phase I, Feasibility Study, Martin will determine the present state-of-the-art for neutralization of waste disposal sites and investigate five candidate sites for neutralization. Three of these sites will be studied in detail. On the basis of the data collected in these studies, one site will be selected for further detailed work and implementation of a neutralization system. A detailed hydrogeologic investigation will be conducted at the selected site during which monitoring wells will be drilled, water samples will be collected and analyzed, and soil samples will be tested. The hydrologic setting of the site will be determined. Based on this information and development of the state-of-the-art for site neutralization, a neutralization technique(s) will be selected. Martin will then design a neutralization system as well as a monitoring network. Monitoring will be conducted at the candidate site to supply data before, during, and after the installation of the neutralization system. In Phase II, a Field Verification Study will be performed involving the implementation of the neutralization and monitoring systems, monitoring for a 28-month period, and evaluation of the results of implementation. In Phase III of this study Martin will prepare a Site Neutralization Guide which will define the strong and weak points of the neutralization operation and extrapolate their potential application to other waste disposal sites.
RESULTS: It is anticipated that this report will provide local municipalities and others with the necessary data to make sound judgements on the selection of viable neutralization procedures. Currently under way on this project is the selection of five candidate sites for initial study and the preliminary collection of data pertaining to the five sites and potential methods of neutralization.
PROJECT MILESTONES: (1) 06/78 Phase I-final report-feasibility study; (2) 03/81 Phase II-final report-verification study; and (3) 05/82 Phase II-final report-guidance manual.

TITLE: Effect of Moisture Regimen on Solid Waste Stabilization
PROJECT NUMBER: C618A-7029
PRINCIPAL INVESTIGATOR: Chian, E.S.
AFFILIATION: Illinois Univ., Urbana (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Municipal Environmental Research Laboratory
MONITOR: Brunner, D.R.
77 FUNDING: Environmental Protection Agency FY77:$10,000
TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: The objectives of this study are to determine gas production rates and total quantities from municipal refuse maintained at different steady state moisture conditions, to determine gas production rates and total quantity of gas produced from municipal refuse under transient conditions of moisture content, increase simulating net infiltration at landfill sites, and to determine the quantity of organic matter in leachate draining from the municipal refuse.
APPROACH: A series of modified 55-gallon drums containing shredded municipal refuse serve as the landfill models. Special features include provision for gas and leachate collection, temperature monitoring, uniform water distribution, and self containment for weighing. Four different steady state moisture conditions and three different transient moisture loading rates are to be studied. Additionally, two different ambient temperatures are to be studied. Gas and leachate composition and volumes and refuse temperature are to be monitored.
RESULTS: An interim report describing construction and initial refuse decomposition will be followed by a final report which summarizes the 2 year study. Results will be evaluated to determine the municipal refuse decomposition rates and to quantitatively establish the effect of moisture on the decomposition

rate. This information, although obtained on bench scale, should provide valuable basic data for evaluating the performance of field landfills and for development of a model to predict the potential leachate and gas discharges from municipal refuse.

DIVISION: Municipal Environmental Research Laboratory
MONITOR: Roulier, M.H.
77 FUNDING: Environmental Protection Agency FY77:$10,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: Develop and test a simulation technique for predicting the movement of nonconservative solutes in saturated and unsaturated soils.
APPROACH: An existing digital computer, Galerkin-finite element, transient, two-dimensional, cross-sectional, saturated flow, conservative solute model is being modified to describe movement of a single, non-conservative solute in both saturated and unsaturated soils in large, three-dimensional systems. The model will be field tested using contaminant monitoring data from an existing landfill or other land disposal site.
RESULTS: Solute movement problems having exact solutions were solved using a finite difference procedure and a Galerkin finite element procedure to calculate the derivatives of concentration and velocity with respect to distance and a third order correct finite difference procedure to calculate the time derivatives. For the Galerkin finite element procedure the following were tested as basis functions: first and second order continuous Hermitean polynomials and zero order continuous linear, quadratic, and cubic functions. Comparison of the results of these various calculations with the exact solutions showed that the Galerkin finite element procedure using first and second continuous Hermitean polynomials as basis functions provided the most satisfactory combination of accuracy and computational efficiency, particularly for larger values of the time step, node spacing, and dispersion coefficient. Because the first derivatives of Hermitean polynomials are continuous at element boundaries, use of these polynomials allows calculation of a continuous flow field and helps to minimize solute mass balance errors which may occur with other methods. Future work will modify the model to account for adsorption/decay of single, non-conservative solutes and will test the model with data from an existing landfill.

77 FUNDING: Environmental Protection Agency FY77:$58,000
TECHNOLOGY: FOSSIL FUEL/General (100.%)
PROJECT DESCRIPTION: The objective of this project is to determine the health and environmental significance of the persistence of fecal streptococci found in leachate from landfill municipal refuse. The project will consist of two phases.
APPROACH: The initial phase will verify microbial analytical methods and determine the presence of study organisms in a variety of leachates. Samples of leachate from different sources of landfilled waste representing different stages of waste decomposition (age of landfill) and different operational conditions (batch versus continuous disposal, controlled versus natural moisture infiltration) will be assayed for microbial and chemical content. Microbial assays will include total aerobic and anaerobic plate counts, indicators of fecal pollution, selected bacterial pathogens (e.g., Salmonella, Shigella, Klebsiella, and Mycobacteria) and anaerobes (e.g., Clostridia) and the major fungi of pathogenic significance. Chemical analyses will be used to describe the leachate environment. The second phase will study the relationship between the extent of waste decomposition and the microbial population dynamics. Three experimental landfills (specially constructed 55-gal. drums) containing municipal refuse, municipal refuse and sewage sludge, and hospital waste will be constructed and operated at 16" of net infiltration per year. Leachates will be assayed bi-weekly initially and less frequently as the rate of population changes decreases.
RESULTS: An assessment of the health significance of the continued leaching of fecal streptococci and determination of the presence of pathogens in a variety of leachates will be made in the final report.
PROJECT MILESTONES: 09/79 Final report.

TITLE: Evaluation of Ames Solid Wastes Resources--An Energy Recovery System
PROJECT NUMBER: C624-7210
PRINCIPAL INVESTIGATOR: Chantland, A.O.
AFFILIATION: Iowa State Univ. of Science and Technology, Ames (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Municipal Environmental Research Laboratory
MONITOR: Wiles, C.C.
77 FUNDING: Environmental Protection Agency FY77:$250,000
TECHNOLOGY: CONSERVATION/General (100%)
PROJECT DESCRIPTION: The study will assess the effects of using municipal solid waste as a supplementary fuel.
APPROACH: Co-firing of MSW with coal in stoker and tangentially fired boilers will be conducted and since one boiler is the same as at St. Louis, studies will permit confirmation, and comparison of selected St. Louis results. Assessments will be made of the technical and environmental aspects of these co-firing techniques. In addition, technical and economic tests and evaluations will be conducted on the second generation MSW processing facility associated with supplying the refuse derived fuel.
PROJECT MILESTONES: (1) 04/77 First annual report (draft) on Ames System; (2) 07/77 report published; (3) 04/78 2nd year report on process studies and environmental impacts; and (4) 02/79 project completed.

TYPE OF FUNDING: EPA pass-thru funding-68-03-2475
77 FUNDING: Environmental Protection Agency FY77:$50,000
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
PROJECT DESCRIPTION: The primary objective of the proposed work is to prepare a comprehensive report informing industrial and municipal engineers about applications of accelerated biodegradation for treating organic industrial and/or hazardous wastes by methods other than lagooning or land-spreading.
APPROACH: The report will identify innovations which enhance biodegradation and describe how these technologies may be applied to existing plant facilities or utilized in the design of package treatment

plants. Study observations will include analyses of biological-sludge disposal problems, the potential generation of toxic or carcinogenic metabolites, and operational costs. Classes of wastes considered during the study will include, but will not be limited to: pesticides, paint sludges, solvents, lead sludges, chemical toilet wastes and oily sludges. Wastes will be identified which are not amenable to biodegradation or which must first be chemically altered before being applied to biological systems. The study will encompass a literature review, site investigations, and engineering and economic analyses of treatment plant designs and operation. A detailed questionnaire will be used to elicit information from plant operators. From this information, specific sites will be selected and studied in detail.
PROJECT MILESTONES: (1) 09/76 Contract award. (2) 02/77 Interim report--3 existing biodegradation processes. (3) 10/77 Interim report--chemicals effectively destroyed by biodegradation. (4) 02/78 Demonstration of practical system for hazardous chemical destruction. (5) 03/79 Project completed. (6) 00/79 Final report.

77 FUNDING: Environmental Protection Agency FY77:$750,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: This is a multidisciplinary research program focusing on the public health consequences of regulated and nonregulated pollutants from mobile sources. To determine the biological effects of inhalation exposure to total emissions from automotive engines equipped with catalytic converters.
APPROACH: The major emphasis of the research approach will be in evaluating the major target organ--the lungs. (a) evaluate pulmonary function in animals exposed to the exhaust. Measurements include such parameters as respiratory rate, pulmonary compliance, pulmonary resistance expiratory flow rates, CO2, O2 and heart rate. (b) Assess effects of exposure on susceptibility to respiratory infection by pathogenic microbes. (c) Pathological assessment of lungs and other selected tissues. (d) Neurophysiological and behavioral tests including activity, food and water consumption and acid-base analysis.
RESULTS: Exposure of animals will be initiated in the Fall of 1976 and terminated in 1977.
PROJECT MILESTONES: 08/76 Initate animal exposures. 04/77 Complete animal exposures. 12/77 Complete data analysis and report.

TECHNOLOGY: FOSSIL FUEL/General (100%)
PROJECT DESCRIPTION: These experiments were designed to assess the health effects of sulfuric acid and other sulfates in rats and guinea pigs.
APPROACH: A comparison will be made of the effect of H_2SO_4, $Al_2(SO_4)_3$, and $CaSO_4$ in order to assess the relative effects of acid and non-acid particulates. Exposures will last 60 days or more. Particulate concentration will be 5 mg/M3 or less and these will be examined during the final week of exposure and will include measurements of static and dynamic compliance, resistance, tidal volume, breathing rate, minute volume and diffusion capacity. Measurements will be made using both stressed and non-stressed animals. The stress may be one of several types, such as heat or forced activity. Blood acid-base analyses (pCO_2, pH, HCO_3, base excess) will be done during the final week of exposure. In addition, growth and food and water consumption will be measured in all exposures. Pregnant animals will be used in all exposures to assess any effects on reproduction and neonatal growth due to exposure.
PROJECT MILESTONES: 08/76 Award contract. 08/76 Quarterly reports begin. 12/78 Final report and publication.

TITLE: Influence of Factors Found in Hard and Soft Waters on the Development of Cardiovascular Disease
PROJECT NUMBER: D614-69
PRINCIPAL INVESTIGATOR: Douglas, B.H.
AFFILIATION: Environmental Protection Agency, Cincinnati, Ohio (USA). Health Effects Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Bull, R.J.
77 FUNDING: Environmental Protection Agency FY77:$197,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The purpose of the proposed study is to examine the effects on the normotensive and hypertensive experimental animal of varying calcium, magnesium, cadmium, lead, sodium and potassium in the diet. An assessment of the relative contribution of these individual factors to the development of cardiovascular disease in animals on a standard diet and on an atherogenic diet will be the prime objective.
APPROACH: Experimental animals will be subjected to variations (high or low dietary quantities) of each mineral individually with and without the atherogenic regimen.
RESULTS: The effect on vascular and organ pathology, serum and tissue electrolytes, blood pressure, and weight will be determined. The data should provide insight into the mechanism of the repeated epidemiological observation that the incidence of cardiovascular disease is negatively correlated with the hardness of drinking water.
PROJECT MILESTONES: 04/77 Start date. 03/81 Completion and final report.

TITLE: Development of a Tissue Selective in Vivo Bioassay for Environmental Agents Producing DNA Damage
PROJECT NUMBER: D614B-44
PRINCIPAL INVESTIGATOR: Hart, R.W.;Witiak, D.T.;Koestner, A.;Lewis, N.J.;Perter, R.
AFFILIATION: Ohio State Univ., Columbus (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Garner, R.J.
77 FUNDING: Environmental Protection Agency FY77:$200,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The long-term goal of this program is the development and quantitation of a rapid, inexpensive, tissue specific in vivo bioassay system for environmental carcinogens/mutagens. It is anticipated that ultimately this assay will permit the quantitative and qualitative prediction of the carcinogenic potential of various agents alone or in combination on any tissue or organ in vivo.
APPROACH: Since most carcinogens damage cellular DNA, the assay will be based on an analysis of this damage in vivo by employment of endonuclease sensitive site assays in combination with DNA molecular weight analysis (sucrose gradient sedimentation and gel electrophoresis). Quantitation of DNA will be accomplished by newly-developed, sensitive spectrofluoromatic assay. We will quantitate this assay by (1) use of 14C-labeled carcinogens of high specific activity (DMBA, BP, and ENU) to measure the extent of binding to, and removal from, DNA; and (2) by comparing the extent of DNA damage in various animals model systems with differential tissue and species sensitivities to the effects of these carcinogens. From such data, we will produce a predictive model system for the rational extrapolation of this information to carcinogenic potentials in man.
PROJECT MILESTONES: 03/79 Molecular quantitation of effects of ethyl-N-nitrosourea. 09/79 Pathology of ENU studies. 03/80 Molecular quantitation of effects of 7,12-dimethylbenzo(alpha)anthracene (DMBA). 09/80 Patholcgy of DMBA studies. 03/81 Molecular quantitation of effects of benzo(gamma)pyrene and amido. 09/81 Pathology of BP. 12/81 Completion of study: final report.

TITLE: Relevance of Drinking Water Quality to Atherosclerosis
PROJECT NUMBER: D614B-51
PRINCIPAL INVESTIGATOR: Revis, N.
AFFILIATION: Energy Research and Development Administration, Washington, D.C. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Bull, R.J.
77 FUNDING: Environmental Protection Agency FY77:$165,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: The relative softness (or hardness) of drinking water has been associated with hypertension. Both positive and negative correlations have been found between soft water and cardiovascular disease in human epidemiological and clinical studies. These apparent discrepancies may be explained, in part, by environmental factors (e.g., rainfall, temperature and relative humidity) which may alter the water quality. Since it is difficult to control all of these variables in humans, another approach has been proposed which involves studying the effect(s) of water quality in the development and progression of atherosclerosis in an experimental animal where the above variables can be carefully controlled. The pigeon was chosen as the experimental animal because they develop atherosclerotic lesions similar to those found in humans.
APPROACH: The experimental design involves the long-term exposure of pigeons to hard (represented by Ca and Mg) and soft (represented by Pb and Cd) drinking water for an overall timetable that consists of forty periods of four weeks. A five factoral design was chosen to best investigate the effects of any one element or diet in the etiology and/or progression of atherosclerosis in pigeons. During each period (i.e., every four weeks), 32 pigeons from eight different experimental groups will be sacrificed and the following test performed: (1) determination of the number of atherosclerotic plaques and fatty streaks in the vasculature, (2) assessment of myocardial, renal and aortic morphology, (3) determining absorption rate of exogenous lipids, (4) serum lipid determination and (5) blood and tissue levels of Pb, Cd, Ca and Mg.
PROJECT MILESTONES: 00/77 Start date. 12/77 Completion of pilot study for determination of levels to be used.

06/81 Completion of project and final report.

TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: (1) To examine the developmental aspects of the central nervous system as they relate to synaptogenesis. (2) To determine whether heavy metals such as lead, affect this normal development and thus account for the behavioral toxicology related to heavy metal poisoning. (3) To measure oxide-reduction intermediates of metabolism to determine whether heavy metals affect the ratio of oxidized to reduced nucleotides. (4) To continue studies on the proof of existence of the purine nucleotide cycle in brain tissue under the influence of elevated potassium. (5) To examine whether the proposed purine nucleotide cycle is affected by heavy metals. (6) To study the effects of heavy metals on their organic derivatives on the physiological bulk transport cations as this affects the balanced control of metabolic or important organic compounds (e.g. substrates and transmitters.)
APPROACH: A. In vivo: chronic exposure to pregnant animals initially with low levels of lead will be employed and its effects on tissue metabolism of the pregnant female will be evaluated. In addition developmental alterations in vitro in the foetal central nervous system will be studied by monitoring fine structural alterations in the spinal cord at the EM level of resolution: particular emphasis will be placed on the processes leading to synaptogenesis. In vitro studies will employ brain sections, isolated organelles and synatosomes, liver and kidney tissues; human platelets will be employed as a single cell model to further evaluate specific effects on ion transport and bioenergetics.
PROJECT MILESTONES: 04/76 Start date. 09/77 Demonstrated that Pb without observable ultrastructural effects. 04/78 Work to begin on the effects of alkyltin compounds. 04/79 Project completion.

AFFILIATION: Oregon State Higher Education System, Salem (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Bull, R.J.
77 FUNDING: Environmental Protection Agency FY77:$60,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: I propose to study the effect that environmental contaminants--particularly at subclinical doses--will have on cell-mediated immunity and to explore possible mechanisms of alteration by observing characteristics of macrophages and lymphocytes. Several different cell-mediated tests will be utilized and subclinical doses of the contaminants will be administered. Lead will be examined initially, but the effect of other heavy metals and insecticides will be measured should lead alter the immune response in mice.
APPROACH: Lead acetate will be administered in the drinking water of mice for prolonged periods so there will be a gradual accumulation simulating natural conditions. Kidneys will be analyzed for content of lead to determine actual concentration and histopathology will determine alterations that may occur from exposure. We will endeavor to ascertain the effect lead, etc., has on: migration of macrophages via direct or indirect sensitization of mice with Bacillus Calmette-Guerin (BCG); possible decrease of phagocytosis of macrophages via measurement using opsonized sheep red blood cells (SRBC); possible suppression of T lymphocyte activity by injecting footpads and measuring CMI; possible suppression of T cell helper function in humoral antibody response and measure the effect of macrophage helper function. If low levels

of environmental contaminants render the host more susceptible to cell-mediated immunity, then permissible levels of these compounds for humans should be re-examined.
PROJECT MILESTONES: 02/76 Start of project. 02/78 End of project and final report.

TITLE: The Effects of Trace Metals on the Developmental Patterns of Intermediary Metabolism in the Brain
PROJECT NUMBER: D614B-97
PRINCIPAL INVESTIGATOR: Bull, R.J.
AFFILIATION: Environmental Protection Agency, Cincinnati, Ohio (USA). Health Effects Research Lab.
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Bull, R.J.
77 FUNDING: Environmental Protection Agency FY77:$54,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: Lead administered pre- and immediately postnatally to rats and mice has been observed to produce hyperactivity in young animals. The state is of considerable interest because of its resemblance to hyperactivity in children, particularly in the paradoxical responses to certain therapeutic agents common to both syndromes. A general retardation in the development of the central nervous system is suggested in this state by certain behavioral findings and an immature pattern of intermediary metabolism has also been detected. Presently available neurochemical findings, primarily related to neurotransmitter concentration, have not been developed in sufficient detail structurally to explain the behavioral findings nor the developmental retardation.
APPROACH: Present work will concern itself with the effects of lead, methyl mercury and organic tin compound on the development of intermediary and oxidative metabolism in the brain of neonatal rats. These agents have been shown to interfere with the oxidation of cytosolic reducing equivalents in the brains of adult rats. Since this lesion is incompatible with the fact that normal adult brain relies almost exclusively on glucose as substrate, it should result in adaptations in the intermediary metabolism of brain in the young animal. The ramifications of such a lesion will be studied in relationship to synaptogenesis and the metabolism of neurotransmitter substances within the central nervous system.
PROJECT MILESTONES: 07/76 Start date. 01/77 Established model, produced pilot work with Pb. 09/77 Demonstration of metabolic defect in neonatal rat. 12/77 Completion of ultrastructural analysis of brain tissue. 12/78 Completion of Pb work. 10/80 Completion of alkyltin work.

TITLE: Investigation of Effects of Prolonged Inhalation of Nickel-Enriched Fly Ash in Syrian Golden Hamsters
PROJECT NUMBER: D625F-112
PRINCIPAL INVESTIGATOR: Wehner, A.P.
AFFILIATION: Battelle Columbus Labs., Ohio (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Moon, W.
77 FUNDING: Environmental Protection Agency FY77:$325,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: To investigate (a) development of lesions induced by inhalation of Ni-enriched fly ash (NEFA) as a function of exposure time and aerosol concentration, (b) mortality as a function of exposure. (c) reversibility of NEFA-induced lesions as a function of exposure and age by periodically withdrawing hamsters from exposure and maintaining them for life-span observations.
APPROACH: Phase I--NEFA and fly ash (FA) will be prepared and characterized. Exposure facilities and equipment will be prepared and tested. Hamsters will be ordered and quarantined. Acute and subacute toxicity tests with NEFA and FA will be conducted. Phase II--Four groups of main Syrian gold hamsters will receive high-level exposures to NEFA, low-level exposures to NEFA, high-level exposures to FA, and sham exposures, respectively. Each group will consist of a subgroup of 50 animals receive life-span (15 months) exposures, a subgroup of 20 animals to be sacrificed quarterly in lots of 5, and another subgroup of 20 animals to be withdrawn from exposure quarterly in lots of 5 for further observation. Dead animals will be necropsied. Lungs and grossly observed lesions will be histopathologically examined.
PROJECT MILESTONES: 11/76 Initiate contract work. 09/77 Generate fly ash. 12/77 Initiate animal exposure. 09/78 Initiate Phase II of study.

77 FUNDING: Environmental Protection Agency FY77:$102,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
PROJECT DESCRIPTION: The objectives of this study are (a) evaluation of sources, production and utilization of coal energy related by-products, (2) evaluation of health effects of coal energy by-products, (3) evaluation of coal energy by-products introduced into drinking water supplies, (4) evaluation of information obtained from 1, 2 and 3 above to define future research needs. This study will be based on information published in periodicals, books, reports or available raw data.
APPROACH: Five separate tasks will cover all the essential aspects of sources and health effects of contaminants derived from coal energy production as well as the pathways through which they enter drinking water supplies.
RESULTS: The conclusions of the study will allow formulation of future research and development needs in the area of coal energy utilization and production as related to drinking water quality.
PROJECT MILESTONES: 10/78 Project completion.
KEYWORDS: ENERGY SOURCE DEVELOPMENT;HEALTH HAZARDS;DRINKING WATER;CHEMICAL COMPOSITION;COAL INDUSTRY;BY-PRODUCTS;WATER POLLUTION;DATA COMPILATION;ENVIRONMENTAL TRANSPORT;ENVIRONMENTAL EXPOSURE PATHWAY;HUMAN POPULATIONS;CHRONIC INTAKE

TITLE: Health Impacts of Acid Mine Drainage on Drinking Water Supplies in Western Coals
PRINCIPAL INVESTIGATOR: Wixson, B.G.
AFFILIATION: Missouri Univ., Rolla (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Greathouse, D.G.
77 FUNDING: Environmental Protection Agency FY77:$158,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
PROJECT DESCRIPTION: The objectives of this project are: (1) Identify coal mining areas in western states where acid mine drainage may get into drinking water supplies. (2) Carry out a literature review to identify possible compounds and levels of organics or inorganics that might cause disease. (3) Identify health effects associated with these compounds and their possible ingestion. (4) Determine, where possible, those compounds that are removed by drinking water treatment. (5) Evaluate the mortality data in respect to specific disease relationship in the western coal states. (6) Propose a representative area and specify the analytical procedures, water characteristics and type of epidemiological studies that will be necessary to establish valid baselines, define problems and seek possible control measures.
RESULTS: The information collected and evaluated by this project should play a major role in determining the appropriate area for concentrated studies on the problems of acid mine drainage-water supplies and health. This information will be critical to the future development of western coals and allow for the maximum utilization of funds and research to answer possible questions of health effects associated with acid mine drainage and drinking water supplies.
PROJECT MILESTONES: 09/78 Evaluation of literature and sampling plan formulated. 10/79 Project completed.
KEYWORDS: ACID MINE DRAINAGE;DRINKING WATER;WATER POLLUTION;HEALTH HAZARDS;RISK ASSESSMENT;COAL INDUSTRY;CHRONIC INTAKE;REVIEWS;DATA COMPILATION;ORGANIC ACIDS;INORGANIC ACIDS;PATHOLOGICAL CHANGES;INGESTION;WATER TREATMENT;MORTALITY;EPIDEMIOLOGY

TITLE: Effects of Energy Consumption Related Pollutants on Pulmonary Fibrosis
PROJECT NUMBER: D625F-115
PRINCIPAL INVESTIGATOR: Bhatnagar, R.S.
AFFILIATION: California Univ., Berkeley (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Lee, S.D.
77 FUNDING: Environmental Protection Agency FY77:$106,000
TECHNOLOGY: FOSSIL FUEL/General (50%);GENERAL SCIENCE (50%)
PROJECT DESCRIPTION: Determine effects of energy consumption-related trace metals, Ru, Ni, Hg, Cu and Zn.
APPROACH: We propose to (1) Determine effects of trace metals on pulmonary connective tissue biosynthesis using lung organ cultures; (2) Determine the dose response of these compounds; (3) Determine qualitative and quantitative changes in collagen induced by above pollutants. Similar studies will be initiated with elastin; (4) Correlate observed biochemical changes with morphological lesions; (5) Parameters of collagen synthesis will be examined in lungs of rats exposed to the above pollutants, at the EPA, Cincinnati. We will also investigate the effect of Cadmium on the synthesis of connective tissue macromolecules. Further studies in relation to the metallic pollutants will involve examination of the interactions of the toxins with critical enzymes involved in connective tissue macromolecular synthesis to determine their sites of action. Studies will also be carried out to determine the effect of the above pollutants on informational macromolecule synthesis in lung organ cultures. The effects of these trace metals on DNA and RNA synthesis will be investigated.
PROJECT MILESTONES: 06/74 Initiate experiments. 06/75 Report on toxic effects of Pd. 06/76 Report on toxic effects of Cd and Pt. 09/77 Report on lung organ culture as a screening system (Ru, Ni, Hg, Cu and Zn). 09/78 Effects on oxidants on pulmonary fibrosis. 11/79 Final report.

TITLE: Subcommittee on the Geochemical Environment in Relation to Health and Disease (GERHD)
PROJECT NUMBER: D625F-116
PRINCIPAL INVESTIGATOR: Petrie, W.L.
AFFILIATION: National Academy of Sciences, Washington, D.C. (USA); Midwest Research Inst., Kansas City, Mo. (USA); Mayo Clinic, Rochester, Minn. (USA)
MONITORING AGENCY: Environmental Protection Agency, Cincinnati, Ohio (USA)
DIVISION: Health Effects Research Laboratory
MONITOR: Grube, W.E.
77 FUNDING: Environmental Protection Agency FY77:$25,000
TECHNOLOGY: GENERAL SCIENCE (100%)
PROJECT DESCRIPTION: GERHD has broad interdisciplinary interests encompassing both earth scientists and biomedical specialists and is concerned with the concentrations of certain minerals in localized areas and with abnormally high and low concentrations of certain elements that may cause specific biologic effects. For example, problems may be related to excesses of iron, selenium, fluorine, copper, zinc, and manganese; on the other hand, problems have been correlated with deficiencies of iodine, zinc, cobalt. Interactions of certain elements such as copper, molybdenum, zinc, iron, and sulfate associated with mining and industrial activities may have potential biological effects. GERHD identifies the association of abnormal levels of trace elements as a guide to research into understanding and protection of plant, animal, and human health. It also evaluates important research opportunities concerned with industrial production, health and environmental interest, and governmental regulatory agencies. Ad hoc Panels preparing reports on their studies are: Panel on the Geochemical Environment and Urolithiasis, George K. Davis, biochemist,University of Florida, Gainesville. Panel on Aging and the Geochemical Environment, Howard C. Hopps, pathologist, University of Missouri Medical Center, Columbia. Panel on the Geochemistry of Water in Relation to Cardiovascular Disease, Ernest E. Angino, geochemist, University of Kansas, Lawrence. Panel on the Trace Element Geochemistry of Coal Resource Development Related to Health, Bobby G. Wixson, biogeochemist, University of Missouri, Rolla.
PROJECT MILESTONES: 01/78 Final report due.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To measure benzene from auto tailpipe emissions in 6 metropolitan areas to provide a data base for writing a health assessment document.
APPROACH: The data are obtained by collecting an integrated sample on a solid support for 24 hours and analyzing the samples in the laboratory. The data collected will be representative of the benzene concentrations that the general public would be exposed to in large cities.
RESULTS: The study was initiated in July, 1977 after benzene was determined to be hazardous. The study will

last approximately 2 years to establish a data base for benzene. The data collected will be available from the National Aerometric Data Bank.
PROJECT MILESTONES: (1) 12/77 Preliminary Data Summary. (2) 12/78 Annual Data Summary. (3) 12/79 Annual Data Summary.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: a. Measure continuously ambient NO2 concentration in 45 metropolitan areas to obtain data for reevaluation of air quality control regions. b. Measure continuously ambient NO2 concentrations in 19 metropolitan areas to support the possible establishment of a short-term ambient air quality standard.
APPROACH: These measurements are obtained using continuous chemiluminescent Bendix analyzers. Data are obtained on a continuous strip chart and results are reported on an hourly basis.
RESULTS: Study was initiated in 1973 at 45 metropolitan areas. In 1975, study was reduced to 19 metropolitan areas. Hourly averages for each site are available through the National Aerometric Data Bank. To support validity of data, monthly calibrations and quarterly audits are performed. Study is anticipated to continue through October, 1978. Data are being used to assess ambient NO2 levels and to assist state agencies in development of State Implementation Plans (SIP).
PROJECT MILESTONES: (1) 1/74 Data summary report. (2) 1/75 Data summary report. (3) 1/76 Data summary report. (4) 1/77 Data summary report. (5) 1/78 Data summary report. (6) 1/79 Final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To receive, store, summarize and then publish precipitation chemistry data contributed from a worldwide network of stations.
APPROACH: Precipitation sampling stations are designated by WMO to be Regional or Baseline stations. They take monthly precipitation samples and analyze them for a variety of parameters as requested by WMO. These parameters are explained in detail in WMO manual No. 299. Results are recorded on standard forms and forwarded to EMSL/RTP, North Carolina. These forms are keypunched and material is stored on magnetic tape. Before publication, all data are sent back to the participant to ensure the values have been punched and stored properly.
RESULTS: The final output is an annual publication printed by the NOAA people in Asheville, N.C. But it is a joint venture by the World Meteorological Organization, the Environmental Protection Agency, and the National Oceanic and Atmospheric Administration.
PROJECT MILESTONES: (1) 1/74 ''Atmospheric Turbidity and Precipitation Chemistry for the World 1972.'' (2) 9/75 ''Atmospheric Turbidity and Precipitation Chemistry for the World 1973.'' RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objectives of this work include: (1) optimizing a simple analytical procedure for sulfate determination and evaluating it for ruggedness; (2) evaluating a series of sulfate methods; and (3) evaluating two techniques for extracting sulfate from atmospheric samples.
APPROACH: Methods evaluation will involve determining the practical working range, precision, accuracy, comparability between methods and the influence of potential interferents. For this study, the practical working range of the methods will be defined as the concentration range of analyte yielding constant variance and accuracy. The barium sulfate turbidimetric procedure is the method to be optimized. The sulfate methods to be evaluated are the optimized turbidimetric method, the Colovos and Midwest Research versions of the automated methylthymol blue method and the Dionex ion chromatograph method.
PROJECT MILESTONES: (1) 10/78 Complete evaluation of sulfate methods. (2) 10/79 Complete evaluation of H2SO4 method.

TECHNOLOGY: FOSSIL FUEL/General (100%)
POLLUTANTS: NOXIOUS GAS/SO2;NOXIOUS GAS/O3;NOXIOUS GAS/CO;NOXIOUS GAS/NO2 (50%);PARTICULATES (50%)
CHARACTER OF STUDY: DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To provide for EPA designation (as either a reference or equivalent method) those models of ambient air monitoring analyzers (or other methods) which have been shown to meet certain prescribed minimum performance specifications and designation of these analyzer models allows States and other users to more easily specify and obtain air monitoring analyzers which are adequate for their monitoring requirements under the ''Clean Air Act.''
APPROACH: Minimum performance specifications applicable to ambient air monitoring analyzers and other methods for SO2, O3, CO, and NO2, together with detailed test procedures to measure each performance parameter, are set forth in EPA regulations at 40 CFR Part 53. Also contained in that Part are instructions for submitting an application for designation. The ambient air monitoring reference and equivalent program receives applications for designation, technically evaluates the submitted test data and other information to determine compliance with all requirements and recommends successful methods for designation by the Administrator. The program also (1) reviews the minimum performance specifications to reassess the tradeoffs between practicality of the methods, (2) enforces compliance with designated method requirements, (3) evaluates new measurement principles applicable to reference methods, and (4) develops and tests calibration procedures for ambient monitoring instruments.
RESULTS: Current progress/plans--As of September, 1977, 25 methods have been designated with several additional methods under evaluation. A new measurement principle and two calibration procedures applicable to reference methods for measuring NO2 have been promulgated. Evaluation of several improved calibration procedures for O3 analyzers is in progress. Future plans call for developmental work on methodologies for TSP and lead.
PROJECT MILESTONES: (1) 9/77 Designation of 14 reference methods and 11 equivalent methods. (2) 12/76 Promulgation of measurement principle and 2 calibration procedures for NO2 reference methods. (3) 9/78 Promulgation of improved calibration procedures for ozone reference methods. (4) 9/78 Post-designation tests for all methods designated prior to 5/78. (5) 6/78 Improved methodology for total suspended particulate (TSP).

TECHNOLOGY: FOSSIL FUEL/General (20%);NUCLEAR/General (20%);GEOTHERMAL/General (20%);SOLAR/General (20%);CONSERVATION/General (20%)
PROJECT DESCRIPTION: To measure continuously bakground ozone and meteorological data in remote regions. These data will be used to determine background concentrations of ozone and transport characteristics of ambient ozone. The data is obtained using continuous chemiluminescent ozone analyzers and modern meteorological systems. The data are recorded continuously on strip chart recorders. The results are reported in hourly averages. Study was initiated in 1973 at 3 National Forest sites. Data in hourly averages for each site is available from the National Aerometric Data Bank. Bi-monthly calibrations ae performed with periodic external audits.
PROJECT MILESTONES: (1) 01/78 Data summary report; (2) 01/79 data summary report; (3) 01/80 data summary report; and (4) 01/81 final report.

TYPE OF FUNDING: Contract No.-68-02-2714
77 FUNDING: Environmental Protection Agency FY77:$105,000
TECHNOLOGY: FOSSIL FUEL/General (25%);NUCLEAR/General (25%);GEOTHERMAL/General (25%);SOLAR/General (25%)
PROJECT DESCRIPTION: The objective of this project is to provide support and technical assistance to the Environmental Monitoring and Support Laboratory in its air pollution analysis testing program for reference and equivalent method determination. The scope of this project includes possible task assignments in the following areas: (1) reference or equivalent method testing of automated or manual methods; (2) technical support services for assessing applications of reference or equivalent method determinations; (3) abridged or special reference equivalent method tests; (4) equivalency-related laboratory tests; and (5) test procedures for determining equivalent mehods for particulates. A major portion of the contract effort will be devoted to conducting abridged or special reference equivalent method tests. Second priority task assignments will involve equivalency-related laboratory tests with the remaining time slated for application review. All procedures will be conducted according to 40 CFR 53, ''Ambient Air Monitoring Reference and Equivalent Methods.''
PROJECT MILESTONES: (1) 09/78 Review 6 applications for reference or equivalent method designations; (2) 09/78 conduct post-equivalency tests on designated analyzers (6); and (3) 09/78 conduct special tests to support equivalency testing program.

TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: NOXIOUS GAS (33%);PARTICULATES (33%);ORGANICS (34%)
CHARACTER OF STUDY: FULL SCALE DEMONSTRATION (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The project objectives are to quantify emissions to the environment from petroleum refineries.
APPROACH: The discharge concentrations are compared to estimated risk levels in the environment. Emissions data are confirmed within known limits of error by the most appropriate means available. Actual field sampling is a major part of this program. The discharge levels are compared to estimate measures of risk by extrapolation from known adverse effects levels. Interested parties in Government as well as industry are invited to participate in the program to ensure the results will be of use to all parties.
RESULTS: Outputs will be reports of emissions data useful for standards setting, offset calculations and estimates of risk from exposure to toxic materials emitted from petroleum refineries.
PROJECT MILESTONES: (1) 8/76 Acquisition of preliminary data. (2) 4/77 Begin field testing. (3) 2/78 Complete first half of field testing. (4) 3/78 Update experimental design. (5) 3/79 Final report.
KEYWORDS: MULTIPLE POLLUTANT;AIR POLLUTION;PETROLEUM REFINERIES;CHEMICAL EFFLUENTS;DATA COMPILATION;TOXICITY

REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/Middle Atlantic
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective is to demonstrate the use of closed-cycle operation in a continuous dye range and to accurately determine the cost effectiveness of hyperfiltration for this application. It is expected that energy, water and materials will thus be recovered.
APPROACH: The project involves the design, installation, and twelve-month operation of a full-scale hyperfiltration (reverse osmosis) system for closed-cycle operation of a textile dyeing operation at LaFrance Industries. The closed cycle operation of a continuous dye range and the groups of ten atmospheric dye becks will be investigated. Both types of equipment are currently being used at LaFrance for dyeing heavy cotton velour fabrics. The two types of equipment are representative of the two broad categories of textile processing--continuous and batch. The full-scale membrane system will be designed for one of these textile processes that is selected based on the evaluation of conceptual system designs developed for each.
RESULTS: The output is technology transfer to the textile industry at large both in the form of an EPA report and a full-scale demo unit.
PROJECT MILESTONES: (1) 10/77 Project organization details. (2) 7/78 Textile process selection. (3) 10/78 Design and cost quantitative. (4) 7/79 Equipment procurement and installation and membrane formation. (5) 10/79 Membrane performance optimization. (6) 1/80 Initial equipment operation. (7) 10/80 Full scale closed cycle demonstration. (8) 7/81 Preparation of final report.

REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Estuarine;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/Middle Atlantic
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of the proposed project is to enhance water management through recovery and recycle of warp size materials in textile slashing and desizing.
APPROACH: The approach will involve the evaluation of warp sizing polymers which precipitate when the desize wastewater is heated. Applicability of the recoverable size materials will be evaluated in pilot plant tests and in production processing tests. Economics of the process will be evaluated. Environmental impact will be determined. Relative energy requirements for the process will be studied.
RESULTS: Output will be technology transfer in the form of an EPA report.
PROJECT MILESTONES: (1) 3/77 Search for materials applicable as recoverable warp sizes. (2) 6/77 Preliminary study. (3) 7/77 Arrange for mill trials. (4) 6/77 Design and construction of pilot scale recovery systems. (5) 8/77 Mill trials. (6) 9/77 Recovery trials on desizing wastewater. (7) 5/78 Evaluation of environmental and economic impact of the system. (8) 6/78 Final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS;ECOLCGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective is to develop the application of membrane separation technology to a variety of textile manufacturing processes. The direct recycle of both the hot purified process water and the concentrated residue will be studied.
APPROACH: In consultation with the SCTMA and EPA, four manufacturing sites will be selected for this study representing at least one case each of batch and continuous processing and as many as possible of the EGD categories. Information obtained from site visits will be used to carry out accurate and detailed assessments of energy savings possible by recycle and to evaluate the feasibility of hyperfiltration

membrane separations in laboratory scale tests with the samples collected.
RESULTS: The output of this project will be the development of an acceptable process to simultaneously reduce pollutant discharge and effect energy conservation by direct discharge. Information will be transferred by an official EPA publication of the final results of the study.
JECT MILESTONES: (1) 6/75 Selection of plant processes for study. (2) 12/75 Evaluation of energy savings. (3) 10/75 Hyperfiltration screening tests. (4) 10/75 In-plant reuse evaluation and data review. (5) 2/76 Selection of sites and on-site testing. (6) 4/76 Energy and economic impact assessment. (7) 6/76 Process modification study. (8) 9/76 Begin continuous dye beck studies. (9) 6/77 Start writing draft of final report. (10) 12/77 Final report due.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The work to be performed under this contract is in support of the technical functions carried out by the Environmental Protection Agency.
APPROACH: Assess environmental and economic impact of the pollution control systems as they become commercially available to the user industries. Provide detailed cost estimates for pollution control systems that are being developed by the EPA. Evaluate the energy conservation potential of new pollution control technologies with the emphasis placed on near term pay off systems. Assess R/D programs in coal liquefaction, low, medium, and high BTU gasification; advanced combustion research; and improved coal extraction and reclamation techniques. Identifying new environmentally acceptable power systems that can provide cleaner, more efficient utilization of fossil fuels.
RESULTS: Process--emissions and control technology survey. Engineering analyses. Associated technical services. Regional assistance and state implementation planning.
PROJECT MILESTONES: (1) 3/77 Contract award. (2) 3/79 Estimated contract completion date.

PROJECT DESCRIPTION: Paper studies, data evaluation will develop health/ecological goals, and will assess existing data on emissions and control technology for fluidized-bed combustion. Comprehensive analyses of emissions from existing FBC units will be conducted as soon as units are available.
APPROACH: To establish environmental goals for the fluidized-bed combustion process based ultimately on health/ecological effects. To obtain comprehensive analysis of emissions from existing fluidized-bed combustors. By comparison of goals with measured emissions, to design a control technology program to meet the goals.
RESULTS: Initial list of potential pollutants of concern developed, with preliminary prioritization. Have participated in development of methodology for environmental assessment. Have completed initial emissions/control technology data review. Have completed sampling for comprehensive analysis on two experimental fluidized combustion units.
PROJECT MILESTONES: (1) 9/76 Complete initial review of available data. (2) 10/76 Complete initial attempt at environmental goals-setting (MEG). (3) 4/77 Complete level 1 comprehensive analysis on 18-inch MERC unit. (4) 6/77 Complete preparation of initial pollutant list, and preliminary prioritization. (5) 8/77 Complete level 1 comprehensive analysis on Miniplant. (6) 10/77 Complete standards support plan for fluidized-bed combustion. (7) 12/77 Complete skeleton standards development research data base report.

PROJECT DESCRIPTION: To conduct comprehensive analysis of emissions from a pressurized fluidized-bed combustor, and to identify the effects of process operating conditions on emissions; to study the potential and environmental impact of sorbent regeneration; and to study add-on devices for particulate control.
APPROACH: A 480 lb/hr (218 kg/hr) pressurized fluidized-bed coal combustion Miniplant and a 25 lb coal/hr (13 kg/hr) bench-scale unit are being operated.
RESULTS: Comprehensive analysis of emissions from the Miniplant combustor have been completed at one set of conditions; future analyses are also planned to further define best technology. A 100-hour Miniplant combustion/regeneration demonstration run has been completed; further short-duration tests are planned. Shakedown of a granular bed filter is underway on the Miniplant to control particulate emissions at high temperature and pressure.
PROJECT MILESTONES: (1) 11/75 Demonstrate operability of Miniplant with 240-hour run. (2) 12/76 Complete first phase testing--SO2 and NO/sub x/ emissions. (3) 8/77 Complete level 1 comprehensive analysis on Miniplant combustor. (4) 7/78 Complete first phase testing of granular bed filter on Miniplant. (5) 6/82 Complete environmental testing on Miniplant combustor/regeneration.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Northeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) To develop a mechanistic mathematical model for the prediction of NO emission from coal burning fluidized beds. (2) To provide physical-chemical input parameters for the model by an experimental study of the NO formation-destruction processes in fluidized beds. (3) To generate information necessary for the development of new control technology of NO/sub x/ emission based on detailed pilot plant scale and bench scale studies at both atmospheric and elevated pressure. (4) To test the mathematical models severely over sufficiently wide ranges of operating variables.
APPROACH: The experimental study consists of two parallel investigations: (1) The study of the NO formation-destruction processes in continuously operated fluidized combustors; (2) Batch type kinetic studies carried out with the 7.5 cm dia externally heated fluidized bed and the 10 cm dia PFB. In the continuous fluidized combustion experiments the spatial distributions of the gaseous and solid species concentrations and of temperature will be determined in the fluidized bed and the freeboard for the variation of operational and design parameters. A batch type combustor will be used to investigate the char oxidation reaction. The experimental data from the continuous combustor and the batch combustor will be used to test the model for the formation and deformation of NO in fluidized bed combustors.
RESULTS: (1) An understanding of the mechanism of formation and destruction of ''fuel NO'' in fluidized beds. (2) The model of NO emission will provide information for the scaling up and further development of fluidized combustion plants.
PROJECT MILESTONES: (1) 4/77 Installation of 7.5 cm batch type combustor. (2) 9/77 Design and installation of 30 x 30 cm APB and sampling train. (3) 10/78 Design and construction 10 cm PFB. (4) 4/79 Complete data analysis. (5) 5/79 Complete mathematical model development.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The work covers all aspects of the atmospheric CAFB development program required to support a Foster Wheeler Energy Corporation demonstration of the CAFB process at the La Palma station of Central Power and Light Company (CPL) in San Benito, Texas, under contract 68-02-2106.
APPROACH: This project includes operation of an 0.75MWe Chemically Active Fluid Bed (CAFB) pilot plant in three periods of extended duration, to test selected design features and modes of operation for the 20MW CAFB demonstration, particularly as they relate to operation on coal and pitch fuels, and bed materials available for the CPL plant. Other work involves batch gasification test, development of process for reducing coal ash retention in the fluid bed, and assistance to Foster Wheeler and CPL in development of plant operational procedures and test programs, and in selection of equipment and materials for high temperature fluid bed operations.
RESULTS: Operation and demonstration of pilot plant. Guidelines for building and running CAFB.
PROJECT MILESTONES: (1) 8/76 Complete mini-run on coal. (2) 9/77 Report on mini-run on coal. (3) 10/77 Provide input to FWEC-operating manual-oil feed input. (4) 1/78 Topical report--solid fuels Batch tests. (5) 5/78 Topical report--run 11 pilot unit. (6) 10/78 Topical report--run 12 pilot unit. (7) 5/79 Topical report--run 13 pilot unit. (8) 3/78 AID in start up demonstration unit at La Palma.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The Chemically Active Fluid Bed Process (CAFB) is to be evaluated to determine air, water and solid emissions to the environment resulting from gasification and combustion of lignite at the Esso Research Centre, Abingdon (ERCA), England, pilot plant. Recommendations will be developed for control requirement for a demonstration plant under construction in Texas.
APPROACH: This environmental assessment will be carried out according to EPA's Level 1 procedures. An extensive field and laboratory program is planned to determine organic and inorganic emissions from the stack, boiler blowdown and solid waste. The field measurement program will determine total particulate, particulate size distributions, CO, CO2, O2, C1-C6 hydrocarbons, NOx, SO2 and SO3 from the stack. In addition, all gas, particulate, solid and water samples will be analyzed by gas chromatography, liquid chromatography, infrared spectroscopy and low resolution mass spectrometry for organic functional groups. These samples will also be analyzed for trace elements by spark source mass spectrometry and atomic absorption spectroscopy. Particulates and solids will be analyzed by x-ray photoelectron spectroscopy (ESCA) for surface elements and compounds, with particular attention paid to vanadium and sulfur species.
RESULTS: The pilot plant is scheduled for continuous operation during the second week in October. The field program will take place during this period.
PROJECT MILESTONES: (1) 1/77 Complete site visit survey and planning. (2) 3/77 Submit sampling plan. (3) 3/77 Complete preliminary Engineering Analysis. (4) 11/77 Complete field testing. (5) 1/78 Complete lab analyses. (6) 2/78 Complete engineering analysis. (7) 4/78 Submit Final report.

PROJECT DESCRIPTION: The contractor will perform experimental and engineering studies to support the CAFB demonstration plant program, to develop the fluidized bed gasification process, and to provide program assistance to EPA.
APPROACH: The tasks include work on the high temperature sulfur removal system, including sorbent selection, spent sorbent processing, spent sorbent utilization, and spent sorbent disposal; alternate concepts, including sorbents, fuels, applications, and process design; control technology; environmental impact; and systems evaluation. The program will extend previous work carried out by Westinghouse in all of the areas identified.
RESULTS: The program will develop design and operating data, identify test programs, test alternative system components, provide technical support, and provide evaluation of test data.
PROJECT MILESTONES: (1) 3/77 Topical Report on Candidate Stones, CAFB DEMO. (2) 7/77 Spent Sorbent Characterization. (3) 7/77 Market potential spent sorbents determined. (4) 10/77 Issue annual report. (5) 10/78 Final report.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objective is to demonstrate, on a commercial scale (about 20 MW), the CAFB process and to perform environmental assessment of the process.
APPROACH: Task I--Design preparation and review: Design, development, fuel selection, definitive design process design manual. Task II--Construction planning: Site planning and approval, construction and fabrication drawings, construction progress. Task III--Experimental test program: Operating variables primary fuel, performance parameters, operating variables secondary fuels, operating variables solids fuels. Task IV--Performance and emission testing: Records, baseline correlations, spent material studies. Task V--System evaluation: Process design manual update. Task VI-Reports of work: Conceptual design commercial systems (about 250 MW).
RESULTS: Definitive design report, a preliminary process design manual and a final report are expected. In addition design drawings, reports of research and operating reports are expected. A conceptual design for a 250 MW unit will be developed.
PROJECT MILESTONES: (1) 12/75 Preliminary design manual. (2) 3/75 Preliminary process manual. (3) 34/76 Definitive design manual. (4) 6/76 Identify primary solid fuel. (5) 12/76 Identify primary liquid fuel. (6) 12/76 Identify primary bed material. (7) 5/77 Start construction. (8) 1/78 Complete construction. (9) 5/78 Start up. (10) 10/79 Complete test program.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Catalytic, Inc. will make an assessment of all residual fuel oil desulfurization processes in order to determine the costs and efficiencies for reduction of pollution.
APPROACH: The study will start with a literature search of all commercial processes now in operation and those which may be placed in operation during the next three years. The commercial processes to be studied are partial oxidation, hydrodesulfurization and flue gas scrubbing. Demonstration plants will then be studied including the chemically active fluid bed process (CAFB). The study will include only production of fuel for boilers, pipe line gas and combined cycle turbines.
RESULTS: A review and analysis of all environmental data, including health aspects has been made for each process. This will be followed by plant testing. The analysis will include sulfur compounds, NO/sub x/, particulates, trace elements, CO, hydrocarbons and carcinogenic compounds.
PROJECT MILESTONES: (1) 8/76 Set up information storage and retrieval system. (2) 11/76 Define categories of usage for residual aid. (3) 2/77 Select units for sampling and testing. (4) 3/77 Make site visit to determine data and data gaps. (5) 8/77 Issue technology background report. (6) 11/77 Complete preliminary preparation for sampling--Level 1 and 2. (7) 4/78 Make sampling trip. (8) 8/78 Issue EA annual report. (9) 12/79 Issue standards of practice manuals.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objectives of this program are to provide comprehensive chemical analyses of up to 100 residual oil samples, achieving parts per million resolution where possible of both organic and inorganic constituents. In addition, mutagenic testing of selected samples and isolable components of the oils will be performed. Recommendations will be made for the best use of each of the various residual oils based on an evaluation of the potential environmental problems seen as a result of the analyses and interpretation of the bioassay tests.
APPROACH: Briefly, the approach involves extensive use of gas chromatography (GC), GC-mass spectrometry, infrared, raman, fourier-transform spectroscopy, liquid chromatography, derivative preparation, and various extraction procedures in order to isolate and measure organic components of the oils. The inorganic analyses will be obtained by extensive use of atomic absorption spectroscopy, optical emission spectroscopy, spectrophotometry, electroanalytical techniques, and wet chemical techniques. Inorganic compound identification will be accomplished by utilizing infrared, x-ray diffraction and Auger spectroscopy.
RESULTS: The bioassay testing will be accomplished by a combination of subcontracts to Litton Bionetics and Stanford Research and concurrent work at Westinghouse Research. E Coli, Salmonella, and Saccharomyces test systems will be utilized. The radionuclide analyses will be subcontracted to Eberline Laboratories of Albuquerque, New Mexico. The elemental analyses of the major constituents of the oils will be subcontracted to Galbraith Laboratories of Knoxville, Tennessee.
PROJECT MILESTONES: (1) 7/77 Submit work plan. (2) 10/77 Complete survey available data. (3) 11/77 Samples selected, test plan complete. (4) 12/77 First samples group acquired. (5) 3/78 Sample collection completed. (6) 6/79 Analysis of samples completed. (7) 9/79 Final report issued.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objective of the project is to design, fabricate, and install in High Bay area (Wing G) of the Industrial Environmental Research Laboratory (IERL), a fluidized-bed combustion sampling and analytical test rig and auxiliary equipment that shall be used for IERL in-house research program. This test rig is fundamentally a research tool. Therefore, the design philosopy utilized shall be based on considerations of flexibility, accuracy, and utility.
APPROACH: The approach consists of designing a test rig with a wide range of sampling access locations suitable for use of alternative sampling and analytical techniques, and to build the rig in a modilae configuration to permit evaluation of alternative control devices. Specifically, the FBC Test Rig will be designed with the flexibility to evaluate variables such as: coal and sorbent system (feed rate, injection point and method, type, size), start-up technique, air system (flow and FGR rate, excess air), distributor configuration, heat removal (bed and flue gas), bed conditions (temperature, fluidizing velocities, depth, area), freeboard, waste solids.
RESULTS: Aerotherm will prepare a conceptual design based on the results of input/output data gathering. A final design will be completed after analysis, review and approval of the conceptual design. The test rig will then be fabricated and installed at the EPA facility, Research Triangle Park, North Carolina. Acceptance testing and personnel training will be performed. An operating manual and as-built drawings will be delivered.
PROJECT MILESTONES: (1) 9/76 Preliminary Design. (2) 2/77 Final Design. (3) 7/77 Installation. (4) 9/77 Acceptance Test. (5) 1/78 Final Report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Catalytic hydrodesulfurization (HDS) and hydrodenitrogenation (HDN) reactions for the removal of organic sulfur and nitrogen compounds from liquid fuels are becoming increasingly important as strict sulfur and nitrogen oxide emission standards are set, and ''dirtier'' oils derived from shale and coal attain wider use. The objective is to investigate this process.
APPROACH: A quantitative description of the interferences between these two reactions, which have only recently begun to be studied, is necessary for optimal design of commercial processing units. To date, we have studied thiophene, pyridine and quinoline as representative sulfur and nitrogen compounds in a continuous flow microreactor to model basic interactions. Pyridine inhibits thiophene HDS under all experimental conditions used. Sulfur compounds exhibit a dual effect on the HDN of pyridine; a reaction rate inhibition gives way to an enhancement at more severe reaction conditions.
RESULTS: Theoretical considerations have been presented to account for each of these effects. Reactions of more complex compounds and their interactive reaction kinetics are currently under investigation.
PROJECT MILESTONES: (1) 10/75 Report on HDS of Thiophene and HDN of Pyridine. (2) 9/76 Report on extension to high pressure of HDS and HDN. (3) 9/77 Report on extension to more complex substances. (4) 9/78 Summary report including model of HDS-HDN interaction.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Provide interim services for the planned coal cleaning demonstration program, whose overall objectives are to: (1) quantify the performance of the system and its components as a means of controlling emissions to meet both existing and new source performance standards; (2) measure the effects of cleaned coal on electrostatic precipitator and boiler performance and availability; (3) compare its cost effectiveness with the alternate of flue gas desulfurization; (4) determine means of predicting and controlling the cleanability of coal reserves; (5) characterize ancilliary environmental effects.
APPROACH: Interim tasks are: (1) provide technical support and analytical services to the heavy medium

cyclone pilot plant test loop operated in conjunction with the USBM at Bruceton, PA through October 1977; (2) conduct initial tests (mass, sulfur, and energy balances) on the initial portion of the coal preparation plant starting up in September 1977; (3) develop the overall three year demonstration program plan; (4) obtain and analyze face samples from the Helen and Helvetia mines for evaluation of the inseam variation of sulfur and trace elements in the Homer City Coal reserve in conjunction with the U.S. Geological Survey.
RESULTS: (1) Produce demonstration program plan. (2) Provide analysis of face samples.
PROJECT MILESTONES: 3/78 Draft report of interim preparation plant tests.

PROJECT DESCRIPTION: Phase V of this research program aims to test the relative worth of various metals used in current denitrogenation catalysts. Another aim is to examine the effect of increasing macropores in the catalysts. Possibly, the effect of hydrogen partial pressure may be tested.
APPROACH: Interactions among these variables are of interest. Especially manufactured catalysts will be used in the series of experiments with coal liquids.
RESULTS: The data should help in the development of more effective catalysts to denitrogenate coal liquids. Completed phases of this program have been described in previous notices of this research project.
PROJECT MILESTONES: (1) 12/73 Completed first test of Catalysts to promote Demetallization. (2) 12/74 Finished extended tests. (3) 12/75 Foreign residual oils tested. (4) 12/76 Work with Russian Catalysts completed. (5) 9/77 Optimum Catalyst identified.

PROJECT DESCRIPTION: The overall technical objective of this program is the performance of a comprehensive multimedia environmental assessment of the technologies for converting coal into liquid fuels and of the utilization of these liquid fuels in stationary source applications. Technologies for conversion of coal to liquid fuels will be considered to encompass all methods of coal treatment in which the majority of the coal-like structure of the raw feed material is transformed to a liquid form, either at the treatment conditions of the process or at ambient conditions. Technologies which involve the production of liquid fuels from coal through the initial use of commercial gasification techniques will also be considered.
APPROACH: The approach to meeting this technical objective will be a ten-phase study program composed of: (1) technical and environmental overviews; (2) technology characterizations; (3) effluent problem definition; (4) identification of technology and information requirements; (5) environmental test program; (6) data acquisition; (7) environmental assessments; (8) effluent control technology evaluations; (9) reassessments and recommendations, and (10) environmental assessment program support.
PROJECT MILESTONES: (1) 7/76 Start. (2) 12/77 Data Base Report. (3) 1/78 Combustion test report. (4) 6/78 Assessment/Control Process report. (5) 7/79 Final status report.

PROJECT DESCRIPTION: The objective of this project is to assess the degree of removal and recovery or destruction of contaminants that can occur during processing for upgrading the products and by-products to make them suitable for marketing. Products of fuel systems are defined to encompass the primary marketable materials from fuel systems. By-products of fuel systems are defined to encompass all other useable or potentially useable components of a fuel system output slate. Fuel system products or by-products which either (1) are totally consumed within the basic production system (as for steam-raising) or (2) are totally consumed as a petrochemical feedstock shall not be considered for control technology development.
APPROACH: Catalytic, Inc. shall conduct a program that will result in the development of technology for the control of environmental pollution from utilization of the products and by-products of fuel conversion/fuel utilization systems based on coal.
PROJECT MILESTONES: (1) 9/76 Contract signing. (2) 1/78 Report on Control Assay Development. (3) 6/78 Applicability of Coke Oven Controls to Synthetic Fuels. (4) 9/79 Evaluation of all applicable controls.
KEYWORDS: CONTROL TECHNOLOGY;TECHNOLOGY TRANSFER;ENERGY SOURCES;BY-PRODUCTS;RECOVERY;ECONOMY;AIR POLLUTION CONTROL;LIQUEFACTION;GASIFICATION

TITLE: Bench Scale Study of the Meyers Process for Coal Desulfurization
PROJECT NUMBER: P-623-A-19
PRINCIPAL INVESTIGATOR: Meyers, R.A.
ADDRESS: One Space Park, Redondo Beach, CA 90278
AFFILIATION: TRW Systems Group, Redondo Beach, Calif. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Tamny, R.D.
TYPE OF FUNDING: Contract No.-68-02-2121
77 FUNDING: Environmental Protection Agency FY77:$175,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: NOXIOUS GAS/SOx (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The Contractor shall process different types of raw coal through a bench scale facility for chemical leaching of pyritic sulfur from coal.
APPROACH: The Contractor shall completely characterize the raw coal samples and shall determine at least proximate and ultimate analyses and sulfur forms analyses. The Contractor shall also examine the raw coal samples for trace constituents.
RESULTS: The Contractor shall, as a minimum, gather the following data: (1) sulfur removal by chemical leaching as a function of time; (2) characterization of the products and (3) trace element distribution in the products.
PROJECT MILESTONES: (1) 3/75 Complete literature Survey. (2) 7/75 Complete Coal Processing characterization. (3) 8/75 Complete Chemical Analyses of Coal Samples. (4) 9/75 Complete Product Recovery Analyses. (5) 1/77 Complete Coal Sample depyritization. (6) 5/77 Complete Data Analysis. (7) 7/77 Complete Engineering Analysis.
KEYWORDS: EMISSIONS;MEYERS PROCESS;BENCH-SCALE EXPERIMENTS;COAL;DESULFURIZATION;CHEMICAL COMPOSITION;TRACE AMOUNTS;MUTAGENESIS

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Middle Atlantic
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The Contractor will construct a reactor test unit for evaluation of the pyrite leaching from fine coal, leach solution regeneration, and initial filtration operations of the Meyers Process for coal desulfurization. The Reactor Test Unit will be capable of continuous operation at the nominal rate of 250 tc 750 pounds of coal per hour.

APPROACH: The input material to the Test Reactor System is properly sized coal, either cleaned or uncleaned; the output material is the reacted coal which has been filtered and washed on the filter.
RESULTS: This test unit will be constructed in accordance with the predesign specifications prepared under Contract 68-02-1335 for the reactor test unit (omitting the coarse coal reactor system). The reactor test unit will be erected at a site provided by the Contractor.
PROJECT MILESTONES: (1) 10/78 Initial test operation of reactor test unit scheduled. (2) 10/79 Long-term continuous operation (120 hr.) of Reactor Test Unit.
KEYWORDS: CONTROL TECHNOLOGY;COAL;DESULFURIZATION;PYRITE;LEACHING;MEYERS PROCESS;REGENERATION;FILTRATION

TITLE: Development Program for Treatment of Coal to Produce Low-Sulfur, Solid Fossil Fuel
PROJECT NUMBER: P-623A-21
PRINCIPAL INVESTIGATOR: Flemming, D.K.
ADDRESS: 3424 South State Street, Chicago, IL 60616
AFFILIATION: Institute of Gas Technology, Chicago, Ill. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Tamny, R.D.
TYPE OF FUNDING: Contract No.-68-02-2126
77 FUNDING: Environmental Protection Agency FY77:$161,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: NOXIOUS GAS/SOx (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objective of this program is to determine on a bench- and pilot-unit scale the operating parameters for the IGT Process to desulfurize coal by thermal and chemical means.
APPROACH: Coal will be treated with a reducing atmosphere in the presence of a sulfur getter. Sulfur removal will be determined as a function of temperature, residence time, coal/getter ratio, coal composition, and particle size.
RESULTS: In work to date under earlier contracts, Midwestern coal with 3.5 to 4% sulfur content has been converted into solid fossil fuel that can be burned directly in conformance with Federal EPA New Source Performance Standards for sulfur emission.
PROJECT MILESTONES: (1) 10/76 Coal Sample Test Batch Reactor Operational. (2) 10/76 Coal Sample Selection for Batch Test Finalized. (3) 10/76 Coal Sample Thermobalance Test Unit Operational. (4) 7/77 Coal Sample Batch Reactor Unit Tests Completed. (5) 9/77 Analysis of Batch Reactor Unit Tests Completed. (6) 8/77 Coal Sample Reactor Test Runs Gas Sample Analysis Initiated. (7) 9/77 Prepared for inclusion in final report.

TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: NOXIOUS GAS/SOx (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objective of this program is to conduct research and development which will lead into a cost effective method for reducing sulfur oxide emissions (during coal combustion) to environmentally acceptable levels.
APPROACH: The approach is based on the use of microwave energy which can be coupled preferentially into iron pyrites and leachants and induce reactions which produce sulfur compounds which can either be separated easily from coal, or do not convert into sulfur oxides during combustion.
RESULTS: Results to date show that iron pyrite (FeS2) and NaOH do indeed couple with microwave efficiently and react to form water soluble sulfur products. Coal on the other hand is a low loss material. The plan is to investigate the mechanism of energy absorption and important reactions involving sulfur rearrangement.
PROJECT MILESTONES: (1) 8/76 Selection of coal samples with reaction characteristics suitable to exposure to microwave energy stimulation. (2) 10/76 Evaluation of the effectiveness of various microwave frequencies to desulfurized coal samples. (3) 3/77 Evaluation of sulfur reaction to various lengths of exposure. (4) 6/77 Evaluation of benefits received from coal wash with sodium hydroxide prior to exposure to microwave energy.
KEYWORDS: COAL;DESULFURIZATION;MICROWAVE RADIATION;PYRITE;SODIUM HYDROXIDES;CHEMICAL REACTIONS;ECONOMICS;AIR

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;ECT;OS
PROJECT DESCRIPTION: The purpose of this research is to develop a fundamental understanding of those factors and conditions which will cause the production of environmental pollutants of synfuels processes and to provide to EPA and to the scientific and technical community the information needed to guide the control of potentially hazardous materials from synfuels plants of the future.
APPROACH: The research plan includes both an experimental and an analytical study. The experimental study includes the design, fabrication and operation of one or more laboratory reactors to simulate conditions which may be utilized in actual synfuels processes, the development and implementation of chemical analysis procedures for the examination of elements and compounds that result, for screening of the major coals that are available in the U.S., and for the determination of the kinetics of formation of the pollutants of significance.
RESULTS: The analytical study provides for utilizing results of the screening tests to (1) project potential human exposure to effluents and emissions from these plants and to establish priority ratings for the various pollutants based upon the extent to which projected exposures are hazardous.
PROJECT MILESTONES: (1) 7/77 Reactor Facility and Analysis Equipment Operational. (2) 12/77 Test Plan Formulated. (3) 12/78 Kinetics of Pollutant Formation Screened. (4) 10/79 Kinetics of Pollutant Formation Measured Thoroughly. (5) 11/80 Environmental Assessment Completed. (6) 7/81 Recommendations for Control Strategies Made.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The objective is to develop measurement techniques to generate engineering data for environmental assessment and control technology development projects evaluating high temperature, high pressure processes. The two processes of initial interest are high pressure fluidized bed combustion and coal gasification. EPA in-house research projects will be supported through review of program plans and test plans in the area of high temperature, high pressure processes and design and construction of an EPA in-house sampling test rig.
APPROACH: The program will first establish a baseline technology effort to provide the resources for continual problem solving. This baseline program will be supplemented with specific assignments by the EPA Project Officer. The technical level of effort will be maintained relatively constant.
RESULTS: A probing system has been designed, fabricated, and demonstrated on a pressurized fluidized bed combustor. The system measures particle size and mass as well as provides a gas sample.
PROJECT MILESTONES: (1) 5/77 Demonstration of probe system for fluidized bed combustion. (2) 2/78 Design of probe system for coal gasification.
KEYWORDS: COAL GASIFICATION;COAL LIQUEFACTION;AIR POLLUTION CONTROL;FLUIDIZED-BED COMBUSTION;MEASURING METHODS;COAL;TECHNOLOGY ASSESSMENT

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of these studies is to provide a firmer understanding of the behavior of porous polymer sorbents in source sampling efforts.
APPROACH: Previous work has dealt with the effects of reaction with acids and acid gases on the sorption capacity and selectivity of these materials. Results to date indicate that sulfonation and nitration can indeed effect both the amount and the relative distribution of representative organic compounds on these sorbents. This effect will be especially significant if the sampling effort is carried out past

breakthrough; that is, if the sorbent trap capacity is exceeded by the challenge concentration. Porous polymer sorbents have been used to sample ambient air and sources at temperatures in which the principle sorption mechanism is gas-solid adsorption. More recently, these sorbents have been used in source sampling at temperatures which cause the condensation of significant amounts of water. This reduces the probability of acid-polymer reaction but also changes the nature of the sorption process to a liquid-solid mechanism. In the work proposed both dynamic (liquid chromatography) and static methods will be examined as methods for the laboratory measurement of sorption capacity and selectivity as a function of pH and temperature. In addition, the relation between water-benzene distribution and water-styrene polymer (XAD-2) adsorption will be examined. Information obtained from literature values for benzene-water-solute systems and laboratory-measured polymer studies will be used to attempt to develop a predictive model for sampling purposes.
RESULTS: Final report to be entered into ORD system. Of direct use to IERL but also of interest to scientific community.
PROJECT MILESTONES: (1) 9/77 Grant starts. (2) 11/79 Final Report.
KEYWORDS: ORGANIC COMPOUNDS;SAMPLING;QUANTITATIVE CHEMICAL ANALYSIS;COAL GASIFICATION;POLYMERS;CHEMISORPTION;SORPTIVE PROPERTIES;CHROMATOGRAPHY;SULFUR COMPOUNDS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: To conduct a theoretical and experimental investigation to determine the effects of high temperature (1100 degrees C), high pressure (15 atm), and particle diameter on particulate collection mechanisms and to identify mechanisms that might be used to remove particles from high temperature and/or high pressure gas streams. Existing and proposed energy processes requiring high temperature and/or high pressure particulate cleanup will also be studied to determine the important characteristics, cleanup requirements, and potential problems of each process.
APPROACH: The investigation will include a thorough literature search, survey, and evaluation of the present state of knowledge concerning high temperature and pressure aerosol mechanics and collection mechanisms. Laboratory scale experiments will be conducted to obtain necessary data on the behavior of aerosols in high temperature and pressure environments, and the results will be used to improve present theory, to identify useful high temperature and high pressure collection mechanisms for particulate removal, and to recommend programs for the development and demonstration of particulate control devices based upon these mechanisms.
RESULTS: Review of theory and bench scale verification of the theory.
PROJECT MILESTONES: (1) 12/75 Contract award. (2) 1/77 Complete theoretical review. (3) 9/77 Complete study of collection requirement for various applications. (4) 4/78 Complete bench scale verification theory.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The development of advanced energy sources such as coal and shale oil gasification result in high temperature and pressure process gas streams which require removal of particulates before utilization. The objective of this research is to evaluate a novel concept for fine particle control in these systems. The apparatus would collect fine particles by mechanisms such as diffusion, inertial impaction, interception and electrophoresis.
APPROACH: A preliminary evaluation of the new concept will be performed, followed by experimental verification of fine particle collection. Presently theoretical calculations are being performed for mechanisms involved in particle collection and system regeneration. The power and residence time requirements for particle capture will be predicted for the most promising mechanisms. Based on these calculations, preliminary bench-scale experiments will be performed to demonstrate the feasibility of fine particle capture in the proposed particle collection system. This will be followed by the economic analysis and recommendations. The second phase of the project will consist of the construction and testing of a model of the new concept with at least 500 SCFM capacity.
RESULTS: Prove feasibility of dry scrubber concept for control of particulate at high temperature and pressure. This concept will bear on the economic success of the advanced energy processes.
PROJECT MILESTONES: (1) 8/76 Contract Award. (2) 8/77 Complete Study of Components of New Device. (3) 8/78 Complete Feasibility Tests of Integrated System.

PROJECT DESCRIPTION: To demonstrate the technical and economic viability of fabric filtration as a means of fine particle control at high temperatures (1500 degrees F) and pressures (10 atm).
APPROACH: Phase I consists of a matrix of bench scale tests designed to demonstrate the basic feasibility of candidate materials and regeneration mechanisms. These materials will be developed by a combination of inhouse expertise and subcontracted work to a fabric weaver. The program will include the development of a high temperature/pressure filtration theory; a thorough search for viable materials to supplement those already identified; and the design, fabrication and use of a bench scale testing apparatus. With the identification of the most promising materials systems an economic analysis will be performed and recommendations made for the continuation of the development program, i.e., Phase II. Phase II of the proposed program will continue the development of the promising concepts identified in Phase I. A pilot scale (500 scfm) facility will be constructed at Aerotherm to demonstrate the reliability of these concepts.
RESULTS: Phase I was initiated 8/76 and will require 16 months for completion. Phase II is anticipated to be an 8 month effort.
PROJECT MILESTONES: (1) 8/76 Contract award. (2) 12/77 Complete matrix of bench scale tests on candidate filtration materials. (3) 8/78 Complete life testing of best materials.

PROJECT DESCRIPTION: To continue the studies of industrial dusts and fumes and the development of apparatus for inducing these pollutants to agglomerate and fallout. Also to investigate the phenomena involved in dust/fume charging with the hope of providing better dust control systems.
APPROACH: The studies will be primarily experimental and will generate the appropriate dusts and fumes under controlled conditions to determine the parameters involved in charging phenomena. University of Arizona will make appropriate industrial measurements and studies to evaluate charging and dust control techniques in the factory environment.
RESULTS: University of Arizona has investigated the charging behavior of a variety of dusts and fumes. Most materials seem to have negative charges, at least for the respirable material, but there are some notable exceptions, i.e., magnetite. It has been demonstrated that these dusts and fumes can be induced to agglomerate and fallout when exposed to properly charged water fog. A number of industrial tests are underway to test prototype fog generators as mechanisms for dust control. University of Arizona has done some preliminary work on control of power plant fly ash and coal tar volatiles (from coke ovens). Here again it appears that the charged fog system has significant potential as a control technique.
PROJECT MILESTONES: (1) 6/77 Grant Award. (2) 6/78 Complete Laboratory Study of Controlling Parameters. (3) 6/79 Complete Field Tests.

PROJECT DESCRIPTION: Provide technical expertise and support to EPA (IERL/RTP) in maintaining and furthering the development of the Fine Particle Emissions Information System (FPEIS) data base.
APPROACH: Specific activities will include (1) periodic updates of the FPEIS data base, including four published summary reports at semiannual intervals; (2) analytical methods development to improve the utility of the data base including documentation. Three such methods are anticipated; (3) technology transfer activities including two user workshops at annual intervals to provide an interchange of information about the system among the user community. Proceedings of these workshops will be published.
PROJECT MILESTONES: (1) 2/77 FPEIS in operation. (2) 12/77 Data from approximately 2000 test runs in system. Continual up-dates of system. (3) 9/79 Development contract complete.

ENERGY CYCLE: COMBUSTION OR END USE (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: This project is for support of the technical activities of the Laboratory in the following areas: (1) assessment of environmental and economic impact of pollution control systems as they become commercially available to user industries; (2) process analysis; (3) cost estimation of pollution control systems that are being developed by EPA; (4) process research; (5) evaluation of the energy conservation potential of new pollution control technologies; (6) engineering analysis; (7) assessment of R and D programs in coal liquefaction, low, medium, and high BTU gasifiction, advanced combination research, and improved coal extraction and reclamation techniques; (8) process emissions and control technology surveys; (9) identification of new environmentally acceptable power systems that can provide cleaner more efficient utilization of fossil fuels; (10) associated technical services; and (11) regional assistance and State implementation planning.
APPROACH: The Environmental Protection Agency's Industrial Environmental Research Laboratory has the mission to support and encourage the development of technology for the control of air pollution from all sources. The activities of the Laboratory range from the identification of emissions sources and quantification of the emissions therefrom, through the development of control technology from conceptual ideas to full-scale implementation, to the evaluation of the economic and environmental impact of applications to the technology. This contract will provide a variety of short-term engineering and technical studies as the needs arise.
PROJECT MILESTONES: (1) 3/77 Contract award. (2) 3/79 Estimated contract completion date.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The proposed research seeks to define methodological approaches for use within EPA which would facilitate the identification of hazards and setting of standards and control priorities. A new comprehensive type of assessment data is being generated within EPA, and the proposed research, in part, would attempt to define how such information might be best utilized by health-effects, atmospheric-chemistry and other involved groups in order to generate meaningful cause-effect results in the shortest time.
APPROACH: The research will include definition of pertinent EPA units and procedures and obstacles to interchange of research results. Methods for improving knowledge transfer will be proposed. Comprehensive alternatives to ''single-pollutant'' methods will be developed. Several approaches will be considered including, but not limited to, those based on previously-developed air quality indexes, prioritization methodologies, and assessments of hypersensitive populations.
RESULTS: The first year will emphasize linkages between the Industrial Environmental Research Laboratory and health effects and standards-setting units of EPA. The second year would emphasize linkages with transport-and-transformation research. The third year would emphasize integration of diverse aspects of the environmental management system.
PROJECT MILESTONES: (1) 10/78 Complete research related to health effect linkages. (2) 10/79 Complete research related to Transport-Transformation. (3) 10/80 Complete integration studies.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The purpose of this work is to determine the effectiveness of known combustion modification techniques to control pollutant emissions from industrial boilers. In addition, the effort will establish what the boiler manufacturers and users can do to control emissions with existing state-of-the-art technology and where combustion research activities should be concentrated.
APPROACH: An experimental field test program was carried out to investigate the effects of operating variables and combustion modification (e.g., excess air level, load, flue gas recirculation, staged combustion, fuel temperature and burner design) on air pollutant emissions from industrial boilers of various designs fired with coal, oil, gas and mixed fuels. The pollutants of interest in this study were oxides of nitrogen, oxides of sulfur, hydrocarbons, carbon monoxide, smoke, combustible and non-combustible particulate and trace elements.
RESULTS: Final reports providing the data and conclusions from the testing of more than sixty industrial boilers under a variety of conditions have been issued. At present, an industrial boiler operator's manual and a manufacturer's manual are being prepared and are expected to be completed in the first half of 1977.
PROJECT MILESTONES: (1) 6/73 Contract Start Date. (2) 10/73 Submit Boiler Survey. (3) 7/74 Phase I--50 Short term boiler field tests completed. (4) 9/74 Phase I--Final Report completed. PROJECT DESCRIPTION: An eighteen-month experimental and analytical program has been initiated to provide information on fuel decomposition, fuel oxidation and flame reactions which is required for the evelopment of a complete understanding of the chemical phenomena involved in the conversion of organic uel nitrogen compounds to NOx during combustion.
APPROACH: The program is divided into three tasks. Task I consists of additional experimental studies of the types of chemical reactions that fuel nitrogen species can undergo as fuel reacts in the early (preflame) stages of combustion. The pyrolysis and oxidation of model nitrogen compounds, coals, residual oil and alternate fuels will be investigated. Task II involves the study of combustion kinetics involved in fuel NOx formation from HCN and NH3 in premixed CH4 flames including: (1) interactions with thermal NOx formation; (2) more detailed analysis of nitrogen-containing species, and (3) organic nitrogen additives

or diffusion flame studies.
PROJECT MILESTONES: (1) 6/75 Initiate Contract. (2) 2/78 Identify Primary and Secondary Fuel Pyrolysis Products.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The objectives of this 3-year systems study are to (1) identify the multi-media environmental impact of stationary combustion sources and NO/sub x/ combustion modification controls and (2) identify the most cost effective combustion modification approach(es) to achieving and maintaining air quality for NO2. The results of this study will guide the development and subsequent implementation of environmentally sound NO/sub x/ control techniques.
APPROACH: Detailed process engineering and multimedia impact studies will be made of the application of commercial heating systems, stationary engines and industrial process furnaces as well as of alternate concepts such as the use of catalytic combustion or of clean fuels. Control of NO/sub x/ emissions by combustion process modification will be emphasized for near-term application. The combination of combustion modification with post-combustion flue gas treatment will be considered for application in the post-1980 period. The initial effort, in progress, is to generate a comprehensive inventory and projection of gaseous, liquid and solid effluents or both controlled and uncontrolled sources. The environmental stresses of the sources and control systems will be evaluated according to pollutant transport and transformation and ultimate receptor impact. Field emission tests will be made to augment the existing data base. Process studies will yield data on control effectiveness, energy efficiency, cost and differential trace emissions for current and emerging control systems.
RESULTS: The study will culminate with a system analysis which will integrate the process engineering and envircnmental impact results to determine the optimum combination of the control systems under consideration, on a regional basis, to comply with NO2 air quality standards.
PROJECT MILESTONES: (1) 6/76 Initiate Project. (2) 2/77 Preliminary environmental assessment report. (3) 7/77 Alternate clean fuels special report. RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The program objective is to evaluate the effectiveness of combustion modifications as means of emissions reduction and thermal efficiency improvement on industrial combustion equipment including kilns, ovens, dryers, process furnaces and heaters, boilers, stationary engines and gas turbines.
APPROACH: The approach will involve a field test program to measure emissions of NO, NOx, SO2, SO3, CO, gaseous hydrocarbons, particulates, trace elements, organics (POM, PCB) sulfates and nitrates. Baseline tests will be conducted on about twenty-five representative combustion devices and combustion modifications will be implemented to determine the influence on emisssions and efficiency. These modifications include lowered excess combustion air, staged combustion, reduced air preheat, fuel changes, water injection and flue gas recirculation.
RESULTS: The program is an extension of work conducted on EPA Contract 68-02-1074 that dealt with industrial boilers. Combustion modification technology that was found effective on boilers will be extended to other industrial equipment, although extensive tests on two industrial boilers equipped with staged air and/or flue gas recirculation are included.
PROJECT MILESTONES: (1) 1/76 Contract Start Date. (2) 3/76 Equipment Survey. (3) 9/76 Test Unit Selection. (4) 3/77 Field Tests completed for Industrial Process Equipment. POLLUTANTS: NOXIOUS GAS/NOx;NOXIOUS GAS/SOx;NOXIOUS GAS/HC;NOXIOUS GAS/CO;NOXIOUS GAS/CO2 (60%);PARTICULATES/Trace elements (30%);ORGANICS/POM (10%)
CHARACTER OF STUDY: RESEARCH/Laboratory (40%);DEVELOPMENT/Laboratory scale (60%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The purpose of this study is to field test power generation combustion equipment including utility boilers, gas turbines, and stationary I.C. engines. Emphasis will be placed on utility boilers firing coal, but the study will include tests of gas- and oil-fired boilers and boilers capable of firing two or more fuels simultaneously. Tests with simultaneous firing of waste and fossil fuels shall also be included.
APPROACH: Emissions to be measured are oxides of nitrogen, oxides of sulfur, hydrocarbons, carbon monoxide, carbon dioxide, oxygen, opacity, sulfates, nitrates, particulate (mass and size distribution), POM, and trace elements. The effect of combustion modification on air pollutant emissions and combustion efficiency will be determined. Also, the effect of modified operation on equipment performance (e.g., slagging, fouling, and steam temperature control) will be investigated.
RESULTS: One primary goal is to determine the effect of staged combustion in coal-fired boilers on tube wall corrosion rates. Staged combustion combined with low excess air firing is the most attractive combustion modification combination because it is an effective method of reducing NOx and is relatively easy and inexpensive to implement. However, some experts suspect the reducing atmosphere in the burner zone to increase tube wall corrosion rates. The Contractor will use three methods for measuring corrosion rates: (1) corrosion probes for an easy, inexpensive, but probably an inaccurate method, (2) ultrasonic tube wall measurement which is more costly but should provide an accurate mapping of the furnace tube wall surface, and (3) test panels which will be welded into the boiler tube wall in areas where extensive corrosion is anticipated. The test panels will be removed after a 6 to 12 month period for precise measurements.
PROJECT MILESTONES: (1) 6/74 Contract Start Date. (2) 4/77 Complete Final Report on Initial Seven Boilers.

(3) 9/77 Complete horizontally opposed boiler corrosion tests. (4) 11/77 Complete Final report on all equipment emission tests. (5) 12/77 Complete Guidelines (Users Manuals). (6) 1/78 Complete Data Supplement. (7) 4/79 Complete single-wall boiler corrosion tests.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: Battelle-Columbus is conducting a program to (1) characterize the spectrum of emissions from industrial coal-fired stoker boilers firing several types of coal under various stoker firing conditions, (2) investigate control methods to reduce these emissions, (3) determine the effect of these control methods and variations in stoker-boiler operation on the overall performance of the stoker boiler, and (4) assess the environmental impact of new technology on the future acceptability of stoker boilers.
APPROACH: The program is divided into two phases. In Phase I, the comprehensive emissions characteristics will be determined from the combustion of untreated, reconstituted, and processed coals in Battelle's 20-hp stoker boiler small-scale stoker. Appropriate data will be collected to determine if criteria pollutants and Level 1 and 2 pollutant groups are responsive to changes in fuel, stoker operation, or combustion parameters. An assessment will be developed that will include defining the potential for untreated, reconstituted, and processed coals to improve the environmental acceptability of stoker boilers. Phase II will be conducted to identify and evaluate potential control concepts for control of emissions from full-scale industrial stoker boilers. The Battelle steam plant 600-hp spreader-stoker boiler will be utilized and modified to evaluate potential control concepts. This phase will provide a systematic evaluation of control concepts while firing several representative stoker fuels, including the most promising treated coal identified in Phase I.
RESULTS: Based on the results of the research program, an assessment will be developed to define the potential of emissions control on the overall acceptability of industrial stoker coal-fired boilers.
PROJECT MILESTONES: (1) 12/77 Model Spreader stoker completed. (2) 6/78 Research program on cleaned coals completed. (3) Development program on Full Scale Spreader Stoker Completed.

TITLE: Combustion Research on Coal Nitrogen and Particulate Organic Matter
PROJECT NUMBER: P-624-A-12
PRINCIPAL INVESTIGATOR: Howard, J.B.
ADDRESS: 77 Massachusetts Ave., Cambridge, MA 02139
AFFILIATION: Massachusetts Inst. of Tech., Cambridge (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Wasser, J.H.
TYPE OF FUNDING: Contract No.-R-803242
77 FUNDING: Environmental Protection Agency FY77:$20,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS/NOx (50%);PARTICULATES/Soot (20%);ORGANICS (30%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: This work has two objectives: (1) Characterization of POM from diffusion and premixed flames. (2) Determination of kinetics of devolatilization of nitrogen compounds during the high temperature pyrolysis of coal.
APPROACH: Task I: The research is concerned with the qualitative and quantitative assessment of the production of particulate organic matter in laboratory flames. The objectives are to determine within the flame and in the exhaust gases (1) the size distribution and concentrations of soot particles, (2) the identities and concentrations of organic compounds, (3) the relationship between soot and organic compounds generated in the flame. Experimental methodology used includes particle concentration and size distribution by electron microscopy, and analysis of polycyclic aromatic hydrocarbon by gas chromatographic mass spectrometry and high resolution mass spectrometry. The major emphasis involves the application of molecular beam sampler and on-line mass spectrometry for complete gas phase analysis. Additional information is obtained by sampling atmospheric pressure turbulent diffusion flames and laminar premixed flames by water-injected sampling probes. Task II: The program objectives are to obtain a better understanding of the processes contributing to the emission of NOx from coal fired boilers to better define control methods. Fuel bound nitrogen complicates development of low NOx burners because the nitrogen in char may persist into the second stage of a staged combustor.
RESULTS: During the past two years laboratory furnaces have been developed for the pyrolysis and oxidation o pulverized coal under conditions simulating utility boilers. Results on nitrogen retention in char have been determined for two coals as a function of temperature and time. Also, the conversion of the fuel nitrogen to NOx has been determined as a function of fuel/air ratio for one furnace temperature. Five additional coals will be studied over a wider range of temperatures and data will be obtained on the gas phase constituents of pyrolysis. The coals chars will be characterized to develop mechanistic models for extrapolation of data to other conditions.

PROJECT MILESTONES: (1) 8/75 Complete experimental systems and initial test. (2) 8/76 Complete study of soot and PCAH formation in turbulent diffusion flames. (3) 8/76 Complete evaluation of compound N behavior for two common coals. (4) 10/77 Final report.

TITLE: Environmental and Energy Assessment of Afterburner Combustion System
PROJECT NUMBER: P-624-A-12
PRINCIPAL INVESTIGATOR: Barrett, R.E.
ADDRESS: 505 King Ave., Columbus, OH 43201
AFFILIATION: Battelle Columbus Labs., Ohio (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Wasser, John H.
TYPE OF FUNDING: Contract No.-68-02-2629
77 FUNDING: Environmental Protection Agency FY77:$56,000
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS/NOx;NOXIOUS GAS/SOx;NOXIOUS GAS/HC;NOXIOUS GAS/CO (50%);PARTICULATES (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (40%);ANALYTICAL (60%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: Battelle-Columbus is conducting a program to assess the performance of afterburner emission control devices by evaluating (1) the potential of afterburners for reducing emissions; (2) the potential of afterburners generating emissions; and (3) the efficient utilization of fuel in afterburners, as it relates to emission control. Afterburner types included in the program are direct flame combustion afterburners, thermal combustion afterburners, and catalytic afterburners.
APPROACH: The program is divided into two phases. Phase I includes the collection and correlation of available data (from the literature, from EPA source tests, from state and local agencies, etc.) to assess the state-of-the-art of afterburner application technology. Phase II includes two tasks that are directed at generating new data on afterburner performance, and two that are directed at documenting the environmental and engineering aspects of afterburner application. The experimental tasks are directed toward obtaining new afterburner performance data in the field and the laboratory, respectively.
RESULTS: The last two tasks consist of utilizing the data generated in the experimental program to complete an environmental assessment of afterburners and to develop a ''Standard Practice Manual'' for use by engineers involved in afterburner application.
PROJECT MILESTONES: (1) 12/77 Preliminary Environmental Assessment Completed. (2) 11/78 Laboratory Studies Completed. (3) 1/79 Field Test completed. (4) 9/79 Environmental Assessment Completed. (5) 2/80 Standard Practice Manual Completed.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: Utilization of low Btu gas (LBG) in an environmentally acceptable and energy efficient manner requires careful attention to overall system design. While most system aspects are being extensively considered, the combustor for utilization of high temperature, nitrogen compound containing LBG without production of high levels of NOx and other pollutants has not been given sufficient attention. Preliminary calculations performed on EPA contract 68-02-1361 indicated significant promise for control of thermal and fuel NOx by proper combustion design.
APPROACH: This program will substantiate those concepts through a coordinated study including: (1) combustor design calculations; (2) bench scale experiments; and (3) design and fabrication of two prototype combustors for testing at the IERL-RTP Laboratory.
RESULTS: Two prototype combustors.
PROJECT MILESTONES: (1) 10/76 Initiate contract. (2) 6/78 Identify promising concepts. (3) 2/79 Complete prototype combustor lab tests.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: This contract involves the formulation and execution of a comprehensive fundamental combustion research program to provide additional insight into the features of combustion controlling the formation of pollutants in flames. In formulating the program primary emphasis is placed upon critically selecting tasks which will maximize the impact of fundamental combustion research (FCR) on commercial realization of pollution control technology.
APPROACH: Execution of the program requires coordination with other elements of the EPA combustion research program, and work being sponsored by other government agencies and by industry. Included in the program are studies of chemical kinetics, combustion aerodynamics, numerical modelling and direct application of FCR to current problems in the Fuels R and D, Process R and D or Field Testing sections of the EPA Combustion Research Program. Additionally, a significant amount of subcontracted work is planned in order to utilize the talents, expertise and equipment at the various research establishments throughout the country.
RESULTS: Annual reports.
PROJECT MILESTONES: (1) 2/77 Initiate Contract. (2) 8/77 Complete Initial Technology Assessments. (3) 10/77 Initiate Major Subcontract Procurements. (4) 2/78 First Annual Report. (5) 12/78 First Demonstration of Application of Fundamental Research to Pollutant Control Systems. (6) 2/79 Second Annual Report. (7) 4/80 Final Report.

TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS/HO/sub x/;NOXIOUS GAS/SO/sub x/ (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: An experimental program will be conducted to measure the concentrations of the important stable and unstable species in methane-air flames. Particular emphasis will be placed on a determination of the presence of nitrates and sulfates in the flame zone. In addition to searching for flame formed nitrates the study will devote a major effort to determining if the nitrate precursor, NO2, is actually present in the early flame zone and if reactions are occurring within the sampling probe which perturb the actual NO/NO2 concentration ratio.
APPROACH: Various sampling techniques will be employed including cooled and uncooled quartz microprobes, optical spectroscopy, and molecular beam sampling for measurements of radical species and stable species with interferences. The molecular beam sampling--mass spectrometry technique will be augmented by use of the appearance potential measurements which greatly increases the number of species which can be measured. Measurements will be made over a range of stoichiometries and with the NO/sub x/ resulting from conversion of both atmospheric N2 and fuel-bound nitrogen.
RESULTS: One experimental series calls for doping the fuel with hydrogen sulfide and sampling to identify the presence of flame formed sulfates. This series of tests will be performed using the molecular beam sampler so that not only sulfates but also their precursors will be identified.
PROJECT MILESTONES: (1) 9/76 Initiate Contract. (2) 10/77 Complete Assessment of Clean Fuel Kinetics including NO2 formation and probe effects. (3) 9/78 Complete Study of probe effects, sulfate formation, and NO/sub x//SO/sub x/ interactions. (4) 11/78 Complete Final Report.

ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS/NOx;NOXIOUS GAS/CO (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: An exploratory development program of analysis and experimentation will be conducted to identify new stationary gas turbine combustion designs which reduce pollutant emissions. Primary emphasis will be placed upon control of the oxides of nitrogen (NOx) from both the thermal and fuel-bound sources, via dry techniques, while at least maintaining current control of carbon monoxide (CO) and unburned hydrocarbon (UHC).

APPROACH: The program is divided into four phases: (1) a review of the various combustor design approaches; (2) screening experiments of the various techniques; (3) design of full-scale combustors for a nominally 25 MW stationary gas turbine engine; (4) evaluation of the full-scale combustors in both test rigs and in an engine.
RESULTS: Through the performance of all four phases, the NOx concentration goals for the combustor designs are 50 ppmv when burning gas or oil containing no more than trace quantities of bound nitrogen and 100 ppmv when burning oil containing up to 0.5 percent (by weight) of chemically bound nitrogen. The CO concentration goal is 100 ppmv regardless of the fuel type.
PROJECT MILESTONES: (1) 12/75 Initiate Contract. (2) 5/76 Complete duty cycle review and combustor concept selection. (3) 10/77 Complete bench scale evaluation of combustor concepts. (4) 12/77 Bench scale testing final report. (5) 1/78 Complete construction of full scale combustors. (6) 8/78 Complete evaluation of full-scale hardware. (7) 10/78 Final Report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The research program will investigate aerodynamic phenomena in the control of pollutants from gaseous and heterogeneous combustion.
APPROACH: (1) Utilize recently developed optical and probing techniques to obtain detailed information on the chemical and physical processes occurring inside a combustor operating on gaseous and liquid fuels. (2) Compare experimental observations with results from a combustor flow analysis (PREP code) to further evaluate the theoretical model. (3) Further develop the combustor flow analysis for predicting the physical and chemical processes occurring in combustors operating on gaseous and liquid fuels. (4) Utilize information obtained from the experimental and theoretical investigation to evaluate potential emission control strategies for gaseous and liquid fuel combustors.
PROJECT MILESTONES: (1) 3/75 Initiate Contract. (2) 12/75 Complete Gaseous Fuel Experiments. (3) 2/76 Complete Phase I Report. (4) 8/76 Complete Liquid Fuel Experiments. (5) 12/76 Complete Experimental Final Report. (6) 3/77 Complete Development of Numerical Analysis Procedure. (7) 8/77 Complete Final Report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: Previous experimental studies indicate that staged combustion processes designed to reduce NOx emissions may enhance SO3 emission. The objective of this proposed program is to investigate the extent to which SO3/SO2 ratios may be increased when NOx emission is reduced under specific and well defined conditions of staged combustion.
APPROACH: For these studies, a simple two-stage laboratory burner will be used. Measurements of NOx, SO2, SO3, and temperature will be at the exit of each stage for both single-stage and two-stage operation of the burner under different operating conditions.
RESULTS: Results from these studies will be used to assess the extent to which enhanced SO3 production can be a problem in staged combustion systems.
PROJECT MILESTONES: (1) 7/77 Initiate Grant. (2) 1/78 Complete Assessment of Enhanced Sulfate Formation from Stage Combustion. (3) 2/78 Complete Final Report.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: The objective of this experimental research project is to develop advanced low emission high efficiency combustion techniques for application to industrial and utility boilers firing fossil and waste fuels. Primary emphasis will be on control of oxides of nitrogen (NOx) through modification of combustion conditions. The facility is a subscale versatile furnace, with capacity of 3 x 10 to the sixth power Btu/hr, capable of firing a variety of solid, liquid and gaseous fuels. The furnace may be operated either in the wall firing mode, using up to 10 individual burners, or in the tangential, corner, firing mode using up to 24 individual fuel/air nozzles. The research burners for single wall or opposed wall firing are of a variable swirl double concentric design with capacities of either 300,000 Btu/hr or 1.5 x 10 to the sixth power Btu/hr.
APPROACH: The first Phase effort will focus on NOx control techniques for conventional fossil fuels, primarily pulverized coal and residual oil. Initially, the combustion characteristics of the furnace will be studied to establish the correspondence to full-scale utility and industrial boilers. Subsequent testing will optimize NOx control through two-stage combustion, flue gas recirculation and low excess air firing for the wall fired and tangentially fired configurations. Emphasis will be given to identification of optimum staging conditions for reduction of NOx from coal fired boilers. The second Phase program will explore NOx control techniques for the firing of mixed conventional fuels, new alternate fuels, waste fuels, and mixtures of conventional fuels with alternate or waste fuels.
RESULTS: Waste Fuel Study
PROJECT MILESTONES: (1) 6/75 Initiate Work. (2) 12/75 Complete System Shakedown. (3) 6/77 Complete Control Technology Tests With Coal. (4) 7/77 Initiate Coal/Oil Slurry Tests. (5) 9/77 Complete Coal/Oil Slurry Tests. (6) 10/77 Initiate Waste Fuel Studies.

TITLE: Evaluation of Pollution Emissions from Industrial Burners Using Low-Medium Btu Gases from Coal
PROJECT NUMBER: P-624-A-23
PRINCIPAL INVESTIGATOR: Larson, D.H.;Waibel, R.T.;Fleming, E.
ADDRESS: 3424 South State St., Chicago, IL 60616
AFFILIATION: Institute of Gas Technology, Chicago, Ill. (USA)
MONITORING AGENCY: Environmental Protection Agency, Research Triangle Park, N.C. (USA)
DIVISION: Industrial Environmental Research Laboratory
MONITOR: Lachapelle, David G.
TYPE OF FUNDING: Contract No.-68-02-2643
77 FUNDING: Environmental Protection Agency FY77:$161,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (80%);COMBUSTION OR END USE (20%)
POLLUTANTS: NOXIOUS GAS/NOx (90%);PARTICULATES/Dust (10%)
CHARACTER OF STUDY: DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The work is designed to evaluate the severity of NOx emissions from combusting ''dirty'' low- and intermediate- Btu gases. It was concluded from an environmental assessment of commercial gasification processes that there are two different groups of ''dirty'' off-gas in terms of potential sources of NOx. Ammonia is contained in both of these groups. Group differentiation is based on the type and concentration of tar-oils and particulates.
APPROACH: In order to keep the proposed work plan within the program's objectives of problem definition, we will investigate one gas with the maximum number of potential NOx sources (ammonia, tar-oils and char) at both an intermediate- (oxygen) and low-(air) Btu heating value. The gas proposed for testing is Wellman-Galusha, based on the existence of a comprehensive data bank gathered for the combustion of clean Wellman-Galusha off-gas during a recently completed program for EPA (Contract No. 68-02-1360).
RESULTS: Two burners were selected for testing based on their extremely different aerodynamic characteristics and their large level of NOx emissions with natural gas. The emissions from the ported baffle burner (PBB; used in melting, reheating, and holding furnaces) is estimated at 92.4 x 10 to the sixth power lb NO2/yr while the gas momentum control burner (GMCB; used in cement, lime, copper, and alumina kilns and drying furnaces emits 441.0 x 10 to the sixth power lb NO2/yr. These burners are the two largest polluters in the industrial category. Their differences in combustion aerodynamics arise over the method employed to control the rate of fuel-air mixing and flame shape. The PBB uses swirl (tangential velocity component) of the combustion air, while the GMCB uses the quantity and velocity of the primary air coupled with the velocity of the fuel jet.
PROJECT MILESTONES: (1) 6/77 Work Initiated. (2) Complete baseline tests with natural gas. (3) 9/77 Complete PBB tests with ''dirty'' gases. (4) 1/78 Complete GMCB tests with ''dirty'' gases. (5) 2/78 Final Report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Demonstrate the environmentally sound use of western coal in combustion systems presently utilizing bituminous coals. Evaluate the emissions and unit performance aspects of converting combustion systems to western coal. Provide application guidelines and evaluate the cost effectiveness of utilizing western coals to their maximum extent consistent with viability and economics. Develop a correlation of sulfur retention by ash for the coals tested.
APPROACH: Ten boilers selected on the basis of design type and size will be systematically tested with each of two coal types corresponding to the design (Eastern) coal and a Western coal. Emissons (NO/sub x/, SO/sub x/, CO, HC and particulates) will be measured. Unit efficiency and the degree of convertibility will be assessed.
RESULTS: Work initiated on February 14, 1975. Testing of 10 boilers completed 8/77.
PROJECT MILESTONES: (1) 2/75 Work Initiated. (2) 4/77 Initiate Study to Correlate sulfur retention by ash. (3) 8/77 Complete testing of 10 boilers. (4) 12/77 Final Report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: A 24-month program has been initiated for design optimization, construction, and field verification testing of a prototype of the low-emission, high-performance residential warm-air-oil furnace which was developed under EPA Contract 68-02-1819.
APPROACH: The program will be conducted in two phases. The first phase will consist of analysis and laboratory testing to further optimize the furnace design and document its pollutant emissions and thermal efficiency performance. The optimum furnace's capabilities to operate with alternate fuels will also be evaluated. In preparation for the next phase, the logistics of field testing residential furnaces will be delineated. The second phase will be concerned with construction of a number of integrated furnace units to be field tested, their installation in selected residences and operation during an entire annual heating season.
RESULTS: The emission and performance characteristics of each test unit will be determined initially and remeasured monthly. Operating conditions will not be adjusted unless required to correct an unsafe or excessive emission condition. Complete descriptions of the furnace design and capabilities will be documented in a concise form usable by furnace manufacturers as a design guide book. The prototype units are being installed in six field locations for testing over a heating season.
PROJECT MILESTONES: (1) 9/76 Initiate contract. (2) 6/77 Complete laboratory optimization. (3) 9/78 Complete field evaluation documentation.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECT
PROJECT DESCRIPTION: Combustion air staging has been demonstrated to be a viable technique for the control of NO/sub x/ emissions from residual oil-fired package boilers. However, the reduction in oxides of nitrogen can be accompanied by an increase in carbonaceous particulate matter which eventually limits the amount of staging and thus the control of NO/sub x/. The formation of both pollutants is strongly linked to the fuel/air mixing process and the properties of the fuel. The overall objective of this program is to define the effect of fuel atomization techniques and of fuel properties on pollutant emissions.
APPROACH: Commercially available fuel atomizers will be surveyed and their characteristic features defined. The influence of various crude oil properties and the petroleum refining process on the characteristics of residual fuel oils will be explored.
RESULTS: The bulk of the program involves a series of experiments with a package boiler simulator to define the influence of various atomizers and fuel characteristics of pollutant formation. Two additional experiments are planned to aid in the interpretation of the experimental results generated by the package boiler simulator. These involve two specially built experimental systems to define the conversion of fuel-bound nitrogen to oxides of nitrogen and to characterize the details of the fuel spray under realistic conditions.
PROJECT MILESTONES: (1) 1/77 Initiate contract. (2) 3/78 Define preliminary criteria for atomization.

CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objective of this program is the establishment of design criteria for application of catalytical combustion to low emission, high efficiency stationary combustion systems.
APPROACH: To accomplish this, a research and development program consisting of experimental small-scale catalyst and combustor concept screening, experimental and theoretical scale-up work for promising concepts, and design development of prototype systems based on selected concepts has been outlined.
RESULTS: A number of catalyst systems have been evaluated by small-scale screening experiments, under a variety of conditions and for several different fuels. Based on the results of single-component catalyst systems, one multi-component catalyst system has been developed and has been tested extensively. The most promising systems will then be further tested by integration into a practical combustion system. These small-scale tests will investigate the effects of interstaged cooling, mixing of secondary air, and bed heat removal. Data from these tests will be used to define optimum catalytic systems and specific equipment applications, and also to identify the mechanisms of catalyst performance by correlating the results with system properties and by conducting detailed analytical studies with appropriate computing techniques, accounting for flow, diffusion, homogeneous and heterogeneous reaction effects, and heat transfer. Larger-scale catalyst system and system concept development experiments will be performed for verification and further development of optimum system, and conceptual designs of promising concepts will be made.
PROJECT MILESTONES: (1) 6/76 Initiate contract. (2) 10/77 Identify promising catalysts. (3) 2/78 Identify system design criteria.

CHARACTER OF STUDY: RESEARCH/Laboratory:RESEARCH/Applied (50%);ANALYTICAL (50%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The research activities being persued under this EPA in-house program fall into two categories: (1) combustion aerodynamics and (2) chemical kinetics. In the combustion aerodynamics category, studies are under way to define the influence of external combustor and burner variables on the flow field structure.
APPROACH: Specifically, a laser doppler velocimeter is being used to map the velocity and turbulence field in a simulated furnace. External variables being investigated are the burner confinement ratio, air swirl level, inlet quarl angle and inlet air velocity level.
RESULTS: The data so generated will be compared to predicted values from appropriate computer programs. In the chemical kinetics category, primary activity centers around the use of computer codes to analyze kinetics data and to define the mechanisms for the formation of NO.

PROJECT MILESTONES: (1) 10/77 Complete assessment of laser doppler velocimetry. (2) 2/78 Complete initial evaluation of numerical techniques for solution of navier stokes equations. (3) Perform various studies elated to fundamental combustion research. (4) Contract programs.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: This project will investigate, in an experimental system, the emissions from combustion of liquid and gaseous fuels at pressures between 1 and 8.5 atmospheres.
APPROACH: Comprehensive analysis for pollutants in addition to the criteria pollutants will be carried out over a range of operating conditions.
RESULTS: Capability for investigating several combustion system categories will be developed. Other areas of work will involve testing and modification evaluation for control technology on actual gas turbine and diesel engines. Water/fuel oil emulsions and catalytic exhaust devices are currently under study.
PROJECT MILESTONES: (1) 9/75 Completed NOx Control Evaluation of Water Injection on GT Engine. (2) 8/77 Completed NOx Control Evaluation of Water Injection on Diesel Engine. (3) 6/78 Complete Assessment of Catalytic Reactor on Diesel Engine. (4) 6/79 Complete Particulate Assessment on GT Engine and Diesel Engine. (5) 7/80 Complete High Pressure Combustion Study on Fluid Bed Model. (6) 9/81 Complete High Pressure Combustor Study.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: The proposed effort has as its objective determination of the extent to which modifications in basic combustion process and fuel constituents will affect the primary emissions of sulfates and other particulates and the extent to which such variables will affect atmospheric formation of particulates.
APPROACH: The basic technique being developed and employed is the coupling of an atmospheric reaction chamber to a laboratory boiler. Detailed boiler exhaust measurements will be performed and the progression of the photochemical conversion of these emissions to atmospheric particulates (such as sulfates and nitrates) will be monitored in the smog chambers. Conditions to be varied initially include combustion modifications, fuel sulfur level and full trace metal speciation and quantity.
RESULTS: To date the boiler has been baselined, and the atmospheric reaction chamber constructed. Actual testing will commence in mid to late August 1979.
PROJECT MILESTONES: (1) 3/77 Issue grant for smog chamber construction. (2) 6/77 Initiate baseline characterization of boiler. (3) 8/77 Initiate boiler/chamber studies. (4) 12/77 Complete initial assessment. (5) 2/78 Issue final report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECT
PROJECT DESCRIPTION: The objective of this project is to evaluate emission performance of alternate fuels and advanced concept control techniques. This evaluation provides an initial assessment of problems and/or promise of different technology approaches.
APPROACH: The study utilizes a 300,000 Btu/hr versatile experimental furnace for comparison of alternate fuel performance to previously established baselines for conventional fuel. The basic furnace allows for burner design changes as well as staged combustion and flue gas recirculation.
RESULTS: To date the project has evaluated: (1) fuel nitrogen conversion and control techniques for liquid fuels; and (2) alcohol fuels. A fuel gas generator system capable of producing simulated low Btu gases with variable CO to H2 ratios, CH4 content and NH3 content at a range of temperatures from 250 degrees F to 1350 degrees F is being delivered. The effort will center on concepts for control fuel and thermal NO/sub x/.
PROJECT MILESTONES: (1) 6/74 Initiate study of alternate fuels. (2) 10/75 Complete study of alcohol fuels. (3) 2/79 Complete study of low Btu gas combustors.

PROJECT DESCRIPTION: This in-house project is designed to provide the capability for fast response testing of commercially available and prototype combustion equipment and combustion improving devices. Measurements include oxides of nitrogen, oxides of sulfur, carbon monoxide, hydrocarbons, oxygen, carbon dioxide, smoke, and particulates (mass and size distribution). In some tests trace species and efficiency measurements are made.
APPROACH: Test equipment includes a residential warm-air furnace rated at 100,000 Btu/hr, a Scotch marine package firetube boiler rated at 2,400,000 Btu/hr, and a firebox firetube package boiler rated at 1,440,000 Btu/hr. Various burner designs are tested in these units. Fuel includes natural gas, distillate oil, and low sulfur residential oil.
RESULTS: Expected outputs include evaluations of water-in-oil emulsions, prototype or commercially available packaged boiler burners, and prototype or commercially available residential burners.
PROJECT MILESTONES: (1) 1/74 Publication of report on EPA in-house residential heater study. (2) 6/74 Preparation of APCA paper on EPA's residential heater program. (3) 10/74 Evaluation of Compagnie Francaise de Raffinage water/oil emulsifier. (4) 12/74 Evaluation of Cottell Reactor water/oil emulsifier. (5) 6/75 Preparation of APCA paper on water/distillate oil emulsifiers. (6) 8/75 Evaluation of Blue Ray Burner. (7) 12/75 Preparation of ASME paper on water/residual oil emulsions. (8) 7/76 Evaluation of Sono Tek prototype modulating burner. (9) 12/76 Preparation of ASME paper on EPA's residential heater program. (10) 1/77 Preparation of brochure for homeowners who heat with oil. (11) 3/78 Evaluation of Elf Union water/oil emulsion burner.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/South
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The feasibility of using industrial waste heat to control the environment of greenhouse will be evaluated relative to three major overall objectives: (a) Testing the capabilities of the environmental control system, (b) determining the effects of the greenhouse environments on the production of ornamental and vegetable bedding plants, cut-flowers, and foliage plants, and (c) evaluating the overall economics of the system.
APPROACH: Two plastic greenhouses, 27 ft by 72 ft quonset-type, will be used; one will serve as the control and the other as the waste heat research greenhouse. Conventional environmental control will be used in

the control greenhouse while both heating and cooling of the research greenhouse will employ air drawn through a cel-dek pad. Heating will be effected by passing air through the cel-dek pad containing cooling water heated by a boiler prior to distributing the air in the research greenhouse. Cooling will be effected by reversing the air flow direction. Ornamental and cut-flower, foliage plant, and vegetable species, which were selected in earlier studies will be grown in the year-long greenhouse production phase of the study. Economic studies will be made for each crop to assess customer acceptance and production costs.
RESULTS: The final report for the project will provide data, methods, and results relative to the horticultural, engineering and economic objectives of the study.
PROJECT MILESTONES: (1) 8/77 Laboratory Studies Completed. (2) 9/77 Greenhouses Constructed. (3) 8/77 Final Report Completed.

PROJECT DESCRIPTION: The objective of the proposed work is to evaluate the technical and economic feasibility of wet/dry cooling towers at specific sites for the purpose of water conservation and/or plume abatement.
APPROACH: An optimization technique will be used such that the wet/dry towers would have optimum dry and wet proportions with respect to capital cost and operational penalties plus quantity of make-up water or fogging impact. The program is conceived as consisting of a set of six tasks. The first is to lay groundwork and to accumulate data for this study. The next three are for water conservation in the coal-rich region in the western United States. For these three tasks, the wet/dry towers will be interfaced with a 1000-MWe coal fired fossil plant. The last two tasks are for plume abatement purpose in urban areas of the conterminous United States. For the last two tasks, the wet/dry towers to be evaluated will be interfaced with both a 1000-MWe fossil plant and a 1000-MWe nuclear plant. The study is scheduled to be completed in June, 1976.
RESULTS: A comprehensive report will document the methods and results of this study. The report will contain graphs and tables relating optimized wet/dry cooling systems and the reference system in terms of costs and wet/dry cooling systems for plume abatement at representative U.S. sites.
PROJECT MILESTONES: (1) 12/76 Draft report submitted to EPA for review. (2) 10/77 Final Report.

PROJECT DESCRIPTION: Evaluate techniques for the environmentally sound disposal of wastes from power plant nonregenerable flue gas desulfurization systems.
APPROACH: Wastes obtained from prototype scrubbers at the TVA Shawnee Power Station at Paducah, Kentucky have been placed in seven ponds nearby. Two ponds contain untreated waste (one with limestone waste and one with lime), three ponds contain chemically treated waste (two limestone and one lime), and two ponds contain untreated waste with an underdrain (one lime and one limestone). An additional pond is scheduled to be filled with oxidized sulfite waste later in 1977. Through periodic sampling and analysis of water, soil and sludge materials, an assessment is being made of current disposal technology. Engineering cost estimates for the alternative approaches are also being developed.
RESULTS: The project was initiated in September, 1974 and is scheduled to continue through March, 1978.
JECT MILESTONES: 6/78 Final Report to be Issued.

PROJECT DESCRIPTION: Develop key process steps, on a pilot scale, in the Pullman Kellogg "Kel-S" process for conversion of lime/limestone scrubbing waste to elemental sulfur and calcium carbonate.
APPROACH: Waste from a limestone scrubber will be reduced to calcium sulfide in a reduction kiln. The reduced product will be slurried then carbonated in a stirred reactor, releasing hydrogen sulfide gas (which can be readily converted to sulfur). The solid reaction products will consist of calcium carbonate and inerts (e.g., coal ash); the inerts will be separated from the calcium carbonate by air flotation. Design data from these pilot tests should be sufficient for scale-up to a large (prototype) test unit.
RESULTS: The project was initiated 8/22/77. Limestone scrubbing waste will be shipped to the reduction kiln site in September 1977.
PROJECT MILESTONES: (1) 1/78 Complete limestone scrubbing waste reduction to sulfide; issue interim report. (2) 4/78 Complete carbonation pilot plant construction. (3) 6/78 Complete carbonation tests. (4) Issue final report on project.

PROJECT DESCRIPTION: The process improvement objectives of the current program are to improve (1) alkali utilization, (2) SO2 removal, (3) sludge disposal properties, and (4) system reliability. Specific tasks to be performed are: limestone/lime advanced testing, sludge fixation studies, and economic studies.
APPROACH: Based on the results of the Phase III Test Program under predecessor Contract PH 22-68-67, and other supporting programs of EPA, Bechtel is performing an extended testing program at the EPA Alkali Scrubbing Test Facility, TVA Shawnee Steam Plant, Paducah, Kentucky, for the removal of SO2 and ash particulate from coal-fired furnace gas. The test facility consists of two parallel scrubber systems--a venturi followed by a spray tower and a Turbulent Contact Absorber. Each system is capable of treating approximately 10 Mw equivalent (30,000 acfm at 300 degrees F) of flue gas containing 1800-4000 ppm sulfur dioxide and 2 to 5 grains/scf of particulates. The scrubbers are integrated into the flue gas exhaust ductwork of boiler No. 10.
RESULTS: The major goals of the overall test program are (1) to characterize the effect of important process variables on sulfur dioxide and particulate removal, (2) to develop mathematical models for economic scale-up to full-size scrubber facilities, (3) to demonstrate reliability, and (4) to demonstrate process and equipment variations to improve the economics of lime/limestone scrubbing.
PROJECT MILESTONES: (1) 9/75 Publish First Progress Report. (2) 9/75 Conduct Industry Briefing Conference. (3) 9/76 Publish Second Progress Report. (4) 10/76 Conduct Industry Briefing Conference. (5) 9/77 Publish Third Progress Report. (6) 2/78 Complete Testing. (7) 5/78 Conduct Industry Briefing Conference. (8) 5/78 Publish Final Report. (9) 6/78 Complete Design/Economic Study Computer Program.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Northeast
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To investigate the effect of controllable system parameters in lime/limestone scrubbing systems in order to suggest methods of limiting oxidation to permit unsaturated operation. System parameters include the concentration and type of inhibitors and catalysts as well as physical factors which control mass transfer. (2) To investigate the possibility of maximizing the efficiency of oxidation in a hold tank when oxidation is forced by aeration. Factors important here are mass transfer (particularly as influenced by air bubble size and contact time) and the kinetics of the oxidation reaction.
APPROACH: Chemical kinetics and mass transfer will be studied in both clear solutions and slurries using stirred reactors and flow reactors in bench scale equipment. The results will be incorporated into a mathematical model to product methods of minimizing or maximizing oxidation in scrubbers.
RESULTS: Construct reactor and assemble apparatus. Study oxidation of bisulfite at pH 4-6 in flow reactor and batch reactor with single and multiple catalysts. Evaluate oxidation inhibitors. Study oxidation of

sulfite with high catalyst concentrations. Develop model for oxidation in slurries including mass transfer and kinetics.
PROJECT MILESTONES: (1) 9/77 Construct reactor and assemble apparatus. (2) 11/77 Low level catalyst studies in flow reactor. (3) 2/78 Bisulfite oxidation in batch reactor. (4) 6/78 Bisulfite oxidation with multipl catalysts. (5) 9/78 Effect of oxidation inhibitors. (6) 10/78 Concentration effects. (7) 9/78 Develop model for oxidation in slurries. (8) 6/79 Verify model. (9) 8/79 Final report.

PROJECT DESCRIPTION: Develop more economically feasible methods than those currently available for continuous treatment of flue gas cleaning (FGC) wastes. Initial efforts are to be concentrated on applying gravity sedimentation to rapidly, inexpensively dewater FGC wastes.
APPROACH: Develop methods for characterizing the physical properties and behavior of FGC wastes. Develop procedures based on the models presented herein to allow accurate design and analysis of gravity sedimentation units used in treating FGC wastes. Perform bench scale and pilot tests to evaluate the feasibility of using gravity sedimentation units for treating FGC wastes. Perform developmental studies to determine the best design for channel promoters. Bench scale and continuous pilot tests are to be performed to evaluate the feasibility of such devices for improving dewatering efficiency while treating FGC wastes. Assess filterability of different types of FGC sludges dewatered to different degrees and pumping requirements for the different sludges.
RESULTS: A gravity sedimentation system can now be proposed which should allow rapid dewatering of FGC waste to high concentrations (35 to 50 percent solids) without the need for chemical additives (flocculants). This system separates the clarification and thickening functions into two units which are much smaller and less expensive than conventional dewatering equipment. Further development of this concept is underway.
PROJECT MILESTONES: 8/78 Issue Final Report.

PROJECT DESCRIPTION: Determine the environmental effects of sludge disposal from a lignite fly ash SO2 scrubber (at the Milton R. Young Power Station, Center, North Dakota) in a decoaled open pit mine. Monitor the groundwater and leachate in the proximity of the buried sludge, as well as an exposed surface sludge pond. Investigate the properties of sludge, ash and soil. Assess the stability of mine spoil deposited over the sludge.
APPROACH: (1) Study available mine, sludge, and sludge disposal characterizations from a 3-year mining plan and laboratory analyses of pilot plant sludge. (2) Conduct additional sludge and mine characterization. (3) Conduct extensive sampling and testing prior to and subsequent to: (a) construction of an exposed surface sludge pond, and (b) installation of several groundwater and leachate wells in proximity of buried sludge in the decoaled mine seam and sludge pond, analyses of groundwater, leachate, supernant, sludge and soil for 15 month period. (4) Obtain and compile cost information from the power plant for inclusion in an economic study by Arthur D. Little, Inc. of disposal of sludge in decoaled mine seam. (5) Assess the data and prepare the final report, to be incorporated in an Arthur D. Little report for Contract 68-03-2334.
RESULTS: Project just initiated.

PROJECT DESCRIPTION: The Environmental Protection Agency in its energy and industrial processes programs is involved in numerous and varied environmental assessment and technology development projects. The objective of this project is to develop, evaluate, adapt, and provide guidelines for the application of quality control and assurance practices and procedures to various measurement systems, devices, and procedures utilized in the above projects.
APPROACH: The team used on this contract has formal training in chemistry, chemical engineering, electrical engineering, and statistics with experience in sampling and analyzing materials in stationary source processes, control devices, and effluent streams. A systems approach will be utilized in developing quality assurance plans consisting of an optimum mix of techniques such as material balances, interrelation of process engineering data and control system parameter values with effluent stream measurements, maintenance of quality control charts and other statistical techniques, and quantitative performance audits to yield the maximum quality assurance at the minimum cost. The basic plan is to prepare general QC/QA plans for a project type, then evaluate the plan by short term implementation at selected IERL/RTP project sites. After field evaluation a QC/QA specific to the project is prepared. A QA plan specific to the demonstration scale projects has been prepared.
RESULTS: Two quality assurance plans have been developed for demonstration projects and environmental assessment projects. Implementation of the quality assurance plan is underway for these two classes of projects.
PROJECT MILESTONES: (1) 3/76 QA plan for demonstration projects. (2) 9/77 QA plan for environmental assessment projects. (3) 11/77 QA plan for field studies. (4) 2/78 QA plan for pilot programs. (5) 5/78 QA plan for research and bench-scale projects. (6) 9/78 QA plan for industry system studies/pollutant system studies.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of the in-house projects is to perform various tests on the ESP, the versatile fabric filter test unit, the single compartment shaker baghouse, and the pulse-jet baghouses to improve particulate collectability in full size collection devices. New ideas and novel collection devices and materials will be tested on the pilot-scale units in order to determine if they do have a possibility for improving the efficiency of the present methods for collecting particulates.
APPROACH: Various materials will be tested in the versatile fabric filter test unit in order to determine the feasibility of using baghouses at temperatures up to 1500 degrees F. Fabric materials will be tested on both the high temperature versatile unit and the ambient temperature units. Fabrics will be tested for both efficiency and endurance. The ESP will be used to test various dust resistivities and also to determine the feasibility of installing a wet-scrubber at the outlet of the ESP. The units are versatile enough to test at many conditions which cover the range of most commercial units.
RESULTS: Current activity is being devoted to shakedown testing of the ESP and the versatile fabric filter test unit with a report to be issued for each area of study.
PROJECT MILESTONES: (1) 6/76 Complete report of filtration study of polyester filter bags. (2) 12/76 Complete report of filtration study of expanded PTFE bags. (3) 4/77 Install pilot-scale ESP. (4) 8/77 Complete installation of versatile fabric filter test unit. (5) 12/77 Issue report of initial ESP testing. (6) 3/78 Complete study of wet-scrubber at outlet of ESP. (7) 9/78 Complete study of resistivity of fly ash. (8) 6/78 Issue report of initial testing on versatile fabric filter unit.
