APPROACH: A collection of temperature-sensitive (ts) mutants (ts with respect to growth) isolate in the Laboratory (Schedule 189 No. P330, RPIS No. 001877N) from Chinese hamster cell lines offers a realistic means for assessing the mutagenicity of high LET alpha radiation from a stabilized Pu-238 source. In addition to measuring the reversion frequencies of ts to wildtype, we plan to quantitate the reversion rates of glycine-requiring auxotrophs and forward mutations rates at the HGPRTase locus as a function of exposure to either low or high LET radiation.
RESULTS: In the next 6 to 12 months, we expect to obtain (1) a comparison of the relative effectiveness of 250-KVP x rays and plutonium on mutation frequency in revertant and forward mutation systems and (2) the general shape of the mutation frequency vs LET curve. These observations are of importance because they provide an experimental basis for judging the hazard associated with plutonium deposited in tissues with special reference to the gonads.

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: This project is directed toward the promotion of a better understanding of the impact phenomena and the development of better techniques of evaluating the behavior of Type B packages subjected to impact loading. The study will address the milestone topics.
APPROACH: Calculational techniques to different mathematical models using a range of material properties. Specifically: (1) evaluate existing analysis methods for each specific load configuration; (2) identify material property needs; and (3) select procedures and develop analysis techniques for application to particular needs.
RESULTS: Expand the safety and integrity features of shipping containers that can be proven by analysis, rather than test.

POLLUTANTS: METALS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The major objective of this investigation is to assess the potential for environmental pollution from trace or minor elements which are discharged or emitted from stored coals or coal processing wastes and to begin to identify suitable environmental control measures, should they be needed. In addition, effluents from raw and cleaned coals will be examined for evidence of contamination by organic components.
APPROACH: To accomplish the program objectives, both laboratory and field investigations are being conducted. Appropriate coals, coal wastes, and climatic and storage conditions have been identified, and representative samples have been collected from the field. The trace elements, minerals, and organic matter of these materials are being characterized, and a preliminary identification of the components of potential concern will be made. In addition, the effects of weathering and aqueous leaching on the trace elements in the various coals and coal wastes are now being investigated in the field and under simulated environmental conditions in the laboratory.
RESULTS: This information will be used to delineate both the character and extent of specific environmental problems from the trace elements associated with coals and coal processing wastes. The latter stages of the program will be directed to identifying methods for controlling or preventing contamination from the trace elements and organic matter in coals and coal wastes. Finally, methods will be evaluated for economically recovering useful minerals or trace elements from coal refuse materials.
PROJECT MILESTONES: (1) FY 1976-FY 1976T Coal types, storage conditions, and environmental parameters identified. (2) FY 1977 Laboratory studies of weathering and leaching of selected coals conducted and field studies initiated. (3) FY 1978 Feasibility studies to be started.

TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$125,000
TECHNOLOGY: FOSSIL FUEL/Oil Shale (100%)
ENERGY CYCLE: EXTRACTION (40%);PROCESSING, CONVERSION (40%);WASTE MANAGEMENT (20%)
POLLUTANTS: PARTICULATES/Raw and spent shale (50%);ORGANICS/PAH;ORGANICS/Shale oil vapor (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Green River Formation
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The long-term goals of this relatively new program may be summarized as follows: (1) obtain samples of the potentially hazardous materials associated with oil shale mining and various processing stages and prepare them in a form suitable for exposure of small laboratory animals; (2) expose the animals by the relevant routes and study both nonlethal and lethal toxic effects; (3) determine by chemical analysis the tissue distribution of the applied substances, possibly including their metabolic products; (4) observe tissues microscopically and biochemically to determine the site and mode of toxic action, including tumor formation; and (5) assess the results in terms of existing or proposed acceptable exposure limits for the workers and the population. The description of the detailed program will follow this order of scientific progression.
APPROACH: Inhalation exposures of Syrian hamsters to both raw and spent shale were begun in mid-1976. Aerosol concentrations ranged from 13 mg/cubic m to 150 mg/cubic m respirable mass, and exposure times varied from a few hours to several weeks. Aerosols were generated from a Wright dust feed after material obtained from the Laramie Energy Research Center (LERC) was reduced to a fine dust by ball-milling. In an effort to deliver more precise doses and to enhance the response, several groups of animals were also exposed to suspensions of the same aerosolized shale material by intratracheal installation. Experiments involving intestinal tract exposure and skin and eye irritation will also be initiated. Fibrogenesis and carcinogenesis are the biomedical end points of primary interest in this program and will be studied by standard methods (e.g., histopathology, histochemistry, hematology, and blood chemistry). Immunological competence will also be tested. Except for those sacrificed for specific studies, most animals in these early groups are still alive, and definitive results cannot be reported. Early histopathology observations on the inhalation animals have shown a minimal response to oil shale, with a slight increase in macrophage activity being the only change noted. When the material is given in large amounts by direct tracheal intubation, macrophage response is more pronounced. One arimal

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: Project summary: The many desirable uses for hydrogen as a fuel all involve hydrogen safety problems. This project is designed to assist in evaluating the possibility of a hydrogen economy by performing a detailed review and study of all factors leading to transportation safety problems. Thus, the overall objective of the project is to define thoroughly the transportation safety problems and to recommend analytical and experimental problems that will lead to satisfactory solutions.
APPROACH: A working relationship will be established with organizations in government and industry competent in the handling and transportation of hydrogen gas and lithium hydride. The safety problems associated with any new materials and construction techniques will be identified and assessed.
RESULTS: The transportation safety problems leading to effective solutions will be recommended. A comprehensive report will be issued that identifies hydrogen transportation safety problems and recommends future analytical and experimental programs for their solution.

CHARACTER OF STUDY: RESEARCH/Theoretical (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: Several advanced technologies are being developed which are applicable as alternatives to existing energy system components. Among these technologies are nuclear fusion using magnetic confinement, magnetohydrodynamics for power generation, and superconducting magnets for energy storage. The magnets associated with these technologies are unshielded and, for the superconducting types, fields up to 10 Tesla can be generated (1 Tesla = 10,000 Gauss). This program will assess ways of controlling or limiting the magnetic fields beyond the site boundaries.
APPROACH: We will first establish magnetic field levels as a function of distance from various energy related devices including SMES magnets, MHD power sources, and fusion reactors. After this is completed we plan to determine types of control technologies which may be used to limit the fields. These technologies will include but not be restricted to: (a) shield coils, (b) ferromagnetic materials, and (c) fence placement.
RESULTS: We will estimate the cost of shielding the various devices described above to acceptable levels. As the acceptable level is not known, this task must be done in the form of tables and graphs in which the acceptable field is a variable.
PROJECT MILESTONES: A final report will be prepared by October 31, 1977.

PROJECT DESCRIPTION: The objective of this project is to examine the effects of dose, dose-rate and radiation quality in the development of late somatic effect, particularly neoplastic development, as well as their mechanistic basis in order to provide information necessary for the establishment of risk estimates in man for exposures to ionizing radiation.
APPROACH: In these experiments emphasis is being placed on the evaluation of the dose and dose rate relationships for carcinogenesis with high LET radiation and the ability of the host to respond to, modify, and/or repair the radiocarcinogenic injury induced. The host factors to be considered include cell killing, changes in cell kinetics, intercellular and intracellular repair, as well as the influence of the immune system on host-tumor interactions.
RESULTS: These experiments will provide important information necessary for the establishment of reasonable and reliable human risk estimates.
PROJECT MILESTONES: (1) Jan. 30, 1977 Report on dose response relationships for lung tumor induction with neutrons and the influence of repair on induction. (2) Jan. 30, 1977 Report on influence of dose and dose rate on neoplastic development in Balb/c mice, decide systems to examine in detail. POLLUTANTS: ORGANICS (50%);RADIATION (50%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The principal somatic hazard of chemicals (polycyclic hydrocarbons, nitrosamines, etc.) and radiation, as products of energy generation and utilization, is of course, cancer. This research program is concerned with the induction of cancer by these environmental hazards as they relate to endogenous RNA tumor viruses, which can also act alone as a carcinogen. It is important to determine if chemicals and radiation act as carcinogens primarily through interaction with endogenous RNA tumor viruses, and to determine the mechanisms by which such interactions may occur. It has been difficult to directly implicate endogenous viruses in radiation-chemical carcinogenesis because these viruses are regulated by normal cell control mechanisms. Therefore, whether the carcinogenic potential of chemicals or radiation is due to one or several mechanisms, the role of the endogenous viruses and cellular controls must be considered as interacting factors. The nature and mechanism(s) of these complex interactions form the basis of this proposal.
APPROACH: The research program is divided into three complementary approaches: (1) the mechanism of radiation and chemical activation of endogenous tumor viruses in cells culture; (2) the potential role of endogenous RNA tumor virus activation by chemical carcinogens in cell culture transformation, and (3) the mechanism of cellular control over RNA tumor virus expression and tumorigenesis.
RESULTS: We believe that extension of these studies in FY 1978 will contribute to understanding the control of viral tumorigenesis.
PROJECT MILESTONES: October 1978 Complete Phase II objectives.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To define quantitative dose response relationships for tumor induction or acceleration in mice exposed topically and systemically to carcinogenic hydrocarbons applied singly and in combination. To establish the physiologic basis for differences in sensitivity between inbred mouse strains as a means of estimating the range of expected human response variation.
APPROACH: Using the well characterized, sensitive and precise mouse skin bioassay, pure carcinogenic hydrocarbons will be tested at various concentrations to establish the form of the relationship between dose and response. Dose variables will include total dose, dose rate and exposure interval. Response variables will include strain and sex differences as well as tumor induction time (latency), tumor type and biological behavior. Interaction between specific hydrocarbons will be assessed by comparing the response obtained using equimolar mixture and that obtained over the same concentration range from each compound separately.
RESULTS: Knowledge of the mathematical relationship between dose and response combined with information concerning the physiologic basis for differences in response threshold will contribute to defining the risk potential associated with an increase, either in the number of persons exposed to the same or similar compounds or to an increase in the concentrations of compounds to which a smaller, occupationally exposed population might conceivably be exposed.

POLLUTANTS: ORGANICS (35%);RADIATION (65%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project includes a variety of investigations concerned with effects of chemicals and ionizing radiation on animals. The interaction of radiation and carcinogenic chemicals, as well as the effects of chemical modifiers on the induction of tumors in mice is the subject of one investigation. Another deals with alterations in esterases as the basis for an assay of potential carcinogenic chemicals. Another is concerned with the effects of ionizing radiation on very early stages of mouse embryos.

APPROACH: The test systems are inbred strains of mice in most cases. Mice are exposed to gamma or neutron irradiation, or are treated with chemicals by injection or by addition to their drinking water or food. Exposure to radiation is usually acute in these particular experiments while exposure to chemicals is for a period of a week to several months.
RESULTS: These studies are all directed toward providing information in animal models that will enlarge our understanding of the health effects of environmental pollutants. They may also provide useful assay systems, and also suggest means of ameliorating deleterious effects of various environmental agents.
PROJECT MILESTONES: (1) June 30, 1977 Data on the effect of the antioxidant BHT on life shortening, leukemogenesis and tumorigenesis induced by DEN and x-rays will be reported. (2) June 30, 1977 Report of additional data on the use of plasma esterase changes as an assay for organic pollutants of the environment. (3) September 30, 1977 Report on effects of ionizing radiation and organics on endocrine and immune systems.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective is to investigate the late somatic effects (tumor induction, degenerative diseases, life shortening) of gamma irradiation delivered at low and high dose rates in inbred mice, and to determine to what degree gamma irradiation is less effective when delivered at a low dose rate.
APPROACH: RFM and Balb/c mice have been exposed to a Cs-137 gamma source acutely or at rates as low as 1 rad/day to a cumulative dose of up to 300 rads. Gross autopsies are done when the mice are moribund or at death. Slides are prepared of various organs and tissues and histopathologic examinations are made.
RESULTS: Data on tumor incidence, degenerative diseases and life shortening will be collected and analyzed. These results are important in the establishment of risk estimates for human exposures to ionizing radiation.
PROJECT MILESTONES: (1) November 30, 1976 Report on the dose-response relationship for reticular tissue neoplasms. (2) June 30, 1977 Report on pathogenic effects of gamma rays delivered to mice at 8.3 rads/day. 77 FUNDING: Energy Research and Development Administration FY77:$152,000
TECHNOLOGY: NUCLEAR/General (10%);GENERAL SCIENCE (90%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The central objective of this project is to gain a more thorough understanding of both the maturation and the regulation of rapidly-proliferating cells of the blood-forming tissues. We have concentrated our efforts on the megakaryocyte-platelet system. Knowledge of this system will strengthen our understanding of normal control of cell growth and differentiation. In addition, it may provide insight needed to promote recovery when the system is malfunctioning, and to understand the pathogenesis of diseases of the blood-forming system.
APPROACH: These studies of megakaryocytopoiesis and platelet production are carried out in rats and in mice. In some experiments animals are injected with antiplatelet serum to produce thrombocytopenia so that the manner in which the system responds to a need for platelets can be studied. In other experiments tritiated thymidine is injected to determine which cells of the maturing megakaryocyte population are undergoing synthesis of DNA. The effects of presumptive thrombopoietic agents on maturation steps in megakaryocytopoiesis will be studied.
RESULTS: Expect to have data relating to the regulation of megakaryocytopoiesis, and to the response of megakaryocytopoiesis in altered physiologic conditions.
PROJECT MILESTONES: (1) July 30, 1976 Completion of a manuscript on the effects of thrombocytopenia on the endomitotic index of mouse megakaryocytes. (2) September 30, 1976 Completion of data collection on an exploratory experiment on the effects of a presumptive thrombopoietic agent on the endomitotic index of mouse megakaryocytes. (3) November 30, 1976 Results of preliminary tests of effects of plasma from platelet poor donors on the megakaryocytopoiesis of rats.

REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Southeast;COASTS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To isolate, identify, and study the mode of action of organic neurotoxins involved in energy production.
APPROACH: The toxins will be isolated by high pressure liquid chromatography, identified by gas chromatography or gas chromatography-mass spectroscopy, and their mode of action studied using biochemical techniques.
RESULTS: We expect to find some substituted phenols much more neurotoxic than phenol itself, and some chlorinated phenols that will tend to persist in organisms, perhaps also in man. If acetylcholinesterase inhibition is involved, it should be possible to set up an assay for human toxicity in vitro. We also expect to determine the effect of chlorination on fish pheromones, as it would occur in cooling waters.
PROJECT MILESTONES: (1) Sept. 1, 1977 Isolation of toxic pheromone analog from tung oil. (2) Sept. 1, 1977 Confirmation or rejection of hypothesis that the mode of action of neurotoxic phenols acts through acetylcholinesterase inhibition.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Radiation and other environmental insults not only have genetic and long-term effects on living creatures but also affect their development. Crustacea comprise more than 70% of marine plankton and are, in freshwater as well as in the ocean, an important link in the food chain. In addition they are in themselves an important edible species for humans in some parts of the world. With our new methods of triggering, stopping and reinitiating precocious, apparently completely normal molts, the growth cycle of Crustacea is now under the experimenter's control, making these animals useful objects for biological, biochemical, biophysical and ecological experiments. The research of the Growth and Regeneration group is specifically directed towards: (1) determination of the biological role of crustacean satellite DNAs, (2) control of molting and attendant phenomena in crustaceans and (3) the study of degeneration and regeneration of crustacean limbs.
APPROACH: The sequences of satellite DNAs are being studied by degrading primary RNA transcripts of the separated strands and identifying the oligo- and mononucleotide products. The biological role of satellites (i.e., the interaction of the separated strands of satellites) with double stranded DNAs is being explored by centrifugation of various types of gradients. The interaction between molting and regeneration studies are being pursued using parabiotic animals triggered to undergo precocious molts by limb autotomy.
RESULTS: The L-(light) strand of the hermit crab (Pagurus pollicaris) satellite II is composed of 33% C, 29% G, 27% A, and 12% T. Preliminary evidence indicates that a major sequence (58%) is GAC; other data indicate that this trimer is preceded by TC. H-(heavy) strand RNA transcripts so far analyzed (happily) have the complementary sequences. The H- and L-strands of guinea pig alpha-satellite associate with all naturally occurring double-stranded DNAs thus far studied.
PROJECT MILESTONES: The L-(light) strand of the hermit crab (Pagurus pollicaris) satellite II is composed of 33 percent C, 29 percent G, 27 percent A, and 12 percent T. Preliminary evidence indicates that a major sequence (58 percent) is GAC; other data indicate that this trimer is preceded by TC. H-(heavy) strand RNA transcripts so far analyzed (happily) have the complementary sequences. The H- and L-strands of guinea pig alpha-satellite associate with all naturally occurring double-strand DNAs thus far studied. (1) By 1977 the primary sequence of several satellites should have been determined and published. (2) The type of association observed between the separated single-strands of guinea pig and possibly mouse satellites and double-stranded DNAs should have been determined and published by 1977. (3) By using parabiotic crabs, we should be able to definitively establish whether the interaction between regeneration and molting is hormonally controlled. This should be completed by 1977.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To improve research programs in the Biology, Environmental Sciences, and Health Physics Divisions of ORNL through collaboration with our statisticians and mathematicians. (2) To conduct research in statistics and mathematics on basic principles and on problems arising in our collaboration.
APPROACH: Life scientists are given assistance in planning, conducting, analyzing and interpreting their investigations. This is accomplished by the application of a broad spectrum of statistical and mathematical methods and theory to their experiments and surveys. The research is accomplished through the independent and joint efforts of our professional staff to improve existing methodology and to discover new methods and principles. Computers are used effectively to aid both applied and basic research.
RESULTS: The use of appropriate statistical principles in design and planning will result in the completion of investigations in the life sciences with a maximum of valid information at a minimum cost of labor, materials and facilities. Statistical and mathematical analyses will result in extracting and quantifying information from investigations. The statistical and mathematical research will continue to produce publications and applications.
PROJECT MILESTONES: Mathematics and Statistics Research Department Annual Reports 7-1-76, 7-1-77. Biology Division Annual Reports 12-31-76, 12-31-77. Environmental Sciences Division Annual Reports 9-30-76, 9-30-77. Health Physics Division Annual Reports 7-31-76, 7-31-77

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The proposed investigation is directed toward understanding the biochemical basis for death of ultraviolet (UV) irradiated Escherichia coli and the mechanisms that cells use to repair damaged DNA. The work on cell death is based on the hypothesis that radiation causes derepression of operons and leads to irreversible physiological changes such as cessation of respiration. The biochemical steps leading to these changes and the control processes involved are being studied. The molecular basis of DNA repair, which may be closely coupled to irreversible physiological changes such as mutation and cell death is being studied in order to determine (a) the roles of various damage-specific endonucleases in DNA repair, (b) identification of enzymes involved in the excision of damaged DNA regions and (c) the role of various DNA polymerases in resynthesizing the excised region without introduction of mutations.
APPROACH: Column chromatography, including DNA cellulose affinity columns, will be used to purify enzymes (from E. coli and M. luteus) responsible for recognition of damage introduced by ultraviolet and gamma irradiation. The substrate specificity of these enzymes will be determined. In vitro systems (permeabilized E. coli cells and a T7 DNA replication system) will be used to study steps in repair of DNA subsequent to incision. The requirements of various enzymes and cofactors in the resynthesis step will be determined. Affinity chromatography techniques will be used to isolate altered pyridine nucleotide binding proteins from irradiated cells. We shall search for a radiation-induced enzyme that causes these alterations. With mutants deficient in cyclic AMP metabolism the respiratory control system will be studied.
RESULTS: Our product is fundamental information about how DNA is repaired and why cells die after being irradiated. We anticipate that the concepts emerging from this work will be applicable to radiation work on higher organisms and may lead to a rational basis for cancer radiation therapy, and to the understanding of the molecular basis of mutation caused by deleterious environmental hazards.
PROJECT MILESTONES: 9/77 Clarification of the role of cyclic AMP in radiation cell death by use of mutants deficient in cyclic AMP metabolism. Partial purification of enzymes involved in recognition of DNA damage. Determination of the role of various DNA polymerases in the resynthesis step of repair by the use of a model in vitro repair system. Comparison of the ability of live and dead cells separated from irradiated cultures to perform repair synthesis and postreplicational repair.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: We are trying to develop new and improved methods for the isolation, fractionation and purification of tumor-specific transfer factors, our collaborators in San Francisco identify donors for the preparation of TF by checking the lymphocytes of household contacts of the patient with the disease to see if any of the contacts have specific cytotoxic lymphocytes directed against a human tumor cell line of the same histological type as that of the patient's tumor. They then prepare a crude TF from a positive donor by a modification of the Lawrence procedure. They then ship the material to Oak Ridge where we attempt to purify it by various types of column chromatographic procedures. We are also trying to produce tumor specific TF in vitro by using a human lymphobastoid cell line that we obtained from Dr. Dimitri Viza that is reported to produce a specific TF when it is induced with a tumor specific TF.
APPROACH: We are taking advantage of the separations expertise that we developed during the past 10 to 12 years for the separation of amino acid specific transfer RNA, to guide our selection of the type of chromatographic columns and the operating parameters to purify TF and/or immune RNA. We have the cytotoxic assays set up in our own lab, that allows us to follow our fractionation procedures. Our own assays are confirmed independently in San Francisco, because we always ship them some of the fractionated material in order to compare results.
RESULTS: We expect to prepare several tumor-specific TF preparations in a high state of purity. At this point we hope to interest clinicians to use TF as another therapeutic modality to treat selected patients. It is also generally known that when lymphocytes are activated, they produce a variety of substances, called lymphokines, that have effects on other cells that are involved in the overall in vivo cellular immune response. If our in vitro system using the human lymphoblastoid cell line can be shown to act as reported, we expect to prepare a number of lymphokines in a high state of purity, which will be made available to the immunology community at large. Hopefully the availability of such materials for many immunologists might be useful in breaking down some of the clouds of mysticism that surround the field of cellular immunity.
PROJECT MILESTONES: (1) Jan. 15, 1977 Proof of relationship of transfer factor to immune RNA. (2) Sept. 15, 1977 Start large scale production of cancer specific transfer factor. (3) Jan. 15, 1978 Start production of one or more lymphokines of interest to the immunology community.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Studies of the enzymology of nucleic acids, particularly those of replication and transcription, are crucial to the elucidation of cellular control mechanisms operating in normal and viral-infected systems. Investigations are in progress using enzymes and mutants of both prokaryotic and eukaryotic systems. An understanding of replication and transcription processes is essential to the elucidation of the mechanisms of mutagenesis and carcinogenesis in relation to cellular regulatory systems.
APPROACH: DNA replication upon T5-phage infection is being studied by characterization of phage-induced DNA polymerase and other proteins. Knowledge gained is being applied to the eukaryote yeast. DNA replication during M13 phage infection, that closely resembles RNA tumor virus multiplication, is being intensively studied. Isolation and characterization of promoter regions in viral DNAs, that are involved in initiation of transcription and replication, are being actively pursued.
RESULTS: Protein factors involved in T5 DNA synthesis will be characterized to determine whether they are initiation or elongation factors. Their origin, whether host or phage induced, will be determined. Interaction of factors with primer-template DNA and with the polymerase will be studied in hopes of reconstituting the DNA replication system in vitro. The studies on dnaC, DNA ligase, 5' exonuclease and other host functions on M13 DNA replication sould be completed. An in vitro rolling circle system for M13 ss DNA synthesis would be developed. Studies with in vitro or semi in vitro system for SV40 or adenovirus DNA and RNA synthesis would be initiated. Further studies on human cell DNAases, particularly those possibly involved in restriction of foreign DNA, and DNA damaged after radiation and chemical insults, would be carried out. Studies of promoter and other active regions of single-stranded M13 DNA should be completed, providing a clearer picture of the functional topology of the M13 genome. Similar results are expected from studies with animal viral DNA. The hope to set up in vitro system for late T4 mRNA synthesis. The purified modified RNA polymerase will be used together with vegetative DNA from T4-infected cells. Other possible necessary factors, furnished by adding small amounts of a supernatant fraction from infected cells, will be characterized. By using various RNA tumor virus systems, we hope to learn more about the specificity of potential tRNAs and other RNAs as primers for viral RNA replication.
PROJECT MILESTONES: (1) T5 replication: Reconstitution of in vitro system 9-30-77. (2) Isolation of proteins

involved in yeast replication 9-30-78. (3) Host functions in M13 replication 6-30-77. (4) Setting up in vitro systems for SV40 replication and transcription 9-30-77. (5) In vitro system for late T4 synthesis 9-30-77. (6) Identification of primer molecules for tumor viral RNA replication 6-30-78.

PROJECT DESCRIPTION: Understanding excitation energy transfer in nucleic acids and photosynthetic lamellae.
APPROACH: For photosynthetic systems the approach includes: (1) the study of chlorophyll fluorescence in plants to get information about the first step in photosynthesis; (2) studies of fluorescence depolarization and other optical anisotropies involving photosynthetic pigments in oriented lamellar systems to determine orientational correlations of pigment molecules in vivo; (3) construction of refined theoretical models of excitation transfer among pigment molecules to determine whether the simple antenna-reaction center dichotomy holds for green plants; (4) isolation of green-plant chlorophyll-proteins and other photosynthetic membrane particles for photochemical and biochemical studies. Our approaches to the problems of singlet and triplet excitation transfer in nucleic acids include: (1) sensitized fluorescence and phosphorescence kinetic studies of nucleic acids with intercalated dyes; (2) fluorescence depolarization studies of nucleic acids; (3) calculation of fluorescence and phosphorescence quenching kinetics in one-dimensional model systems; (4) experimental studies of laser-excited absorption and fluorescence, and their theoretical interpretation.
RESULTS: Contributions to the development of (1) technologies for the conversion and storage of solar energy, and (2) new biophysical methods for measuring the effects of certain pollutants on the conformations of native nucleic-acid-containing structures such as chromosomes.

DIVISION: Division of Biomedical and Environmental Research
MONITOR: Carter, C.E.
TELEPHONE: F233-5468
TYPE OF FUNDING: Contract No.-W7405-ENG-26
77 FUNDING: Energy Research and Development Administration FY77:$197,000
TECHNOLOGY: FOSSIL FUEL/General (30%);NUCLEAR/General (70%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Enzyme regulation is being studied from three points of view. One is to determine how certain enzymes that have undergone an alteration through mutation can be restored in their catalytic activity by a suppressor mutation. The second is to use hemoglobin and serum albumin as model proteins to study the mutagenic effect of x-rays and other mutagens. The third is to develop assays and procedures that will use enzymes to monitor the process of cancer initiation and development.
APPROACH: The suppressor mutation is presumed to exert its influence on four target genes in Drosophila melanogaster, through transfer RNA. The tRNAs of the suppressor mutant are being compared to those of wild type. In addition the biochemical abnormalities of each target gene is being studied. The mechanism of radiation mutagenesis in the mouse is being studied through changes that occur in hemoglobin and serum albumin. The mechanism of carcinogenesis will be studied through specific enzymes that are controlled by genes on the x-chromosome of the mouse. Three different enzymes are under study to determine their suitability for this purpose.
RESULTS: In the suppressor mutant I expect to find chromatographic and chemical differences between one of the tRNAs of suppressor mutant and wild type. In the study on mutagenic effects of x-rays I expect to find altered forms of hemoglobin and serum albumin at a frequency of 1/500 to 1/25,000. I also expect that such altered hemoglobin and serum albumin mutants will be useful as models of human hereditary abnormalities. The preparation of enzyme tools to study the carcinogenic process will result in a more detailed understanding of the three enzymes, alpha-galactosidase, glucose-6-phosphate dehydrogenase, and ornithine transcarbamylase, and in the production of mutants that have abnormal forms of these enzymes. These enzyme tools will allow us to determine whether a cancer originates in a single cell alteration or a change in many cells in the tissue affected.
PROJECT MILESTONES: Publish results of research in biochemical literature. (1) Tyrosyl-tRNA Synthetase: the basis for its specificity for tRNA Isoacceptors, Dec. 1976. (2) Alpha-galactosidase of the mouse: characteristics of the two electrophoretic forms, Dec. 1976. (3) Isolation and characterization of pteridines from heads of Drosophila melanogaster by a modified thin layer chromatography procedure, Sept. 1976. (4) Mechanism of suppression in Drosophila. V. Localization of the purple mutant of Drosophila melanogaster in the pteridine biosynthetic pathway, Sept. 1976. (5) Rapid, high resolution electrophoresis of hemoglobin on starch gel, Dec. 1976. PROJECT DESCRIPTION: (1) Studies are being done to determine the quality and frequency of various kinds of genetic damage induced by x-rays at the hemoglobin loci in germinal cells of mice. This should provide a better understanding of the types and frequencies of events that are likely to be associated with mutations at the 7 specific loci extensively studied by W. L. russell. (2) Studies are being done to determine the influence of specific alleles on the general physiology of congenic strains of mice. (3) Methods are being developed to evaluate the mutational, toxic and physiological side effects of chemicals, such as immunosuppressant drugs. Mutations produce aberrant cells that may become cancerous and the incidence of tumors increases following treatment with immunosuppressant drugs, yet the inherent mutagenicity of many of these compounds has never been tested.
APPROACH: (1) Hemoglobins from mice that express x-ray induced mutations are being analyzed chemically to identify amino acid substitutions or complete absence of gene products resulting from nucleotide substitutions, frame shifts or deletion of genes at the hemoglobin loci. (2) Congenic strains of mice differ from one another at very restricted regions of the mouse genome; therefore, congenic mice are useful to study the effect of specific alleles on immunology, cellular differentiation and function, ageing, viral infection and pathological diseases. (3) Tests are being made to determine whether the mutagenicity of immunosuppressant compounds can be measured in vivo by analyzing the frequency of induced HGPRT/sup -/ colony forming stem cells in bone marrow. Depressed cellularity and stem cell survival, as well as measurements of recovery, are used to assess toxicity.
RESULTS: These studies will define the nature of x-ray and chemically induced mutations at restricted regions of the mouse genome in both germinal and somatic cells. The data will also permit comparisons of the effects of x-rays with various chemicals in somatic and germinal cells. If somatic cells reliably indicate the quality and extent of hazard of similar insults to germinal cells, then somatic cell mutational assays should be used more extensively for screening purposes because costs for somatic cell testing are considerably less than for germinal cell testing. Direct tests for the mutagenicity of a number of compounds already being used in humans should make us aware of the balance between the benefits and hazards of many chemicals that have not been adequately tested.
PROJECT MILESTONES: The chemical definition of the x-ray induced mouse hemoglobin mutants will be completed. Studies will proceed to determine whether the deficiency of expression of the alpha-chain gene product is due to gene inactivation or true deletion of the gene. These studies are being done in collaboration with Dr. French Anderson, NIHL. The effects of immunosuppressant drugs as potential mutagens on the hematopoietic stem cells will be studied.

PROJECT DESCRIPTION: Provision of fundamental information for the estimation of the genetic hazards of exposure of human beings to ionizing radiation.
APPROACH: Since none of the human data, not even the Hiroshima and Nagasaki studies, have provided information adequate for the estimation of genetic risks, the approach has been to do experimental work with mice. This long-term project is providing the most extensive set of data in the world on gene-mutation induction by radiation in mammals. The other major category of genetic damage, chromosomal aberrations, is also being extensively studied. Complementing these studies on specific types of genetic damage is an approach to measure the induction by radiation of a whole class of congenital abnormalities.
RESULTS: Completion of the data necessary for a full understanding of the influence on mutation frequency of such physical factors as dose, dose rate, dose fractionation and radiation quality, and such biological factors as sex, cell stage, age, and interval between irradiation and fertilization. Determination of the nature, extent and persistence of the actual anatomical and physiological damage expressed in descendants of irradiated populations.
PROJECT MILESTONES: Four of the milestones to be aimed for in the near future are: (1) Completion of experiments to collect more data on the lowest dose rate feasible in mouse experiments, in order to gain a better evaluation of the risk at low levels of radiation in man. (2) Collection of new data on mutation induction in female mice involving germ cell stages that may be more comparable to the cell stage primarily at risk in women. (3) Determination of the frequency and nature of radiation-induced congenital skeletal defects as an example of part of the overall damage to be expected in descendants of irradiated populations. (4) Initial results on gene mutation induction by plutonium in mice.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Events occurring during meiosis determine the viability or nonviability of the progeny. Recombination and chromosome distribution are the two meiotic processes of prime importance in this regard but many aspects of both remain ill defined. We are attempting to (1) more precisely establish the time of recombination in relation to other events in the meiotic cycle, (2) elucidate the biochemical mechanism of its operaion, (3) define the role of the synaptonemal complex in the process, (4) clarify the dependency of subsequent events, particularly correct chromosome distribution on recombination and (5) evaluate the way in which mutations and perturbations by heat and radiation act to modify the normal course of meiosis.
APPROACH: Our studies include genetic, biochemical and electron microscopic approaches to these problems. We have mutagenized approximately 20,000 third chromosomes with EMS and recovered 20 new mutants representing two closely linked loci which are defective in recombination. Each mutant is being characterized genetically, biochemically, and at the EM level for a correlation of its effect on recombination, enzyme activity and the synaptonemal complex. We are developing ways to isolate and examine enzymes involved in the recombination process. When the gene coding for such an enzyme is located on the genetic map, mutants which affect its catalytic activity and ones affecting recombination may be induced. Temperature studies are being pursued to mark the time of crossing-over of specific genes. Thermal effects on recombination frequency and interference patterns are so great that they are of special interest in themselves.
RESULTS: Electromicrographic studies of certain of the recombinationless mutants are revealing structures resembling synaptonemal complexes lying in the cytoplasm rather than within the nucleus and exhibiting characteristic morphology from mutant to mutant. Genetic studies of two different alleles at the other rec/sup -/ locus show polarized reductions in exchange with the greatest effects distally or proximally, depending on the allele. A third allele exhibits temperature sensitivity which will be of great value for localizing the recombination event more precisely. For the first time loci for DNase enzymes are being mapped. One gene product which acts on native DNA has been precisely located and a mutant has been induced at this locus. The other loci specify DNases acting on denatured DNA. One has been mapped precisely and the other localized to a chromosome arm by analysis of melanogaster-sinulans hybrids. Their roles in genetic recombination are being examined.
PROJECT MILESTONES: (1) Aug 1976 Electron microscopic study of the aberrant synoptonemal complex material within the cytoplasm of 15 new C(3)G mutants. (2) Oct. 1976 Genetic and biochemical studies of DNase I. (3) Dec. 1976 Distributive pairing between chromosomes 2 and 4. (4) Mar. 1977 Correlation of crossing-over in region of histone genes. (5) June 1977 Study of alleles at the new rec/sup -/ locus. (6) Aug. 1977 Pattern of heat and interchromosomal effects on recombination. (7) July 1978 Study of serial reconstruction of normal and rec/sup -/ oocyte nuclei labeled with /sup 3/H thymidine. (8) Sept. 1978 Report on DNase II and III genes polymerase genes. (9) Dec. 1978 Report on electromicroscopic studies of heterozygously inverted genomes.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Our work is concerned with the mechanisms by which eukaryotic cells undergo mutagenesis induced by ultraviolet light, ionizing radiation (e.g. gamma rays) and certain chemical mutagens (e.g. hydrazine). With standard genetic and biochemical techniques, we hope to gain considerable insight into the cellular processes responsible for mutation fixation, as well as eventual mutational expression as mutant gene product. Of particular interest is the underlying molecular basis of the relationship between mutagenesis and repair mechanisms.
APPROACH: We are using the yeast Saccharomyces cerevisiae and to a more limited extent the yeast-like unicellular fungus Ustilago maydis as model eukaryotic microorganisms with which it shall be possible to coordinate genetic and biochemical approaches to studies of mutation pathways. UV and chemical mutagenesis are being investigated with special emphasis on genetic modification of mutation potential, through use of various mutants that confer mutation sensitivity or mutation resistance. Many experiments are designed to investigate the dependence of induced mutability on post-treatment growth in complete media. Another approach concerns the use of an in vivo enzyme assay (nitrate reductase) in Ustilago that can detect mutational events in cells at the level of active gene product rather than at the level of mutant colony.
RESULTS: Genetic analysis and preliminary characterization of ultraviolet mutation resistant (umr) mutants of yeast have been completed. Effects on UV-induced forward and reverse mutation, on UV sensitivity, and on sporulation ability have been studied. We have found that the chemical, hydrazine, is mutagenic in yeast. The effect on forward mutation at CAN1 is strongly dependent upon post-treatment cell division, suggesting a possible mechanism involving mispairing of an altered DNA base at chromosome replication. The in vivo assay for nitrate reductase enzyme in Ustilago has been used successfully to monitor the appearance and frequency of mutant gene product (active enzyme) after mutagenic treatment with gamma rays. We conclude that radiation-induced mutagenesis can occur in nonviable cells under nongrowth conditions with equal frequency as among surviving cells, suggesting that error-prone repair processes may be constitutive in this eukaryote rather than inducible by the radiation.
PROJECT MILESTONES: (1) 1 Nov. 1976 Hydrazine mutagenesis of yeast: Loss of mutability during growth inhibition. Publication to be prepared. (2) 1 Jan. 1977 Genetic control of hydrazine mutagenesis investigated. (3) 1 June 1977 UV, chemical mutagenesis of Ustilago.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This work will emphasize two closely related themes. One is the use of several species of bacteria in the evaluation of mutagenic events induced by chemical and physical agents, and the other is a detailed study of those mutagenic events which specifically affect the ability to accomplish cell division. Because of the rapidity and relative simplicity of the individual experiments which must be conducted, it is realistic to pursue both themes with a small research group. As a result of activities included in the first theme, we hope to provide a better understanding of the details of chemical mutagenesis and a greater appreciation of the extent to which the result of mutagenesis studies in microorganisms can be extrapolated to higher organisms. Work accomplished under the second theme should lead to a better understanding of the genetic and biochemical events involved in normal and abnormal cell division. This, in turn, may contribute to an appreciation of the differences between normal and cancerous cells.
APPROACH: The electron microscope is the primary tool used for investigation. Currently methacrylate compounds with free reactive groups (hydroxyl and carboxyl) are being tested as possible substrates for attachment of antibody molecules. To accomplish these goals, use will be made of a variety of bacteriological and biochemical techniques. Most of these are already well established, but it is anticipated that some novel ones will have to be developed. For most of the work, standard laboratory equipment and reagents will be suitable. Some specialized equipment may be required for time lapse cinematographic studies.
RESULTS: The results of this work will be communicated in the form of open literature scientific publications and by oral communication with investigators in ORNL and elsewhere. These results should influence the interpretations put on the results of mutagenic assays done by other groups and should increase our knowledge of the basic events involved in normal and abnormal cell division.
PROJECT MILESTONES: (1) Development of a mutagenic assay system in bacterium not previously used for such studies, July 1, 1977. (2) Establishment of an assay system for cell extracts that stimulate cell division, July 1, 1977. (3) Mutagen assay system used on energy-related pollutants and results compared to results obtained with Escherichia coli and Salmonella system, July 1, 1978. (4) Attempts to isolate cell division promoting extracts from organisms other than E. coli will have been made, July 1, 1978.

PROJECT DESCRIPTION: The primary objective of the Mammalian Cytogenetics program is to establish baseline data for estimating human genetic risk from acute and chronic high and low dose radiation and putative chemical mutagens.
APPROACH: Chromosome damage is quantitatively analyzed after either in vivo or in vitro exposures of mammalian, including human, cells. The cells of principal interest are circulating immature lymphocytes and all maturing stages of male and female germ cells. Cross species comparisons are made in the in vitro studies and existing quantitative differences are used to correlate human germ cell hazards from those experimentally determined in the mouse and marmoset. The radiation treatments range in dose rates of 100 rad/minute to 0.001 rad per minute, the data from the latter dose rate being vital to estimate hazards from environmental, and reactor introduced, radiations. Similar approaches are being used to generate baseline data for estimating risk from chemical mutagens. At the moment known mutagens are being used. These are triethylenemelamine, cytosine arabinoside, and myleran.
RESULTS: The low dose rate experiments with the mouse are designed to test the suggestion that there will be no difference between acute and chronic exposures with low LET radiations at low doses (<50 rad). The dose response curve for reciprocal translocations induced in spermatogonia of the marmoset will be studied in great detail at low acute doses. The marmoset appears to be a suitable model for the human as far as translocation induction and recovery are concerned. Using the information from the mouse on the relationship between chronic and acute exposures at low doses, it should be feasible by back extrapolation of the marmoset dose response curve to estimate the genetic hazard from reciprocal translocations to man for environmental level chronic radiation exposures.
PROJECT MILESTONES: Precise human vs. mouse cytogenetically based comparison of radiosensitivity (June 1977).

Determination of female mouse radiosensitivity to X ray-induced chromosome damage as function of oocyte maturation (Sept. 1977).

PROJECT DESCRIPTION: To develop automated instrumentation and methodologies for blood sample preparation, identification of mutant proteins therein, and the assessment of their rates of occurrence in human populations.
APPROACH: Automated preparation of whole blood samples yielding plasma washed erythrocyte, and red cell hemolysate fractions for screening for mutant proteins. Investigate high-resolution chromatographic separation and direct measurement of isoenzymes; and heat denaturation and chemical activation or denaturation, differential kinetic assay, and mathematical deconvolution methods for detection and quantification of mutant proteins by kinetic assay on the Centrifugal Fast Analyzer.
RESULTS: Automated system for the fractionation of whole blood into plasma washed erythrocyte and red cell hemolysate fractions; and the transfer of these fractions into cryovials for storage at ultralow temperatures. Develop methodologies and instrumentation for the screening of human populations to assess rates of genetic mutation caused by chemical or energy source perturbations in the natural environment.
PROJECT MILESTONES: (1) Fabrication of a complex prototype blood preparation (BP) system and verification of its design properties. (2) Evaluation of the BP system in the Human Genetics Laboratory, University of Michigan. (3) Development and successful testing of fast kinetic procedures on the prototype portable Centrifugal Fast Analyzer. (4) Development of a high-resolution chromatographic system complete with detection system capable of separating and quantifying isoenzyme systems such as lactate dehydrogenase and creatine phosphokinase.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Our studies on gametogenesis of the mouse are designed to provide information required for interpretation of experiments on the genetic effects of radiation, chemicals and other agents, and to provide guidelines for extrapolation of these results to man. This involves the assessment of cell survival after different doses and agents, and the demonstration of changes in the cell populations surviving different treatments (differential cell survival) as modifying factors in the mutational response. Our precise timing of spermatogenesis allows relation of genetic effects to specific cell stages at time of treatment. We should like to obtain similar information for the female in order positively to identify the oocyte stages at which number of mutations induced by radiation shifts from a low to high frequency. These results are relevant to evaluating the significance of genetic effects in the mouse oocyte for the estimation of hazards to the human female.
APPROACH: Our present data suggest that once formation of the zona pellucida has begun, the follicle and its contained oocyte progresses at a rate unaffected by pregnancy or irradiation. However, rate of recruitment from earlier oocyte stages may be altered. There also is a possibility that a few of these earlier stages contribute to ovulations in the 6-7 week interval of high radiation-induced mutation frequency. Since N(acetyl-H-3)D-glucosamine cannot be used to time development of oocytes prior to zona formation, H-3-thymidine will be used as a label to study growth kinetics of early follicles. Spermatogonial stem cell survival gives a linear fit over the 100-1000 R acute exposure range. However, cells surviving both a single 1000 R exposure and 1000 R given as two 500 R fractions 24 h apart differ qualitatively from those surviving doses of 100-600 R. Furthermore, there is a difference in the cell populations surviving the two 100 R doses. Multiple injections of H-3-thymidine will be given prior to irradiation in order to label a large proportion of the stem cell population. Frequency of labeled stem cells then will be determined at intervals giving minimal cell counts in order to further determine the possible role of differential cell survival in observed mutation frequencies.
PROJECT MILESTONES: We should complete a study on response of spermatogonial stem cells of the mouse to acute X-ray exposure and a test for differential cell survival as affected by dose and dose fractionation by January 1, 1977. By July 1977 we should have a precise estimate of the stage at which radiation

sensitivity of the mouse oocyte shifts from very low to high. This then will allow study of the changes in the oocyte associated with the shift in mutational response.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) Chromosome aberrations present a genetic risk to human populations snce they are induced and transmitted with relative ease from mutagenic exposure of certain gametogenic stages of mammals. Various chromosomal conditions can lead to complete male sterility or to severe disturbances in fertility. One set of objectives of this project is to study the relation of such chromosomal conditions to the circumstances of exposure and to investigate the basic cytogenetic causes of disturbances in male fertility. (2) Another objective of this project is to develop the use of certain chromosome aberrations as tools in basic cytogenetics and in the detection and measurement of other types of mutations, including point mutations. Such methods are being tested for their value in providing information on mammalian mutagenesis that is supplementary to that obtained in specific-locus studies.
APPROACH: For most of the studies in this project, we utilize chromosomal aberrations in the mouse that are being induced and recovered in the course of mutagenesis studies elsewhere in the Mammalian Genetics Section, ORNL. Such studies are performed with a variety of mutagens on different gametogenic stages. In portions of the project dealing with male fertility, those sons of mutagen-treated mice that show fertility impairments are studied morphologically, histologically, and cytologically (using recently developed banding analyses). The effectiveness of chemical and genetic therapy for infertility is also being explored. In other portions of the project, we use genetically characterized deficiencies as tools to search for new lethal, subvital, and visible mutations within the chromosomal segments involved in such deficiencies. We also carry out cytogenetic investigations of special chromosome aberrations (e.g., tandem duplication, pericentric inversion) to explore their possible use as tools in future mutagenesis studies.
RESULTS: The types of chromosomal conditions affecting male fertility will be identified, and common pathways may become apparent in the etiology for sterilities caused by different chromosomal conditions. Information will become available on the types of mutagenic exposures that cause fertility impairment in male progeny. Other experiments in this project will provide information on the relative numbers of lethal, subvital, and visible mutations that occur within a given segment of the mouse genome.
PROJECT MILESTONES: (1) July 1977 Completion of histological and cytological study of sterile sons of male mice treated with each of three chemical mutagens in each of several postspermatogonial stages. (2) July 1977 Mutagen treatment for new experiment to detect mutations in given segment of Chr 7. (3) December 1977 Completion of study on sterile sons of male mice exposed continuously to sodium bisulfite (a metabolite of SO/sub 2/). (4) December 1977 Completion of preliminary study on possible genetic therapy for genetically caused male sterilities. (5) December 1977 Completion of first experiment to detect new mutations in a given segment of Chr 9. (6) December 1977 Completion of preliminary phase of investigations on a tandem duplication and a pericentric inversion. (7) July 1978 Completion of preliminary exploration of the meiosis-to-first-cleavage interval for the study of specific aberrations.

PROJECT DESCRIPTION: To define the role of radiation induced immunodepression in the mechanisms of radiation carcinogenesis and life shortening.
APPROACH: The extensively studied murine model is being utilized. To determine the effect of acute, intermittent and protracted immunodepression on the rate of tumor induction and metastatic spread, immunological parameters of humoral (T, B and stem cell proliferation, antibody response) and cell-mediated immunity (GVHR, delayed type hypersensitivity, cellulose cytotoxicity, T-cell mitogenesis) are monitored at intervals following irradiation over the entire lifespan of the animal as many tumors have long latent periods, immune capacity declines with age and radiation-induced immunodepression reoccurs late in life although initial recovery is observed. By correlating the immune competence of non-irradiated control, irradiated, and irradited immunologically reconstituted animals with specific patholcgy, tumor incidence, metastatic and mean lifespan, the significance of a sub-optimal immune system in radiation-induced oncogenesis and life shortening can be determined.
RESULTS: It is expected that radiation immunosuppressive forces can be segregated from inductive forces and their significance assessed in radiation carcinogenesis and life shortening, although it is recognized

that immunodepression may be an integral part of the inductive mechanism.
PROJECT MILESTONES: (1) Compilation of mortality curves from single and intermittent acute exposure and immunological recovery assessment (January 1977). (2) Pathological assessments of tumor incidence (July 1977).

PROJECT DESCRIPTION: To elucidate cellular control mechanisms in hemopoietic systems with the long range objective of contributing to the understanding of the basis of disease states (such as leukemia) in man.
APPROACH: Highly inbred (genetically defined with respect to MHR, major histocompatibility region) mouse strains are used as donors and irradiated recipients in bone marrow transplantation studies. Lymphocytic cells have been taken from various sources (e.g. thymus, peritoneum, lymph nodes) to be transplanted along with marrow stem cells in order to examine effects of cellular interactions on the hemopoietic process.
RESULTS: Experimental results are expected to contribute significantly to our understanding of the contribution of cellular interactions to control of cell division.
PROJECT MILESTONES: It is anticipated that results pertaining to a CFU-S amplification will be completely collected by September, 1976, and the paper will be written, edited and submitted for publication by January, 1977. Experiments in colony site are more tedious and the microscopic work time-consuming. Data will be compiled by January, 1977, and submitted for publication by June, 1977. Experiments with Dr. Marusic will be completed by April, 1977, and submitted by July, 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To study the regulation of differentiation in eukaryotic cells. Emphasis is placed on the mechanism of gene expression. The projects include: (1) to study the mechanism of repression-derepression of globin genes and alpha-fetoprotein genes; (2) the fidelity of the sequence of genome replication from one cell cycle to the next; (3) the temporal relationship between the replication of a specific gene and its transcription.
APPROACH: Analysis of DNA synthesis and transcription in synchronized cells in tissue culture. Isolation of specific polysomes and mRNA (globin, albumin alpha FP). Isolation of specific genes (globin, albumin, alpha FP).
RESULTS: To understand the mechanism of gene expression. To define by physicochemical and biochemical techniques the proteins and nucleic acids involved in the regulation of gene expression. To dissociate and reassociate the components of a recognized gene in vitro.
PROJECT MILESTONES: (1) Isolation of serum albumin mRNA (24-5-76). (2) Isolation (partial) of phenylalanyl-tRNA genes (24-5-76). (3) Isolation of albumin and alpha-fetoprotein polysomes (24-5-76). (4) Inhibition of hemoglobin synthesis by hydrocortisone (24-5-76).

TELEPHONE: F233-5468
TYPE OF FUNDING: Contract No.-W-7405-eng-26
77 FUNDING: Energy Research and Development Administration FY77:$200,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The goal is to identify abnormal protein synthesis components resulting from

bioalterations and to correlate them with the inducer of the phenomena. We anticipate and are applying the results of these studies towards solving abnormalities in the control and regulation of protein synthesis as manifested in aging, mutation, radiation and pollution phenomena. Complementary to these studies is the elucidation of factors that contribute to the regulation of translation of tumor viral and messenger nucleic acids (MIZNAS) in protein biosynthesis.
APPROACH: Our main test system is an in vitro protein synthesis system produced from ascites tumor cells propagated in C57 B1 mice and in RNA produced from encephalomyocarditis virus propagated in the tumor cells. After depleting the system of individual components, we test the suspected components for rate, extent and especially fidelity of protein synthesis. If abnormal effects are discovered, we analyze the components for alterations at the molecular level. Ancillary systems derived from E. coli are used to study the role of nucleic acid modification reactions on control of protein synthesis, and will be applied to mammalian systems in the future.
RESULTS: We intend to test protein synthesis components from abnormal cells and tissues for their ability to support fidelity of protein synthesis. We have stored tissues from abnormal mice and will obtain others from experimental studies of others. We will be in a position in the future to determine precisely whether insults of aging, mutation, radiation, etc. to mice can affect the fidelity of protein synthesis and by what mechanism it occurs. Analogously we intend to elucidate factors that either inhibit or stimulate the functional activity of mRNAs depending on whether the mRNA is homologous or heterologous to the test system from ascites tumor cells. We intend to elucidate the role of nucleic acid modification reactions on the control of protein biosynthesis.
PROJECT MILESTONES: We hope to elucidate, at the molecular level, the mechanisms by which syndromes of aging, mutation, viral carcinogenesis and radiation can contribute to a loss of fidelity of protein biosynthesis.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The principal goals of the research project described below are to determine what proteins are involved in the reduction of ribonucleotides in Euglena gracilis, to delineate the function of these proteins, and to determine if the enzyme ribonucleotide reductase exists within Euglena as a complex, associated with other catalytic or structural proteins. Ribonucleotide reductase catalyzes the reduction of ribonucleotides and is a very important enzyme in the DNA biosynthetic pathway. This enzyme has been suggested as a potential control point for the regulation of DNA synthesis since its activity fluctuates during the cell cycle and is detectable only in the S period of the cycle. In bacterial cells, ribonucleotide reduction has been shown to involve two other proteins, in addition to the reductase. These proteins, thioredoxin and thioredoxin reductase, facilitate transfer of hydrogen from NADPH to the enzyme for reduction of the 2' carbon of the sugar in the nucleotide.
APPROACH: Biochemical methods and techniques will be used to identify enzyme involved with ribonucleotide reduction in Euglena.
RESULTS: Now that the Euglena ribonucleotide reductase has been isolated as a different and larger molecular species, it is necessary to reinvestigate the allosteric regulation of this ''new'' enzyme by deoxyribonucleoside triphosphates to determine if the pattern of regulation of enzyme activity is different from that determined previously. Purified enzyme will be obtained by the most recently described protocol and kinetic analysis will be made of the effect of deoxyribonucleotides on the reduction of the four common ribonucleotide substrates. In addition, we will continue to monitor our fractions for DNA polymerase activity to determine if this enzyme co-purifies with ribonucleotide reductase. Preliminary experiments indicate that the enzyme at 50-fold purification contains both ribonucleotide reductase activity and DNA polymerase activity. I also expect to obtain a clearer role of the additional proteins in Euglena which are required to couple NADPH oxidation to ribonucleotide reduction. These studies will be performed by isolating similar proteins with known functions from bacterial cells and determining if they perform similar functions when coupled to the ribonucleotide reductase reaction, using the Euglena reductase.

PROJECT DESCRIPTION: To study quantitative mammalian cell mutation as a means of estimating the genetic

hazards of energy-related environmental agents to humans and to investigate the role of mutation in chemical carcinogenesis.
APPROACH: To employ mammalian cell specific gene mutational assays to study quantitative specific gene mutagenesis of mammalian cells by chemical mutagens and carcinogens, radiation, and by the interaction of chemicals and radiation. Pilot experiments on studying the role of mutation in chemical carcinogenesis using mammalian cell system have just begun.
RESULTS: We expect to validate the mammalian cell gene mutational assay through quantitative studies of gene mutation by X-ray, ultraviolet, and prototype alkylating mutagens and polycyclic hydrocarbons. Meanwhile, a small-scale screening for the mutagenicity of energy-related environmental agents is being explored.
PROJECT MILESTONES: We expect that validation of the mammalian cell mutational system will be largely concluded by the middle of FY 1978. Such activity should furnish information on chemical structure-mammalian mutagenicity relationship of various chemicals including prototype environmental agents screened. Studies on the correlation between mutagenesis and carcinogenesis are expected to be well underway by the end of FY 1977 and expanded during FY 1978 and thereafter.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Sensitive chemiluminescence and bioluminescent methods are being developed for various pollutants or adapted for determinations of both metals and organics. The methods generally depend on the influence trace metals have on chain reactions which in turn lead to chemiluminescence. In the case of bioluminescence organics may be converted to a compound which is either a chain initiator or is required for luminescence in an enzymatic system.
APPROACH: Methods for quantitatively trapping ozone as an ozonide are being investigated. Aldehyde obtained by hydrolysis of the ozonide will be measured by means of a bioluminescent system derived from bacteria.
RESULTS: Most chemical methods for ozone do not distinguish this compound from NO/sub x/. The method under development should be both highly sensitive and highly specific for ozone.

PROJECT DESCRIPTION: Quantitative and qualitative understandings of the molecular products resulting from exposure of cells and biochemicals to radiations, especially ionizing radiations, and cellular responses thereto.
APPROACH: Statistical correlations and fitting to theoretical mechanistically based models, concurrently developed, of measured biological end points and physical parameters. Use of electron spin resonance techniques. Calculation of ratios of neutron doses to neutron flux, especially at low energies, using evaluated nuclear data files and taking into account all energetically possible nuclear interactions and product energy domains.
RESULTS: LET dependence of DNA strand breaking repair, DNA degradation and colony forming ability of bacteria cells using particle beams. Better values of neutron dose to flux for typical materials and tissues at low neutron energies. Determination and characterization of radiation-induced chemical species.
PROJECT MILESTONES: Irradiation of cellular and DNA preparations with ion beam in ORIC (cyclotron). Completion of dose to flux calculations for low energy neutrons.

PROJECT DESCRIPTION: To apply UV dye laser to investigation of protein luminescence particular time dependent behavior of singlet and triplet states. The high resolution capability of tunable UV dye lasers will also be used to acquire high resolution phosphorescence spectra at both low and high temperatures relying on the photoselection of individual sites with highly monochromatic excitation.
APPROACH: A tunable UV dye laser of N/sub 2/ pumped type will be operated from liquid N/sub 2/ boil-off to provide long-term capability. High speed photo-multipliers, coupled to NIM MCA which will be interfaced by GPIB system to a muP graphic terminal, tektronix 4051, will provide a powerful and versatile data acquisition system. A SPEX single photon counting spectrometer, using monochromators with low stray light features will also become available.
RESULTS: Time-dependent fluorescence anisotropy spectra of proteins and nucleic acids will be determined. By cross beam procedures transient triplet-triplet absorption spectra will be measurable from 2 ns time resolution, initially at a single wavelength, later at all wavelengths by use of an optical MCA and spectrograph. High resolution phosphorescence spectra of proteins will be determined using monochromatic site photoselection methods. High temperature phosphorescence spectra and kinetics of proteins will be determined.
PROJECT MILESTONES: (1) Autumn 1976 Begin construction of UV dye laser coincidence spectrometer. (2) Winter 1976 Begin implementation of interface of NIM MCA to muP video terminal. (3) Spring 1977 Collect time-dependent fluorescence anisotropy data with UV dye laser pulse source. (4) Summer 1977 Collect triplet transient absorption spectra of proteins with UV dye laser pulse source as pump. (5) Autumn 1977 Collect anisotropy relaxation data on fluorescence labeled membranes of human tissue cultured cells. (6) Winter 1977 Collect spectra of room temperature phosphorescence of protein with SPEX single photon counting spectrometer. (7) Spring 1978 Collect kinetic decay of room temperature phosphorescence of protein with UV dye laser system.

PROJECT DESCRIPTION: To apply basic knowledge of DNA physical chemistry to the development of methods for detecting low levels of damage to DNA.
APPROACH: Development of analytical techniques which will avoid the use of prelabeled DNA. Work out methodology for purifying DNA from alkaline sucrose gradients; detection of DNA using spectroscopic or postlabeling techniques.
RESULTS: (1) Ethidium bromide fluorescence enhancement and (2) I-125 labeling of cytosine residues (Commerford method) have been applied to this problem with limited success. Further refinements are required in order to make these approaches feasible on a routine basis. The perfection of these techniques will allow analysis to be made of damage and repair processes in a large number of cellular systems which heretofore have been inaccessible to investigation because of inability to prelabel the DNA.
PROJECT MILESTONES: (1) Analysis of 35 ml alkaline sucrose gradients using I-125 labeling and ethidium bromide fluorescence as applied to human cells (nondividing) December 31, 1976. (2) Application of centrifugal fast analyzer to the detection of fluorescence associated with DNA purified from sucrose gradients July 1, 1977.

PROJECT DESCRIPTION: The objective is to obtain as full an understanding as possible of the way in which mutagens, including especially those of concern for the energy program, cause mutations in DNA. Such understanding is important for judging the applicability to humans of the results of laboratory test procedures.
APPROACH: The bacterium Haenophilus influenzae is used because it is one of the few species in which DNA can be readily taken out of and put back in cell (transformation) to test for mutation, thus allowing a more precise analysis of the events leading to mutation. Bacteria are tested with the mutagen for a brief time and mutations are detected quantitatively either in the progeny of the treated cells or in the cells DNA by transformation. Mutant strains are used to alter DNA repair and replication. Biophysical and biochemical techniques are used to detect changes in the DNA.
RESULTS: The approach is expected to establish for each major class of mutagens what the molecular processes are that cause the initial damage to DNA to be converted to final mutation.
PROJECT MILESTONES: (1) 30/9/77 Completion of survey of mutagens. Choice of those to study further. (2) 30/9/77 Completion of initial phases of study of polyaromatic hydrocarbons (PAH's) and other fossil fuel related pollutants. (3) 30/9/78 Work on role of repair and nature of mutation fixation for PAH's and other mutagens well advanced.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The primary objective of the Medical and Molecular Genetics Group is to elucidate the molecular events in human cells when cellular macromolecules such as DNA are damaged by radiation or chemical agents. We study and characterize (1) the sequence of DNA repair events, (2) the various modalities of repair, (3) the genetic inhibition of repair due to mutation, and (4) the physiological inhibition of repair due to biochemical inhibitors.
APPROACH: Our technological capacities reside in the several very sensitive, rapid and informative experimental techniques we have developed for the assay of DNA repair in all of its facets. Examples are: (1) bromodeoxyuridine photolysis, (2) radiochromatography, (3) molecular weight analyses. Our ultimate goals are: (1) to isolate and analyze the repair component of the mutagenic and/or carcinogenic event in human cells, (2) to elucidate the magnitude and significance of this repair component as it impinges on the practical problems of human radiation or exposure to actual or potential chemical mutagens and carcinogens.
RESULTS: We expect to be able to fully characterize the forms of DNA repair in human cells, and the nature of the damage produced by the various physical and chemical environmental agents which are capable of damaging human DNA. This characterization will be in terms of the structure of the agent, its interaction with the DNA molecule, the kinds of damage-monitoring systems in the cell and the precise molecular events

of the repair process.
PROJECT MILESTONES: Publication of comprehensive report on DNA damage and repair induced by selected chemical and physical environmental agents with regard to human risk.

PROJECT DESCRIPTION: (A) All activities of eucaryotic cells are dependent upon intra-cellular organelles for energy or ATP. These organelles contain their own genetic (DNA) apparatus complete with transcription and translation. Thus any consideration of the potential hazard of any environmental insult must take into consideration the genetic system of organelles. Our objective in this project is directed toward understanding the molecular genetics or molecular biology of cellular organelles. (B) The other activity in which we are involved concerns the development of convenient and rapid methods for partial purification and characterization of the mammalian liver enzymes used in mutagen activation of coal conversion products and by-products.
APPROACH: (A) Using neurospora, euglena and HeLa cells as model systems we are characterizing the translational apparatus of mitochondria and chloroplasts with emphasis on the genetic origin of its components and their relationship to their cytoplasmic counterparts. (B) We are attempting to develop affinity column chromatography techniques to permit one step purification of the enzymes from induced rat livers which are used by our Comparative Mutagenesis Unit.
RESULTS: (A) We will have purified to homogeneity the met tRNAs of mitochondria, chloroplasts and cytoplasm from neurospora and euglena for sequencing. We will have purified the phe-tRNA synthetases from organelle and cytoplasm for characterization and sequencing. (B) We will have developed a one step procedure using Cibracon Blue affinity chromatograph for the large scale purification of mutagens activating enzymes.
PROJECT MILESTONES: (1) Dec. 6, 1976 The technique of purification of mutagen activating enzymes will be completed. (2) Feb. 14, 1977 The met tRNAs from organelles and cytoplasm will have been purified to homogeneity. (3) August 10, 1977 The synthetase from organelles will have been purified to homogeneity.

PROJECT DESCRIPTION: To determine the effects of chronic low-level irradiation on the fitness of natural and laboratory population of aquatic organisms, examine potential interactions between ionizing radiation and environmental toxicants, examine the uptake and effect of transuranic elements on aquatic organisms, and relate the concentration of radionuclide by aquatic organisms to radiation doses and biological effects.
APPROACH: Continue long-term studies on natural populations of aquatic organisms from White Oak Lake to determine the effects of chronic low-level radiation of the fitness and genetic structure of natural populations. Conduct laboratory studies on the chronic effects of radiation and on the synergistic effects of radiation and environmental pollutants on aquatic organisms. Investigate the radiological and chemical toxicity of uranium and plutonium on developing fish embryos.
RESULTS: Results from our ongoing and proposed research help fulfill ERDA's obligations to determine the effects of radiation on aquatic ecosystems. Our previous studies have been used in evaluations of both planned and accidental releases of radionuclides to aquatic environments. Our research on long-term effects of chronic low-level radiation exposure has provided some of the few data available in this area.
PROJECT MILESTONES: Determine the uptake distribution and dose effect of transuranium radionuclides on developing fish eggs. Complete experiments to determine whether Gambusia from White Oak Lake carry a higher frequency of recessive lethals than Gambusia from nonirradiated populations. Determine the biological effectiveness (RBE) for the production of chromosome aberrations in Chironomus by alpha radiation for incorporated transuranic radionuclides.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objectives of the project are to delineate which processes in the terrestrial environment that dominate the transport of radionuclides may be released from nuclear fuel cycles.
APPROACH: To properly assess these processes the research is divided into three major areas: (1) transport of radionuclides in soils, (2) radionuclide uptake in plants and (3) radionuclide movement through terrestrial food chains. Soil thin layer chromatographs are being used to evaluate the influence of various soil properties on the movement of radionuclides (Pu, Sr, Cs, I, U, Np and others) in soil. The role mycorrhizal fungi have on plant uptake of radionuclides and the distribution of bound tritium in various trophic levels of the biological food chain are also being determined.
RESULTS: The results of these investigations will be presented to special symposia and will be published in open literature scientific journals.
PROJECT MILESTONES: (1) Determine the influence of soil pH, organic matter, cation exchange capacity and base saturation on movement of radionuclides using soil thin layer chromatographs 1/3/77. (2) Determine the influence of mycorrhizal fungi on plant uptake of radionuclides 1/3/77.

POLLUTANTS: METALS/Chromium (10%);RADIATION/Cobalt;RADIATION/Iodine;RADIATION/Cesium;RADIATION/Hydrogen-3 (90%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Global;HYDROGRAPHIC AREAS/Other hydrographic areas Small lakes, reservoirs
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine the distributional patterns of important dose-contributing radionuclides such as Co, I, and Cs in biotic and abiotic components of aquatic environments. To examine mechanisms which govern the mobility of radionulcides in aquatic systems. To investigate food-chain kinetics in aquatic communities and their influence on concentrations of radionuclides at higher trophic levels.
APPROACH: Conduct field and laboratory studies to determine the significance of sediment contribution to radionuclide concentration in aquatic food chains. Provide experimental data needed to test and refine a dynamic model which has been developed at ORNL to simulate movement through aquatic pathways. Determine the specific activities of selected radionuclides and stable chromium in food chains in White Oak Lake.
RESULTS: Provide experimental data needed to test and refine (AQUAMOD) a model which has been developed at ORNL for radiological assessment of dose to man and for predicting the fate of radionuclides in aquatic environments from planned and accidental releases.
PROJECT MILESTONES: Complete laboratory experiments for determining the contribution from various sediment fractions to the concentration of select radionuclide in fish. Development and refinement of (AQUAMOD) based on experimental data which will more realistically predict the movement of radionulides in aquatic environments.

PROJECT DESCRIPTION: To advance the basic methodology and theory underlying applied environmental modeling and develop techniques having high potential applicability to programmatic objectives.
APPROACH: By the development of new mathematical techniques and methodologies and their application to ecological problems.
RESULTS: New analytical tools in frequency response analysis, nonlinear analysis, and new methodologies for determining prediction error in ecological models.
PROJECT MILESTONES: (1) Apply model validation theory to Walker Branch Watershed model and data by end of third quarter FY 77. (2) Development of nonlinear analysis techniques for population effects by end of second quarter FY 77. (3) Control theory applications to ecosystem management by mid FY 77. (4) Estimation theory applications to water chemistry data by end of FY 77. (5) Time series analysis of forest community dynamics by end of FY 77.

ENERGY CYCLE: COMBUSTION OR END USE (80%)
POLLUTANTS: NOXIOUS GAS/SO/sub x/ (30%);METALS/Cadmium;METALS/Lead;METALS/Zinc;METALS/Copper;METALS/Mercury (25%);PARTICULATES/Aerosols;PARTICULATES/Fly ash (25%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/Site specific East Tenn.;HYDROGRAPHIC AREAS/Other hydrographic areas Tenn. River Basin
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this study is to investigate biogeochemical cycles of forest ecosystems such that the fate of chemical releases to the environment can be quantitatively related to biotic and abiotic processes influencing: (1) atmospheric deposition, (2) storage within ecosystem components, (3) biological responses to perturbations, and (4) eventual release from the landscape system to groundwater and aquatic ecosystems.
APPROACH: Three modes of research are employed: (1) monitoring of atmospheric inputs, stream outputs and concentration levels in biota and soils; (2) detailed research to elucidate mechanisms controlling biogeochemical cycles and how these mechanisms are affected by chemical perturbations; and (3) development of mathematical models of element transport as a means to summarize complex data, to design relevant future research and eventually to apply research results to other landscape systems.
RESULTS: Analysis of the sulfur cycle (distribution in biota and soils, annual transfers, input, accumulation, and export) for Walker Branch Watershed will be completed. From this study, major mechanisms controlling sulfur cycling will be identified; impacts of accelerated sulfur inputs will be evaluated. Storm events are being studied to determine their role as a mechanism controlling trace metal transport from the land. The role of hydrologic source areas on water quantity and quality is being determined. Studies are under way to validate a physically based simulation model of plant-soil-water relationships. Monitoring activities are ongoing in order to quantify input/output relationships and evaluate long-term trends in atmospheric chemistry and steam water quality.
PROJECT MILESTONES: (1) Summarize and report revised sulfur cycle September 1977, (2) review sulfur lysimeter experiment for continuation revision or termination September 1978, (3) review experiments on sulfur impacts under varying soil fertility levels for revision or termination December 1978, (4) assess need for experiments on relative mobilities of S components based on deep profile measurements February 1978, (5) conceptual model and hydrologic source area behavior developed September 1977, (6) evaluation of source area model with FY 1978 field data September 1978, (7) review storm event stress chemistry results for future research direction February 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this program is to develop knowledge for predicting the impacts of power plant cooling systems on warm water fisheries. Condenser cooling systems of nuclear power plants increase temperatures in the cooling water and in the waters which receive the effluents. There can be directly localized effects and broad-scale effects, both in geographic extent and in ecological ramifications. A major scientific challenge at the present time lies in relating increments of direct biological change (lethality; changes in growth, fecundity or behavior, etc.) to responses in populations and ecosystems. A second major challenge is to identify ecological limitations for thermal discharges that can provide acceptable engineering designs and siting criteria.
APPROACH: We plan to accentuate the study of temperature as it affects the dynamics and interactions of populations. Studies of the physiological and behavioral responses of individual organisms to temperature will be studied specifically as they relate to questions derived from the population or community levels. At the same time, it is expected that some of these studies of individuals will generate information valuable in setting preliminary limits on power plant siting, design and operation. Because no single power plant site represents an ideal system to analyze, we plan to integrate field experiments at two local power stations (Bull Run and Kingston) and in the nearby Clinch and Tennessee Rivers with artificial environmental and laboratory studies that will best elucidate the important ecological questions for warm water reservoirs. We also anticipate continuing and expanding cooperative studies of other sites such as Par Pond on ERDA's Savannah River Plant. A major effort will be expended on cooperative studies with the Tennessee Valley Authority and other Oak Ridge environmental programs on fish and benthic populations of Watts Bar Reservoir which receives cooling water from the Kingston Steam Plant.
RESULTS: (1) Data on thermal requirements of aquatic organisms that can be used in (a) water temperature criteria for setting water temperature standards, (b) environmental impact analyses of thermal discharges, and (c) design criteria for new power plant cooling systems (open cycle and cooling reservoirs). (2) Concepts in thermal responses of aquatic systems that will allow long-range planning for power plant cooling on a continental (or even world-wide) scale.
PROJECT MILESTONES: Applicable only at level of subprojects, for which milestones (Critical Objectives) are listed in form 189.

PROJECT DESCRIPTION: Develop and implement formulations of a Cumulative Exposure Index (CUEX) which relate radioactivity measured at a monitoring station to the applicable dose limit when all exposure pathways are considered.
APPROACH: Develop and maintain models, computer implementations, and data bases for predicting the time dependent movement of released radioactivity through environmental pathways to man and for estimating the doses to individuals and populations from the resulting internal and and external exposure.
RESULTS: Documents describing and illustrating the index (CUEX) and the application of it. This includes not only details concerning calculation of the index, but also the details of computational capabilities and data bases inherent to the environmental transport and dosimetry aspects of the CUEX methodology. Development and documentation of CUEX is important because the methodology continues to be used extensively in the preparation of radiological sections of environmental impact statements for all segments of the various nuclear fuel cycles, and for other safety assessments involving environmental radioactivity.
PROJECT MILESTONES: (1) 1-2-77 Report documenting new computer implementation of TERMOD. (2) 4-1-77 Report documenting computer implementation of AQUAMOD. (3) 7-1-77 Report describing the AIRDOS code with the CUEX module. (4) 10-1-77 Report documenting literature search on soil infiltration by radionuclides. (5) 4-1-78 Report documenting the radionuclide soil-infiltration model and its implementation. (6) 10-1-78 Report describing the regional application of the CUEX methodology to the Tennessee Valley.

PROJECT DESCRIPTION: The purpose of this research is to assess and predict the reactive products, effects, and ultimate fate of biocides in aquatic environments. Emphasis is placed on persistence, degradation, and effects of chronic low level doses of chlorinated organics on aquatic biota. Investigations to elucidate the kinetics of chlorination of natural waters to develop predictive capabilities concerning formation of chlorinated organics continue.
APPROACH: Laboratory investigations designed to elucidate microbial degradation, photolysis and hydrolysis, sedimentation and ecological effects (using short lived species and weak links in life cycles) are conducted. Collection of water, concentration, and coupling of GC, IC, and MS for identification of chlorinated organics.
RESULTS: Predictability for formation, persistence, and effects of chlorinated organics in aquatic environments so that the magnitude of the potential problem associated with chlorination of waters can be assessed.
PROJECT MILESTONES: (1) Persistence of chlorinated purines and pyrimidines in natural waters II QT FY77, manuscript. (2) Interactive toxic effects of major classes of chlorinated organics IV QT FY 77, data collected. (3) Examine effects of important chemical parameters on reaction yield and products IV QT FY 77, data collected.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this research program is to develop and apply models and statistical methodologies for fish populations that will be of value: (a) in evaluating the consequences of man-made stresses, (b) in placing previously qualitative statements into a quantitative framework, and (c) in defining issues where field and laboratory research are essential for more accurate estimates of impacts.
APPROACH: Two interrelated approaches are used in our computer simulation modeling of fish populations. First, a population transport model is developed in cases where it is important to consider spatial phenomena in addition to temporal phenomena. Such population transport models serve to estimate short-term impacts, such as the yearly reduction, due to entrainment and impingement mortality, in the number of fish that survive their period of susceptibility to power plants. Second, an age-dependent, life-cycle population model is developed to estimate the long-term impact of increased mortality in a given age class on the size and age structure of the total population and, where appropriate, on the yield to the fishery.
RESULTS: Results expected include testimony and ORNL reports to be used in forthcoming hearings for EPA, NRC, and/or FPC, as well as open literature publications.
PROJECT MILESTONES: (1) Investigate the potential for compensatory mechanisms offsetting the effects of man-induced mortality on young-of-the-year striped bass through development and application of a completely mixed young-of-the-year cohort model. (2) Perform a sensitivity analysis of those functions and variables in the ORNL tidal-averaged, one-dimensional transport model which are not spatially dependent and do not directly depend on transport phenomena. (3) Examine the problem of validation of completely mixed models and transport models by comparing simulated and observed temporal and spatial distributions of the various life stages. (4) Develop a methodology for predicting and determining the minimum statistically detectable difference between fish population levels.

CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/Site specific Unspecified
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The key objective is to develop knowledge necessary to assess the impacts of cooling tower operation on terrestrial ecosystems. Primary tasks are directed to obtaining a predictive capability of drift transport, deposition, interception and retention by vegetation and soil, and the effects of trace contaminants in drift on biota. An additional objective is that of comparing model estimates of drift deposition with biological data.
APPROACH: Studies include quantification of drift toxicants (chromium and zinc) in air, soil, groundwater, plants and small mammals in the vicinity of large, megawatt size cooling towers. Response of biota to drift contamination is determined through laboratory and field studies. Results are intended for integration to resolve ecological questions concerning drift toxicant contamination, cycling and potential for adverse effects. Data are available for model validation and provide operational or monitoring data of changes in contamination. Although site specific the data are applicable to generic problems concerning tower operation.
RESULTS: Products of the research are applicable to utilities and industries in siting of cooling towers, establishing monitoring programs and guidelines, and to state and federal regulatory agencies in environmental impact assessments. Monitoring or inventory data are valuable to test various drift deposition models. Results are also important to identify sensitivity of plant taxa to chromium contamination and to the state-of-the-art concerning the environmental cycling and transport of chromium.
PROJECT MILESTONES: (1) Interception of drift by plants with contrasting leaf morphology initiate April 1977.

(2) Effects of drift contamination (chromate) on plant processes (photosynthesis) initiate April 1977. (3) Effects of drift on invertebrate populations initiate April 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Collect and compile information on energy and energy-related R and D that is conducted or sponsored in the U.S. Information is gathered from government agencies, private industry, trade associations, universities, and non-profit organizations. The scope of projects of interest is broad, including: (1) all types of energy sources, (2) electric power-generation, transmission, distribution, and storage, (3) energy uses and conservation, (4) economic and legal aspects, and (5) environmental and health effects.
APPROACH: Identify places and people involved in energy-related R and D and query them. the responses are categorized, keyworded, coded, edited, and verified if necessary. Summary tables relating expenditures to type of sponsor, type of performing organization, research location, subject categories, type of research, and combinations of the preceding are prepared.
RESULTS: The energy R and D information is computerized and can be searched via the ERDA-RECON computer system. This information is also available in printed form as a House Committee Print. Summary tables of expenditures will be available in printed form.
PROJECT MILESTONES: Publication of results as ''Inventory of Energy Research and Development: 1973-1975'', 5 volume set, Committee Print for House Committee on Science and Technology, Serial U, January 1976. The energy R and D information up-dated on the ERDA-RECON computer system.

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) To evaluate and understand the long-term behavior of Pu in soil with special reference to oxide and monomeric species; (2) to determine the chemical form and characteristics of Pu in soils and sediments of a 30-year-old contaminated floodplain and associated White Oak Creek drainage basin. (3) To estimate Pu distribution in biotic components of the floodplain forest, including intake coefficients for agricultural crops planted in the flood plain soil. (4) To associate plant uptake of Pu with measures of extraction from the contaminated floodplain soil. (5) To determine pool sizes of transuranics in biotic and abiotic components of White Oak Lake. (6) To study food-chain mechanisms for transuranics in edible fish including gastrointestinal uptake, tissue distribution, and turnover kinetics.
APPROACH: Research is conducted on biotic and abiotic behavior of transuranic elements in both field and laboratory systems. Chemical forms of the elements in sediment, soil and water and biota are characterized; kinetics and equilibria of element transfer between biotic and abiotic components are determined; data are developed for use in generic models of biochemical cycling of the transuranic elements. Information developed from the research is directed toward understanding food-chain transfer of transuranic elements to man.
RESULTS: The results are truly providing useful information about Pu in humid environments of Eastern United States. The research efforts are interrelated within three major themes: (1) Pu cycling in a 30-year-old contaminated floodplain, (2) Fundamental research on environmental chemistry and Pu kinetics in soil and sediment matrices, (3) Pu behavior in fresh-water environments of White Oak Lake. Specific results are related to environmental chemists where Pu(IV) is the predominant oxidation state because Pu(VI) is readily reduced and Pu(III) appears unstable in oxidative environments. These findings are significant

because oxidation state may be a very important factor influencing Pu mobility in soils and sediments.
PROJECT MILESTONES: (a) Determine oxidation state characteristics of actinide elements in reference environmental systems June 1, 1976. (b) Determine concentration ratios for Pu uptake by plants from soil contaminated with Pu 30 years ago June 1, 1976. (c) Determine distribution of /sup 237/Pu in abiotic and biotic components of reference aquatic environments in the laboratory. (d) Determine the fraction of indigenous soil Pu, Am, and Cm that is available for assimilation by plants. (e) Understand the chemical species of Pu in soil and water environments, and answer questions about long-term behavior of Pu in reference environments of the Eastern United States.

PROJECT DESCRIPTION: The major objective of the HPRR program is for support of research in radiation dosimetry and radiobiology. The HPRR is a unique facility for research in the dosimetry of mixed neutron and gamma radiation fields. Depth dose studies are known to be important in large animal irradiations, including man, and there is a concentrated effort at the HPRR in depth dose studies (experimental and calculational) at both the microscopic and macroscopic levels. Additionally the HPRR is used to improve the accuracy and reliability of radiation dosimetry systems and to test for nuclear accident.
APPROACH: The HPRR is made available to the ORNL Biology Division and other research institutions interested in determining dose-response relationships and performing depth dose studies. The reactor may be operated in either a steady state or pulsed mode to meet the experimental requirements. Intercomparison studies of nuclear accident dosimeters and personnel monitoring devices are conducted on an annual basis for establishing the accuracy and reliability of dosimetry systems. A criticality alarm testing program is conducted to meet the needs of those developing or testing criticality alarm monitors.
RESULTS: Reports are prepared on the conduction and results of the dosimetry intercomparison studies and other aspects of nuclear and criticality safety. Dosimetry results are provided to each principal experimenter utilizing the HPRR for biological, chemical, physical or nuclear engineering investigations.
PROJECT MILESTONES: Conduct 3rd Personnel Dosimetry Intercomparison Study (PDIS) February 1977.

PROJECT DESCRIPTION: This program bears directly on a central problem for the use of atomic energy, specifically, the evaluation and control of internal exposure within acceptable limits. The program is directed toward estimating the absorbed dose to various body organs resulting from the deposition of radioactive material in the human body. In the area of internally deposited emitters, this program has taken the lead in formulating guidelines currently in use in most nuclear energy programs including those in our own country.
APPROACH: The program provides accurate estimates of permissible concentrations of radionuclides in air, water, and food or, equivalently, of limits of daily or yearly intake which would result in doses to man within prescribed limits. We attempt to obtain reliable metabolic data either from experiments or from the literature and interpret them to obtain estimates of the dose received by body tissues as a consequence of various types of exposure to radionuclides: ingestion, inhalation, wounds, medical uses.
RESULTS: The results of this program are usually standards for internal emitters published by the ICRP, NCRP, or ANSI. In addition, dose estimates for radiopharmaceuticals are published by the SNM-MIRD Committee.
PROJECT MILESTONES: (1) Publication of First Revision of ICRP Publication 2 1976-77. (2) Publication of Revision of MIRD Pamphlet 5 1976-77. (3) Publication of additional parts of ORNL-5000 1976-77.

PROJECT DESCRIPTION: To understand the basic interactions of environmental pollutants with matter and the fundamental processes by which man is affected by these pollutants. Our work is also relevant to the elucidation of problems arising in the studies of energy utilization and conversion.
APPROACH: We are developing concepts and methodology to understand the processes by which radiation, noxious pollutants, and airborne particulates exert a deleterious effect on matter and, ultimately, man. Theoretical analysis, computer studies and model building are the main approaches used. We contribute to fundamental understanding of forces between swift charged particles and matter, the transport of ionizing radiations and interactions between particles and surfaces, and between molecules and matter. Our work is closely coupled with experimental programs in the Division which are directed toward the same problems and couplements them in interpreting and suggesting new experiments.
RESULTS: Research which produces models for energy losses of ionic clusters in matter, the transport of high energy radiation in matter equivalent in composition to human tissue, the transfer of electrons in atom-atom collisions, the forces between bodies in an aqueous medium, the forces between particulates and macroscopic bodies.
PROJECT MILESTONES: Regular publication of research results.

PROJECT DESCRIPTION: Basic studies of the interaction of electrons, photons and ions with polyatomic molecules are carried out for the purpose of (a) understanding the effect of radiation on matter (in particular living cells), (b) characterizing the properties of atmospheric pollutants and (c) developing advanced concepts for pollution monitoring.
APPROACH: Molecular beams are crossed with electron, photon and fast atomic beams and their interactions are studied by mass and energy analysis of the resulting ions and energy analysis of the secondary electrons. High and ultra-high vacuum techniques coupled with intense laser beams are employed.
RESULTS: Electron affinities, ionization potentials, and electronic states of complex molecules are determined. Rate constants and cross sections are obtained for electron, photon and atomic collisions with complex molecules and are measured with product analysis.
PROJECT MILESTONES: (1) Accurate measurement ionization rates for two-photon ionization of cesium in the vicinity of the 7 /sup 2/P/sub 1/2,3/2/ states. (2) Complete general characterization of pi-electron affinities of organic molecules (theory and experiment). (3) Complete development of new technique for studying electronic states of molecular negative ions.

PROJECT DESCRIPTION: We are trying to determine the optical and electronic properties of submicron particulates and holes. We are also continuing at the University of Tennessee on our research on the electronic behavior of liquids.
APPROACH: Laser and low energy electron beams are directed at submicron particles and holes and the scattering patterns are observed.
RESULTS: We will learn the surface electronic structure of various particulates. These are midway in size between molecules and solids and are uncertain in behavior. We will look for collective electronic states, effects of point and dipole image forces, presence of surface waves. Application to particulate collection by exhaust filters, adsorption of fibers (e.g. asbestos) in lung tissue, generation and removal from atmosphere.
PROJECT MILESTONES: (1) Separation of interference and plasmon effects on laser excited micron cylinders Jan. 1, 1977. (2) Completion of particulate (laser and electron) irradiation facility July 1, 1977. (3) Obtaining of electron scattering distribution on submicron fibers for determining surface potentials Jan. 1, 1978. (4) Preliminary attempt to measure laser and electron scattering from macromolecules July 1, 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS
PROJECT DESCRIPTION: The objective is to study some fundamental properties of solids and macromolecules before and after exposure to selected pollutants. This program takes a basic approach to understanding and predicting the effects of pollutants on man and his environment.
APPROACH: Photons with energies from the IR to the soft x-ray region are used to obtain reflectance, transmittance, and photoelectron yield. Such data can be analyzed to yield the optical and dielectric functions associated with the bulk material, thin film effects, and interface properties such as surface roughness. In certain cases electron mean-free-paths and/or electron attenuation lengths can be obtained. Interpretation is in terms of energy levels in the solids and macromolecules and photon-electron, photon-plasmon, electron-electron and electron-phonon interactions in the systems.
RESULTS: These basic observations have direct application to understanding, predicting, and possibly modifying the behavior of selected systems. Specific examples include the development of solar energy collectors, the prediction of the behavior of liquid lithium in a fusion reactor environment, and the measurement of electron mean-free-paths in communications materials. More generally it is desired to understand the basic interactions occurring between normal cells in vivo and the subsequent effects of chemical and radiation assaults.
PROJECT MILESTONES: Periodic publication of the results of basic research in the open literature.

PROJECT DESCRIPTION: Study in detail the elementary processes which accompany the interaction of radiation with matter. Investigate the effects of the nature and density of the environment on the elementary photophysical and charge transfer properties of biomolecules and the elementary processes that accompany the interaction of radiation (ionizing and nonionizing) with matter. Link the physical and chemical properties of biomolecules in gases with those in the condensed phase.
APPROACH: Quantitative and integrated experimental and theoretical studies on low-energy electron-molecule interaction processes, negative ions, electron transport and photoionization of molecules in low- and high-pressure gases and in liquids.
RESULTS: Obtain coherent picture of radiation interaction with matter especially low-energy electrons. Link knowledge on basic radiation interaction processes in gases with that on similar processes in condensed media for systems of radiobiological as well as of environmental and toxicological interest. Link physics

with chemistry and both with life sciences and establish in this way a sound understanding of radiation effects and mechanisms on the molecular level.
)JECT MILESTONES: Continue vigorously basic research and publish regularly and promptly results.

PROJECT DESCRIPTION: The objective of basic measurement science is to develop and implement new concepts, theories, devices, and advanced techniques which improve man's ability to measure or observe new phenomena.
APPROACH: Advances in other fields of science, mathematics, and technology are exploited and applied to the broad field of measurement science and technology. Since such an endeavor requires a skillful interweaving of measurement theory with devices and technique development, the basic measurement science group is composed of interdisciplinary professional measurement scientists who interact with scientists and technologists from other disciplines to determine appropriate programs and goals for the group.
RESULTS: As a result of this project, various theories, devices and advanced technologies will be developed to enable and improve measurements important to the success of other ERDA programs. This project is an ongoing one with research areas changing to meet ERDA needs; one major, current research area is centered on the development and understanding of radiation imaging systems. This area includes the study of new concepts for position sensitive proportional counters (PSPCs) as well as the study of optimum digital filters for statistically-limited PSPC images. Another major, current research area is centered on the development cf an advanced type of fast-neutron spectrometer which will be used in thermonuclear fusion diagnostics.
PROJECT MILESTONES: (1) The testing in the laboratory of a large-area prototype PSPC torso camera. (2) The testing of the PSPC torso camera by clinical whole-body imaging of radionuclide distributions. (3) The testing in fusion experiments with d-d neutrons of the fast-neutron spectrometer. (4) The derivation of optimum digital filters for two-dimensional statistically-limited images. (5) The testing of optimum digital filters for two dimensional statistically-limited images. (6) The derivation of optimum coded-apertures for one dimensional statistically-limited images. (7) The testing of optimum coded-apertures for one dimensional statistically-limited images.

PROJECT DESCRIPTION: The solid-state dosimetry research has as a major objective the development of improved detectors and techniques for the quantitative characterization of man's natural and artificial radiation environment. In addition to investigating phenomena, there is the goal of providing a proven product for an identified user.
APPROACH: The approach involves rigorous field testing of the products of research effort in order to improve the existing radiation monitoring capabilities. Applications are mostly in personnel dosimetry for fast neutrons ad weakly penetrating radiations, environmental radiation monitoring, medical patient dosimetry and intercalibration of neutron and photon sources as well as the dosimeters themselves. Special applications include radon monitoring either in dwellings or uranium mines and measurement of tritium or neutrons in the environs of CTR's.
RESULTS: Improved radiation detectors for personnel and environmental monitoring constitutes the product of this project. Important results of the project also include the publication of critical reviews, surveys, bibliographies, and the holding of workshops and training sessions for specialists.
PROJECT MILESTONES: (1) Decision on whether or not to proceed with exoelectron dosimetry 12/1/76. (2) Development of plastic recoil atom track, neutron detectors, suitable for field testing alongside NTA film and Albedo dosimeters 2/28/77. (3) Conduct 3rd International Intercomparison of Environmental Dosimeters at ORNL 6/30/77.

PROJECT DESCRIPTION: The objectives of studies of the dosimetry of human exposure are to improve the physical dosimetry of human radiation exposures and the correlations between biological effects of radiation exposures and radiation dose. The emphasis in these studies is currently on investigations of depth-dose distributions and dose to specific organs within the body from neutrons and gamma rays as functions of exposure geometry. Results of these studies are important in radiation protection, dosimeter design, and cancer radiotherapy. These dosimetry studies and liaison studies with the Radiation Effects Research Foundation (RERF), in Japan, will also result in significant refinements in estimates of radiation exposure risks derived from biological effects observed in survivors of the atomic bombings in Hiroshima and Nagasaki.
APPROACH: Computer codes are developed to analyze radiation dose-biological effect relationships. Use is made of the vast medical and epidemiological studies of the atomic-bomb survivors which constitutes the most extensive source of data on the latent effects of human exposures. Also, they are of major importance in formulating radiation protection criteria.
RESULTS: Review of experimentally measured and theoretically predicted depth dose for neutrons and gamma rays FY77. Age dependent calculations of absorbed dose to organs in which significant biological effects have been observed in A-bomb survivors.
PROJECT MILESTONES: Winter, 1976-77 Low-resolution electron-density distribution of ricin crystals; definition of shape of molecule. Spring, 1977 Determination of binding site for oligosaccharide (membrane receptor). Winter, 1977-78 High-resolution electron-density distribution of ricin crystal; construction of skeletal molecular model.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this research is to define the biological and engineering parameters which cause physical damages to aquatic organisms entrained in power plant condenser cooling water, and the effects of these damages on organism survival. The principal points of physical damage are (1) at the intake screens where larger organisms are removed from the condenser flow (impingement), and (2) in pumps and piping where smaller, non-screenable organisms are deformed and broken. The parameters causing damage are to be defined in ways which will allow preparation of engineering design criteria to minimize or eliminate (if possible) these potential damages.
APPROACH: In the area of impingement, field and complementary laboratory studies will be conducted to determine causes of mortality of fish upon intake screens. Initial field studies will attempt to identify the extent to which fish are moribund before reaching plant intakes and therefore impinged secondarily. Concurrent laboratory experiments will investigate causes of this phenomenon, which appears related to the thermal tolerance of the species. We, in cooperation with TVA, will monitor a series of chemical and physical parameters in the intake canals of three TVA power plants (one nuclear and two fossil-fuel) and concurrently assess impingement and fish abundance and movements within those canals, to assess the influence of the parameters on impingement and the impact of impingement on the fish populations. In the laboratory, a tank enabling scaled-down simulation of several intake and canal designs will be used to study the behavioral responses of small fishes to intake screens, skimmer walls, and the associated ranges of light, temperature, water velocity, and turbulence. The ability of various species to withstand impingement and the effect of schooling on their behavior will also be examined using existing laboratory facilities.
RESULTS: Engineering design criteria for intake and condenser systems which will minimize or eliminate (if possible) potential damages.
PROJECT MILESTONES: (1) Determination of mortalities caused by condenser tubing, and the hydraulic parameters responsible. (2) Determine swimming behavior of young striped bass and other species at intake screens.

(3) Determine effects of cold stress on swimming performance of threadfin shad and other species susceptible to winter impingement. (4) Determine population effects of impingement losses of important fish species.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This research project is designed to provide models which will assess the regional impact of energy technology development on water quality and quantity, agricultural systems, forest productivity and habitats for endangered species, and air quality.
APPROACH: Research will involve development of computer programs to assess the importance of base-flow and quick-flow chemistry to runoff water quality, determine the effect of low level pollutant concentrations on agricultural systems, provide for maintenance of forest productivity and the existence of habitats for endangered species, and incorporate considerations of chemical transformation and depletion rates into long range atmospheric models.
RESULTS: Documentation of computer programs that perform separation of storm and base flow components of water quantity and quality, application of programs to selected watersheds, and generation of a data base relating energy activities to changes in rate and chemistry of runoff components. Documentation of the agriculture version of the UTM, application of the UTM to agricultural systems, and development of computer program files for use in environmental assessment work. Documentation of regional forest management strategies derived from consideration of ecologic impact on sensitive forest species. Estimates of removal rates for pollutants from a plume.
PROJECT MILESTONES: (1) Documentation of water flow components analysis 1/4/1977. (2) Application of components analysis to selected watersheds 1/7/1978. (3) Development of UTM for agricultural applications 1/1/1977. (4) Documentation of UTM applications to crops 1/1/1978. (5) Adaptation of forest stand growth model tc pine forest 1/10/1977. (6) Application of stand growth model to forest management 1/4/1978. (7) Estimates of sulfate and aerosol deposition rates 1/10/1977. (8) Research coupling of long-range air transport model to ecosystem effects models 1/7/1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To develop and apply techniques for measuring particulate transport in coastal marine waters.
APPROACH: Radioactive tracers are used to label and follow sand and silt transport. Sediment concentrations

in bottom boundary layers are measured. Transport models are compared to actual data to test understanding of transport processes.
RESULTS: Quantitative rates of sediment transport. Qualitative insight into transport processes.
PROJECT MILESTONES: Construction and testing of prototype self-contained suspended sediment gage in 1977.

POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Miscellaneous (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The Environmental Response Center proposed to provide ERDA-wide response and referral services within approved funding limitation including: in-depth literature services, using computerized data bases and extensive library facilities; the answering of specific environmental questions posed by the scientific community, government agencies, industry, and others; and development of specialized data bases and document collections with publication of resultant bibliographies as natural by-products of the response service.
APPROACH: The role of ERC is the utilization of pooled resources at the command of the Information Center Complex of ORNL to provide timely, comprehensive coverage of the environmental aspects of the broad spectrum of Energy Research and Development.
RESULTS: The operating procedures will be developed to provide speedy processing of inquiries and expansion of the information range. All efforts of ERC will be concentrated on providing ERDA, EPA and other interested agencies the answers to specific questions. Some topical bibliographies will be generated through the preparation of responses to those questions.
PROJECT MILESTONES: In responding to numerous requests for environmental information from persons located throughout the world with a diversity of scientific and technical disciplines, the ERC has made exhaustive use of both manual and computerized searching techniques. Locally generated environmental data bases have been computer-searched. A selective resource center has been established with increased capabilities for maintaining several specialized hard copy document collections and also includes basic environmental reference documents and all pertinent environmental abstract journals that are not yet available in computerized form. A manual environmental information source file is being gathered and includes quick source data for information acquisition, as does ICC's own Document Acquisition File and comprehensive directory of technical environmental specialists. Specialized collections have been developed in such fields as advanced fossil systems and other nonnuclear energy-related areas. This is an ongoing effort that is continually maintained.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine the 3-dimensional structures of macromolecules and relate structure to function. Present efforts are concentrated on ricin toxin, a protein (and antitumor agent) which is bound to specific receptors on cellular membranes and is then brought into the cell by endocytosis, where it inactivates protein synthesis. We are also working on the variant half of a Bence-Jones protein (part of a human immunoglobulin), and are collaborating in studies on nu bodies, the DNA-histone structural unit of chromosomes of eukaryotic cells. Minor goals include the development of improved methods for macromolecular crystallography, and structure determinations of small molecules of biological interest.
APPROACH: The technique for determining molecular structure is through X-ray diffraction of single crystals of the material. A number of proteins, belonging to the group of lectins and toxins of which ricin is a member, have been extracted from seeds, purified by chromatographic techniques, and crystallized by a variety of procedures.
RESULTS: Determination of the molecular structures would lead to new understanding of the related functions. Determination of the stereo-chemistry of the binding of ricin to its cellular receptors (by X-ray studies of crystalline complexes with moieties of these receptors, once the structure of ricin itself has been determined) would help to explain this type of macromolecular interaction at the cell surface. Structure determination of the Bence-Jones variant half-dimer, and of its complexes with small molecules, would enlarge our knowledge of immunology at the molecular level. An understanding of chromosomal structure is particularly pertinent to understanding biological hazards related to energy production, since their mutagenicity and carcinogenicity are results on interactions with chromosomes, not naked DNA.
PROJECT MILESTONES: Winter, 1976-77 Low-resolution electron-density distribution of ricin crystals; definition of shape of molecule. Spring, 1977 Determination of binding site for oligosaccharide (membrane receptor). Winter, 1977-78 High-resolution electron-density distribution of ricin crystal; construction of skeletal molecular model.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To characterize the active sites of enzymes in order to acquire a more complete understanding of enzyme mechanisms.
APPROACH: Reactive reagents that are structural analogs of natural substrates are prepared by techniques of organic syntheses. Because of its structural similarity to substrate, the reagent will have a high affinity for the active site and thus in many cases selectively modify an active-site residue. Once chemically labeled, the active-site residue can be identified by standard techniques of protein chemistry.
RESULTS: (1) Partial characterization of the active site of phosphoglycerate mutase by the affinity label bromoacetyletharolamine phosphate. (2) Two newly-synthesized reagents, 2-chloroglyceraldehyde 3-phosphate and 2-phosphoglycolic acid azide will be tested against several glycolytic enzymes. (3) Sequences of active-site peptides from phosphoglycerate mutase and ribulosebiophosphate carboxylase will be obtained.
PROJECT MILESTONES: It is impossible to predict milestones in basic research. Attempts to design new affinity labeling reagents for the characterization of active sites of enzymes will continue. Highly selective enzyme reagents have potential application as chemotherapeutic agents.

PROJECT DESCRIPTION: To study the molecular mechanisms of chemical- and radiation-induced mutagenesis in

mammals.
APPROACH: Our finding that unscheduled DNA synthesis, taken to be repair of damaged DNA, occurs in certain meiotic and post-meiotic germ cell stages of male mice after in vivo chemical or X-ray treatment has opened a new approach for rapid screening of potential mutagens. A suspected chemical mutagen is administered to male mice and at the same time tritium-labeled thymidine is injected directly into the testes. At various times after treatment germ cells are recovered and analyzed for the unscheduled uptake of [/sup 3/H]thymidine indicating DNA repair. Also, isotopically labeled mutagens are being used to study the number of chemical lesions induced in mammalian germ cells and the molecular targets of these mutagenic agents.
RESULTS: Considerable data will be accumulated on the types of chemicals that can induce DNA repair in mammalian germ cells and the relative effectiveness of different classes of chemicals in inducing DNA repair. Also, a clearer idea of the molecular targets in the germ cells that are important in chemical mutagenesis experiments should emerge.
PROJECT MILESTONES: Milestones to be aimed for in the near future include: (1) Determining the possible role of protamine (a basic protein in mammalian sperm cells) in the production of dominant lethal mutations by chemical agents. (2) Measuring DNA repair induced in mouse germ cells by a variety of chemicals including polycyclic aromatic hydrocarbons (by-products of coal liquefaction). (3) Determining the sites in the DNA of mammalian germ cells which are attacked by chemical mutagens.

PROJECT DESCRIPTION: We plan to determine the roles of various substrates, cofactors and enzymes of DNA metabolism in DNA synthesis after irradiation or chemical damage, using bacteria and cultured mammalian cells made permeable to nucleoside triphosphates and other small molecules.
APPROACH: A wide variety of environmental agents are known which induce damage in DNA leading to an inhibition of DNA synthesis or faulty DNA replication. The extent to which DNA repair processes restore the original fidelity of the DNA will ultimately determine the fate of the damaged cell. We are using both bacteria and mammalian cells to assess the roles of several known DNA polymerases and other DNA metabolic enzymes and factors in DNA repair, replication and recombination. DNA mutants of E. coli and B. subtilis provide a genetic approach to defining the roles of individual components of the DNA repair and replicative systems. The information obtained with prokaryotes should provide leads to assess the details of DNA repair and replication in mammalian systems including man.
RESULTS: Our program should provide additional insight into the cellular systems for repairing chromosomal damage. The similarities and differences between ionizing radiation and certain chemicals in regard to the repair response elicited will be further clarified.
PROJECT MILESTONES: (1) Selective chemical control of DNA repair systems in mammalian cells. (2) Rapid screen for potential mutagens and carcinogens inducing DNA Polymerase I repair synthesis in Escherichia coli.

PROJECT DESCRIPTION: The purpose of this program is to assess available data sources and methodology appropriate for use in analytical studies and environmental impact statements concerning the potential impact of nuclear power plants on public health. The first part of the program involves determination of the availability of vital statistics and demographic data of local, state, and national origin which are useful for analysis of health effects. The second part involves assessment of methods used by epidemiologists, biostatisticians, and other scientists as seen in the literature on health effects.
APPROACH: Intensive review of methodology for health effects assessments in cooperation with faculty of Johns Hopkins University (Epidemiology Dept.). Involves use of cancer mortality and morbidity statistics on a nationwide basis by county and vital statistics for State of Tennessee. Comparative analyses are made of an area containing a nuclear facility (Oak Ridge), a similar highly educated population not proximate to a nuclear facility, and Tennessee as a whole.
RESULTS: Development of a reliable methodology for the assessment of health effects, and of computer codes for analytical computations of public health statistics.
PROJECT MILESTONES: (1) Assessment of the reliability of methodology on health effects FY 1977. (2) Development of computer programs for continued assembly and monitoring of public health statistics proximate to energy facilities FY 1978.

PROJECT DESCRIPTION: Examine results of very severe reactor accidents such as might result from willful malevolent acts to establish timely and realistic countermeasures.
APPROACH: Realistic accidents involving present and contemplated reactor types will be analyzed. Accidents leading to core meltdown with varying degrees of damage to containment will be considered. Models developed at ORNL using the computer codes YIELDS (ORNL-4996), RELEASE (ORNL-TM-4702), and METSWP (ORNL-4979) plus data bases on meteorological conditions (supplied by NOAA) and demographic variables (from the Regional and Urban Study Group at ORNL) will be used to calculate the impacts on society.
RESULTS: (1) Recommendations for actions to be taken while an accident is in progress to mitigate the effects of the accident. (2) Recommendations for modifications to present siting and containment concepts to decrease the effects of possible accidents. (3) Recommendations for decontamination, reoccupation, and recovery of an affected area. (4) Recommendations for siting criteria and operational safeguards.

PROJECT DESCRIPTION: This project involves the development of specific antileukemic agents, the exploration of the nature of OH radical attack on proteins and nucleic acids, the nature of the interactions of

carcinogens with DNA and the adaptation of chemiluminescence methods to investigate the oxidation of aromatic hydrocarbons to more carcinogenic compounds.
APPROACH: Synthetic organic chemical techniques will be utilized to prepare specific new compounds as required to accomplish the objectives of the program; e.g., to develop competitive inhibitors of enzyme systems involved in the multiplication of the leukemic cell, model compounds for radical and DNA binding studies and such structural variations of luminescent compounds as are necessary to elucidate the nature of the reaction. Anti-leukemic compounds will be tested in in vitro enzyme systems and correlated with results obtained in a collaboration with a group studying leukemia in cell culture.
RESULTS: (1) Useful anti-leukemic agents. (2) A better understanding of the radical interactions in biological material. (3) A chemiluminescent method for determining the presence of oxidized intermediates of carcinogens in biological material.

PROJECT DESCRIPTION: The role of immunity and immunologic phenomena in sustaining life and well-being has long been appreciated. Therefore, the objective of this research is to determine the effect of energy-related chemical pollutants, toxic by-products, catabolites and environmental mutagens on the immune system.
APPROACH: Two general categories of approach are underway. (1) To establish suitable technology to evaluate the activity of environmental compounds with regards to immune responsiveness in mice, i.e., in vitro and in vivo screening tests to identify potentially hazardous agents and to determine an order of magnitude for deleterious activity and (2) mechanism studies aimed toward clarifying the suspected role of depressed immune competence in chemical carcinogenesis.
RESULTS: To identify the hazard of the effluent of by-product chemical compounds (e.g., oxides of carbon, sulfur and nitrogen from fossil fuel combustion and toxic agents like plutonium from nuclear fuels) on immunopoiesis. To assess the recovery of the immune system from such injury and to bring this information to the level of clinical applicability.
PROJECT MILESTONES: Results published in the open literature.

PROJECT DESCRIPTION: In view of ERDA's responsibilities in developing fossil fuels for energy we will be confronted with many biological hazards from polycyclic aromatic hydrocarbons (PAH) which are associated with their conversion and utilization. These PAH may have carcinogenic, tumor initiating or promoting activities in man. We propose to study the mechanism of action of certain PAH carcinogens and tumor promoters in epidermal cells both in vivo and in vitro with some studies performed on human epidermal cells in culture.
APPROACH: Dose-response studies on the tumor initiating and promoting abilities of a methylated and non-methylated PAH (7,12-dimethylbenz(a)anthracene and benzo(a)pyrene, respectively) and their cellular metabolites will be undertaken in order to better define complete carcinogenesis. A skin tumor sensitive strain of mice will be used in the above tumor experiments. Since these mice are not available commercially, we plan to start a breeding colony of these mice plus a tumor resistant strain. These mice will be extremely valuable to our research program. We have begun studies of chemical carcinogenesis in vitro using mouse and human epidermal cells. We will determine if there is a correlation between the tumor initiating ability of several PAH and their ability to bind to the bases of DNA and to specific regions in the genome. The cellular metabolism of phorbol ester tumor promotors will be studied using high pressure liquid chromatography.
RESULTS: The results from the tumor experiments on what metabolites contribute to tumor initiating and promoting activities will be available. A quantitative in vitro transformation of both human and mouse epidermal cells into cancer cells should be available. The metabolism studies with phorbol ester tumor promoters will be completed. Some of the studies with the anticarcinogenic agents will be completed and their use as potential chemophophylaxic agents will be known.

PROJECT MILESTONES: Since the majority (greater than 85 percent) of human cancers arise from epithelial tissue it is important to have a quantitative in vitro transformation system. We hope to attain this goal. Also, if we can transform the normal human epidermal cells in culture into cancer cells we will be the first ones to accomplish this. As results become available from our experiments they will be published in appropriate journals.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To study the biochemical characteristics of cancer cells and how these characteristics are acquired: (1) the mechanism of initiation of alpha-fetoprotein synthesis in carcinogen treated liver cells; and (2) the regulation of DNA synthesis and the sequence of DNA synthesis in carcinogen treated cells.
APPROACH: The synthesis of alpha FP in embryonic liver cells and hepatoma using radioimmunoassay procedures. Induction of alpha FP synthesis in carcinogen treated animals. Isolation of alpha FP mRNA. Isolation of alpha FP-DNA sequences. Effect of carcinogens on the physicochemical properties of these nucleic acids.
RESULTS: To understand the interaction of carcinogens with specific DNA sequences and their regulatory proteins. To understand how these carcinogens derepress the expression of these genes.
PROJECT MILESTONES: (1) Isolation of a specific gene and the proteins which regulate its expression. (2) To determine how carcinogens affect the expression of these genes.

PROJECT DESCRIPTION: The primary goals of this project are to generate the means for ex vivo immunodepletion therapy, for automated monitoring of the immunological indices of the host/tumor relationship, and for early cancer detection.
APPROACH: The path towards our primary goals is a closely interwoven program to invent, develop and evaluate the required instrumentation and methods; and to produce the necessary pure immunoreagents. The significant events along this path are: (1) mathematical simulation and experimental verification of the chemical kinetics and fluid dynamics of immunosorption reactions, (2) development of systems for immunodepletion, reagent detection and production, and automated immunoassay; and their associated immunosorbents and protocols; (3) production and purification of specific reagents, and (4) development of automated assays for cell-mediated immunity.
RESULTS: (1) Immunodepletion of tumor antigens and associated antibodies from extracorporeal shunts of animals and then human tumor-bearers. (2) Production of a homeostatic state in the disturbed immune regulatory system thru No. 1. (3) Automated immunoassays to monitor patient/tumor relationship: (a) radioimmunoassay for antigen and antibody, (b) cell-mediated immunoassay, (c) immune complex assay, and (d) anti-idiotypic antibody.
PROJECT MILESTONES: (1) Development of prototype automated immunoassay system. (2) Development of immunodepletion cartridge for ex vivo use in humans. (3) Development of control and monitoring system for immunodepletion protocol. (4) Production of pure immunoreagents: antibodies against tumor antigens, tumor antigens, and anti-idiotypic antibodies. (5) Development of automated cell-mediated immunity assay.

PROJECT DESCRIPTION: To explore fundamental relationships in areas of bioengineering research, particularly with regard to microbial and enzyme engineering separation technology, and bioprocess development for pollution abatement.
APPROACH: Use established chemical engineering research methods and techniques to conceive, design, and evaluate practical biochemical reactors and processes.
RESULTS: A new, highly efficient bioreactor, the tapered, fluidized bed bioreactor (TFBBR). An understanding of the fundamental relationships of biomechanisms andd bioprocesses which will allow efficient design of bioprocess equipment.
PROJECT MILESTONES: (1) Complete studies of the fluid dynamic properties of the Tapered Fluid Bed Bioreactor (TFBBR) April 1, 1977. (2) Complete studies of the mass transfer properties of the TFBBR Oct. 1, 1977. (3) Complete evaluation of TFBBR for degradation of phenolic acids in aqueous wastes Jan. 1, 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: It is well recognized that certain physical and chemical agents can induce DNA damage. However, a more insidious effect of pollutants may be by their indirect means of inducing carcinogenic and mutagenic damage in cellular DNA by inhibiting the DNA repair mechanism. Numerous studies have shown that DNA repair mechanisms are of primary importance in preserving and monitoring the genetic integrity of cellular DNA. Carcinogens and mutagens would have greater effects in their yield of cancers and mutations were it not for these repair mechanisms which efficiently correct DNA damage induced by these agents. If DNA repair mechanisms are inhibited or interfered with in any fashion, damage induced by carcinogens or mutagens would be proportionately increased. Of great importance in this area is the effect of pollutants and products of non-nuclear energy production, particularly those compounds found in coal liquefaction and gasification processes. This vast array of compounds includes such pollutants as ozone, sulfur, and nitrogen oxides and such products as polycyclic hydrocarbons and aromatic amines. Several of these compounds are proven or suspected mutagens and/or carcinogens and can be expected to include possible inhibitors of DNA repair.
APPROACH: We have sensitive, rapid, and informative techniques for studying DNA repair which include (1) bromodeoxyuridine photolysis and (2) molecular weight analysis. In addition, we have fully characterized DNA repair in human cells (normal and repair deficient mutants) after DNA damage by a variety of agents. Clearly, experimental analysis of these compounds must take into account the following observations: (1) if the compound acts as an inhibitor of DNA repair following a physical or chemical insult, (2) if the compound itself damages the cellular DNA and (3) if such damage by the compound is corrected by a cellular repair mechanism.
RESULTS: From our results of the preceding year it is clear that we are encountering several different effects of putative repair inhibitors. First is a frank inhibition of DNA repair with no photodynamic action. Secondly, a combination of DNA repair inhibition and photodynamic action either resulting in cross links or molecular weight reduction in the DNA, the latter being the most frequent. Thirdly, no inhibition of DNA repair but a photodynamic action resulting in a molecular weight reduction in the DNA. That is, an actual damage to the DNA done by these agents in combination with 313 light. Such photodynamic action would be expected in vivo in individuals exposed to certain of these agents and subsequently exposed to normal sunlight. We have received from Dr. Epler, of the Mutagenesis Testing Unit, a large number of additional coal conversion chemicals which are presently under test and will be examined in FY 1977. These include the quinoline derivatives, chloromercuribenzoate compounds and polycyclic hydrocarbon epoxides. Because these are important compounds in coal conversion processes, it is important to investigate these for the three possible types of action that we have encountered with previous putative repair inhibitors as outlined above. When enough of these chemicals have been characterized with regard to what category they may fall into we will be able to make a statement concerning the relationship.
PROJECT MILESTONES: Publication of comprehensive report on selected representative compounds, relating their chemical structure and interaction with DNA to their molecular ability to inhibit DNA repair in human cells.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Tests are being developed to assess the frequency at which base substitutions naturally occur and are induced in human somatic cells following exposure to irradiation or hazardous chemicals. In hemoglobin, amino acid substitutions resulting from nucleotide substitutions become fixed in germinal cells at a low frequency, approximately 10/sup -9/ per codon per year. Base substitutions must also occur at some low frequency in somatic cells. Base substitution genetic damage caused by exposure of humans or animals to irradiaton or chemical mutagens can be determined by measuring the increase over the natural base substitution frequency. Techniques presently used to test for genetic damage in somatic cells cannot measure the frequency of base substitutions, which is an important measurement to make because it represents the kind of mutation that occurs most frequently in evolution.
APPROACH: Methods involve chemical measurements of the frequency at which the wrong (noncoded) amino acids are erroneously incorporated into proteins of humans or experimental animals. Human hemoglobin A is ideal because it is easy to purify and it has no coded isoleucine; therefore the small quantity of isoleucine present in human hemoglobin A is incorporated because of translational errors and/or nucleotide substitutions in the hemoglobin genes of a few erythropoietic stem cells. Data are being collected from the hemoglobin of the Marshallese exposed to gamma-radiation fallout in 1954 and persons accidentally exposed or receiving irradiation therapy. Experimental animal models are being developed to interpret human findings; in particular, a dose-response curve must be etablished in an experimental animal.
RESULTS: These studies will provide the first known data on the natural frequency of base substitution mutations in somatic cells for comparison with the known frequency of nucleotide substitutions in germinal cells. Data will also be obtained on the extent to which base substitutions are elevated in somatic cells of humans exposed to irradiation. A priori, this can be used to estimate the frequency of base substitutions induced in humans exposed to irradiation. The methods will be useful as a means to determine the mutagenic effect of potentially hazardous chemicals.
PROJECT MILESTONES: This year we expect to do a dose response study of the incorporation of isoleucine into the beta-chain of rabbit hemoglobin. Additional analyses will be made on the isoleucine content of Marshallese exposed to fallout in 1954. Blood from others accidentally exposed will be analyzed as it becomes available through Dr. Clarence Lushbaugh, ORAU.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The major goal of the comparative mutagenesis group is to provide a means of mutagenicity testing of those compounds produced by various existing or proposed methods of energy generation. These include the primary effluents of existing fossil fuel sources such as sulfur dioxide, the oxides of nitrogen, ozone, hydrocarbons, and heavy metals. It will also include products of newly proposed methodology such as coal liquefaction and of auxiliary methodology.
APPROACH: The work is divided into two phases: one dealing with known compounds expected to occur in the environment through energy production, conversion, or use; and another dealing with actual samples from existing or experimental processes. Using rapid screening genetic assays (''Ames System''), the group is attempting to identify mutagenic agents associated with coal and oil shale extraction, conversion or utilization. To approach the problems of testing large numbers of compounds, we set up a form of the ''tier system.'' Operating units utilizing Salmonella, E. coli, yeast, human leukocytes, mammalian cells, and Drosophila have been initiated.
RESULTS: A large group of compounds were preliminary tested. Many of these compounds are polycyclic hydrocarbons and require metabolic activation with mammalian extracts. The comparative role of assays with activation in microbial systems and the mutagenic response in higher organisms is being investigated. Primary and subfractions of products and aqueous discharges were assayed. Potential mutagenic fractions were identified and attempts will be made to ascertain the specific compound(s) responsible for the mutagenic action.
PROJECT MILESTONES: (1) 1/1/77 Complete short-term assay on (a) 4 process-aqueous discharge, (b) begin work on comparative assays; begin cell culture assay. (2) 3/31/77 Preliminary information on specific compounds; extension to comparative assays; begin work on revised fractionation procedures. (3) 6/30/77 Complete work on revised fractionation. (4) 9/30/77 Preliminary evaluation--cell culture assay; completion of short term assays on environmental effluents; preliminary evaluation--comparative approach; begin work on specific compounds/revised fractionation.

POLLUTANTS: NOXIOUS GAS (20%);METALS (20%);ORGANICS (60%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This is a comprehensive mouse mutagenesis program to test those chemical compounds and mixtures related to non-nuclear energy production which pose a potential genetic risk to human populations.
APPROACH: The program is comprehensive in three senses. First, it includes tests for transmitted gene mutations as well as for transmitted chromosomal aberrations. Second, since no single end-point has proved adequate for detection of chromosomal aberration events, we use not only the dominant-lethal test, but also the test for heritable translocations, and the X-chromosome-loss test developed by us. Third, related tests are employed that help in the performance or evaluation of the mutagenesis work. Among these are: (a) toxicity tests; (b) fate and metabolism, including dosimetry and interaction with germ-cell DNA; (c) measurement of female reproductive performance (important in itself, but also an indicator of dominant lethality); (d) germ-cell lethality measurement to evaluate the role of selection; (e) measurement of DNA repair in germ cells.
RESULTS: Quantitative evaluation of the risk from any chemicals related to non-nuclear energy production which prove to be mutagenic. In tests where no mutagenic effect is found, the data are expected to show that the sample size was large enough to have detected mutagenicity if it had been at a level considered hazardous.
PROJECT MILESTONES: This is a long-term project to test, one after another, those chemicals or mixtures related to non-nuclear energy production which are identified as possible mutagens. Priority for testing will be based on many factors, including results from non-mammalian tests and probable extent of human exposure. Immediate milestones are the completion of tests on sulfur dioxide, heavy metals, and some polycyclic aromatic hydrocarbons.

PROJECT DESCRIPTION: To elucidate the physics or gas phase chemistry of atmospheric ion-molecule and ion-ion interactions which result from natural and man-made sources in the environment. Reaction rates, dissociative products, fragment kinetic energies and reaction spectra are determined for a variety of molecular species.
APPROACH: Low energy negative ions are produced by dissociative electron attachment reactions. The negative ions thus produced are allowed to react with target molecules where products are analyzed by a quadrupole mass spectrometer. In a second experiment dissociative ionization by electron bombardment is used to produce molecular ion products which are energy and mass analyzed by time-of-flight and by a quadrupole mass filter.
RESULTS: (1) Kinetic energies or effective temperatures of reaction products. (2) Branching ratios for dissociative products. (3) Ion-molecule scattering cross sections. (4) Ion-ion reaction rates. (5) Detached electron energy spectra.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Through theoretical calculations and experimental measurements, the clustering reactions of a number of positive and negative ions will be determined. Species of interest in atmospheric processes and in combustion of fossil fuels are to be characterized as to types of cluster ions formed, cluster sizes, characteristics, and clustering rates under different ambient conditions.
APPROACH: Supersonic expansion nozzles will be used to create molecular clusters which interact in a crossed beam apparatus with photons, electrons and atomic beams. Reaction products are analyzed by time-of-flight and by quadrupole mass spectrometry.
RESULTS: Detailed information will be obtained on the formation and subsequent clustering of positive and negative ion species of atmospheric constituents and of pollutant ions. These data include cluster sizes, reaction rates, electron affinities of clusters, and other characterizations of such chemical species.
PROJECT MILESTONES: (1) Completion of Phase I experimental apparatus for studies of clustering phenomena in condensable gases Spring 1976. (2) Completion of Phase II experimental apparatus for studies of clustering phenomena in non-condensable gases Fall 1976.

PROJECT DESCRIPTION: To understand the basic interactions of environmental pollutants with matter and to study, theoretically and experimentally, the forces on charged or neutral bodies located near a solid or liquid surface.
APPROACH: Basic techniques of theoretical physics (e.g., classical electromagnetic theory, quantum mechanics) will be employed in this work. Emphasis will be placed on the role of collective electron and ion oscillatory motion associated with the surface of the condensed phase in determining these forces. Experimental measurements of such forces will be made to complement the theoretical studies.
RESULTS: This project is expected to provide a better understanding and description of the processes of particle accretion, adhesion of particulate matter to macroscopic bodies, energy transport in an atmosphere which contains particulate matter, and reactions among molecules at gas-condensed matter interfaces.
PROJECT MILESTONES: Regular publication of research results.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: To adapt or develop methodologies for the sensitive and specific assays of labile environmental pollutants by measurement of transmission, absorption, fluorescence, chemiluminescence, or light-scattering signals on the portable Centrifugal Fast Analyzer.
APPROACH: One aspect of this work will be directed toward developing methods for pollutants which are unstable or whose concentration would be changed during transportation from the point of sampling to a laboratory facility. Examples are residual chlorine and ozone in natural waters downstream from power plants. A second aspect of this development effort will be directed toward the accurate and sensitive measurement of biomass and nutrients in the field. Here development of methods for adenosine monophosphate (AMP) and adenosine diphosphate (ADP) are needed to go along with an available method for ATP. In addition, methodologies are needed to measure polysaccharides and phosphate and nitrate at the ppM level.
RESULTS: It is expected that techniques can be developed for the preloading of CFA rotors with reagents for useful analyses of environmental pollutants including silicate, phosphate, nitrate, and ammonia. Using these rotors with the portable CFA and dynamic introduction of samples, it is anticipated that analyses for a number of environmental pollutants can be performed in the field with high precision and accuracy. Coupling fast kinetic data acquisition with assays utilizing enzymes is expected to improve analytical specificity.
PROJECT MILESTONES: (1) Demonstrate sensitive and reproducible enzymatic assay for nitrate reductase from Chlorella September 1976. (2) Demonstrate preparation of preloaded rotors with reagents for four nutrients, phosphate, silicate, ammonia, and nitrate December 1976. (3) Demonstrate kinetic assays for AMP and ADP as additional measurements of biomass March 1977.

PROJECT DESCRIPTION: To assess needed instrumentation in personnel site monitoring and analytical chemistry related to energy source development (coal, nuclear). To apply new electronic devices and techniques to development of advanced detection instruments and systems for spectral identification and quantification of metals and organics.
APPROACH: The unifying concept is the application of light amplifiers, multidetector arrays, camera tubes and television technology to analytical spectroscopy. The conventional single slow detector will be replaced with thousands of detector elements operating simultaneously making possible rapidly responding instruments requiring smaller samples. Novel detection techniques which are extensions of nuclear instrument technology will be applied to hydrocarbons in gas phase.
RESULTS: (1) Improved solid state detector array system for analytical spectroscopy having photon counting sensitivity employing analog spectrum correlation and recognition. (2) Personnel and area monitoring systems for polynuclear aromatic hydrocarbons. (3) Improved hydrocarbon detector for gas chromatography.
PROJECT MILESTONES: (1) Electrically cooled, intensified, solid state array (1024 elements) detector operating. (2) Operating analog binary sequence correlator (1024 elements). (3) Prototype personal air sampler, integrating with alarm. (4) Operating prototype hydrocarbon detector for gas chromatography.

PROJECT DESCRIPTION: To perfect resonance ionization spectroscopy (RIS) and to apply it to systems for the detection of low levels of atomic species.
APPROACH: Dye lasers are used to selectively excite and then ionize atoms. By saturating ionization and detecting electrons in a proportional counter or an electron multiplier, one atom detection is possible.
RESULTS: (1) Demonstrate one atom detection for a variety of applications. (2) Study energy pathways relevant to the species involved in one atom detection.
PROJECT MILESTONES: (1) Demonstrate one atom detection by generating one atom at a time by using the B-10(n,alpha)-Li-7 process by fall of 1976. (2) Demonstrate the use of Rydberg states for one atom detection with lower energy (10/sup -3/ joule) per pulse by March 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To understand the consequences of the absorption of radiation in matter in a detailed fashion. The energy pathways followed as an irradiated system returns to a new state of equilibrium provide the underlying basis for understanding radiation effects at the chemical and biological levels.
APPROACH: A Van de Graaff accelerator is used to irradiate gases with 2-MV protons. Studies are made using time resolved vacuum ultraviolet emission spectroscopy, resonance ionization spectroscopy (using dye lasers to ionize excited species), and total ionization measurements.
RESULTS: (1) Understanding of radiation interactions with gases, including detailed knowledge of excited species created and their further interaction with gases. (2) Energy pathways concepts and supporting data for the design of sensitive pollution detectors.

PROJECT MILESTONES: (1) Extending the development of resonance ionization spectroscopy to excited states of Ne, Ar, Kr, and Ze by December 1976. (2) Evaluate the possibility for time resolved resonance fluorescence for pollution analysis by December 1976. (3) Model energy pathways in all noble gases by December 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: (1) Evaluate the role of a forested landscape in the removal of airborne trace contaminants, (2) to determine the physicochemical characteristics of source emissions and atmosphere inputs of selected trace contaminants to a terrestrial landscape, (3) to optimize the use of an atmospheric transport model to compute inputs of trace contaminants to the terrestrial landscape from selected point sources, and (4) to determine if atmospheric emission and landscape deposition of trace contaminants derived from coal-fired power plants result in significant net annual and/or long-term accumulation of these contaminants on a representative East Tennessee watershed.
APPROACH: The technical approach involves use of an intensively instrumented and well-characterized forested catchment (located within 15 km of two large coal-fired power plants) on which measurements of selected trace contaminants in air, rain, on leaf surfaces and in stream water are made on a basis designed to elucidate transport, deposition and cycling of these contaminants on a landscape scale.
RESULTS: Successful attainment of these objectives will provide (1) an increased understanding of the influence of forest vegetation on air quality in the vicinity of coal-fired power plants, (2) an improved state of knowledge concerning the physicochemical characterization of coal-derived aerosols which has implications to both environmental and human health effects considerations, (3) an improved atmospheric transport model for predicting ambient air concentrations and deposition of coal-derived aerosols, and (4) an evaluation of the potential for accumulation of coal-fired power plant emissions deposited on the landscape.
PROJECT MILESTONES: Completion of meteorological tower instrumentation June 1976. Initiation of full-scale aerosol-canopy interactions study. Initiation of plume sampling for source characterization. Material balance of selected contaminants for Walker Branch Watershed.
KEYWORDS: FATE;FOSSIL-FUEL POWER PLANTS;AIR POLLUTION;LAND POLLUTION;TERRESTRIAL ECOSYSTEMS;FORESTS;MONITORING;AIR QUALITY;CHEMICAL EFFLUENTS;AEROSOLS;AIR;ELEMENTS;TRACE AMOUNTS

REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest;HYDROGRAPHIC AREAS/Other hydrographic areas Streams, reservoirs
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To develop information on the mechanisms and rates of enrichment of Cd, Ni, and Cr in detritus food chains in Walker Branch Watershed streams and to determine the biological availability of these three elements to aquatic biota in a stream and quarry used as a disposal site for fly ash from a coal-fired electric generating plant.
APPROACH: Baseline measurements of Cd, Ni, and Cr concentrations in detritus food chains in a small stream will be determined, including concentrations in leaf detritus as a function of stage of decomposition. Contribution of surface microflora (bacteria, fungi, algae) to the accumulation of Cd, Ni, and Cr in leaf detritus will be determined in both field and laboratory studies. Mechanisms of enrichment will first be determined in the laboratory by sterilizing leaf detritus and killing algae with radiation and determining differences in enrichment of radiotracers of these three elements. Availability and turnover of Cd, Ni, and Cr to detritivores will also be determined using radioactive tracers in laboratory studies.
RESULTS: Results of this study will define the mechanisms of enrichment of Cd, Ni, and Cr in detritus-based food chains in freshwater environments and the turnover and bioaccumulation of these three elements in aquatic biota. In addition, the biological availability of Cd, Ni, and Cr to aquatic biota in a stream-quarry-reservoir system used for fly ash disposal will be determined. This information will provide information necessary to assess the potential effects of pond disposal of fly ash from coal combustion

and/or other coal technologies.
PROJECT MILESTONES: Complete baseline experiments on the analyses for Cd, Ni, and Cr in the detritus food chain in the Walker Branch Watershed stream.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Ecological Effects of Coal Combustion: Response of Vegetation to SO/sub 2/, O/sub 3/, and Acid Precipitation will examine physiological responses of plants as indicators of acute and sub-acute response of plants to air pollution stress. Primary emphasis will be placed on determining the physiologically significant features of pollutant doses.
APPROACH: With gaseous pollutants (SO/sub 2/ and O/sub 3/) concentration peaks, duration and frequency will be varied while the frequency, pH, intensity and chemical composition of acidified rainfall will be examined and related to plant response. Response parameters to be measured include photosynthesis, respiration, transpiration, and carbohydrate metabolism, and growth. Both individual and combined pollutant regimes will be studied to develop a physiological basis for evaluating probable effects of pollutant stress under field conditions.
RESULTS: This project is designed not only to improve our understanding of the response of plants to pollutant stress, but to provide a means of characterizing pollutant dose in biologically meaningful terms. While the initial phases rely heavily on controlled laboratory exposures, increased emphasis will be placed on evaluation of pollutant stress under field conditions as the project proceeds.
PROJECT MILESTONES: (1) Determine the influence of individual and combined dosage kinetics of SO/sub 2/ and O/sub 3/ on physiology of kidney bean. (2) Determine influence of treatment duration and acidity level, and chemical composition of acid rainfall on plant physiological processes. (3) Examined combined effects of SO/sub 2/, O/sub 3/, and acid precipitation on plant physiology and growth.

CHARACTER OF STUDY: RESEARCH/Applied (50%);DEVELOPMENT/Laboratory scale (50%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) To coordinate data management and processing activities within the Division. (2) To assess and implement data management capabilities for Division research projects. (3) To store computer accessible data as a resource for future research. (4) To apply data management techniques to project needs.
APPROACH: A data base resource is being developed containing both numeric research results and textual documentation for the support of projects which analyze and evaluate the environmental impacts of energy technology on regional scales. Research efforts are directed toward collection and management of data on ecological effects of pollutants on ecosystems, or resource use/effects on landscape and drainage systems, and on aesthetic and sociological factors in relation to human welfare.
RESULTS: Efforts in FY 1977 and FY 1978 will expand the data bank so that comprehensive information will be available on effects of many nonnuclear technologies on all aspects of the environment. We will have accumulated enough information to serve as a base from which we can identify and add ''missing'' data. That is, by subsetting information in the data bank according to subject area or phenomenon, it should be readily apparent as to what data are needed to fully understand that ecological phenomenon. Statistical analysis and graphical displays will be used along with existing computer models to actively interrogate the data bank contents. This change from developing the data management capability to actually using that capability is only possible after a critical mass of information has been accumulated. The thrust of these initial efforts will be to identify deficiencies in the data bank such that essential data may be added as required.
PROJECT MILESTONES: (1) Procurement, implementation and presentation to research members of new methodologies in the Statistical Analysis System, 1976 version, 10/1/76. (2) Integration of data resources and data related equipment on a continuing basis, 10/1/76. (3) Expandable air quality data base for southeast U.S., 3/1/77. (4) Data management methodologies for reading any amount of data in any form, 6/1/77. (5) Identification of data resources needed for completing regional assessments, 10/1/77. (6) Procurement and implementation of data resources as previously identified by Division projects, 3/1/78. (7) Continued integration of computer resource and data analysis capabilities with Environmental Science Division research needs, 10/1/78.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To develop an index which is a time-integrated pollutant concentration in a particular sampling medium such that the estimated total exposure to humans via all relevant pathways corresponds to the statutory or otherwise pre-established exposure limit. This index serves as an operational exposure guide and assessment tool applicable to any nonradioactive pollutant from any given source or sources.
APPROACH: Develop and maintain models, computer implementations, and data bases for predicting the time dependent movement of released pollutants through environmental pathways to man, and for estimating the resulting exposures (pollutant concentrations) in target tissues in man.
RESULTS: The final result will be the ability to assess a facility's compliance with existing pollutant standards and to determine if the release poses a threat to human health. The unique features are that the calculated numerical value or ''index'' can be used to determine if a facility is meeting accepted emission standards and the fully developed CUMEX methodology will permit an assessment of human health effects of a combination of several pollutants where synergistic or antagonistic effects may occur.
PROJECT MILESTONES: (1) ORNL Report - CUMEX and cadmium last quarter FY 76. (2) ORNL-TM - CUMEX and SO/sub 2/ 2nd half FY 77. (3) ORNL-TM's - CUMEX and other single pollutants throughout FY 78. (4) Journal article - CUMEX Application mid FY 78. (5) ORNL Report - CUMEX and multiple pollutants end FY 78.

TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: METALS/Plutonium (25%);PARTICULATES/Plutonium;PARTICULATES/Soils (75%)
CHARACTER OF STUDY: RESEARCH (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/South;GEOGRAPHIC AREAS/Far West;GEOGRAPHIC AREAS/Northwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To identify the association with the soil and sediment, to determine availability to biota, differentiate the forms, and to assess the potential movement and fate of plutonium existing in contaminated sites of selected ERDA facilities. The sites include Nevada Test Site, Oak Ridge National Laboratory, Rocky Flats and Mound Laboratory. From results obtained from actual-contaminated sites, laboratory studies are performed to define more definitively the reaction mechanisms of plutonium when in contact with soils and sediments matrices of different regional environments and different original release forms.
APPROACH: The existing size association, mineral association, and organic association are determined. Solubilities of the different site sources are determined using selective leaching or complexing agents. With sediment samples, the interstitial water is removed and the ''soluble'' plutonium determined. Representative samples are treated to obtain ultimate size association and mineral association by applying dispersive treatments. Samples are collected as functions of distance from the initial release source, depth into the soil profile, and special situations such as vegetation versus bare areas. Results are related to intra site characteristics as well as inner site differences.
RESULTS: These results are used by each site in their comprehensive evaluation of the contamination. Solubility results are used to evaluate concentrations in plant and animals at each site; size association of the plutonium is used in evaluating the inhalation hazard of the resuspended and resuspendible fractions. Depth distribution results determine potential groundwater contamination as well as rate of reduction in the resuspendible fraction and the ground surface. The different source terms at the sites assist in evaluating potential behavior of different source terms such as oxide forms, solubilized forms, and complexed forms.

TECHNOLOGY: FOSSIL FUEL/Coal (50%);FOSSIL FUEL/Oil and Gas (25%);NUCLEAR/Fission (25%)

CHARACTER OF STUDY: RESEARCH (25%);ANALYTICAL (75%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/South
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Reduce lead time needed to bring new energy facilities on line by anticipating regional economic conditions that will change energy demands and by anticipating the impacts resulting from alternative energy supply solutions.
APPROACH: Development and trial application of a methodology to regionalize national demographic, economic and energy scenarios. Proposed work will be applied to the effects of alternate strategies for increased coal utilization in the South.
RESULTS: (1) Base-line distributions of population employment and energy conditions in the South for 1985, 2000, 2020. (2) Alternative distributions of population, employment, and energy conditions in the South for 1985, 2000, and 2020 based on national coal assessment scenarios. (3) Discussion of the sensitivity of these results with respect to assumptions of the National Coal Assessment.
PROJECT MILESTONES: (1) Preliminary BEA area distributions of population and employment in the South under base case low coal assumptions (first quarter of FY 1977). (2) Preliminary conversion of BEA area population and employment in the South to energy requirements by load center (first quarter of FY 1977). (3) Final BEA area distributions of population, employment and energy requirement in the South under base case low coal assumptions (third quarter of FY 1977). (4) Preliminary population and employment distributions by BEA area in the South for the high coal electric cases: present environmental and reclamation standards and strict standards separately (third quarter of FY 1977). (5) Final BEA area distribution of population and employment in the South for the high coal electric scenarios (fourth quarter of FY 1977). (6) Preliminary population and employment distributions by BEA areas in the South for the high coal-high liquids and/or gases scenarios (fourth quarter of FY 1977). (7) Preliminary reestimation of BEA area energy requirements for high electricity and high liquids and/or gases to determine the extent to which alternative coal strategies impact regional energy needs (fourth quarter of FY 1977). (8) Final and preliminary BEA area energy, economic, and population results for each scenario summed to the south and compared with similar results estimated for other regions by other national laboratories (fourth quarter of FY 1977).

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: This research project is concerned with assessing the regional environmental impact of energy technology facilities sited in the southern United States. Assessment will include considerations of atmospheric transport of pollutants, water resources, ecological effects, and human health impacts.
APPROACH: A framework is being developed for the optimization of energy facility levels of activity among a number of feasible sites located in the region. Input to this assessment framework will include data on air quality and distribution of airborne pollutants, regional water resources, regional land cover and pollutant sensitive forest species in the South, and the distribution of sensitive habitats and bird and mammal species in the region.
RESULTS: Report on the optimum allocation procedure involving considerations of air quality, water resources, and ecologic considerations with case studies for various subregions of the southern United States. Display of distribution of point sources loads of sulfur dioxide, nitrogen oxides, and other pollutants for the South and estimates of forest growth inhibition resulting from implementation of various energy scenarios. Regional data base of firm water yield by regional geographic cells for inclusion to the optimal siting problem. Documentation of land cover variables as they relate to the optimum allocation procedure for siting and application of the forest and growth simulation to assess pollutant impact. Inventory of bird and mammal habitats within the South, description of the niche requirements for these species and development of a model to quantify the impact scenario implementation.
PROJECT MILESTONES: Optimization Case Studies Documented: Air, Oct. 1, 1977; Water, Oct. 1, 1978; Southern Air Quality Trends Documented: March. 1, 1977; Estimates of Sulfur Dioxide Levels for Energy Scenarios: July 1, 1977; Estimates of Vegetative Effects on Atmospheric Transport: July 1, 1978; Documentation of low-flow frequency analysis method: Jan. 1, 1977; Tabulation of firm water yields for selected basins: July 1, 1978; Identification of Spatial Land Cover Needs for South: July 1, 1977; Documentation of forest stand growth similar for SO/sub 2/ sensitive species: Jan 1, 1978; Data base for distribution of birds and mammals in South: July 1, 1977; Development of model to quantify technological impact on birds and mammals: July 1, 1978.

PROJECT DESCRIPTION: To develop a unified methodology to assess the impact of energy related facilities upon individuals, communities and regions for the purpose of explaining and predicting social impacts over the effective life of the facility.
APPROACH: A time-series analysis of individual and community changes for nuclear and coal-fired generating facilities. Continuation of nuclear power plant study in Hartsville, Tennessee, and comparison with a new facility as yet unnamed utilizing coal. This cross-technology approach will enable abstraction of common impacts and technology specific.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: This project will examine the Appalachian coal region to assess the environmental consequences of coal extraction and the potential of Appalachian coal resources to meet future energy needs. The work applies to areas presently being mined and those likely to be mined within portions of Kentucky, West Virginia and Tennessee.
APPROACH: The project will focus upon developing methodologies to analyze high altitude photography and ERTS imagery for use in ascertaining location and extent of strip mining activity. Hydrologic data recently acquired will be used in predicting water quality changes associated with mining activity. Wildlife and terrestrial impact will be assessed.
RESULTS: Maps of Appalachia showing strippable coal reserves based on consideration of environmental, economic and physical constraints. Maps of Appalachia showing drainage basins affected by coal extraction and identification of potentially impacted basins from the standpoint of wildlife habitat and land resources potential, documentation of methods for assessing changes in wildlife species population densities and for predicting changes in water quality constituents as a function of surface mining activity.
PROJECT MILESTONES: (1) Compilation and storage of coal reserves data for eastern United States in computer retrievable form in FY 1977 (1st quarter). (2) Store water quality data relative to present conditions for most of Appalachia in FY 1977 (1st quarter). (3) Develop regional wildlife resources assessment methodology, regional recreational and land resource model, and model for predicting water quality changes (3rd quarter). (4) In response to surface mining in FY 1977 (3rd quarter). (5) Apply method for predicting

water quality changes to a selected watershed within the Tennessee Valley region and begin to synthesize the wildlife, recreational, and water quality assessments for selected major areas.

PROJECT DESCRIPTION: The purpose of the National and Regional Siting Project is to develop the capability to perform energy facility site screening analysis in the southern United States over space and time initially using a county-level resource information system. The approach requires specification and use of engineering, environmental, and social criteria associated with siting various mixes of energy facilities, including both coal and nuclear technologies.
APPROACH: The analysis approach will utilize a county-level information system. The approach requires specification and use of engineering, environmental, and social criteria associated with siting various mixes of energy facilities including coal and nuclear technology.
RESULTS: (1) Report documenting siting factors associated with coal and nuclear technologies. (2) Report describing the siting procedure and design of each factor model. (3) Computer plots of siting suitability for the southern U.S. at the county level for both coal combustion and nuclear technologies and possibly some types of coal conversion facilities depending upon characterization processes provided by the National Coal Assessment.
PROJECT MILESTONES: (a) Transformation of energy demand projections for the South as provided by the National Coal Assessment (NCA) and distributed by ORNL analyses according to numbers of energy facilities by BEA regions will be completed by the first quarter of FY 1977. (b) Factors important in the siting of nuclear and coal-fired power plants by the first quarter of FY 1977. (c) Preliminary siting distibutions for low-coal high-nuclear (NCA No. 1) by the beginning of the second quarter of FY 1977. (d) Design of the factor models essential to calculate reliable measures for siting at county level by the end of second quarter of FY 1977. (e) Preliminary siting suitability for NCA No. 2 high-coal electric scenarios by the second quarter of FY 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH;ECOLOGICAL PROCESSES AND EFFECTS
)JECT DESCRIPTION: Environmental behavior of U and Th as related to Th fuel is to evaluate the environmental consequences of high specific activity U and Th isotopes released to terrestrial and aquatic ecosystems. Primary focus will be on isotopic dilution with natural U and Th isotopes and establishment of food chain transport parameters. Critical pathways for radionuclide movement in food chains will be delineated and this data related to radiological assessments of impact to biota.
APPROACH: The literature survey will be used to establish the priorities for further laboratory or field work. Existing literature will be reviewed to establish the extent to which biologically-labile pools of U or Th have been identified. Those reports specifying compartment transfers will be examined in depth. Field and laboratory studies underway attempt to develop soil to plant transfer coefficients and to evaluate labile pools of soil U or Th.
RESULTS: (1) A literature evaluation to determine the state of knowledge on U and Th transfer from soil/sediments to biota. (2) Soil/plant transfer data and soil chemistry data.
PROJECT MILESTONES: (1) Evaluate soil-plant transfer of U and Th Oct. 1977. (2) Evaluate ''available'' U and Th in soils Dec. 1976. (3) Determine feasibility of Plant-Animal transfer studies Apr. 1977.

POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH;HEALTH EFFECTS
PROJECT DESCRIPTION: To define molecular mechanisms by which gene expression is regulated in mammalian cells and determine how these are altered by carcinogenic chemicals.
APPROACH: Control of gene expression by hormones (steroids, insulin, cyclic nucleotides) is analyzed in biochemical terms, principally in a hepatoma-inducible enzyme system developed for that purpose. Turnover of specific mRNAs and proteins is analyzed in liver, hepatoma cells, and thymic lymphoma. Control of expression of endogenous virus genomes is analyzed in embryonic mouse fibroblasts.
RESULTS: Most environmentally-induced diseases, especially cancer, can be related to defective regulation of gene expression. This project will provide information necessary for proper evaluation of the health hazard associated with various energy technologies and for development of effective preventive measures.
PROJECT MILESTONES: (1) Jan. 1, 1977 Complete penetration of tyrosine amino transferase mRNA. Begin preparation of CDNA probe. (2) March 1, 1977 Begin analysis of transcriptional control at chromatin level. (3) October 1, 1977 Complete preliminary experimentation on terminal transferase in thymic lymphoma; begin analysis of control by glucocorticoids. (4) October 1, 1977 Begin fractionation of mouse fibroblast chromatin into active and inactive fractions; determine distribution of tumor virus genome using CDNA probe.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH;HEALTH EFFECTS
PROJECT DESCRIPTION: The morphological and biochemical characterization of preneoplastic lesions is one of the most important goals of basic and clinical cancer research. It is the key (1) to the identification of individuals with a high risk of developing cancer and (2) to the development of therapeutic intervention. The purpose of our studies is (1) to correlate ultrastructural and cytochemical changes with the evolution of neoplasia in respiratory epithelium exposed to chemical carcinogens and (2) to correlate subcellular changes with altered biological behavior such as growth in vitro, motility, plasma membrane activities and invasiveness.
APPROACH: The tracheal transplant system is used for ''localized'' tumor induction with carcinogenic polycyclic hydrocarbons. This in vivo system will be the source of carcinogen-altered epithelium and of invasive carcinomas to be studied in vivo and in vitro. We will examine whether the invasiveness of carcinoma cells is due to degradation of extracellular tissue constituents by surface bound lytic enzymes or by lysosomal lytic enzymes. The possibilities of increased phagocytic uptake and degradation of extracellular matrix and increased migration of invasive cells into the surrounding tissue will also be examined. For this purpose the enzyme profiles and the lipid composition of the plasma membranes will be studied in several tumor cell lines maintained in vitro. Subsequently, cell lines derived from carcinogen-exposed but not yet neoplastic epithelium will be similarly investigated. Normal tracheal epithelium grown in vitro will serve as reference material. Ultrastructural studies will be conducted

simultaneously.
RESULTS: The tumor cell lines are being established in vitro and are tested to establish plating efficiency growth rate, saturation density, growth in soft agar, and tumorigenicity. Methods are being developed to grow at least primary cultures of normal tracheal epithelium. Procedures are being developed for subgross identification of carcinogen-induced epithelial lesions in the tracheal transplant system. This will allow us to select abnormal epithelial areas for the study.
PROJECT MILESTONES: The first project milestone is to establish all methods required to maintain normal carcinogen exposed and neoplastic epithelial tissues in vitro and to establish essential growth parameters. Secondly, to determine the ultrastructural and cell biological characteristics of normal, carcinogen exposed, and neoplastic epithelial cells growing in vivo and in vitro.

PROJECT DESCRIPTION: To provide biochemical understanding of host involvement during environmental carcinogenesis in mammalian organisms, including humans, with current emphasis on two aspects: (1) responses of host cells at the genomic level upon carcinogenic insults, and (2) unique membrane properties of cancer cells.
APPROACH: The test systems employed are in vitro cell cultures of human and mouse origin. Specific research projects include (1) transfection (human cells become infected by treatment with DNA preparations containing RNA tumor virus genome) as a measure for studying factors influencing insertion of a foreign genetic material into human cell genome, (2) biochemical characterization of mouse Fv-1 gene expression which restricts leukemia virus infection, (3) development of lectin-gel affinity chromatography for isolation of cancer cell antigens, (4) biological assays of transfer factors related to cell-mediated immunity against human cancers.
RESULTS: Development of efficient techniques for studying transfection including procedures for isolation of DNA with high activity of viral genome, and methods for rapid quantitative assay of transfection. Isolation and purification of the Fv-1 gene specific RNA molecule which transfers the resistance property into susceptible cells. Application of PHA-Sepharose, lentil lectin-Sepharose and concanavalin A-Sepharose columns for isolation of tumor virus specific glycoprotein antigens and human breast cancer cell surface glycoproteins. Utilization of labeled adenosine in in vitro assays of lymphocyte-mediated immunity against human cancers.
PROJECT MILESTONES: (1) Transfection in human normal fibroblast-line HSBP: RD-114 virus system (Sept. 1976), Simian sarcoma virus system (Dec. 1976) and Baboon endogenous virus system (March 1977). (2) Purified Fv-1 gene specific RNA preparation (Jan. 1977). (3) Isolation of gp 69/70 antigen from Baboon endogenous RNA tumor virus (Dec. 1976).

POLLUTANTS: METALS/Cadmium and zinc (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: COASTS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The role of toxic air contaminants (both organic and inorganic) and of obstructive pulmonary diseases in the development and the progression of heart failure has been a major interest of this group. In addition, this group has been involved in studying the in vitro metabolic effect(s) of two occupational and urban inorganic air and water pollutants, cadmium and zinc, on lung, heart, kidney and the aorta of rodents. Our objectives are to gain (1) better understanding of the biochemical and physiological events leading to and occurring in the failing heart, (2) determine the biochemical effect(s) of cadmium and zinc on those tissues described above.
APPROACH: We have been studying the binding properties of noradrenaline and glucagon to the plasma membrane of the experimental failing heart of rats and hamsters. In addition, we are attempting to quantitate the phospholipids in the plasma membrane of this heart because hormone binding has been shown to require the phospholipids, phosphotidylinositol and phosphotidylserine. The in vitro effect(s) of cadmium and zinc on the enzymes monoamine oxidase and catechol-O-methyl transferase and the binding of noradrenaline to the plasma membrane of lung, kidney, heart and the aorta of rats and hamsters are presently being studied.
RESULTS: We will determine (1) if the binding of hormone to the plasma membrane and the synthesis of plasma membrane phospholipids are altered in the failing heart, (2) the in vitro and in vivo effect(s) of cadmium

and zinc on those enzymes described above and the binding of hormones to the plasma membrane in rats and hamsters.
JECT MILESTONES: Within the next three years we anticipate that we will be able to elucidate why hormonal metabolism is altered in the failing heart. Information gained during this period will be reported in the scientific journals.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this research program is to develop and apply models and statistical methodologies for fish populations that will be of value: (a) in evaluating the consequences of man-made stresses, (b) in placing previously qualitative statements into a quantitative framework, and (c) in defining issues where field and laboratory research are essential for more accurate estimates of impacts.
APPROACH: Two interrelated approaches are used in our computer simulation modeling of fish populations. First, a population transport model is developed in cases where it is important to consider spatial phenomena in addition to temporal phenomena. Such population transport models serve to estimate short-term impacts, such as the yearly reduction, due to entrainment and impingement mortality, in the number of fish that survive their period of susceptibility to power plants. Second, an age-dependent, life-cycle population model is developed to estimate the long-term impact of increased mortality in a given age class on the size and age structure of the total population and, where appropriate, on the yield to the fishery.
RESULTS: Results expected include testimony and ORNL reports to be used in forthcoming hearings for EPA, NRC, and/or FPC, as well as open literature publications.
PROJECT MILESTONES: (1) Further develop and apply age-dependent, life-cycle population models for striped bass and other fish species to estimate the long-term impact of man-induced mortality in a given age class on the size and age structure of the total population and, where appropriate, on the yield to the fishery. (2) Develop and apply the maximum entropy spectral analysis technique to the analysis of environmental time series, with an emphasis on the time series for Atlantic Coast commercial landings of striped bass. (3) Develop a methodology for predicting and determining the minimum statistically detectable difference between fish population levels.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To improve our understanding of the physical and chemical interactions that radiation undergoes with biological material and to develop models for predicting the biological effects of radiation.
APPROACH: To start with basic cross sections and describe the initial physical interactions that radiation undergoes with matter and to link these early physical events to later chemical events and ultimately to biological effects.
RESULTS: A better understanding of the structure of charged particle tracks in biological material, the initial processes by which radiation interacts with matter, the mechanisms by which deposited energy is transported through matter, the identification of the processes or mechanisms which are most significant in producing biological effects, and the improvement of models for predicting biological response to radiation.
OJECT MILESTONES: Regular publication of research results.

POLLUTANTS: NOXIOUS GAS (10%);PARTICULATES (20%);ORGANICS (70%)
CHARACTER OF STUDY: RESEARCH (50%);DEVELOPMENT (25%);ANALYTICAL (25%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: This program is focused on toxic pollutants associated with coal conversion processes. The concurrent problem of producing and dealing with large quantities of polycyclic aromatic hydrocarbons (PAH) impoases the obligation of providing adequate protection and measuring devices for workers and the general public. Another ''new'' energy system with serious pollution problems is geothermal (H/sub 2/S, NH/sub 4/, As, Hg, etc.), and it is deserving of the same attention we are giving to coal conversion technology. The prime objectives are to identify the modes of encounter with PAH and other pollutants and to devise instruments and monitoring techniques which will lead to rectification of these problems, principally those of an occupational nature.
APPROACH: Continued assessment of monitoring needs for coal conversion and other energy systems such as geothermal, adaptation and field testing of presently available instruments which respond to PAH at existing coal conversion facilities, and experimental studies of the kinetics of PAH adsorption onto dust-sized particles.
RESULTS: Initiation of studies leading to the development of a survey meter for organic byproducts of coal conversion.
PROJECT MILESTONES: (1) Convene the second ORNL workshop on polycyclic aromatic hydrocarbons: characterization and measurement with a view toward personnel protection 2/28/77. (2) Submit review article on current and projected states of the art for measuring fugitive emissions from synfuel systems 10/1/76. (3) Test and derivative spectrometer and gas chromatography systems in conjunction with personnel dosimeters for collecting polycyclic aromatics 10/1/76. (4) Compile the latest spectroscopic characteristics of biologically important PAH compounds produced in synfuel systems 7/1/77.
KEYWORDS: INSTRUMENTATION;AROMATICS;HYDROCARBONS;AIR POLLUTION;COAL;GEOTHERMAL ENERGY CONVERSION;MONITORING;CARCINOGENS;CHEMICAL EFFLUENTS;POLYCYCLIC AROMATIC HYDROCARBONS;SYNTHETIC FUELS;PERSONNEL DOSIMETRY;PERSONNEL MONITORING;RESPIRATION;COAL LIQUEFACTION;COAL GASIFICATION

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: This project provides well defined, standard samples for biological and environmental assessment studies on coal conversion related materials. A sample bank, consisting of whole samples and fractions will be established to provide both in-house and perhaps outside needs.
APPROACH: Sample materials will be produced through both private sources and collaborating agencies. These materials will include process, product and effluent stream samples which seem most pertinent in the developing industry. Whole sample stabilities will be determined so that reliable compositional information is available. Whole samples will be fractionated and fraction compositions and stabilities characterized. Analytical and preparative scale approaches will be devised.
RESULTS: A sample bank of whole samples and fractions (according to chemical properties, e.g., aliphatic-aromatic enriched) will be established with compositional data and stability data available. These coal related samples will be available to support biological and environmental research.
PROJECT MILESTONES: (1) Analytical scale fractions of products, appropriate process samples, and effluents will be available and supplied routinely 1/1/77. (2) Reproducibility and recovery of preparative scale fractions will be known 1/6/77. (3) Chemical characterization will be sufficiently advanced to focus on biologically active fractions and to identify and quantitate specific compounds 1/1/78.

ERGY CYCLE: PROCESSING, CONVERSION (100%)
ARACTER OF STUDY: ANALYTICAL (100%)
_SEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Information activities produce a valuable data base for administrators, decision-makers and researchers. As our energy supplies decrease there will be more emphasis on energy conservation and there is a need to examine some of the effects of energy conservation. This project has the objective of making information on these effects (such as the effect or human health of lowering home thermostats) available in a useful form.
APPROACH: The open literature is searched by manual and machine methods, relevant information acquired and the literature overview prepared by a team of discipline specialists.
RESULTS: An overview will be prepared and 100 copies printed. A computerized bibliographic support base will be maintained.
PROJECT MILESTONES: (1) Draft document for review 8 months after date of commencement. (2) Establishment and maintenance of a data base on-going.
KEYWORDS: ENVIRONMENT;HEALTH HAZARDS;AIR POLLUTION;COAL GASIFICATION;COAL LIQUEFACTION;ENVIRONMENTAL EFFECTS;DATA COMPILATION;CHEMICAL EFFLUENTS;EARTH ATMOSPHERE;MAN;SYNTHETIC FUELS;WATER

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Providing socioeconomic data, analysis, assessment and technical assistance to a diverse user community. Services have been oriented toward providing the specific data needed to focus on problems of local, state and federal organizations, to investigate technical questions in support of ERDA research programs, to develop an integrated information system and to provide effective assistance in comprehensive data analysis and display related to socioeconomic and energy related studies.
APPROACH: Maintain a small staff, trained in the social, information, statistical, economic and computer sciences to acquire volatile, massive data bases, make these skills and constantly developing areas of expertise available by providing data and technical assistance on an intra-ERDA program basis, maintaining and expanding information resources, assessing information needs of the user community, automating and centralizing documentation and data, developing methods for data analysis and manipulation.
RESULTS: Document experience, thrust and potential of the RUSTIC program, incorporate management of new data, as well as provide for changing user requirements, increase efficiency and enhance cost effectiveness by as far as is practical, improvement of capabilities in the centralized data management system, continue documentation and definition of the RUSTIC repository of socioeconomic, energy and software holdings.
ROJECT MILESTONES: (1) Development of methodology for integrating data bases with a unified information

system. (2) Implement procedures for synthesizing, analyzing and updating data files. (3) Refine and extend existing administrative procedures for collaboration with other agencies in data collection, analysis, dissemination, activities.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global;GEOGRAPHIC AREAS/Site specific ORNL
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The purpose of this program is to assess the potential health and environmental effects from radioactive releases and magnetic fields associated with fusion power. A systematic assessment is proposed to evaluate available data, and models to identify potential environmental and health effects, and to identify what new information is required for a comprehensive environmental analysis of Controlled Thermonuclear Reactors (CTR).
APPROACH: The objectives will be accomplished using the best present estimates of releases, environmental behavior, and risks to human health. At each stage of the assessment, the current state of knowledge will be reviewed to identify the unknowns and to estimate the relative effect of uncertainties on the final potential impact.
RESULTS: Results are expected to include a ranking in order of relative importance the priority areas for general research and model development; and a review of a number of tritium management strategies designed to minimize exposure to operational workers and members of the public.
PROJECT MILESTONES: Review of Environmental and Metabolic Aspects of Niobium Nov. 1976. Dose Calculations for Unit Releases of Activity for Major CTR Designs Jan. 1977. Assess the Accuracy to which the Conversion Rate of HT to HTO Must be Known for Dose Calculations June 1977. Complete a Meaningful Deficiency Analysis of Metabolic and Environmental Data for Activation Products June 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) Identify existing biological monitoring programs, organizations, and data repositories. (2) Systematically compile pertinent information on each project as to type of data being monitored. (3) Obtain or generate tabular or graphical display of data and/or summaries resulting from selected monitoring programs. (4) Generate indices to allow categorization of programs by data types, organizations, and funding.
APPROACH: Key persons (administrators) were identified in appropriate departments of state and federal government, universities and colleges, consulting firms and business firms. These key persons were contacted by telephone to obtain names of Principal Investigators involved in biological monitoring projects. A packet containing a covering letter, definition sheet, three documentation forms and a return envelope was mailed to each principal investigator. The original packet was followed by two reminder letters. All materials were composed on the basis of a review of literature pertaining to "improving returns of documentation forms." A MINI-BIOMON (Minimal documentation) data base was established to facilitate handling and accounting of projects when received. The MINI-BIOMON now contains over 3,000

projects and provides such information as sponsor of project, state site, funding level, investigator, title, change and cause of change plus appropriate key words and code words. Establishment of the main biological monitoring data base is in progress.
;ULTS: Product/Results Expected: The main Biological Monitoring Data Base will consist of more complete information on selected projects and will be supported by a number of satellite data bases the first of which is the MINI-BIOMON. Other planned satellite data bases will include bibliographic, taxonomic and geographic description. All will be searchable on-line at ORNL and can be manipulated to produce hard-copy summaries. Experience with bibliographic data bases indicates that a two-year cycle is about optimal for update purposes. We therefore propose an update effort for the inventory in FY 1978. This will be done cautiously to avoid antagonizing previous participants. Previous nom-participants will be asked to fill in documentation forms fcr new projects and ones previously missed. With periodic updates the Inventory may be established as a fully operational information analysis center with all of the implied services and products, i.e., regularly scheduled publications, response-referral services, visits and contacts with allied efforts, etc.
PROJECT MILESTONES: July 10, 1976 (tentative date) Demonstration Data Base searchable on-line from ORNL. Sept. 30, 1976 (tentative date) Majority of Biological Monitoring Projects Searchable on-line from ORNL. (1) The complete, finished on-line, data base will consist of approximately 1,000 records. (2) Final camera-ready products to be produced will include (a) Volume 1 Descriptions of the project and the data base, the rationale for the survey, and a user's guide to the data base. (b) Volume 2-A computer-generated, edited, hierarchical, cross-referenced index to the data base. (c) Volume 3-Full file printout aggregated by regions or groups of adjacent states. Indefinite Completion of special interest reports for Council on Environmental Quality and Fish and Wildlife Service.

PROJECT DESCRIPTION: The Environmental Control Technology Data Base of the Environmental Resource Center, Information Center Complex, ORNL, has been established to serve as an information resource to the Environmental Control Technology Division, ERDA, following the formation of that division during FY 1975. This information resource file is to assist division personnel in identifying the problem areas in environmental control, in locating and acquiring relevant information, and in evaluating the effect of such information on the research plan.
APPROACH: The Environmental Resource Center is initiating the development of a resource data base in the area of environmental control technology with special emphasis on fossil energy systems (combustion, conversion, and oil shale) and provides response services to the Environmental Control Technology Division upon request.
RESULTS: This resource data base is in the form of a hard-copy literature collection controlled and manipulated via a computerized bibliographic file. In addition, Environmental Resource Center personnel together with Ecological Sciences Information Center staff are preparing several chapters pertinent to environmental control for a broad overview document on coal conversion pollutants.
PROJECT MILESTONES: (1) Response service - upon request. (2) Literature Collection and Bibliographic File June 1976.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/All (100%)
CHARACTER OF STUDY: RESEARCH (30%);DEVELOPMENT (40%);PRODUCTION (30%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT;OS
OJECT DESCRIPTION: An Information Center for Energy Safety (ICES) is being established at Oak Ridge National Laboratory (ORNL). ICES will provide a means for collecting, evaluating, storing, and disseminating relevant safety information essential to the development and use of various forms of energy. In particular, this Center will be uniquely concerned with the safety considerations and relevant standards in the design, construction, and operation of the various energy systems and their supportive research facilities. Emphasis will be given to the various energy options which ERDA is developing, exclusive of nuclear and non-ERDA information analysis centers at ORNL. However, available information as it pertains to the health and ecological effects of all energy sources will be accessible to both ERDA and

other potential users.
APPROACH: Information pertaining to the safe design, construction, and operation of all energy-related systems, facilities, and in some cases, transportation means, will be obtained from information systems where possible, particularly the energy data base at ERDA's Technical Information Center (TIC). However, it is apparent that such sources will have to be supplemented by the acquisition and processing of additional documents, journals, non-ERDA meetings and symposiums, and foreign literature. Such additional documents will be stored in ERDA's computer facilities at Oak Ridge where it can be made available on ERDA's RECON network either as part of TIC's or NSIC's data base, or later as a separate system.
RESULTS: The information will be evaluated, as required, by user's needs and disseminated in various forms, e.g., reports, bibliographies, journal articles, response to inquiries, retrospective searches, periodic selective dissemination of information (SDI), a newsletter, NSC newsletter, articles, etc. Among reports ICES would be expected to prepare are state-of-the-art reviews of the safety of various energy systems, compilations of relevant safety standards, codes and/or specifications.
PROJECT MILESTONES: While ICES will, insofar as possible, answer inquiries now, it is not expected that the Center will be fully operational until the latter part of FY 77. However, it is expected that the need to ''catch-up'' will largely be complete and the Center will be able to shift from collecting, cataloging, and storing of information to the evaluation phase and dissemination to the users. 1977 ICES is presently operational. Services now provided are consultation, conduction of special services, and some evaluation.

PROJECT DESCRIPTION: Define potential ecological effects of coal conversion effluents, identify critical pathways of trace contaminants to biota (including man).
APPROACH: Environmental toxicological studies of whole and fractionated effluents as well as transport, fate,

availability investigations utilizing represenative class compounds.
RESULTS: (1) Quantities of COS released may cause modification of phytoproduction. (2) Phenolic and ammonia components are major acute toxic materials in aquatic environments. (3) PAH and Arylamines are key organic contaminants that might move through aquatic environment to man.
PROJECT MILESTONES: (1) Identify interactions between key atmospheric organic contaminants. (2) Determine validity of chemical fractionation to acute toxicity screening. (3) Develop initial predictive model for availability and transport of PAH's in aquatic environment. (4) Develop protocols for evaluating potential problems of solid wastes.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: This project emphasizes the development of methodology for systematic analyses of complex organic materials which result from or are involved in coal conversion technologies.
APPROACH: Real samples will be procured from private sources and collaborating agencies. These, in conjunction with model samples, will be used to develop the techniques for analyzing for classes of compounds as well as specific compounds in any complex, natural matrix. Separations methodologies will include gas-liquid chromatography, gel chromatography and acid-base fractionation. Chemical identifications will be made using infrared, NMR and mass spectroscopy.
RESULTS: Generalized approaches to the analyses of PAH's and heterocyclic compounds is expected. A great number of heretofore unidentified materials should be added to the catalogue of information on synthetic fuel and effluent compositions. Concomitant studies in the life science areas should result in the analyses of several health and environmentally important compounds.
PROJECT MILESTONES: (1) Development of methodology for the rapid estimation of approximate composition of complex samples, including aqueous samples 1-1-77. (2) Development of methodology for quantitative determination of PAH's in a PAH isolate 1-7-77. (3) Development of methodology for the identification and determination of heterocyclic compounds of nitrogen and sulfur 1-1-78. (4) Determination of principal acidic and basic components 1-7-77.

CHARACTER OF STUDY: RESEARCH/Laboratory (50%);DEVELOPMENT/Laboratory scale (50%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Southwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objectives of the program are twofold: (1) development, design, and construction of advanced, automated, continuous monitoring systems for specific environmental pollutants and (2) characterization of expected pollutants and evaluation of advanced systems in actual and simulated process effluents. The program is primarily concerned with the second task as it relates to coal conversion processes.
APPROACH: Identify specific environmental pollutants associated with coal conversion processes and then develop automated environmental systems for continuous in-situ monitoring of specific airborne or soluble pollutants. An evaluation of automated instrumentation and development of such instrumentation will be pursued.
RESULTS: The results of this program should permit the development of rapid, accurate, and automated analytical instrumentation for monitoring pollutants from coal conversion processes.
PROJECT MILESTONES: Quarterly reports describing progress and the development of automated analyzers.

PROJECT DESCRIPTION: The objective of this project is to establish sample repositories of well characterized synfuels derived primarily from coal. These sample materials could then be utilized for example to test for biological and/or physical evaluation. Primary emphasis is placed on obtaining samples of coal liquids, combustion products, and wastes effluents from conversion processes.
APPROACH: The approach to this project is to simply obtain samples from various coal conversion processes for future characterization and evaluation. Primary effort is directed toward using these samples to obtain research data on the various coal conversion processes. The samples collected are chosen carefully to insure that they represent truly viable coal conversion processes currently under consideration.
RESULTS: It is expected that the availability of various coal conversion process samples will permit the generation of useful research data, particularly from a chemical and biological activity point of view. It is not anticipated that the data generated can be used to establish the environmental acceptability of a specific coal conversion process.
PROJECT MILESTONES: The project was completed in FY77.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To provide routine surveillance and periodic maintenance to ensure that a release of radioactive materials to the environment does not occur because of gradual deterioration of containment.
APPROACH: Routine visual inspections, checks, and tests are made to ensure that the required equipment is operational and that no radioactive materials are released to the environment. Radiation levels, air flows, and pressures are routinely read and recorded and in some situations this information is telemetered to a central surveillance station.
RESULTS: Routine surveillance over the surplus facilities will prevent the release of radiation and/or the spread of contamination to the environment during the interim while plans are being developed to decommission the facilities.
PROJECT MILESTONES: There are no milestones in this effort. Surveillance will continue until the surplus facilities have been decommissioned.

PROJECT DESCRIPTION: The Oak Ridge Graphite Reactor (OGR), the Low-Intensity Testing Reactor (LITR), the Homogeneous Reactor Experiment No. 2 (HRE-2), and the Molten-Salt Reactor Experiment (MSRE) have been permanently shut down. At the time of shutdown, fuel was removed from the OGR, LITR, and HRE-2; but the MSRE fuel was drained from the reactor into shielded storage tanks in the reactor building. All four of the reactor structures must be kept under surveillance and maintained to keep them environmentally safe. The objective of this program is to study alternative methods for decommissioning the reactors so that little or no future surveillance will be required.
APPROACH: Each reactor structure is being studied in detail in order to provide a step-by-step job breakdown both for complete dismantling and disposal of radioactive portions and for entombment in place in concrete for the LITR, the HRE-2, and the MSRE. Since the OGR is a listed National Historical Landmark, only entombing of the more radioactive portions in concrete within the reactor shield is being considered. From the job breakdowns, estimates of manhour requirements, tooling requirements, and costs will be made.
RESULTS: The studies will provide sufficient information to allow a decommissioning method for each reactor to be chosen on the bases of environmental safety and costs.
PROJECT MILESTONES: Completion of procedures and cost estimates for: (1) LITR June 1975. (2) HRE-2 February 1976. (3) OGR July 1976. (4) MSRE October 1976.
KEYWORDS: REACTORS;DECOMMISSIONING;SAFETY;COST;DECONTAMINATION

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
)JECT DESCRIPTION: The sources of, and components in, the aqueous wastes of coal conversion processes will be identified alcng with existing guidelines and standards for the discharge of those materials to the environment. A set of anticipated emission standards for coal conversion processes will be developed. A variety of environmental control technologies will be assessed for their adaptability to coal conversion wastewater.
APPROACH: The literature will be surveyed and pertinent research and development personnel will be contacted in order to estimate the sources, quantities, and compositions of the aqueous effluents. Experimental

screening tests will be performed to determine their suitability to both synthetic and actual wastewater.
RESULTS: Results of this assessment are in the form of a first draft of a final report that identifies effluents from coal conversion plants and evaluates existing and anticipated federal and local effluent guidelines and standards and their impact. The suitability of new and existing wastewater cleanup technologies including biological degradation, char adsorption, and polyelectrolyte adsorption will be determined.
PROJECT MILESTONES: Final report on Assessment of Environmental Control Technology for Hydrocarbonization: (a) initial draft, final report 7/1/77; (b) final report, 10/1/77 (depends on editing and reproduction load at ORNL).

PROJECT DESCRIPTION: To understand the alterations in kinds and amounts of the various RNAs of human cells produced by cells progressing to the malignant phase of carcinogenesis. To understand the biochemical and molecular basis for such modifications and how they relate to cancer production.
APPROACH: Human cells will be treated with various levels of selected physical and chemical agents that are known to be carcinogenic. Activated and non-activated forms of polynuclear hydrocarbons will be used and their effect on metabolism and synthesis of the various types of RNAs will be evaluated.
RESULTS: We hope to clearly define the mechanism(s) of cell toxicity of such pollutants and to define their role in altering cellular regulatory processes that may play an important role in cancer production, promotion and progression to malignancy.
PROJECT MILESTONES: (1) Begin studies with PAH 1-10-76. (2) Effects on RNA metabolites 1-1-77. (3) Effects on synthesis 1-6-77. (4) Effects on turnover and breakdown of RNAs 1-9-77.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To assess human risk and to provide understanding of the mechanism for possible intervention therapy, to understand the metabolic fate in animals and man and to correlate animal and human cell data for prediction of risk to man.
APPROACH: Human cells will be exposed to radioactively labelled PAH's. The complete metabolic fate will be established by chemical and radiochemical analysis of reaction products. The ultimate carcinogen and its molecular reaction will be determined. Mutagenic frequency per unit dose will be correlated with frequency of oncogenic cell transformation.
RESULTS: Human cell systems (in vitro) will be developed for rapid, inexpensive and reliable screening for mutagenic and carcinogenic activity of hydrocarbons. The mechanism of reaction, damage and repair will become available.
KEYWORDS: CARCINOGENESIS;MUTAGENESIS;METABOLISM;HYDROCARBONS;ANIMAL CELLS;HAZARDS;DATA;RADIOISOTOPES;RADIOCHEMICAL ANALYSIS;CHEMICAL ANALYSIS;CELL CULTURES;MAN

JECT DESCRIPTION: Through detailed understanding of viral relationship of mouse leukemia and their associated antigens, specific radiolabelled antibodies will be used to provide immune radiotherapy for this type of cancer.
APPROACH: Using mouse leukemia system purified antibody against viral specific cell surface antigens will be coupled to high specific activity radioiodine as a means of delivering a cytotoxic radiation dose to leukemic cells.
RESULTS: It is expected that the animal model system will determine the feasibility of this type of therapy for cancer as a model for similar studies in human cancer.

PROJECT DESCRIPTION: Exploit the amphibian oocyte and embryo as a model to identify cell membrane and cytoplasmic regulatory mechanisms which may be targets of environmental acute and chronic toxicity.
APPROACH: To evaluate the effects of energy conversion environmental contaminants on cellular and developmental events. Effluents from energy producing processes contain potentially dangerous environmental products. In order to test such products, we have developed a model system which is inexpensive, rapid and in which several parameters can be monitored. The system uses the ciliate, Tetrahymena pyriformis, and monitors behavior, cytology, respiration and growth. T. pyriformis forms an integral part of all aquatic ecosystems and is an excellent model for testing pollutants. In our initial studies possible coal-conversion effluents have been examined to determine the lethal and threshold concentrations affecting cytological and functional changes. The aims of this new effort are: (1) examination of hazardous products which are structurally related (i.e., phenol, cresol, halogenated and substituted phenols) to determine how toxicity might be related to molecular structure, thus allowing predictive evaluations; and (2) extension of data obtained with the model system to other aquatic organisms such as Daphnia and amphibians. The amphibian studies, for instance, have already begun and ascertain such parameters

TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: TRANSPORTATION (90%);STORAGE (10%)
CHARACTER OF STUDY: RESEARCH/Theoretical (100%)
REGIONS OF INTPREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: Current regulatory packaging standards concerning nuclear criticality safety in shipments of fissile materials may not be adequate and may not provide a consistent minimum margin of safety. Regulations require five times the number of packages allowed in a normal shipment be subcritical when optimally arranged and reflected by water. The factor protects possible criticality in the event several shipments commingle. The factor may not provide a sufficient margin of subcriticality, however, for other contingencies encountered in normal transportation. In several instances calculations have shown that, while a package can meet current criteria, the k-eff of any array can be significantly increased by replacing a water reflector with a concrete reflector. Concrete floors and walls are common to many storage locations and warehouses where packages can be temporarily stored when in transit. The extent of the problem needs to be determined; and, if necessary, the safety standards should be revised.
APPROACH: The effect of fissile mass loadings of various commonly used package insulating materials such as Celotex, wood, polyfoam, Foamglas, and others, will be examined to determine the extent that current standards for specification of mass loadings in fissile packages breach acceptable margins of safety, and are inconsistent in assignment of transport indices.
ULTS: Determine the extent that current regulations for specification of mass loadings in fissile material packages breach acceptable margins of safety and are inconsistent in assignment of transport indices.

Confirm existing criteria or formulate new criteria. Submit results for review and comment. Complete study and issue final report.
PROJECT MILESTONES: Final report due approx. Sept. 1978.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objective of this project is to provide a technical and economic comparison of processes available for the control of gaseous hydrocarbon (HC) and carbon monoxide (CO) emissions. The Lurgi gasification process and the HCOAL liquefaction process will be considered as reference source systems, and comparisons of control technologies will consider incineration as the reference control system.
APPROACH: The following tasks will be performed during this study: Task I--Develop information concerning joint sources of contaminated gas from reference source systems; Task II--Identify EPA emission allowances for HC and CO; Task III--Examine industrial and development stage processes for HC and CO removal, recovery, or destruction; Task IV--Develop cost estimates and assess project efficiencies; and Task V--Presentation of results.
RESULTS: A review of the study results will be prepared for ERDA/DECT. The review will include recommendations for future analyses and/or experimentation.
PROJECT MILESTONES: (1) July 15, 1977 Project initiation. (2) September 1, 1977 Mid-project review. (3) September 30, 1977 Final review.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To define the role that Cd, an environmental agent associated with energy developments, plays in the induction and progression of emphysema or chronic obstructive pulmonary disease (COPD).
APPROACH: Acute exposures of rats to cadmium aerosols will be used to provide a relevant and convenient model for the induction of emphysema. Initial damage after cadmium exposure will be evaluated histologically and autoradiograms prepared to quantitate cell proliferation (as indicated by /sup 3/H-thymidine incorporation). The progression of emphysematous disease will be monitored by pulmonary function tests, morphometric and scanning electron microscopic examination of the lungs, and selected biochemical indices of pulmonary connective tissue metabolism. The influence of host factors such as age-of-exposure, exercise, exposure rate and presence of other environmental stresses (sulfates, NO2 and smoking) will also be considered.
RESULTS: Methods being developed to identify and quantify emphysematous changes. Cd exposures being initiated and retained doses will be determined via serial sacrifice samplings.

TITLE: Genetic Effects of Plutonium in Mice
PROJECT NUMBER: 002527
PRINCIPAL INVESTIGATOR: Russell, W.
ADDRESS: Oak Ridge National Laboratory, Oak Ridge, TN 37830
AFFILIATION: Oak Ridge National Lab., Tenn. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Carter, Charles E.
TELEPHONE: F233-5468

TYPE OF FUNDING: Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$180,000
TECHNOLOGY: NUCLEAR/Fission Converters;NUCLEAR/Fission Breeders (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: RADIATION/Plutonium (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: There is a sudden increase in general concern over the potential hazard from genetic effects of plutonium. Recent work has shown that plutonium concentrates near the basement membrane of the seminiferous tubules of the testis, thereby exposing spermatogonial stem cells to a significant dose. That being the case, the continuous low-level radiation exposure of these cells is likely to be more easily detected by gene mutation tests than by measures of chromosomal damage. Therefore, since some chromosomal damage has already been demonstrated, there is a high probability that the gene mutation studies will prove positive. The Biology Division of ORNL is the only U.S. laboratory equipped to handle the gene mutation studies, which will be carried out for spermatogonia, in parallel with determinations of chromosomal damage.
APPROACH: Male mice will be injected intravenously with Pu-239 citrate and, after 10 weeks, each will be mated serially with 4 T stock females per week. All offspring will be examined for specific-locus mutations. A subset of the offspring will be fertility tested to score for presumptive translocations. Translocation induction will also be determined cytologically by examination of diakinesis in treated males. To aid in the interpretation of the genetic results, histological examination of the testis will be carried out in Pu-239-treated and control males to determine the extent of any cell selection. Dosimetry by autoradiography and liquid scintillation counting will be done along with the genetic testing, on a simultaneously treated population of male mice. When the various experiments on males are well underway, pilot experiments will be initiated to determine distributional and dosimetric information for injected females. Data from these will be used to determine the feasibility of conducting subsequent genetic tests on Pu-239-treated females.
RESULTS: Mutation rates for specific locus mutations and translocations induced by Pu-239 in spermatogonia will be determined. From these it will be possible to estimate the RBE of plutonium. The spectrum of mutations produced by the specific-locus study, and further cytogenetic analysis of the mutants recovered, will provide information on whether or not plutonium produces relatively more of the serious type of damage (e.g., deficiencies) than occurs with x or gamma irradiation. Information will be obtained on the feasibility of conducting genetic experimerts with Pu-239-injected females.
PROJECT MILESTONES: (1) 30 Sep. 1977 Preliminary estimate of specific-locus mutation rate in spermatogonia. (2) 30 Sep. 1977 Dosimetry information for exposed spermatogonia will be complete. (3) 31 Dec. 1977 Cytological scoring for translocations completed. (4) 31 Dec. 1977 Pilot study on distribution and dosimetry in injected females completed. (5) 31 Dec. 1977 Decision point on whether to proceed with genetic study of plutonium in females. (6) 31 Mar. 1978 Fertility testing of F-1 for translocation estimates completed. (7) 30 Sep. 1978 Cytological analysis of F-1 steriles completed. (8) 30 Sep. 1978 Determination of specific-locus mutation rate in spermatogonia completed.

PROJECT DESCRIPTION: The chemical toxicology program will provide a quick response to questions arising out of the use of potentially toxic materials in ERDA's operations, materials associated with the production of synthetic fuels, and materials associated with energy effluents.
APPROACH: We will set up a program to conduct classical toxicological testing for both acute and chronic toxicity. The method of administration of the materials will depend on what is most appropriate. We have considerable capability in inhalation toxicology as well as the more conventional routes of administration. Tests will consist of, but would not be limited to, acute toxicity as measured by the LD/sub 50/, skin irritation, conjunctival irritation, causticity, and other tests as appropriate. In some cases it may be advisable to do more chronic toxicity testing to evaluate the incidence of chronic degenerative disease, cancer, mutagenesis and teratogenesis.
RESULTS: As a first step, we expect to recruit a full time toxicologist and equip the laboratory. Next, we will standardize all our testing procedures. Once this is done, we will move rapidly into extensive toxicity testing. We anticipate some testing for another division of ERDA, and will work closely with the Division of Operational Safety to help them in some of their problem areas. Toxicity testing will also be conducted on selected coal conversion products preliminary to more extensive testing in the carcinogenesis and mutagenesis programs.
PROJECT MILESTONES: (1) October 1976 Hire toxicologist and equip laboratory. (2) March 1977 Toxicology testing procedures standardized. Begin toxicology testing in animals.

REGIONS OF INTEREST:
BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The proposed research deals with the biological effects following exposure to radiation. These studies are relevant to accidental exposures and are of particular relevance to separation and waste management aspects of nuclear technology. This project is concerned with basic biological and chemical indices that may aid in the detection and understanding of the primary effects of radiation insult and may also serve in the diagnosis of such early effects. Included within this project are studies of the role of virus in radionuclide induced malignancies, and investigations of the role of free radicals in radiobiological damage.
APPROACH: Considerable effort has been expended to determine the effects of ingesting Sr-90. Those studies provided an experimental animal model to study the mechanism of radiation induced neoplasia. Our current research is designed to complement and extend the research with Sr-90 as well as other radiation induced malignancies (e.g. plutonium induced bone and lung tumors) in rats and beagle dogs. The quantitative relations between radiation dose, radical yields and radical reaction rates obtained in these studies will allow an accurate assessment of the importance of irradiation produced biochemical radicals in the development of radiobiological damage. These studies provide information required in the development of theoretical models for radiobiological damage. Likewise, theories developed can be tested for applicability in model biochemical systems.
RESULTS: At the present time oncogenesis in radiation exposed animals (and man) is poorly understood. Until recently the available technology was insufficient to allow determination of whether the observed malignancies were due to the direct (mutagenic) effects of radiation or due to indirect effects. We feel that developments in nucleic acid hybridization procedures, nucleic acid finger-printing techniques and advances in research with oncornaviruses have provided the technology necessary to begin to answer these basic questions. Free radicals are formed in all cellular systems exposed to ionizing radiation. The purpose of this study is to assess the reactivity of radicals formed in irradiated biochemical systems, identify the most susceptible sites for radical attack, determine the extent of damage initiated by such attack, and suggest chemical methods for modifying or preventing this damage.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: Development and improvement of methods for and the evaluation of the radiological impact of the nuclear industry on workers and environmental residents. Provide support to the U.S. Transuranium Register through radiochemical analyses of USTR samples from exposed workers and controls. Advance procedures for improved measurement sensitivity in analysis of autopsy samples. Provide data based on standardized procedures for use in approved epidemiology studies if warranted.
APPROACH: The approach to this research centers on a program of sampling of human tissues from former residents in the environs of the Hanford project and control groups, analysis of these tissue samples for plutonium and other emitters in a low level analytical laboratory maintained for such measurements. This laboratory also performs measurements on tissue samples for USTR. A model for assessment of environmental impact assessment associated with nuclear waste storage center on a program of measurement of Cs-137 in children whose drinking water supply could become contaminated with nuclear wastes and control groups. The approach to a diagnostic method for promethium 147-Oxide has centered on human testing using Pm-143 preceded by suitable animal studies.
RESULTS: The outputs of this research consist of measurements of plutonium and other radionuclides in relevant tissue samples obtained from human populations postmortem. Program outputs also include tissue

analyses for the USTR. Included as a result of these measurements is data for model development for predicting consequences of nuclear accidents. Output of in vivo studies is expected to be a monitoring technique for assessing environmental impacts of nuclear waste storage facilities where release to ground water is possible. Output of diagnostic technique is a method of sufficient sensitivity for determining the initial body burden following inhalation of promethium oxide.
PROJECT MILESTONES: (1) 1 April 1977 Report of autopsy results through 1975 prepared. (2) 1 Aug. 1976 Interlaboratory calibrated samples sent. (3) 1 Nov. 1976 Results of interlaboratory calibration samples received. (4) 1 Nov. 1977 4th set of calibration samples received. Continuing USTR and environmental sample acquisition and analysis. (5) 1 Oct. 1976 Pm-147 animal studies completed. (6) 1 Oct. 1977 Human testing completed, final report on Pm-147 model prepared.

PROJECT DESCRIPTION: To determine the agents or combinations of agents and their levels that are responsible for the high incidences of severe respiratory disease such as pneumoconiosis, emphysema, and carcinoma that are reaching epidemic proportions in uranium miners.
APPROACH: Experimental studies have resulted in pulmonary fibrosis, severe emphysema, and bronchiolar-alveolar and squamous carcinoma in rodents and beagle dogs that receive daily exposures to radon daughters and uranium ore dust, with and without concomitant cigarette smoking. Continuing studies are designed to: (1) define the possible contributing pathogenic roles of uranium ore dust and cigarette smoking; (2) provide reliable data to relate exposure dose to absorbed dose; (3) determine effects of altered dose-rate on carcinogenesis; (4) measure the relative effectiveness of altered radon daughter attachment fractions and ratios upon induction of severe respiratory disease to determine whether the working level concept may not be both inadequate and dangerous in evaluation of inhalation hazards of present and future uranium mining operations.
RESULTS: Determination of maximum permissible air concentrations of pollutants in uranium mine air.

PROJECT DESCRIPTION: This project seeks to find methods to decrease the damage potential from inhaled, skin- or wound-absorbed, or ingested radionuclides.
APPROACH: Diethylenetriaminepentaacetic acid and other chelating agents are being tested for their ability to remove Pu, other actinides and radionuclides from rats and dogs (previously exposed to the radionuclide by inhalation or through simulated wounds). Mechanisms of radionuclide uptake and release and the ability of test agents to influence such release from cells are made in a lung macrophage test system. This is especially useful in studying methods to remove particulate forms of radionuclides. Various pharmaceutic forms of agents are prepared for testing, e.g. slow-release and encapsulated forms. Successful agents are evaluated for toxicity since they will have potential application in man.
RESULTS: Improved and safer agents and methods for decreasing the damage potential from incorporated radionuclides by hastening their removal from the body and thus decreasing the radiation dose to tissues is the main aim of this research. While primarily benefiting workers in the nuclear industry accidentally

exposed to radionuclides, the results of this research would also benefit the public exposed to radionuclides from some accident or in a nuclear war.

MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Ballantine, D.S.
TELEPHONE: F233-3600
TYPE OF FUNDING: Contract No.-E(45-1)-1830
77 FUNDING: Energy Research and Development Administration FY77:$185,000
TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: METALS (10%);SPECIFIED OTHER POLLUTANTS/Radionuclides (90%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Northwest;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objectives of the Fallout Rates and Mechanisms program are (1) to provide a continuous record of the atmospheric concentrations of a spectrum of radionuclides which can be used to assess the hazard to the environment resulting from future releases of radionuclides by nuclear weapons tests, nuclear power reactors, or nuclear fuel reprocessing plants; (2) to detect and characterize episodes of high atmospheric radionuclide concentrations; and (3) to develop an improved understanding of physical processes which determine atmospheric concentrations and rates of removal.
APPROACH: The atmospheric concentrations of a spectrum of 39 radionuclides are being measured continuously at Richland, Washington and Point Barrow, Alaska to provide a record of radionuclide concentrations to be used in assessing the hazards resulting from future releases. When episodes of high concentrations occur the concentrations of 47 radionuclides will be measured, the size spectrum and physical, chemical and radiochemical properties of the radioactive particles measured, and the I-131 dose to man through the grass-milk-thyroid pathway calculated from the measurements of I-131 concentrations in grass samples throughout the United States. Radionuclide measurements will be used to calculate atmospheric residence times, vertical diffusion rates, and deposition velocities.
RESULTS: Air samples will be analyzed for the nuclear power reactor produced radionuclides Am-243, Cm-242, and Cm-244 to determine whether significant amounts of transuranium elements are being released into the atmosphere by nuclear power reactors. The fraction of the transuranium radionuclides present on particles in the respirable size range will be determined, since this is the size range which represents the greatest hazard to man. The I-131 dose to the human thyroid will be calculated from measurements of I-131 in grass in the event of large releases of radioactivity by either nuclear tests or nuclear reactors. The physical and chemical properties of the radioactive particles will be characterized. The solubility of the radionuclides in various aqueous solutions will be determined, since the solubility influences the rate of uptake by the biosphere.
PROJECT MILESTONES: The analysis of current and archived air filter samples for the transuranium radionuclides Pu-241 and Am-241 and also Pb-210 has been initiated. An intrinsic germanium diode has been put into operation for the analysis of air samples.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Along the atmospheric route from energy facility to man, particles and vapors react and interact with liquids, solids, and gases, each of which may remove, temporarily retain, or have no effect on these particles or volatile materials. The airborne concentrations near the ground and consequently the inhalation hazard will be decreased when these particles and gases ultimately deposit and are retained on environmental surfaces. Consequently, the objective of this research is to develop models for predicting removal of airborne particulates and gases by dry deposition onto environmental surfaces.
APPROACH: Dry deposition rates are measured in both wind tunnel experiments and in field experiments. In the wind tunnel, the effects of particle diameter, density, wind speed, and surface properties can be readily controlled to determine their effect on observed deposition velocities. In field research, experiments are made over more complex terrain using mass budget techniques and comparisons between depositing particles and a non-depositing gas.
RESULTS: This research will develop models for predicting the atmospheric removal rates of airborne particles

and gases by dry deposition onto environmental surfaces. At the present state of knowledge deposition rates are assumed independent of particulate chemical composition and can be adequately predicted for only the simplist of surfaces and conditions. Deposition rates are needed for predicting removal rates over complex terrain including forests, urban areas, and oceans.
JECT MILESTONES: (1) New predictive deposition velocity model developed 29/10/76. (2) Dry deposition chapter for ERDA book, ''Meteorology and Power Production'' 31/12/76. (3) Initial measurement of fallout deposition over long distances 23/4/77. (4) Field deposition velocity measurement using multiple tracers 23/7/77. (5) Field testing a Li-SF/sub 6/ deposition technique over a forest 23/10/77. (6) Field testing deposition velocity techniques over a city 23/4/78. (7) Initial reporting and comparing deposition data 23/8/78.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Northwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To gain a better understanding of the dispersive capacity of the atmospheric boundary layer and to provide a basin for the improvement of predictive models.
APPROACH: Vertical gradients of the ambient atmospheric pollutants SO/sub 2/, SO/sub 4/, O/sub 3/, and NO/sub x/ will be measured near the ground in both western and eastern Washington state. These gradients will be combined with concurrent micrometeorological measurements to infer the rate of deposition of these pollutants as a function of the meteorology and of the characteristics of the deposition surface. Additionally, an analytical/numerical simulation of resuspension is being made to determine the contribution which the previously deposited material makes to the annual exposure when it is reinserted into the atmosphere.
RESULTS: A data volume will be published detailing the results of past diffusion experiments conducted within this program. A report will be published, summarizing analysis of atmospheric turbulence data collected from a 200' vertical array of fast-response anemometer. This report will emphasize the application of the results to diffusion prediction. Deposition velocities for SO/sub 2/, SO/sub 4/, O/sub 3/, NO/sub x/ and possibly other ambient pollutants will be determined as a function of meteorology for deposition surfaces characteristic of both western and eastern Washington, environments similar to much of the western United States. The contribution of resuspension to the annual exposure from a point source will be determined for input to environmental assessment models.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Middle Atlantic;HYDROGRAPHIC AREAS/Great Lakes
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: This project is designed to determine the nature and quantities of various energy related pollutants which are emitted to the atmosphere, to determine the rates of transport and diffusion and deposition on the earth's surface, and the chemical and physical transformations during transport. The data obtained are used to develop parametrizations of the various processes for incorporation into numerical models which will then be tested and validated.
APPROACH: Inert tracers are introduced into urban plumes or advantage is taken of the presence of inert atmospheric tracers (CO or fluorocarbons). Concentrations of these tracers and urban pollutants, like SO2, particulates, NOx, are then measured at various downwind distances using aircraft or ground level vehicles. Data for various times and distances permit elucidation of the processes which are operative.
RESULTS: During FY 1977 field experiments were conducted in the Milwaukee and Chicago areas. It was determined from vertical profiling flights in which various pollutants were measured that vertical mixing was considerably less vigorous when the Milwaukee plumes traveled over Lake Michigan than when they traveled over land. From data on Ca, Fe, Pb and Zn upwind and downwind of Milwaukee, emission rates for

these elements were calculated. Sulfate increased with distance initially and then showed decreases suggesting SO2 conversion to sulfate followed by deposition. Maximum sulfate concentrations seem to occur at greater distance when the plume travels over the Lake rather than when it travels over land.
PROJECT MILESTONES: A major field experiment is planned for the fall of 1977.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Radioactive particles once deposited on natural or man-made surface can be resuspended by wind and mechanical activity so that the particles once more might become a radiological hazard to man. The resuspension process may be repeated many times. The objective of this research is to establish resuspension release rates, and to develop models for predicting atmospheric concentrations, and downwind movement of particles on the basis of observable and/or measurable particle, surface, and atmospheric variables. An important concern to nuclear energy development is the resuspension of plutonium and other transuranics from inadvertent soil contamination, from transportation accidents, and from fallout from nuclear devices.
APPROACH: Resuspension is measured with both controlled inert tracers placed on surfaces and with radioactivity from environmentally contaminated areas. Resuspension rates are measured automatically as a function of wind speed increments and atmospheric stability as well as mechanical disturbances causing resuspension. These field experiments are directed toward determining any resuspension rate changes with time and the effects of increasing resuspension surface roughness. Ultimately, resuspension will be measured for representative climatic and geographic conditions.
RESULTS: Experimentally based resuspension models with predictable resuspension rates will be developed to predict the downwind resuspension and transport of particles as a function of particle, surface, and meteorological parameters. Resuspension rates developed should be applicable to surfaces contaminated from the air as well as contaminated from soil covered radioactive wastes.
PROJECT MILESTONES: (1) Determine if fallout radioactivity is continually being resuspended 10/29/76. (2) First determination of effect of atmospheric stability on resuspension 11/15/76. (3) Resuspension chapter for ERDA book, ''Meteorology and Power Production'' 12/31/76. (4) Experiment started to determine effect of particle properties 2/20/77. (5) Develop resuspendability index 5/21/77. (6) Proof testing of multiple tracer resuspension concept 9/20/77. (7) Proof testing of a rapid means for measuring resuspension 2/21/78. (8) Initial measurement of resuspension over more complex terrain 7/21/78.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The purpose of this study is to characterize and evaluate the interactions of airborne contaminants and of Pu with the foliage of terrestrial plants. Current investigations are concerned with the fate of submicronic particles (0.01 to 0.8 mu m) once intercepted by plant leaves. This includes evaluation of retention mechanisms, leachability, and the availability of foliar Pu deposition for translocation to seed and root tissues.
APPROACH: A low windspeed aerosol exposure facility is used to generate particulates of known physical and aerodynamic size and exposure of plant canopies. Retention mechanisms for particulates deposited onto foliage are evaluated by differential leaching procedures. Availability of foliarly deposited Pu for translocation out of leaves is determined under various vector situations.
RESULTS: This program will provide needed data on the fate and bioavailability of airborne particulates containing Pu with respect to interception by plant foliage and entry into the food chain. Data of this nature is required for the adequate use of long-term predictive models which evaluate critical routes of entry and potential hazards to man.
PROJECT MILESTONES: (1) 1 Feb 1977 Determine the relative mobility of transuranics (Pu, Am, Np, Cm) deposited

on foliar surfaces. (2) 1 June 1977 Illucidation of the mechanisms involved in the foliar retention of particulates. (3) 1 Dec 1977 Determination of the physical parameters of particulates of plutonium which nfluence their availability for translocation from foliar surfaces to seed and root tissues.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objective of this program is to determine transformation rate of gaseous to particulate in urban plumes from urban areas and power plant complexes, and identifying mechanism(s) responsible for it. Special emphasis is placed on sulfur dioxide to sulfate and ozone in the plume from Milwaukee.
APPROACH: The approach consists of field experiments supported by diagnostic modeling and data interpretation. The measurement will be made in a Lagrangian frame of reference using instrumented aircraft.
RESULTS: A definite buildup of ozone was measured downwind of the city. Furthermore, in most cases, increases in the concentration of sulfate and nitrate aerosol with distance from the source was detected. These increases were also reflected in the independently measured aerosol size distributions. There was evidence from the trace metals data to indicate that meteorological conditions over Lake Michigan were sufficiently stable to render diffusion and particulate deposition essentially negligible.
PROJECT MILESTONES: (1) Analysis and interpretation of data collected during last field operation 1 October 1976. (2) Organize significant findings for reporting and publication 1 December 1976. (3) Preparation for yield operation 1 February 1977. (4) Conduct a Lagrangian experiment over Lake Michigan 1 June 1977. (5) Data analysis 15 July 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) Provide information concerning the present day gaseous and aerosol levels of the hemispheric air. (2) Provide chemical and physical evidence for verification of the long range trajectory model. (3) Measure atmospheric pollutant depletion processes on a large scale. (4) Measure hemispheric cleansing from major cyclonic weather systems. (5) Provide data for health hazard evaluation of toxic aerosols.
APPROACH: Maintain a constant watch on the worldwide aerosols and gaseous materials entering the USA from the vantage point of our West Coast Station. Provide this site with the most sensitive and advanced instrumentation possible. Intercorrelate the chemical, physical and meteorological information obtained to derive a complete picture of the natural and anthropogenic processes contributing to the resultant hemispheric air concentrations.
RESULTS: (1) Establish the present day levels of energy related materials and use them as a future comparator for changes in them. (2) Predict input of major pollutant sources, worldwide, to aerosol concentrations in the USA. (3) Assess the natural hemispheric cleanup processes. (4) Assess the pollutant input to specific oceanic areas. (5) The particle size distribution associated with the elemental distribution will allow evaluation of the aerosol inhalation hazard.
JECT MILESTONES: (1) Define the particle size distribution of the aerosol, 6 months. (2) Measure chemical change of important species on long range trajectories, 9 months. (3) Quantitate the hemispheric depleting

processes, 18 months. (4) Measure energy related organic pollutants in hemispheric air, 12 months. (5) Extent of natural ozone to ground level air concentrations, 12 months.

POLLUTANTS: NOXIOUS GAS/NO/sub x/;NOXIOUS GAS/SO/sub 2/;NOXIOUS GAS/Oxygen (25%);PARTICULATES/Fossil fuel residues (25%);RADIATION/Solar (25%);SPECIFIED OTHER POLLUTANTS/Atmospheric tracers, ruthenium, silver, etc. (25%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The purpose of this program is the provision of technical support for ERDA-DBER Atmospheric Research programs, in the form of airborne laboratories and tracer-release facilities. Aircraft support is required especially for the following Atmospheric Sciences programs: Precipitation Scavenging, Atmospheric Boundary Layer Studies, Particle Resuspension and Translocation, Cooling Tower and Cooling Pond-Atmospheric Impact, Aerosol and Trace Gas Transformation, and Urban Pollution and Tracer Studies.
APPROACH: Two aircraft, a Cessna-411 and a Douglas DC-3, have been equipped with tracer release facilities as well as the necessary instrumentation for highly sophisticated measurements of cloud physics, aerosols, pollutant-gases, atmospheric tracers, and turbulence.
RESULTS: Completion of the interfacing of the VLF Navigational System intof the Data Acquisition System of the DC-3 and the installation of the display unit and onboard teletype will provide a data collection system that is extremely flexible for recording a large number of parameters. It will also provide economical recording formats for direct computer input. The DC-3 will be utilized for two types of experiments in support of the MAP3S's Aerosol and Trace Gas Transformation work in St. Louis. It is anticipated that the wind speed and wind direction obtained from the newly installed VLF system will increase the accuracy of the results obtained from these experiments. Aircraft support will be given to precipitation scavenging experiments in the N.E. which are planned for the MAP3S program. Tracer releases into clouds will be made, measurement of pollution distribution entering clouds will be taken, and associated cloud physics and meteorological measurements will be made from the aircraft. The Cessna-411 will be used for continuing Particle Resuspension-Translocation work from forest fires. If funding permits, it may also be used in St. Louis in support of the MAP3S. Additional studies will be conducted on fossil fuel energy plant pollutants and fuel gasification and liquefaction plant pollutants.
PROJECT MILESTONES: These depend on other programs' plans, progress and accomplishments.

PROJECT DESCRIPTION: To maintain the scientific and educational integrity of the Arid Lands Ecology (ALE) Reserve on the U.S. ERDA Hanford Reservation.
APPROACH: Maintain fences and roadways on the reserve, provide assistance and special equipment to graduate students, promote the use of the reserve by graduate students, prevent unauthorized trespass by livestock and off-road vehicular traffic, preserve parts of the preserve in pristine condition, and to provide a buffer zone for waste management areas on the Hanford Reservation.
RESULTS: Continue to provide protection for an irreplaceable natural resource for scientific and educational study.
PROJECT MILESTONES: The Arid Lands Ecology Reserve has served as an important scientific and educational resource since 1968. In 1976, the reserve was designated by the Institute of Ecology as one of the top 10 ecological sites in the United States qualified to be designated as an Experimental Ecological Reserve (EER). The reserve has served as a study site for the International Biological Program's ecosystem analysis study and as a federal research natural area.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The major objectives of the Animal Ecology program are to: (1) characterize animal populations inhabiting pristine and disturbed communities in the shrub-steppe; (2) conduct quantitative sampling programs to determine density and biomass values for major consumer groups; (3) document transfer pathways and determine consumer feeding preferences; (4) determine transfer rates for selected nutrients, radionuclides, and energy through food chains; and (5) construct a simulation model to depict population dynamics, trophic transfer rates, energy flow, and nutrient cycling through the ecosystem, thereby providing an essential tool for ecosystem management.
APPROACH: Animal characterization studies employ a variety of sampling techniques; live traps, pitfall traps, drift fences, and individual searches. Quantitative density and biomass estimates for major consumer groups are estimated from drop trap, mark-recapture, and unit area censusing techniques. Consumer feeding preferences and transfer pathways will be documented through a microscopic identification of ingested food materials.
RESULTS: (1) Seasonal and altitudinal variations of consumer populations on the Hanford Reservation. (2) Effects of cattle grazing and wildfire on major consumer populations. (3) Food habit preferences of major consumers (invertebrates, small mammals, birds) on the Hanford Reservation. (4) Documentation of seasonal abundance of major consumers occupying dominant plant communities on the Hanford Reservation.
PROJECT MILESTONES: (1) Publish food preference analysis of grasshoppers occupying the Hanford Reservation. (2) Complete analysis of invertebrates inhabiting grazed, ungrazed, and burned sagebrush/bunchgrass communities. (3) Publish analysis of transfer pathway associated with major beetle populations inhabiting the Hanford Reservation. (4) Initiate studies of raptor population dynamics, food habits, and associated prey levels.

PROJECT DESCRIPTION: To provide quantitative baseline data concerning ecological parameters in shrub-steppe ecosystems in the Pacific Northwest.
APPROACH: Field sampling procedures, random selections of study plots, means and variances, short- and long-term changes in plant populations, secondary successions, importance of natural and man-induced environmental stresses, simulation modeling, and controlled field experimentation.
RESULTS: Quantitative ecological characterization of ecosystems in the shrub-steppe region, word models, and mathematical models. These data are applicable to evaluations of the environmental impacts of construction and operations of energy facilities (nuclear and non-nuclear) throughout the shrub-steppe region of western North America.
PROJECT MILESTONES: CY 1976 synthesis of five consecutive years of data collections from climax and seral plant communities. Phytomass changes seaonally and year-to-year, mineral cycling behavior, impact of cattle grazing and wildfire.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Principal emphasis in terrestrial studies is on development of an understanding of (1) technetium chemistry and microbiology in soil as these influence technetium solubility over the long-term and plant availability, and (2) the mechanisms, kinetics of uptake, sites of deposition, and form of technetium in plants as these influence the form and availability of technetium in animals. Studies encompass a broad range of soils and plants in order to develop a sound predictive base. Aquatic studies represent a relatively small effort but are directed toward completion of studies on the biogeochemical fate of mercury in the Columbia River and initiation of similar studies of technetium in the river system.
APPROACH: Soils and sediments play a direct role in influencing the behavior, transport, and biological interactions of pollutants in the terrestrial and freshwater aquatic environment. These highly integrated studies involve characterization of the properties of soils and benthic sediments, measurements of the pollutant distribution between solid and liquid phases, and laboratory and field studies to determine the chemical and microbiological factors influencing pollutant form and distribution. This information is being developed for a broad range of soils and sediments and integrated with measurements of pollutant uptake kinetics, biochemistry, and sites of deposition of radionuclides and trace metals in terrestrial plants and animals and benthic organisms.
RESULTS: This program is designed to develop understanding of soil and sediment microbial and chemical processes governing the bioavailability by technetium, iodine, and trace metals. The program provides a basis for identification of critical elements over a broad range of conditions and over the long-term. This information is required for remedial measures and to establish plant siting and engineering criteria.
PROJECT MILESTONES: Soils: (1) 1 Dec 1976 Initiation of investigations to determine the chemical form of technetium in soils; Initiation of investigations to assess the influence of soil properties on technetium availability to plants and the effectiveness of nutrient analogs in fertilizers as remedial treatments; Completion of studies to determine technetium retention in soil as a function of soil properties; (2) 1 Jan 1977 Initiation of investigations to determine the extent of technetium immobilization in soil microflora and plant roots and the rate, extent, and form of technetium released on decomposition of these tissues; Completion of kinetic studies to establish the mechanism of technetium uptake by plants and possible nutrient analogs. (3) 1 June 1977 Completion of studies to determine the chemical form of technetium in plants; Initiation of studies to determine the mode of action and toxicity of technetium in plants. (4) 1 Jan 1978 Initiation of studies to determine the availability of technetium in plant tissues to animals. Sediments: (1) 1 Jan 1977 Measurement of seasonal changes in mercury sedimentation and resuspension rate in Columbia River reservoirs. (2) 1 June 1977 Measurement of the potential for microflora to transform inorganic mercury to volatile forms as a function of seasonal changes in watershed conditions; Initiate laboratory studies to define the sediment and water factors influencing the sorption and release of

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The study objectives are to determine the effects of low-level tritium irradiation on the immune response of rainbow trout to infectious disease; the nature of radiation stress on immune competence; the genetic transmission of radiation induced immune incompetence; and the development of techniques for measuring sublethal stress.
APPROACH: Trout, exposed to tritium irradiation during embryogenesis, are challenged with a pathogen and their antibody synthesis is measured and compared to controls. Modifications in blood chemistry are measured electrophoretically, and the potential for genetic transmission of radiation induced changes are investigated through study of the progeny of irradiated fish.
RESULTS: Expected results include the development of sensitive techniques for measurement of sub-lethal radiation stress that can be applied to natural fish populations environmentally exposed to tritium irradiation and other energy technology induced stresses.
PROJECT MILESTONES: (1) 31-12-77 Completion of breeding of irradiated fish and primary antigenic stimulation of progeny. (2) 31-12-78 Completion of testing of genetic transmission of radiation induced alteration of immune response in fish.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The anticipated growth in numbers of coal-fired steam plants with cooling lakes and the develcpment of new coal technology (SRC) will result in an increased release of effluents into aquatic environments. Trace metals and other pollutants are known to occur in these effluents and can be passed through and concentrated in the aquatic food web leading to man. These effluents may impact on the biota of natural receiving waters or limit the intended multiple use of the cooling lakes for recreation, irrigation, or aquaculture. This program is designed to study the behavior and effects of these effluent components in freshwater ecosystems.
APPROACH: Research will be conducted at operating fossil fuel plants and in the laboratory to provide information for future studies in controlled experimental ecosystems. The proposed research is concerned with the characterization of the effluents, their effect on aquatic productivity, their fate in freshwater systems and their effects, particularly sublethal, on aquatic organisms.
RESULTS: The eventual output of this program will be the development of predictive information on transfer rates of coal combustion effluent components in freshwater food webs, especially large, multiple-use cooling lakes and receiving waters of solvent refined coal plant effluents. In addition, data on chronic and acute sublethal effects on organisms of the food web will provide input for the management of these ecosystems.
PROJECT MILESTONES: (1) 3/78 Assessment of current state-of-the-art--Site surveys of western coal-fired electrical generating plants. (2) 9/78 Bioassays of selected effluent constituents. (3) 9/79 Studies of developing coal technologies--Determination of sublethal effects of effluents on aquatic organisms. (4) 9/80 Determination of transfer rates and mediators of the affects of selected effluent constituents.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;ECT
PROJECT DESCRIPTION: This is a reprogrammed and retitled project from the currently funded 189 entitled ''Combined Effects of Temperature and Pollutants and of Temperature and Disease on Fishes'', ID No. 000637. The proposed research program is designed to quantify the combined action of thermal stress and chemical pollutants and temperature and disease on the physiology of selected aquatic organisms. To date, few data have been collected on the combined interactions of chemical and thermal toxicity on freshwater fishes and fish food organisms. Obtaining quantitative information on environmental stressors acting in concert is crucial to accurate assessment of potential impact from nuclear and fossil fueled electrical generating station effluents. The objective of the proposed investigation is to produce data on the interactions of elevated water temperatures and chemical species typical of cooling water discharges.
APPROACH: Both acute and chronic flow-through bioassays, using multiple test and acclimation temperatures and multiple chemical species (e.g., Cl-2, Cu/sup +/, Cu/sup ++/, Hg, Zn, Cr) will be conducted on warm (Lepomis gibbosus, pumpkinseed) and cold (Salmo gairdneri, rainbow trout and Salvelinus fontinalis, eastern brook trout) water fish and fish food (Pacifastacus leniusculus, crayfish) organisms. In addition to mortality, sublethal parameters such as growth, reproduction, bioretention and tissue destruction will be measured in response to low level toxicant dosage.
RESULTS: Research results will be published in the open literature. Data relevant to the objectives of this proposal are essential and fundamental in determining criteria for establishing regulations on steam-electric stations and other effluents from energy related projects which require environmental impact analysis. The monograph on Columnaris and water temperature will be completed. A literature review will be made describing the relationships between water temperature and other parasitic and infectious diseases of aquatic organisms with specific reference to those which are pathogenic to man.
PROJECT MILESTONES: (1) October 1, 1976 Completion of warm water temperature regime tests of the effects of nickel and chlorine on juvenile coho salmon and rainbow trout. Beginning of chronic cold temperature bioassays of coho salmon and rainbow trout. (2) January 1, 1977 Initiate preparation of a manuscript concerning the acute effects of chlorine-nickel toxicity on rainbow trout and coho salmon. Conduct any experiments that were not possible to be conducted during the warm water period in the summer due to the temperature differential. (3) June 1, 1977 Begin preparation of a manuscript concerning the mechanism of action of nickel in coho salmon and rainbow trout during acute bioassays.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this project is to generate information on the combined effects of swimming induced fatigue and thermal stress on fish and the definition of fish response to sudden cold shock. The former task is yielding valuable basic information related to exercise and active metabolism which is being used to improve estimates of the effects on fishes of thermal discharges into natural systems. The latter task extends from the determination of lower lethal limits and rates of temperature change tolerated on the basis of established level, to the exploration of physiological adaptations that occur within the organisms as a result of cold stress, as might occur from the sudden cessation of power plant discharge.
APPROACH: The fish fatigue studies are based in classical physiological techniques using biochemical indicators of stress and fatigue, i.e., blood glucose and lactate, respectively. The studies of cold shock response are also based in classical thermal response techniques. The critical thermal maximum is being determined for a variety of acclimation states and rates of temperature decline. The temperatures and decline rates are representative of those which might be experienced during power plant shut down.
RESULTS: The fish fatigue studies have revealed valuable information concerning the ability of fish to cope with the combined stressors of enforced exercise and elevated water temperatures. In addition, physiological information is derived regarding metabolism under stressful conditions, the techniques and information will have broad application in the interpretation of chemical and thermal discharge effects. The cold shock program has generated information on the limits of temperature decline and rates for several freshwater species. Additionally, a model simulating the thermal decay rates of an interrupted plume discharge has been generated.
PROJECT MILESTONES: The project currently has reached a significant point in that the investigators have a firm understanding of fish fatigue under conditions of enforced swimming and elevated temperature. This will be manifested in several publications which are now in preparation. The project has also generated an important hypothesis with regard to fish stamina under these conditions and this will be investigated in the next fiscal year. Finally, the critical swim speeds for important fish species at different temperatures and in the presence of chemical toxicants will be determined. (1) Fish Fatigue Laboratory Studies; (2) Fish Fatigue Publications; (3) Cold Shock Laboratory Studies; (4) Cold Shock Publications; (5) Task 1 Fish Stamina; (6) Task 2 Related Consequences; (7) Hypoxia Hypothesis Testing; (8) Toxicant Interaction; (9) Hypoxia Recovery;

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This program is designed to investigate the rates of deposition, dissolution and chemical forms of airborne dust in the coastal marine environment. Emphasis will be placed on establishing the validity of Be-7 as a tracer for deposition of anthropogenic airborne pollutants. Of particular interest will be the chemical forms of the toxic trace metals that dissolve after the aerosols enter the ocean, since this will determine the degree of bioavailability of the metals. A second portion of the program deals with the transuranium elements.
APPROACH: Aerosol and atmospheric deposition samples will be collected in the coastal environment. These samples will be analyzed for Be-7 and trace metals. Aerosol samples will be placed in seawater to measure the rate of dissolution of trace metals and the chemical form of the trace metals in solution.
RESULTS: (1) Deposition rates of metals into coastal marine waters. (2) The validity of Be-7 as a tracer for air-to-sea transfer of pollutants. (3) The dissolution rate and chemical form of aerosols after entering seawater. (4) The behavior of Pu in the coastal marine environment.
PROJECT MILESTONES: (1) July, FY 78 Continue collecting fallout and aerosol samples. (2) July, FY 78 Measure dissolution of aerosols and determine subsequent chemical forms of trace metals in seawater. (3) Dec., FY 77 Collect sediment cores for Pu analysis. (4) July, FY 78 Analyze cores for Pu. (5) Dec., FY 78 Determine Pu levels in coastal water with season. (6) July, FY 79 Measure deposition and chemical behavior of aerosols in seawater at other coastal sites.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objective of this chemical oceanography program is to help establish and predict the environmental quality of the oceans with regard to trace metal constituents. This study will provide detailed characterization of the trace metal distribution, behavior and fate in the coastal and open ocean marine environment. It is designed to provide open ocean (baseline) and coastal measurements of the geographical and vertical distribution of trace metals and help elucidate the effect of natural geochemical, biological and physical processes which control the trace metal economy of the oceans.
APPROACH: Through participation in the multi-institutional GEOSECS program and by participation in ship-of-opportunity cruises on ERDA, NOAA and university ships, seawater samples from coastal and oceanic regions are available for trace metal analyses. A variety of analytical techniques, including neutron activation, atomic absorption, and d-c plasma emission spectrometry are being employed for these measurements. Utilizing our own data and the wealth of GEOSECS data on other important constituents the oceanic parameters and processes which affect the trace metal geochemistries will be considered in constructing predictive models for describing the behavior of energy generated contaminants entering the oceans.
RESULTS: (1) Establish the natural oceanic concentrations, distributions and interrelationships of trace elements at Atlantic and Pacific Ocean GEOSECS tracks to distributions in coastal areas. (2) Establish the sources of trace metals to the oceans, including inputs from geothermal and hydrothermal sources. (3) Define the biogeochemical mechanisms which control the natural input, removal and cycling of trace metals in the oceans. (4) Establish concentration gradients and interrelationships of trace metals extending from the continental shelf areas to the open oceans. (5) Define the natural physicochemical processes which recycle or deplete the trace metal concentrations in coastal waters. (6) Develop improved methods of collecting, storing, and handling seawater to provide uncompromised samples for ultra-trace metal analysis. (7) Develop rapid and highly sensitive analytical techniques for measuring trace elements in small volumes of seawater.
PROJECT MILESTONES: (1) 8/30/FY 77 Prepare journal paper describing the geographical and vertical mercury distribution in the Atlantic and Pacific Ocean GEOSECS cruise tracks. (2) 12/31/FY 77 Prepare journal

paper describing the oceanic distribution and geochemistry of a large number of energy related trace elements. (3) 7/31/FY 78 Participate in oceanographic cruises to collect seawater samples extending from the coastlines to the open ocean areas, and begin trace element analysis of large groups of metals. (4) 7/FY 77 Continue neutron activation analysis of open ocean GEOSECS seawater samples for the measurement of Co, Zn, Sb, U, Cs, Rb, Ag and As. (5) 7/FY 77 Initiate measurements of Cd and Se in open ocean GEOSECS waters.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This program is designed to investigate the acute and chronic effects of thermal discharges into the marine coastal environment. The program is determining: (1) tolerances of selected Pacific Northwest species to sudden and gradual thermal increases, (2) the effects of long-term temperature increases on coastal attached communities, and (3) the effects of elevated temperature on the growth and reproduction of important commercial, sport, and food-web species.
APPROACH: Thermal tolerances are being analyzed by subjecting test species, e.g., Pandalus danae, to given rates of temperature increase in order to establish a CTM. Hatching success of sand sole, Psettichthys melanostictus, eggs are being investigated by testing for temperature-salinity combined effects using a 6 x 6 temperature-salinity matrix. Community studies use a variety of colonized portable substrates that are subjected to chronic thermal stress and evaluated using biomass and a non-parametric test of species presence.
RESULTS: The anticipated output is the establishment of realistic thermal criteria and, ultimately, the wise uses of heated discharges. Without this information, the biological impact of thermal effluents will remain questionable, and their beneficial use unexplored.
PROJECT MILESTONES: (1) December 1977 Publication of CTM data; completion and analysis of intertidal community experiments. (2) December 1978 Completion of growth studies on flounder and shrimp; completion of modified CTM determination on fish eggs and larvae; completion of studies on thermal influence on reproduction and development of shrimp and flounder. (3) December 1980 Completion of thermal effects on macroalgae community structure.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This program utilizes the unique natural laboratories in the Marshall Islands to determine the rates of geochemical mobilization and biological incorporation and cycling of transuranium elements in the marine environment. The relatively high concentrations of the transuranics in these Pacific atolls allow the determination of the specific chemical forms undergoing remobilization from the sediments. The rates of transfer of these specific forms between the sediments, water and marine organisms can be measured. This investigation will expand our understanding of the geochemical and biological transformations of Pu and Am in the marine environment and will provide insight concerning the behavior of these elements in other marine locations such as coastal and estuarine environments.
APPROACH: Bikini and Eniwetok Atolls, as well as Thule, Greenland, are unique natural laboratories in which geochemical and biological transformations of Pu and Am will be investigated. Plutonium and Am were released during the testing of nuclear devices at the Pacific atolls; Pu, in a well defined form, was released at essentially a point source from a US B-52 accident at Thule, Greenland. The move of transuranic radionuclides from sediments in the overlying waters will be investigated as a function of bottom-dwelling organisms and leaching by seawater. Vertical distributions of Am and Pu will be determined by core sampling and measurement of transuranic distribution profiles in interstitial waters. Chemical leaching solutions will be used in laboratory investigations to determine if seawater release can be adequately modeled by laboratory experiment.

RESULTS: The principal product in this program will be the determination of the fates of transuranium elements deposited in selected marine sediments and the potential of these isotopes for incorporation in marine organisms.
OJECT MILESTONES: 9-1-76 Preparation of literature publication describing results of geochemical investigations of samples from Thule, Greenland.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The principal objective of this study is to develop an understanding of the soil and plant factors influencing the availability of plutonium to agricultural plants and to animals with major emphasis on (1) the soil and soil microbial processes which influence the formation of ligands stabilizing plutonium in soil solutions and determination of plutonium long-term behavior in soil, and (2) plant processes which influence transport across the plant root membrane, the form of plutonium and sites of deposition in mature plants and in animals consuming plants.
APPROACH: An integrated approach involving the disciplines of soil science, microbiology, plant physiology, and biochemistry is being employed to study the chemistry of the transuranics in soil, and the ability of soil microorganisms isolated from soil on the basis of transuranic resistance and carbon requirements, to modify the transuranics in a broad range of soil, and the uptake kinetics, biochemistry, and sites of deposition of plutonium in plants and animals.
RESULTS: This program is designed to develop an understanding of the soil and plant factors influencing the form and concentration of transuranic elements in plants and animals. It provides the basis for interpretation of environmental phenomena, identification of critical environmental pathways to man, and prediction of the biological effects of these elements over a broad range of environmental conditions and over the long-term. This information is for remedial measures and to establish nuclear plant siting and engineering criteria.
PROJECT MILESTONES: (1) Complete isolation in vitro of major classes of plutonium-resistant microorganisms (plutonium added as nitrate from an agricultural soil on the basis of metabolic (mixed carbon source) requirements. (2) Initiate soils studies to characterize microbial metabolites as a function of available carbon source and validate predicted metabolic products from in vitro studies. (3) Initiate investigation of the chemical form of xylem, mobile plutonium, and plutonium bond types in sink tissues (with initial emphasis on plant roots). (4) Verify preliminary studies indicating increased plutonium availability to animals on ingestion of plant tissues. (5) Initiate interpretive studies (based on data from soil-plant studies) to explain increased gut transport of plutonium from plant tissues. (1) Complete studies on a range of soils of the rate of plutonium uptake, translocation, and sites of deposition in soybean and alfalfa tissues. (2) Initiate investigations of the fate of plutonium applied to soil in complex and oxide forms. Correlate (for soluble plutonium amendments) the rate and extent of uptake, sites of deposition, and form of plutonium in plants with soil microbial processes and with the properties of soils.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Iodine-129 and technetium-99 are both long-lived fission products which have volatile and water-soluble forms with potential for release from nuclear fuels reprocessing plants. The very long half-lives and relatively high fission yields of these radionuclides make it important to study their environmental mobility since decisions must be made on permissible release limits for these nuclides. This

research has been undertaken to study the long-term fate of I-129 and Tc-99 released to the environment and the resultant dose rates to be expected in biota as the I-129 and Tc-99 activity is raised in terrestrial and aquatic ecosystems.
APPROACH: Special emphasis is being placed on dose pathways leading to human populations. Existing fuels reprocessing plants in arid and humid environments are being used as sources of environmental I-129 for field studies and laboratory studies are being conducted using I-125 as a tracer for I-129.
RESULTS: Data on I-129 and Tc-99 concentrations in ecosystem components and transfer processes will be used to make more accurate dose projections than are presently possible. Failure to revise these projections could delay implementation of the nuclear energy program.
PROJECT MILESTONES: BNWL document on Iodine-129 environmental mobility and radioecology; Comment draft Dec. 31, 1976; Final draft Aug. 1, 1976.

BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: This program is primarily concerned with the development of radiochemical instrumentation and analytical technology for the measurement of low levels of radionuclides which enter the environment from the nuclear industry and nuclear testing operations. It is also concerned with the development and refinement of neutron activation analysis technology for the trace elements released to the environment from fossil fuel combustion, coal conversion, oil shale retorting and geothermal power generation. In the nuclear fuel cycle transuranium and long-lived fission products are of immediate concern. Instrumentation and technology developed can be utilized in radioisotope studies of environmental samples; it can be applied with neutron activation analysis to define stable element behavior whereby routes used by natural, tracer, or waste radioisotopes and other toxic pollutants can be followed in the environment.
APPROACH: Improved X-ray, beta-gamma, alpha-beta-gamma, and gamma ray radiation detection systems, together with X-ray fluorescence, neutron activation and other techniques will be combined with analytical techniques to characterize radioisotope and trace element movement through the environs at the various levels encountered. Large surface area detectors with low backgrounds will be developed for direct measurement of X-ray emitting isotopes. A portable field detector for Pu analysis to be developed with a sensitivity of at least an order of magnitude better than now available will be tested in areas contaminated with long-lived radionuclides. The use of a neutron subcritical multiplier will allow trace elements to be determined through their short half-life neutron capture products. Special emphasis will be placed on developing techniques for measuring toxic trace elements in fossil fuels and in the effluents of fossil-fueled electrical generating plants.
RESULTS: This program provides the necessary instrumentation and techniques for the measurements of radioactive and non-radioactive pollutants in environmental samples. Low levels can be measured by the emission of pollutant concentrations at their release points and in the environment thus providing the data base for hazard evaluation to man.
PROJECT MILESTONES: (1) Evaluation completed of low background NaI(Tl) system 12-1-76. (2) Literature report on Cf-252 multiplier facility 5-1-77. (3) Literature publications on background sources and low background system 6-1-77. (4) Evaluation completed for intrinsic Ge for nuclear fuel transuranic elements 9-1-77. (5) Installation completed for automatic cyclic activation analysis in subcritical multiplier 4-1-78. (6) Complete literature report on intrinsic Ge applications to field measurements of fuel cycle radioisotops 6-1-78.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
OBJECT DESCRIPTION: The Radiation Dosimetry program has the long-term goal of developing basic theoretical relationships between observable physical characteristics of ionizing radiation and the induction of biological damage. Understanding the physical and temporal factors involved in radiation induced damage provides the knowledge necessary for logical extrapolation of experimental laboratory results to the chronic dose levels to which man may be exposed as a result of nuclear power generation. Such knowledge is also valuable in assessing the potential of new radiation (e.g., neutrons and pions) for use in cancer therapy.
APPROACH: This study includes the development of mathematical models of the radiation effect and recovery processes and the design of suitable tests of the validity of those models. Another aspect is the characterization of the initial interaction of radiation with matter in a way which is most closely related to the biological effect. To accomplish this, it will, of necessity, draw heavily on the more basic information regarding the physical and early chemical effects of radiation and upon fundamental radiobiological data at the cellular level. Experimental portions of the program provide specialized irradiation apparatus and dosimetry to determine the radiation parameters relevant to specialized biological experiments.
RESULTS: This work will result in better understanding of the factors involved in the production of cellular damage by ionizing radiation. This understanding will make possible sound predictions of the effect to be expected for irradiations, doses, and dose rates which cannot be directly measured.
PROJECT MILESTONES: (1) November 1976 Complete pilot study of survival of mitotic mammalian cells synchronized without drug treatment. (2) August 1977 If above is favorable, complete definitive measurements and prepare report. (3) August 1976 Complete paper on dose-rate effect. (4) March 1977 Complete paper on temperature dependence of recovery. (5) November 1977 Complete study of the effects of oxygen and stopping power on recovery in a model cell system. (6) August 1977 Select an organism for study which has LET dependence and survival characteristics indicating a fast recovery process. (7) September 1978 Prepare report on fast recovery process. (8) February 1977 Present paper on the microdosimetry of external radiations using the computer programs of the internal microdosimetry project. (9) May 1977 Prepare report on the mean and variance of the specific energy due to individual fast electrons. (10) June 1977 Incorporate an analytical model of cross-section data in Monte Carlo track structure codes and prepare report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This research is directed toward understanding the mechanisms through which radiation interacts with matter with major emphasis on material of biological interest. Information on the interactions by which ionizing radiation loses energy in traversing matter and the subsequent transport and degradation of that energy is needed as input to any model which relates the observed biological effect to measurable physical quantities.
APPROACH: This program provides an integrated experimental and theoretical investigation of initial interactions by which ionizing particles transfer energy to matter and the subsequent transport and degradation of that energy. Measurements concentrate on determination of initial interaction cross sections for gas targets and on measurements of life times of quenchable excited species in liquid systems. The work includes investigation of the partition and distributions of energy in the radiation field and in the irradiated media, and determination of the rates and mechanisms of energy transport in the early stages of molecular rearrangement.
RESULTS: The results of this study provide the basic information on the initial interaction processes and formation of early chemical species along charged particle tracks. This information is basic to an understanding of the mechanisms underlying LET effects and dose response relationships.
PROJECT MILESTONES: (1) August 1976 Publish analysis of differential cross sections for noble gas atoms based on criteria of Y.-K. Kim. (2) October 1976 Complete accumulation of data on proton ionization of H/sub 2/O, H/sub 2/, and O/sub 2/. (3) January 1977 Initiate measurements of molecular fragmentation by fast protons. (4) April 1977 Complete study of energy dependence on ionization by carbon ions. (5) May 1977 Obtain preliminary results of Monte Carlo calculation of electron emission from fast proton ionization of carbon foils. (6) June 1978 Publish first study of molecular fragmentation by fast protons. (7) June 1976 Complete manuscript on temperature dependence of energy transport around proton tracks in liquids. (8) September 1976 Complete measurements of LET dependence of fluorescence. (9) November 1977 Publish a stochastic model for fluorescence quenching in binary chemical systems. (10) December 1977 Initiate experiments to measure energy transport effects at less than 10/sup -10/ sec.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The Radiation Biophysics program provides the critical experimental tests of existing and evolving theories of radiation action needed to guide further development of these theories. The kinetic behavior of biological repair and other processes at lethal and sublethal radiation levels are studied with emphasis placed on those aspects of the theories which are necessary for the extrapolation of biological effects from typically high laboratory doses and dose rates to the chronic doses that may be experienced as a result of nuclear power generation.
APPROACH: Theories developed in the Radiation Dosimetry program are tested on simple biological systems with emphasis on mammalian cells but utilizing other eucaryotes as needed for specific experiments. The effects of dose rate and LET on the probability of reproductive death will be investigated as a function of factors such as cell cycle age, oxygen concentration and temperature. A cellular system in which the cumulative effects of free radical damage are not masked enzymatic recovery processes will be sought.
RESULTS: This work will result in a clearer understanding of the processes involved in producing radiation damage, and provide the foundation for realistic predictions of effects produced by environmental radiation levels.
PROJECT MILESTONES: (1) June 1976 Determine mean recovery time for a typical eucaryotic cell in split dose experiments. (2) November 1976 Measure survival of mammalian cells at mitosis under electron irradiation. (3) November 1976 Determine the temperature dependence of recovery time for a eucaryotic species. (4) March 1977 Begin a study of oxygen and LET effects on a eucaryotic species. (5) October 1977 Begin rapid mixing experiments to study effects of radiolysis products.

TYPE OF FUNDING: Contract No.-E(45-1)-1830
77 FUNDING: Energy Research and Development Administration FY77:$80,000
TECHNOLOGY: NUCLEAR/Fission (100%)
ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Northwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objectives of this study are: (1) develop the historical background of the pond, (2) characterize the pond limnologically to establish an ecological profile, (3) determine the ecological distribution of transuranics in the pond, (4) measure rates of transfer of transuranics moving between ecological compartments in the pond, (5) develop a material budget which describes the movement of transuranics through a model aquatic ecosystem, and (6) synthesize acquired information to express the ecological (and health physics) significance of transuranics entering a freshwater system.
APPROACH: Characterization of limnological and radiological aspects of the pond is being done routinely by measuring baseline parameters which describe the physicochemical conditions, species composition, biomass and production rates, and by sampling ecosystem components and supply sources for transuranic analyses. To develop material budgets for transuranics moving through a pond ecosystem, artificial ponds will be used as models which will be studied continuously to follow the passage of plutonium and americium introduced from a reprocessing waste effluent source.
RESULTS: The anticipated results of this research will be qualitative and quantitative expressions of the behavior and fate of transuranics in a freshwater ecosystem. This information may be applied to the development of predictive capabilities for assessing ecological and health physics significance of transuranics in aquatic and adjacent ecosystems.
PROJECT MILESTONES: (1) Completion of limnological characterization of waste pond. (2) Completion of identification of transuranic distribution in ecological compartments of waste pond. (3) Completion of in situ Pu and Am uptake/retention in waste pond biota. (4) Completion of autoradiographic studies of Pu/Am in sestonic diatoms. (5) Completion of development of approximate methods for determining Pu/Am in waste pond samples. (6) Completion of Pu/Am material budget studies in controlled pond systems. (7) Completion of comprehensive final report on waste pond studies.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Northwest;GEOGRAPHIC AREAS/Global;HYDROGRAPHIC AREAS/Other hydrographic areas Rivers and reservoirs
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objectives of this project are to determine the effects of dissolved gas supersaturation on freshwater aquatic organisms and to determine the effects of short-term fluctuations in river flow caused by use of hydroelectric facilities to meet load demands. Studies of gas bubble disease involve determining effects of temperature on tolerance of selected fish species to supersaturation and ability of fish to recover from loss of equilibrium due to gas bubble disease. River level fluctuation studies include determining degree of dehydration of smallmouth bass nests and effects of entrapment of fish in ponds which intermittently communicate with the main river.
APPROACH: Gas bubble disease is studied in the laboratory in a variety of testing procedures based on the 4-day bioassay. Mortality, equilibrium loss, and recovery are monitored. Gas levels are measured by a gas tensicmeter or by gas chromatography. River level fluctuations are studied in the field using standard population sampling techniques.
RESULTS: This research will produce open literature reports including significant findings and supporting data. These findings will define the degree of impact on aquatic ecosystems of gas bubble disease and river flow variations. Omission of this project will result in a continuation of operation of hydroelectric facilities with less than a complete understanding of their environmental impacts. A continuation of operations having significant impacts would reduce ecosystems diversity and might cause a reduction in valuable sport and commercial fishery production.
PROJECT MILESTONES: (1) March 1976 Publication of proceedings of Gas Bubble Disease Workshop (CONF-74-1033). (2) March 1976 Selection of study sites for river level fluctuation. (3) April 1976 Aerial photography of river level fluctuation study sites during special low flow period.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This is a laboratory research program to define effects of petroleum (crude oil and refined oils) on marine intertidal communities and to develop standard procedures to allow comparison between this and other laboratory studies and field results.
APPROACH: A continuous-flow petroleum metering system for bioassay work has been developed and tested using chemical measurement methods and bioassay organisms. Preliminary tests and a six-month continuous exposure have been conducted using a No. 2 fuel oil and field-colonized artificial substrates. Minimally the approach provides a highly efficient screening device to determine oil-sensitive species.
RESULTS: It is anticipated that the study will be extended to other oils and that the resulting community structures will be diagnostic of oil contamination.
PROJECT MILESTONES: (1) August 1976 Describe effects of a No. 2 fuel oil on marine intertidal communities. (2) March 1977 Describe system distribution of Prudhoe Bay crude oil at multiple concentrations. (3) September 1977 Describe effects of chronic exposure to Prudhoe Bay crude oil dispersions on marine intertidal communities. (4) March 1978 Determine tissue content of petroleum hydrocarbons for selected community members. (5) June 1979 Evaluate reliability of laboratory predictions using artificial substrate units in field monitoring.

REGIONS OF INTEREST:
BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this project is the development of methodology for concisely assessing the environmental, social and economic impacts of thermal power plant site and design alternatives on the potentially affected community.
APPROACH: The methodology being developed incorporates procedures for making technical estimates of impact on several criteria including human health and safety, aesthetics, water quality, air quality, economics, cultural/recreational opportunities and characteristics, and animal/plant life. Community values with respect to each of these criteria are also solicited. Technical estimates of impact for each criterion are combined with the respective community value and the resulting weighted estimates of impact summed across all criteria to produce a composite assessment of power plant impact.
RESULTS: The composite index of impact will provide a means of ranking the acceptability to the community of power plant site and decision options and thus will provide one basis for selecting among options. In addition, because of the incorporation of multiple criteria of impact, each with an associated community value, areas of specific community concern can be readily identified. Offending siting or design factors could be revised accordingly.
PROJECT MILESTONES: (1) January 1977 Complete survey instrument pretesting. (2) January 1977 Complete peer group review of completed methodology. (3) March 1977 Topical Reports: Methodologies for: Quantified Assessment of Thermal Power Plant Effects on Human Health and Safety, and Community Cultural and Recreational Characteristics. (4) March 1977 Select site for initial testing, commence data acquisition. (5) January 1978 Complete initial testing, select site for time dependence testing, commence data acquisition for ''pristine'' site condition.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective is to evaluate the biological hazard of exposure to elemental tritium and Kr-85 by determining the biological effects in rodents and larger animal species exposed to the radioactive gas atmospheres.
APPROACH: Studies will include both short-term and chronic exposure of animals to H-3 and Kr-85 gas atmospheres to determine tissue distribution and retention kinetics, as well as long-term biological effects, for purposes of defining the tissues at risk. Also included are dose-effect studies to determine

tumorigenicity teratologic potency and capacity to induce changes in lung biochemistry and pulmonary function.
--SULTS: Past estimates of the hazard of radioactive noble gases and elemental tritium have been based largely on theoretical arguments which consider the external surface dose as the limiting factor or make other assumptions concerning physical-chemical reaction rates. The present study will test the validity of the theoretically based hazard evaluation by providing biological data which compares the effect of internal dose, particularly to lung, with a predominantly surface dose cumulated during immersion in a gas atmosphere. The relative importance of these two distributions of dose in the induction of latent biological effects will be evaluated.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The uranium-thorium breeder reactors proposed for nuclear power production will employ fuel mixtures and fuel recycle process solutions that have not been evaluated for the biological hazards needed for safety evaluation. This project will investigate for special hazards associated with these materials; namely the mixed U-Th-Pu oxide fuels, the nitric acid process solutions of these fuels, the high specific activity uranium isotopes and the radioactive decay products that are unique to this nuclear process.
APPROACH: The metabolism of the oxide fuels and nitrate solutions of the major radionuclides, following inhalation, ingestion and cutaneous application will be studied in rodents. The influence of specific activity, amount of radioactivity and composition of various fuels and process solutions on the toxicology will be determined. The toxicity of uranium isotopes in equilibrium with their decay products or in freshly separated state will be investigated. The long-term biological effects of inhaled fuels, U-232, U-233 and process solutions will be determined and compared with results from similar studies with the transuranic elements.
RESULTS: The results of short-term studies (in vitro and in vivo) will aid in evaluating the importance of specific activity in the toxicology of uranium and U-232 contaminated fuel materials. Long-term biological effect studies will provide the information needed to relate the toxicity of thorium fuels to that of other nuclear materials, e.g., oxides of uranium and plutonium, that have been studied extensively in biological systems.

POLLUTANTS: PARTICULATES/Plutonium (100%)
CHARACTER OF STUDY: DEVELOPMENT/Laboratory scale (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objective of this project is to develop an instrument which will measure airborne particulate plutonium at concentrations below the MPC level on a continuous, real-time basis. An additional objective is that the instrument provide information on the quantity of plutonium in each individual particle and, under appropriate conditions, on the size of each particle.
APPROACH: A new mass spectrometric technique for detection and measurement of plutonium in air is being investigated. A small mass spectrometer with a direct air-inlet to the ion source is being developed for this purpose. Particulate material entrained in the stream of air sampled will strike a hot filament in the source and produce a burst of ions. The ions will be mass separated in the magnetic field of the

spectrometer and an ion detector will monitor mass 271 corresponding to /sup 239/Pu/sup 16/O/sub 2/.
RESULTS: This project is expected to produce a new instrument which is a million times more sensitive than existing instruments for real-time measurement of plutonium concentration in air. In addition, the direct-inlet mass spectrometer is expected to provide information on the size distribution of plutonium particles, a capability which no other instrument presently provides.
PROJECT MILESTONES: (1) First ion beam through the plutonium direct-inlet mass spectrometer (Pu DIMS) March 1976. (2) Completion of minicomputer-based data system September 1976. (3) Pu DIMS calibrated with non-radioactive material December 1976. (4) Begin dual detector development March 1977. (5) Pu DIMS calibrated with plutonium June 1977. (6) Begin field demonstration of Pu DIMS July 1977. (7) Dual detection system operational January 1978.

REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Global;COASTS/Northeast;COASTS/Southeast;HYDROGRAPHIC AREAS/Continental shelf;HYDROGRAPHIC AREAS/Other hydrographic areas Puget Sound
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To evaluate potential hazards of pollutants associated with sediment drift, dredging operations, or biological uptake in harbors, estuaries and coastal waters. This program improves existing techniques and applies the new measurement techniques for in situ analysis for trace pollutants from coal, oil, oil shale, coal conversion and nuclear technologies. In situ measurements are developed which require no sample collection or subsequent laboratory analysis, thereby permitting real-time analysis and analysis of the sediment surface in its undisturbed natural environment.
APPROACH: Three areas will be emphasized: (1) in situ analysis of toxic trace elements; (2) in situ analysis of radionuclides; and (3) in situ analysis of organic pollutants. An in situ X-ray fluorescence probe will be used to map concentrations in sediments of inorganic pollutants which are ranked as priority one by EPA. The X-ray fluorescence analysis probe will be evaluated at Puget Sound and in Lake Washington with correlation of data obtained by other techniques. Depth profile capabilities will be improved to allow in situ analysis of energy-related pollutants which have been deposited over a period of tens of years. Carbon and Ni pollutants from oil-related materials will be measured with a portable 14 MeV neutron generator.
RESULTS: This program allows the in situ analysis of pollutants in sediments and therefore allows studies of the stress of ecosystems within well characterized marine and fresh water environments.
PROJECT MILESTONES: (1) Publish results of in situ X-ray fluorescence field measurements in Lake Washington, February 1977 and San Francisco Bay, August 1977; (2) Open ocean evaluation of in-situ x-ray fluorescence system, June 1978; (3) Evaluation of 14 keV portable neutron generator for field analysis of C and Ni, May 1977; (4) Determine modifications of in-situ x-ray fluorescence system needed to measure elements at depths to 1000 ft, May 1977.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Middle Atlantic;HYDROGRAPHIC AREAS/Great Lakes
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The principle objective of this project is to develop a computer model which will simulate the atmospheric transport, chemical transformation, and wet and dry removal of the pollutants produced from coal-fired power plants. The model is to be used in the evaluation of the human health and ecological effects of these pollutants over a multi-state region. The initial emphasis will be the sulfate problem in the northeast United States.
APPROACH: This project is to be accomplished by developing the model in a segmented fashion. It is to be composed of the most technically and economically appropriate methods available for describing the relevant processes. A comprehensive series of tests with meteorological data as well as source data will be conducted to determine the model's sensitivity to the parameterizations of the transformation and removal processes. Continuing interaction with experimental programs will provide information valuable for

the parameterizations.
RESULTS: The work on the quasi-Lagrangian segment model emphasized: (1) the development of a more realistic representation of the mixed layer behavior and its relationship to dispersion of the emitted pollutant, (2) a reactive plume model capable of more complex chemistry, (3) addition of a feature which allows calculation of H ion concentration in precipitation, and (4) efforts to derive a realistic precipitation scavenging algorithm. A model verification test showed that use of time averaged precipitation led to more than twice the wet removal of SO2 than use of the real time precipitation data.
PROJECT MILESTONES: Model Develoment Task: (1) Improve the formulation of mixing depth behavior, plume chemistry and chemistry in the precipitation. 1 Jan 1977. (2) Incorporate more sophisticated flow representations with multiple layers and isentropic considerations. 1 Mar. 1977. Model Testing and Application: (1) Extensive sensitivity testing of the model and its components for the various transport and mixing depth formulations as well as the transformation and removal parameterizations. 1 Apr. 1977. (2) A comparison of modeled precipitation chemistry results with the measurements from the precipitation chemistry network. 1 May 1977. (3) Investigation of the effect of using bulk values in precipitation. This effect is to be closely coordinated with work in this same general area by Brookhaven National Laboratory (BNL) and Argonne National Laboratory (ANL). C. M. Sheih (ANL) and L. L. Wendell (PNL) worked at BNL for approximately one month collaborating with personnel from BNL. This collaboration proved very fruitful because of the complementary nature of the work at the ERDA laboratories.

PROJECT DESCRIPTION: Determine the effect of time (ageing and weathering) on the uptake of transuranic elements from soil by range and crop plants.
APPROACH: An experimental approach using small, weighing lysimeters is used to expose soil and plants to realistic soil water, temperature, and other field conditions.
RESULTS: Determine if ageing and weathering enhances the availability of transuranic elements from contaminated soil by range and crop plants.
PROJECT MILESTONES: Twenty years of soil ageing and weathering associated with botanical and microbial activity with yearly observations of plant uptake values and measurements every 3 years to determine solubility of the transuranium elements in the soil and other factors which might affect the phytoavailability of the transuranics.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this program is to enable man to predict the long-term effects of energy related activities on the coastal ecosystem and thus make sound judgments on the uses of this region and allow a maximum utilization of a resource with a minimum of environmental impact.
APPROACH: A multidisciplinary effort is being made to identify the source term, chemical interactions, bioavailability and effects, and fate of the effluent materials through field and laboratory investigations. Site measurements of pollutant quantities and forms are made and the data used to design laboratory experiments. The laboratory experimental results are used to develop predictions models which are then verified by field investigation.
RESULTS: This research will provide an understanding of the bioavailability and fate of energy facility pollutants in the marine ecosystem. This will enable man to develop realistic criteria for effluent releases that will allow a maximization of the systems absorptive capacity while protecting the

environment. It will also provide needed data for design and site selection criteria for existing and new energy technologies.
PROJECT MILESTONES: (1) December 1977 Characterization of long-term effects of copper on Pandalus danae. (2) December 1978 Completion of initial phase of Sequim Bay sediment studies; completion of initial source-term identification and characterization; completion of initial copper tolerance studies; verification of mathematical hydrodynamic model of Sequim Bay. (3) December 1980 Completion of simple food-chain studies.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The energy needs of the country can best be met by major utilization of coal, oil, natural gas, oil shale, nuclear fuels, and geothermal steam. Before a realistic assessment can be made of the potential environmental impact of the pollutants from these energy-related technologies, it is essential that amounts and physical and chemical properties of associated pollutant materials be determined. Pollutants enter the environment as a result of fuel extraction, transport, conversion and utilization in energy production and should receive early and detailed characterization to provide the essential information for subsequent studies of their environmental impact. This program develops both laboratory and field instrumentation and methods for detailed pollutant analysis. It designs and evaluates new sampling and analysis techniques required to obtain maximum sensitivity under practical conditions, and methods to study the physical and chemical forms of non-nuclear pollutants in the environment.
APPROACH: Environmental pollution analysis requires the development of laboratory and field methods and instrumentation to measure the molecular form, chemical form, physical form, transport, fate, and transformation of pollutants. The most useful techniques for characterization include anodic stripping, voltametry, specific ion analysis, ESCA, ion probe, and the GC/MS.
RESULTS: This program is expected to develop laboratory instrumentation and methods for the analysis of physical and chemical forms of specific pollutants such as As, Hg, and Pb. The required evaluation of new sampling and analysis techniques is being pursued to obtain maximum sensitivity under the conditions required for the measurement of pollutants in environmental samples. Instrumental techniques are expected to be developed for pollutant species and forms and from all types of energy-generating technologies.
PROJECT MILESTONES: (1) July 1976 Open literature publication prepared on matrix correction program for X-ray fluorescence analysis of thick environmental samples. (2) Sept. 1976 Open literature publication prepared on simple 2-point integration spectral analysis method for X-ray fluorescence.

PROJECT DESCRIPTION: The purpose of this project is to examine in small mammals the fate and effects of inhaled transuranic compounds, specifically the nitrate forms of Pu-238 and Es-253 and the dioxide forms of Pu-238, Pu-239, Am-241 and Cm-244.
APPROACH: Both the Wistar rat and the Syrian golden hamster have been studied, with emphasis being placed on studies with the rat. The scope of the research also includes (1) an examination of the spatial and temporal dose-distribution patterns (for alpha irradiation) in the lung as they influence the pathogenesis and incidence of lung cancer, (2) a morphometric study of the response of lung tissue to inhaled /sup 239/PuO/sub 2/, and (3) attempts to determine the mechanism(s) of malignant transformation in the lung.
RESULTS: This study will provide data required for hazard evaluation and the establishment of permissible exposure limits for man for inhaled transuranics.

77 FUNDING: Energy Research and Development Administration FY77:$390,000
TECHNOLOGY: NUCLEAR/Fission Breeders (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: METALS/Plutonium nitrate (50%);PARTICULATES/Plutonium (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives are to determine the deposition, translocation, distribution, dosimetry and biological effects of inhaled soluble forms of plutonium in a long-lived species of animals so that the results of accidental contamination in man can be evaluated.
APPROACH: Beagle dogs will be given single inhalation aerosol exposures to /sup 238/Pu(NO/sub 3/)/sub 4/ or /sup 239/Pu(NO/sub 3/)/sub 4/ at initial alveolar deposition levels of 2, 10, 50, 250, 1250, or 3000 nCi. These dogs will be held for life span observations and additional dogs will be periodically sacrificed to provide information on deposition and translocation and to study the pathogenesis of dose-related effects. The dogs on study receive periodic examination, thoracic radiographs, and hematologic and clinical chemistry evaluations. The dogs sacrificed receive a complete necropsy and histopathologic examination, and tissues are radiochemically analyzed.
RESULTS: The project will help to provide maximal permissible body burdens of ''soluble'' plutonium after inhalation and will help predict the results of accidental contamination in man. The critical tissue after inhalation of soluble forms of plutonium could be lung, tracheobronchial lymph nodes, skeleton, or liver. The effects of continued translocation of plutonium from the lung to the bone, lymph nodes, and liver will be evaluated. These effects will be compared with hot particles of plutonium oxide in the lungs of dogs and comparisons made between the different spatial distribution of soluble and insoluble plutonium.

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Aerosol Technology - The objective of this effort is improvement of aerosol exposure techniques for nuclear power source materials and concerns generation and characterization of inhalation atmospheres, relation of aerosol properties to respiratory deposition and clearance, and accuracy of aerosol exposure dose control. Analytical Technology - The objective of the analytical technique develcpment phase of this program is to improve the radiochemical analysis procedure and sample analysis and handling techniques. The tasks include improvement of sample management and quality control to reduce sample backlog and storage problems, to reduce the cost of low-level Pu analysis, to improve the sensitivity of the Pu analysis procedures, and to develop new techniques for low-level assay of radioisotopes. The scope of the research covers development of analytical facilities and techniques needed to support PNL programs, but not identifiable with an individual program.
APPROACH: The approach in developing aerosol exposure techniques is aimed at improving the ability to predict and/or control the dose delivered to experimental animals by inhalation. On-line aerosol characterization, lung deposition studies and improved aerosol generation techniques as well, contribute to the goal. Analytical technique improvement effort is directed to increasing efficiency of biological sample preparation by use of such procedures as freeze drying, increasing low level plutonium analysis efficiency by use of High Performance Liquid Chromatography and overall analytical efficiency by use of computers for sample logging and data storage.
RESULTS: By the end of FY 77 it will be possible to determine the particle size distribution of radioactive aerosols on-line (within a few minutes of the time the aerosol sample is taken). This development, together with instruments already available and results of deposition research, should make it possible to control inhalation dose to within 25 to 30 percent of the target value. Improved column extraction procedures should reduce analysis time for very low level biological samples by several hours per sample. Computer logging procedures will ensure a smooth flow of samples through the analysis laboratory.

PROJECT DESCRIPTION: This project is directed at evaluating the influence of exogenous agents and environmental situations on the metabolism and effect of transplutonic elements.
APPROACH: This project currently involves studies on the influence of iron reserves on plutonium metabolism, on the mechanisms of induction of mammary tumors in rats injected with plutonium, plutonium metabolism and effect during pregnancy and lactation, and on the relationships between size of exposed area and the effects of beta-irradiation on the skin of miniature swine. Studies on the effects of alcohol on the metabolism of plutonium and other radionuclides are presently being completed and experiments on transplutonic element metabolism under conditions of protein deficiency are being initiated.
RESULTS: The data resulting from this project will be available for consideration in establishing exposure guidelines. It may be useful in identification of groups of individuals who may be inappropriate for employment under conditions wherein permissible occupational exposure levels may be experienced or for whom additional protection is required.

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/Applied (90%);DEVELOPMENT/Laboratory scale (5%);ANALYTICAL (5%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific PNL
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The ''Dosimetry of Internal Emitters'' Program is aimed primarily at providing dosimetric guidance and support to radiobiology programs at PNL. In particular, the program includes considerations of dosimetric design of experiments; materials; theoretical and experimental dosimetry of various tissues and organ systems and eventual relating of dosimetry data to observed biologic effects. The program assists in providing the scientific data required to evaluate risks, establish acceptable levels of exposure and elucidate mechanisms of radiation interaction with biological systems.
APPROACH: The program combines scientific data with theoretical and experimental dosimetry of biological tissues. The test systems are in vivo (mouse, rat, hamster, dog, swine, primate) and in vitro. The exposure conditions are radioisotope ranging from acute to all manner of chronic. The biological endpoint will be relating relevant absorbed dose to all biologic effects.
RESULTS: The product/results expected for the internal emitters program are the development of scientific data for evaluating risks that may be associated with Nuclear Energy Technology, the establishment of acceptable levels of exposure through relevant extrapolation of animal data to man, and elucidation of mechanisms of radiation interaction with biological systems.
PROJECT MILESTONES: As this program is generally aimed at providing dosimetric guidance to the radiobiology studies at PNL, specific milestones are incapable of precise definition and will be dependent upon the progress of the individual studies.
KEYWORDS: DOSIMETRY;NUCLEAR ENERGY;DOSIMETRY;TECHNOLOGY ASSESSMENT;RADIOBIOLOGY;BIOLOGICAL MATERIALS;TISSUES;ANIMALS;DOSE-RESPONSE RELATIONSHIPS;HUMAN POPULATIONS;HEALTH HAZARDS;COMPUTER CODES;PLUTONIUM;RADIOISOTOPES;SAFETY

TITLE: Analytical Techniques for Tc-99 Measurements in Environmental Samples
PROJECT NUMBER: 001428
PRINCIPAL INVESTIGATOR: Kaye, J.H.
ADDRESS: 320 Building, 300 Area, Battelle-Northwest, Richland, WA 99352
AFFILIATION: Battelle Pacific Northwest Labs., Richland, Wash. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Wood, Robert W.
TELEPHONE: F233-5355
TYPE OF FUNDING: Contract No.-E(45-1)-1830
77 FUNDING: Energy Research and Development Administration FY77:$60,000
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objective of this project is to develop a mass spectrometric technique for high sensitivity analyses of Tc-99 in environmental and other materials. The measurement sensitivity to be attained is to be more than 100 times greater than that available with existing analytical techniques. Such sensitivity is required for performance of programmed environmental studies of Tc-99.
APPROACH: The analytical approach to be employed involves, first, the addition of a known amount of Tc-97 tracer to the sample. Then a radiochemical separation and purification of the Tc-97 and the unknown quantity of Tc-99 is made. The resulting solution is loaded onto a mass spectrometer filament and the ratio of Tc-97/Tc-99 is determined. Since the amount of Tc-97 which was added is known, the absolute amount of Tc-99 present in the sample can be calculated directly from the measured isotopic ratio.
RESULTS: The results of this research and its application to effluent and environment analyses should establish the behavior of Tc-99 in the environment. This will allow a determination of its possible accumulation in sufficient concentration as to contribute significantly to the radiation exposure in time to take corrective action. Tc-99 is both difficult to monitor and contain; thus the consequences, if any, of its loss and accumulation in the environment should be established.
PROJECT MILESTONES: (1) Report of Tc-99 analysis procedure 15 October 1976. (2) Begin development of Tc-97 isotope dilution technique 18 October 1976. (3) Reduce detection limit by factor of ten 28 March 1977. (4) Complete improvements to mass spectrometer operating parameters 30 June 1977. (5) Complete final testing and demonstration of analysis procedure 30 September 1977. (6) Initiate development of dual detector system 3 October 1977. (7) Complete evaluation of procedure modification needs 30 December 1977. (8) Complete development of dual detector system 30 June 1978. (9) Completion of project 30 September 1978.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project is concerned with long-term experiments to determine the dose-effect relationships of inhaled plutonium oxide in beagle dogs, and shorter-term experiments to study the kinetics and dosimetry of transplutonium elements, such as /sup 241/AmO/sub 2/, /sup 244/CmO/sub 2/, and various oxide mixtures.
APPROACH: A life-span study involving about 300 beagles is currently in progress. The dogs received a single 5 to 30-minute exposure to /sup 239/PuO/sub 2/ or /sup 238/PuO/sub 2/ aerosols 3 to 5 years ago.
RESULTS: These data will be used for estimating the relative risk of these alpha-emitting radionuclides, which are prominent components of nuclear fuel cycle effluents.
PROJECT MILESTONES: Dose-effect relationship data for inhaled /sup 239/PuO/sub 2/ or /sup 238/PuO/sub 2/ at the median life-span (12 years old) of beagles will be available in 1982.

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION/Radionuclides (100%)
CHARACTER OF STUDY: RESEARCH (90%);ANALYTICAL (10%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of this project is to obtain information on metabolism and effects needed to establish appropriate exposure limits for radionuclides of potential hazard to the rapidly growing infant or child or for the pregnant woman.
APPROACH: Specific areas of current emphasis in this project include studies on the factors controlling the transplacental passage and distribution of plutonium and other transplutonic elements in the fetoplacental unit and to define the differential metabolic and morphologic factors responsible for differences in the biological disposition and effects of /sup 239/Pu and /sup 241/Am administered in the prenatal and neonatal periods are in progress. Studies using organ culture are examining the pathogenesis of the embryotoxicity of prenatally administered radionuclides and the role of cell kinetics and differentiation in amplifying the potential for neoplastic change after perinatal radionuclide exposure is being studied in other experiments. Studies on the deposition and retention of inhaled /sup 239/PuO/sub 2/ by neonatal and adult rats are being extended to include intermediate ages and evaluations of effects.

RESULTS: This project is producing quantitative information which serves as input to the deliberations of various standards-setting bodies relative to the analysis of radionuclide hazards during development. These data and resulting standards will help to prevent exposure of developing individuals to deleterious levels of radionuclides. At the same time, this knowledge will help to prevent unnecessarily high control levels resulting from overestimation of hazard to this age group.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: This study is aimed at developing laser techniques for the detection of very low levels of pollutants on either a real-time basis or with minimum sample preparation. The objective of this program will be to develop techniques by which many species of pollutants may be detected at concentrations which are orders of magnitude below those achieved by conventional means. Where possible, real-time detection will be achieved for non-nuclear and nuclear pollutants.
APPROACH: The program will take advantage of several properties of dye lasers to allow real-time analysis of low level trace constituents. Species which have excited electron transition states in the near ultraviolet are viable candidates for this technique. Following excitation, the species of interest will be detected either by fluorescent emission or by ion pair detection following further excitation to the ionization level. Since the narrow band widths of dye lasers allow selective excitation of a given species without interference from neighboring atoms or molecules, sample preparation is generally limited.
RESULTS: The principal result of this program will be the development of new experimental techniques which will be applicable to the environmental problems associated with energy production. Specifically, laser excitation techniques will be developed for the detection of isotopes of Kr, Xe, Ar and I/sub 2/ from nuclear sources, and fossil fuel related pollutants such as Hg, Se, No/sub x/, SO/sub x/, H/sub 2/S, PNA's, light-induced free radicals and other products.
PROJECT MILESTONES: (1) Jan. 1, 1977 Publication on analysis for I-129/sub 2/ in the presence of I-127/sub 2/. (2) Mar. 1, 1977 Communication submitted on Doppler-free high resolution spectra of naturally occurring krypton. (3) Oct. 1, 1977 Installation completed of CW dye laser for thermal lensing and saturation spectroscopy. (4) Dec. 1, 1977 Publication on laser excitation techniques. RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: Characterize the inorganic, organic, and possibly metallorganic compounds which are released during pilot plant operations of various coal conversion processes. We will determine the concentrations and distribution of the toxic elements, the general class of organic and metallorganic compounds in the major effluent and emission stream at each pilot plant and the concentrations of the more toxic mutagenic and carcinogenic substances. Samples and subfractions of samples will be tested using the Salmonella/microsome mutagenicity test as a screening technique to find which fractions are most mutagenic or carcinogenic. Although the principal objective is not the development of analytical techniques for measuring pollutants, where necessary, we may improve the technology to permit a detailed characterization.

APPROACH: Neutron activation and x-ray fluorescence techniques will be used to determine trace metal concentrations. Aqueous and liquid samples will be analyzed using spectroscopy, polarography, d.c. discharge emission spectroscopy and mass spectrometry. Organic and organometallic compounds will be separated into class groups using gas chromatography, high pressure liquid chromatography, and mass spectrometry. The Salmonella/microsome mutagenicity tests will be used for screening compound classes.
RESULTS: The anticipated output of these studies is a compilation of toxic, mutagenic and carcinogenic organic compounds and elements which will arise from coal conversion processes. Some information about the relative mutagenicity of various effluent fractions will be obtained.
PROJECT MILESTONES: (1) Publications on completed mutagenicity tests and organic characterization from solvent refining coal processes. (2) December 1, 1976 Initiate sampling at coal gasification plant.
KEYWORDS: COAL INDUSTRY;COAL GASIFICATION;COAL LIQUEFACTION;AIR POLLUTION;WATER POLLUTION;LAND POLLUTION;CHEMICAL EFFLUENTS;HEALTH HAZARDS;MUTAGENS;CARCINOGENS;TOXICITY;MUTAGENESIS;CHEMICAL ANALYSIS

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Middle Atlantic;HYDROGRAPHIC AREAS/Great Lakes
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The project is designed to study the distribution and quality of precipitation in the greater N.E. USA and to relate this to fossil fuel emissions and synoptic meteorology. It also involves a study of the mechanism of scavenging of gaseous and aerosol pollutants by storm systems and a development of models which describe the scavenging mechanism.
APPROACH: Four tasks will be performed in order to accomplish the goals of this project. These are: (1) The specification of wet transformation rates and the concurrent meteorological conditions for the conversion of SO/sub 2/ to sulfate. (2) The analysis of the movement of air pollution in frontal storms. (3) The prediction of wet removal of pollutants from the atmosphere. (4) The acquisition of reliable, high quality precipitation chemistry data. References: (1) Davis, W.E., and L.L. Wendell, Some Effects of Isentropic Vertical Motion Simulation on a Regional Scale Quasi Lagrangian Air Quality Model, to appear in the proceeding of the Third Symposium on Atmospheric Turbulence, Diffusion, and Air Quality, October 1976. (3) Lavoie, R.L., A Mesoscale Numerical Model of Lake-Effect Storms, J. Atmos. Sci., 29, pp. 1025-1040, 1972.
RESULTS: A series of 7 precipitation chemistry sites were established and data are being routinely generated and disseminated. A series of lake effects storms field experiments were conducted over Lake Michigan and data are being analyzed.
PROJECT MILESTONES: Wet Transformation Task-Milestones for FY 1977 are: (1) Installation of instrumentation and samples for study of SO/sub 2//SO/sub 4/ (ratio downwind of a coal-fired power plant). 1 December 1976. (2) Completion of feasibility study on fabrication of a separator for sampling sulfur dioxide and sulfate in the air and in the suspended droplets. 1 April 1977. Air Pollution Trajectory Methods Task-Milestones for FY 1977 are: (1) To complete comparison of model using average temperatures and wind with model using observed data. 1 November 1976. (2) To incorporate an average radiational cooling submodel. 1 June 1977. Precipitation Scavenging Task-Milestones for FY 1977 are: (1) Decision on the type and location of a precipitation scavenging field experiment during the winter of FY 1977. 15 October 1976. (2) Completion of field experiments and formulation of the Lavoie model. 1 March 1977. (3) Completion of initial wind tunnel or tandem aircraft tests for sizing aerosol tracers. 1 July 1977. (4) Decision on field experiment for the winter of FY 1978. 30 September 1977.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this project are to study the biological behavior and effects of present and anticipated coal mine air contaminants, with particular emphasis on the mechanisms of development of the chronic respiratory disease, coal workers pneumoconiosis (CWP), and to evaluate the degree of hazard associated with possible extensive use of diesel engines in coal mines as they are currently used in hard-rock (non-gaseous) mines.
APPROACH: This research will correlate results from air sampling in working coal mines, together with

experience in characterization of complex organic gas-aerosol atmospheres from combustion engine exhausts, with observed biological changes in large and small experimental animal models developed for study of human respiratory diseases.
RESULTS: The development of pneumoconiosis, its progression to massive pulmonary fibrosis and to emphysema will be studied to clarify the mechanisms of induction of these diseases and the levels of specific mine air contaminants that are necessary to induce them.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Iron deficiency and protein deficiency are common in both industrialized and underdeveloped countries. However, little is known about the synergistic toxicity when nutritional deficiencies are combined with exposures to heavy metals. Certain metals are known to interfere with iron deficiency, and some are detrimental to the immune system. In addition, the hematopoietic system and immunocompetence are adversely affected by either iron or protein deficiency. The objectives of this project are to define these interrelationships.
APPROACH: This project will investigate, in laboratory animals, the effects of iron and/or protein deficiency on the toxicity of pollutant metals. Screening studies will determine those metals whose toxicity or absorption appears enhanced in nutritionally deprived animals. Based on these preliminary studies, subsequent investigations will investigate, in detail, the effects on the hematopoietic and immune systems. The incidence of neoplasia of nutritionally deprived animals exposed to pollutant metals will be compared to control animals similarly exposed.
RESULTS: This research will provide information regarding populations that may be at greater risk from heavy metal exposures, and could ultimately result in re-evaluation of existing permissible exposure limits.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine the biological behavior and effects of plutonium released with sodium in a manner simulating a hypothetical core disruptive accident in a liquid metal fast breeder reactor.
APPROACH: (1) Develop technology for generating vaporization-condensation aerosols from LMFBR fuel and mixing these with sodium in appropriate sequence. (2) Develop and apply techniques for exposing experimental animals to these aerosols. (3) Study the deposition, distribution, excretion and biological effects of these inhaled aerosols.
RESULTS: These experiments will enable us to compare the biological behavior and effects of these aerosols with the data obtained for high-fired /sup 239/PuO/sub 2/ particles inhaled by experimental animals and, thus, to determine whether or not the presence of sodium or the method of /sup 239/PuO/sub 2/ preparation has any significance.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project will investigate the long-term biological effects in rats following inhalation of inorganic acid aerosols generated from solutions of nitric acid, sulfuric acid, and hydrochloric acid. The object is to supplement our knowledge of the latent effects of acid exposure where little information is now available.
APPROACH: Rats will be exposed by inhalation to graded doses of acid aerosols and the late developing histopathology will be observed in life span studies. The dose-response relationship for lung and bone tumor induction will be of particular interest since earlier studies indicate these lesions may be related to acid inhalation.
RESULTS: Nitric acid and other mineral acids are commonly used reagents in many industries, including the nuclear industry. The carcinogenicity of acid aerosols will be evaluated and compared with other agents, e.g. radionuclides, which are generally considered to be the major hazard. This information will be useful in assessing the overall health hazard of the nuclear industry.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Site specific Shale country
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The purpose of the study is to identify the potential health hazards which may be associated with exposure to particulates resulting from mining and retorting of oil shale and to evaluate the carcinogenic potential of shale oil fractions shown to have mutagenic activity by the bacterial and cell-culture assay systems in the project ''Mutagenicity of Oil Shale.''
APPROACH: The initial studies to evaluate the fibrogenic potential of oil shale and spent shale particulates and possible carcinogenic activity of these materials are underway. The experimental animals are exposed to the particulates by intratracheal injection in both studies.
RESULTS: Shale oil fractions demonstrated to have mutagenic activity are being prepared to determine their carcinogenic activity in mice. These initial studies will provide data on health effects needed to plan and initiate inhalation exposure studies.

TECHNOLOGY: FOSSIL FUEL/Oil Shale (100%)
POLLUTANTS: ORGANICS/Oil shale (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This program provides a rapid screening procedure which will identify potentially carcinogenic materials in oil shale, or materials formed during the processing of the shale into new shale oil, upgraded shale oil, etc. Such potentially carcinogenic materials (including pure chemicals identified in the various fractions) will then be available for more extensive testing in animals.
APPROACH: We are therefore investigating the development and utilization of bioassays employing microbial and mammalian cells in culture. These assays, used as a screen for mutagenic and carcinogenic effect, may

allow the selection of agents and concentration ranges for evaluation in whole-animal assays. They can be performed at relatively low cost and relatively quickly, allowing evaluation of large numbers of test materials and combinations of materials. Further, since these assays involve cultured cells, they also afford simple biochemical means for studying the mode of action of a given mutagenic and/or carcinogenic substance.
RESULTS: The major output will be a rational and comprehensive assessment of the carcinogenic potential of oil-shale, shale-oil, shale-oil products, etc. by in vitro and in vivo assays.

DIVISION: Division of Biomedical and Environmental Research
MONITOR: Wood, Robert W.
TELEPHONE: F233-5355
TYPE OF FUNDING: Contract No.-E(45-1)-1830
77 FUNDING: Energy Research and Development Administration FY77:$150,000
TECHNOLOGY: NUCLEAR/Fission Converters;NUCLEAR/Fission Breeders (100%)
POLLUTANTS: RADIATION/Alpha (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The purpose of this study is to apply the statistical concepts characteristic of microdosimetry to the case of point sources of charged particles within lung tissue. Since ionizing radiation deposits energy in the form of charged particle tracks, the specific energy is not constant from one microscopic site to another, but has a variance which depends on the LET of the radiation and the size of the site among other things. When the tracks originate in source particulates, the variation between sites may be even more significant, and may be a major factor in determining biological response.
APPROACH: Because of the non-uniform nature of both the source and the absorber, this problem must be solved by mathematical means. Monte Carlo calculations will be used to determine the energy deposition along the track of an alpha particle. This track structure will serve as input to calculate the specific energy in any size site resulting from any combination of source particle positions, and allowing for the presence of air spaces as well as tissue between source and site. Mathematical model of the lung structure will be developed based on measurements of air and tissue path lengths. Results of studies on the rate of translocation of particles in lung will also be used.
RESULTS: The results of this study will make possible meaningful comparisons of results of inhalation toxicology experiments in different species and under different exposure conditions. This should remove much of the ambiguity in this analysis and help eliminate uncertainties in the estimates of hazards associated with inhaled particulate sources.
PROJECT MILESTONES: (1) July 1976 Complete phenomenological model for single particle source term in H/sub 2/O. (2) September 1976 Complete statistical studies of air-tissue distributions and determine final form of lung model. (3) December 1976 Complete track structure calculations for energy deposited in a site by a single particle. (4) January 1977 Begin biological studies of particulate kinetics in lung. (5) July 1977 Have all significant variables incorporated in a computer program. (6) September 1977 Apply developed concepts to inhalation toxicology. (7) September 1978 Transfer technology to the Dosimetry of Internal Emitters program.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This research project seeks to develop treatments for overexposure of workers or the public to toxicants, particularly metallic or organometallic agents, encountered during non-nuclear energy or fuels research, development or production.
APPROACH: Metal removal agents are being sought from among natural chelating agents, e.g., the siderochromes produced by some microorganisms, and from existing chelators. The candidate agents are tested for their relative chelating ability toward Pb, Cd, Hg, V, Cr, Co, As, Fe, and Tl using chromatography. Chelon and chelate toxicity are evaluated in tissue cell culture systems. If they appear promising further tests are made for the ability of the agents to remove injected or inhaled metallic toxicants from mice or rats. Successful agents will be tested in rodents and dogs to see if they can ameliorate pathological conditions due to acute exposures and to chronic, low-level exposure to the toxicants, as well as being toxicologically evaluated for possible trial in man.
RESULTS: The treatments evolved from this research should provide improved therapy for accidental, acute

overexposures of workers and the public from toxic metals or metalloorganic compounds released or encountered in non-nuclear energy production or research. Further, the treatments should decrease the damage potential from such agents for the chronic, long-term, low-level case.

TYPE OF FUNDING: Contract No.-E(45-1)-1830
77 FUNDING: Energy Research and Development Administration FY77:$70,000
TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: METALS/Transuranics (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Satisfactory data on the long-term effects of biogeochemical weathering processes on the biological availability of transuranium elements is presently not available. This program addresses this problem by using naturally occurring elements which behave similar to the transuranic elements and which have been subjected to long-term weathering processes. Concentration ratios for analog elements will be measured from the weathered portions of soils into plants, and these concentration ratios will be compared to corresponding transuranium elements. Extrapolation of these data will allow us to make estimates of the eventual steady-state equilibrium in the environment for soil-to-plant concentrations of transuranic elements.
APPROACH: Plant lysimeters will be spiked with chemical forms of Nd, /sup 241/Am and /sup 244/Cm to compare the soil-to-plant concentration ratios for these elements. Short-term laboratory experiments will be performed using the nitrate form of these isotopes with soils having a significant organic matter content. These studies will allow a determination of the distribution coefficients of these elements in soil-Ca(NO/sub 3/)/sub 2/ systems as a function of equilibrium time and soil pretreatment. Chemical extraction methods will be developed to determine the maximum and minimum extractible concentrations of the analogs in order to define the upper and lower concentration limits of the pool of potentially mobile species. These techniques will be applied to representative soils and associated crops for the determination of the transfer coefficients of the analog elements.
RESULTS: The principal output of this program will be a prediction of the ultimate biological availabilities of transuranic elements in the environment with extrapolations to long-term behavior of these elements.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Determine the uptake of uranium by range and crop plants and to determine the uptake and elimination of uranium in domestic animals and animals which inhabit the shrub-steppe communities.
APPROACH: Plants, grown in soil contaminated with uranium, are maintained under natural field conditions to determine realistic uptake values. Contaminated food stuffs are fed to animals to determine uptake and retention functions.
RESULTS: Data is to be collected to quantify the transfer of uranium from soils to plants, the effect of time on the various processes, and the kinetics of uranium in certain animals. Information obtained in this field study will provide realistic data to be applied to natural conditions in assessing hazards associated with the food chain to man.
PROJECT MILESTONES: (1) Plant uptake studies are to be continued through FY 1979. (2) Animal kinetics studies to be initiated in FY 1977 and completed in FY 1979. (3) The feasibility of doing an ecosystem study is to be determined in FY 1979.

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/Continental;COASTS/Northeast;COASTS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To provide quantitative and statistical support and methodology for the design and analysis of plutonium and other transuranic ecosystem and field studies.
APPROACH: Emphasis is being directed toward the evaluation or development of methods for sampling and statistical analyses designed to identify and deal with the very high variability present in plutonium and other transuranic concentrations in environmental samples. The design problem is being considered in terms of the rather different objectives that may be considered in planning field studies, such as the movement and dynamics of plutonium within and between ecosystem components and the estimation of amounts and concentrations in these components and, more generally, sampling to assess the need for ''clean up'' or to evaluate hazards.
RESULTS: Anticipated results are reports and publications directed at radioecologists active in the design and statistical analysis of environmental plutonium and other transuranic studies. These publications are intended tc result in the use of improved statistical methodologies for environmental studies.
PROJECT MILESTONES: We anticipate publishing a report on effective methods for summarizing and reporting plutonium data. A similar report on uses of nonparametric methods in environmental plutonium studies is anticipated. Statistical analyses for the Pu-239 watershed study near Urbana, Ohio should be completed by mid FY 1977, depending on the rate at which chemical analyses are performed. Our work on ratio and linear regression estimators should have progressed to the point of a published report by mid FY 1977. The development of models for describing spatial variability of plutonium concentrations in soil is a longer term project. All of the above reports are expected to result in open literature publications.

POLLUTANTS: METALS/Heavy metals (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The goal of this study is to study four regulatory properties of cell membranes which are susceptible to alteration by heavy metals. These data will provide fundamental information needed to predict effects of heavy metals and aid in establishing exposure limits.
APPROACH: (1) The regulation sites and functions of lymphocyte membranes which are important to the immunological response are being examined in vitro. (2) The role of the cell membrane in regulation of cell division via cell-cell contact is being studied in culture brain cells. (3) The induction of exocellular proteases in Neurospora crassa by impermeant protein induces is used as a model system for studying relay of information through the cell membrane. (4) An enzyme (ATPase) on avian leukemia virus is used as marker for studying virus maturation.
RESULTS: We intend to delineate the role of the cell membrane in regulating cell activity involved in immunclogical competance, reception and transmission of external information and interaction with tumor viruses. This information will permit assessment of the susceptibility of these processes to heavy metals from fuel combustion and the pathogenesis likely to arise from their disruption by the metals.

TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS/NO/sub 2/;NOXIOUS GAS/SO/sub 2/;NOXIOUS GAS/CO/sub 2/ (30%);METALS/Mercury;METALS/Selenium;METALS/Titanium;METALS/Vanadium;METALS/Nickel;METALS/Cadmium (10%);PARTICULATES/Flyash (40%);ORGANICS/PNA's (20%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Site specific Power plant sites
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The goal of this program is to provide a model whereby the chemical and physical forms of flue gas emissions can be predicted from the given input of coal composition, combustion temperature, flue gas temperature, pressure profiles, precipitation devices and stack conditions. The scope of the model is limited to the physical and chemical transformations which occur from the instance of combustion in the firebox to a point in the plume where chemical and physical transformations of the aerosols are no longer dominated by plume comditions.
APPROACH: Physical and chemical measurements will be made of flyash, char and volatile combustion products in the laboratory and at plant sites for empirical parameter definition within a developing physical model. These data will be compared with model calculations. The initial theoretical model will be developed for a specific 600 MW coal-fired power plant.
RESULTS: The output of this program will be a model directly applicable to technology related to control of emissions from a coal-fired combustion plant. From this program will also proceed the production of information concerning catalytically enhanced reactions basic to the understanding of environmental problems. The end result is expected to be a model applicable to major power plants when given appropriate parameter input.
PROJECT MILESTONES: (1) 8-1-76 Stack sampling at coal combustion plant. (2) 11-1-76 Quadrupole mass spectrometer rated with cell for high temperature reaction studies. (3) 1-2-77 Literature report completed on surface characteristics of fly ash. (4) 7-1-77 Literature report completed on high temperature reaction kinetics of NO to NO/sub 2/ in presence of catalysts. (5) 7-1-78 Aircraft sampling of coal combustion plume.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental;GEOGRAPHIC AREAS/Site specific Colorado, Utah, Wyoming
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: This study will identify potential pollutants which may reach the environment as a result of emissions from oil shale and tar sand retorting operations. Such a study is necessary at the present time because of currently vigorous interest in oil shale and tar sand tecnology being shown by both private and government sectors.
APPROACH: Effluents from both above-ground and in situ processes will be characterized for a wide spectrum of inorganic, metallorganic and organic compounds and species. A wide variety of analytical methods including gas chromatography-mass spectroscopy, neutron activation, X-ray fluorescence, high pressure liquid chromatography, atomic absorption and plasma DC-emission spectroscopy will be used for the characterization measurements. Effluents to be characterized will include raw oil shale, spent shale, crude shale oil, various shale oil boiling fractions, upgraded shale oil, process water, off-gases, as well as tar sand and crude oil from the sand. Priority will be given to those processes which show promise of early commercialization. On analysis, priority will be given to compounds of elements known or suspected as being carcinogenic, toxic or otherwise harmful. A list of such compounds and elements to be looked for will be formulated and reported as part of the project. Source term calculations will be made for each process.
RESULTS: The outputs of this program will be detailed analyses of effluents from oil shale and tar sand pilot retorting operations for inorganic metallorganic and organic species. The data will be used to make source term calculations. The characterization, data and calculations will be summarized in early reports for each pilot plant discussing the possible environmental problems associated with the commercial operation of each type of process and suggesting the need for abatement procedures where necessary.
PROJECT MILESTONES: (1) December 1976 Collection of samples from various sites (completion). (2) August 1976 Formulation of working lists of toxic and carcinogenic compounds. (3) September 1976-July 1977 Preliminary characterization of samples. (4) March 1977-December 1977 Comprehensive characterization and material balances.

77 FUNDING: Energy Research and Development Administration FY77:$50,000
TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: PRODUCTION (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Our objectives are (1) to evaluate the effects of chronic, low-level radiation exposures on human populations, and (2) to develop adequate statistical and epidemiological methodologies for assessing available data on chronic low-level exposures.
APPROACH: Our tasks include analysis of the Hanford mortality data, expanding the Hanford mortality base to include J.A. Jones construction workers, developing and adapting statistical and epidemiological procedures for analyzing chronic low-level exposures, and critically evaluating other studies and opinions concerning human risks from chronic exposures.
RESULTS: Our major result will be a complete analysis of the Hanford data with particular attention to assessing the effect of occupational exposure on mortality. Current estimates of somatic effects on humans from low-level radiation exposure are based on extrapolation either from a single high level exposure or from animal studies, so it is of critical importance that available data on chronic exposures to human populations be evaluated using the best possible statistical methodology. A second result will be a paper cataloging procedure for handling low-level chronic exposures. This should prove valuable in providing the capability (to ourselves and others) for analyzing available data on chronic exposures.
PROJECT MILESTONES: (1) Report on proportional mortality for Hanford workers Sept. 1976. (2) Report on complete analysis of Hanford data including deaths through 1971, Mid-1977. (3) Report on updated analysis and inclusion of construction workers 1978. (4) Paper on statistical methodologies, Mid-1977. (5) Studies will be evaluated as requests are made.

CHARACTER OF STUDY: RESEARCH/Applied (50%);DEVELOPMENT/Pilot plant (50%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Northwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Demonstrate the use of unmodified spoil banks to direct precipitation to a strip of topsoil between the spoil banks to increase the effectiveness of natural precipitation so the relatively high value agricultural crops can be cultivated without irrigation. Demonstrate that a combination of surface treatment, unmodified spoil bank shape and crop species can survive and be productive without irrigation in arid areas.
APPROACH: Artificial spoil banks or mounds have been constructed on the Hanford Reservation in one of the driest areas of the U.S. Four mounds of native alluvium, each 100 m long by 5 m high by 20 m wide are oriented perpendicular to the strongest winds (SW) and four similar mounds, 100 m away, are oriented parallel to these winds, forming six valleys. Each valley will be instrumented for precipitation, wind, soil and air temperature, and soil water content, and planted with relatively valuable and drought-resistant crops such as winter wheat, crested wheatgrass, grapes, and ponderosa pine. These crops require irrigation for survival here. Runoff and surface stability of the mound slopes will be modified with various treatments such as rubbersheeting and paraffin. A seventh area away from the mounds will be similarly instrumented and planted. Plant survival and production will be correlated with microenvironment and surface treatment.
RESULTS: Native plants adapted to arid environments, as well as winter wheat and grape vines, were planted in the test areas. All native species grew satisfactorily. A crop of winter wheat was harvested from the valley zone receiving runoff from 6 inches of natural rainfall. Thus, the mound-valley landform is a desirable feature for water conservation in arid climates.
PROJECT MILESTONES: Annual NERP status report.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Colorado, Wyoming, Utah
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: This program will prepare and document oil shale and tar sand materials to be used for health effects and environmental exposure studies. This material will also be used for analytical procedure development studies. It will provide uniform and well characterized samples for all workers in ERDA laboratories as well as outside laboratories working in analysis and health environmental effects studies. The quality and reliability of results will be improved because they will be obtained on known and homogeneous samples. All such results will be directly comparable. Research materials to be collected and prepared will include oil shale and specific fractions thereof, spent oil shale, crude shale oil, upgraded shale oil, tar sand and crude oil from tar sand.
APPROACH: The samples will be suitably prepared, stabilized and characterized for a broad spectrum of inorganic, metallorganic and organic species and compounds. A number of analytical techniques will be used for the characterization including gas chromatography-mass spectrometry, high pressure chromatography, fluorospectrometry, neutron activation, X-ray fluorescence and specific ion electrodes.
RESULTS: The outputs of this program will be: reference oil shale; reference spent shale; reference crude shale oil; reference upgraded shale oil; reference tar sand; reference crude oil from tar sand; documentation on the composition of all the above reference materials.
PROJECT MILESTONES: (1) Collection of raw materials September 1976. (2) Preparation of research materials January 1977. (3) Distribution of research materials to other labs January 1977. (4) Initial characterization of research materials July 1977. (5) Final characterization of research materials July 1978.

TYPE OF FUNDING: Contract No.-E(45-1)-1830
77 FUNDING: Energy Research and Development Administration FY77:$80,000
TECHNOLOGY: NUCLEAR/General (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific ERDA Contractors
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The objective of the research projected ALAP- Technical Guidelines for Maintaining Occupational Exposure As Low As Practicable is to establish a data base which will be used for the preparation of a Manual of Good Practice for maintaining occupational exposures ALAP. This will be accomplished by reviewing existing programs and practices at ERDA contractor installations to identify the problem areas and radiation exposure trends.
APPROACH: The project will be carried out in three phases. The initial phase will be to identify and characterize the activities at ERDA owned facilities that result in ''reasonable avoidable'' radiation exposure to workers. Phase two will be concerned with in-depth analysis of data and methods for exposure reduction. The third phase will be the preparation of a ''Manual of Good Practices'' for maintaining occupational exposures ALAP for use in initiating ALAP programs and for judging the quality of such programs. Specific changes in dosimetry, monitoring methods and record keeping programs that could facilitate future ALAP analysis will be identified.
RESULTS: This study will result in criteria which may be used as assurance of ALAP with respect to radiation worker exposure for on-going programs in general and in particular for inclusion in the design stage of future programs.
PROJECT MILESTONES: (1) Program initiated March 1976 for characterization of activities resulting in personnel exposure. (2) Site visits for data accumulation completed by April 1977. (3) Analysis of exposure data complted by August 1977. (4) Draft of manual of good practices for ALAP submitted for review by April 1978. (5) Manual of good practices for ALAP published by September 1978.

POLLUTANTS: ORGANICS (90%);SPECIFIED OTHER POLLUTANTS/Miscellaneous (10%)
CHARACTER OF STUDY: DEVELOPMENT (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific All ERDA nuclear sites
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: Provide recommended methods and procedures for greater comparability among ERDA contractor environmental and effluent radiological monitoring and reporting systems.
APPROACH: Conduct ERDA site interview and report reviews for current practices, literature reviews for state-of-the-art methodology, and workshops and individual site discussions for resolutions of problem areas; provide guides and recommendations reflecting comments received during the review process.
RESULTS: Draft guides (or Handbooks) of recommended methods and procedures for environmental and effluent radiolcgical monitoring and reporting at ERDA sites; provide letter of recommendations for changes in ERDA Manual Chapter 0513.
PROJECT MILESTONES: (1) June 1, 1976 Final revised draft of Environmental Monitoring Guide forwarded to ERDA-DSSC. (2) June 30, 1976 Draft of Effluent Monitoring Guide issued for preliminary comment. (3) December 31, 1976 Revised draft forwarded to ERDA-DSSC for contractor and field office comment. (4) June 30, 1977 Final revised draft on Effluent Monitoring Guide and recommendations forwarded to ERDA-DSSC.

FUNDING: Energy Research and Development Administration FY77:$23,000
HNOLOGY: NUCLEAR/General (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: To develop and apply a systematic method to analyze the criticality safety programs in ERDA facilities.

APPROACH: All of the ERDA contractors who maintain a criticality safety program will be surveyed. The survey will be conducted through site visits in which the individual characteristics of the different criticality safety programs will be determined and a compilation of their operating experience made. A preliminary fault tree will be developed and utilized to prepare questions for the criticality safety survey.
RESULTS: The evaluation of the fault tree will determine the probabilities for various paths leading to an accident. This will allow the most likely pathways to be identified and optimal areas for correlation to be found. A report detailing the results and conclusions of the study will be issued.
PROJECT MILESTONES: Issuance of final report.

ENERGY CYCLE: EXTRACTION (30%);COMBUSTION IN SITU (20%);PROCESSING, CONVERSION (50%)
POLLUTANTS: PARTICULATES/Oil shale and aerosols (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Southwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The purpose of this project is to develop the technologies and provide the necessary support for designing the animal inhalation experiment. The technologies developed will primarily concern aerosols of oil shale, spent shale and retort vapor aerosols.
APPROACH: Effort will be made to arrive at the best available technique for dry dust generation of oil shale and spent shale aerosols for animal inhalation studies. The choice of technique will be based on reliability, output and degree of dispersion of aerosolized material. Methods of aerosol characterization by mass concentration and aerodynamic equivalent particle size distribution techniques will be developed for individual characterization of biologically significant components of the oil shale and spent shale aerosols such as silicates, heavy metals and organic compounds.
RESULTS: The output of this research will be methods and techniques for generating and characterizing aerosols of oil-shale related materials and for delivering the aerosols to experimental animals for inhalation toxicological studies.

ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Northwest
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objective of this program is to identify areas in developing nuclear fuel cycles where inadequate consideration is being given to environmental controls, where inconsistencies and conflicts exist in environmental policy, and where environmental control improvements can be justified on a cost/risk/benefit basis to ensure that funds are not expended for control in instances where neither the potential effects nor public concerns warrant such expenditures.
APPROACH: (1) Environmental control systems and technology in use and under development for controlling radiological and chemical effluents from nuclear energy systems will be described. (2) Physical and chemical form of the input feed and required process materials will be defined to the extent known. (3) Treatment and confinement processes to eliminate or control the release of residual radiologically and chemically toxic materials to the biosphere will be described for adequacy.
RESULTS: Draft report on Treatment and Confinement System Analysis for LWR fuel cycle.
PROJECT MILESTONES: (1) Comparison of LWR environmental impact with current R and D programs. (2) LMFBR Environmental Control Technology Analysis.
KEYWORDS: POWER REACTORS;FUEL CYCLE;ENVIRONMENTAL EFFECTS;RADIOACTIVE WASTE PROCESSING;RADIOACTIVE EFFLUENTS;RADIOISOTOPES

ENERGY CYCLE: TRANSPORTATION (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objectives of this project are to: (1) characterize the present transportation systems for energy materials; (2) project system characteristics through the year 2000; (3) identify possible problems that could occur in energy material transportation; and (4) suggest actions that could be taken to prevent their occurrence. Such identification of potential problems well in advance of their occurrence will serve to reduce the number and severity of potential crises.
APPROACH: The project will include literature searches, workshops, discussions with key personnel in energy and transportation, and analysis of the information obtained.
RESULTS: A primary output of this project will be a ranked list of requirements and tasks which ERDA must face in evaluating the environmental effects and safety of energy materials transportation.
PROJECT MILESTONES: (1) Issue report on Potential Problems in Nuclear Fuel Cycle Materials Transportation 12/15/76. (2) Issue report on characteristics of current Fossil Energy Materials Transportation Systems 9/30/77. (3) Initiate study to identify potential shipping system characteristics for advanced energy materials 10/1/77. (4) Initiate work toward projection of shipping systems and forecast of problems in fossil energy materials shipments in the remainder of the century 10/1/77.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY

PROJECT DESCRIPTION: This study is designed to assess the capabilities of current technology for treatment and disposal of shale oil development related wastewaters in an environmentally acceptable fashion. Experimental studies will be conducted to evaluate current treatment technology on actual retort water produced by ongoing pilot and demonstration operations for shale oil recovery.
APPROACH: A comprehensive review of the literature disclosed that shale oil retort water, the principal wastewater generated by the pyrolysis recovery process, is heavily polluted with both organic and inorganic constituents and is produced in approximately the same volume as that of oil recovered in in situ operations. Further, in situ recovery methods produce an excess of this wastewater which cannot be used for moisturizing and compacting spent shale as is the case for above-ground retorts. Shale oil retort water differs substantially from other industrial wastewaters but is similar in some respects to wastewaters generated by petroleum refineries and coal conversion and coking plants. Shale oil retort water is generally much higher in dissolved organics than these wastes and tends to have a greater aliphatic/aromatic ratio than coal-derived wastewaters. The processes selected for bench scale experimental studies are essentially patterned after those used to treat petroleum refinery wastewater. The first steps in the processing sequence involve removal of suspended solids, oils, and greases by gravity sedimentation and dissolved air flotation. These steps are followed by steam stripping to reduce the high ammonia content and remove hydrogen sulfide. The waste stream is then treated biologically to remove degradable organics and is clarified by chemical coagulation and filtration prior to removal of refractory organics by activated carbon sorption. A demineralization step, such as reverse osmosis, may also be included to remove excessive dissolved mineral matter.
RESULTS: The performance of a bench scale trickling filter in combination with an activated sludge unit was evaluated with simulated retort water containing a high proportion of readily degradable organic matter (acetic and octanoic acids). These units operated quite effectively together in removing 95% of the organic carbon from the simulated retort water, however trickling filter performance varied between 10 and 50% removal. Although high organic removal was attained by biological treatment alone on the simulated waste, this may not be sufficient to meet discharge criteria because of the unusually high concentrations of organics in retort water. Supplementary treatment such as activated carbon sorption is expected to be required to achieve environmentally acceptable organic residuals for discharge to surface receiving streams. Ammonia removal studies were initiated with a 2 in. diameter steam stripping column packed to a depth of 36 in. with 1/4 in. saddles. A 5 gal sample of retort water from the 6000 kg simulated in situ retort at the Lawrence Livermore Laboratory was fed to the top of the stripping column and countercurrently contacted with steam at a ratio of 1.5 lb of steam to 1 gal of wastewater. The overheads (condensate) from the stripping column were recycled continuously to the feed in order to generate a gaseous ammonia stream and keep volatile organics in the aqueous liquid stream. Preliminary results indicate 99% removal of ammonia without addition of caustic. This removal is sufficient to reduce the ammonia below toxicity levels for biological treatment. Studies on land treatment and disposal of retort water have been completed, and it was concluded that wastewater characteristics and climate are not generally favorable for this disposal method in the oil shale regions of Colorado, Utah and Wyoming. The high concentrations of dissolved salts typically found in retort water are deleterious to vegetation growth and the quality of groundwater beneath a disposal site. The long winters in these regions would require large basins to store the wastewater during freezing weather when land disposal is not possible.
PROJECT MILESTONES: A draft report on land disposal and deep well injection of shale oil wastewaters is scheduled for completion by December 1977. Results of initial bench scale treatability studies will be presented in an interim report scheduled for April 1, 1978. Results of studies of a sodium bicarbonate removal process for alkaline mine waters will be documented in a topical report scheduled for February 1, 1978.

77 FUNDING: Energy Research and Development Administration FY77:$29,000
TECHNOLOGY: FOSSIL FUEL/Coal Conversion gasification (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: NOXIOUS GAS (50%);METALS (10%);PARTICULATES (30%);ORGANICS (10%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Data on material and energy flows in commercial plants that use either Winkler or Koppers-Totzek gasifiers to generate synthesis gas will be sought by contacting manufacturers of these gasifiers and by searching the literature. The objectives of the study are: (1) to determine if environmental control technologies in commercial use are adequate relative to existing and proposed standards, (2) to identify areas where improved control technologies are needed, and (3) to rank research and development programs in terms of their potential benefit.
APPROACH: Suppliers of the subject gasification system were contacted to obtain material balance information on commercial gasification systems. No data was available which required use of information in the literature to assess the adequacy of control technology used with commercial systems.
RESULTS: A draft final report on technologies used in commercial systems and the adequacy of these technologies will be submitted. Control technologies are well developed; no attempts are made to control release of trace elements.
PROJECT MILESTONES: 30 September 1977 Draft of final report on project issued.
KEYWORDS: COAL GASIFICATION PLANTS;CHEMICAL EFFLUENTS;AIR POLLUTION;POLLUTION CONTROL EQUIPMENT;DESIGN;COST;ENVIRONMENTAL EFFECTS;GASEOUS WASTES;SULFUR COMPOUNDS;COAL GASIFICATION;TECHNOLOGY ASSESSMENT

PROJECT DESCRIPTION: The objective of this study is to identify the significant technological environmental concerns associated with compressed air energy storage (CAES), and to provide ERDA Division of Environmental Control Technology with a management program plan to eliminate or mitigate these concerns.
APPROACH: The approach used in this study is to identify potential and likely CAES sites, identify major environmental concerns, identify previous, on-going, and planned related research, and suggest any needed research in order to meet ERDA protocol and directives on environmental issues.
RESULTS: The output of the study will be a management program plan that will be used by ECT in establishing its program of environmental assessment of CAES.
PROJECT MILESTONES: (a) Task 1--Identification of Environmental Concerns for CAES Plants, to be completed August 31, 1977. (b) Task 2--Identification of CAES Environmental Research, Technology and Procedures, to be completed September 15, 1977. (c) Task 3--Program Management Plan, to be completed September 30, 1977.

TECHNOLOGY: GEOTHERMAL/General (100%)
ENERGY CYCLE: EXTRACTION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The drilling phase of geothermal energy development has many safety aspects which must be addressed to identify the safety problems involved and the need for standards. The applicability and completeness of any existent safety standards promulgated by governmental or professional groups must be determined. While the geophysical exploration phase involves environmental and safety impacts to a lesser degree, similar analyses and reviews will be required. This proposal outlines a study that would be accomplished to identify: (1) the existing safety problems, (2) applicable existing standards, (3) the need for specific new geothermal safety standards, (4) the purpose and scope of these proposed standards, and (5) identification of needed data bases.
APPROACH: Generic solutions for assuring personnel safety and environmental protection will be suggested by literature analysis and field consultations with recognized experts.
RESULTS: Specific standards and data base programs will be proposed to deal with generic problems in the geothermal enery program.
PROJECT MILESTONES: Characterization of specific problem areas late FY77; identification of applicable standards early FY78; characterization of specific standards mid FY79.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objective of this program is to review the state-of-the-art for disposing of liquid wastes from geothermal, electric and nonelectric installations. A research program plan will then be developed to provide commercially viable techniques for waste disposal.
APPROACH: A review team was assembled from within the Pacific Northwest Laboratory. This team reviewed the available literature and evaluated the existing methods for disposal of liquid wastes from geothermal facilities. The techniques were evaluated from legal, technical, environmental, safety and economic standpoints. During this evaluation, research needs were identified. The results of the evaluation will constitute a state-of-the-art review of disposal methods for geothermal liquid wastes. A research program plan will be written to develop the required technology on information that was identified as lacking during the review task. This program plan will be reviewed by a task force of recognized experts in the geothermal or disposal fields.
RESULTS: The results of this work will be two documents. (1) The state-of-the-art of existing disposal methods; (2) A research program plan to develop commercially viable liquid waste disposal methods within safety and environmental constraints.
PROJECT MILESTONES: Complete draft of state-of-the-art report--September 1977. Complete Research Program Plan--December 1977.

AREAS/Deep ocean;HYDROGRAPHIC AREAS/Continental shelf;HYDROGRAPHIC AREAS/Other hydrographic areas West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The Division of Biomedical and Environmental Research supports research programs in the marine sciences area at a variety of institutions from Alaska to Southern California. Presently the programs are diverse in disciplines and objectives, and are being conducted independently. Under the charter responsibilities and objectives of ERDA, it is essential that the programs of these diverse contractors become focussed on ERDA's programmatic marine sciences issues and needs.
RESULTS: The functions of the coordinator are: (1) establish liaison between participating scientists through mechanisms of meetings and data exchange, (2) encourage the collection of comparable data that can form the basis of a future data synthesis program for Pacific Coast ecosystems, (3) determine the need for a scientific Advisory Committee and make recommendations to ERDA, (4) identify visible shortcomings in the Pacific Coast programs and make recommendations to ERDA, (5) determine shiptime needs of ERDA programs and coordinate scheduling of R.V. Cayuse with ERDA allocation of ship funds, and (6) establish a continuing and working liaison with other Federal and State agencies responsible for marine coastal programs to assure programs are complementary and not unnecessarily repetitive.

ENERGY CYCLE: TRANSPORTATION (50%);STORAGE (50%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Marine;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The principle issue addressed in this plan is the concern that LNG operations and facilities may present an unacceptable risk to the public. This perception may work to limit the number or capacity of LNG facilities at a time when they are needed. A better understanding of LNG hazards will provide information for the development of sites and control systems about which public judgements regarding acceptability can be more quickly and equitably made. The program is directed toward providing, through research and development, LNG safety and environmental control information for use by industry, regulatory agencies, and the general public.
APPROACH: By conducting adequate background studies and literature searches, and by using the information and opinions of LNG experts, to acquire the pertinent information needed to conduct an R and D program in LNG safety and environmental control.
RESULTS: The LNG Safety and Environmental Control Program Plan was prepared under the direction of ECT. The major part of the Appendices of this Plan were written under the direction of the PNL staff, and the plan was developed from general guidelines guidance from ECT. These Appendices include a State-of-the-Art documentation of past and present LNG safety research.
PROJECT MILESTONES: (1) Project begun October 1976. (2) LNG Safety and Control Workshop December 1976. (3) Draft ready of Integrated LNG Safety and Environmental Control Program Plan August 1977. (4) Approval to publish Program Plan September 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Designed to provide information to assure the public that environmental impacts and certain potential human hazards associated with waste management practices are acceptable and to provide information on impacts which are not acceptable so that the operators of Hanford waste management facilities can provide ameliorations or alternatives.
ROACH: (1) Accumulate baseline information on ecosystem structure and function where they are in contact with waste management facilities. (2) Characterize the radiological conditions relative to the ecosystems including transport of radionuclide and possible radiological effects.
RESULTS: (1) Manuscript on comparative dose estimate to small mammal populations in a waste burial ground. (2) Manuscript on lizard distribution and densities. (3) Report on relationship of radionuclide concentrations in Hanford waste ponds to waterfowl clutch size and hatching success. (4) Reports on

structure and function of Hanford ecosystems. (5) Characterization of eight aquatic sites will be reported.
PROJECT MILESTONES: (1) Major site characterization to be completed end of 1978. (2) Radionuclide studies to begin at selected waste management areas and control sites in 1977 to characterize type, distribution, concentration, and transport. (3) Publications on the dose levels and observed effects if any on burrowing animals to be produced at end of FY 1978.

ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objective of this program is to determine the extent and status of radionuclide migration in the 300 area burial grounds. Detailed evaluations of potential mechanisms which may result in migration of wastes will be conducted and modeled to provide analysis of risks associated with the alternatives of designating these sites for permanent storage and/or removal of wastes.
APPROACH: (1) Geophysical evaluations; (2) sample collection and radiochemical analysis; (3) physical characterization of fluid transport in sediments; (4) fluid migration, fluid modeling; (5) evaluation of biological transport mechanisms; and (6) report.
RESULTS: Technique development is expected to continue. Drilling patterns of select burial grounds will be established and drilling program initiated. Additional arrays of monitoring stations will be emplaced in order to dimensionally quantify fluid transport within burial trench and caisson areas. All data collected will be compiled and analyzed. Quarterly reports will continue.
PROJECT MILESTONES: Determine in situ contamination pattern. Prepare final report.

TECHNOLOGY: FOSSIL FUEL/Coal Conversion gasification (100%)
POLLUTANTS: NOXIOUS GAS/NOx;NOXIOUS GAS/SO2;NOXIOUS GAS/CO (25%);METALS/Trace elements (25%);PARTICULATES/Fine particles (25%);ORGANICS/Polynuclear and phenols (25%)
CHARACTER OF STUDY: RESEARCH/Laboratory (50%);DEVELOPMENT/Pilot plant (50%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Hanna, Wyoming
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objective of the program is a characterization study which can be used to identify the compounds formed during in situ coal gasification. The program involves identifying and quantitatively analyzing the spectrum of organic and inorganic components in the product gas, the entrained water vapor, the coal for by products and the gaseous effluents from combustion of the gas. Particular emphasis will be placed on volatile trace elements such as Cu, Zn, Br, Sb, Sc, Hg, Cd and As, and organic compounds such as polynuclear aromatics and phenols.
APPROACH: The inorganic analysis will be carried out using neutron activation, x-ray fluorescence and atomic absorption spectroscopy. The organic compounds will be identified and quantitatively determined using in combination gas chromatography/mass spectrometry and high pressure liquid chromatography.
RESULTS: The sampling methods and analytical methods developed for these studies should be applicable to many of the problems associated with characterization of pollutants from in-situ coal gasification experiments. Secondly, based on samples obtained from in-situ coal gasification a better understanding of the environmental problems associated with in-situ coal gasification will be obtained.
PROJECT MILESTONES: During FY77 representative samples of coal, particulates, gases and liquids will be obtained from the Hanna, Wyoming, in-situ coal gasification site. Initial work on the characterization of up to 40 elements will begin. Initial work on organic components will also commence. Suitable reports will be issued as data becomes available.

TITLE: Toxicology of Sodium
PROJECT NUMBER: 2718
PRINCIPAL INVESTIGATOR: Zwicker, G.M.
ADDRESS: Pacific Northwest Laboratory, Richland, WA 99352
AFFILIATION: Battelle Pacific Northwest Labs., Richland, Wash. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
77 FUNDING: Energy Research and Development Administration FY77:$75,000
TECHNOLOGY: NUCLEAR/Fission Breeders (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: During an accident, high concentrations of sodium hydroxide, carbonate, and perhaps other sodium compounds as well could reach members of the general population for a limited period. Another scenario of interest for purposes of this proposal involves the rupture of a secondary sodium pipe outside of the containment building. Liquid sodium would be sprayed into the air where it would be oxidized and transported to the site boundary. In a relatively humid atmosphere, a large fraction of the sodium would be converted to Na2CO3 which is presumably less toxic than NaOH. In an atmosphere of low relative humidity, more of the sodium would exist as the oxide and hydroxide.
APPROACH: The first part of this project would involve the conceptualization, design, and fabrication of an aerosol generation system and an exposure system for rodents. The second part of this project would involve the whole-body exposure of adult and immature rats to different concentrations of aerosol, probably for periods up to 2 hours.
RESULTS: It is expected that these data will allow us to determine which biological system will be the most limiting in terms of the acute response. Additional experiments will be designed on the basis of the data obtained in this phase of the study.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Development of methods for the production and characterization of aerosols in the required physicochemical form, including monodisperse aerosols, for inhalation toxiclogy studies is one of the objectives of this project. A second objective is the evaluation of the relative importance of various physicochemical properties on the biologically relevant deposition and dissolution behavior of inhaled materials.
APPROACH: Production of aerosols with the desired properties requires different procedures. Monodisperse aerosols are obtained by centrifugal separation followed by resuspension and nebulization. Vaporization methods are used for the production of ultrafine particles and Ru-1060/sub 4/ aerosols. Methods being developed and studied for aerosol characterization relate to determinations of aerodynamic diameters, real diameters, size distribution, density, chemical form, surface area, electrostatic charge and in vitro dissolution rates. These assessments of physical and chemical properties will be correlated with observed differences in biological behavior.
RESULTS: Based on studies conducted with monodisperse particles of pure and mixed actinide oxides, the relative importance of several physicochemical properties on their dissolution behavior will be assessed and general concepts derived. The stability, coagulation, gas-particle interaction and deposition behaviors of vapor condensation aerosols, Ru-1060/sub 4/-Ru-1060/sub 2/ and ultrafine Pu-2390/sub 2/ will be evaluated. Suitable methods for the determination of charge distribution and surface area of aerosol samples will be developed and used.
PROJECT MILESTONES: (1) Project summary on mixed oxide dissolution studies October 1, 1976. (2) Generation and exposure system developed for /sup 106/RuO/sub 4/ gas April 1, 1977. (3) Generation methods developed for ultrafine particles of /sup 239/PuO/sub 2/ July 1, 1977. (4) Report on self-charging of alpha-emitting aerosols October 1, 1977. (5) Summarize results for gravimetric surface area measurements October 1, 1977. (6) Develop Kr-85 method for surface area determination April 1, 1978. (7) Publish results on behavior of ultrafine /sup 239/PuO/sub 2/ particles July 1, 1978.

TECHNOLOGY: NUCLEAR/Fission (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: RADIATION/Alpha-emitting particulates (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To assess the hazard represented by inhalation of transuranic aerosols in man, studies are conducted in experimental animals to determine the radiation dose imparted to lung and other tissues and organs after inhalation exposure to aerosols with different characteristics. The effects of different parameters such as particle size, specific activity, chemical form and elemental composition on these dose patterns are being studied to provide needed information for correlation with observed biological effects.
APPROACH: Single acute inhalation exposures of between 15 and 45 minutes duration are conducted using several

experimental animal species. Important parameters under investigation include animal age at inhalation exposure, species, chemical form of the aerosol, aerosol particle size and size distribution and specific activity of the aerosol particles. Serial sacrifice experiments are conducted to elucidate the role of these parameters on the initial respiratory tract deposition, lung retention and rate of translocation of the inhaled material to other body tissues and organs in order to define the pattern of radiation dose imparted as a function of time after inhalation exposure.
RESULTS: The radiation dose pattern data serve as vital input into the interpretation of biological response observed in this Institute's dose-response research using these aerosol forms. The data also will provide interspecies comparisons to assist in the extrapolation of animal data to make human risk estimates of the hazards associated with inhalation of aerosols formed from transuranic radionuclides.
PROJECT MILESTONES: (1) Report radiation dose patterns for Pu-239 O/sub 2/ in Syrian hamsters 1 October 1976. (2) Initiate studies with monodisperse particles of Pu-238 O/sub 2/ and Pu-239 O/sub 2/ in Fischer rats 1 December 1976. (3) Report radiation dose patterns for different particle sizes of Pu-238 O/sub 2/ and Am-241 O/sub 2/ in Syrian hamsters 1 March 1977. (4) Initiate study of particle size effects for monodisperse Pu-239 O/sub 2/ particles inhaled by Beagle dogs 1 April 1977. (5) Report current status of lung microdosimetry studies 1 July 1977. (6) Initiate studies with laboratory animals exposed to ultrafine aerosols of Pu-239 O/sub 2/ 1 October 1977. (7) Summarize results from study of particle size effects for Pu-238 O/sub 2/ inhaled by Beagle dogs 1 July 1978.

POLLUTANTS: RADIATION/Alpha-emitting particulates (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: There currently exists major concern over the adverse human health effects that would accompany extensive use of nuclear power systems utilizing alpha-emitting radionuclides in their fuel cycle. This project will provide quantitative dose-response information from laboratory animals exposed to alpha emitters encountered in this technology to assess the potential hazard to man.
APPROACH: Several animal species will be exposed by inhalation to graded levels of selected alpha-emitting radionuclides and observed over their lifespan. The experimental design will provide information on the influence of particle size, particle number, specific activity and cumulative local dose on the nature and time distribution of biological effects occurring in lung and other critical tissues. Of primary concern is the occurrence of cancer and those dose patterns which maximize this effect.
RESULTS: Studies currently under way will first provide data on the influence of particle size and particle number on early to intermediate forms of lung injury from inhaled Pu-238O/sub 2/ and Pu-239O/sub 2/. Of major interest will be the results obtained from continued longer-term observations of animals with lower lung burdens and the manner in which the patterns of alpha irradiation (uniform versus quite nonuniform) may influence the development of lung cancer.
PROJECT MILESTONES: (1) Expose rats to graded activity levels of monodisperse or polydisperse aerosols of Pu-239 O/sub 2/ and maintain for lifespan observation 1 January 1977. (2) Expose rats to graded activity levels of monodisperse or polydisperse aerosols of Am-241 O/sub 2/ and maintain for lifespan observation 1 April 1977. (3) Submit results of dose-response study with Syrian hamsters exposed to Pu-238 O/sub 2/ for publication 1 June 1977. (4) Complete exposures for one-half of total complement of dogs planned for the dose-response studies involving 0.75, 1.5 or 3.0 mu m particles of Pu-239 O/sub 2/ 1 July 1977. (5) Initiate a limited dose-response study with Rhesus monkeys exposed by inhalation to monodisperse particles of Pu-239 O/sub 2/ 1 December 1977. (6) Report status of dose-response study involving Beagle dogs exposed to monodisperse aeroscls of Pu-238 O/sub 2/ 1 April 1978. (7) Complete exposure of all dogs currently planned for inclusion in the Pu-239 O/sub 2/ dose-response study using 0.75, 1.5 or 3.0 mu m particles 1 July 1978.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS

PROJECT DESCRIPTION: This project is aimed at providing detailed information on the injury and repair responses of the irradiated lung. Included are studies on (1) the functional changes in the lung resulting from chronic radiation injury, (2) morphologic and cytologic alterations occurring as part of the injury response, and (3) the biochemical alterations which lead to late-occurring diseases.
APPROACH: Closely interrelated in vitro and animal inhalation exposure studies will be conducted utilizing selected beta-gamma or alpha-emitting radionuclides encountered in nuclear power operations. Subsequent evaluation of the pathogenesis of changes in the injured lungs include biochemical, morphological, physiclogical, immunological and cytogenetic methodology.
RESULTS: The results of this research will delineate the significant tissue and cellular alterations which lead to serious lung diseases. These include changes in pulmonary clearance, collagen metabolism, pulmonary physiology, chromosomal structure, lung lipids, and changes in specific pulmonary cell types. The major emphasis will be on the pathogenesis of chronic, debilitating diseases and lung cancer which result from the local pulmonary deposition of alpha-emitting radionuclides. Of particular interest will be the delineation of events associated with transformation to neoplastic cells.
PROJECT MILESTONES: (1) Complete exposures for plutonium pathogenesis study 1 November 1976. (2) Delineation of local cell changes from inhaled alpha emitters 1 August 1977. (3) Identification of changes in immune responses from inhaled alpha emitteres 1 February 1978. (4) Definition of changes in collagen metabolism which leads to pulmonary fibrosis 1 June 1978.

PROJECT DESCRIPTION: This project is directed toward the development and evaluation of methods to prevent or treat radiation-induced disease. Objectives are to evaluate methods to remove radioactive material from the body; to demonstrate prevention of radiation-induced disease after radionuclide removal; to develop methods to treat delayed effects of radiation; and to evaluate the biomedical risks of these treatments.
APPROACH: Experiments will be done in beagle dogs and hamsters. Exposures will be single, acute and by inhalation to fission product and alpha-emitting radionuclides. Short-term experiments to evaluate treatments to remove radionuclides will be 2 to 3 months duration. Experiments to evaluate treatments to prevent or alter radiation disease will run 6 months to several years. Experiments will evaluate the relative removal of radionuclides from animals or the prevention of disease or altered disease endpoint and extended life span.
RESULTS: Removal of radionuclides by lung lavage in combination with chelation treatment will be demonstrated. The role of the alveolar macrophage in the removal process will be further defined. The effect of removal of inhaled radionuclides on induced diseases, particularly cancer, and effect of treatment on induced diseases will be evaluated.
PROJECT MILESTONES: (1) Lung lavage treatment risk assessment completed 1 October 1976. (2) Lung cell, particle and lavage interaction study completed 1 January 1977. (3) Treatment of radiation induced lung fibrosis completed 1 March 1977. (4) Lavage removal of alpha-emitting particles completed 1 July 1977. (5) Summary report on the therapeutic use of lavage completed 1 November 1977. (6) Prevention of disease by removal of alpha- or beta-emitting particles initiated 1 January 1978. (7) Macrophage-particle interaction used to increase lavage efficacy 1 July 1978.

PROJECT DESCRIPTION: To provide data and information to the DBER funded group conducting the epidemiological study of lifetime health and mortality experience of employees of ERDA contractors.
APPROACH: Compile data and information required by the study group to establish the relationships, if any, between mortality patterns and levels of radiation exposures.
RESULTS: Determination of the presence or absence of any lasting biological effects on human populations of the low level occupational radiation exposures received by atomic energy workers over long periods of time.
PROJECT MILESTONES: Compilation of radiation exposure data and employee personnel, work history, and

industrial hygiene information through calendar year 1976 completed and submitted to study group by 9/30/77. Submission of updated information and data previously submitted to include calendar year 1977 by /30/78.

POLLUTANTS: RADIATION/Radioactive particulates (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: It is the objective of this project to compare the radiation dose pattern and resulting biological effects following repeated inhalation exposure with those following a single acute inhalation exposure.
APPROACH: The effect of repeated inhalation eposures on radiation dose patterns is being studied in beagles repeatedly exposed to Cs-137 labeled fused aluminosilicate particles (FAP). The deposition and retention of these particles is being determined during and after each exposure. The biological effects of repeated bimonthly inhalation exposure of beagles, mice and Syrian hamsters to Ce-144-FAP or Ce-144 O/sub 2/ is being studied. In other biological effects studies, mice and Syrian hamsters are being exposed bimonthly to Pu-239 O/sub 2/.
RESULTS: It is expected that additional data on the long-term retention of Cs-137-FAP in Beagle dogs will be obtained. The study of the biological effects of the repeated exposure of mice to Ce-144 O/sub 2/ will be completed. All repeated exposures of Syrian hamsters to either Ce-144 O/sub 2/ or Pu-239 O/sub 2/ will have been completed and preliminary data on the dosimetry and pulmonary histopathological changes obtained. Repeated inhalation exposures of mice to Pu-239 O/sub 2/ will also be completed with the mice being held for life span observation. Additional studies of the effects of repeated inhalation exposure of Beagle dogs for up to 10 years and rats for 1 year to either Pu-239 O/sub 2/ or Ce-144-FAP will have been initiated.
PROJECT MILESTONES: (1) Report early retention, dosimetry and biological effects for beagle dogs exposed repeatedly to Ce-144 FAP 1 October 1976. (2) Complete repeated exposures of mice to Pu-238 O/sub 2/ 1 January 1977. (3) Initiate repeated inhalation exposure of dogs to Ce-144 FAP Aerosols (10-year study) 1 January 1977. (4) Initiate repeated inhalation exposure of dogs to mono-disperse Pu-239 O/sub 2/ aerosols 1 April 1977. (5) Complete repeated exposures of Syrian hamsters to Pu-238 O/sub 2/ 1 July 1977. (6) Report biological effects of mice and Syrian hamsters exposed to Ce-144 O/sub 2/ 1 October 1977. (7) Report on biological effects of repeated inhalation exposures of Syrian hamsters to Pu-238 O/sub 2/ 1 July 1978.

TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: RADIATION/Beta-gamma emitting particulates (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of this project is to develop information defining dose patterns to lung and other tissues after inhalation of beta-gamma-emitting particulates by various animal species. Emphasis is placed on study of the influence of different physical, chemical and biological parameters of the aerosol and the exposed subject.
APPROACH: Experimental animals including mice, rats, Syrian hamsters, Beagle dogs, subhuman primates and ponies are typically exposed once, briefly, to a selected radioactive aerosol. Retention and metabolic patterns for the inhaled aerosol are defined for that animal species and exposure condition. Results are used to produce models to assist in defining radiation dose to critical tissues in animal dose-response studies. Dosimetric measurements are also made to study the distribution of radiation dose within and near tissues of importance.
RESULTS: Results will be used to construct models predicting the retention and metabolic patterns for inhaled adionuclides in experimental animals and man. Dose pattern information provides a needed input for the efinition of dose-response relationships in experimental animals and the needed extrapolations to human exposure situations. Additional data on the retention and metabolic patterns for specific particle sizes, uniformity of deposition, retention and dose patterns for inhaled radionuclides and additional data pertinent to the consequences of inhaling radionuclides will be available for use by individuals setting radiation protection standards and conducting hazard analyses.
PROJECT MILESTONES: (1) Initiate study of particle size effects on long-term pulmonary retention in

laboratory animals 1 November 1976. (2) Initiate study of behavior of Ru-106 O/sub 4/ gas inhaled by rodents 1 April 1977. (3) Report on the uniformity of pulmonary radiation dose in dogs that inhaled insoluble Sr-90/Y-90 1 July 1977. (4) Report on fractional energy absorption of beta emitters deposited i small organs and tissues 1 October 1977. (5) Initiate new radiation dose pattern studies with Ru-106 compounds using Beagle dogs 1 January 1978. (6) Progress report on particle size effects on pulmonary retention in laboratory animals 1 June 1978. (7) Report on Pm-147-labeled particulate distribution patterns in the lungs of dogs 1 September 1978.

ENERGY CYCLE: PROCESSING, CONVERSION (10%);ELECTRICITY GENERATION (80%);WASTE MANAGEMENT (10%)
POLLUTANTS: RADIATION/Beta-emitting particles (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective is to identify dose-related health effects resulting from inhaled beta-emitting radionuclides.
APPROACH: Animals have been exposed by inhalation to graded activity levels of selected beta-emitting radionuclides with different physical parameters which result in different radiation dose patterns in the body. They are being maintained for their lifespans to determine the resulting pathologic and carcinogenic effects of inhaled radionuclides. Beagle dogs have been exposed once to graded levels of aerosols of soluble or insoluble forms of Y-90, Y-91, Cs-137, Ce-144 or Sr-90. Initial body burdens range from those which cause acute injury and early deaths to those which may result in no discernible effects. The influence of age is being studied in dogs exposed when immature or aged. Syrian hamsters and mice have been exposed to Ce-144O/sub 2/ to determine differences in species response to inhaled beta-emitting radionuclides.
RESULTS: These studies will determine the relative importance of dose rate versus cumulative dose in causing pulmonary injury and late-occurring diseases, such as lung cancer, in a relatively large, long-lived species. They will also permit correlation between tumor types and local radiation dose. Multispecies comparisons will strengthen extrapolation of data to man. These results will provide needed input for hazard analyses.
PROJECT MILESTONES: (1) Add additional blocks of immature dogs to dose-response study with insoluble Ce-144 1 October 1976. (2) Initiate dose-response study with Fischer 344 rats exposed to insoluble Ce-144 1 October 1976. (3) Report on dose-response relationships to Syrian hamsters exposed to Ce-144 O/sub 2/ 1 January 1977. (4) Report on the early and intermediate biological effects in Beagle dogs exposed to Ce-144 Cl/sub 3/ or Y-91 Cl/sub 3/ 1 April 1977. (5) Complete dose-response exposures of all immature dogs to insoluble Ce-144 1 November 1977. (6) Initiate preliminary dose-response study with Rhesus monkeys exposed to insoluble Ce-144 1 March 1978. (7) Summarize results for BALB/c mice exposed to insoluble Ce-144 1 September 1978.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Efforts will be directed toward analyzing, developing and promoting the use of appropriate aerosol sampling metals for radioactive aerosols, determiing their physical-chemical characteristics and incorporating this information into current models for describing metabolism and dosimetry for inhaled radionuclides.
APPROACH: Efforts within this project are being directed toward development of mathematical models of the metabolism and dosimetry of inhaled radionuclides, identifying the most important aerosol characteristics which influence metabolism and dosimetry, reviewing information on aerosol samplers to identify the most useful devices for characterization and to apply these methods to existing problems surrounding nuclear industrial operations.
RESULTS: A new generalized model for describing retention and dosimetry of inhaled radioactive aerosols will be developed using experimental animal studies and similar information in humans where available. This model will incorpcrate aerosol particle size and solubility measurements. Experience gained in integrating

these measurements and analyses will be used to formulate and promote improved field sampling techniques and be available for analyzing specific accidental releases as they may occur from nuclear industrial perations.
ECT MILESTONES: (1) Models for describing the metabolism and dosimetry for inhaled lanthanides and uthenium 1 January 1977. (2) Models for describing the metabolism and dosimetry for inhaled actinides, especially plutonium, americium and curium 1 January 1977. (3) Recommendations for aerosol sampling devices useful in industrial environments to size particles and determine their solubility will be summarized 1 January 1978.

POLLUTANTS: RADIATION/Plutonium and transplutonium (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Plutonium aerosols are produced in routine operations in the nuclear industry. These aerosols could be accidentally released from their normal containment vessels or enclosures and be inhaled by personnel working nearby. These aerosols are being characterized to provide needed input to hazard analyses for these activities.
APPROACH: This research involves field measurements of plutonium aerosols within safety enclosures at selected industrial sites. Samples are used to assess: radioactive aerosol concentration, aerodynamic and geometric size distributions, physical density and shape factors, electrostatic charge distribution and in vitro dissolution characteristics.
RESULTS: Studies of plutonium aerosols formed during mixed oxide fuel fabrication will be completed. Plants to be studied are Westinghouse-Hanford, Kerr-McGee and Babcock and Wilcox. Major effort will be in characterizing aerosols at various plutonium-uranium oxide powder mixing operations and centerless grinding operations. If commercial reprocessing starts, these plants will also be studied. Studies at Rocky Flats, Colorado and Mound Laboratories will characterize aerosols as formed in fabrication of nuclear weapons and SNAP devices. Anticipated results are respirable sized plutonium aerosols at concentrations 10/sup 6/ to 10/sup 10/ times MPC/sub a/ that exhibit plutonium solubility characteristics 10/sup 4/ times as soluble as pure Pu-239 O/sub 2/. Lung retention half-times of approximately 150 days are predicted in the event of an inhalation accident.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/Middle Atlantic
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Project Da Vinci is a series of instrumented balloon flights to investigate the transport and transformation of pollutants on a time scale of days and over distances of a few hundred kilometers. The objectives of the program are to: (1) elucidate the chemical and physical processes which transform primary pollutants to other forms which are potentially more damaging to man and (2) develop and verify models which can be used to predict the observed transformation and the interregional impacts of such sources of aged pollutants.
APPROACH: The balloon payload contains a complement of equipment for direct measurement of principal gaseous pollutants as well as filter and grab sampling systems for particulate and other stable trace chemical species in the atmosphere. In addition, supporting measurements of temperature, humidity, solar uv flux, and other basic data are made to establish the flight environment; and measurements of relative motion of the balloon with respect to the air mass and of turbulent properties in the near vicinity are also made. The balloon payload is sufficiently large that flights lasting as long as 36 to 48 hours are possible.

This implies continuous characterization of the air parcel over distances ranging from 500 to 700 kilometers from its source.
RESULTS: Da Vinci data should be most useful in documenting the interregional impacts of pollutants emanating from power plants and other diverse sources. Understanding the mechanism by which transformations occur, the principal species involved, and the resultant concentrations should provide means for defining the sources of rural ozone and acid rain, for example, and suggest possible control measures to minimize adverse consequences.
PROJECT MILESTONES: (1) Nov. 1, 1976 Publish Summary and Data Report for Da Vinci II and III. (2) Mar. 1, 1977 Publish interpretive report on Da Vinci II and III.

POLLUTANTS: RADIATION/Radon and plutonium (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Rocky Flats
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: Underground uranium miners are at increased risk of lung cancer and the radiotoxicity of plutonium has been confirmed in animal experiments. The objective of our research is to seek a biological dose-response in workers exposed to daughters of Radon-222 and Plutonium-239. The biological response we use for uranium miners and plutonium workers is the prevalence of chromosome breaks and rearrangements in cells of workers with different estimated exposures to the radionuclides and controls. The biological response results are compared to demographic, medical history, and physical dose estimate data. The somatic cell chromosome mutation rates may provide a biological indication of a toxicological problem.
APPROACH: The test system used is the readily obtained, radiosensitive, human peripheral blood lymphocytes. The lymphocytes are grown in vitro for one cell cycle. The cells are arrested at metaphase and the chromosomes banded and analyzed for dicentric, ring, inversion, translocation, and deletion aberrations. After analysis, the worker (or control) is assigned to an appropriate exposure group based on physical dose estimates of exposure or burden. The prevalence of aberrations/100 cells is plotted against physical dose estimates. In addition to the population studies, individuals with aberrations markedly in excess of control levels or with any heritable chromosomal variation are so appraised. Exposure conditions are by inhalation in the miners and by inhalation or wound in the Pu-workers. The radiation is usually chronic.
RESULTS: Biological Endpoints: Although, in the state of the art, health risks should not be deduced from the somatic cell chromosome aberrations study, this is one kind of testing for potential mutagenicity. In addition, the biological dose-response indicator is yielded directly from the men's cells and with a biological directness that cannot be obtained with physical dose methods. A biological dose-response is evolving in these two worker populations, but implications go beyond workers in a carefully controlled nuclear industry and include concern for nuclide waste safety for long periods of time. The relationship, if any, with biomedical late-effects will only be determined at an undefined later time. For now, we have observed a model biological response measure that may be useful for other non-nuclear, energy producing pollutants.
PROJECT MILESTONES: The evolution of a biological dose-response to low-level, chronic in vivo irradiation required a sufficient population and cell sample. We have attained this milestone in both the uranium miner and plutonium worker populations. A future milestone would be the confirmation of a biological dose-response at the lowest estimated exposure levels in both the miners and plutonium workers, thereby revealing a test sensitivity not fully anticipated in the beginning of the study.

CHARACTER OF STUDY: RESEARCH/Applied (40%);FULL SCALE DEMONSTRATION (60%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental;COASTS/Other coasts Unspecified;HYDROGRAPHIC AREAS/Other hydrographic areas All
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: Determine vulnerability of selected radioactive material packages to malevolent attack, quantify resulting contamination, if any, and determine practical measures for improving package resistance to attack.
APPROACH: (1) Categorize various packages by structure, contents and frequency of use. (2) Determine likely modes of adversary attack. (3) Conduct simulated attacks on model and full scale packages to determine damage. (4) For attacks likely to result in dispersion of radioactive material, conduct tests with suitable instrumentation to measure quantity and distribution of dispersed material. (5) Through analysis and test, investigate methods of improving package resistance to attack.
RESULTS: (1) Document threshold of attack above which package is breached and radioactive material is scattered. (2) Provide a prior information on magnitude of dispersal problem which can be expected if attack occurs for use in emergency planning. (3) Provide methods of improving package designs for attack resistance. (4) Provide checklist of most effective/appealing attack modes for use by security personnel engaged in planning, training and operations.
PROJECT MILESTONES: (1) Conduct air drop tests mid FY 75. (2) Conduct obsolete cask explosive tests begin FY 75, complete late FY 76. (3) Define package characterization begin mid Fy 76, complete FY 76A. (4) Conduct adversary simulation analysis begin mid FY 76, complete early FY 77. (5) Conduct simulated attack testing begin FY 76A, complete mid FY 77. (6) Conduct dispersal tests and analysis FY 77.

TITLE: Full Scale Vehicle Testing Program
PROJECT NUMBER: 800043
PRINCIPAL INVESTIGATOR: Yoshimura, H.R.
ADDRESS: Sandia Laboratories, Division 5432, Albuquerque, NM 87115
AFFILIATION: Sandia Labs., Albuquerque, N.Mex. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Environmental Control Technology
MONITOR: Brobst, William A.; Sisler, James A.
TELEPHONE: F233-5361
TYPE OF FUNDING: Contract No.-AL-3617A
77 FUNDING: Energy Research and Development Administration FY77:$830,000
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: TRANSPORTATION (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (50%);FULL SCALE DEMONSTRATION (50%)

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: (1) Conduct of full scale truck impact test Oct. 30, 1976. (2) Conduct of full scale grade crossing test Dec. 31, 1976. (3) Conduct of full scale impact and fire test of a special rail car FY 77 or FY 78.
APPROACH: Full scale hazardous material packaging systems will be exposed to a series of extreme full scale transportation accidents that will be carried out under laboratory controlled conditions. This test series will measure the response of actual hardware to real accident conditions. Prior to each full scale test, analyses and scale model tests will be conducted as necessary to predict the results of the full scale test and to understand the response of the packaging system.
RESULTS: These tests will provide a means for assessing the validity of ERDA's analytical and scale modeling techniques. Instrumentation will be used to measure accident parameters in extreme accident transportation environments. Full scale crash tests are spectacular events and will create considerable public and media interest. This high level of interest will be useful in that the public will gain knowledge and understanding of the processes used to assure public safety.

ENERGY CYCLE: TRANSPORTATION (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: Collect, store, and make available for use, data concerning the intensity and duration of environmental parameters generated in the transportation of energy materials. Both normal and abnormal (accident) situations will be evaluated.
APPROACH: (1) Dispense data presently stored in the ERDA Transportation Environmental Data Bank (established FY 75). (2) Review and store new data from standard sources. (3) Search for and store missing data from new sources. (4) Conduct or recommend new data gathering endeavors to obtain data unobtainable from 1 or 2 above. (5) Perform analyses of data from 3 above to place it in most useful form.
RESULTS: (1) A ready source of transportation environmental data will be maintained on a continuing basis. (2) Gaps of needs for new data will continue to be identified and reported. (3) New data sources will be located and reported. (4) Recommendations will be developed for possible regulatory actions where accident reporting can be improved. (5) Data and data needs will be reviewed and recommendations will be developed for laboratory tests to acquire needed data.
PROJECT MILESTONES: (1) Acquisition of initial ship accident data Aug. 15, 1976. (2) Distribution of report, Transportation Accident Data Needs (Parameter Study) Sep. 30, 1976. (3) Second report, Transportation Accident Data Needs to include Accident Data Sources, Recommendations for Regulatory Actions, Recommendations for Tests to acquire data Sep. 30, 1977. (4) Semi-annual reports Sep. 30, 1976.

TITLE: Transport of and Containers for Radioactive Materials - Films
PROJECT NUMBER: 800050
PRINCIPAL INVESTIGATOR: Colgan, R.C.
ADDRESS: Sandia Laboratories, Division 3153, Albuquerque, NM 87115
AFFILIATION: Sandia Labs., Albuquerque, N.Mex. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Environmental Control Technology
MONITOR: Brobst, William A.
TELEPHONE: F233-5361
TYPE OF FUNDING: Contract No.-E-(29-1)-789
77 FUNDING: Energy Research and Development Administration FY77:$50,000
TECHNOLOGY: NUCLEAR/General (100%)
CHARACTER OF STUDY: PRODUCTION (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To produce films (motion pictures) on the packaging and shipping of radioactive materials. To provide motion picture coverage of Sandia tests and projects being conducted for the Transportation Staff/ECT/ERDA, and provide and/or coordinate motion picture coverage of other ERDA laboratories or multi-laboratory projects in this area.
APPROACH: Prepare a film specification sheet on a specific topic defined by the Transportation Staff. This sheet will define the film's purpose, content, audience, length and production analysis. It will be followed by a film treatment (more completely stating what and how material will be presented), then, a shooting script and photography to gain the needed visuals, followed by a narration script, narration, editing, interlock and optical-track prints.
RESULTS: In FY 76 and 76T, production of a 30-minute, sound, color film, ''The Indispensable Element,'' on the packaging of radioactive materials. Production of two sound films (shot by Aerojet Nuclear Co.) on the retrieval and storage of transuranic wastes. Production of a sound film, ''Ship with Care,'' for use in the ERDA traveling exhibit on packaging and shipping of radioactive materials. Production of several silent, interim report films on Sandia's testing of spent fuel casks. In FY 77, the production of an information film for use with non-technical public audiences on the overall testing program for the various types of radioactive-material containers and casks.
PROJECT MILESTONES: For the review and approval of the Transportation Staff and other technical consultants,

there will be significant milestones during the production, such as film specification sheet, treatment, narration script (with some scene description) and interlock. Other significant milestones will be the completion of given areas of work, such as Research, Photography, Editing, Animation Art and Photography, Conforming and Release (optical-track) Prints.

POLLUTANTS: NOXIOUS GAS (10%);METALS (40%);PARTICULATES (10%);ORGANICS (40%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Far West;COASTS/Far West;HYDROGRAPHIC AREAS/Other hydrographic areas Groundwater
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Determination of the impacts of in situ coal gasification on groundwater quality within the target coal seam and adjacent to the target coal seam.
APPROACH: Pre- and post-test aquifer characterization and groundwater sampling and analyses will determine changes in groundwater flow patterns as well as changes in groundwater quality with quantification of contaminant concentrations as functions of time and distance from the gasified area.
RESULTS: (1) Model predictions of dispersion of contaminants leached from the gasified area. (2) Site specific data for the Hanna, Wyoming, site where the tests are being conducted.
PROJECT MILESTONES: (1) Pre-test aquifer characterization and water quality determinations--Completed. (2) In situ coal gasification test conducted--Completed. (3) Post-test water sampling and analyses--Oct 77 to Mar 79. (4) Data interpretation and dispersion modeling--Jan 78 to Jun 79. (5) Final report quantifying results--Jun 79.

TELEPHONE: F233-5587
TYPE OF FUNDING: Contract No.-E(29-1)-789
77 FUNDING: Energy Research and Development Administration FY77:$115,000
TECHNOLOGY: SOLAR/Direct heat - cool (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Miscellaneous (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The primary purpose of this project is to compile a list of SHAC materials (working fluids, storage media, insulations, and other materials) and to examine them from the viewpoints of toxicity, fire safety, economics, and engineering properties. Included in the list will be commonly used materials with similar properties for comparison. This list is to be suitable for distribution to the public and is envisioned to be used by the homeowner as a guide for selecting, using, and disposing of SHAC materials.
APPROACH: A complete literature and manufacturer survey or a preliminary chemical analysis as last resort will be made to determine the composition of the working fluids, storage media and solid materials. Discretion will be exercised in selecting the detail of the analysis for each candidate material. Those not immediately found to be of minimal environmental consequence will be investigated further in Phase II.
RESULTS: The data compiled in FY 77 will be presented in a written report to ERDA for issue to the general public. The language used in the report will be understandable to the average homeowner. Those materials for which insufficient composition and toxicity data are available will be studied further by experimental means.
PROJECT MILESTONES: October 1--Submission of draft report for ERDA review; January 31--Final report.
KEYWORDS: EMISSIONS;SOLAR HEATING SYSTEMS;SOLAR COOLING SYSTEMS;MATERIALS;WORKING FLUIDS;THERMAL INSULATION;TOXICITY;HAZARDS;FIRES;ECONOMICS;ENVIRONMENTAL EFFECTS;CARCINOGENS;WASTES

CHARACTER OF STUDY: RESEARCH/Applied (90%);ANALYTICAL (10%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: This study is designed to provide an indication of the potential environmental impact of radionuclides mobilized from combustion of Western coal in electric generating plants. Specific objectives involve (1) an assessment of the radionuclides U-234 and U-238, Po-210, Pb-210, Ra-226, and Th-230 in samples of coal from major Western mines as well as coal, ash, stack effluents, air, soil, and vegetation associated with a power plant using Western coal; (2) an evaluation of radiation doses to populations; and (3) a determination of the need for further research.
APPROACH: In this preliminary study, the samples described above are prepared for and analyzed by alpha pulse height spectrography. The data will be used to close the radionuclide balance for a power plant and in modeling radiation dose to the population adjacent to the power plant. The predicted population dose, projected future use of Western coal, and problems identified as significant but not fully addressed in the preliminary study will be used in evaluating the need for further research.
RESULTS: (1) Data will be obtained on concentrations of U-234 and U-238, Po-210, Pb-210, Ra-226 and Th-230 in coal from major Western mines; mobilization of these radionuclides during combustion; deposition on surrounding terrain; and partitioning to ash residues. (2) Estimates will be made of radiation dose to people residing in the area and/or feeding on crops from the area. (3) An evaluation will be made of the need for further research.
PROJECT MILESTONES: (1) Modifying analytical procedures and developing quality control for analysis of U-234 and U-238, Po-210, Pb-210, Ra-226, and Th-230 in coal, bottom ash, fly ash, air (filters), soil and vegetation. (2) Analysis of samples from major Western mines and one power plant for specified radionuclides. (3) Close radionuclide balance for power plant. (4) Evaluation of population dose estimates. (5) Synthesis of information and generation of report.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Evaluate genetic changes due to electric fields.
APPROACH: The project involves a joint effort by investigators at the Sandia Laboratories in Albuquerque and the Los Alamos Scientific Laboratory (LASL). In the LASL effort, mammalian cells are exposed in vitro (conducting medium) to 60-Hertz electric fields to evaluate possible genetic changes or perturbations of cell replication, growth, or survival. Effects on chromosome structure will also be investigated. These experimental activities will be closely integrated with a theoretical study at Sandia of rate processes in both exposed and unperturbed systems. A study of bioeffects of 60-Hertz magnetic fields will be added during the next year.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: Methods are under development to obtain aerosol and gas samples from low Btu coal gasifiers in order to predict possible fugitive and stack emissions. The high temperatures and pressures present requires development of methods to sample and characterize aerosols from hot gas streams.
APPROACH: Following method development, aerosol samples will be obtained for chemical, physical and biological characterization and toxicological evaluation. Emphasis will be placed on characterizing potential organic, organometallic and trace metal emissions. Deposition-retention studies in rodents using material from gasifier streams will determine the lung burden buildup and removal rates of metals from lung. Particulate samples will be subjected to in vitro dissolution studies for correlation with dissolution rates in lung. Analysis of the dissolved fraction of effluent samples as well as in vivo data will be used to determine dissolution kinetics of a number of elements. Analysis of lung deposition-retention patterns for organics will require the use of serial sacrifice studies with lungs and other organs analyzed for exposure material and metabolites. Tissues will be digested and extracts subjected to high performance liquid chromatography to separate and quantitate materials of interest.
RESULTS: These data will assist in selecting specific materials for more definitive health risk assessment studies.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;OS
PROJECT DESCRIPTION: To determine the physiological and biochemical basis for acute and delayed lung damage resulting from acute and chronic exposure of experimental animals to NOx, SOx, particulates and associated hydrocarbons from stack effluents of conventional power plants.
APPROACH: Uses rodents exposed to carefully controlled levels of noxious gases with and without fly-ash particulates of respirable sizes. Heavy emphasis on lung surfactants including their synthesis. Correlations of lung surfactant biochemistry, collagen, and elastin synthesis and physiological and pathological changes resulting from acute and chronic exposure.
RESULTS: An evaluation of dose-response relationship for acute and chronic exposure. These data will be used to derive risk estimates for acute and delayed toxicity for atmospheric pollutants indicated.
PROJECT MILESTONES: (1) FY-1977 and 1978 Complete acute exposures and report evaluation for short-lived rodents. (2) FY-1979 Begin chronic exposures. (3) FY-1980 Report evaluation of acute and chronic effects for short-lived rodents.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: Collect field effluents pre and post stack control from fluidized bed combustors under various operating conditions. Characterize aerosol emissions (gaseous and particulate). Evaluate the distribution, retention and solubilization in vivo in experimental animals. Define the lung dose for FBC effluents.
APPROACH: Collect effluents from Morgantown Energy Research Center FBC combustor and characterize particulates physically and chemically (size and chemical constitution). Expose rodents to characterized particulates of respirable aerodynamic diameter. Evaluate distribution and refining of particulates and noxious gases.
RESULTS: Prediction of the chemical dose to the respiratory system for gaseous and particulate components of FBC effluents.
PROJECT MILESTONES: (1) FY-1977-1978 Obtain samples of effluents of MERC Experimental Combustor. (2) FY-1978-1979 Chemically and physically characterize gaseous and particulate components of effluents.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Biologically identify and characterize by short term cellular screening the candidate chemical agents in FBC effluents for animal toxicological evaluation.
APPROACH: Use rapid in-vitro and in-vivo screening methods to determine the relative toxicities of gaseous, particulate and particulate associated organics to establish priorities among chemical components for subsequent animal bioassay. The preliminary tests will be microbial screens (Ames method) followed by alveolar macrophage screening and biochemical changes in lung epithelial cells obtained by lavage.
RESULTS: Preliminary toxicity, mutagenicity and carcinogenicity information to select and reduce the number

of chemical agents for which more expensive animal toxicological testing will be required.
PROJECT MILESTONES: (1) FY-1977-1978 Screen samples of FBC effluents by microbial methods for toxic agents. (2) FY-1979 Begin in-vivo animal screening for cytotoxic agents.

ENERGY CYCLE: COMBUSTION IN SITU (100%)
POLLUTANTS: METALS (30%);PARTICULATES (40%);ORGANICS (30%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To define the cellular and physiological basis for development of latent damage to respiratory system from inhalation of toxic airborne pollutants from FBC.
APPROACH: Use cytokinetic measurements of lung epithelial cells. Increased cell turnover for critical cells is used to evaluate early damage and the prelude to latent damage hyperplastic and neoplastic progression.
RESULTS: A correlation of lung cell changes with physiological and pathological changes in animals exposed to selected airborne pollutants especially trace metals and particle-associated hydrocarbons.

ESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This project is dealing with problems of plant growth and differentiation, with strong emphasis on its control by environmental factors, and their relations to hormone effects. It is thus related to Project No. 194, ''Environmental Control of Plant Development and its Relation to Hormones,'' but uses different ''systems'' and different approaches, and is presently primarily concerned with a problem of flowering not covered by that project, namely, the existence of transmissible materials in plants inhibitory to flowering, which together with the flower promoting ''floral stimulus'' investigated under Project No. 194 may determine when and under which environmental conditions the plant forms flowers, fruits and seeds.
APPROACH: The main approach has been grafting experiments between flowering and non-flowering plants in the nightshade family. If successful these will be continued using different plants, in order to assess how widespread the phenomenon is. In parallel, work will be initiated at extraction and identification of the inhibitory materials, and on their interaction with the flower-promoting ones.
RESULTS: While there is considerable, although still purely physiological evidence for flower-promoting, hormone-like substances in plants (floral stimuli or florigen) the existence of antagonistic, flower-inhibitory substances has, despite some evidence to this effect, not been explored in depth. The project is expected to settle this problem. If confirmed, such inhibitory substances (''anti-floral stimuli,'' ''anti-florigen'') may be an important factor in the regulation of flowering and, hence, fruit and seed production in plants.
PROJECT MILESTONES: While there is considerable, although still purely physiological evidence for flower-promoting, hormone-like substances in plants (floral stimuli or florigen) the existence of antagonistic, flower-inhibitory substances has, despite some evidence to this effect, not been explored in depth. The project is expected to settle this problem. TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine which hormones function in plants as intermediaries between perception of an environmental factor and the morphological expression. Specific cases under investigation: (1) Flower formation: objective is to identify the floral stimulus (florigen), the material that is transmitted from an induced leaf to a vegetative bud, where it causes flower formation and the formation of which is regulated by environmental conditions (photoperiod, temperature). (2) Stem growth: to determine the nature of the gibberellins that mediate stem growth in rosette plants as induced by long photoperiods; to determine if the effective hormone level is controlled by compartmentation.
APPROACH: (1) Phloem exudates of Perilla are chemically analyzed and tested for flower-inducing activity. (2) Gibberellins are isolated and identified by gas chromatography-mass spectroscopy. If possible, the hormones are radioactively labeled and their metabolism studied. Compartmentation is investigated by isolating various organelles and determining the distribution of endogenous gibberellins. (3) Abscisic acid biosynthesis and metabolism are studied in leaves in situ as well as when detached from the plant. Localization of abscisic acid and its metabolites will be studied in leaves by cell fractionation.
RESULTS: (1) Identification of the floral stimulus in plants will resolve one of the outstanding problems in Plant Biology, and would undoubtedly have extensive applications in Agriculture. (2) Understanding of the mechanisms by which the photoperiod controls stem growth via gibberellins. (3) Production of abscisic acid in response to stress is common in plants, but the mechanism by which the biosynthesis is triggered is not known. Moreover, most of the abscisic acid in a leaf appears to be physiologically inactive, so that knowledge of its distribution in various cell compartments is essential for understanding its physiological effects.
PROJECT MILESTONES: (1) Identification of gibberellins in spinach Jan. 1977. (2) Sites of abscisic acid biosynthesis and metabolism at the subcellular level Jan. 1978. (3) Localization and sites of interconversion of gibberellins June 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To obtain information on the site and mechanism of action of three of the five major plant hormones: cytokinins, ethylene, gibberellins, at the molecular and cell level. A major part of the project deals with the regulation of aging in plants by ethylene and cytokinins. Of particular interest are the positive feedback mechanism by which ethylene induces its own synthesis during senescence, the localization and characterization of the ethylene-synthesizing system in plant cells, and the effect of ethylene on cell membranes.
APPROACH: Studies (1) on the fate of radioactively labeled gibberellins and cytokinins in the tissue; (2) on the interaction of these hormones with cellular components, especially their binding to particular components, using hormones and hormone analogs of different biological activity; (3) on rapid effects of ethylene on cell structures.
RESULTS: (1) Characterization and cellular localization of the site of action of plant hormones; identification of primary hormonal response. (2) Understanding, in molecular terms, of regulation of hormonal levels, as a premise for regulation of hormone-controlled plant responses.
PROJECT MILESTONES: (1) Identification of a hormonal binding site in plants Dec. 1976. (2) Identification on how ethylene biosynthesis is induced and regulated Mar. 1977. (3) Elucidation of the cellular events of ethylene action Sept. 1977.

PROJECT DESCRIPTION: (1) Identification and characterization of cellulose synthesis in high plants. (2) Study of the synthesis of other plant cell wall polysaccharides. (3) Study of glycoprotein synthesis in plants.
APPROACH: Characterization of substrates and intermediates in cellulose, other polysaccharide and glycoprotein biosynthesis, in vivo and in vitro, using labeled compounds and inhibitors. Studies on the regulation of these processes, using hormones, metabolites and other compounds known to interfere with cellulose formation, or having this potential.
RESULTS: Information on the biosynthesis of cellulose (precursors, intermediate products, ''packaging'' of the cellulose molecules) and its regulation, and similar information on biosynthesis of other cell wall polysaccharides and of glycoproteins in plants. The latter will serve primarily to supplement the project on cellulose biosynthesis as these syntheses have common features, but the work on glycoprotein has also interest for problems of optimization of fertilizer utilization by crops (further information listed in item No. 96).
PROJECT MILESTONES: (1) In vitro synthesis of cellulose--FY 1977. (2) Regulation of cellulose synthesis--FY 1978. (3) Understanding of regulation of glycoprotein synthesis--FY 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To characterize the regulation of the pathways of nitrogen and sulfur assimilation, and the integration of the regulation of these pathways in plants, to learn how plants coordinate the activities of functionally convergent pathways with each other and with the demand for their common product, mainly, protein. Specific objectives are to determine how plants regulate the assimilation of nitrogen from different sources (nitrate, ammonia, urea), and how this is inter-related with assimilation of sulfur.
APPROACH: The experimental system is cultured plant (tobacco) cells, as a relatively uniform material in which presumably all cells are engaged in similar metabolic activities. The cells are grown with various nitrogen sources, and the patterns of the activity of assimilatory enzymes and accumulated metabolites are studied. Variant (''mutant'') cell lines with altered nitrogen and sulfur metabolism will be isolated.
RESULTS: Determination of the physiological conditions for optimization of the utilization of bound nitrogen

(and bound sulfur) by plants.
PROJECT MILESTONES: Evaluation of effectiveness of resistance to selenate (a sulfate analog) as selection criterion for mutant plants with altered, more efficient nutrient utilization will be completed in FY 1978.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project is concerned with determining the structure, function and metabolism of extensin, the hydroxyproline-rich protein present in the primary cell walls of most green plants. Extensin is a glycoprotein in which the hydroxyproline hydroxyl group is glycosidically linked to short arabinose oligosaccharides, while the serine hydroxyl group is glycosidically attached to galactose. Both of these glycopeptides linkages could function as cross links between the cell wall polysaccharides, and extensin may have a crucial function in cell wall growth and hence plant growth in general. Also being studied is the structure of soluble hydroxyproline-rich glycoproteins, to determine which polysaccharides (if any) are attached to extensin before insertion into the wall structure.
APPROACH: Most of the current work is devoted to the determination of the structure of extensin (including polysaccharide attachment) from cell walls of higher plants, using in vitro cell cultures.
RESULTS: Ultimately, we expect to describe how extensin fits in to the overall plant cell wall structure, and what role it has in plant growth.
PROJECT MILESTONES: (1) Unequivocal demonstration of polysaccharide attachment to extensin FY 1977. (2) Complete amino acid sequence of extensin FY 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The project is dealing with fixation of atmospheric nitrogen (N/sub 2/) by bluegreen algae (cyanobacteria), the ultimate objective being bioengineering of a symbiosis between these microorganisms and crop plants which will be independent of supply of nitrogenous fertilizers. N/sub 2/ fixation in these organisms is closely tied in with cellular differentiation and interaction, and this interaction provides a model for the interactions essential for a successful symbiosis between an N/sub 2/-fixing organism and a higher plant. Therefore, the project includes studies on the origin and physiological bases of these cell interactions.
APPROACH: (1) Studying, with the radioisotopes N-13 and C-14, the substances passing from cell to cell (The production of N-13 at high specific activity and purity has been accomplished in cooperation with the MSU Cyclotron Laboratory); (2) isolating mutants which will help in attaining the above objectives; (3) identifying substances produced by the algae and controlling their differentiation; (4) determining the major biochemical differences between the different cell types in the algae. We hope to be able (5) to introduce appropriately mutated algal cells into plant cells in tissue culture.
RESULTS: The symbioses sought should produce protein-rich food without need for nitrogen-containing fertilizer. Elucidation of developmental interactions could help in developing new medical practices in the areas of organ regeneration and cancer.
PROJECT MILESTONES: FY 1977 (1) Determination of details of pathway of initial metabolism of N-13/sub 2/; (2) Isolation and characterization of auxotrophic mutants suitable for symbiosis; (3) Identification of substances passing from cell to cell; (4) Initial characterization of substance stimulating spore formation. FY 1978 (1) Attempts at creating symbiosis, using auxotrophs; (2) Attempts at transfer of genetic information relating to nitrogen fixation.

PROJECT DESCRIPTION: This project deals with the exchange of mass and energy between plants and environment, taking into consideration both normal and stressed environments, and environments marginal for plant growth. The work is centered on the stomatal mechanism, as the prime and specific control mechanism of the plant for the regulation of the exchange of mass and energy with the environment.
APPROACH: (1) Analysis of the gas exchange of leaves by a computer controlled gas analysis system. (2) Computer modeling of energy and water exchange by plants. (3) Biochemical and biophysical analysis of the metabolism of guard cells, including roles of CO/sub 2/ and of abscisic acid, both of which interact and play an important role in the requisition of the stomatal movements.
RESULTS: (1) Elucidation of the processes in the plant which (a) trigger the production or release of the stress hormone ABA, (b) affect the transfer of ABA to the guard cells, (c) are responsible for the action of ABA on guard cells Fiscal Year 1977. (2) Elucidation of the biophysical and biochemical mechanisms underlying the transductor and effector functions of the guard cells Fiscal Year 1977. (3) Elucidation of the functioning of the stomatal control system in the optimization of plant behavior in response to variations in the plant's environment Fiscal Year 1978. (4) Development of first realistic models of water and energy exchange in plants, based on (2) and (3) Fiscal Year 1978.
PROJECT MILESTONES: (1) Preparation of review on stomatal action July 1975. (2) Demonstration of interrelations between abscisic acid and CO/sub 2/ in stomatal mechanism March 1976. (3) Elucidation of the fate of CO/sub 2/ within the stomatal apparatus Sept. 1976.

TECHNOLOGY: SOLAR/Biomass (50%);GENERAL SCIENCE (50%)
POLLUTANTS: HEAT, THERMAL (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Global;HYDROGRAPHIC AREAS/Other hydrographic areas Streams, lakes
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The project consists in studies of the composition and properties of cell membranes; how these are changed by environmental factors, particularly heat; and how these changes are in turn influenced by other conditions, such as presence of certain metal ions, acidity, etc. The rationale is that cell membranes are ubiquitous structures of cells and of many cell components (organelles), and are the first to be affected by any environmental, chemical and physical, factors. They are known to be labile structures and thus play undoubtedly an essential, but very poorly understood, role in the earliest responses of organisms to environment and environmental stress.
APPROACH: Analysis of cell membrane composition (lipids, proteins) and properties by physical and chemical methods in ''normal'' and stressed environments. Fluidity of membrane lipids has been used as a major parameter as it was found to be constant under a variety of environmental conditions. At present, the principal materials are simple unicellular ''model'' organisms (mycoplasmas); extension of the work to other organisms including higher plants is being initiated.
RESULTS: Understanding of early environmental effects on plants: nature of the primary lesion(s); by what conditions, particularly certain metal ions and acidity, they may be modified or limited; existence of repair and/or adaptive mechanisms. Results may be applicable also to man and animals since the principles of cell membrane composition and structure are quite similar in all organisms.
PROJECT MILESTONES: Understanding of early environmental effects on plants: nature of the primary lesion(s); by what conditions they may be modified or limited; existence of repair and/or adaptive mechanisms. Results may be applicable also to man and animals since the principles of cell membrane composition and structure are quite similar in all organisms.

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Excited states and ions or electrons are generally produced in the radiolysis of a liquid system. These states in themselves are of great interest to the field of chemistry and, in many cases, a pulse radiolytic technique is the most convenient way of generating many species for subsequent study.
APPROACH: Three approaches or general areas of research are pursued to varying degrees at different times in the research grcup. Area 1. Experiments are carried out to understand more fully the details of the processes involved in the radiolysis of a liquid system. Area 2. Within a certain level of understanding the ''known'' radiolytic events in a system may be used to probe the system so that changes produced in the system by additives may be explained. Area 3. Photolysis experiments, especially those carried out by pulse laser technique, are often useful in interpreting analogous experiments in the radiolysis of the same system. The group has published several pieces of work in this line. For example, excited states may be positively identified via flash photolysis and the data used to assess the radiolytic damage in similar systems. Electrons may be generated by a two-photon photolysis technique and their physical properties established. These parameters can be subsequently used in radiolytic experiments.
RESULTS: In biological systems various membrane studies are underway. Red blood cells, membrane of E. Coli, mammalian cells and neuron systems are being studied. The factors affecting the transport of material across the membranes is of prime importance. Pulse radiolysis will also be used to determine the chemically active groups on the surface of membranes. OH radicals and e/sub aq//sup -/ produced in the aquecus phase will react with the membrane surface to give radicals that on identification will give information regarding the cell surface. A program of irradiation of various E. Coli cells is underway. The survival of these cells after CO/sup 60/ gamma irradiation is being studied. The various additives that affect the membranes are being used to determine their effect on cell survival. A flow system to add the solutes at short periods (10/sup -3/ sec) before or after irradiation has been constructed.

POLLUTANTS: RADIATION/Ionizing (50%);SPECIFIED OTHER POLLUTANTS/Chemosterilant (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The major objectives of this research project are: (1) accumulation of basic cytogenetic information following irradiation and chemosterilant treatment in the yellow-fever mosquito, Aedes aegypti, and (2) possible application of knowledge thus gained for genetic control purposes. Areas currently active include cytogenetic analysis of radiation-induced translocations, developmental basis of mutagen-induced sexual sterility and manipulation of chromosomal mechanisms for mosquito control. A particular emphasis is being placed on the use of chromosomal translocations for genetic control purposes. A sex-linked translocation homozygote was tested for the principle of population replacement under laboratory conditions. Several double translocation heterozygotes were synthesized and evaluated for genetic control. In addition, the sex-ratio distorter gene was combined with a double translocation heterozygote. Males of this stock will be used for field releases at the W.H.O. unit in Delhi, India.
RESULTS: Fertility of a double translocation system was related to the disjunctional chromosomal segregation. Also trisomy for the longest chromosome was observed. In addition, considerable progress was made on the ultrastructure and differentiation of female gametogenesis.

PROJECT DESCRIPTION: (1) For hematologic disorders, the objective is to determine the role of chromosomal changes in the development of human leukemia. (2) For human environmentally induced tumors, the objective is to determine whether specific chromosomal patterns are related to particular etiologic agents.
APPROACH: (1) We are establishing the types and frequency of chromosomal abnormalities in various hematological disorders such as leukemia, preleukemia, and other chronic myeloproliferative disorders. We have also studied a few patients with acute leukemia, who previously had lymphomas or multiple myeloma treated with x ray and/or chemotherapy. For all of these disorders, we hope to identify consistent patterns of abnormalities, and then to determine whether these can be correlated with any previous exposure to various environmental carcinogens. (2) We also have recently begun work on chromosomal analysis of thyroid cancer associated with a history of irradiation in childhood. This project will attempt to determine whether there are consistent patterns in these thyroid cancers and whether the patterns are similar to or different from those seen in thyroid carcinoma that arise ''spontaneously.'' Other environmentally induced tumors will also be examined as the opportunity arises.
RESULTS: (1) We will be able to compare the chromosomal patterns in acute leukemia arising de novo with that of CML in the blast phase, and with those observed in patients with a previous history of polycythemia vera, treated lymphoid malignancy, or other treated cancer. We can tell whether similar patterns are seen in all leukemias, or whether those arising in patients with an apparently successfully treated lymphoid neoplasm are different. If they are different, we will see whether the patterns correlate with either the initial malignancy or with the type of treatment used. (2) We will be able to compare chromosomal patterns in thyroid cancer presumably caused by various agents and determine whether the patterns are different for different agents.
PROJECT MILESTONES: (1) 1978 Determining chromosomal patterns in 20 patients with acute leukemia who previously had successfully treated lymphoid neoplasms. (2) 1978 Correlate with previous disease and treatment. (3) 1977 Determine whether chromosomal patterns exist in thyroid cancers. (4) 1978 Determine whether the patterns are agent specific.

PROJECT DESCRIPTION: The determination of protein covalent structures and the elucidation of relationships between these structures and the function of the proteins in question. The enzyme rhodanese is probably most pertinent to the goals of ERDA since it is a detoxifying liver enzyme which renders cyanide harmless. It is widespread in nature and we have determined its covalent structure and certain facts regarding its function.
APPROACH: Our approach to sequence analysis is based largely upon automated Edman degradation of intact derived proteins and large fragments generated there from by chemical and enzymic cleavage procedures. Probes at residues essential to function are made by chemical modification.
RESULTS: Rhodanese: Now that we have the sequence and with the expectation of having soon the 3-dimensional enzyme structure, we hope to have a model to serve as a basis for understanding the molecular events of enzymic catalysis in this chemically well-defined system. We are now in a position to study residues of catalytic importance and to initiate a survey at rhodaneses in other systems. It may be possible to relate industrial cyanide poisoning to levels of rhodanese in human subjects.
PROJECT MILESTONES: (1) Mechanistic studies of rhodanese through covalent structure analysis of yeast inorg. pyrophophatase 1977; snake venom phospholipases 1976; bapolipoprotein (human serum) 1978.

PROJECT DESCRIPTION: The objective of the research activities is to characterize the mechanisms that regulate cell-mediated and humoral immune responses. The ultimate goal is to develop rational approaches for the selective manipulation of these responses in order to inhibit growth of tumor, to favor acceptance of bone marrow grafts, and to prevent allergic reactions to environmental materials. The effect of carbon monoxide on atherogenesis is also being explored.
APPROACH: SV40 virus-induced hamster tumor and transplantable Morris rat hepatoma are the two model tumor systems. Graft-versus-host reactivity and mixed leukocyte culture responses are the model systems for evaluating reactivity to histocompatibility antigens. Conjugation of lipid to antigen and other ''adjuvants'' are being used to enhance development of cell-mediated responses. The role of anti-idiotypic

(anti-receptor) antibodies in regulating both cellular and humoral responses is being determined.
RESULTS: Selective intervention in the immune response should enable successful transplantation of allogeneic lymphoid cells and bone marrow as well as specific treatment of progressively growing tumors.
--OJECT MILESTONES: Basic animal research efforts will require several years before clinical trials are feasible.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: We are continuing the investigation of the primary structure of the subunits of the phytohemagglutinin molecular as well as the structure and sequence of the carbohydrate side chains on the protein backbone. We are isolating the human alpha-fetoprotein from fetal sources as well as the body fluids of adult patients with malignant hepatoma. We are studying the confirmation and primary structure of the human alpha-fetoprotein as well as studies of its biological functions particularly in regard to its role as an immunosuppresive and immunoregulatory agent during fetal life.
APPROACH: We are continuing our efforts to isolate the peptide obtained by the digestion of phytohemagglutinin with trypsin. This digestion has accomplished after the protein has been citraconylated. We plan to study the amino acid composition in sequence of each peptide isolated as well as to study the structure of the second carbohydrate side chain found on the molecule. We isolate the human alpha-fetoprotein by means of immunoadsorbent affinity chromatography. We have already begun a study of its amino acid composition on sequence and plan to continue these studies. In addition we assess its ability to suppress human lymphocyte transformation utilizing in vitro cultures of peripheral blood human lymphocytes stimulated by various mitogenic substances such as poke week mitogen, phytohemagglutinin, Concanavalin A, anti-thymocyte serum and the mixed lymphocyte culture. We plan to study the role of sialic acid moieties present on the alpha-fetoprotein molecule with respect to its biological activity as well as to determine the relative effectiveness of various electrophoretic variants of alpha-fetoprotein with regard to their ability to suppress lymphocyte transformation.
RESULTS: With respect to the structure of phytohemagglutinin our ultimate aim is to accomplish the resolution of the complete amino acid sequence of this protein as well as the composition and structure of its carbohydrate side chains. We hope by this to arrive at some insights with regard to the mechanisms by which such mitogenic proteins interact with cell membranes. We intend to characterize the mechanism by which human alpha-fetoprotein acts as a potent immunosuppressant and to determine whether or not this effect is mediated by affecting the interaction of the cell membrane with the stimulatory substances or by suppressing some subsequent event that derives from a stimulus of the cell surface translated into the cells interior.
PROJECT MILESTONES: (1) To determine the amino acid sequence of the phytohemagglutinin molecular together with its carbohydrate side chains. (2) To isolate and study the biological properties of the electrophoretic variants of human alpha-fetoprotein. (3) To determine the role of sialic acid present on human alpha-fetoprotein and its biological activity. (4) To determine the mechanism of action by which human alpha-fetoprotein inhibits the response of human lymphocytes to mitogenic stimuli and acts as an immunosuppressive agent.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Over the past few years, we have detected and physically mapped some 16-18 tRNA genes in the chromosome of T5 phage. The tRNA genes are clustered in a 13,800 nucleotide segment of T5 DNA. Our objectives, both immediate and in the near future, are as follows: (1) to refine our tRNA map so that each tRNA gene along the T5 DNA molecule is precisely ordered; (2) to isolate the T5 DNA segment containing all the tRNA genes; (3) to determine if the mechanism of tRNA transcription, in vitro, follows the order of tRNA gene arrangements in the T5 chromosome; and (4) to examine the possibility of tRNA control of protein synthesis using a phage-infected in vitro translation system.
APPROACH: Refinement of the T5 tRNA map will be carried out by the detection of isoacceptor tRNA species and mapping their gene position; by preparing small T5 tDNA-containing fragments (with restriction enzymes) for hybridization with T5 tRNAs, and by electron microscopic examination of specific tRNA.DNA hybrids. Isolation procedures for preparing T5 tDNA segments have already been partially successful using S1 nuclease, however, larger quantities of material are needed. This tDNA segment will be used as a template for RNA polymerase. Appropriate identification of specific tRNAs synthesized will be done by hybridization-competition or nucleotide sequence analysis. In vitro protein synthesis studies using ribosomes from T5 infected cells is underway.
RESULTS: We expect to gain important information about tRNA gene arrangement in T5 DNA and how the

transcription of these genes are regulated. Since tRNAs play an intimate role in the process of translation, their assembly directly affects, and regulates, the rate of protein synthesis. The order of tRNA transcription can also function to regulate protein synthesis and we would like to know whether RNA polymerase initiates tRNA synthesis at one or several different tRNA promotor sites when a cluster of tRNA genes are encountered in a single chromosome. The presence of a T5-specific tRNA/sup F Met/ species suggests the possibility that perhaps it plays a special role for the initiation of T5 proteins. The information gathered from these studies should help us to better understand the relationship between DNA transcription and protein synthesis, a process that is basic not only to the expression of genetic information but to its proper control and regulation.
PROJECT MILESTONES: (1) The arrangements of tRNA genes in T5 bacteriophage 1977-1978. (2) The translational mechanism for T5 tRNA genes 1978-1979. (3) The nucleotide sequence of T5 initiator tRNA/sub F//sub Met/ 1977-1978. (4) The role of T5 tRNA/sub F//sup Met/ in protein synthesis 1976-1977.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Our objectives are: to elucidate and map the genes and genetic content of the mtDNA, to understand the control of mtDNA transcription, and to understand how the mitochondrial and nuclear genomes interreact to form a functional mitochondrion. We also are trying to evaluate the mechanisms by which heart myofibrils are assembled and degraded, and the effect of a growth stimulus or the removal of such a growth stimulus on muscle protein synthesis and turnover. From the understanding of mitochondrial biogenesis and of heart muscle protein synthesis and turnover we hope to be able to explain mechanisms of cardiac hypertrophy and atrophy and the changes in mitochondria that occur after hormonal administration.
APPROACH: We are attempting to map yeast mtDNA using restriction endonuclease digestion, deletion mapping with petite mutants, electron microscopic tRNA or rRNA hybridization, and genetic analysis. We are also isolating messenger RNAs from wild type and mutant yeast for analysis of the control of RNA transcription. With regard to muscle proteins we are measuring turnover rates by mathematical analysis of the kinetics of labeling of product and precursors. We are isolating in pure form calcium-activated neutral protease and will evaluate its participation in protein turnover. We are also evaluating the transcriptive control of mitochondrial and myosin messenger RNAs.
RESULTS: We hope to derive a complete genetic map of mitochondrial DNA. We also hope to define the messenger rRNA and tRNA, transcripts of mitochondrial DNA and elucidate the mechanisms by which transcription is controlled. We hope to establish the mechanisms by which the mitochondrial genome and its synthetic systems are specifically interreacting with the nuclear and cytoplasmic genetic and synthetic systems. We also hope to determine whether precursor pools of myosin light and heavy chains exist and mechanisms by which their turnover is effected. We hope to evaluate the role of calcium-activated neutral protease on protein turnover. We expect to isolate messenger RNA for myosin light and heavy chains, and for some mitochondrial components in heart and to generate complementary DNA probes. We will use these to evaluate the control of transcription, and protein synthesis in heart muscle before and after cardiac hypertrophy has been produced experimentally.
PROJECT MILESTONES: Restriction endonuclease mapping of yeast mitochondrial DNA January 1977. (2) Mapping of tRNA and ribosomal RNA cistrons, and structural genes of mitochondrial DNA July 1977. (3) Cloning of mitochondrial DNA restriction fragments in plasmids and E. coli and evaluating transcription and translation products January 1977. (4) Elucidation of gene products of yeast mitochondrial DNA July 1977. (5) Electron microscopic mapping of mitochondrial tRNAs January 1978. (6) Elucidation of interreaction between nuclear and mitochondrial genomes July 1979. (7) Evaluation of the role of calcium-activated protease in cardiac muscle protein turnover January 1978. (8) Elucidation of the control of turnover of mitochondrial proteins July 1979.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: In order to increase our understanding of the basic mechanism of protein synthesis, we are continuing our efforts to determine how the initiator site of messenger RNA (mRNA) is selected and the precise sequence in which the various components interact in the E. coli bacterial system. Specifically, we hope to obtain more definitive evidence on various aspects of the initiation process, particularly, since two important conclusions regarding the process had been based on suggestive but inconclusive

evidences. The first conclusion was that a complex of the 30S ribosomal subunit with mRNA and the initiator tRNA is an cbligatory intermediate in the initiation of protein synthesis, and the second, was that initiation factor IF-3 functions specifically to recognize and select the initiator site of natural mRNA. Our study also includes a search for new factors which may participate in the initiation reaction. In terms of long range goals, our work additionally includes the related problem of translational control, a study which should be facilitated by new knowledge gained through our current efforts.

APPROACH: The work involves careful examination of the requirements and kinetic analysis of the overall reaction, as well as the partial reactions, of the process of initiation. The study is being carried out mainly with purified and defined components. For example, we are presently measuring the rates with which initiation complexes are formed using purified initiation factors and ribosomal subunits, N-formylmethionyl-tRNA or N-acetylphenylalanyl-tRNA as initiator tRNA, and MS2 RNA, or synthetic RNAs with limited initiator codons, as mRNA.

RESULTS: Kinetic studies on the formation of an initiation complex of the 30S ribosomal subunit with mRNA and N-formylmethionyl-tRNA, the natural initiator tRNA, are essentially complete. The results show unequivocably that a complex of the 30S subunit is an obligatory intermediate in the initiation of protein synthesis. A comparison of the efficiency of viral mRNA and of synthetic RNAs, with appropriate base compositions, should help in determining whether ribosomes recognize specific mRNA sites and provide insight into the mechanism by which the initiator site is selected in protein synthesis. By careful kinetic studies, we also expect to increase our understanding of how all of the components known to be involved function in the process, and perhaps even discover additional components of the reaction. Presently, we are investigating the function of two new protein factors which appear to stimulate the formation of an active initiation complex of the 70S ribosomes from that of the 30S ribosomes.

PROJECT MILESTONES: (1) August 1971 Discovered two 50S ribosomal proteins which were essential for the interaction of elongation factors EF-G and EF-T with the ribosomes. (2) November 1973 Showed that initiator factor IF-3 was not as specific for mRNA as generally believed. The factor stimulated the formation cf the 30S initiation complex with synthetic RNA and either fMet-tRNA or AcPhe-tRNA as initiator tRNA. (3) January 1975 Obtained kinetic evidence for the obligatory formation of an initiation complex of the 30S ribosomal subunit, mRNA and initiator tRNA.

TYPE OF FUNDING: Contract No.-E(11-1)-69
77 FUNDING: Energy Research and Development Administration FY77:$189,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: It is planned to carry out studies on lipid-lipid, lipid-protein and protein-protein interactions in model and biological systems with particular reference to the low- and high-density lipoproteins (LDL and HDL) of human serum and cell membranes (blood granulocytes and cultured skin fibroblasts). The main purpose of the proposed studies is to define the physico-chemical basis for the lipoprotein-cell interactions since we consider this information essential for the understanding as to how lipoproteins regulate lipid metaboism within the cell and how cells secrete fat-soluble products into the surrounding body fluids. The investigation will continue to be concerned with the above systems under physiological conditions and once the basic mechanisms are sufficiently well clarified, extend the studies to an analysis of those factors expected to affect structure of lipoproteins, transport of lipids, organization of cell surface, cell proliferation and metabolism.

APPROACH: An integrated approach relying on physical, chemical and immunological methods will be used. Through the work of the past few years this laboratory has helped to define a number of the properties of circulating lipoproteins and of their apoproteins. Preliminary work was also conducted on isolated blood granulocytes and cultured skin fibroblasts, both of which systems were found to have cholesterol biosynthesis and egress regulated by serum lipoproteins. By using these systems it is now planned to define the surface topology of both lipoproteins and cells by using chemical (cross-linking agents, specific mcdifications of functional groups, etc.), enzymatic (proteolytic enzymes, phospholipases, triglyceride hydrolipase etc.) and immunological approaches. In the latter respect specific antibodies raised against each of the LDL and HDL apoproteins will be used. Tracer techniques will also be used to label the protein and lipid constituents of lipoproteins and membranes. Finally, whenever required, spectroscopic techniques will also be carried out by taking advantage of instrumentation available to this laboratory (nuclear magnetic resonance, small-angle x-ray scattering, circular dichroism, etc.).

RESULTS: The results to be obtained are expected to be of importance both from the basic and health-applied aspects. Very little is currently known on the exact mode whereby lipid exchange between lipoproteins and cell membranes and also on the structural requirements underlying the receptor-mediated effects by lipoproteins on cell metabolism. Fat-soluble substances which include hydrocarbons or other toxic agents are likely to be transported in association with lipoproteins and from them transferred to the cells. Thus, our proposed studies will provide results not only of strict physico-chemical importance, but ought to give an insight on the mechanisms underlying potentially pathological processes such as, for instance, the accelerated cell growth which is in common to both cancer and atherosclerotic processes.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) Elucidate nature of reversible and unreversed radiation injury in cells, tissues, and organs; study radioprotective and therapeutic agents. (2) Develop experimental basis for biological dosimetry. (3) Investigate carcinogenic potential of alpha radiation from inhaled radon gas. (4) Elucidate physiological perturbations in animals exposed to electromagnetic radiation.
APPROACH: (1) Radiation injury is studied in vivo (rodents) using correlated multidisciplinary methodology (ranging from subcellular to actuarial). (2) Biological dosimetry is explored by correlating functional changes with energy absorbed in tissues of animals exposed to ionizing radiation. (3) Potentiation by radon of chemically induced lesions in the lung is studied in rats. (4) Neuroendocrine assays in rats and dogs are used to study effects of x-rays and microwaves.
RESULTS: (1) The Casarett theory that ionizing radiation induces long-term degenerative effects via increased endothelial permeability, fibrotic changes, and microcirculatory impairment will be further evaluated; this will include acquisition of data on macro-molecules in connective tissues and improved insights into protection and remediation. (2) Effects of ionizing radiation (from both external and internal sources) on hematopoietic function will be evaluated in several species of animals in relation to the radiation dosimetry problem. (3) Insights into the possible cocarcinogenic or potentiating action of radon alpha radiation will be obtained. (4) Biological risks, thresholds of responses, and implications for man will be assessed relative to exposure to ionizing electromagnetic radiation, microwaves, and ELF fields emanating from high voltage transmission lines.
PROJECT MILESTONES: (1) Begin in-depth literature review of biological effects of ELF electric and magnetic fields asscciated with high voltage power lines Dec. 1975. (2) Characterization of x-ray-induced pituitary/thyroid cancer in the rat Dec. 1976. (3) Complete studies on cocarcinogenic mechanisms of radiation induction (x-rays plus antithyroid agents) of thyroid cancer Sept. 1977. (4) Evaluate hypothalamic-pituitary-adrenal sensitivity threshold for microwave exposure (in rats) Dec. 1977. (5) Develop neutron dosimetry techniques for in vivo dosimetry and for personnel monitoring Jan. 1978. (6) Finish rodent studies on the quantitative relationship between neutron dose and hematopoietic response Jan. 1978. (7) Finish testing of Casarett theory regarding mechanism of radiation induction of delayed and permanent degenerative changes and the therapeutic potentials of several types of chemical agents Sept. 1979.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) Continue developing the yeast cell as a eukaryotic model for defining genetic phenomena such as mutation, regulation, suppression, recombination, damage, and repair in terms of specific chemical processes. (2) Utilize the well-characterized yeast model to identify molecular alterations in DNA caused by such carcinogens as X-rays, alpha-particles, uv, alkylating agents, etc. (3) Utilize cultured mammalian cells to define and explain adverse effects of external stresses in relation to DNA damage and repair, chromosome damage and repair, cell progression, and mitotic delay.
APPROACH: (1) Using genetic analysis of the cycl gene in yeast and precise determinations of chain sequence in the gene product (iso-1-cytochrome c), it is possible to deduce nucleotide changes associated with mutations. This method will be used to study environmental mutagens and also the error-prone or mutagenic system of DNA repair in yeast. (2) Other repair studies in yeast will explore enzymatic removal of alkyl groups from DNA after exposure of cells to MMS, EMS, or nitrosoguanidine. (3) Repair and related processes will be studied in cultured mammalian cells using synchronized cell populations. Specific inhibitors will be used to ''isolate'' stage-dependent processes. DNA double strand breaks will be correlated with cell survival.
RESULTS: (1) Development of a more completely characterized and more useful eukaryotic genetic model (the yeast, S. cerevisiae). (2) Complete description of the types of base-pair changes that are associated with the mutagenic action of the several chemical agents listed above. (3) Improved understanding of DNA damage and repair and of pollutant-induced alterations in the cell replication cycle.
PROJECT MILESTONES: (1) Using yeast model, improve methods for obtaining yeast cycl mutants that are defective in iso-1-cytochrome c Jan. 1976. (2) Using ionizing radiation and other stresses to alter the replicative cycle in mammalian cells, conduct studies of DNA-repair and other properties of post-arrest G-2 cells June 1976 to April 1977. (3) Begin using defined cycl mutants (yeast) with known pathways of reversion for testing the specificity of mutagenic agents Jan. 1977. (4) Develop a reasonably complete model for the organization of DNA in the mammalian chromosome; perform precise analysis of the effects of ionizing radiation on the molecular weight of chromosomal DNA in the mammalian cell 1977-78. (5) Using the yeast model, obtain a more complete description of the action of mutagens by characterizing numerous forward mutations and deducing nucleotide sequences that are stable and immutable in Jan. 1977.

TECHNOLOGY: NUCLEAR/General (5%);GENERAL SCIENCE (95%)
ENERGY CYCLE: ELECTRICITY GENERATION (5%)
POLLUTANTS: ORGANICS (10%);RADIATION (90%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) Using the bacterial virus, coliphage T/sub 4/, as an experimental model, develop a better understanding of how genes are expressed and how the process of expression is controlled. (2) Evaluate the usefulness of the T/sub 4/-E. coli combination as a test or model system for evaluating the response of mammalian cells to environmental agents. (3) Working with molecular model systems, characterize the nature of radiation damage in DNA. (4) Develop a better understanding of how replication is regulated in prokaryotes and eukaryotes and how cell division is affected by environmental agents.
APPROACH: (1) In the coliphage study, use is being made of the biochemical-genetics approach in which T/sub 4/ mutants are produced and characterized in order to deduce the exact intracellular roles of specific genes. (2) Electron spin resonance (ESR) and electron nuclear double resonance (ENDOR) are used to detect free-radical species formed by ionizing radiation in DNA constituents. (3) In order to elucidate mechanisms whereby DNA replication is regulated, experiments are being conducted with E. coli to determine the timing of protein synthesis (incorporation of labeled precursors) and the timing of protein involvement in the replicative process.
RESULTS: (1) Purify and study DNases presumed to be controlled by genes 46, 47, and das of T/sub 4/; show that the product of gene regA is normally bound to ribosomes and, if such proves to be true, purify and characterize the gene product. (2) Complete characterization of free radical products formed in irradiated 3'-cytidylic acid and 5'-deoxycytidylic acid; utilization of this information to devise a general scheme for radiation damage in DNA. (3) Information on identification and function of specific proteins involved in DNA and cell replication of E. coli (prokaryote model) and mouse leukemia cells (eukaryote model).
PROJECT MILESTONES: (1) A significant milestone will be reached by the end of this summer (1976) with the publication of several reports outlining a scheme of radiation damage. (2) Demonstration that genes 46 and 47 of T/sub 4/ coliphage control the structure of DNase involved in recombination June 1977. (3) Delineation of mode of action of the T/sub 4/ das and reg A genes December 1977. (4) Discovery of new T/sub 4/ mutants affected in other regulatory processes December 1977. (5) Significant accomplishments are also expected in the study of factors that regulate the replication of prokaryotes (E. coli) and eukaryotes (mouse leukemia cells). However, it is difficult to make specific predictions and formats of milestones are omitted.

PRINCIPAL INVESTIGATOR: Goldstein, D.A.
ADDRESS: University of Rochester, Medical School, Rochester, NY 14642
AFFILIATION: Rochester Univ., N.Y. (USA). School of Medicine and Dentistry
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Carter, C.E.
TELEPHONE: C(301)353-5468
TYPE OF FUNDING: Contract No.-E(11-1)-3490
77 FUNDING: Energy Research and Development Administration FY77:$246,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: METALS (80%);ORGANICS (20%)
CHARACTER OF STUDY: RESEARCH (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) Elucidate nature of divalent cation bending to membrane surfaces and nature and regulation of divalent cation transport in membrane systems. (2) Elucidate mechanisms by which hormones regulate and other agents impair metabolic function (including membrane transport) in bone cells. (3) Develop mathematical models describing membrane phenomena and function. (4) Develop clearer insights into the manner in which certain toxic metals (including cadmium and mercury) and other chemical agents alter membrane processes and function.
APPROACH: (1) Binding and transport of Ca/sup ++/ and Mg/sup ++/ are being studied in mitochrondria (rat liver) as a model using radiotracer methods in conjunction with spin resonance (EPR) techniques that utilize the Mn/sup ++/ ion as a Ca/sup ++/ analog. (2) Ca/sup ++/ + Mg/sup ++/ - ATPase (from rabbit muscle) is studied as a model for Ca/sup ++/ transport and its relation to muscle contraction. (3) Ca/sup ++/-carriers are isolated from membranes and characterized. (4) Cells isolated from fetal rat bone are studied in suspension, before or after fractionation by centrifugation. (5) Mathematical models are developed in collaborative studies as circumstances may require. (6) Interactions of environmental agents (e.g., Hg/sup ++/, CH/sub 3/HgCl, Cd/sup ++/, Pb/sup ++/, etc.) with membrane structures and accompanying functional alterations are explored using approaches discussed above.
RESULTS: (1) Further characterize divalent cation transport in mitochondria. (2) Test Gorey-Chapman theory of ''diffuse double layers'' for Mn/sup ++/ binding to phospholipids and ion exchange resins. (3) Obtain evidence for or against hypothesis that local anesthetics act by displacing divalent cations from membranes. (4) Determine dose requirements, time course, and cell type selectivity for the action of parathyroid hormone and calcitonin on separate bone cell types. (5) Clarify structure and function of Na/sup +/+K/sup +/-ATPase, Ca/sup ++/ + Mg/sup ++/ - ATPase, Ca/sup ++/-ionophores, and other membrane components essential to transport activity. (6) identify effects of CH/sub 3/HgCl and heavy metals on structure and function of membrane components essential to transport activity.
PROJECT MILESTONES: In view of the basic nature of this research, the work is essentially open-ended and

typically proceeds via a large number of small experimental steps, each of which is important to the success of the study. Hence, it is difficult to identify milestones or decision points and predict their time of occurrence in a meaningful way.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) Generate reliable dose-effect data for mercury and other energy-related pollutants using behavioral base lines in animal models. (2) Evaluate in animal systems the inhalation toxicity of mercury vapor and cinnabar (H/sub 2/S) dust, both singly and in combination. (3) Use animal models to study the toxicity of other airborne substances as well as toxicity associated with the carbon-fluorine bond (e.g., fluoroacetate).
APPROACH: (1) Substances such as methylmercury, lead, or organic solvents are administered to trained animals to produce measurable deficits in performance (vision, tactile response, or counting ability). (2) Standard toxicological procedures are used to study metabolism, tissue dose, response parameters, and pathophysiology in animals exposed to other toxic agents.
RESULTS: (1) Using trained monkeys exposed to low levels of methylmercury, there will be further collection of data on both visual discrimination and count discrimination tasks. New methods of measuring behavioral responses in primates will be developed. (2) Data obtained from the more routine animal testing will better define hazards associated with the inhalation of mercury vapor, the inhalation of fluorospar (alone and in combination with hydrogen fluoride vapor), and exposure to other agents of interest.
PROJECT MILESTONES: (1) The relationship between the brain distribution of mercury and the neurotoxicity displayed by three animal species will be reported in FY 1977. (2) Study of dose-response in rats exposed to fluoroacetate will be completed in July 1977; preliminary microsomal studies to be completed in Dec. 1977. (3) Study of animals exposed to HF+ fluorospar by inhalation should be completed by Jan. 1978.

PROJECT DESCRIPTION: The general services group is a multi-purpose division and provides the following services to the laboratory: administration, microphotography, biostatistics and equipment development and repair. The bio-statistics section is a most important program; more and more it is becoming the centralized data collection center for the intra-laboratory groups and for inter-laboratory (i.e., Davis, Argonne, Battelle, Lovelace, etc.) relationships and communications. The other two sections, microphotography and equipment development and repair, are intra-laboratory organizations and provide services only within this laboratory.
APPROACH: Through following of proper business procedures, to provide the necessary required business administration as requested by the US ERDA. To provide scientific assistance as required in the fields of microphotography, biostatistics and equipment development and repair and the state of the art in each of these fields allows.
RESULTS: The proper services provided by this group will assist in bringing about the results expected in the scientific groups of the laboratory.
PROJECT MILESTONES: (1) Plutonium-toxicity-young adult beagles, low-level study 1984-85. (2) Radium-toxicity-young adult beagles, low-level study 1982. (3) Plutonium-toxicity-puppies-pilot study 1984. (4) Plutonium/radium-toxicity-puppies study designed, not yet implemented. (5) Plutonium/radium-toxicity/biopsy, old adult beagles full implementation by 1979. (6) Radium-228 (mesothorium)-toxicity-young adults finished within 5 years. (7) Thorium-228 (radiothorium)-toxicity-young adults finished within 5 years.

TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: RADIATION/Plutonium and transplutonium element (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This laboratory is involved mainly in studies of the health effects of low levels of radionuclides of the nuclear fuel cycle, Pu-239, Am-241, Cf-249, Cf-252 and other transuranic elements such as curium-243/244 and einsteinium-253 to predict the toxicity of these radionuclides to man.
APPROACH: The conceptual relationship by which the results obtained in beagles can be extrapolated to man is given by the equation: Beagle plutonium-239 toxicity/Beagle radium-226 toxicity approximately Human plutonium-239 toxicity/Human radium-226 toxicity. If the left hand side of the equation and the denominator of the right side are both known, it is theoretically possible to solve for the toxicity of plutonium-239 in man. Other radionuclides may be substituted for plutonium, e.g., americium, californium and others. Likewise, mesothorium may be substituted for radium-226.
RESULTS: The results expected are to have the ability to predict toxicity of nuclides (Pu, Am, Cf, etc.) in man at various ages.
PROJECT MILESTONES: (1) Plutonium-toxicity-young adult beagles, low-level study 1984-1985. (2) Radium-toxicity-young adult beagles, low-level study 1984. (3) Plutonium-toxicity-puppies-pilot study 1982. (4) Plutonium/radium-toxicity-puppies, study designed, not implemented. (5) Plutonium/radium-toxicity/biopsy-old adult beagles, full implementation by 1979. (6) Radium-228 (mesothorium)-toxicity-young adults, finished within 5 years. (7) Thorium-228 (radiothorium)-toxicity-young adults, finished within 5 years.

PROJECT DESCRIPTION: The function of the chemistry group is to determine the retention, distribution (whole body and intra-organ) of the various radionuclides being studied within the laboratory, especially Pu-239.
APPROACH: Studies of the biological endpoints, acute and chronic, which occur following the injection of these various nuclides, will continue.
RESULTS: The principal endpoints are life-shortening and osteogenic sarcomas, with other pathological changes contributing to death in the higher doses. These observed effects are being correlated with the radiation dose.
PROJECT MILESTONES: (1) Plutonium-toxicity-young adult beagles, low-level study 1984-85. (2) Radium-toxicity-young adult beagles, low-level study 1982. PROJECT DESCRIPTION: (1) Evaluation of the retention, distribution and dosimetry of internally deposited radionuclides. (2) Prediction of the radiation risk to humans from occupational and environmental exposure. (3) Safe removal of radionuclides from the body. (4) Assistance to US ERDA and other organizations on questions of the risk to man from radiation, especially plutonium.
APPROACH: (1) Experimental evaluation of the metabolism and dosimetry of internally deposited radionuclides in beagles and mice by total body counting and tissue analysis. (2) Predicting the effect of Pu-239 in man from the observed toxicity of Ra-224 and Ra-226 in man and the ratio of Pu/Ra toxicity in experimental animals. (3) Establish experimentally the optimum dosage and protraction of various decorporation agents (such as Zn-DTPA) in removing toxic metals from the body and the prevention of the redeposition of these elements from lung or wound to bone and liver. (4) Providing current information to US ERDA on the predicted health effects from Pu and other radiation sources to man.
RESULTS: Improved understanding of the metabolism of internally deposited radionuclides and their expected effects on man: in particular, better estimates of Pu risk to bone, liver and lung.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The regulation of two ''branch point'' enzymes, glutamine synthetase and PRPP synthetase, is being examined in normal and neoplastic tissues. Factors responsible for in vitro and in vivo regulation are being characterized, and cell culture systems are used for further definition of cellular and external mediators of the overall control of the enzymes. We are examining the in vitro regulation of purified human erythrocyte adenylate (AMP) deaminase, the specific binding of AMP deaminase to the inner surface of the erythrocyte membrane, and residues on both the enzyme and the membrane responsible for the enzyme-membrane binding. The objectives of the laboratory are to describe, characterize, and compare enzyme regulation in normal and neoplastic cells, to determine the mechanisms whereby such regulation is achieved, and to probe normal membrane function. The results of these studies will provide well defined systems to be used for the screening of potential pollutants as well as the mechanisms by which specific pollutants act both in vivo and in vitro.

APPROACH: The approach to be used in all of the proposed studies is biochemical. Enzymes have been or are being purified to homogeneity for detailed kinetic and structural studies. Antibodies against purified enzymes will be used to study enzyme levels and enzyme protein degradative rates. Human skin fibroblasts and hepatoma cells will be used for more detailed studies of cell regulation. Purified erythrocyte membranes are being used to study the binding of purified human erythrocyte adenylate deaminase.
:SULTS: Glutaminase will be tried to see whether analogous response in glutamine synthetase-specific activity is seen in normal liver and in rat hepatomas in response to the specific deprivation of L-glutamine as is seen in protein starvation of the host animals. Further studies will be done to provide a greater definition of the characteristics of the normal liver cells and hepatomas in short-term cultures, especially as modified by L-glutamine concentration and glucocorticoids in the growth media. We expect that studies on the active transport of L-glutamine will be completed during 1978. We also expect the sequence analysis of the ''active site'' peptide of B. subtilis glutamine synthetase to be completed during 1978. We expect further characterization of isolated adenylated deaminase during 1977. Amino acid analysis, N-terminal amino acid(s) determination, and sedimentation velocity and gel filtration studies at differing salt concentrations will be initiated. Studies characterizing the kinetics of binding of the isolated erythrocyte enzyme to the erythrocyte membrane will be done, and we expect the initial experiments in this area to be completed in 1977. Studies to identify the peptide(s) binding the enzyme to the membrane will be initiated. We anticipate characterizing the binding process of enzyme to the erythrocyte membrane in greater detail. Other enzymes will be tested also to
PROJECT MILESTONES: Glutamine Synthetase: (1) Characterization of enzyme induction process 1/1/77. (2) Measurement of enzyme degradation rate in cultured cells 7/1/77. Adenyate Deaminase: (1) Characterization of enzyme subunit structure 7/1/77. (2) Characterization of enzyme and erythrocyte membrane binding 7/1/77. PRPP Synthetase: (1) Characterization of the effect of purine and pyrimidines on the levels of PRPP synthetase in cultured cells 1/1/77. (2) Characterization of the effect of purine analogs on the levels of PRPP synthetase in cultured cells 7/1/77.

PROJECT DESCRIPTION: To purify the hormone erythropoietin, study its chemical and biological properties, its mechanism of action as the primary inducer of red blood cell formation, to test its clinical effectiveness and to investigate the general problem of blood cell differentiation.
APPROACH: Fractionate the crude proteins of plasma and/or urine to isolate erythropoietin by chromatographic methods. Develop methods for study of red cell differentiation in bone marrow cell cultures. Purify and study other hemopoietic inducing factors.
RESULTS: Isolation in mg. quantities of pure human erythropoietin, determination of chemical and physical properties, determination of usefulness in replacement therapy and understanding of molecular mechanisms of cell differentiation.
PROJECT MILESTONES: (1) September 1976 Purification of human erythropoietin. (2) April 1977 Clinical trial of erythropoietin.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Object: To gain an understanding of the mechanisms whereby organisms (particularly plants) obtain information concerning the state of their environment through the reception of light or of heat. The research is focussed on the earliest events of environmental perception: the sites or materials in the cells which take up the environmental ''signal'' and transform (''transduce'') it into a biochemical ''message'' which ultimately results in the response.
PPROACH: Measurement of the physiological responses of the organism to light (e.g., establishment of an action spectrum) or to heat, to determine characteristics of the particular sensory transducer involved. These characteristics are then used to identify the sensory transducer. An assay has been developed for a photosensory transducer for blue light responses and is now being used to monitor steps in the purification of the photoreceptor pigment. Work is carried out using higher plants as well as ''model''

lower organisms (cellular slime molds).
RESULTS: This work is expected to identify the photo- and thermo-sensory transducers of plants. This information will provide an entry into the mechanism for heat and light detection, and procedures whereby one can control the responses by plants to heat or to light, and thus adapt them to stress conditions, i.e., unusual environment such as can be the consequence of increased energy production and new technologies.
PROJECT MILESTONES: (1) Identification of blue-light receptor in plants FY 1978. (2) Characterization of the heat transducer in slime molds FY 1978.

POLLUTANTS: PARTICULATES (20%);ORGANICS (80%)
CHARACTER OF STUDY: RESEARCH/Laboratory (60%);DEVELOPMENT/Laboratory scale (40%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The broad objectives of this study are to develop the basic science, the investigative methods and the hardware so that the demanding analytical requirements associated with the characterization of organic and inorganic pollutants in effluents from energy generating sources can be met in a viable practical manner. Particular emphasis is devoted to the development of multipollutant analytical concepts and on the determination of ultratrace pollutants. Special attention is being placed on those inorganic and organic pollutants which are or may be emitted from fossil-fueled energy sources and from coal liquefaction and gasification plants. Many of these pollutants are certainly health hazards, and some already identified are proven carcinogens.
APPROACH: Two approaches are utilized. The first involves a critical evaluation of the capability of macroreticular resins in sorbing quantitatively intermediate molecular weight organic compounds as well as polynuclear aromatic hydrocarbons from air at levels from approximately ppb up to 100 ppm. The second approach is focused on the selective energy transfer of energy, from X-ray beams to pollutant molecules of interest followed by optical emission of characteristic radiation. The goal of this study is to devise multipollutant anlytical systems.
RESULTS: (1) Development of reliable techniques for isolating ultratrace amounts of intermediate molecular weight organic compounds, as well as polynuclear aromatic hydrocarbons (PAH) from air samples followed by their quantitation by gas chromatography, mass spectroscopy and other techniques. (2) Development of an analytical system for observation of x-ray excited optical luminescence (XEOL) of PAH's immobilized in Shopol'skii solvents.
PROJECT MILESTONES: (1) 1978 The principal organic vapors emitted from the Ames power plant, which is burning solid waste to provide 20-25 percent of the fuel, will be identified and characterized for a period of a year or more. (2) 1979 The complete analytical system for the observation of the XEOL and time resolved phosphorescence of PAH's immobilized in Shopol'skii solvents should be operational and ready for field applications.

ENERGY CYCLE: PROCESSING, CONVERSION (25%);ELECTRICITY GENERATION (25%);WASTE MANAGEMENT (50%)
POLLUTANTS: NOXIOUS GAS (25%);METALS (25%);PARTICULATES (25%);ORGANICS (25%)
CHARACTER OF STUDY: RESEARCH/Applied (50%);PRODUCTION (50%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Site specific Power plants
APPROACH: The approach in this study is to make use of standard sampling procedures (EPA recommended methods) where feasible and to develop new or modified sampling methods where needed to measure all emissions from the boiler units.
RESULTS: It is expected that if the study shows insignificant changes in power plant emissions when wastes are added to the coal that the technique can be recommended as a desirable method for resource recovery and disposal of solid wastes. A second result expected is a more complete evaluation of coal fired plants with particular emphasis on the emissions of heavy organics.
PROJECT MILESTONES: (1) Jan. 1, 1977 Complete sampling of first traveling grate unit for all gaseous and particulate emissions. (2) Feb. 1, 1977 Results for composition of fuels, ash and all emissions except heavy organics available. Start sampling tangentially fired boiler unit. (3) Jan. 1, 1978 Complete sampling of tangentially fired boiler unit for gaseous and particulate emissions. Results on heavy organics from traveling grate unit available. (4) Feb. 1, 1978 Results of measurements on tangentially fired boiler available except for heavy organics. Preliminary evaluation of relative effectiveness of the

types of boilers for burning solid wastes with coal. Measurements started on large traveling grate unit with emphasis on emission of carcinogens and other heavy organics. (5) Jan. 1, 1979 All currently planned measurements on the three units will be completed and a comparison of data from the two traveling grate units, the tangentially fired unit and the St. Louis facility will be available. A decision will be made with respect to the need for additional data on carcinogens and heavy organics from the power plant and in the surrounding ambient air. (6) Oct. 1, 1979 Project completed and publication of all results unless there is a need for additional carcinogen and heavy organics monitoring.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) By continuing literature survey to monitor plant related problems arising from increases in energy production and costs, and changes in energy technology. (2) General research on metabolic responses of plants subjected to environmental insults (e.g., lack of water). The accumulation of the free amino acid proline, and the value of this activity to the plant will be investigated, proline accumulation being a feature found in many plants subjected to various environmental stresses. (3) Applied work to assemble germ plasm of known field tolerance to environmental stresses (especially drought) and to use this material for developing physiological and biochemical criteria for use as screening tests in selecting stress-resistant plants.
APPROACH: (1) Continuing literature survey. (2) and (3) Determination of levels, formation and fate of proline in plants, comparing stress (drought) sensitive and tolerant varieties and species, under normal and stressed conditions.
RESULTS: (1) Identification of problems related to plant growth and production, arising from increases in energy production and costs and from increasing use of new technologies, in critical need of investigation. (2) Identification and understanding the biochemical mechanisms of stress injury and tolerance, as basis for protecting plants and producing plants resistant to environmental stresses. (3) Development of simple, reliable methods for screening crop plants for stress tolerance.
PROJECT MILESTONES: (1) Assessment of value of proline accumulation as a criterion for drought resistance in wheat, for application to a breeding program aimed at development of high-yielding wheats resistant to a range of environmental stresses Mar. 1978. (2) Completion of assembly and seed multiplication of a range of wheat with defined tolerance to water stress (and salinity and cold stresses) Mar. 1978.

PROJECT DESCRIPTION: To develop a system for monitoring human populations for mutation rates at the protein level; and to develop studies of the same protein indicators of mutation in experimental animal and tissue culture material. The latter should facilitate extrapolation to man of the results of studies on laboratory animals.
APPROACH: For man, placental cord blood samples will be screened for protein variants and appropriate studies performed when a variant is encountered to determine if it is a new mutation. It is expected that this experience will not only contribute to knowledge of spontaneous mutation rates but also provide the basis for decisions regarding the desirability of large scale monitoring programs in the U.S. For experimental animals and cell culture material, mutation rates will be determined in treated and control material.
RESULTS: Data on somatic cell and germinal mutation rates, employing protein indicators, which data should have certain desirable characteristics not possessed by previous data on mutation rates, such as precision of phenotype and end point.
PROJECT MILESTONES: (1) Systems in place Dec., 1976. (2) Substantial data Dec., 1977. (3) 1,000 blood core samples will be collected and analyzed for protein variants and an indication of spontaneous germ cell mutations in human populations September, 1978.

TECHNOLOGY: SOLAR/Biomass (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Monosomics lack a pairing partner in each meiotic cell and genes on an entire chromosome

are present in the hemizygous condition. We have isolated monosomics for chromosomes 1, 2, 3, 4, 6, 7, 8, 9, and 10 in Zea mays utilizing a recently-discovered system. This is the first time that a series of this type has been produced in any diploid form. The monosomics are surprisingly vigorous, good cytological samples can be taken, and crosses made. We are isolating all possible monosomic types and characterizing them by studying (1) the cytology of meiosis, (2) the cytological behavior of monosomic chromosomes, (3) the effect of monosomy on recombination, (4) the frequency and types of spontaneous chromosomal aberrations arising in monosomics, (5) the effect of monosomy on free amino acids in leaves, and (6) the ultrastructure of maize monosomics. By comparing a monosomic with its diploid siblings, one compares one and two copies of all genes on an entire chromosome. If a gene expressing dosage effects resides on the monosomic chromosome, a difference will be found between these plant types. This rationale is the basis for parts 1, 3, 5, and 6.
RESULTS: This study has discovered genetic factors that control meiosis, genetic recombination, lipid biosynthesis, fatty acid biosynthesis, and the free amino acid pool in monosomic leaves. It has also shown that the 5S rRNA template is not necessarily for nucleolar formation; thus, it is not a nucleolar organizing region. It has also shown that ribosomal gene compensation and magnification does not occur at the nucleolar organizing region in maize.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This is a broad study of the effects of radioiodines on the thyroids of animals and man. One aspect deals with the latent effects of this material in the therapy of hyperthyroidism, i.e., thyroid failure and tumor development. The other aspect deals with the dose level which produces tumors in rats. Most attention here is devoted to a relatively low dose range following which the tumors develop. A model seems to be found so that tumors can be expected in a relatively high percentage of animals. The biological implications of these are being explored.

TECHNOLOGY: GENERAL SCIENCE (100%)

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To study and elucidate (1) transport and attachment processes of electrons in biomolecules; (2) mechanism of DNA replication in vitro and in vivo, the effects of ionizing radiation on this process, and eventually the isolation of the replication complex; (3) changes in DNA precursor pool sizes postirradiation and define underlying mechanism(s); and (4) the relationship between protein synthesis and radiation-induced mitotic delay (need for ''mitotic proteins'' or ''recovery proteins'').
APPROACH: The use of (1) 1 MeV pulsed electrons; (2) isolated nuclei and nuclear extracts from a synchronously dividing slime mold; (3) radioactive DNA precursor and the determination of precursor pool sizes and specific activities, with and without irradiation; and (4) correlation of biochemical and cytological events in synchronously dividing sea urchin eggs and in slime mold plasmodia.
RESULTS: (1) ''Design'' of better radiosensitizers and development of high-sensitivity monitoring systems for electrophilic compounds (potential carcinogens); (2) identification and eventual isolation of a DNA replication complex; (3) identification of reasons for decreased efficiency of DNA precursor incorporation in irradiated cells; and (4) definition of effects of ionizing radiation on proteins associated with apparatus and the process of mitosis.
PROJECT MILESTONES: (1) Observation of efficient electron attachment rates to both radiosensitizers and carcinogens; (2) achievement of highly efficient DNA synthesis in vitro (25% of in vivo rate, 15% of genome replicated); (3) partial elucidation of DNA precursor pool effects in irradiated cells; and (4) identification of a new ''marker'' for sensitivity (in terms of mitotic delay) to combined radiation and cycloheximide in late prophase. Our ''Project'' in reality consists of four sub-projects; therefore, the Project Summary (item 93) had to be broken down as four items under each heading. Through an oversight, the ''Milestones'' listed (item 94) are achievements that have occurred (rather than anticipated achievements). In terms of projected milestones, these may be listed as: (1) design of an instrument for determination of extremely low concentrations of organic electrophilic compounds (potential detection of carcinogens in gaseous effluents); (2) identification and/or isolation of a ''replication complex'' from isolated nuclei of a synchronous slime mold; (3) improved means to determine absolute rate of DNA replication from the incorporation of radioactive precursors; and (4) identification of the protein involved in recovery from radiation-induced mitotic delay as either a structural (''mitotic'') protein or an enzyme (''recovery'' protein).
KEYWORDS: RADICAL PRODUCTION;IONIZING RADIATIONS;BIOLOGICAL RADIATION EFFECTS;BIOCHEMICAL REACTION KINETICS;DNA;PROTEINS;BIOSYNTHESIS;MITOTIC DELAY;MITOSIS;BIOCHEMISTRY;CYTOLOGY;ELECTRONS;SEA URCHINS;EGGS;CARCINOGENS;RADIOSENSITIZERS;BIOLOGICAL RECOVERY;ENZYMES

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION/Plutonium toxicity (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Acquire an understanding of mechanisms and processes of translocation and excretion ratios for americium and plutonium from contaminated wounds. Study effects of removal agents on contaminants.
APPROACH: Implant isotopes of interest subdermally. Make routine biochemical and histological samples from the beagles thus injected. Serial sacrifice of 1/2 of population. Divide second group for study of removal agents.
RESULTS: Elucidation of what happens when plutonium and other contaminants enter the body from wounds. Develop a logical method of minimizing or reducing effect of such contamination.
KEYWORDS: PLUTONIUM;AMERICIUM;INJECTION;BEAGLES;TISSUE DISTRIBUTION;EXCRETION;WOUNDS;TOXICITY;PATHOGENESIS

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: ORGANICS/Teratogens (20%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine the extent to which changes in the synthesis of individual serum proteins cause alterations in the growth and development of early embryos observed in response to developmental age, nutrition, teratogens, and genetic factors.
APPROACH: In vitro cultures of intact early chick embryos are used as the test system. Yolk-sacs are isolated from these embryos and incubated with radioactive amino acids to measure serum protein synthesis. To determine the response to serum proteins, individual serum proteins are isolated by column chromatographic and immunological procedures. Intact embryos (chick, rat) and isolated organs (brains and heart) are used to test the response to serum proteins.
RESULTS: Serum proteins are important regulators of growth and development in early embryos. Changes in the synthesis of serum proteins cause some of the deleterious responses of embryos to nutrition, teratogens, and genetic factors.

PROJECT MILESTONES: Serum proteins are important regulators of growth and development in early embryos. The deleterious responses of embryos to nutrition, teratogens and genetic factors are mediated by changes in serum protein synthesis. The molecular mechanisms by which serum proteins act on the embryo are defined. The molecular mechanisms by which nutrition, teratogens, and genetic factors alter serum protein synthesis are defined.
KEYWORDS: PROTEINS;BIOSYNTHESIS;EMBRYOS;CHICKENS;ANIMAL GROWTH;AGE DEPENDENCE;RATS;BLOOD SERUM;BIOLOGICAL EFFECTS;IN VITRO;METABOLISM;TERATOGENESIS

TITLE: Toxicology and Metabolism of Nickel Compounds
PROJECT NUMBER: 006026
PRINCIPAL INVESTIGATOR: Sunderman, F.W. Jr.
ADDRESS: Department of Laboratory Medicine, University of Connecticut School of Medicine, Farmington, CT 06032
AFFILIATION: Connecticut Univ., Farmington (USA). School of Medicine
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Harvey, Elmer B.
TELEPHONE: C(301)376-4678
TYPE OF FUNDING: Contract No.-E(11-1)-3140
77 FUNDING: Energy Research and Development Administration FY77:$101,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: METALS/Nickel (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Freshwater;BIOMES/Marine;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The toxicology and metabolism of nickel compounds (including particularly Ni/sub 3/S/sub 2/, Ni/sub 3/Se/sub 2/, NiSe, NiS, NiCl/sub 2/ and Ni(CO)/sub 4/) are being investigated following administration to mice, rats, hamsters and rabbits. The objectives of these investigations include: (1) elucidation of the mechanisms of nickel toxicity and carcinogenesis; (2) evaluation of the teratogenicity and mutagenicity of nickel compounds; (3) understanding of the nutritional and physiological roles of nickel and of the disturbances of nickel metabolism in pathological conditions; (4) delineation of potential hazards to man and animals from environmental or occupational exposures to nickel compounds, particularly in relationship to nickel exposures from coal-gasification technologies; (5) development of new techniques for identification and measurement of nickel compounds in biological materials and environmental samples; (6) development of new biochemical indices of nickel exposure; and (7) introduction of improved methods for the prevention, detection and therapy of poisoning by nickel compounds.
APPROACH: The procedure involves the study of Ni-63 metabolism following administration of Ni-63(CO)/sub 4/, Ni-63/sub 3/S/sub 2/, and Ni-63Cl/sub 2/ to animals in order to identify (a) the nickel-binding constituents of body fluids, (b) the organ distribution and routes of elimination of Ni-63, and (c) the biochemical alterations which are associated with nickel carcinogenesis. The research also involves (d) evaluations of the teratogenicity and mutagenicity of nickel compounds in animals, and (e) the use of atomic absorption spectrometry to determine Ni-59 concentrations in biological fluids and tissues of normal men and of men who are subject to environmental or occupational exposures to nickel. The test objects and agents include rats, hamsters and rabbits, and blood, urine, feces, hair, sweat, saliva and semen from human subjects.
RESULTS: The expected products of this research are the accomplishment of the objectives that were listed under 93a above. There is currently widespread concern by government, industry and the general public regarding the hazards to human populations from environmental and occupational exposures to nickel compounds. Certain nickel compounds are extremely toxic (e.g., Ni(CO)/sub 4/) and highly carcinogenic (e.g., Ni/sub 3/S/sub 2/), whereas other nickel compounds (e.g., NiCl/sub 2/) are relatively less toxic and are apparently non-carcinogenic. The relevance of this research to national priorities has been enhanced by the recent introduction of nickel catalysts in several industrial processes for gasification of coal.
PROJECT MILESTONES: (1) Investigations have demonstrated the carcinogenicity of Ni(CO)/sub 4/ and Ni/sub 3/S/sub 2/ in rats. (2) Alterations of serum nickel concentrations have been found in common human diseases such as myocardial infarction. (3) Atomic absorption methods have been developed for analysis of nickel in biological materials. (4) Data has been obtained regarding the effects of environmental and occupational exposures upon nickel concentrations in body fluids and excreta. (5) A new chelating agent, triethylenetetramine, has been found to be an effective antidote for acute Ni(II) toxicity in rats.
KEYWORDS: NICKEL COMPOUNDS;TOXICITY;METABOLISM;RATS;HAMSTERS;RABBITS;MAN;CARCINOGENESIS;TERATOGENESIS;NEOPLASMS;CARCINOGENS NICKEL;HEALTH HAZARDS;COAL GASIFICATION;MUTAGENESIS;CHEMICAL ANALYSIS

TITLE: Pathophysiologic Effects of Stable Iodine Used As A Thyroidal Blocking Agent to Reduce Thyroid Radiation Exposure
PROJECT NUMBER: 006027
PRINCIPAL INVESTIGATOR: Becker, D.V.
ADDRESS: Cornell University Medical College, 1300 York Avenue, New York City, NY 10021
AFFILIATION: Cornell Univ., New York (USA). Medical Coll.
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Weyzen, Walter
TELEPHONE: C(301)353-5355
TYPE OF FUNDING: Contract No.-E-(11-1)-3173
77 FUNDING: Energy Research and Development Administration FY77:$30,000
TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION/Gamma (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This study will determine whether iodide-induced thyroid follicular cell necrosis, previously documented in dogs (J. Clin. Endocrin: 36:466 March 1973), occurs in man and will attempt to delineate factors relating to the occurrence of the lesions including susceptibility, size and time of iodine dose required to produce the lesion as well as to define the potentially susceptible population.
APPROACH: Clinical opportunities will be exploited to provide this information in man. Many patients of potential susceptibility receive iodides as part of their general management, i.e., hyperthyroid patients

with rapid iodide turnover and small thyroidal iodine pool, patients prepared for surgery for hyperthyroidism without thionamide antithyroid agents and patients receiving large doses of iodides for various diagnostic and therapeutic purposes. In these patients, the lesion will be searched for by serial measurement of serum thyroglobulin, thyroxine and triodithyroxine (by radioimmunoassay) and late measurements of thyroid autoantibodies. When appropriate, direct examination by light and electron microscopic (including scanning microscopy) procedures will also be carried out.
KEYWORDS: IODINE;BIOLOGICAL EFFECTS;MAN;THYROID;HYPERTHYROIDISM;PATIENTS;DIAGNOSTIC TECHNIQUES;THERAPY;ANIMAL CELLS;NECROSIS;PATHOLOGICAL CHANGES;TOXICITY;DOSE-RESPONSE RELATIONSHIPS

TITLE: Characterization of Biological Membranes by Physical Chemical Methods
PROJECT NUMBER: 006036
PRINCIPAL INVESTIGATOR: Solomon, A.K.
ADDRESS: 25 Shattuck Street, Boston, MA 02115
AFFILIATION: Harvard Medical School, Boston, Mass. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Harvey, Elmer B.
TELEPHONE: C(301)376-4678
TYPE OF FUNDING: Contract No.-E(11-1)-3010
77 FUNDING: Energy Research and Development Administration FY77:$48,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The project is concerned with the structure-function relationship of biological membranes. We plan to determine the three parameters which define the permeation process in human red cells, resealed ghosts and preparations of the human red cell membrane in the normal configuration, called right side out vesicles, and in the inverted configuration, called inside out vesicles. The three parameters are the hydraulic conductivity, the reflection coefficient and the permeability coefficient.
APPROACH: We plan to address these two questions: how do proteins affect the passive flux of water and polar nonelectrolytes, and how does the molecular arrangement of the membrane lipids affect small lipophilic solute permeability. To study the first, we will use specific sulfhydryl and amino group reagents; for the second we will modify membrane cholesterol and use specific phospholipases.
RESULTS: We have made an exact measurement of the dead time of our stop-flow apparatus for measuring red cell swelling. We will use this value in applying our new computer solution which enables us to determine all three permeation parameters in a single series of experiments. We plan to determine the reflection coefficient for urea permeability across the human red cell membrane. We have found that the specific amino group reagent that inhibits anion self-exchange, DIDS, also inhibits water and urea flux across the human red cell membrane, and we will explore the implications of this finding.
PROJECT MILESTONES: We hope that the output of our stop-flow device can be coupled on line to our new PDP 11/34 computer so that the parameters we want to determine can be computed automatically. If we succeed, this will be a milestone.

77 FUNDING: Energy Research and Development Administration FY77:$31,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: RADIATION/Gamma irradiation (2%)
CHARACTER OF STUDY: RESEARCH (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Development of knowledge of mechanisms by which production of platelets by the bone marrow is regulated, and purification of the humoral regulator (thrombopoietin) of platelet production. Many toxins (e.g., irradiation, bacterial endotoxins, some hydrocarbons) produce damage to the bone marrow, with resultant thrombocytopenia and death. Therefore, information about mechanisms of thrombopoiesis and preparation of purified thrombopoietin will potentially allow treatment of a variety of disorders in which there is bone marrow failure.
APPROACH: Currently, animal models in mice and rabbits are being used to study alterations in thrombopoiesis and assay systems have been developed to measure thrombopoiesis and the thrombopoietic effects of agents which either stimulate or depress bone marrow function. Some measurements are based on altered incorporation of the radionuclide, selenomethionine-Se-75, into megakaryocytes and platelets.
RESULTS: We expect to eventually purify thrombopoietin, gain greater understanding of the mechanisms by which megakaryocytes respond to stimuli, and finally to be able to more effectively treat persons whose marrows have been damaged by exposure to a variety of environmental toxins, pollutants, and other hazardous agents.
PROJECT MILESTONES: (1) Partial purification of thrombopoietin. (2) Improved animal models for the study of thrombopoiesis, and evaluation of environmental pollutants and other biohazards that alter thrombopoiesis. (3) Administration of thrombopoietin to appropriate humans with bone marrow depression.
KEYWORDS: BLOOD PLATELETS;BLOOD COAGULATION;BONE MARROW;BLOOD FORMATION;HORMONES;HEMIC DISEASES;SELENIUM 75;TRACER TECHNIQUES;BONE MARROW CELLS;THERAPY;BIOCHEMISTRY;MEDICINE;CHEMICAL EFFLUENTS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The biological effects of radiation are most noticeable in the short and long term effects of cell division. This laboratory has been concerned with genetic regulatory mechanisms which would control the initiation and inhibition of cell division and the effects of radiation on these mechanisms. We have proposed a new hypothesis for the regulation of gene expression which postulates that RNA sequences from degraded functional RNA act as primers for the synthesis of new RNA. Data from experiments on the turnover of ribosomal RNA are consistent with this hypothesis. During the coming year, we will attempt to demonstrate incorporation of labeled oligonucleotide segments as primer RNA in the synthesis of high molecular weight RNA. Small molecular weight degraded RNA fragments will be added to both nuclear and whole cell preparations to test for their ability to stimulate transcription. Recent studies on cell membranes have shown the importance of these structures in cell behavior and transformation. We shall be studying the effect of cell growth, confluence, transformation and x-irradiation on the number and location of insulin receptors. Because of recent evidence that RNA sequence and integrity may be important in genetic stability and transcription, we shall be investigating the effect of x-irradiation on RNA strand breakage and on vasopressin induced radioprotection.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: ORGANICS (10%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To measure and interpret biochemical constituents of animal tissues as the regulated outcome of genetic, age, embryological, physiological and pathological influences. The purpose is to describe the biochemical equivalents of anatomical, pysiological and pathological processes, and ultimately to use these sensitive indices for identification, diagnosis, etc.
APPROACH: Enzymes are measured because they are the most sensitive and varied components, as well as being the functional elements and the products of the cell's genome. Cumulative data matrices of our own determinations and useable ones from the literature are constructed. Numerical analyses by computer programs identify relationships (chemical distances) between the patterns of tissues, from which inferences can be drawn.
RESULTS: The many chemical things known about the body will be integrated into a coherent picture analogous to those in other areas of basic medical science. The theme is genomic, organismic, and environmental regulation of the metabolic machinery of cell-types and therefore of their functions. The highly resolving terms of biochemistry are expected to extend greatly our insight into the dynamic nature of animal tissues as they grow, function and respond to disease.
PROJECT MILESTONES: (1) Inducible enzymes in animals were discovered in 1952. (2) Differentiation of tissues by stepwise inductions of enzymes were discovered in 1968. (3) The first substantial chemical atlas of tissue differences was published in 1972. (4) The chemical similarity of different kinds of cancers and their resemblance to fetal tissues was demonstrated in 1972 (''fetalism'' of neoplasms). (5) Immediate goals are characterization of the chemical nature of cancers for possible diagnostic use; discrimination of cancers from representative normal tissues; and description of the changing genetic programs during normal development.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Establishing the relationship between radiation injury and the malignant transformation of cells and tissues. The ultimate objectives are knowledge of the mechanisms of radiation carcinogenesis and better knowledge of dose-effect relationships. These will permit the establishment of better-documented safety standards for exposure and the determination of synergistic or antagonistic relaticnships between radiation and selected other types of injurious agents encountered in the production and conservation of energy.
APPROACH: The test objects are rats, mice and other rodents. The sources of radiation are chiefly 250 kv x-rays. Leukemia, solid tumors, and other morphologic evidences of tissue damage are used as end indicators of effect. In certain experiments the use of whole body radiation permits establishment of the relative sensitivity to carcinogenesis of the various tissues. Attention is given to the role of hormonal imbalance as a cocarcinogenic factor with radiation. The possible synergistic effect of radiation and a different carcinogen (asbestos) administered intratracheally, intrapleurally and intraperitoneally is being investigated.
RESULTS: Knowledge of the relative sensitivity of different cell and tissue types to known amounts of radiation. More accurate dose-effect data.
PROJECT MILESTONES: (1) September 1, 1976 Completion of study of factors in adrenal cortical tumorigenesis. (2) October 1, 1976 Completion of data analysis on relative tissue sensitivity to carcinogenesis. (3) January 1, 1977 Completion of hormonal level analyses in radiation-induced mammary tumorigenesis. (4) August 1, 1977 First cancers expected in asbestos-radiation carcinogenesis study.

77 FUNDING: Energy Research and Development Administration FY77:$64,000
TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: RADIATION (60%);SPECIFIED OTHER POLLUTANTS/Ultraviolet (40%)
CHARACTER OF STUDY: RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of this research is to establish as quantitatively as possible how various radiolcgic and biologic factors, such as, dose, dose rate, age, other carcinogens, etc. affect the induction of tumors in rat skin after irradiation with various types of radiation. The possible existence of a linear term in the dose response curve, which has great implications in radiation protection, will be studied by means of a multiple dose fractionation schedule.
APPROACH: Recovery for epidermal stem cell survival will be determined as a function of the cell cycle and compared to recovery for tumor induction. The effect of dose rate on tumor induction will be studied within the context of a proposed theoretical model. Chemical sensitization with DNA specific agents, such as, bromodeoxyuridine, will be utilized to determine to what extent the target for oncogenesis resides in the nucleus. The kinetics of DNA repair will be compared to the kinetics of recovery as a possible basis for a mechanistic relationship.
RESULTS: The proposed experiments are expected to produce the following results: a better delineation of the tumor induction dose-response curve and significance of recovery for high and low LET radiation, a clearer idea of the role of cell cycle and nuclear dose in the oncogenic action of radiation, and how extremely low dose rates and age affect the tumor response.
PROJECT MILESTONES: (1) Completion of high LET experiments on Bevalac at Lawrence Radiation Laboratory. (2) Completion cf lcw dose rate irradiations with electrons.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: As in the past, major research efforts propoed by our laboratory are directed toward defining the potential radiological health problems associated with nuclides encountered at the two ends

of the nuclear fuel site, i.e., the mining of uranium ores and possible exposures to actinides during nuclear waste handling, fuel reprocessing or fuel fabrication. Proposed research is directed toward efining those metabolic parameters, i.e., uptake, retention and disposition of the natural long-lived aughters of the U-238 chain, Pb-210 and Po-210 and of the transuranic nuclides, Am, Cm and Pu. oncomitant studies will be carried out in exposed humans with measurable body burdens and in adult and juvenile baboons.
RESULTS: The efficacy of Na/sub 3/DTPA was assessed in decorporation therapy for removing systemic burdens of Am-241 from the primate. Americium-241 is cleared rapidly from the circulation after i.v. injection with less than 10% remaining in the blood after one hour and less than 1% of I.D. after 24 hours. A new method of estimating skeletal burdens of ''bone-seeking'' radionuclides has been developed and tested employing in vivo methods.

PROJECT DESCRIPTION: The objective of the research which is supported by ERDA in the Institute of Biological Sciences is to add to the knowledge of the normal chemistry and physiology of the lens in order to gain a better understanding of the metabolic aberrations that lead to cataract formation.
APPROACH: (1) Investigate the relation between ion transport and aberrations in hydration of the lens leading to swelling and production of cataract. (2) Investigate the changes in electrolytes and hydration levels of the lens and relate them to opacities following short-wave radiation. (3) Measure the key intermediate of the cycle (oxoproline) in the presence and absence of various amino acids by blocking the utilization of the intermediate by specific agents.
RESULTS: (1) Investigate the quantitative significance of the gamma-glutamyl cycle in the lens and its relation to amino acid transport. (2) Study the function of membrane sulfhydryls and glutathione in the transport of rubidium and other cations. (3) Further examine the changes in various biochemical parameters during the formation and reversal of galactose cataract in order to provide an understanding of the mechanism of cataract reversal. (4) Study further the saturation of the Na-K ATPase system responsible for extruding sodium from the lens in relation to lens hydration. (5) Determine those constituents which are needed and those which are toxic for maintenance of lens clarity in culture medium.
PROJECT MILESTONES: (1) Formulation of a mathematical model that describes quantitatively the movement of the alkali metal cations, potassium, rubidium and cesium into and out of the lens. (2) Demonstration that potassium, rubidium, and cesium are actively transported into the lens by a carrier-mediated system similar to or identical with Na-K ATPase, with a single kind of active site. (3) Observation that permeability of the lens for the above mentioned cations is dependent on absorptive rather than frictional forces, i.e., on the anionic field strength of the membrane that limits diffusion. (4) Evidence that glutathione synthesis in galactose cataract is unaffected and is in contrast to the observations in z-ray-induced cataracts where the enzymes of GSH synthesis have been shown to be inhibited.

PROJECT DESCRIPTION: In this project we measure the size and organization of mammalian chromosomal DNA, its breakage and repair following exposure to ionizing radiation, and the effects of such damage and its repair on cells, tissues and organisms (especially man). Molecular studies rely on sedimentation and viscometry using DNA from synchronously and randomly growing mammalian cell cultures. The tissue and animal studies are based on a well defined analog system in the planarian. The molecular basis of differentiation control in tissue maintenance is studied by the use of biochemical methods. In the human radiation studies we have developed a retrospective-prospective epidemiological study of mortality and morbidity of about 6,000 plutonium workers throughout the country.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Our objectives have been to learn more about the morphogenesis of human lung cancer. This is being accomplished in many ways. Our foremost study entails analysis of sputum samples from uranium miners and, by annual study of these samples, identify abnormal sputum metaplastic cells that, when fcllowed for many years, eventually become malignant in a significant number of cases. Second, we are following miners who have carcinoma in situ, determining the length of time it takes these cases to progress into invasive carcinoma. The incidence of specific cell tumor types in the uranium miners is being accumulated for comparisons with carcinoma of the lung in non-miners. Too, and probably most important, we hope to learn more of the process of morphogenesis of cancer of the lung in man.
APPROACH: (1) Continuation of sputum collection and collection of lungs from deceased miners. (2) ''Predictive'' analytical study of sputum samples taken from individual miners over several years. (3) Uranium Miners Lung Study.
RESULTS: (1) Early diagnosis of lung cancer by sputum smears. (2) Many publications of our findings. (3) Manual on Pulmonary Cytology.
PROJECT MILESTONES: (1) Satisfactory technique for preparation of sputum smears. (2) We have proven that carcinoma in situ will remain in that stage for three plus years before becoming invasive.

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (90%);HEAT, THERMAL (10%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To study the effects of potentially toxic agents on the mammalian embryo. A major portion of these investigative efforts involves studying the effects of intrauterine X-irradiation exposure on adult life expectancy and the frequency of adult malignancy. Other radiation embryologic projects include threshold determination for radiation-induced congenital malformations, the mechanisms involved in radiation-induced embryonic death and embryonic malformations, the importance of yolk sac radiation and four other radiation embryology projects using in vivo and in vitro systems.
APPROACH: Pregnant rat and mouse embryos are exposed to X-irradiation at various stages of embryonic development. Biochemical, pathological, immunological, histological and morphologic techniques are used to describe in great detail the quantitative and qualitative aspects of embryonic radiation exposure. Besides laboratory animal experiments, an in vitro embryo culture technique will be used to study the effect of embryotoxic agents during the period of organogenesis. This will permit us to better evaluate the significance of changes in the cultured embryo, since we have an extensive experience with the prognostic implications of pathological findings in the embryo grown in vivo. The data from the human epidemiological study involving diagnostic radiation exposure is obtained from referrals to our research center from all over the ccuntry.
RESULTS: Learn more about the quantitative and qualitative effects of embryonic irradiation at different stages of mammalian gestation with regard to malformations, embryolethality, adult pathology, adult malignancy induction and repair mechanisms. Determination of the importance of dose and dose-rate of X-irradiation upon lethality and malformation thresholds. Learn more about the appropriateness of embryo culture techniques for screening for potentially toxic agents (including radiation). Because of the concern about the exposure of pregnant women to diagnostic irradiation, it is important to confirm the animal experiments in the human which indicate that gross congenital malformations should not be expected in the 5-rad and below range.
PROJECT MILESTONES: Reported findings and contributions of these investigations: (1) Embryonic and fetal growth retardation are intimately associated with malformations produced by radiation. (2) The embryo, while very sensitive to radiation, also has sophisticated repair mechanisms which can prevent the effects of radiation if the dose rate and dose are very low. (3) The preimplantation period of mammalian development is a stage that is resistant to the teratogenic and growth retarding effects of radiation. (4) X-ray exposures below 10 rads have no ability to produce gross malformations in this mammalian embryo. (5) Fractionation cf radiation dose markedly reduces the malforming effects of X-irradiation. (6) Data from these investigations and the associated publications were important in revising the approach to handling the potentially pregnant women who may be exposed to radiation.

TECHNOLOGY: FOSSIL FUEL/General (50%);NUCLEAR/General (50%)
POLLUTANTS: METALS/Strontium;METALS/Lead;METALS/Cadmium (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this investigation are to delineate the molecular mechanism whereby calcium, magnesium, strontium and barium are transported across intestinal membrane. This includes a study of factors which control these processes such as parathyroid hormone and the active form of vitamin D, 1,25-dihydroxyvitamin D/sub 3/. A second objective is to study factors which control the processes whereby pollutants such as lead, cadmium and possibly plutonium are absorbed from small intestine. The ultimate aim is, by understanding the molecular mechanisms which facilitate the absorption of these cations, that methods of preventing absorption can be devised.
APPROACH: Using rats and chicks, factors which are known to stimulate or retard intestinal calcium absorption have been studied for their effect on the biosynthesis of the active form of vitamin D as a possible mechanism whereby they affect intestinal absorption of the cations. To study the molecular events, radioactive 1,25-dihydroxyvitamin D/sub 3/ has been prepared and its subcellular location, and its receptor proteins have been studied and isolated. The subcellular fractions which bind calcium following 1,25-dihydroxyvitamin D/sub 3/ administration have also been studied, revealing the existence of a 220,000 molecular protein in the brush borders of small intestine which facilitate the transport of calcium and presumably other divalent cations. Finally, a study of the factors which affect lead absorption using an in vivo rat model have been initiated. It is now clear that calcium interferes with lead absorption whereas vitamin D enhances the absorption of lead.
RESULTS: We expect by studying the molecular mechanisms whereby the divalent cations are transported and the factors which affect the transport across intestine that procedures and methods for preventing the absorption of unwanted environmental pollutants such as strontium 90, barium, cadmium and lead can be devised.
PROJECT MILESTONES: The project milestones have been a demonstration that vitamin D must be metabolically converted to an active hormone, 1,25-dihydroxyvitamin D/sub 3/, before it stimulates the intestine. The 1,25-dihydroxyvitamin D/sub 3/ was found to bind to a receptor protein and is transferred into the nuclear fraction where it initiates the events responsible for calcium absorption. It has been shown that strontium interferes with calcium absorption by blocking production of 1,25-dihydroxyvitamin D/sub 3/. Other factors such as diphosphonates and lead function in a similar manner. Using in vivo models it has been possible to show that lead absorption is controlled by vitamin D and is inhibited by the presence of calcium. Other important discoveries have been the idea that the parathyroid hormone stimulates intestinal absorption of calcium by stimulating production of 1,25-dihydroxyvitamin D/sub 3/.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Chemical mutagenicity and carcinogenicity are determined by the competition between DNA excision repair and post replication recovery. Since these processes occur to different extents in different species and in different tissues of the same organism, the carcinogenicity of a compound will be determined by the interactions between the processes. We wish to: (1) develop precise and convenient methodologies for the quantitative estimation of these processes in human cells; (2) determine the mechanisms of post replication recovery in human cells, and; (3) determine why a portion of the post replication recovery mechanism is ''error prone'' leading to mutation and possibly to tumor induction.
APPROACH: Development of the benzoylated naphthoylated DEAE cellulose methodology (BND-cellulose) for the estimation of excision repair makes possible the rapid determination of changes in the DNA of a variety of cell types under different experimental conditions. We plan to study the repair capabilities of lymphoblastoid cells and lines to determine the quantitative repair capabilities of human cells for damage induced by specific agents. We plan to adapt the ''nude'' mouse to the growth of lymphoblastoid cell lines in order to permit assay of the repair activity of human cells under approximately in vivo conditions. Since the critical event for mutation/carcinogenesis occurs during post replication recovery, we plan to continue our efforts to isolate intermediates in this process. We have developed a model which supposes that branch migration plays a key role in recovery. We plan to utilize the BND-cellulose methodology to isolate intermediates in post replication repair and to test the predictions of our model.
RESULTS: (1) A quick, inexpensive, precise method for the measurement of DNA excision repair. This methodology should be a useful addition to the armamentarium of screening techniques since it should be applicable to readily obtainable human cellular material. (2) Information about the characteristics of the post replication repair process. This information should make possible the assessment of the precise conditions at which exposure to carcinogens becomes harmful and should permit prediction as to which compounds are likely to be carcinogenic.
PROJECT MILESTONES: Development of a rapid excision repair technique and a methodology for the measurement of individual human excision repair activities for a particular chemical agent.

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective is to elucidate the mechanism of DNA fragmentation after UV irradiation. The damage to DNA by UV irradiation is far in excess of the energy absorbed which indicates that the damage may occur subsequent to irradiation. It has been shown both in E coli and in eukaryotes that methylation of the DNA continues after UV irradiation even though there is no synthesis. We have postulated that there may be endonucleases which cleave the aberrantly methylated DNA. This postulate has been confirmed recently by Dr. Sanford Lacks who has demonstrated the existence of a methyl dependent endonuclease. We are developing inhibitors of DNA methylation with the hope that such inhibitors may protect against radiation damage by preventing aberrant methylation of DNA.
APPROACH: Cells in tissue culture are incubated with putative inhibitors of DNA methylase. Methylation and synthesis of DNA are determined by the use of appropriately labelled metabolites. Mammalian cells are grown in tissue culture, are washed in fresh medium, are re-suspended and the methylase inhibitor is added if it is not UV absorbing. If it is, it is added after irradiation. Aliquots of cells are exposed to increasing dose of UV the usual way. The cells are then incubated for varying periods, viability as well as methyl content are measured the usual way.
RESULTS: We hope to obtain efficient inhibitors of DNA methylases which could be used to protect against radiation damage. We, of course, do not visualize irradiation screening agents. We hope to have inhibitors of DNA methylation which could be administered intravenously after some accidental radiation exposure.
PROJECT MILESTONES: The achievement of a non-toxic inhibitor of DNA methylases.

PROJECT DESCRIPTION: Objectives are to map genes for various cellular RNA components in the chromosome complements of humans, primates, and laboratory animals; to discover the mechanisms whereby iterated genes are maintained at their optimal multiplicity; and to characterize the mammalian phenotypes caused by partial deficiencies of RNA genes.
APPROACH: Various techniques of RNA-DNA and DNA-DNA hybridization are used, including hybridization to chromosomes in situ. Genetic experiments are performed to manipulate the iteration numbers of RNA genes and allow observation of phenotypic effects, and of compensatory changes in multiplicity.
RESULTS: We expect to identify the phenotypic effects of departures from optimal multiplicity of rRNA and 5S RNA genes in humans, and to estimate the frequency of occurrence of such abnormalities. In addition we hope to understand the evolution of the multichromosomal distribution of rRNA genes in higher primates.
PROJECT MILESTONES: First description of a mammalian phenotype caused by partial deficiency of rRNA or 5S RNA genes.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To determine the genetic structure of populations keeping in mind the two, often conflicting, demands made of any species: high individual fitness (largely a problem of developmental genetics) and high population fitness (a matter involving the continuation of the population through a series of fluctuating environments).
APPROACH: The approach has remained constant only in the use of a single experimental organism: Drosophila. Otherwise, through past years, the approach has varied from the study of irradiated populations, of the viability effects of newly induced mutations on both their homozygous and heterozygous carriers, of the ecology of intra- and inter-specific competition, and, very recently, of the fine structure of the scute locus in D. melanogaster. The last study has been prompted by a new model for the control of gene action which has emerged from past studies.
RESULTS: At the moment it seems that the genotypes which lead to the optimal development of individuals consist of dissimilar alleles at many gene loci, an advantage, in a sense never made clear before, of heterozygosity per se. Such genotypes must, of necessity, generate a variety of individuals in any cross-fertilizing population. Rather than constituting a genetic load, however, this variation provides the population with a means for carrying out a systematic and orderly culling of individuals under environmental stress. Such culling is necessary if the population is to avoid periodic pathological overcrowding and subsequent extinction in a capricious environment.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: For the next triennium characterization of mung bean nuclease with respect to its chemical properties and particularly with respect to function is the major task. The investigation of a newly observed action (resembling that of rec BC DNase) of venom phosphodiesterase is our next goal.
APPROACH: Mung bean nuclease has been purified to the stage of homogeneity by several criteria and was characterized as a glycoprotein. If the amount of material allows, we will attempt the sequence. The immediate emphasis, however, will be on the mode of action. In particular, detailed sequence of cleavages on supercoiled DNA is intriguing. Is a nick on one strand sufficient to attack the opposite strand, or is the gap required before a scission occurs. If so, how big a gap.
RESULTS: Mung bean nuclease already found application for removal of single-stranded parts of double-stranded molecules (e.g., sticky ends of lambda phage DNA) and in relaxing supercoil viral DNA. In some respects, it is an intermediate between restriction enzymes and common nuclease. It may hopefully be useful in excising damaged regions of the whole genome.

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION/Ionizing (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Application of physico-chemical techniques to the study of the action of radiation on biochemical and biological systems. Particularly, the application of fast time resolution pulse radiolysis techniques to the study of enzyme systems (hydrolytic and redox); study of radiation damage on biological and biochemical systems at the nucleo-protein level, emphasizing the interaction between the protein and nucleic acid components at low radiation doses of the order of 250 rad. The use of chromatin as the test substance. The development of fast ultra-violet laser flash photolysis techniques to supplement pulse radiolysis in the dynamic investigation of irradiated systems in the microsecond and sub-microsecond region.
RESULTS: Elucidation of consecutive intramolecular radical chain reactions in the radiation interactivation of hydrolytic enzymes, particularly ribonuclease. Development of the technique of pulse radiolysis for the study of biochemical redox processes. The role of divalent sulfur and aromatic amino acids in radiation effects.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Iceland
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This is a continuation of a long term project involving genetic and linking studies of the Icelandic population.
APPROACH: A Genealogical Register has been built up covering the population in the period 1910 to present. And, in progress is transcription of demographic data from parish registers to punch cards in the period 1840-1910. These data yield some 350,000 birth records. The demographic register is gradually being linked up and is being used as a background for various genetical and sociological studies such as: (1) The possible inheritance of breast cancer and association of various types of cancer with blood groups. (2) Thorough investigation of first-cousin marriages in Iceland covering 630 individuals. The inheritance of blood groups are being studied in collaboration with leading European laboratories and clinical data will be investigated.
RESULTS: Mental disorders, intelligence, and population structure have been analyzed and school records have been used for a study of assortative mating. Chromosomal linking in man. Various genetic markers are being investigated such as GBG-types and HL-A.
PROJECT MILESTONES: Almost all mongoloid individuals living in Iceland have been karyotyped and cytotechnical work will continue.
KEYWORDS: ICELAND;HUMAN POPULATIONS;GENETICS

TITLE: Comparative Mutagenesis
PROJECT NUMBER: 006207
PRINCIPAL INVESTIGATOR: Brockman, H.E.
ADDRESS: Department of Biological Sciences, Illinois State University, Normal, IL 61761
AFFILIATION: Illinois State Univ., Normal (USA). Dept. of Biological Sciences
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
TYPE OF FUNDING: Contract No.-E(11-1)-1314;Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$18,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Drugs, pesticides, herbicides, smoking (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Our previous studies at the ad-3 region of Neurospora crassa have shown that the lethal and mutagenic activities of the acridine mustard ICR-170 and of some related ICR-compounds are greater in the absence than in the presence of O/sub 2/. We propose from our studies on the mechanism of the anoxia effect that the intracellular degradation of ICR-170 is dependent on oxidative phosphorylation and hence is less under anoxic than under hypoxic conditions. We have isolated ad-3 mutants induced by ICR-170 in the presence of O/sub 2/ or of N/sub 2/, and we will characterize these mutants in order to determine whether the spectrum of genetic alterations induced by ICR-170 is different in these two groups of mutants. We will also study the mutagenicity of the antibiotic streptonigrin under anoxic and hypoxic conditions. We will continue to study various ICR-compounds in order to determine the effect of different

structural changes on mutagenic activity in the presence and absence of O/sub 2/. We will initiate studies on water samples from a lake that receives runoff from farm land that is exposed to herbicides and insecticides in order to determine whether these samples have mutagenic activity. We also will initiate studies on the possible mutagenic activity of urine from heavy cigarette smokers as compared to nonsmokers.

MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Contracts Management Office, Argonne, IL 60439
MONITOR: Duda, George D.
TELEPHONE: F233-5037
TYPE OF FUNDING: Contract No.-E(11-1)-0790
77 FUNDING: Energy Research and Development Administration FY77:$35,000
TECHNOLOGY: NUCLEAR/General (25%);SOLAR/Biomass (50%);GENERAL SCIENCE (25%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Membrane transport in plants (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine the energy-linked mechanisms by which plants accumulate inorganic and organic solutes. These mechanisms are implicated in the absorption of such pollutants by plants, and serve as the primary control on the entry of pollutants into biological food chains. Cell and organelle membranes are the boundaries where the active transport processes are located, and the objective becomes one of determining how the membranes actively transport the pollutant solutes, and thus what one might do to control the process.
APPROACH: Two systems are being studied. Corn mitochondria are used to explore energy-linked ion transport in a relatively simple membrane-bound organelle. Both influx and efflux transport mechanisms energized by respiration or ATPase are being examined, and considerable progress has been made with inorganic and organic ion transport. The corn root system proves to be one in which we can induce an alteration in the rates and efficiency of ion transport, and much work is being done in measuring cell resistances, cell potentials, H/sup +/- fluxes and ion transport rates as affected by alteration of the root. Models have been devised to account for the energy-linkage, and these are being tested. We are attempting to determine how changes in transport are induced.
RESULTS: We expect to understand how respiratory energy is linked to solute transport in terms of selective carrier proteins. Eventually we should know the basis for selection and carrier operation, and have an understanding of why there is variation in pollutant absorption. This will lead to rational studies on the control of pollutant uptake.
PROJECT MILESTONES: Publication of results of experiments on organic acid transport through mitochondrial membranes; publication of results on investigations of disulfide reducing agents on cell potentials, cell resistance, H/sup +/ and K/sup +/ fluxes in corn roots; publication of results of investigating effects of injury on ATP and other nucleotide levels in corn plants.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Air pollutants (100%)
CHARACTER OF STUDY: RESEARCH/Applied (80%);DEVELOPMENT/Laboratory scale (20%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To plan and construct genetic and chromosomal techniques in mice which will permit the analysis of the mutagenic effects over a major portion of the mouse genome. These systems will be applicable to assessment of mutagenesis of all pollutants or potentially hazardous environmental agent.
APPROACH: To develop chromosomal inversion systems which ''inhibit'' meiotic recombination over a significant portion of the genome so that induced mutations can be tracked in those regions over several generations after exposure or treatment to the potential mutagen. Robertsonian metacentrics will be used in conjunction with induced inversions to tie together a greater portion of the genome in a single test system.
RESULTS: From results obtained so far, we expect to be able to produce a single test system which will analyze at least 15 percent of the mammalian genome for recessive lethals and detrimentals. This test should assess the recessive detrimental and lethal effects for all loci in the region analyzed. Furthermore, lethals induced can be examined with this system for their heterozygous effects, an important but relatively unknown health consequence for mammals including humans.
PROJECT MILESTONES: Within this year two inversions will be combined in a single test system. The application of this system should be underway within two years. Inversions within Robertsonian metacentrics are expected within a year. A system employing two inversions coupled by a Robertsonian metacentric should be in use within three years. Quantitative analysis of mitotic crossing over has not been possible in mammalian tissues heretofore. Initial analysis of mitotic crossing over in mammals using inversions in somatic tissue will be completed within a year.

TITLE: Inborn Anemias in Mice
JECT NUMBER: 006217
NCIPAL INVESTIGATOR: Russell, E.S.
ADDRESS: The Jackson Laboratory, Bar Harbor, ME 04609
AFFILIATION: Jackson Lab., Bar Harbor, Maine (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
TYPE OF FUNDING: Contract No.-E(11-1)-3264;Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$56,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Hereditary anemias of mice are the chief objects of our investigations. They include: three macrocytic anemias, four hemolytic anemias, non-hemolytic microcytic anemia, transitory siderocytic anemia, sex-linked iron-transport anemia, and an auto-immune hemolytic anemia (NZB). New anemias will be analyzed as new mutations appear. In all cases, congenic stocks will be produced to facilitate study of gene action. Analyses of these anemias will continue through: (a) characterization of peripheral blood, (b) determinations of RBC lifespan, (c) studies of iron metabolism, (d) histological and biochemical study of blood-forming tissue, (e) tests of the stem cell component, (f) study of responses to erythyroid stimuli and environmental agents, and (g) transplantation of tissue between individuals of differently affected genotypes.
RESULTS: All 10 hematopoietic mutants under study have now been placed on homogeneous genetic backgrounds. Four anemias involve peripheral cell defects, with reduced RBC lifespan, hypochromia, or abnormal cell size. Of three macrocytic anemias, one (W/W/sup v/) is caused by gene-action within blood-forming cells, and one (S1/S1/sup d/) by gene-action in non-erythyroid surrounding cells with effects imposed upon blood-forming cells.

POLLUTANTS: ORGANICS/Polycyclic aromatic hydrocarbons (50%);RADIATION/Ultraviolet (50%)
CHARACTER OF STUDY: RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To investigate the mechanism for the production and control of chemiluminescence, bioluminescence and Adventitious Chemiluminescence in biological systems. To determine the relationship between the shear-sensitive membrane transducing system for triggering bioluminescence in the dinoflagellates and the regulation of this stimulable system by external ambient light. To characterize the spectral emission in the spontaneous chemiluminescence of cigarette smoke. We have proposed in a theory of the origin of bioluminescence, that adventitious chemiluminescence, the production of excited states incidental to oxygenase reactions not involving the luciferases of bioluminescent organisms, is ubiquitous in aerobic organisms. We have proposed that the metabolic production of the ultimate carcinogenic form of polycyclic aromatic hydrocarbons results in an eta pi* excited state and that all carcinogenic PAH's have common active site geometries and chemical reactions.
RESULTS: We have developed a 6-channel polyspectrometer and a 6-channel relative spectral comparator for measuring low level light emission as well as rapid flashes of chemiluminescence. We have measured the action spectrum for photoinhibition of mechanically stimulable bioluminescence in the dinoflagellate Dissodinium lunula. We are in the process of characterizing and separating the precursors to the spontaneous chemiluminescence of cigarette smoke extracts. We have been able to measure significant spontaneous adventitious chemiluminescence in small samples of saliva and urine.

POLLUTANTS: ORGANICS/PCH (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Future objective: (1) improvement of the current neoplastic transportation system, and (2) advancement in the studies on the chemistry and metabolism of the polycyclic hydrocarbons.
RESULTS: Results: (1) We have established a mammalian cell system (Syrian hamster embryonic fibroblast) which can be used both for neoplastic transformation studies and somatic mutation studies. The system is particularly useful for studying the mechanism of transformation since every cell is potentially a target cell for transformation and a defined exposure of the carcinogen can be established for the system. (2) The chemistry and metabolism of 6-hydroxy-B(a)P and 6-oxo-B(a)P radicals have now been much more thoroughly understood. The biochemical data indicate that 15-20% of the B(a)P metabolism is probably going through the 6-hydroxy-B(a)P pathway in rat liver homogenates. The biological data indicate that the 6-hydroxy-B(a)P can be the candidate of one of the proximate/ultimate carcinogens of B(a)P metabolism. (3) Preliminary experiments involving incorporation of 5-bromodeoxyuridine into the hamster fibroblasts

followed by photoradiation with light at 320 nm indicated that DNA is probably one of the target macromolecules in the cell for transformation. (4) Comparisons of the somatic mutation frequency and the neoplastic transformation frequency induced by the same carcinogen (B(a)P) or mutagen (MNNG) indicated that the genetic target size of the neoplastic transformation may be 100 to 1000 times larger than that for somatic mutation.

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION/UV;RADIATION/X-rays (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Currently, it has become a national policy to pay more attention to improving and preserving the physical environment and thereby promoting the health and welfare of man. Studies on the effects of ionizing radiation exposure on man and his environments have been established as an area of interest and importance. Since it was first discovered by Mueller in 1928, it has been generally acknowledged that x-rays cause mutagenic and lethal effects in biological systems. Despite these possible genetic risks, the clinical use of x-rays has been widespread because of beneficial medical results. Our understanding of the biological effects of ionizing radiation has largely been in terms of physical and biological concepts because assay of radiation damage to cells is generally based on measurements of reproductive inactivation, chromosomal aberration production, unscheduled DNA synthesis, and increased mutation rates. Although these gross changes are easily discerned, the information thus gathered provides little knowledge concerning the threshold intensity or of setting up a radiation standard. Thus, the study of radiation chemistry relevant to biological effects becomes of crucial importance for these purposes as well as for the understanding of the biological effects of ionizing radiation on a molecular level.
APPROACH: Currently, we are using the following five approaches for this study: (1) chemical isolation and characterization of radiation products; (2) mutagenic study with reactive radiation products; (3) chromosomal aberration study with reactive radiation products; (4) radiation sensitization study with reactive radiation products; and (5) near-UV radiation study for the comparison with ionizing radiation.
RESULTS: The understanding of the biological effects of ionizing radiation on a molecular level is our goal. Such information will enable us to set up an ionizing radiation standard for health safety and will make further studies possible in order to devise effective methods for protection against and repair of damage caused by ionizing radiation.
PROJECT MILESTONES: (1) The unambiguous identification of the major radiation product of nucleic acids. (2) A molecular mechanism for the ionizing of radiation induced mutation in vivo has been delineated.

PROJECT DESCRIPTION: The objective of our program is to obtain an understanding of energy conversion in plant photosynthesis, the mechanisms of the photochemical reactions, and the inherent and extraneous factors that determine the yield and efficiency of the process. Generally, the program is a continuation of previous programs.
APPROACH: The behavior of the four O/sub 2/ precursor (''S'') states is being studied as a function of redox potential, O/sub 2/ tension, and ionophores. Rapid and sensitive polarographic techniques are used to detect oxygen exchange. A rapid (less than or equal to msec) pH technique is being used to analyze the kinetics of (1) the release of protons during the O/sub 2/ evolution process, (2) proton translocation across the membrane, an energy storage device coupled to electron transport between the photoacts, and (3) proton translocation in photosynthetic bacteria.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The infection of Bacillus subtilis by bacteriophage PBS2 whose DNA contains uracil instead of thymine will be studied to determine how uracil-DNA is synthesized and functions. [In addition, the mechanism of inhibition of animal cell growth by 5-hydroxymethyldeoxyuridine (a component of bacteriophage phi e DNA) will be determined.]
APPROACH: PBS2 phage-induced enzymes will be isolated and characterized. Specific inhibitions and mutants will be used to study the mechanisms of host versus viral DNA synthesis. In vivo and in vitro systems will be employed to make host and viral DNA containing either uracil or thymine. [Also, C-14-hydroxymethyldeoxyuridine will be administered to cultured animal cells to determine how it affects DNA synthesis.]
RESULTS: New PBS2-induced enzymes will be discovered and characterized to determine how the virus modifies the host's deoxyribonucleotide metabolism to allow the accumulation of dUTP and to prevent the synthesis of dTTP. [Also, we will determine whether hydroxymethyldeoxyuridine blocks DNA synthesis in animal cells by incorporation into the DNA.]
PROJECT MILESTONES: We hope to determine why PBS2 phage DNA uniquely contains uracil, while almost all other DNAs in nature contain thymine. Thus, we may learn why thymine evolved for most DNAs. [Also, we will learn how hydroxymethyldeoxyuridine exerts its cytostatic (and possibly cancerostatic) effects on animal cells.]

CHARACTER OF STUDY: RESEARCH (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The primary objective of the research is to elucidate the etiology and pathogenesis of bovine leukemia.
APPROACH: We have consistently demonstrated C-type particles in mitogen stimulated lymphocyte cultures from leukemic cows and cows with a persistent lymphocytosis. These particles have been concentrated and partially purified by continuous flow, density gradient, ultracentrifugation. Newborn calves and late stage bovine fetuses have been inoculated with these concentrated cell-free preparations. Our current study involves extensive monitoring of these inoculated animals to detect early precancerous changes.
RESULTS: Two of the inoculated fetuses died one month after birth. Both showed identical pathological changes. The cause of death in both cases was severe aplastic anemia. Most of the other inoculated animals show early pre-leukemic changes in their lymphocytes, including the production of C-type particles. We hope to demonstrate induction of the tumor phase of the disease.
PROJECT MILESTONES: A significant project milestone would be the development of the tumor phase of the disease in inoculated animals.

PROJECT DESCRIPTION: This project will investigate the control of lymphocyte growth at the molecular level in response to mitogens, and will include further attempts in elucidating the regulatory mechanisms involved in the coupling of ribosomal protein and rRNA transcription and processing leading to the delivery of cytoplasmic ribosomes. Studies into factors controlling gene readout in these cells will be coupled with the correlative analysis of growth kinetics and lymphocyte surface factors.
APPROACH: To date we have demonstrated that (a) ribonucleoprotein particle synthesis and processing in

lymphocyte nucleoi depend upon continuous delivery of new ribosomal protein; (b) PHA can directly stimulate RNA synthesis of both lymphocyte nuclei and naked chromatin; and (c) we have further characterized the nature of the circulating lymphocytes in patients with chronic lymphocytic leukemia and nodular lymphoma.

PROJECT DESCRIPTION: It is proposed to synthesize certain halogenated nucleoside derivatives that will sensitize neoplastic tissues or appropriate viral infections to the lethal effects of radiation by a specific sensitization of key enzymes of the DNA biosynthetic pathway.
APPROACH: A procedure for the synthesis of the proposed compounds will be developed to attain not only the compound but in adequate amounts. These will be evaluated for their radiation sensitizing effect in purified enzyme systems, in cell cultures and in animal systems.
RESULTS: To date a number of compounds have been prepared which do indeed sensitize specific enzymes to UV-radiation. A newly developed method of synthesis now affords large scale production of 5'-amino analogs of a variety of nucleosides which possess radiation sensitization and antiviral activities.
PROJECT MILESTONES: Development of agents that will sensitize certain disease states to the lethal effects of radiation such as appropriate neoplasms or virus infections.

CHARACTER OF STUDY: RESEARCH/Theoretical (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To understand the fate of mutations in populations subject to natural selection, when many genes are taken into account simultaneously rather than considering each gene in isolation.
APPROACH: Mathematical evaluations, but especially large-scale computer simulation of populations with the full set of forces including mutation, selection, finite population size, associative mating, simulated on digital computers.
PROJECT MILESTONES: Discovery that the entire chromosome must be treated as the unit of selection because of cumulative effect of weak interactions.
KEYWORDS: POPULATIONS;MUTATIONS;MATHEMATICAL MODELS;SIMULATION;BIOLOGICAL EVOLUTION;COMPUTER CODES;DNA;MAN

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Viruses (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The major objective of the proposed research is to investigate the nature of virus-induced cell fusion. Cell fusion is being studied with mutants of the KOS strain of Herpes Simplex Virus Type 1 (HSV-1) which cause cells to fuse in an otherwise normal virus infection. The wild type strain does not cause extensive cell fusion. The use of mutants allows both a genetic and a biochemical study of the fusion process. In the next year we plan to compare the glycosyl transferase and glycosidase enzyme activities in uninfected, wild type infected and syncytia-producing (syn) mutant infected cells; to determine the effect of ammonium chloride, adamantanone and other membrane pertubers on viral functions involving membranes; to determine the effects of membrane perturbing molecules on the physical state of the membrane; to characterize the kinetics of cell fusion in single and mixed infections with wild type and syn mutant viruses for a variety of experimental conditions; and to continue examination of the fusion process by electron microscopy.

RESULTS: Our specific objectives for the coming year are as follows. (1) Comparison of glycosyl transferase and glycosidase enzyme activities in uninfected, wild type infected and syn mutant infected cells. (2) Determination of the effect of NH/sub 4/Cl, adamantanone and other membrane perturbers on viral functions involving membranes. (3) Determination of the effects of membrane-perturbing molecules on the physical state of the membrane. (4) Characterization of the kinetics of cell fusion in single and mixed infections with wild type and syn mutant viruses for a variety of experimental conditions. (5) Examination of cell fusion using electron microscopy.

TYPE OF FUNDING: Contract No.-E(11-1)-3083;Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$23,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: We will investigate the properties, biosynthesis and origins of all the necessary elements directly concerned with mitochondrial protein synthesis. Specifically, we plan to study: (1) the structure and alignments of mitochondrial DNA by analyzing DNA segments produced by restriction endonucleases coupled with rRNA and tRNA hybridization; (2) biosynthesis of mitochondrial tRNA through careful identification of precursor tRNA in mitochondria; (3) properties of the cytoplasmic and mitochondrial synthetases for those tRNA species in mitochondria which are known to be nuclear DNA transcripts; and (4) physico-chemical properties of ribosomal proteins and RNA isolated from mitochondrial ribosomes of Tetrahymena pyriformis.
RESULTS: Mitochondrial DNA of Tetrahymena was shown to be fragmented with Hin and E. coli endonucleases. While Hin produced numerous size fragments, EcoR1 resulted in several large DNA pieces. Tetrahymena mitochondria contain tRNAs of not only mitochondrial DNA transcript but nuclear DNA. The nuclear DNA-transcript tRNA in mitochondria designated ''imported'' tRNA is synthesized in vivo under acriflavin treatments. The imported tRNA may be identified as acriflavin resistant tRNA in acrylamide gels.

TYPE OF FUNDING: Contract No.-E(11-1)-875
77 FUNDING: Energy Research and Development Administration FY77:$30,000
TECHNOLOGY: SOLAR/Biomass (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Freshwater
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The first objective of this basic research program is to elucidate the molecular level mechanisms of the sensitized photooxidation of biological substrates (photodynamic action). This involves studies of the formation, properties, energy and hydrogen/electron transfer capabilities and interactions with amino acids, proteins, purines, and pyrimidines of light-excited photodynamic sensitizers. The second objective is to use photosensitized reactions as a tool in studying structure-function relationships in certain proteins and the role of membrane properties in the photocontrol of the swimming of selected microorganisms.
APPROACH: The molecular level mechanisms are studied by making kinetic studies of the oxygen consumption in photodynamic systems using an oxygen electrode. Reactions of the various light-excited states of photodynamic sensitizers are examined using fluorescence, phosphorescence, and, in particular, flash photolysis techniques. Responses of single cells to light are measured using microbeams of light in conjunction with a recording TV microscope; light responses of populations of microorganisms are measured using a phototaxigraph.
RESULTS: A better understanding of the fundamental mechanisms of energy and electron reactions involved in photosensitized reactions in biomolecules and in photosensitized behavioral responses in cells should result from these studies. These basic results may be useful in developing more sensitive techniques for the photobiological detection and assay of photosensitizing pollutants (such as the array of polycyclic hydrocarbons resulting from coal combustion).
PROJECT MILESTONES: We have partially completed the determination of the relative participation of the major reaction pathways involved in the photooxidation of a variety of biologically important molecules (amino acids, pyrimidines). We are in the process of establishing the importance of different chemical groupings on biological important molecules in determining the susceptibility of the molecule to sensitized photooxidation.

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The two main purposes of these experiments are (1) to determine the RBE for neutrons of different energies in gonial cells of D. melanogaster; and (2) to obtain information on specific locus mutations induced by neutrons in gonia for purposes of interspecies comparisons.
APPROACH: Based on an extensive body of data which exists for 250 kVp x-rays in Drosophila, females are exposed to neutrons of energies in the range 0.22-15 MeV at several dose points. Brooding procedures are used to sample cells irradiated as gonia. X-linked lethal and specific locus mutation tests are conducted. Results are compared with those found after exposure with x-rays wherever comparable.
RESULTS: Results (preliminary) from both tests indicate that of the neutron energies studied (0.68, 2, 6, 15), 0.68 MeV neutrons have the highest RBE followed by 2 or 6, with 15 MeV having the lowest RBE. The X-linked lethal test indicates that 0.68 MeV neutrons have an RBE of 3-4 relative to 250 kVp x-rays. 0.43 and 0.34 MeV neutrons are expected to be similar to 0.68 MeV results.
PROJECT MILESTONES: Quarterly review of existing data is conducted by the principal investigator and scientific personnel to determine experimental direction, i.e., which energy of neutrons and which dose points will be most fruitful to attain the experimental objectives.

AFFILIATION: Wisconsin Univ., Madison (USA)
MONITORING AGENCY: Energy Research and Development Administration, Chicago, Ill. (USA). Chicago Operations Office
DIVISION: Chicago Operations Office
MONITOR: Miller, Harold N.
TELEPHONE: C(312)739-7711
TYPE OF FUNDING: Contract No.-E(11-1)-2001
77 FUNDING: Energy Research and Development Administration FY77:$41,000; National Institutes of Health
TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The aim of our investigation is to develop a mathematical model of the dose-kinetics for sex-linked lethal mutations induced by X-rays in Drosophila oogonia, which is valid for a wide range of doses (20-6000 R).
APPROACH: In weekly experiments young Drosophila females are exposed simultaneously to several X-ray doses. By suitable breeding procedures offspring from irradiated oogonia are obtained. Only one single daughter per treated parent-female is tested further to detect a possible newly arisen sex-linked mutation in the treated (maternal) X-chromosome. Confirmation crosses and extensive progeny counts are made on all suspected lethal cultures.
RESULTS: Our own extensive data do not show linear proportionality but can be fitted to a linear-quadratic equation. If this is a valid model we would predict that equivalent doses will give different yields of mutations when given acutely, as opposed to fractionated or protracted exposures.
PROJECT MILESTONES: Conclusions drawn from our large-scale investigation will contribute to the pool of information on which risk estimates of genetic damage from radiations are based. They will also be of importance for our understanding of radiation damage in respect to chromosome structure and the nature of radiation-induced mutational damage.

77 FUNDING: Energy Research and Development Administration FY77:$21,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The purpose of this research is to study the structure and synthesis of small viruses since such knowledge is important both for control of virus infection and knowledge of protein and nucleic

acid synthesis. In the past it has been useful to study viruses that are easy to handle, but which have properties in common with viruses that are medically or economically important. Probably the viruses now in most need of study are the multi-component viruses, viruses whose genetic information is divided among several nucleic acids. The small plant virus, brome mosaic virus (BMV), is one of the best model multicomponent viruses. The cistronic content of the RNA messages will be determined. The factors controlling synthesis will be sought.
APPROACH: We have a cell-free system from a eukaryotic organism, wheat embryo, that can translate a homologous messenger, BMV RNA, with great fidelity and efficiency. We plan to simplify and to further characterize this system using the BMV RNAs as homologous messengers. We will use the system to determine what messenger information exists in BMV.
RESULTS: It is expected that the results obtained by studying model small plant viruses will be relevant to viruses in general and to the cells in which they are replicated.

77 FUNDING: Energy Research and Development Administration FY77:$30,000
TECHNOLOGY: SOLAR/Biomass (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The R chromosome region in maize is under study with a view to determining the number, kind, and arrangement of the genic and structural components involved in the control of anthocyanin pigmentation. Organization of the region is investigated by analysis of the variation found in cultivated races or that arising in experimental cultures. Variation among races appears to reflect local chromosome structural differentiation, such as small duplications or inversions, as well as genic divergence. Changes arise in culture spontaneously by mutation or intralocus recombination, and are induced in appropriate heterozygotes by paramutation. The classification of intralocus recombinants for outside markers permits recognition and serial ordering of the various R components. Characterization for simultaneous changes in less conventional properties, such as paramutation, permits the corresponding determiners to be spatially ordered relative to the pigmenting elements. Particular attention also is to be given to the following phenomena: interaction between determinants based on local position; suppression by particular R alleles of chlorophyll striping; and the analysis of R mutations not associated with exchange of linked markers.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Characterize the effects of chemical and physical agents on the DNA of living cells, measure the repair of the damage, and assay the consequences, particularly the ability of the cell to survive and the appearance of genetic mutation.
APPROACH: The repair of DNA double-strand breaks is being studied in E. coli, and will be extended to Saccharomyces cerevisiae. The incidence of mutations from agents producing known DNA lesions in lambda bacteriophage and E. coli is being studied in E. coli cells with various defects in repair capabilities.
RESULTS: The aim of this research is an understanding of DNA repair and mutagenesis in simple prokaryotic systems, which can then be used as the basis for understanding these processes in much more complicated human cells.

REGIONS OF INTEREST: BIOMES/Estuarine;GEOGRAPHIC AREAS/Northeast;COASTS/Northeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: We propose to analyze and define the subtle variables which regulate the microbial and micrometazoan assemblages in salt marshes and shallow embayments in the greater New York City metropolitan region. This year we plan to make a comparative assessment of the role of diverse species of marine nematodes and ciliates in the detritus food chain including: mineral cycling and concentration, energy flow, biological half-life, food web complexion, biotic potential and trophic efficiency estimations. Microcosm experiments will be used to evaluate effects of environmental stress including: intense radiation; thermal; heavy metal; organic and petrochemical; as well as in the design and testing of a water quality assay system for near-shore water testing. It is hoped that the identification of the structure-function relationships may help to establish realistic guidelines for more effective use and management of this important habitat which surrounds much of this great city.
APPROACH: With the aforementioned objectives in mind, we have chosen 4 principal areas of the general problem for study this year by the personnel supported by this contract. We expect to make considerable progress in each of the areas, but primary emphasis will be placed on objectives 1-4. Data from one aspect of the work or related projects will be fed into others as soon as it becomes available. (1) Field experiments on transplanted and local natural communities aimed at testing the changes in community structure at a particular location due to: local water quality, heavy metals, organochlorides, and water insoluble fractions of crude petrochemicals. These experiments will be coupled with laboratory and field studies aimed at evaluating the effects such changes will have on energy flow and mineral cycling. (2) Laboratory studies of structured microcosms aimed at evaluating the effects of food quality and patchiness on energy flow, efficiency of secondary production and competition between microherbivores and meioherbivores. (3) Comparative quantitative and qualitative assessment of the role of diverse species of marine nematodes, copepods and ciliates in the detritus food chain of marine marshes including: (a) mineral cycling and concentration, energy flow, biological half-life and trophic efficiency estimation. (b) food web complexion studies and ''special growth factors.'' (c) estimation of biotic potential
RESULTS: Briefly summarized, our long range goals are as follows: (1) Characterize the shallow water marine aufwuchs microbial and meiofaunal community structure in key bays in the greatest New York City metropolitan region, study their changes in time and space, and to make additional comparative characterizations of nearby (less than 300 miles) of less stressed communities. (2) Study the theoretical and realized niches of many of the organisms in the community with the aim of understanding the bases for the huge diversity of species on the same trophic levels and, through these studies, discover and analyze the subtle variables which regulate population structure, succession, energy flow, mineral cycling and information content of the community. (3) Construct, using the above field and laboratory data, small defined microcosms which can be used in predicting and interpreting the changes which take place, or which could take place in the detritus food web and in coastal productivity as the result of inorganic, organic, thermal, herbicide, pesticide or industrial pollution. (4) Develop model microcosms which can be used as bioassay tools for judging water quality in inshore environments in the greater N.Y.C. Region.

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Marine;GEOGRAPHIC AREAS/Site specific Scandinavia;COASTS/Other coasts Baltic;HYDROGRAPHIC AREAS/Other hydrographic areas Baltic
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Purpose of the proposed project is to study the movement and dynamics of transuranic elements in the subarctic environment. Plutonium and americium are generally considered to cause a risk to higher animals and man only via inhalation in general environmental conditions. This is not true in communities based on reindeer economy. The reindeer obtains the bulk of these transuranium elements via fodder (lichen) and reindeer herders an important part of their intake via reindeer liver and meat. This offers a unique opportunity to study a transuranium foodchain in fully natural conditions. Baltic studies will be carried out to have background values of transuranic elements in the hydrospheric foodchains of the Baltic Sea.
APPROACH: Studies of transuranic isotopes Pu-238, Pu-239,240, and Am-241 in lichen, in organs of reindeer and in lung, liver, bone, placenta and teeth of man will be carried out to elucidate absorption, transfer and elimination of these radionuclides in the organisms of the foodchain lichen-reindeer-man. Elk will be analyzed as comparison for reindeer. Sr-90 and Pb-210 will be analyzed in bones as markers of man-made and natural fallout. The same transuranic radionuclides will be analyzed also in marine sediment cores from the Baltic Sea. Age determination of the sediment layers will be made by the Pb-210 method.
RESULTS: The project is expected to give new information on the environmental behavior of these transuranium elements in the subarctic biota, particularly in the foodchain lichen-reindeer-man and in the Baltic Sea in order to make possible evaluation of their biological significance in the future, when their concentrations in the biosphere will increase.
PROJECT MILESTONES: 3-yr. Technical Progress Report prepared May 10, 1976. Proposal for continuation under new title: ''Foodchains of Transuranium Elements in the Subarctic Environment'' proposed for 1976-79.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Proposed research deals with biogeochemical processes that control the distribution and abundances of certain trace metals in Chesapeake Bay water and sediment. During the proposed contract

year, work will continue to develop and perfect analytical techniques for minor elements in interstitial waters with emphasis on Hg, Cd, and Cu. Particular attention will be given to processes that transport these metals across the water-sediment interface and into the overlying waters. Fine grained, slow-settling particles in Bay Waters will be studied to determine what fraction is derived from interstitial waters, and from other sources such as power plant cooling waters or from mine drainage.
APPROACH: Chemical composition of particulate and associated aquatic phases will be determined to study the effects of different sources of metals and minerals (such as coal mine wastes or steam-electric generating plants) on waters and sediments of river, estuarine and marine systems.
RESULTS: Mass emission rates of metals and possibly other waste products released during various parts of fuel (coal) production, combustion, and energy transformation processes.
PROJECT MILESTONES: (1) Oct. 1976 Major element composition of sediments in Upper Chesapeake Bay. (2) Jan. 1977 Completion of first phase reconnaissance of fine grained particulate matter in surface waters of Upper Chesapeake Bay. (3) Jan. 1978 Comparison of selected metals in interstitial waters of sediments with the solid phases and their surface coatings.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This is a study of the dynamics of phytoplankton growth and succession in a natural estuarine system. Our marine station is at the Rhode River on the Chesapeake Bay just south of Annapolis. The study includes: (1) light spectral and nutrient dependent physiology of growth and migration. (2) Relative contributions to the nutrition of herbivores and filter feeders of phytoplankton and detritus. (3) Development of instrumentation, biochemical diagnostic parameters and statistical sampling procedures for modeling the stability of localized plankton ecosystems nutrient, biocide, or thermal loading. New growth over a division cycle is measured in plankton cages containing captured natural samples, replaced in situ, and in pumped water with metered additions. Underwater measurements of absolute spectral scalar irradiance are made seasonally for the Chesapeake Bay and used to obtain ecological photosynthetic efficiencies. (4) Mechanisms of dinoflagellate accumulations into blooms.
RESULTS: The results are summarized in the following publications: (1) Ches. Sci. 13, 282-299 (1972); (2) AIBS Symposium on Plant Physiology (1973) in F.J. Vernberg (ed.) Physiological Adaptation to the Environment; Intext Educ. Pub. N.Y. 1975; (3) Ches. Sci. 15, 185-204 (1974); (4) Ches. Sci. 16, 79-92 (1975); and (5) Proc. 1st International Conference on Toxic Dinoflagellate Blooms, V.R. LoCicero (ed.); Mass. Sci. Tech. Found., Wakefield, Mass. 1975, pp 181-205.

PROJECT DESCRIPTION: (1) Identify the major factors regulating phytoplankton primary productivity during each season in Chesapeake Bay and on the adjacent continental shelf. (2) Determine the effects of potential pollutants from energy technologies now sited on Chesapeake Bay (and its tributaries) on productivity regulation. (3) Determine the effects of heated power plant effluents and cooling tower effluents on bacterial processes in Chesapeake Bay.
APPROACH: Field studies with natural phytoplankton and bacterial populations employing both experimental introduction of selected pollutants (heat, acid, biocides, hydrocarbons, heavy metals) and physiological measurements on natural populations subjected to power plant effluents.
RESULTS: More complete understanding of the impact of energy related technologies on coastal marine and estuarine ecosystems.

Streams
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) The establishment of lower and/or upper thermal limits within the normal stream temperature range of 0-26 degree C, and degree-day (cumulated temperature) relationships for representatives of broad functional ecological groups of stream organisms. (2) Determination of the lability of the thermal control with respect to nutritional differences.
APPROACH: A combination of laboratory and field procedures, particularly involving the use of two large (40 ft. long, 5 ft. wide, 1/2 ft. deep) experimental stream channels with flow, temperature, light and nutrient control. A mini computer facility is almost totally dedicated to data acquisition, management and processing.
RESULTS: Identification of ecological groups of stream organisms that can be used to assess environmental conditions influenced by temperature.

REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Global;HYDROGRAPHIC AREAS/Great Lakes
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: These continuing studies focus on integrated investigations of the qualitative and quantitative cycling of particulate and dissolved organic matter in lakes and the mechanisms controlling this dynamic cycling in eutrophication. Emphasis is placed on the biotic and abiotic sources and fates of dissolved organic matter (DOM), the interactions of DOM in inorganic nutrient cycling, and the relationship of these mechanisms to nutrient physiology and metabolism of phytoplanktonic, sessile algal, macrophytic, and bacterial populations. Experimental evaluation of the regulatory mechanisms of growth and nutrient cycling is yielding quantitative insight into control interactions among (1) the microflora of the pelagial zone, (2) the littoral photosynthetic producer-decomposer complex, and (3) allochthonous inorganic-organic influxes. All parameters are fundamental to determination of the functional regulation of rates of eutrophication.
APPROACH: The studies integrate experimental and in situ analyses of inorganic and organic nutritional-biotic interactions that permit a causal interpretation of control of carbon flux rates in lakes of differing productivities. The investigations further permit a quantitative evaluation or responses of system metabolism to stress parameters such as nutrient loading, and thermal and organic enrichment leading to eutrophication.
RESULTS: See above. (All results are published in the open scientific literature.)

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS

PROJECT DESCRIPTION: The objectives are to determine the environmental factors, primarily chemical, limiting phytoplankton growth in Lake Michigan, to determine the influences of nutrient inputs on phytoplankton and to assess the effects of resulting changes on the Lake Michigan ecosystem.
APPROACH: The approach has been two fold. First, the effects of nutrients, phosphorus, silica and nitrogen, on phytoplankton growth have been assessed experimentally by adding nutrients to lake water with its natural phytoplankton assemblages. Second, data on phytoplankton abundance, species composition and nutrient chemistry have been collected at different locations in the lake so the experimental results can be related to the lake system.
RESULTS: These results are essential for decisions on management of nutrient inputs to the lake. The results are also useful in assessing the relative magnitude of different pollutants and stresses on the ecosystem and in separating man induced and natural changes in the ecosystem.
PROJECT MILESTONES: It has been shown that phosphorus is the major nutrient that is controlling the rate of eutrophication in Lake Michigan. An imbalance of phosphorus in the nutrient inputs to the lake has stimulated the growth of diatoms, resulting in a general decline in concentration of silica. Concentrations of silica in the summer limit diatom growth in some parts of the lake, favoring the growth of blue-green and green algae and contributing to a general decline in water quality. These results have led tc the development of a conceptual model that can be used to assess the rate of eutrophication.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The ultimate objective of our investigations is to evaluate the possible influences of envircnmental changes on the behavior and ecology of wild animals. Our approach has been to develop techniques for monitoring individual animals, mostly by means of radio telemetry. Data on movements and behavicr of these marked animals are then used to develop accurate population monitoring techniques and methods for evaluating environment changes.
APPROACH: Telemetry equipment is being developed to determine position and activity of terrestrial animals and position activity, temperature, and depth of aquatic vertebrates. Investigations are being carried out in three species of tree squirrels, pronghorn antelope, sea otters, and chinook salmon. Emphasis is on aspects of coexistence of the tree squirrels and on population dynamics and movement patterns of the other species.
RESULTS: Current studies on movements, activity and temperature patterns of chinook salmon are being carried out in the Snake River in Washington. an automatic radio tracking system and a computer software system have been developed for obtaining and analyzing ecological and behavioral data on wild animals living under natural conditions. Data have been collected and are being analyzed on coexistence of three species of tree squirrels. Radio telemetry data have been accumulated on sea otter movement in Alaskan waters, and the effects of oil and immobilizing drugs on these animals studied. A telemetry study of pronghorn antelcpe was initiated to document seasonal movements of antelope in Idaho at the Idaho National Engineering Laboratory site.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The amounts, sizes, chemical composition and the sources of the particulate materials utilized by various species of Tintinnida in building a lorica are being determined. Among the ciliated protozoa, the agglutinated Tintinnida have the unique ability to take up mineral particles in the size range of silts and incorporate them into their shells. The ecological significance of such mineral accumulation is twofold: (1) it is a source of biological concentration that could lead to rapid cycling of radionuclides, heavy metals, or other toxic substances from the sediments or water column to the biota; (2) the types and amounts of accumulated particles are expected to be helpful where the loricae are used as biological indicators, e.g., water movements or special environmental perturbations.
APPROACH: Specimens are to be studied from stressed environments for comparisons with others from relatively clean, less perturbed habitats. Included will be specimens from thermally stressed areas, polluted

environments, and an estuary, to determine whether lorica development in these habitats is affected in a way that modifies their mineral burden. Scanning electron microscopy and electron probe analysis are being used extensively in this study. A variety of methods of building loricae have been observed, and the principal types of materials accumulated are being characterized for species in different habitats. Quartz particles are the kinds most commonly found on the loricae of arenaceous tintinnids along the northeastern coast of the U.S.; CaCO/sub 3/ particles were detected agglutinated to specimens collected at Eniwetok. The agglomerated species appear to take up particles randomly; they include both biogenic fragments, such as diatom frustules, protozoan shells, and coccoliths, and non-biogenic grains and flakes, probably quartz.
RESULTS: (1) The amount and the chemical composition of the minerals accumulated by Tintinnida will be determined for species (a) growing in the vicinity of a nuclear reactor effluent, and (b) from a habitat containing high concentrations of metals either sorbed to silt-sized particulate matter, or as particulates themselves. (2) It will be determined if the materials accumulated by agglutinated benthic foraminifera and the planktonic tintinnids are the same in the habitats given in (1) above. (3) It will be determined whether or not temperature is a major factor governing the accumulation of particulate materials by Tintinnida, i.e., if temperature influences the sizes, amounts, or the chemical composition of the particles being accumulated.
PROJECT MILESTONES: (1) The chemical nature of the particulate materials accumulated by protozoa in the vicinity of a nuclear reactor effluent will be identified. (2) The physical, chemical, and biological factors that affect the uptake of particulate substances by protozoa, deemed to be potential hazards to public health, will be determined.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine the principles and mechanisms involved in the movement of metal cations through the soil to the plant root, their absorption by the root and their translocation to the shoot.
APPROACH: The reactions between metals and soil particles that influence their rates of diffusion are investigated. The absorption characteristics of plant roots are evaluated. A mathematical model of the process is developed and a computer program written to define all of the steps involved.
RESULTS: A mathematical model which will include the soil and plant parameter that control the flux of the metal through the soil and into the plant. This model can then be used to predict the effect of growing various plant species on particular soil sites in terms of metal movement from the soil to the plant.
PROJECT MILESTONES: Completion of an adequately tested mathematical model which includes all the principles and mechanisms of metal transport from the soil into the plant.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To define the concentration and distribution of alpha emitters (plutonium, americium and uranium) in carbonate materials from Bikini and Eniwetok Atolls. Samples will include various corals, corralline algae, and marine cements; the resultant data will be interpreted with the hope of defining more precisely the mobility and biogeochemistry of plutonium, americium and uranium in the natural environment.
ROACH: Techniques have been developed in our laboratory to measure the concentration of alpha emitters in the picocurie per gram range and to define the location of the alpha emitters in samples within a few microns based on an alpha-track detection method using cellulose nitrate. The cellulose nitrate detector is placed directly on the sample surface to be analyzed so that the alpha particles can be detected in a manner which allows the source of the alpha particles to be recognized.
RESULTS: An understanding of the precise location of alpha emitters in samples from Bikini and Eniwetok which should lead to a better capability of defining the biogeochemistry of the alpha emitters, especially

plutonium.
PROJECT MILESTONES: As reported in the latest project report (COO-3462-12) concentration levels of alpha emitters ten to 100 times higher than previously measured have been found in a coral Favites virens.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This is a long-term program dealing with the ecology of terrestrial biota on Surtsey Island which was formed during an eruption in 1963, and also the effects of the volcanic activities on Heimaey that took place in January 1973. This study's objectives are to investigate the dispersal of various life forms on Surtsey and the ability of species to colonize its inert volcanic substrate. It is proposed tc continue the study of colonization and spread of the various life forms on Surtsey as well as on the new lava on Heimaey and compare it with the ecosystems on the older islands in the Vestmannaeyjar archipelago. A number of lower and higher plants and animals have established themselves on Surtsey. In 1973 there were 1273 vascular plants on the island. Of these 537 over-wintered and many new plants were found in 1974. Three species of birds have nested on the island, of which the newest addition is the black-tacked gull.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Site specific INEL
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Population ecology of the black-tailed jackrabbit population on a 250-square-mile area in Curlew Valley, Utah has been studied from 1962-1974. In spring 1975 the studies were expanded to include a 450-square-mile portion of the Idaho National Engineering Laboratory. The main objective is to describe observed changes in jackrabbit density in terms of mortality and natality rates, to relate changes in these two parameters to variation in environmental factors, and to integrate the results into a mathematical model describing population change.
APPROACH: Jackrabbit densities are estimated in spring and fall with 160 randomly located 1-mile transects. Natality rates are calculated from litter sizes and littering frequency per female as determined from results of monthly collections and autopsy of adult females. Mortality rates are calculated for the total population from fall-spring, for the adult population from spring-fall, and for the juvenile population from birth-fall census. Prenatal mortality is also estimated from autopsy of pregnant females. Mortality and natality rates are related through mathematical models to coyote/rabbit ratios, rabbit population density, and rodent biomass. Coyote and rodent densities are estimated using trap transects, trapping grids, scat lines and scent-post lines.
RESULTS: Data collections were initiated on (1) controlled experiments to investigate genetic and/or behavioral changes in the jackrabbit population associated with observed high rates of juvenile mortality; (2) field studies to observe the effects of food supply on jackrabbit population dynamics; and (3) habitat preferences of rodents on the Idaho National Engineering Laboratory site.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Investigate mica weathering to vermiculite in relation to retention of radioactive cations of fission origin. Relate adsorption and fixation of 137-Cs/sup +/ to layer charge and steric configuration in crystallographic wedges and of 90-Sr/sup 2+/ adsorption on associated hydrous metal oxides. Trace sources of aerosolic dusts that fix 137-Cs/sup +/, other fission products, and uranium.
APPROACH: Naturally weathered micaceous vermiculites of soils are being tested by saturation with various fixing cations (K/sup +/, Rb/sup +/, Cs/sup +/) and non-fixing control cations (Li/sup +/, Na/sup +/) and measurements of retention are being carried out by beta and gamma ray counting. Hydrous oxides of iron and aluminum, fresh and variously aged to model soils, are being tested for retention of a wide variety of divalent cations common in fission products, applied in trace amounts (10/sup -3/ to 10/sup -7/M). Marker minerals such as quartz, from dusts containing micaceous vermiculite, are being subjected to mass spectrometry of oxygen isotopes and neutron activation analysis for signature trace elements in order to learn the source of the formations and their movement in relation to past climates and possible prediction of the distant future nature of waste product disposal and nuclear plant sites.
RESULTS: Through electron microscopy (and radiochemistry, above), visual and chemical models of soil mineral fixation sites for fission products and transuranium elements are being characterized. Natural and thermal neutron-produced fission particle tracks in micas are being employed as a sensitive analytical measure of uranium concentration in soil minerals and to age-date minerals formed in soils. Evaluation of U ore accumulation processes in micas of soils and sediments is envisioned. Time spans of a few tens of years up to one billion years allow determination of relative stability of geological formations and may assist in evaluating possible reactor sites and disposal sites for waste products, both from nuclear and carbonaceous fuels.
PROJECT MILESTONES: (1) Uranium fixation and accumulation in flaws of micaceous vermiculite in soils during weathering, as model for uranium-ore accumulation and waste retention. (2) Establish sites on minerals where radioactive elements are fixed, for example Cs-137/sup +/ in mica occlusions in kaolinite crystals and Sr-90/sup 2+/ adsorbed on specific sites of iron oxide surfaces where retained and not desorbed by concentrated monovalent salt solutions. (3) Establish meteorological patterns of dust origin and flow in relation to radioactive elements adsorption from the atmosphere from fallout from power plants and bomb testing. Evaluate soil role in fate of stored transuranium and other radioactive fission waste products in relation to the long-range weather and glacial cycles in landscapes on a global basis based on interdisciplinary information accumulating in palynology, ecology, oceanography, agricultural (anthropological) history, and ice/water oxygen isotopic ratios.

PROJECT DESCRIPTION: A long-standing study trying to lay the basis for prediction of the movements, rates and fates of long lived artificial radionuclides introduced into marine environments; this obviously requires clarification of the basic geochemical and biological processes in which they participate. Measurements are made both of soluble tracers like strontium-90 and cesium-137, and of largely particuate tracers like iron-55 and the transuranic nuclides. Samples of water (all depths), aerosols, biota and sediments are analyzed routinely for Sr-90, Cs-137, Fe-55, Pu-238, -239, and -240, and Am-241; in special cases also for Pu-241, Am-242m, Cm-242, Cm-244, and many others, stable element analyses also are made by a wide variety of techniques. Although most of the study refers to fallout nuclides, waste disposal situations and experimental introductions are also studied.
RESULTS: Summarized in 30 reprints within last 17 months, most published or in press; apply to Principal Investigator for bibliography.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: We will continue to measure plutonium and americium radionuclides from fallout in the water, sediments and biota of Lake Ontario; also, we will begin to investigate non-fallout sources of transuranic nuclides in this lake, and in the materials supplied from Lake Erie to the Niagara River fan. In the process of evaluating the significance of the transuranic elements to questions of public health, water quality, and environmental effects, it is important to estimate their trajectories and rates of movement from such point-sources as shore-based nuclear reactors or nuclear fuel services. It is also important to estimate more accurately the rates of back diffusion of transuranics from lake sediments, and to establish the chemistry responsible for this process. A certain number of measurements of strontium 90, cesium 137 or iron 55 have proved very useful in interpreting the distributions of the transuranic elements.
RESULTS: Much detail with regard to the fate, transport and distribution of fallout plutonium and americium in Lake Ontario are contained in two reports. In addition to the measurements of transuranics from fallout sources, the detection of Cm-244 in some sediment cores has pointed to a small but significant input of transuranic elements from non-fallout sources.

PROJECT DESCRIPTION: The objective of our program is to describe and understand the mechanisms controlling the distribution of trace elements in the ocean. A major factor in the distribution of non-conservative species is their interaction with and transfer by particulate phases both biogenic and inorganic. During the coming year, we plan to complete analyses of Pb-210, Po-210 and several stable trace elements on particulate matter and water of samples collected from the Gulf of Maine in January 1975. We will attempt to describe the rate at which trace elements are cycled within a silled basin in the Gulf of Maine. As a further extension of our continental shelf studies we plan to participate in the FLEX 76 program, a major international cooperative effort to study the onset and development of a plankton bloom in the North Sea.
RESULTS: Our studies of Pb-210 and Po-210 in the open ocean on a transect of the Atlantic Ocean at 15 degrees N indicate that excess Pb-210 is consistently present in the surface due to the atmospheric delivery while Po-210 is consistently depleted due to uptake by phytoplankton. Po-210 is being removed from the mixed layer with residence times from 0.17 to .47 yrs and the comparable residence times for Pb-210 are 2-5 years.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Marine;COASTS/Other coasts All
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The role bacteria play in coastal waters will be investigated. The percent of the total biomass composed of bacteria will be defined and the rates of mineralization of organic matter will be determined. The effect of heavy metals and other pollutants on bacteria in coastal waters will be studied. The morphology and physiology of bacteria ranging in diameter from 0.1-0.5 microns will be investigated and new techniques for the in vivo identification of specific bacteria will be developed. In these studies the Limulus amoebocyte lysate, ATP, chlorophyll a, radioisotope and fluorescence techniques will be employed. Studies will be carred on in Cape Cod Bay and the New York Bight.
RESULTS: Techniques have been developed to measure the concentration and distribution of bacteria in oceanic environments. With these techniques it is possible to determine what percent of the total biomass is composed of bacteria. Studies in Buzzards Bay suggest that bacteria comprise over 50% of the biomass and that they utilize 50-90 percent of the energy captured by photosynthetic processes in this marine envircnment.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To understand metal fluxes in the estuarine system. Members of uranium decay series, Mn, Fe and selected trace metals are followed in soil profiles, ground water, streams, estuarine waters and deposits to elucidate sources, sinks and kinetics of transfer.
APPROACH: Systematic studies of major drainage basins (e.g., Susquehanna) and major estuarine systems (e.g., Long Island Sound) involving time series analyses of water samples, particulate materials and sediment cores for uranium and its decay products, Mn, Fe, Cu, Pb, Zn and Cd as well as major elements.
RESULTS: Results, reported as Progress Reports, PhD Theses and scientific papers in journals. A detailed pathway for trace metals in Earth surface agueous systems will be worked out by the detailed analyses described above.
PROJECT MILESTONES: (1) The observation that the mean residence time of metals in streams and estuaries relative tc particulate removal is about 1 day. (2) The observation that bioturbation disturbs the record of man's impact on coastal sediments.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Applied (20%);ANALYTICAL (80%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) Specify recurrent weather regimes causing anomalous energy consumption rates; (2) determine weather effects upon different demands for energy.
APPROACH: (1) Define interannual variability of global circulations and relate these to characteristic U.S. weather patterns by severity; (2) develop physical bases for assessing impacts of weather upon energy demand by end use, and incorporate adaptive consideration of socio-economic factors which influence conservation measures.
RESULTS: (1) A medium- to long-range capability for anticipating those weather changes which produce severe or minimal demands for energy; (2) models for calculating the weather-sensitive requirement for energy, nationally or by distinct geographical region, which can be updated or projected without recourse to historical data as changes in the contributive physical or socio-economic factors occur or are anticipated.
PROJECT MILESTONES: (1) FY 1976 Defined a 24-day winter-season vacillation in atmospheric energy parameters and tied it to behavior of planetary long waves which influence midlatitude weather regimes; defined a midwinter dip in zonal potential energy which is reflected in development of blocking highs that affect North American weather patterns. (2) FY 1976 Develop model for predicting space heating demand for gas in a western high plains rural city. (3) FY 1977 Discover additional interannual variations in global circulation; correlate hemispheric flow patterns with midwinter dip and 24-day vacillation and in turn with characteristic U.S. weather regimes and their severity. (4) FY 1977 Develop model for predicting space-conditioning demand for electricity and gas in rural, suburban and metropolitan areas representative of a major distinct U.S. geographical region.
KEYWORDS: SPACE CONDITIONING;WEATHER SENSITIVITY;ENERGY CONSERVATION;WEATHER;ENERGY DEMAND;ENVIRONMENTAL EFFECTS;SOCIO-ECONOMIC FACTORS;ENERGY;CONSUMPTION RATES

CHARACTER OF STUDY: RESEARCH/Applied (95%);ANALYTICAL (5%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Midwest;HYDROGRAPHIC AREAS/Great Lakes
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Quantitative field measurements are acquired of natural, anthropogenic, and intentionally released tracers processed by clouds and precipitaon, and deposted at the surface. These measurements are interpreted through numerical and empirical models of precipitation scavenging to generalize the results for application to a wide range of energy conversion pollution problems.
APPROACH: Through the use of aircraft, surface instrument networks, upper air measurements, and remote sensing of storms by radar, the 3-dimensional distribution of specific aerosol species is observed and the surface wet and dry deposition is determined. The field measurements are obtained over an area of 4000 km-squared with well defined boundaries for assessment of the areal source contribution to the larger regional airshed.
RESULTS: Lead, cadmium and manganese concentrations vs. particle size distributions measured in and around St. Louis show wide variations both in concentration and the shape of the distribution curves which indicate useful information about the source, human pathological studies and delineation of atmospheric chemical transformations and interactions. Tracer aerosols of indium and lithium released into the updrafts of convective storms are removed with variable efficiency by precipitation scavenging. The temporal and spatial distributions of the deposited tracer indicates cell to cell transport aloft. Similar scavenging efficiencies and deposition patterns were observed for trace metals of anthropogenic origin. From deposition measurement source strength estimates can be made. The effect of the urban area on the planetary boundary layer indicates that the city roughness results in a sizeable convergence and upward motion of the air near the top of the subcloud layer, which, coupled with thermodynamic effects, results in a deeper mixed layer over the city than in the country.
PROJECT MILESTONES: (1) Final report of previous 5-year measurement program prepared for printing 31 March 1977. (2) Preparation for second phase field measurements 31 August 1977. (3) Initialization of second phase field measurements 1 September 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: We are trying to understand the large-scale energy budget of the atmosphere-ocean-cryosphere system with the hope that we may then arrive at rational explanations for the observed changes in the energy budget. There has been much speculation that anthropogenic carbon dioxide, or tropospheric aerosol may, or will soon, influence climate. There has also been much consideration of possible changes of ozone due to anthropogenic effects and the resulting possible changes on ultraviolet radiation received at the ground and on climate. It is desirable to understand in detail the operation of the system as it is presently constituted before one attempts to gauge the influence of potential changes. Our approach has been to study global observations in an effort to gain this understanding.
APPROACH: Study of global data on wind, air, and sea temperature, pressure, moisture, and other trace constituents. Computations of means, variances and covariances, empirical orthogonal representations, and trends. Correlation between results and measurements of total ozone, volcanic eruptions, stratospheric and tropospheric aerosol, and food production in several countries. Computation of radiative heating rates by trace substances, such as carbon dioxide, water vapor and ozone. The data base for atmosphere and ocean has been developed at MIT. The ozone data was obtained from Atmospheric Environment Service, Canada.
RESULTS: The factors controlling mean air temperature over the globe and its variations. The inter-relationship between meteorological parameters and food production, and possibly energy use. The reasons for year to year variations in total ozone. The global transport data may be applied to any other trace substance such as carbon monoxide.
PROJECT MILESTONES: (1) December 1976 Integration of sea and air temperature changes into global set. (2) April 1977 Extension of analysis into near real-time.

SEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
OJECT DESCRIPTION: The objective of this research is the theoretical calculation and interpretation of yields of the initial (''primary'') events in the absorption of various ionizing radiations by matter. These events are equally crucial for the physical, chemical, and biological action of the radiations. The work has started with ''electronic'' radiations (beta, gamma, or X-rays) and a few representative varieties of matter. The first stage for each material is assembly of a complete set of cross sections for all relevant inelastic processes (excitation and ionization) induced in the atoms or molecules by electron impact, at all electron velocities. These are obtained from analysis of optical data (oscillator-strength distributions) and of experimental cross-section determinations, together with theoretical calculation. The electron degradation-spectrum is then calculated. Under current study is the influence of inner shell ionization upon the degradation spectra of electrons. Completion of this task through pilot stage should conclude the contemplated work of this project.
RESULTS: Publications and reports.
PROJECT MILESTONES: Project completed in 1976.

PROJECT DESCRIPTION: Establish improved methods for making large volume (approximately 100 cm/sup 3/) high-purity germanium detectors. Achieve better energy resolution. Identify and eliminate factors which presently limit operating performance. Study effects of hydrogen and annealing procedures.
APPROACH: A new process (Radial Gradient) has been developed for making gamma detectors from high purity germanium. Compatible processing steps are being introduced and measurements of detector performance are being conducted and evaluated in order to determine the advantages of radial gradient coaxial detectors.
RESULTS: Anticipated result is a class of large volume coaxial gamma detectors with improved resolution and reliability, and having an extended range of energy response.
PROJECT MILESTONES: (1) Fabricate coaxial detector. (2) Measure performance. (3) Analyze results. (4) Improve annealing procedures to eliminate hydrogen effects.

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To seek more meaningful and accurate means of measuring radiation fields with reference to possible biological effects caused by such fields particularly in humans. The radiations considered singly and in various combinations include x rays, gamma rays, electrons, neutrons, protons, and pions.
APPROACH: Conducting plastic mixtures which simulate various biological tissues, such as muscle and bone, have been synthesized. These materials are employed in ionization chambers and proportional counters for the accurate measurement of radiation dose. Ionization chamber configurations are studied with respect to practicability and precision in dose measurements. Associated instrumentation including low-noise cables and electrometers as well as measurement procedures are included in the overall study.
RESULTS: New materials which simulate a given biological tissue with respect to a wider range of radiation type and energies and which possess more desirable physical properties are expected products of this project. A greater understanding of present simulating materials and of ionization chambers and measuring techniques can also be anticipated.
PROJECT MILESTONES: Tissue-equivalent (muscle) mixture which more accurately simulate muscle with respect to high energy (greater than 15 MeV) neutrons.
KEYWORDS: DOSIMETRY;X RADIATION;GAMMA RADIATION;ELECTRONS;NEUTRONS;PROTONS;PIONS;RADIATION DOSE DISTRIBUTIONS;TISSUE-EQUIVALENT MATERIALS;PLASTICS;IONIZATION CHAMBERS;PROPORTIONAL COUNTERS;RADIATION DOSES;PERFORMANCE TESTING;NEOPLASMS;MEDICINE;SAFETY;PERSONNEL DOSIMETRY;RADIOTHERAPY;RADIATION PROTECTION

TECHNOLOGY: NUCLEAR/Fission (50%);NUCLEAR/Fusion (50%)
CHARACTER OF STUDY: RESEARCH/Applied (50%);DEVELOPMENT/Laboratory scale (50%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: To develop and apply physical methods of radiation field measurement. Both quantitative and qualitative aspects of complex radiation beams employed for radiobiological experiments and clinical applications are under study. The aim of these investigations is to improve the accuracy and precision of dosimetry and develop advanced dosimetric instrumentation.
APPROACH: Methods of achieving the objectives of this research include the use of a portable tissue equivalent calorimeter developed in our laboratory. In addition, characterization of the neutron beams produced at the Sloan-Kettering cyclotron in terms of neutron energy spectra and microdosimetric parameters is under continuing study in order to determine W values for T.E. gas and g-values for ferrous sulfate.

RESULTS: It is expected that improvements in the accuracy of neutron dosimetry using the portable tissue equivalent calorimeter will result in improving the dosimetric uncertainty of approximately +-6% associated with ionization chamber techniques currently employed to approximately +-2%. The significance of this improvement is relevant to improving the quality of neutron radiotherapy now underway at several centers throughout the United States.
PROJECT MILESTONES: Significant milestones expected in the near future include the completion of construction of an advanced field calorimeter for measurements at high LET radiotherapy centers. Measurements of the thermal defect in tissue equivalent plastic are underway and these data should provide a valuable contribution to calorimetric dosimetry. Determination of W- and G-values using calorimetric and ionometric methods will also prove valuable for the dosimetry of densely ionizing radiation.

CHARACTER OF STUDY: RESEARCH/Laboratory (50%);DEVELOPMENT/Laboratory scale (50%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Our main objective is to explore new techniques of solid state radiation detection. Of particular interest are techniques which may lead to solid state, passive, integrating dosimeters for fast neutrons that can be used in mixed neutron and gamma-ray environments. In addition, techniques for imaging x-rays and neutrons are being studied.
APPROACH: We are investigating thermoluminescent (TL) and thermally stimulated current (TC) phenomena in high purity insulators. Lithium fluoride, alumina gadolinium gallium garnet and high temperature plastic polymers are being studied. Direct neutron interactions, neutron activation reactions and densely ionizing charged particle interactions are determined. X-ray responses are also measured.
RESULTS: We expect to determine some of the processes underlying the operation of solid state radiation dosimeters. From this, we can demonstrate the feasibility of particular dosimeter configurations and delineate the range of practical applications.
PROJECT MILESTONES: (1) Test of thin film alumina TC dosimeters to proton recoil. (2) Composite image of fast neutrons with fluorine activation. (3) Identification of the surface dopant in LiF responsible for the 300 degree C peak. (4) Test of mixed polymer-alumina TC dosimeter.

POLLUTANTS: HEAT, THERMAL (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;HYDROGRAPHIC AREAS/Other hydrographic areas Shallow lakes and streams
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Development of an analytical model of photosynthesis of submerged aquatic vascular plants and terrestrial plants. Light, temperature, pH, inorganic carbon concentration and form, oxygen concentration and flow rate of water past the plants all affect the photosynthetic rate of submerged vascular hydrophytes. Further investigations will be conducted on the optimum conditions for photosynthesis. Additional data on photosynthetic rate will be gathered using a pH-Stat system. Elodea densa will continue to be used until species native to Michigan can be cultivated in quantity.
APPROACH: The photosynthetic response of shoots of Elodea densa is being measured under a variety of environmental conditions, with special emphasis on temperature, light and inorganic carbon concentration. The data thus obtained will be analyzed using equations based on first principle of physics and chemistry in order to develop a physically and chemically valid analysis.
RESULTS: Using the above procedure, a detailed analysis of the response of photosynthesis of aquatic vascular plants to variation in the environment will be produced. The final analysis will indicate the kinds of changes in photosynthesis of aquatic vascular plants which can be caused by changes in the environment. Ability to predict stomatal diffusion resistance will permit better understanding of plant growth in response to changes in environmental factors. It will also permit inclusion of stomatal responses in the overall energy budget of a plant leaf.
PROJECT MILESTONES: (1) Development of an apparatus which controls light, temperature, pH and flow rate and which measures the change in the oxygen level continuously. (2) Measurement of the photosynthesis of

Elodea densa has begun with indications of an interaction between pH and the ionic composition of the water. Light intensity and inorganic carbon concentration studies are the main emphasis at present. A description of the temperature responses of photosynthesis should be completed within a year.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: (1) Anaerobic oxidation of methane and aliphatic hydrocarbons in lake sediments will be studied using 14C-labelled methane and hexadecane. A mechanism for anaerobic oxidation via methyl mercaptan is proposed and has been partially tested. (2) The importance of forests and grassland soils as sources of atmospheric sulfur gases will be tested, using 35S-labeled sulfate. It is proposed that sulfate-reduction to H2S occurs in anaerobic microenvironments in normal soils, the reaction being driven by the large amounts of organic matter present in such soils. On a global basis, it is considered that sulfate reduction in soil may greatly exceed sulfate reduction in water as a source of atmospheric sulfur gases.

MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Duda, George
TELEPHONE: F233-5037
TYPE OF FUNDING: Contract No.-E(11-1)-2223
77 FUNDING: Energy Research and Development Administration FY77:$28,000
TECHNOLOGY: FOSSIL FUEL/General (25%);GENERAL SCIENCE (75%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The effects of membrane structural perturbation induced by a number of semispherical molecules will be investigated. These investigations will concentrate on physiological processes which have a coincident detectable effect on the motion of spin labels. The interrelationship between membrane physical state and cytoplasmic viscosity will be investigated through the technique of using nickel as a paramagnetic line-broadening agent to subtract ESR signals outside membrane-bounded zones. The use and synthesis of N-15 spin labels will be further developed and the general treatment of electron spin exchange and magnetic dipole interactions continue to be developed for the purpose of making nickel more useful and better understood as a line-broadening agent.
APPROACH: Outline of proposed research: (1) synthesis of amphiphilic spin labels; (2) toxicity of these labels to cells; (3) localization of spin label in cell or other preparation; (4) rate spin label crosses membrane preparation; and (5) sensitivity to detection of cell events, especially cell surface events.
RESULTS: In most reports dealing with spin labeled cells or membranes, the spin label probes all membranes in the system. The approach used here is to construct suitable spin labels so that only a part of the cell is labeled. Such spin labels should also be well characterized. The present approach represents an extension and refinement of the spin label techniques and deals with the development of a new class of spin labels that probe only the surfaces of membrane-bounded enclosures.

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Laser flash photolysis will be carried out on small peptides and enzymes, emphasizing the significance of photoelectron generation. The decay of photoelectrons will be investigated in detail,

based on current work indicative of non-homogeneous "spur" reactions. Our recent extension of diffusion theory to small reactive species generated external to biological targets will be applied to ionizing and photodynamic irradiations of cell suspensions. The latter will emphasize singlet oxygen damage to S. cerevisiae sensitized by dye and psoralen sensitizers. A new spin label technique will be explored in which the attack of singlet oxygen on a nitroxide precursor generates the probe within the membrane. Flash photolysis and fluorescence studies of psoralen sensitizers will be continued, directed towards identifying the initial photochemical stages of biological sensitization.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The objectives of this research include the development, test, and evaluation of a spectrometer for measuring neutrons in the energy region from a few MeV to several hundred MeV, and the demonstration and utilization of this instrument in applications pertinent to ERDA programs. In the forthcoming year, we propose (1) to develop the capability for utilizing the spectrometer as an on-line neutron beam monitor, and (2) to demonstrate the feasibility of utilizing the spectrometer to measure neutron spectra at particle accelerators with low duty cycles such as the Los Alamos Meson Physics Facility (LAMPF). To demonstrate this feasibility, we propose to measure the neutron spectrum from the main beam stop at LAMPF. As time and resources permit, we plan to pursue additional measurements relating to ERDA programs.

TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: RADIATION/Gamma radiation;RADIATION/Effects on plants (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Site specific Rhinelander, WI
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) To determine the effects of ionizing radiation on the tree flora of two forest types and their interviewing ecotone (i.e., zone of transition). (2) To elucidate patterns of succession (recovery) in the tree flora. (3) To determine the relation of foliage production and tree basal area and to relate foliage production to degree of forest disturbance.
APPROACH: A 10,000 Ci source of Cs-137 was used to irradiate the forest near Rhinelander, Wisconsin (during the growing season). Fine belt transects concentric to the radiation source at 10, 20, 30, 40, and 50 meters have been used annually to record changes in the tree flora. Seedlings, saplings, and mature trees are recorded by species. Annual collections of leaf litter are made along each transect immediately following leaf fall in October.
RESULTS: The short term effects of radiation have been decribed. Most trees were killed to 20 meters from the source. We are now studying the pattern of tree seedling reinversion of the irradiated (destroyed) forest area. We are finding that competition from weed species is slowing the rate of re-establishment by trees.
PROJECT MILESTONES: (1) Irradiation occurred during the summer of 1972. (2) Two papers have been published concerning preirradiation conditions with regard to trees, saplings, and seedlings, and also leaf litter production. (3) A third paper on short term radiation effects, and recovery patterns, is presently in press.

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: We expect to determine the basic mechanisms for ionizing radiation damage to biomolecules using substituted pyrimidines as a model system analogous to naturally occurring nucleic acids in genetic material.
APPROACH: The structures of free radicals produced by ionizing radiation damage are determined by Electron Spin Resonance Spectroscopy. A comparison is made of the types of alteration arising from similar molecular structures in a variety of crystalline environments.
RESULTS: The synthesis of our data with that of others is expected to lead to general mechanisms of biomolecular radiation damage that will apply to a variety of molecular structures.
PROJECT MILESTONES: Results are regularly published in the scientific literature.

PROJECT DESCRIPTION: To gain a better understanding of the mechanisms of wound healing in the tissues of the eye. The response to physical and chemical injuries are under study. The means by which eye tissues are able to restore themselves (regenerate) following damage are being studied in vivo, and in isolated ocular tissues maintained in organ culture. To establish a basis upon which means of amelioration can be developed.
APPROACH: The eye is exposed to physical or chemical forms of injury. Changes in cellular ultrastructure, and cell-to-cell interrelationships, are studied, utilizing transmission and scanning electron microscopy. Macromolecular synthesis and cellular proliferation are analyzed utilizing autoradiographic and cytochemical techniques.
RESULTS: A better understanding of some of the basic mechanisms of wound healing in tissues of the eye, and the way in which various physical and chemical factors of the environment can cause tissue injury, and the possible means of preventing injury or promoting recovery.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The proposed program is an effort to uncover regulators of protein synthesis in living

systems. It is hoped that a deeper understanding of the mechanisms by which such regulation is accomplished in normal cells will lead to a better perception of the aberrations which lead to the deficient protein synthesis associated with radiation damage, and the excessive protein synthesis of neoplasia.
PROACH: Our current studies consist of several somewhat related approaches: (1) A search for the effect of Ap_4A and unidentified new nucleotides on growth regulation; (2) A search for new regulators of translation in a cell-free system; (3) A search for regulation of protein synthesis in E. coli, with mutant aminoacyl tRNA synthetases; and (4) Development of a chemical sequencing technique that will facilitate sequencing of mRNAs, particularly oncogenic viral messenger RNAs.
RESULTS: This study is an interwoven effort of members of these laboratories to study details of the mechanism of protein synthesis in normal living systems. Such investigations are hopefully basic to an understanding of the aberrations of protein synthesis which accompany radiation damage and carcinogenesis.
PROJECT MILESTONES: This study is an interwoven effort of members of these laboratories to study details of the mechanism of protein synthesis in normal living systems. Such investigations are hopefully basic to an understanding of the aberrations of protein synthesis which accompany radiation damage and carcinogenesis.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To provide knowledge relating the architecture of cellular membranes to their role in modulating cell behavior and in regulating the transport of molecules into and out of cells.
APPROACH: The structure and organization of biological membranes will be studied using a variety of physical and biochemical techniques together with electron microscopy and freeze-etching. The human red blood cell will serve as a model system in which to develop new covalent labelling techniques that will identify specific transmembrane proteins in freeze-fractured replicas with precision sufficient to specify how these proteins are distributed and associated with each other in the plane of the membrane and how such associations are altered in response to environmental and physiological perturbants.
RESULTS: Evidence has been obtained that freeze-etching fractures biological membranes in a hydrophobic region which splits the membrane into halves. Morphological, biochemical and biophysical approaches have been combined to probe structure and heterogeneity within human erythrocyte membranes. Labelling methods to assess a novel combination of freeze fracture and autoradiographic techniques have been perfected.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECT
PROJECT DESCRIPTION: This research project proposes mechanisms for radiation damage in DNA by radiation produced radicals and details a series of experiments utilizing electron spin resonance (ESR) spectroscopy to test the proposed mechanisms.
APPROACH: Studies are along the following lines: (1) The production and reaction of the positive and negative ions of DNA components and DNA. (2) Spin Trapping Experiments on DNA. (3) gamma-irradiation studies of frozen concentrated aqueous solutions of DNA components and DNA.
RESULTS: We expect to elucidate various mechanisms for radiation damage in DNA, specifically the role of ion radicals.
PROJECT MILESTONES: Thus far we have found that: (1) Thymine anion protonated at position 6. (2) Thymine cation deprotonates at the methyl group. (3) Electron transfer in DNA is such as to localize the electron on thymine. (4) The cation in DNA is localized on guanine.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: Develop portable system for rapid sample preparation and analysis of lead in low-volume blood samples.
APPROACH: Develop method to rapidly produce toroidal-shaped dried blood sample from less than 0.5 cc whole blood. Develop small 4 mm diameter radioisotope x-ray excitation source to use with toroidal blood sample. Develop XRF system, including detector and fluorescent x-ray energy spectrometer, to give optimum sample-source-detector geometry and counting statistics to permit the analysis of down to 0.2 ppM of lead in blood within a measurement time of 10 minutes.
RESULTS: The objectives of the R and D approach have been achieved. The system has been shown to have potential application to the rapid multielement analysis of trace pollutants in biological and environmental samples in addition to blood. The system was effectively applied to the NYUMC problem of measuring zinc in baboon blood.
PROJECT MILESTONES: The lead-in-blood project has been completed. A new proposal is expected related to multielement analysis in biological and environmental samples using basic techniques developed under this contract.

TECHNOLOGY: FOSSIL FUEL/Coal (100%)
POLLUTANTS: NOXIOUS GAS/Sulfur dioxide;NOXIOUS GAS/Hydrogen sulfide;NOXIOUS GAS/Nitrogen oxides (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) To study the ability of soils to sorb important air pollutants and to assess the potential of soil for purification of polluted air. (2) To determine the factors affecting sorption of pollutant gases by soils and to study the mechanisms of pollutant gas sorption by soils.
APPROACH: The soils used will be selected to obtain a wide range in properties, including pH, texture, organic-matter content, and cation-exchange capacity. The pollutant gases will include major air pollutants generated by combustion of fossil fuels or by microbial transformations of sulfur and nitrogen compounds in soils and natural waters (SO/sub 2/, H/sub 2/S, NO, NO/sub 2/, etc.). Sorption of pollutant gases by soils will be studied by performing appropriate soil and gas analyses before and after exposure of air-dry and moist soils to air containing different levels of these gases. Static and flow systems will be used, and gas analyses will be performed by gas chromatographic techniques.
RESULTS: Results will permit assessment of the ability of soils to sorb pollutant gases and indicate (a) soil properties affecting the rate and extent of sorption of different gases and (b) the mechanisms of sorption of nitrogen and sulfur gases by soils.
PROJECT MILESTONES: Interim reports distributed. The importance of soil as a sink for gaseous atmospheric pollutants and the need for reassessment of the role of soils in the atmospheric nitrogen and sulfur cycles will be demonstrated.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To evaluate the influence of soil freezing and thawing on soil surface characteristics which are influential on wind erosion and dust transport.
APPROACH: (1) Field monitoring of frost effects on soil surfaces at Rocky Flats. (2) Field mapping of soil units for frost susceptibility. (3) Laboratory experimentation on soils from Rocky Flats to evaluate susceptibility to different forms of ground ice.
RESULTS: (1) An evaluation (map) of the susceptibility of soils on Rocky Flats to frost induced changes in surface structure which might lead to later wind erosion of surface material. (2) An evaluation of frequency with which such events occur naturally at Rocky Flats. (3) An estimate of the amounts of surface material capable of being eroded from the soil surface by such influences.
PROJECT MILESTONES: (1) Computer and Laboratory simulation of soil freezing events and their influence on soil surface characteristics. (2) Occurrence of an ''ideal cycle'' under natural conditions. This would involve sequentially, snowfall, drifting, diurnal freeze-thaw and then relatively high wind speeds. Very unlikely. (3) Statistical fitting of results from test site to longer term records from Rocky Flats Plant. (4) Production of a soil-frost map for Rocky Flats area. (5) Production of a snow-drift map for same area.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine quantitatively some of the mechanisms by which fish, alligators, and turtles adjust to thermal stress in their natural environment.
APPROACH: To construct mathematical models to describe the thermoregulation of these animals in their aquatic habitats and to test these predictive models by laboratory experiments and field studies. Climate spaces will be determined for these organisms and then tested. Field studies will be conducted at the Savannah River Ecology Laboratory.
RESULTS: Upon completion of this study we will be better able to predict the response of these animals to thermal effluents from steam and nuclear power plants. In addition, a model will be developed for the study of the effects of environmental alterations on the biology of affected organisms. If this procedure proves effective it can reduce the difficulty of dealing with complex environmental effects of energy activities in the future.
PROJECT MILESTONES: (1) Completion of steady state climate space for alligator July 74. (2) Laboratory testing of same July 76. (3) Completion of steady state model of fish climate space July 76. (4) Completion of steady state climate space for turtle July 76. (5) Testing steady state model of fish July 77. (6) Testing steady state model for turtle December 77. (7) First manuscript on field studies of turtles at the Savannah River Ecology Laboratory July 77. (8) Testing transient model for alligators June 78. (9) Develop time dependent model for turtles June 78. (10) Develop time dependent model for fish June 78.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: This research will investigate the meteorological and topographical factors for the dispersion and transport of pollutants in valleys and terrains of the western United States. Field

experiments on turbulent dispersion of pollutants in the planetary boundary layer in valleys will be conducted, and models for turbulent diffusion will be constructed. This research will provide information which is essential in the establishment of optimum site selections for oil shale plants in mountain-valley terrains of the western United States.
APPROACH: (1) Field experiments on diffusion of pollutants in mountain-valley terrains will be conducted. (2) Models for turbulent diffusion in mountain-valley terrain will be constructed for this investigation. (3) Analyses of diffusion characteristics in the planetary boundary layer will be made. (4) Analyses of the mean and turbulent motions in the planetary boundary layer in mountain-valley terrains will be made.
RESULTS: Airborne experiments with SO2 in mountain-valley terrains indicate that the effect of mountains is to increase the turbulent intensity, therefore, EDDY diffusivity. Turbulent diffusivity in the planetary boundary layer was found to be largest near mountains and decreased toward the center of the valley. The along-wind component of the turbulent diffusivity in the PBL was about six times the lateral component.
PROJECT MILESTONES: Additional full experiments will be conducted in the Salt Lake Valley.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objectives of this research are to characterize the environmental effects of evaporative cooling tower plumes. This involves obtaining a variety of field data around the Keystone-Connemaugh power plant in SW Pennsylvania such as: (a) plant operating conditions as an input to a plant energy balance model to specify the tower as a source of heat and moisture for plume model validation studies; (b) temperature and droplet concentrations inside towers to relate environmental effects to tower characteristics; (., aircraft turbulence measurements of temperature, water vapor and vertical velocity inside plumes for tests of plume model predictions and a better understanding of plume behavior; (d) surface based Doppler Sodar measurements; (e) drift-drop size distribution measurements in plumes; (f) measurements of aerosol size distributions, particle identification and SO2 in merging stack and cooling tower plumes to define the sulfur balance in this region and predict deposition of sulate; (g) measurement of ambient conditions from the surface to 10,000 feet altitude to provide background information for models.
APPROACH: (1) Measurements within cooling tower. (2) Ground based measurements such as with the Sodar equipment. (3) Use of instrumented aircraft for plume measuremnts of temperature, velocities, drift particle size, and SO2 concentration.
RESULTS: (a) Published plume data from over 20 flights and over 200 plume aircraft. (b) Measurements of plume drift drop size distributions as a function of distance from the tower and some model estimates of salt deposition. (c) Elucidation of two critical and competing mechanisms for the formation of sulfate in merging stack and cooling tower plumes. (d) The first continuous measurements of turbulence (temperature structure constant) in plumes from ground based sodar and demonstration of desirability of this approach. (e) The first latent heat flux measurements in a cooling tower plume. (f) Detailed plant energy balance model for Keystone Power Plant. (g) Sensitivity testing on one-dimensional plume modal.
PROJECT MILESTONES: (1) Publication of volume on measurements of plume and associated meteorological data for 20 flights. (2) Completion of measurements on cooling tower plume at Keystone-Connemaugh complex. (3) Complete and publish analysis of Keystone-Connemaugh plume measurements.

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Marine
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The overall objective of the project is to establish the extent that technetium-99 is retained by soils and taken up by plants. This involves the following two more specific objectives: (1) to determine the extent that Tc-99 is retained by specific soils and soil materials and the relative contributions of ion-exchange, precipitation/coprecipitation, chelation or other sorbing mechanisms on soil retention, and (2) to determine the extent that Tc-99 is taken up by plants from both true solution and soil systems and its distribution within the plant.
APPROACH: The extent that Tc-99 is adsorbed from solution by soils will be determined by equilibrating aqueous solutions containing Tc-99 in the form of TcO/sup -//sub 4/ with a given quantity of soil and determining the reduction of Tc-99 in solution as a function of time. Soils having a wide range of properties will be used and adsorption following various soil treatments or in different ionic environments will be studied. Plant uptake of Tc-99 under growth chamber and greenhouse conditions will be determined from both true solutions and soils to which Tc-99 has been added.
RESULTS: Results should show the extent that Tc-99 is taken up by plants and distributed in the photosynthetic tissue and seeds and ultimately into the food chain. Soil adsorption studies are designed to determine both the extent and mechanisms by which Tc-99 is retained by soils.

DIVISION: Div. of Biomedical and Environmental Research
MONITOR: Watters, Robert L.
TELEPHONE: F233-5329
TYPE OF FUNDING: Contract No.-E(11-1)-2450
77 FUNDING: Energy Research and Development Administration FY77:$30,000
TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: RADIATION/Iodine-129 (100%)
CHARACTER OF STUDY: RESEARCH/Applied (50%);FULL SCALE DEMONSTRATION (50%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The research objective is an understanding of the modes of transport and accumulation of the long-lived fission product, /sup 129/I, in different trophic levels and major segments of the local environment.
APPROACH: Iodine is chemically isolated from representative samples of precipitation, milk, surface waters, terrestrial and aquatic fauna and flora and surface soils. Neutron irradiation is used to produce /sup 130/I, /sup 128/I and /sup 126/I from /sup 129/I(n,gamma)/sup 130/I, /sup 127/I(n,gamma)/sup 128/I and /sup 127/I(n,2n)-/sup 126/I, respectively. Mass spectrometric measurements of the stable decay products, /sup 130/Xe, /sup 128/Xe and /sup 126/Xe, are used to determine the /sup 129/I and /sup 127/I in each sample.
RESULTS: The levels of I-129 in representative samples of local environment will be measured and the modes of transport and accumulation evaluated by measurements on the I-129/I-127 ratio in representative samples. Since this area is remote from environmental sources of I-129, the I-129/I-127 ratio will decrease as the fission product moves through the local environment.
PROJECT MILESTONES: The first results of analyses on I-129 in systematic samplings of milk, surface waters and precipitation will become available this summer and will begin a quantitative evaluation of seasonal variations in the local influx of I-129. This fall we will obtain the results of isotopic analyses on iodine in aerosol samples containing ''carrier'' iodine and thus determine if our aerosol collection program is capable of providing reliable measurements on I-129 in aerosols.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: ORGANICS (20%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Develop methods for bioincorporation of stable isotopes into living systems. These studies will provide a safe method for studying labeled molecules in humans and other living animals.
APPROACH: (1) Develop organic synthesis methods for preparing precursors. (2) Incorporation using bacteria, antibody-antigen specificity, etc.

RESULTS: Use of C-13 NMR methods in a clinical monitoring of labeled molecules. As a nonradioactive isotope C-13 has the potential for tracing more dangerous pollutants in air and water media.
PROJECT MILESTONES: (1) Injection of labeled compounds in animals and dogs and isolation of metabolic products from bile, blood or urine samples. (2) Good methods for enriching RNA and other genetic materials

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Estuarine;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To investigate the combined and synergistic effects of chlorine, temperature, ammonia, and other organic wastes upon marine plankton organisms that may be subject to these multiple stresses within the cooling water system and the nearby receiving waters of power generating stations located in estuarine and coastal marine waters. The organisms to be studied will include phytoplankton, zooplankton and both invertebrate and fin fish larvae. The latter two categories will include indigenous species that are important for commercial or recreational values.
APPROACH: The studies will be experimental in nature, making use of the new Environmental Systems Laboratory of the Woods Hole Oceanographic Institution. Rapidly-growing species (i.e., phytoplankton) will be studied in continuous culture while the planktonic animals will be studied in continuous flow-through systems. Survival, growth, behavior and other biological criteria will be used to assay both immediate and long-term effects of the environmental stresses produced on the organisms by chlorine, temperature, and ammonia, singly and in combination.
RESULTS: Attempts will be made to develop standard bioassay techniques that may be generally applicable to the assessment of these and similar environmental stresses on marine plankton. Major emphasis will be placed on fitting the experimental data to simple mathematical models. The models may then have widespread use in the evaluation of toxicity stresses in natural waters.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To define the temperature range for successful reproduction and relate it to the critical thermal lateral limits. Both constant and fluctuating temperatures are involved.
APPROACH: Measure reproductive success as eggs laid /g/day at 10 temperatures ranging from 18 to 36C and 5 fluctuating temperatures ranging from 24-18C to 36-30C.
RESULTS: Final paper is prepared. Under constant temperatures the range for successful reproduction is 24-30C and from 24-18C to 28-34C.
PROJECT MILESTONES: (1) Oogenesis is the most sensitive stage of the life history to temperature. (2) The pupfish acclimates to the mean of extremes of fluctuating temperatures. (3) The reproductive temperature tolerance range is 1/7 that of the critical thermal maximum and minimum. (4) The narrow temperature range for successful reproduction may require a re-evaluation of thermal limits of the effluents power plants and other industries.

TITLE: Cellular System for Screening and Analysis of Mutagenic, Carcinogenic and Teratogenic Agents. A Cellular Approach to Agricultural Genetics
PROJECT NUMBER: 006935
PRINCIPAL INVESTIGATOR: Carlson, P.S.
ADDRESS: Department of Crop and Soils, Michigan State University, East Lansing, MI 48824
AFFILIATION: Michigan State Univ., East Lansing (USA)
MONITORING AGENCY: Energy Research and Development Administration, Chicago, Ill. (USA). Chicago Operations Office
DIVISION: Chicago Operations Office
MONITOR: Miller, Harold N.
TELEPHONE: C(312)739-7711
TYPE OF FUNDING: Contract No.-E(11-1)-2528
77 FUNDING: Energy Research and Development Administration FY77:$90,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (75%);DEVELOPMENT/Laboratory scale (25%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: It is the aim of this project to develop and characterize a higher plant system to quantitatively and reliably detect mutagenic, carcinogenic and teratogenic agents. The system will utilize higher plant cells cultured in vitro. Many of the difficulties inherent in higher eukaryote assay systems can be circumvented by employing single cells as the assay material. Furthermore, the high resolution procedures developed in microbiological assay systems can be directly transferred for use with plant cell cultures.
APPROACH: This project is aimed at utilizing the techniques and methods of in vitro cell cultures obtained from higher plants in developing an effective and reliable screening system to detect, characterize and analyze mutagenic, carcinogenic and teratogenic agents. In vitro methods using higher plant cells circumvent many of the difficulties inherent in other higher eukaryote (e.g., mammalian) assay systems. Genetic and epigenetic events can be distinguished by regenerating whole plants from variants recovered in vitro. This system utilizes haploid single cells and high resolution screening systems as the basis for all of its manipulations. These factors permit the scoring of large test populations with the recovery of rare biological events. Furthermore, mutagenic, carcinogenic and teratogenic effects are all scored from one homogeneous cell population and under defined growth conditions.
RESULTS: It is imperative that an adequate battery of methods be developed for evaluating the mutagenic, carcinogenic and teratogenic properties of chemicals and other biologically active agents. These methods should utilize a range of biological materials and provide a rapid and quantitative assay of the biological activity of a range of agent. Although satisfactory screening methods are currently being developed with microbial and animal material, no methods are available or being developed with botanical materials. An adequate battery of methods for evaluating potentially harmful agents would certainly include plant materials primarily because plants offer a less expensive and less ambiguous system to evaluate mutagenic, carcinogenic and teratogenic effects than other higher eukaryote systems. It is the aim of this proposal to develop a higher plant assay which can be rapidly and routinely utilized to determine the biological effects of a range of chemical and physical agents.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Strontium-90 is one of the hazardous products of both peaceful and military use of nuclear energy. While high doses (1 mu c/gm) are highly carcinogenic in man, the human population comprises individuals with dissimilar genetics and susceptibility to cancer. The objective of this study is to test strontium-90 carcinogenesis at various doses in mice with different susceptibility to cancer and carrying different types of tumor viruses. Also, the therapy of osteogenic sarcoma by immunological means will be investigated.
APPROACH: Strontium-90 carcinogenesis will be studied at different doses in various strains of mice. Mice of a healthy strain will also receive immunosuppression by different means to determine if this will influence the final incidence of tumors by strontium-90. Especially whole-body irradiation will be studied in this connection. Immunotherapy trials will be run on tumors induced in inbred mouse strains by strontium-90 and by FBJ osteosarcoma virus. The relationship between the tumors induced by these two agents will be investigated.
RESULTS: We hope to obtain new data relevant for prevention and therapy of tumors induced by strontium-90 and other bone-seeking radioisotopes produced through use of nuclear energy.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Northeast;COASTS/Northeast;HYDROGRAPHIC AREAS/Continental shelf;HYDROGRAPHIC AREAS/Other hydrographic areas Rivers and ponds
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To describe and, where possible, to explain the sublethal effects of oil fractions and temperature changes on the behavior of freshwater catfish and marine snails and lobsters.
APPROACH: Measure alterations in feeding and social behavior of the organisms to determine pollutant effects. Monitor changes in neurophysiological responses of chemoreceptors to understand the mechanism of action on the organism. Test organisms: (1) Nassarius obsoletus, mud snail; (2) Homarus americanus, lobster; and (3) Ictalurus nebulosus, catfish. Pollutants: (1) no. 2 fuel oil; whole oil and oil fractions at concentrations from 10 ppb to 50 ppm; and (2) heat; applied in 5 degrees C increases over baseline values from 10-30 degrees C. Exposure: (1) oil, mudsnail: 1 hour static system, 1-14 days flowthrough; lobster: 5 day static system, one time oil application; and (2) heat, lobster and catfish: 5 days at elevated temperature between a 10-day pre heat and a 5-day post heat control period.
RESULTS: Theoretical models have been proposed in the course of our earlier studies and these are now being tested to determine basic mechanisms of interference. Changes in behavior may be the essential areas to be reflected at the population level and effects on chemo-reception may be generalized across different species. If such a generalized model of oil interference proves to be valid, realistic safety standards can be set up based on these experimental data.
PROJECT MILESTONES: A generalized model of pollutant interference with chemo-reception and animal behavior: (1) Documentation of heat effects on social behavior 1976-1977; and (2) Documentation of fuel oil effects on feeding and social behavior 1978-1979.

PROJECT DESCRIPTION: (1) Determine the potential for revegetation at Rocky Flats. (2) Determine recovery of grasslands vegetation following exposure to ionizing radiation or being disturbed by fire, tilling or scraping. (3) Determine the radiosensitivity of grassland vegetation to chronically administered radiation.
APPROACH: (1) Remove existing vegetation by tilling and reseed with various mixtures of native species under varying conditions. (2) Expose grasslands vegetation to ionizing radiation on burn, rototill or scrap and measure secondary succession. (3) Chronically expose grassland vegetation to ionizing radiation.
RESULTS: (1) Determine feasibility of revegetation and/or reclamation at Rocky Flats. (2) Comparison of recovery of grasslands after damage by ionizing radiation to recovery after other types of disturbance. (3) Determine equilibrium radiosensitivity of grasslands vegetation.
PROJECT MILESTONES: Determined radiosensitivity of grasslands vegetation.

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Midwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) To describe quantitatively the natural recovery of strip mines. (2) To design a technique for rapid strip mine restoration by endemic organisms.
APPROACH: The island biogeographical and ecosystem energetic approaches of ecology are being used in stripped grasslands.
RESULTS: (1) A novel technique to measure easily vegetative cover on small areas from aerial photographs is being developed. (2) A quantitative understanding of limiting factors and basic processes involved in natural strip mine recovery. Rates of natural reclamation have been determined for strip-mined land. These baselines indicate that natural ecosystems will be re-established after 40 to 90 years depending on size of the strip mine and on condition of spoil.
PROJECT MILESTONES: (1) The photointerpretation technique for vegetative cover will be perfected by September 1976. (2) The spatial aspects of natural vegetative recovery of strip mines will be obtained by 10/77. (3) Energetics of strip mine recovery should be available 10/78.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: This study is designed to identify, quantify and describe processes whereby hazardous waste products from energy production processes are transferred through milk to humans. One objective of these studies is to look at the transfer of heavy elements into milk. Among these will be members of the actinide series.
APPROACH: Among the procedures to be used will be oral and I.V. doses of a radio tracer to lactating animals. When it is determined that an element transfers across the mammary gland an attempt will be made to look at the transfer constants across the mammary epithelium.
RESULTS: In addition to obtaining quantitative information on amounts of potentially harmful substances entering milk as a function of time after exposure by animals, it is a long range objective of the study to develop a general theory of the accumulation of the ions in milk.
PROJECT MILESTONES: From results of the first year of the project it is apparent that in goats less than 1% of an oral dose of thallium, lead, polonium or bismuth will be found per liter of milk. The goat seems to transfer more of these elements to milk than the cow.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To investigate, by physiological, biophysical and other pertinent techniques, the mode of transport of toxic metal ions across epithelial membranes (particularly intestine), interactions among different metal ions, macromolecules possibly involved in toxic metal transport, and characterization of metal binding protein.
APPROACH: Initial investigations were designed to assess turnover and distribution of Cd-109 in model animals (chicks and rats) as a function of stable cadmium concentration of diet, and the effect of dietary cadmium on animal growth, intestinal function, synthesis of Cd-binding proteins, histopathology of various tissues, and ultrastructural electron microscopic alterations of epithelial tissues (intestine, kidney). Subsequent investigations will assess rate of intestinal absorption of Cd and other metal ions as a function of total metal ion concentrations in animals acclimated to different concentrations of that specific metal ion, the transport path of that metal ion, and effect of nutritional deficiencies and other variables on metal ion absorption.
RESULTS: To understand more completely the manifestation of Cd and other toxic metals poisoning on the physiology and biochemistry of epithelial tissues, and the mode of transport of Cd and other toxic metal ions across the epithelial membrane.
PROJECT MILESTONES: The initial studies have shown: the presence of a Cd-inducible Cd-binding protein (presumably metallothionein) not only in kidney and liver but also in intestinal mucosa; that toxicity Cd has adverse effects on growth and the synthesis of a specific protein in the intestine; that Cd toxicity depresses the absorption and retention of Cd-109 is inversely related to the Cd concentration of the diet; that the turnover of orally-administered Cd-109 can be described by a two or more component curve and that the slow component represents primarily Cd-109 residual to the gastrointestinal tract of chicks and Cd-109 residual to the carcass minus gastrointestinal tract in rats. These observations represent both new information and background information for the subsequent physiological and biophysical investigations.

TITLE: Physiopathology of Blood Platelets and Development of Platelet Substitutes
PROJECT NUMBER: 007054
PRINCIPAL INVESTIGATOR: Baldini, M.G.
ADDRESS: Division of Hematologic Research, Memorial Hospital, Pawtucket, RI
AFFILIATION: Memorial Hospital, Pawtucket, R.I. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
TYPE OF FUNDING: Contract No.-E(11-1)-2783;Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$65,000
TECHNOLOGY: NUCLEAR/General (40%);GENERAL SCIENCE (60%)
POLLUTANTS: RADIATION/X-ray (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
PROJECT DESCRIPTION: Research will continue on four main subjects of platelet physiology: (1) To identify platelet functions and stimuli which result in changes in cyclic nucleotides and to study the mechanism by which these nucleotides affect the platelet response. To measure the levels of cyclic AMP and cyclic GMP in platelets during storage at 4 and 22 degrees C and to see whether the platelets' ability to synthesize these compounds deteriorates with storage. To measure changes in the major intracellular nucleotide pools in relation to platelet-aging in the circulation. (2) The effect of high doses of x-irradiation on the functional capacities of human platelets will also be studied. Furthermore, investigations will continue. (3) Ways to determine platelet ''activation'' in patients so that the imminent risk of thromboembolism can be predicted and possibly suppressed by a combination of platelet inhibiting drugs. Work will also continue on improved methods of detection, measurement and treatment of platelet alloimmunization.
RESULTS: During the past year the effect of platelet transfusions in patients previously alloimmunized to blood platelets was greatly improved by adsorption of the alloantibody with a suspension of platelet membranes infused prior to platelet transfusion. Studies on cyclic nucleotides were also continued and demonstrated that addition of serotonin to a platelet suspension caused a 6 to 10 fold increase in cyclic GMP within 30 sec. Alpha-tocopherol was found to suppress platelet lipid peroxidation and inhibit platelet aggregation. Adhesivity of platelet to collagen was found to be dependent on cell age. Technical details in the utilization of frozen platelets in patients in need of platelet transfusion were also studied and improved.

ESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: (1) To identify concentrations of sulfite, sulfate, trace metals and nitrite species in particulates produced by smelting and fossil fuel industries. (2) To establish the conditions and mechanism of sulfite formation and study the stability of the various sulfur species in the ambient atmosphere.

APPROACH: Develop appropriate measurement techniques with emphasis on calorimetric titration and ESCA techniques. Determine the stability of sulfur (IV) aerosol species with time. Correlate the trace metal content humidity and temperature with the sulfur (IV) species and attempt to devise an explanatory mechanism.
RESULTS: Accumulate samples in the Four Corners power plant area and in the vicinity of the copper smelter at Garfield, Utah, and analyze for sulfur (IV) species and other relevant parameters.
PROJECT MILESTONES: Prepare annual report on project findings.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project involves functional comparison of normal lymphocytes and their sub-populations with respect to kinetics of growth in vitro. Another area deals with basic investigations into the control of lymphocyte growth at the molecular level. Studies into ribosome synthesis and the regulation of RNA transcription will be carried on in a parallel fashion.
APPROACH: To date we have: (1) Described the interaction between ribosomal protein and RNA synthesis in the regulation of ribosome assembly in resting and stimulated lymphocytes; (2) Demonstrated direct effect of PHA on lymphocyte chromatin; (3) described the patterns of abnormal growth kinetics in lymphocytes from lymphoproliferative disorders.
KEYWORDS: LYMPHOCYTES;GROWTH;IN VITRO;RIBOSOMES;BIOSYNTHESIS;PHYTOHEMAGGLUTININ;RNA;CHROMATIN

TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: METALS/Beryllium (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To ascertain the solubility of intermetallic beryllium compounds. (2) To determine the pulmonary morphologic response to these compounds and the timely development of pulmonary lesions. This will be compared to beryllium metal. (Toxicity of compounds). (3) To determine if the compounds are carcinogenic and do cause pulmonary neoplasms.
APPROACH: (1) The solubility will be determined in water and serum over a period of up to 12 months. The compounds will be suspended in these fluids. After centrifugation the amount of beryllium will be determined by A.A.S. (2) The compounds are intubated into the trachea of rats, 5 mg of beryllium per sample per rat. Serial sacrifices will be done and the morphologic alterations will be recorded and

evaluated by light microscopy. All other organs will be examined for possible toxic effects.
RESULTS: The solubility of the compounds is expected to be low. The toxic or carcinogenic effects cannot be predicted.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Far West;COASTS/Northeast;COASTS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: SIMS: During 1976 SIMS will continue to coordinate the Study as outlined in the Proposal (February 1976). This coordination will in part consist of ensuring communication between the Review Panel and the centers at Columbia and Stanford; it will also consist of ensuring direct communication between the two centers in the form of both personal visitations by members of the Study and seminars as appropriate. As soon as any technical reports and papers are produced as a result of the Study, SIMS will see that there is suitable distribution. Columbia: The first steps will be taken towards the construction of a doubly stochastic Poisson process as a model for mortality and morbidity data in which the rate parameter is itself a random variable depending on time, weather, and pollution. Research will begin to develop sounder statistical methods than so far employed for detecting geographic areas in which there is nonrandom clustering of cases of a certain disorder, with proper control for such factors as size of population, proximity to treatment facilities, and utilization of those facilities. Principal components analysis for individual pollutants will begin of correlations, covariances, and raw cross-products between readings from the 40 monitoring stations in the New York City aerometric network. Stanford: During the first year, research will include the following:
PROJECT MILESTONES: (1) Research Application Conference on Environmental Health, July 1976, supported by grant from NSF (grant not included in Study funding). (2) First Review Panel meeting, October 1976.
KEYWORDS: AIR POLLUTION;MORTALITY;MATHEMATICAL MODELS;STATISTICS;HUMAN POPULATIONS;EPIDEMIOLOGY;METEOROLOGY;AIR;CARCINOGENS;HEART

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Site specific NY city
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project deals with the analysis of plutonium in human tissues from environmental sources.
APPROACH: Conduct analysis on 50 sets of autopsy tissues which include the right lung, liver, kidney, helar lymph nodes, blood, and half the bodies of three thoracic vertebrae. The results of these studies will be compared with calculated values derived from lung modeling techniques and air concentration data to verify transport models of these materials in the environment and their metabolism and kinetics in the body.
RESULTS: Accomplishments during the first year included tissue acquisition, radiochemical method development, and analysis of a small subset of the available tissues.
PROJECT MILESTONES: Complete analysis of the 50 sets of autopsy tissues, September 30, 1978.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To sample and measure surface waters in the immediate vicinity of the decommissioned Hallam Nuclear Power Plant facility to determine the radioactivity of such waters to ascertain whether there has been any migration of the radioactive material sealed and buried on the plant site.
APPROACH: Conduct a sampling of the ten wells and two surface water supplies closely adjacent to the entombed radioactive material and conduct a radiochemical analysis of each sample for gross alpha and beta radioactivity and do a gamma scan of a composite of all the samples to determine quantity and identify gamma emitters.
RESULTS: (1) We expect to determine the radioactivity twice a year to the water (surface and ground) adjacent to the plant site. (2) Report all results of the environmental surveillance program to the U.S. Energy Research and Development Administration as required by Contract AT(11-1)-2097.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To assess the effects of accident conditions on the structural response of high level waste and spent fuel transportation containers to aid in determining safety and potential environmental consequences.
APPROACH: The approach is to use scale modeling techniques to experimentally study the behavior of typical nuclear high level waste and spent fuel transportation systems during simulated accident conditions as specified in 10 CFR 71, Appendix B. 1/8, 1/4, and 1/2-linear scale models of uranium- and lead-shielded shipping containers are tested at various temperatures, impact angles and inertial loads.
RESULTS: The measured inertial loads and strains induced onto the nuclear shielding and primary containment vessel will provide the base line data necessary for safety analyses and licensing of ERDA shipping casks; correlation of new computer codes being developed by LASL; standard development; safety and risk assessment studies; and will aid in gaining public confidence in the transportation of nuclear energy waste materials.
PROJECT MILESTONES: FY 76-76T. (1) Select range of experimental parameters for investigation. (2) Review status of dynamic materials properties. (3) Design and fabricate SS/Pb models. (4) Develop scaling criteria for SS/Pb models. (5) Develop test matrix. (6) Complete scaling and strain rate experiments with SS/Pb models. (7) Complete temperature, g-load, impact angle, and containment experiments on SS/Pb models. (8) Begin design of SS/U models.

JECT DESCRIPTION: Research to investigate semiconducting metal oxides (SnO2, ZnO and others) in the form of thin films for toxic or flammable pollutants gas detection. Develop test dosimeter materials and determine responses to a variety of gases and gaseous mixtures. Identify processes involved in solid-state gas sensor systems in order to provide reliable dosimetry systems.
APPROACH: Thin films of semiconducting metal oxides will be deposited on substrates using various approaches. Response to exposure to known gases and mixtures will be investigated and analyzed.
RESULTS: Basic and applied data on performance of semiconducting metal oxide films for selectively measuring exposure to toxic or potentially hazardous gases.
PROJECT MILESTONES: Final report prepared and delivered around early fall of 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The RBE for cancer induction of high LET radiation is very difficult to establish especially at low radiation dose rates. These studies are directed toward understanding the relationships between cell transformation in vitro and lung cancer induction in vivo for uniform and non-uniform radiation exposure.
APPROACH: Slow growing cell cultures will be exposed to alpha irradiation from 238-PuO2 particles and uniform alpha radiation exposure. Their ability to transform will be related to exposure conditions. These data will be compared to tumor induction in rat lung following particulate and more uniform exposure to alpha particles.
RESULTS: The effects of non-uniform dose distribution should be determined and used for hazard evaluation.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The work proposed involves three kinds of evaluation, using side-by-side ambient, chlorinated and ozonated effluents from an experimental condenser system.
APPROACH: The kinds of studies proposed are as follows: (1) Test organisms for this work will represent typical estuarine and freshwater fishes. (2) Acute (96 hour) and chronic (28 day) toxicity studies will be conducted in flow-through proportional dilution toxicity systems. (3) The stress study is to detect effects of the treated effluents at concentrations below those which elicit the type of behavioral avoidance response evaluated in the behavior portion of the program.
RESULTS: An engineering, economical, and biological evaluation of the applicability of ozonation as a method for condenser fouling control.
PROJECT MILESTONES: (1) Project starts 1 May 1977; project ends 30 April 1979; (2) Design of test facilities: July to August 1977; (3) Construction of test facilities: August to September 1977; (4) Activities: start up:site 1, 77/10;site 2, 78/07; avoidance/preference studies, toxicity studies, physiological stress, pathology, primary productivity: site 1, 77/11 to 78/5; site 2, 78/08 to 79/02; seminars: site 1, 78/03; site 2, 79/02; reports: interim, 78/11; final: 79/04.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Our basic objectives are the development of satisfactory procedures for the clinical treatment of serious radiation exposure in man and trouble free transplantation of large organs using the dog as a model.
APPROACH: Lethal radiation of dogs and transplants of marrow and lung or kidney from donors matched for histocompatibility antigens on the basis of typing their peripheral blood lymphocytes with a battery of cytotoxic alloimmune sera.
RESULTS: Chimeric dogs obtained by the above procedure of lethal radiation exposure followed by successful

transplant of allogeneic marrow have been shown to tolerate completely without immunosuppression a lung or kidney transplant from the original donor of marrow.
KEYWORDS: DOGS;MAN;LETHAL IRRADIATION;BONE MARROW;LUNGS;KIDNEYS;TRANSPLANTS;IMMUNE REACTIONS;LYMPHOCYTES;IMMUNE SERUMS;RADIATION CHIMERAS;IMMUNOSUPPRESSION;RADIATION INJURIES;THERAPY;NEOPLASMS

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: ORGANICS (50%);RADIATION (50%)
CHARACTER OF STUDY: RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The time patterns of tumor induction in mouse and rat skin and hamster lung are being studied when two or more carcinogens are present simultaneously or sequentially for long periods of time. Various carcinogens, such as, ionizing radiation, ultraviolet light, benzo(a)pyrene, nitroquinolinoxide, beta propriolactone and diepoxybutane will be applied directly or topically to skin either alone or in combination with one other carcinogen.
APPROACH: A powerful tumor promoter, phorbol myristate acetate, will then be applied repeatedly in order to accelerate the appearance of the tumors. The carcinogenic effect of BaP and electron radiation given repeatedly for long periods will be analyzed in terms of a model that relates the weekly dose rate (d) to the 50% induction time T/sub 50/ in accordance with the formula dT/sub 50//sup m/ - constant and the utility of promotion as an indicator of potential carcinogenicity will be determined.
RESULTS: The temporal characteristics of the response will be assessed in terms of log normal or Weibel functions and the possible progressive characteristics of the conversion from benign papillomas to malignant carcinomas will be included in the analysis. The binding of the carcinogens to cell constituents, especially proteins and nucleic acids, will be utilized as a dosimetric technique and small populations of transformed cells will be studied by cytofluorometry.
PROJECT MILESTONES: (1) Completion of single dose experiments. (2) Completion of dual dose experiments. (3) Start of chronic studies with radiation.
KEYWORDS: IONIZING RADIATIONS;CARCINOGENESIS;CARCINOGENS;TESTING;SKIN;MICE;RATS;LUNGS;HAMSTERS;CARCINOGENS;NEOPLASMS;HYDROCARONS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To define enzymatic mechanisms involved in the repair of DNA treated with chemical carcinogens and gamma-irradiation.
APPROACH: Isolation, purification and characterization of enzymes which recognize DNA treated with methylnitrosourea, 7-bromomethyl-12-methylbenz[a]anthracene, beta-propiolactone, dimethylsulfate, etc., from procaryotic and eucaryotic sources.
RESULTS: Clarification of the mechanisms of DNA repair which to date in mammalian systems are not clear. If specific enzymes can be identified and measured accurately in extracts, then levels can be measured to determine who in the population may be susceptible to chemical carcinogens.
PROJECT MILESTONES: (1) The identification of a mammalian endonuclease or N-glycosidase which recognizes O-6-methylguanine in DNA treated with methylnitrosourea. (2) Identification of altered enzyme levels in a genetic disease or in cancer prone individuals. (3) Definition of the nature of the gamma-irradiation damage to purines.

PROJECT DESCRIPTION: To develop advanced physical chemical techniques which can be used in association with biological methods which can aid in the identification of certain mutagens and/or carcinogens.
APPROACH: With the develcpment of polar and non-polar high resolution gas chromatographic capillary columns used in conjunction with mass spectrometry and high performance liquid chromatography as well as other techniques, attempts will be made to identify at a very early stage and with great reliability 'chemical fingerprints' of those substances introduced into a variety of biological assay systems which eventually prove to be mutagenic and/or carcinogenic.
RESULTS: (1) The development of a rapid, reliable chemical procedure which hopefully could be eventually used to determine whether or not man has been exposed to certain mutagens and/or carcinogen by examining his urine, blood, saliva, tissues, etc. (2) The development of a rapid, reliable chemical procedure which can be employed to augment the reliability of certain biological assay systems in determining the mutagenicity and/or carcinogenicity of certain chemical compounds.
PROJECT MILESTONES: Successful early identification by chemical means of certain mutagens and carcinogens present in biological systems.
KEYWORDS: POLYCYCLIC AROMATIC HYDROCARBONS;MIXTURES;MUTAGENS;CARCINOGENS;CHEMICAL ANALYSIS;GAS CHROMATOGRAPHY;MASS SPECTROMETERS;BIOASSAY;BIOLOGICAL EFFECTS

REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of this study is to attempt to probe the question: How do mutagens act in higher organisms.
APPROACH: The test species is Drosophila melanogaster. We will be exposing these animals to a variety of chemical mutagens, most of which will be ingested or breathed. Then, using two unique chemical selection systems which were developed in my laboratory, we will select for alcohol dehydrogenase negative mutants and revertants to wild type.
RESULTS: These experiments should allow us to characterize how mutagens get in an animal system. By studying the reversion frequencies it should be possible to tell, at the molecular level, how the mutant has affected the organism's genetic material.
PROJECT MILESTONES: This will be the first demonstration at the molecular level of how mutagens act in higher organisms.

TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: METALS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To study the metabolism, toxicity, and mode of action of heavy metals, with special emphasis on hazards to human health. (2) To develop assay systems for monitoring somatic mutations in vivo and in vitro (cell culture) in populations exposed to mutagenic agents. (3) To develop methods for assessing effects of environmental agents on oogenesis in a mouse model system.
APPROACH: (1) Epidemiological and toxicological studies on exposed populations. (2) Observations on human

volunteers given tracer doses of radioactive heavy metals. (3) Studies on mechanisms of metabolism and toxicity in experimental animals. (4) Studies, in a life cycle perspective, of genetic, reproductive, and developmental effects of environmental agents, particularly mercury and lead.
RESULTS: (1) Determination of the kinetic parameters for uptake, translocation, and excretion of inhaled mercury in man. (2) Assessment of the relationship between dose-effects and dose-response in man. (3) Improved methods of monitoring exposures to hazardous agents in human populations. (4) Improved analytical methods for measuring heavy metals in biological samples. (5) Improved procedures for removing toxic heavy metals from the human body. (6) Improved risk assessments in exposed human populations.
PROJECT MILESTONES: (1) Completion of initial studies on volunteers, including tracer doses of radioactive mercury vapor Jan. 1976. (2) Development of methylmercury metabolic model using data from inbred mouse Oct. 1977. (3) Completion of somatic cell mutation assay and assessment of feasibility of population screening Oct. 1977. (4) Integration of mouse and human data to provide metabolic model for methylmercury in man Oct. 1978.

CHARACTER OF STUDY: RESEARCH (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) Develop detailed understanding of metabolism in bone of Ca/sup ++/ and other bone-seeping metal cations as a basis for protecting the skeleton from damage by toxic metals. (2) Develop improved radiopharmaceuticals for the early diagnosis of inflammatory responses to pollutant stress. (3) Characterize viscoelastic properties, tensile strength, and membrane stabilizing systems of blood cells in order to define how pollutants may affect cell function and survival. (4) Define role of the liver in overall response of the intact animal organism to environmental and other stresses.
APPROACH: (1) Transmission electron microscopy and electron probe microanalysis are used to identify cell organelles involved in Ca/sup ++/ transport and bone formation. (2) Standard immunologic techniques are used in conjunction with radiolabeling methods to develop new tissue-specific radiopharmaceuticals. (3) A variety of physical and chemical techniques (including electron microscopy and EPR spectroscopy) are being used to study the structure and function of blood-cell membranes and membrane components. (4) The technique of prolonged perfusion of the isolated rat liver will be used to study factors (hormones, injury, stress, pollutants) that affect net hepatic synthesis of specific plasma proteins.
RESULTS: (1) Identify which cell organelles function in Ca/sup ++/ transport across epithelial membranes; identify cell types, and cell organelles, that are responsible for movement of Ca/sup ++/ to sites of bone formation. (2) Improved method for the early detection of inflammatory responses by scintillation scanning after administering a radiolabeled antibody preparation. (3) Develop base of information relative to elasticity, resistance to deformation, and membrane integrity of blood cells, plus insights into the degree to which radiation, heavy metals, or other stresses may adversely affect overall membrane stability. (4) Definition of the role of the liver and its re-responsiveness to hormonal signals in the body's response to stress or injury.
PROJECT MILESTONES: (1) Devise conditions for preserving intestine and chick allantoic membrane in functional state by freeze drying July 1977. (2) Conduct studies in vivo to detect initial signs of inflammation using radiolabeled antibody as diagnostic agent July 1978. (3) Describe ion distribution in freeze-dried intestine and chick allantoic membrane Aug. 1978. (4) Describe ion and element distribution in bone and bone-forming tissue Dec. 1978. (5) Initiate studies utilizing radiolabeled antibodies as diagnostic agents in detection of pollutant effects in vivo July 1979. (6) Establish and apply techniques for prolonged (12-30 hours) perfusion of the isolated rat liver as a model test system for evaluating role of the liver in the total response of the organism to injury - no date presented.

ENERGY CYCLE: COMBUSTION OR END USE (8%);ELECTRICITY GENERATION (12%)
POLLUTANTS: METALS (75%);RADIATION (25%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) Define role of bone cells and, in particular, the bone cell membrane in controlling fluxes of material into and out of the skeleton. Attention now centers on cellular mechanisms controlling the turnover and retention of material in bone. (2) Elucidate mechanisms of active transcellular transport of divalent ions. (3) Characterize conformational changes induced by substrate, cofactors, and various

metal ions in isozymes of yeast hexokinase, a magnesium-requiring enzyme. (4) Study binding properties of specific serum proteins to gain a better understanding of mineral transport in the blood.
APPROACH: (1) Calvaria (rat, mice, chick) with intact membrane systems are studied (as model systems) in conjunction with the principal hormonal agents known to affect bone cell activity and membrane function. (2) Transcellular transport is studied in vitro using the embryonic chick allantoic membrane. (3) Fluorescence spectroscopy is utilized as a sensitive and versatile method of studying conformational changes in the hexokinase system. (4) The binding of a model compound, novobiocin, to serum albumin is quantitatively examined. The quantity bound is measured by equilibrium dialysis. A change in circular dichroic spectrum accompanies the binding reaction and provides, via analysis of the Scatchard plot, information on the binding process.
RESULTS: (1) Information on fluxes and gradients of Ca/sup 2+/, phosphate, H/sup +/, K/sup +/, lactate, etc. across the periosteal and endosteal bone membranes under a variety of stresses. This should provide a partial understanding of the homeostatic mechanisms employed by bone to control blood levels of calcium and phosphate. (2) Better understanding of how cells transfer material, physiologic or toxic, through the cytosol of a cellular membrane and into the recipient organ. (3) Additional information on the circulatory transport and metabolism of materials involved in skeletal metabolism.
PROJECT MILESTONES: (1) Reports on the colloidal nature of radionuclides in seawater and the results of a physicochemical study of a novobiocin-bovine serum albumin complex are expected to be published Fall 1976. (2) Direct measurement of subperiosteal pH by means of microelectrodes, if possible, will be completed in normal rats January 1977. (3) Most correlations of lactate fluxes with Ca/sup 2+/, inorganic phosphate, and perhaps K/sup +/ as well should be completed July 1977. (4) Significant accomplishments are expected during the 1976-78 period in the study of divalent cation transport by epithelial tissues. However, it is difficult to predict milestones and such forecasts are omitted.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Research will be done to increase basic knowledge of platelet function and structure and apply this knowledge (1) to improve methods of platelet transfusion and storage; (2) to prevent platelet damage caused by ionizing irradiation; (3) to find new methods of inhibition of platelet adhesion and aggregation for the prevention of thromboembolic disorders.
APPROACH: (1) Human platelets will be utilized throughout the study. Platelet alloimmunization will be studied in multitransfused patients by measuring survival of Cr-51-labeled donor platelets in the sensitized recipients. Effect of antibody adsorption by infusion of platelet antigenic material will be studied. (2) The levels of cyclic AMP and cyclic GMP will be measured by radioimmunoassay in platelets during storage at 4 degrees C and at 22 degrees C to see whether the platelets' ability to synthesize these compounds deteriorates with storage. The effect of modified preservation media in preventing these changes will be studied. (3) To study the effect of high doses of ionizing irradiation on the platelets, membrane vesicles will be isolated after exposure. The structural changes in these platelet membranes will be studied by two-dimensional polyacrylamide gel electrophoresis. Electrophilic probes will be used to study changes in cell surface topography. (4) Prethrombotic phenomena in the platelets will be studied in postoperative patients by measuring platelet viscosity to assess early changes leading to increased platelet adhesion and aggregation. Methods to prevent these changes will also be investigated.
RESULTS: It is expected that (1) Improved survival and hemostatic effectiveness of platelets will be obtained in allcimmunized recipients; (2) Specific changes in platelet cyclic nucleotides may be found which can shed new light on the reasons why human platelets lose viability and function during storage; (3) Changes in reactivity of irradiated platelets may be found and the effect of high dose irradiation may be elucidated; (4) Measurement of platelet ''activation'' will serve in the detection and prevention of thromboembolic phenomena in patients.
PROJECT MILESTONES: Our piloting experiments have shown that adsorption of platelet alloantibodies can effectively be obtained in vivo by the infusion of purified antigen. Our recent studies have shown that contact of the platelets with altered surfaces causes a number of changes (''activation'') which precede and lead to platelet aggregation and thrombus formation.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This is a broad program of study and maintenance of mutant alleles at T locus or chromosome 17 of the mouse. Its objective is the maintenance of a complete panel of different types of mutant alleles at the T-locus the mouse on chromosome 17, as well as other known marker genes of that chromosome. The genetic study of these genes with special reference to their interactions with one another and the fine structure of the portion of chromosome occupied by the T-region.
APPROACH: The maintenance and inbreeding of 35 stocks of mice carrying different mutations in the T/t region of chromosome 17 will continue. Detailed genetic analysis of these mutations and their interrelationship with one another will be performed with particular emphasis on (1) experiment designed to map T/t locus mutations and their marker relative to one another. (2) embryological and cytogenetic analysis of two dominant T-like factors that may be chromosome deletions (3) the genetic and embryological analysis of new f-alleles that arise in the laboratory by mutation or are found in the wild population.
RESULTS: The product of their work is increased understanding of a complex genetic locus in the mouse and the resultant implications that this has in a variety of practical problems whose solution requires such knowledge about genetic characteristics of mammals.
PROJECT MILESTONES: Continuing examinations.
KEYWORDS: MICE;MUTANTS;CHROMOSOMAL ABERRATIONS;ANIMAL BREEDING;LABORATORY ANIMALS;MUTAGENESIS;BIOLOGICAL MODELS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The purpose of this study is to determine the deposition of nutrients and pollutants in dust, rain and snow at polluted and unpolluted sites in Minnesota and North Dakota.
APPROACH: Automatic precipitation and bulk deposition collectors will be used for sampling dust, rain and snow and analyses will be performed for major cations and anions and physical characteristics of samples.
RESULTS: The results should help answer the following questions: (1) what is the present-day composition of wet and dry deposition in polluted and non-polluted areas of the upper mid-West; (2) is dustfall a significant contributor of phosphorus and nitrogen to soils and lakes; (3) is the gradient in pH of snow across Minnesota and North Dakota caused by changes in atmospheric particulate matter; and (4) will the development of coal-burning power plants in the western U.S. change the composition and properties of rain and snow in the upper mid-West.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To develop an integrated alternative energy plan and to implement this plan for the City of Riverside, California.
APPROACH: To characterize the energy end-use by category; i.e., residential, industrial, and commercial; and develop a projection of energy needs for the remainder of this century. Alternative energy resources will be identified and fitted into an integrated energy master plan. Supporting studies of institutional and public education will be performed.
RESULTS: A final report and conference.
PROJECT MILESTONES: (1) Program plan June 15, 1977. (2) Monthly letter reports. (3) Quarterly progress meetings, July 1, Oct. 1, 1977, Jan. 1, April 1, 1978. (4) Final report draft Feb. 15, 1978. (5) Sponsor review of final report Mar. 15, 1978. (6) Issue final report April 1, 1978. (7) Oral report to sponsor May 1, 1978. (8) Conference June 1, 1978.

REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The purpose of this study is to determine the deposition of sulfuric acid aerosol on plant canopies and to determine injurious effects on foliage.
APPROACH: Plants with different canopy densities will be exposed to a simulated aerosol in a wind-tunnel and mass and number of droplets intercepted will be determined as a function of aerosol and canopy characteristics. Plants will be exposed to sulfuric acid aerosols in a growth chamber and anatomical, cytological and physiological measurements will be made.
RESULTS: This study will provide information related to the following questions: what is the capacity of vegetation to scavenge atmospheric aerosols; what is the effect of canopy characteristics on filtering capacity; and what is the minimum concentration of sulfuric acid aerosol that produces harmful effects on vegetation.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The program has three major parts: a baseline study, a mass balance study, and a transport/biological effects study. The purpose of the baseline study is to establish the natural levels of several trace metals in soils, stream sediments and biota in the regions which will be subjected to impact during oil shale development. Some trace metals will be volatilized during the retorting process and others will either be released in liquid waste effluents or are subject to leaching from spent shale. The mass balance studies will involve measurement of the trace metal contents of raw shale and spent shale. Some of this work can be done with spent shale from pilot and industrially-owned units of varying scales which are now operating. Some work will be done with bench scale models. An extension of the mass balance studies will include work on the transport of trace metals after release as in stack gases or after mobilization from the spent shale. These studies will be concentrated on the mobilization of trace elements in spent shale and the potential for contamination of ground or surface waters and the role of stream sediments and soil in eliminating or reducing this potential problem. The third major effort will deal with biological availability of the trace metals to plants used to revegetate the massive amounts of spent shale which will be generated.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This proposal treats various aspects of rehabilitation of lands affected by oil shale development. The research is divided into six subprojects which utilize four different types of field study plots. Development of a Handbook: This is intended to be a detailed characterization of the Piceance Creek Basin ecosystem. It would describe the attributes of the area and the ecosystems prior to disturbance. It would present risk factors associated with development. In one sense it will summarize the baseline conditions, and it would present this information in a form useful to a wide range of people. Evaluation of the Long-Term Fertility Requirements of Disturbed Areas: This work would deal with the long-term need for nitrogen and phosphorus for success of revegetation, particularly for stabilization of spent shale piles. Both nutrients are expected to be critical due to their very low concentrations in processed shale. Long-term stability of established vegetation may be limited by the development of a stable soil organic matter component in these new ''soils.'' Soil Microbiology Study: Whenever soil is disturbed, the microbiological community it supports is altered. This is particularly true in mining operations. New communities are established through natural mechanisms for innoculation

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT;ECT
PROJECT DESCRIPTION: This study is to assist ERDA and industry in defining future research and development needs in the area of environmental controls and equipment for utilization in the gasification industry. The proposed effort identifies and categorizes the effluents from and control methods utilized in the four proposed gasification facilities so that the proposed designs can be evaluated with respect to existing and probable environmental regulations and best available technology. The specific objectives are to: (1) Determine the effluent control levels for the four gasification facilities for each pollutant as specified by: law (state and federal), plant design, and ''best available'' equipment. (2) Determine the ''cost'' of the pollution control for each pollutant analyzed in terms of monetary units and energy units. (3) Determine the operational reliability of the design effluent control equipment and the design reliability of projected effluent levels, for each pollutant identified. (4) Identify the probable future environmental regulations and the control technology available for these effluents. (5) Identify effluent control weaknesses in the designs and what research and development is needed to strengthen the design.
APPROACH: The environmental impact statements and filing information for each of the proposed facilities is used as the primary data base. The Environmental Protection Agency and state agencies have provided the regulatory information. Control technology status has been established with the appropriate vendors.
RESULTS: The product of this work will be a report.
PROJECT MILESTONES: Not applicable due to the short term (16 months).

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECT
PROJECT DESCRIPTION: The objective of this project is to demonstrate the feasibility of reducing the far field low frequency audio noise spectrum (120 Hz to 360 Hz) of a model transformer by means of an active sound cancellation system. Cost studies will be made to determine applied estimated cost of the noise reduction system to a 30 MVA, OA, power transformer.
APPROACH: The system operates by sensing the acoustic radiation from a sound source, conditions and amplifies this acoustic radiation to drive a sound projector in phase opposition to the sound source. The conditioning and amplification of the acoustic signal is continuously modified through a feedback loop so that changes in the transformer environment or applied voltage may be compensated.
RESULTS: Two engineering prototype sound cancellation units will be designed and built. A model, one cubic foot transformer will be designed and built. The system will serve as a demonstration model.
PROJECT MILESTONES: (1) Model transformer built 10/15/77. (2) Sound reduction system built 10/15/77. (3) Test of system 10/22/77.

CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Marine;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental;COASTS/Northeast;COASTS/Southeast;COASTS/Gulf;COASTS/Far West;COASTS/Alaska
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To provide an analysis of LNG storage facilities and transportation units. The data to be compiled will include, as appropriate: owner/operator; location; construction/start-up date; storage tank description; containment description; services description; primary jurisdiction; population density; points of cargo loading and discharge. Data will be tabulated, aggregated, and analyzed for time trends.
APPROACH: Surveys of LNG companies will provide updating information for existing records. Past experience of the IGT staff will guide the analysis of the data.
RESULTS: In addition to the Tables which describe the LNG industry today in the United States, projections are made of numbers and capacity for base-load import terminals and LNG vessels. During the 1976-1977 winter heating season, LNG accounted for about 12% of total peakshaving supplies for the gas industry. (The balance of 88% came from underground storage.) In New England, LNG provided 9% of total out of 11 companies during the winter heating season.
PROJECT MILESTONES: (1) Project begun May 1977. (2) Project ended August 1977. (3) Final report received August 1977.

REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental;COASTS/Other coasts U.S.
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The use of large scale mechanical systems for processing and burning municipal solid wastes for energy production has, since about 1968, been receiving a great deal of consideration. Studies to date primarily have been directed at the mechanical aspects of the individual system elements used for processing the solid waste and for energy production. Environmental impacts of such systems have been given little consideration in past work except possibly for air pollution. Almost no attention has been directed toward possible problems of excessive use of water and production of wastewater which might present mechanical or economical limitations to design and application. Consequently a study was initiated in October 1977 to make an evaluation of water use and wastewater production at municipal solid waste processing/energy recovery systems to identify possible adverse environmental impacts.
APPROACH: The study consists of three phases. Phase I (Oct. 1976--Sept. 1977) involves surveying existing technology through literature reviews and site visits and working with design engineering and manufacturing firms. This survey will help identify points of water use and wastewater production and document available information, and will serve as a basis for developing follow-up procedures for collecting additional data needed to accomplish the objectives of the evaluation program. Phase II and III (Oct. 1977 and following) will involve detailed follow-up studies to determine the treatability of wastewaters produced, to evaluate the availability and suitability of water pollution control technology to treat these wastewaters, and to identify possible ways to reduce water use and wastewater production.
RESULTS: Phase I (FY 77) has shown that water is used at solid waste processing/energy recovery facilities for scrubbing off-gases from burning operations, quenching incinerator residues, sluicing ash from incinerators and air pollution control devices, cooling, lubricating, fire fighting and miscellaneous housekeeping. There has been essentially no documentation of the volumes of water used for or wastewater produced by these purposes. In most cases, no measurements of wastewater quantities have been made and very little data are available on the quality of wastewaters and, in most cases, wastewater streams are discharged to sanitary sewers without regard to their treatability or impact on municipal wastewater treatment system.
PROJECT MILESTONES: Reports will be completed according to the following schedule: Phase I Interim Report: Prepared Sept. 1977, available FY 78; Phase II Interim Report: Prepared Sept. 1978, available FY 79; and Phase III Final Report: Prepared June-Sept. 1979, available Oct. 1979.

CHARACTER OF STUDY: RESEARCH/Laboratory (50%);DEVELOPMENT/Laboratory scale (50%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This study proposes to: (1) perform a detailed characterization of pollutants associated with a high temperature entrained gasification process; (2) determine the relationship between coal composition, ash composition, coal particle size, coal feed rate, steam/coal ratio, oxygen/coal ratio, reactor pressure, reactor temperature, residence time, and the resultant pollutants; and (3) recommend preferred environmental control strategies.
APPROACH: Samples will be collected during at least five different tests with each of four coals. These samples will be taken (1) from both the cooled and water-scrubbed gas stream; (2) from the scrubber effluent liquor; (3) from the gas evolved on depressurization of the scrubber liquor; and (4) from the settleable solids which collect in the gas-scrub liquor disengaging section. The composition of these samples will be determined using gas chromatography, proton induced x-ray emission spectroscopy, atomic absorption spectroscopy, and thermometric titrimetry.
RESULTS: (1) A qualitative and quantitative listing of process by-products. (2) A determination of process parameters that affect the magnitude and nature of the by-products generated. (3) A recommendation of environmental control modifications.
PROJECT MILESTONES: (1) Development of all analytical methodologies. (2) Acquisition of data. (3) Process design studies.

PROJECT DESCRIPTION: The objective of this study is to survey the developing energy technologies to determine the existing and/or anticipated environmental control needs for noise level control. This survey will identify practical noise control procedures and/or process modifications to mitigate the impact of noise where appropriate. An essential product of the survey is the identification of areas where existing environmental noise control is inadequate, and the development of recommendations for a program to address such inadequacies.
APPROACH: Literature search, some field measurements, and analysis.
RESULTS: Final study report with recommendations.
PROJECT MILESTONES: Final report.
KEYWORDS: NOISE;HEALTH HAZARDS;VIBRATIONAL STATES;SOCIOLOGY

TITLE: Improved Water Management of Coal Conversion Processes by Preliminary Absorption of Halides
PROJECT NUMBER: 800161
PRINCIPAL INVESTIGATOR: Parsons, W.A.
ADDRESS: 6200 Oak Tree Blvd., Cleveland, OH 44131
AFFILIATION: McKee (Arthur G.) and Co., Cleveland, Ohio (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Environmental Control Technology
MONITOR: Witmer, Fred E.
TELEPHONE: C(301)353-5517
TYPE OF FUNDING: Contract No.-EE-77-C-02-4375
77 FUNDING: Energy Research and Development Administration FY77:$25,000
TECHNOLOGY: FOSSIL FUEL/Coal Conversion liquefaction;FOSSIL FUEL/Coal Conversion gasification (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (30%);WASTE MANAGEMENT (70%)

POLLUTANTS: METALS/Halide salts (100%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: Coal conversion processes produce raw gas containing particulates and other undesirable chemical constituents that are removed prior to use of the gas for fuel. The study will evaluate the feasibility and advantages of the capture of ammonium chloride and strong acid gases from the raw gas in a low volume purge to facilitate disposal and water management.
APPROACH: The study will analyze technical and economic factors associated with the implementation of the concept on a 60 ton per day fixed bed gasifier operating in conjunction with appropriate effluent regulations. Engineering analysis and cost estimation will be employed to evaluate gas cleaning alternatives, effluent treatment alternatives, effluent disposal alternatives and recycle/reuse alternatives.
RESULTS: It is expected that preliminary absorption of halides will be revealed as an important water management concept that will be particularly attractive for application to high halide coals such as predominate in the Eastern and Midwestern United States.
PROJECT MILESTONES: (1) Assessment of technical feasibility--Month No. 8 of study. (2) Assessment of economic feasibility--Month No. 13 of study.

TELEPHONE: F233-5510
TYPE OF FUNDING: Contract No.-EE-77-S-02-4204
77 FUNDING: Energy Research and Development Administration FY77:$69,000
TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
ENERGY CYCLE: TRANSPORTATION (50%);STORAGE (50%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Marine;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental;COASTS/Northeast;COASTS/Southeast;COASTS/Gulf;COASTS/Far West;COASTS/Alaska
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To review existing analytical and experimental information on the properties of LNG spills on water and land (vapor generation; dispersion, and fire), and to compare predicted or extrapolated characteristics for very large spill sizes. Significant discrepancies will be discussed and an assessment made of the possibility of resolving disagreements with the limited measurements which might become available from a few large tests. An analytical framework will be developed for deciding what measurements should be made to answer certain key questions.
APPROACH: The volume of spilled LNG is considered the major variable defining the size of a spill. The description of the complete history of an unignited spill is a necessary prelude to understanding the full range of possible fire hazards. Other physical properties (e.g., thermal or mechanical properties of soil or water, storage vessel shape, wind speed, atmospheric stability) are considered parameters which affect the extent of the hazard but which need not necessarily be taken into account explicitly in determining the effects of scale.
RESULTS: Preliminary results for unconfined water spills, unconfined land spills, and confined land spills show that thermal radiation intensity and vapor concentration vary nearly in proportion to the spill volume, but that the time scale on which the spill events proceed increases only slightly with spill size. A striking result of the analysis is that many of the effects or observable quantities vary as a small fractional power of the spill volume (e.g., evaporation time, fireball burnup time, critical wind speed for plume formation.) A special note should be made of the effect of wind speed on the nature of cloud dispersion process. The distinction between low and high wind speed, as it affects plume shape or mixing, is practically independent of spill size. Thus field tests of spills should be carried out for a range of wind speeds and atmospheric stabilities independent of spill size. Extrapolation can then be made for fixed metecrological states.
PROJECT MILESTONES: (1) Project begun 1 Dec 1976. (2) First annual report 1 Dec 1977.

TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
ENERGY CYCLE: TRANSPORTATION (50%);STORAGE (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (50%);DEVELOPMENT/Laboratory scale (50%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To assess three different measurement concepts for an inexpensive, accurate, reliable, and rapidly responding instrument for measuring atmospheric concentration of methane. For each of the concepts, quantitative data will be obtained on response time, absolute accuracy, and concentration ranges

over which the technique is useful. Emphasis will be placed on conditions representative of those which would be encountered in field tests of the dispersion of vapors from LNG spills.
APPROACH: To build breadboard models of several feasible systems and to measure the response parameters as they are affected by various factors in the laboratory, so that credible extrapolations may be made for field use.
RESULTS: An assessment of the capabilities (advantages and disadvantages) of three types of methane detectors for use in field experiments involving spills of LNG on land and water.
PROJECT MILESTONES: (1) Project began June 1977. (2) Simulated field test March 1978. (3) Final report June 1978.

TITLE: Evaluation of the Effect of Coal Cleaning on Fugitive Elements
PROJECT NUMBER: 800236
PRINCIPAL INVESTIGATOR: Boyer, J.F. Jr.;Ford, C.T.
ADDRESS: 350 Hochberg Road, Monroeville, PA 15146
AFFILIATION: Bituminous Coal Research, Inc., Monroeville, Pa. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Environmental Control Technology
TYPE OF FUNDING: Contract No.-EE-77-S-02-4427
77 FUNDING: Energy Research and Development Administration FY77:$375,000; Bureau of Mines FY77:$75,000
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
ENERGY CYCLE: EXTRACTION (1%);TRANSPORTATION (1%);PROCESSING, CONVERSION (96%);COMBUSTION OR END USE (1%);WASTE MANAGEMENT (1%)
POLLUTANTS: METALS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (96%);ANALYTICAL (4%)
IONS OF INTEREST: GEOGRAPHIC AREAS/Continental
EARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
ROJECT DESCRIPTION: By virtue of its origin, coal has been found to contain nearly every naturally occurring element. During coal mining, preparation, and utilization these elements may be released to the environment. The primary objective of this project is to assess the effect of controlled coal cleaning on fugitive elements present in run-of-mine coal. The second project objective is to prepare a comprehensive state-of-the-art report on the effect of coal mining, preparation, transportation, and utilization on the

trace elements found in coal. The third objective is to provide a description of accurate analytical methods that can be used by coal industry and commercial laboratories for determining the concentration of selected trace elements in a variety of coals.
APPROACH: The effect of coal cleaning on fugitive elements will be evaluated by exhaustively studying 20 samples of ROM coal obtained from various geographical locations throughout the United States. All ROM samples will be subjected to controlled coal cleaning at the BCR laboratory. Each coal will be crushed to a 1-1/4-inch topsize, sampled, and then screened into 1-1/4 x 1/4-inch, 1/4-inch x 30-mesh, and minus 30-mesh fractions which are typical of present cleaning plant circuitry. The 1-1/4 x 1/4-inch and the 1/4-inch x 30-mesh fractions will be gravity separated at the following gravities: 1.35, 1.55, and 1.80. The minus 30-mesh material will be separated into four distinct fractions, using a hydraulic classifier. Each fraction produced by the coal cleaning task will be characterized by general chemical and trace element analysis, as well as petrographic analyses where appropriate, and the data will be evaluated to determine the trace element concentrations in the various clean coal and reject fractions.
RESULTS: Conclusions to be drawn from this study will concern the potential for coal cleaning as a strategy for controlling trace elements that otherwise may become an environmental problem during subsequent utilization of a particular coal.
PROJECT MILESTONES: (1) July 1978 State-of-the-art review. (2) July 1979 Analytical procedure report. (3) July 1979 Final report on the effect of coal cleaning on fugitive elements.

POLLUTANTS: SPECIFIED OTHER POLLUTANTS/Synthane process wastewater (100%)
CHARACTER OF STUDY: DEVELOPMENT/Pilot plant (100%)
REGIONS OF INTEREST: BIOMES/Freshwater
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECT
PROJECT DESCRIPTION: The objective of this project is to characterize SYNTHANE process wastewaters, to evaluate concentrations of effluents in relation to established standards, and to devise treatment methods capable of meeting such legally established or proposed regulations.
APPROACH: Treatment steps being considered are oil and tar separation, solvent extraction, ammonia and acid gas stripping, biological oxidation (aerobic or anaerobic), char or charcoal adsorption, reuse in cooling towers and blowdown concentration and evaporation. Many of these steps have been researched at PERC on wastewater from the SYNTHANE PDU gasifier. This gasifier is a scaled model of a commercial unit and the water generated should be representative of what is expected from larger units. Further treatability studies are needed.
RESULTS: Characterization and correlation of SYNTHANE process by-product water, investigation of the treatability of by-product water using various biological and physico-chemical processes, the continuation of char sorption studies, the initiation of a program to construct and operate an integrated wastewater treatment system and an investigation of using acids for oil and tar removal by depressing the pH into the 2-5 region.
PROJECT MILESTONES: (1) Complete construction-continuous unit 1 January 1978. (2) Solvent extraction 30 March 1978. (3) Cooling tower tests 1 June 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: A need exists for rapid, accurate, and precise simultaneous multielement methods of determining trace and ultratrace levels of inorganic and organic components in energy related materials. The goal of this project is to apply the selectivity of specially designed chelating and sequestering resins to the analysis of energy related materials for the determination of trace metallic and organic contaminants. The final analysis of metallic elements in eluants or by direct injection of the complete resin column into the inductively coupled plasma discharge will provide simultaneous, multielement

determination. Other chelating and sequestering resins are under development for organic materials, and conventional and new detection systems will be combined with the resins for selective analysis.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Site specific Unspecified
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The principal objective of the program is to develop methods for collecting and quantitating fugitive emissions from coal liquefaction processes and coal conversion processes in general.
APPROACH: To develop a method based on various absorbant procedures for collection of fugitive emissions from coal liquefaction processes and to demonstrate the quantitation of the method using compounds which are found in coal liquids including alkyl derivatives of polynuclear aromatics, hydroaromatics compounds, and various heteroatom species containing O2, N2 and S. To demonstrate the method for collection of emissions from coal liquefaction processes at temperatures up to 450 degrees C.
RESULTS: The end result of this research effort will be the development of analytical techniques for determining and quantifying the fugitive emissions resulting from coal liquefaction processes. The determination of such emissions will be extremely useful in determining the in-plant environmental aspects of coal liquefaction processes.
PROJECT MILESTONES: Monthly end quarterly reports.

REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: R and D to characterize the performance of a simple aerosol classifier using the principle of virtual impaction and a continuously variable slit width.
APPROACH: Conformal mapping techniques will be used to describe the properties of two-dimensional jets of ideal fluid impinging normally upon a void. The analysis includes fluid deflecting plates of finite length inclined at arbitrary angles to the incident jet. Particle trajectories will be numerically simulated for various theoretically admissible geometries. Scaled up water models will be used to record the flow field.
RESULTS: Report with experimental results and design data.
PROJECT MILESTONES: Final report should be received around the middle of 1978.
KEYWORDS: AIR POLLUTION;AEROSOLS;PARTICLE SIZE CLASSIFIERS;DESIGN

<087821>
TITLE: Evaluation of CO in Blood Samples from the Second Health and Nutrition Survey
PROJECT NUMBER: 7590
PRINCIPAL INVESTIGATOR: Radford, E.P.
ADDRESS: Pittsburgh, PA 15261
AFFILIATION: Pittsburgh Univ., Pa. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Chicago, Ill. (USA). Chicago Operations Office
TYPE OF FUNDING: Grant No.-EY-76-S-02-4023
77 FUNDING: Energy Research and Development Administration FY77:$14,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: NOXIOUS GAS/CO (100%)
~"\RACTER OF STUDY: RESEARCH/Laboratory (100%)
;IONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
;EARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: This study is extremely important for providing two types of information: (1) standard analytical methodology for COHb analysis, which, given NIOSH's indication that CO may be considered an indicator for PNA's in the workplace, makes COHb measurement important in medical surveillance, and (2) COHb levels in the 64 communities provide information on human COHb variations due to CO levels in

communities of different transportation/industry configurations. Complete medical and smoking histories of the individuals in HANES are available for future analysis by HHS contractors. Dr. Radford provides a subsample of bloods to Dr. Rodkey, Naval Medical Center, for ''blind'' analysis to compare with Radford's results. Comparison to date has been about 99% agreement of COHb measurement using different methodologies.

<087822>
TITLE: Structural Organization of Chloroplast Membranes: Correlation of Grana Stacking to Light Harvesting Efficiency
PROJECT NUMBER: 7604
PRINCIPAL INVESTIGATOR: Arntzen, C.L.
ADDRESS: Urbana, IL 61801
AFFILIATION: Illinois Univ., Urbana (USA)
MONITORING AGENCY: Energy Research and Development Administration, Chicago, Ill. (USA). Chicago Operations Office
MONITOR: Duda, George D.
77 FUNDING: Energy Research and Development Administration FY77:$40,000
TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To map the exposed surface proteins of the lamellar membranes of chloroplasts and to relate them to the organizational changes that occur in these membranes during the formation of grana.
APPROACH: Dr. Arntzen proposes first to study the transition from agranal to granal chloroplasts and will determine: (1) the unit size of photosystem I and photosystem II by their spectral response; (2) changes in the protein content during plastid membrane differentiation; and (3) changes in the membrane surface proteins during grana formation. Related experiments on the chloroplast lamella membranes include: (1) determination of the proteins on the interior of the membrane; and (2) determine whether or not membranes that are light energized (i.e., conducting light stimulated electron transport) will show suspected conformational changes in their surface proteins.
KEYWORDS: PLANT CELLS;CHLOROPHYLL;CHLOROPLASTS;CELL CONSTITUENTS;PROTEINS;CELL MEMBRANES;BIOCHEMICAL REACTION KINETICS;PHOTOCHEMICAL REACTIONS;MORPHOLOGICAL CHANGES;CHEMICAL COMPOSITION;PHOTOSYNTHESIS

<087823>
TITLE: Microbial Production of Aliphatic Hydrocarbons
PROJECT NUMBER: 7605
PRINCIPAL INVESTIGATOR: Tornabene, T.G.
ADDRESS: Fort Collins, CO 80521
AFFILIATION: Colorado State Univ., Fort Collins (USA)
MONITORING AGENCY: Energy Research and Development Administration, Chicago, Ill. (USA). Chicago Operations Office
77 FUNDING: Energy Research and Development Administration FY77:$79,000
TECHNOLOGY: SOLAR/General (75%);CONSERVATION/General (25%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: This project addresses the prospect of use of efficient hydrocarbon-producing microorganisms to produce desirable fats and oils and other organics from a variety of simple substrates.
APPROACH: (1) Identify and screen microorganisms for optimal non-gaseous hydrocarbon production. (2) Determine the physiological conditions necessary to improve growth and hydrocarbon production. (3) Elucidate the genetic basis for hydrocarbon production. (4) Genetically transform cells to high hydrocarbon production. Heavy emphasis will be placed on micrococci and mycobacteria some species of which produce 1 to 2% of their dry weight in fats. Some green algae produce 17% by weight in actively growing culture. Reference is made to genetically transformed hybrids of micrococci with 10 fold increase in hydrocarbon content it is of great significance that some microbial species excrete a large fraction of the fatty hydrocarbons they produce.
KEYWORDS: HYDROCARBONS;FATS;OILS;BIOSYNTHESIS;MICROORGANISMS;GENETIC VARIABILITY;METABOLISM;BACTERIA;BIOMASS

TITLE: Relationship of DNA Repair Processes to Mutagenesis and Carcinogenesis in Mammalian Cells
PROJECT NUMBER: 7606
PRINCIPAL INVESTIGATOR: Evans, H.H.
ADDRESS: Pittsburgh, PA 15213
AFFILIATION: Case Western Reserve Univ., Cleveland, Ohio (USA)
MONITORING AGENCY: Energy Research and Development Administration, Chicago, Ill. (USA). Chicago Operations Office
77 FUNDING: Energy Research and Development Administration FY77:$119,000
TECHNOLOGY: GENERAL SCIENCE (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (50%);COMBUSTION OR END USE (50%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project addresses an important issue in carcinogenesis and mutagenesis and that is whether post-replication repair of DNA (error-prone repair) is the molecular event for initiation of carcinogenesis and for induction of gene mutations.
APPROACH: Dr. Evans proposed to get at this problem by a novel mutagenization and selection technique using infection with damaged cytocidal viruses which can be reactivated only if cells have active repair systems. Thus, one can select repair deficient mutagens. The efficiency of the process is not known.
RESULTS: The first year effort will be to test the lethal effects of the mutagenizing agents and measurement

of mutagenic efficiency and cell transformation. Attempts will be made to define optimal conditions for mutagenesis and capability to conduct excision repair. Success will determine the fate of the remainder of the program.

TITLE: PRF-Screen for Hazardous Chemicals: Rapid Detection of Health Hazards
PROJECT NUMBER: 7607
PRINCIPAL INVESTIGATOR: Smith-Sonneborn, J.
ADDRESS: Laramie, WY 82070
AFFILIATION: Wyoming Univ., Laramie (USA)
MONITORING AGENCY: Energy Research and Development Administration, Chicago, Ill. (USA). Chicago Operations Office
DIVISION: Chicago Operations
77 FUNDING: Energy Research and Development Administration FY77:$83,000
TECHNOLOGY: FOSSIL FUEL/Oil Shale (100%)
ENERGY CYCLE: EXTRACTION (100%)
POLLUTANTS: ORGANICS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Develop and use protozoan system to screen for mutagens in process and waste water from shale oil processing.
APPROACH: The heaviest emphasis in her work would be on aqueous wastes and their route to ground and surface waters which can be looked at right now. The first year will be spent checking her screen against the popular Ames test for carcinogens and mutagens. The system once perfected will be used to screen the LERC aqueous effluents. Our hope would be that she would continue the 2-tiered test throughout the length of the project, and that Dr. Smith-Sonneborn would collaborate with analytical chemists at LERC.

POLLUTANTS: ORGANICS (50%);SPECIFIED OTHER POLLUTANTS/Photochemical reactions (50%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: This project is intended to study the production and quenching cross sections of photoexcited triplet states through the concommitant conversion of the spin states of positronium.
APPROACH: Ortho positronium, when formed in a gas, decays with a characteristic lifetime of the order of 100 ns. Spin conversion of ortho positronium to para positronium on an excited triplet state is expected to shorten the lifetime drastically, by 2 to 3 orders of magnitude. Measurements of the concommitant reduction in the long-lived component of the positron annihilation spectrum can be measured with high accuracy tc give access to experimental spin conversion cross sections pertinent to the prediction of the photochemical reactivity of impurities in gases.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The development of analytical procedures for the identification and determination of radioactive elements in environmental and biological materials, including the direct in vivo determination in humans. The procedures must be reliable and have sufficient accuracy and sensitivity to meet the needs of existing standards and guides. The same radiochemical procedures are equally applicable and necessary whether characterization of source terms and pollutants, measurement technology, or monitoring are being considered.
APPROACH: The best chemical techniques and modern instrumentation will be exploited to develop, modify or adapt new procedures to the particular types of samples requiring analyses, or to provide extraordinary sensitivity, accuracy or precision for the problems encountered.
RESULTS: New analytical radiochemical procedures are expected to be more sensitive, precise and, particularly, more accurate and reliable when applied to various sample matrices than existing procedures. For example, only total decomposition by appropriate fusion techniques will be permitted before chemical separations are begun in the determination of refractory elements. All final procedures will be published in the permanent literature.

PROJECT DESCRIPTION: To administer environmental studies on the Idaho National Engineering Laboratory National Environmental Research Park. To provide field facilities, site characterization and dissemination of information.
APPROACH: The objectives are being met through the appointment of a NERP coordinator. Several studies are in progress to characterize the INEL Site environment. Meetings have been held with all personnel involved in ecological studies at the INEL and proceedings are currently being mailed. A NERP brochure and two displays describing the INEL NERP are being planned.
RESULTS: The INEL Site environment will be characterized. A series of studies will result in knowledge concerning the best land-use for desert areas similar to the INEL. The environmental impact of energy development programs will be better understood. Natural research areas are being established. The environmental impact of various types of land use policy will be better understood.

PROJECT DESCRIPTION: To obtain basic information on the flora and fauna of the Idaho National Engineering Laboratory Site which will enhance future environmental planning, preparation of environmental impact statements, and provide data to determine the movements and effects of radioactive materials in the ecosystem involved. Characterize the environment of the INEL National Environmental Research Park.
APPROACH: The objectives will be met through several ecological studies conducted on the INEL by graduate students (supervised by ERDA personnel). These studies will be conducted to obtain basic ecological information of the INEL Site environment. The studies being conducted or in planning are: (a) a study of raptor species; (b) demographic analysis of the burrowing owl; (c) vegetation analyses on grazed and ungrazed areas; (d) faunal population levels correlated with different/and use practices; (e) validation study of rodent populations; (f) plant and animal succession on a burned area; (g) a study of plant succession by use of long-established (26 yr) plant transects (h) seasonal diet of coyotes; (j) a demographic analysis of the pygmy rabbit (k) a study of amphibian and reptilian fauna; (l) periodic distribution and food habit relationship of fishes.
RESULTS: Baseline data on animal and plant populations and communities on the INEL Site will be obtained from these studies. Information on species composition, movement and density of animals on the INEL Site can be used to assess potential radionuclide movements through food chains and can be used to determine the effects of nuclear power plants on radionuclide accumulation in man. The concentration and transport of radioactive contaminant will be more accurately evaluated as a result of these studies. Some of the sub-projects will provide new ecological information on certain species such as the pygmy rabbit. The information gleaned from these studies will also enhance our ability to prepare Environmental Impact Statements for nuclear reactor construction and operation.
PROJECT MILESTONES: Acquired understanding of fish population dynamics and movement of fish within the INEL site. 1977, Evaluation of ERDA's water management program in conjunction with aquatic life. 1977, Obtain a better understanding of fish home ranges, migration, and dispersal in relation to biotic parameters, and the significance to fishery management. 1978, Development of water management program to lessen environmental impact to aquatic life by INEL activities. 1979, Development of methodologies and predictable tools to aid future research and land use planning.

TITLE: Radiation Measurement Technology
PROJECT NUMBER: 001352
PRINCIPAL INVESTIGATOR: Helmer, R.G.
ADDRESS: Aerojet Nuclear Company, Nuclear Technology Division, 550 2nd Street, Idaho Falls, ID 83401
AFFILIATION: Aerojet Nuclear Co., Idaho Falls, Idaho (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
TYPE OF FUNDING: Contract No.-E(10-1)-1375;Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$80,000
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (25%);ELECTRICITY GENERATION (50%);WASTE MANAGEMENT (25%)
POLLUTANTS: RADIATION (90%);SPECIFIED OTHER POLLUTANTS/Technology transfer to other pollutants (10%)

CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: The purpose of this program is to provide a technology base to assure that new advances in technology associated with radiation measurements will be assessed and utilized. The need for develcpment of well documented measurement techniques and proven instrumentation is expanding at a rapid rate. To meet this need it is essential that advanced concepts in detection systems, measurement techniques and remote sensor operation be developed. It is also essential that for the specialized equipment required, performance criteria be identified and developed to a useful state. To meet these needs, the major objective of this program is to provide a continuing effort in the development of experimental methods required to apply the techniques of nuclear spectroscopy as an analytical tool for elemental and isotopic analysis and to expand the application of these techniques to non-nuclear energy problems.
RESULTS: Expected Results in FY 77: The major emphases of this program in FY 77 will be: operation of phase II remote controlled gamma-ray spectrometer system; fabrication and testing of a phase III remote gamma-ray spectrometer design of other remote environmental assessment systems; characterization of planar intrinsic Ge detector; acquisition of coaxial intrinsic Ge detector; continued improvement of basic computer programs for analysis of gamma-ray spectra from Ge(Li) detectors; and collection of additional spectra and preparation of text for the Ge(Li) Gamma-Ray Spectrum Catalogue. Expected Results in FY 78: The major emphases of this program will be the continued development of electronic systems for remote environmental assessment, the improvement of spectroscopy techniques and detector characterization. The phase III remote gamma-ray spectrometer will be operated to obtain experience related to determining an optimum design of the software. A possible commercial system will be designed. This technology will be applied to other areas of environmental assessment. Electronics systems will continue to be improved as needed for various uses. The effort to characterize the operation of state-of-the-art gamma-ray detectors will continue. Publish supplements to the Gamma-Ray Spectrum Catalog including additional spectra. Provide documentation of updated computer programs for the analysis of Ge(Li) gamma-ray spectra.

RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: This is a continuing project for the collection, computerization, and distribution of effluent and on-site discharge data at ERDA sites. The information provides a management overview of ERDA environmental releases. Expansion of computer programs and output formats will provide more ready timely access to data and in a more usable form for both ERDA-HQ and field organizations.
APPROACH: The computer-based annual reporting systems consist of two management information systems. These two systems are identified as the U.S. ERDA Effluent Information System (EIS) and the U.S. ERDA On-site Discharge Information System (ODIS). The two management information systems consist of over 50 computer programs which maintain current nuclide data bases and narrative summary information for each effluent release point and on-site discharge point as reported by the ERDA-owned facilities throughout the United States. Computer printouts are generated to summarize the data into routine annual reports for validation of calendar year information. Systems analysis and programming maintenance service is provided for all operational programs. Changes and improvements are made as directed by ERDA-HDQ and as determined by operational experience to be pertinent and appropriate.
RESULTS: The ERDA EIS and ERDA ODIS Systems were designed to help accomplish the reporting requirements for radioactive effluents and radioactive on-site discharge as set forth in ERDA Manual Chapter 0513, Effluent and Environmental Monitoring and Reporting. These two management information systems have helped assemble a ''best available'' inventory of past on-site and off-site radioactivity releases for all retired and active ERDA facilities. Data bases from two systems provide a central source of information to provide routine and ''on call'' output reports and graphs for use by ERDA and ERDA contractors. Summary and alert reports are generated to serve as a management tool for maintaining an overview of the levels and trends in radioactive effluents and discharges. EIS and ODIS data collected from ERDA and ERDA contractors is processed each calendar year and all required and requested reports generated.

TECHNOLOGY: FOSSIL FUEL/General (25%);NUCLEAR/General (25%);GENERAL SCIENCE (50%)
CHARACTER OF STUDY: RESEARCH/General (25%);DEVELOPMENT (75%)
RESEARCH CATEGORY: OPERATIONAL SAFETY
PROJECT DESCRIPTION: The objectives of this project are: (1) Improved evaluation and subsequent reduction of risks and hazards associated with ERDA work; (2) Improvement of communications and control relating to ERDA risks and hazards - internal and external to ERDA; (3) The establishing of standardization of method and comparability of hazard and risk assessment programs within ERDA; and (4) Improved allocation of resources to risk evaluation and hazard control. Total program scope is indicated on a planning tree.
APPROACH: The approach to be used is a continuing system safety process which: (1) Evaluates ERDA OES needs; (2) Searches the ES field for established and proven analytical methods; (3) Adapts existing methods or develops new programs to fill the needs; (4) Tests the methods in ERDA project context; (5) Designs risk evaluation and hazards control programs which are compatible with good general management practices; (6) Develops and implements software and training programs; and (7) Provides continuous consulting and

evaluation of the effectiveness of those methods implemented within ERDA. The activities indicated above are implemented through a contract based System Safety Development Center.
RESULTS: (1) The product expected is a series of OES guideline manuals and training programs related to implementation of the methods described in the manuals. (2) The results expected are: (a) Improved ERDA safety program based on cost-risk-benefit-communications criteria; (b) Improved comparability between the risks and hazards associated with the several ERDA energy programs; and (c) A reduction in the hazards and risks associated with ERDA programs.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine the physical circulation of the Eniwetak Atoll lagoon and the flux of carbon, phosphorus and nitrate across the atoll's reef flats.
APPROACH: Conduct a field measurement program of physical properties using current meters and drogues and of selected nutrient chemical properties by sampling and analysis.
RESULTS: Models depicting the circulation system and residence times of water and certain of its nutrient properties.
KEYWORDS: ENIWETOK;COASTAL WATERS;SEAWATER;SAMPLING;CHEMICAL COMPOSITION;NUTRIENTS;CARBON;PHOSPHORUS;NITRATES;QUANTITATIVE CHEMICAL ANALYSIS;ENVIRONMENTAL TRANSPORT;AQUATIC ECOSYSTEMS;MATHEMATICAL MODELS

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Southwest
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: Task I: Rover and Tory Fuel. Approximately $25.5M worth of fuel remained at the NRDS after closeout of the Space Propulsion Project. This fuel is being processed and shipped to the INEL for further reprocessing.
APPROACH: Task II: Personal Property Processing and Excessing. Responsibility for disposing of the NRDS facility property was assigned to NV on closeout of the Space Nuclear Propulsion Project. An exception to the ERDA (AEC) Manual was granted which allowed the requester of the surplus property to be billed for property management service in the area. During mid-FY 1976 it became apparent that the movement of this property had reached a state where such requests were not covering the costs of managing the property. This task covers the remainder of the work expected to be required for disposing of the remaining uncontaminated personal property in the area.
RESULTS: Task III: NRDS Standby. On completion of the fuel processing and property disposal activities in FY 1977 the NRDS facilities currently in use will be placed in standby status. This task covers the guard costs and periodic maintenance required to protect these assets.
PROJECT MILESTONES: FY 1977. The Tory II C fuel will be processed and shipped to INEL. The facility will be decontaminated and placed on standby status. Property management activities will be completed in FY 1977.

POLLUTANTS: ORGANICS (50%);RADIATION (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: From an ontogenetic approach, our objective is to identify, describe, and determine the temporal limits of the various stages in the gametogenic pathway of cattle, swine, and rat and to determine the effect of stage and species within stage on the quantity and quality of germ cells subjected to toxicants emitted by the energy-producing industry.
APPROACH: Effects of toxicants, administered either chronically or acutely, on the germ cell of the female are assayed through counts of germ cells and follicles in serially sectioned ovaries and through observation of reproductive performance, i.e., number and quality of offspring produced during a limited portion of the lifespan. In the male, germ cells are quantified in cross sections of testes and

whole-mounts of seminiferous tubules. The quantity and quality of semen is also assessed.
RESULTS: Parameters, derived from our studies, describing the dose-response curves of the germ cells of cattle, swine, and rat will enable us to predict with reasonable accuracy how the germ cell of man will respond to a given energy-related toxicant at varying stages of development and senescence.
KWORDS: GENETICS;REPRODUCTION;CATTLE;SWINE;RATS;GERM CELLS;ENERGY SOURCES;ENVIRONMENTAL EFFECTS;POLLUTION;TOXICITY;DOSE-RESPONSE RELATIONSHIPS;GAMMA RADIATION;HYDROCARBONS;GAMETOGENESIS;FETUSES

POLLUTANTS: ORGANICS (50%);RADIATION (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To improve estimates of risk to humans from various forms of energy generation by studying in long-lived mammals the late somatic effects of ionizing radiation or pollutants associated with use of fossil fuels.
APPROACH: Burros exposed to gamma irradiation in 1951 or 1954 or to neutron-gamma (bomb) irradiation in 1957, together with unirradiated controls, are being maintained under observation. Causes of death of animals dying spontaneously are determined through postmortem examinations. Data on mortality from this and other experiments with long-lived animals will be evaluated using competing risk analysis. Preliminary experiments, designed to study carcinogenic effects of polycyclic aromatic hydrocarbons, are being started, with swine as the experimental animal. Compounds known to be carcinogenic in rodents will be fed or applied cutaneously and the biological effects studied by appropriate methods.
RESULTS: The experimental work with burros will provide data about the carcinogenic effect of ionizing radiation in a species which has a low rate of spontaneous neoplasia. This information will be helpful in understanding relative-versus-absolute risk in radiation carcinogenesis. The results of experiments with chemical carcinogens will enhance the value of extrapolation to man of data obtained from other mammals by increasing the number of species studied.
KEYWORDS: ENERGY SOURCES;POLLUTION;HEALTH HAZARDS;NEUTRONS;GAMMA RADIATION;BIOLOGICAL RADIATION EFFECTS;MORTALITY;BURROS;HYDROCARBONS;NEOPLASMS;RADIOINDUCTION;FOSSIL FUELS;BIOLOGICAL EFFECTS;AGING;ANIMALS;CARCINOGENS;GAMMA RADIATION

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Through the application of in vitro culture techniques, chromosome analyses, and various measures of the in vitro behavior of cells, to investigate the effects of energy-related environmental pollutants on chromosome structure and cell function in representative mammalian systems.
APPROACH: Data from large animals can, in general, be more meaningfully extrapolated to man than that from laboratory species, and extrapolations are always stronger when interspecies comparisons can be made. Structural changes in chromosomes are taken as indicators of genetic rearrangement and thus indicative of mutagenic action by various agents. Aberrations found in the early embryonic stages can be measures of either damaging effects of the embryo or, more important, of damage which has been transmitted from the parent germ cell line.
RESULTS: The level of induction of chromosome aberrations by selected agents applied to preimplantation embryos will be quantitated and evaluated for its relationship to embryo survival. Methodology for obtaining adequate chromosome preparations will be refined in laboratory species and then applied to swine embryos. An ultimate relationship is sought between chromosomal sensitivity in somatic, germ, and embryonic cells within a species so that predictions of germ and embryonic cell sensitivity could be made for man on the basis of somatic cell evaluations.

POLLUTANTS: METALS (50%);ORGANICS (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Objectives are threefold: (1) elucidate biology of regulation and synthesis of aspartate-derived amino acids; (2) determine mechanism of effects on intermediary metabolism induced by energy-related pollutants; and (3) mutagenesis for crop improvement.
APPROACH: The approach in 1 and 2 above are very similar; i.e., learn as much as possible concerning the system under investigation and then design research that utilizes the information. For example, nutrition studies using amino acids alone and in combination with and without analogs help to pinpoint mechanisms and regulatory sites in the pathway in both/barley and tobacco. The presence of and form(s) of key enzymes are determined. Information is then used to design screens to enhance the probability of isolating mutations involving key sites and/or processes that can be utilized for crop improvement.
RESULTS: Expected results include: (1) plant systems that can be utilized to monitor the environment for toxic and/or mutagenic pollutants; (2) improved crop varieties that maintain high productivity of quality products even under environmental stress; (3) barley plant types with increased lysine content; (4) demonstrate feasibility of using in vitro-cultured cells to induce and recover desirable mutants in tobacco, or model system; (5) development of rapid assay system for methionine in soybeans; and (6) biochemical and genetic characterization of mutants that can be utilized to better understand the genetics of amino acid synthesis and the nature of tolerance to pollutants, for example.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The purpose of the program is to conduct basic research studies of atmospheric turbulence and diffusion and to provide a continuing meteorological service to ERDA and its contractors in the Oak Ridge Operations area. Basic research includes atmospheric diffusion studies, planetary boundary layers studies, numerical studies of turbulent flows and turbulent heat flux, and momentum transfer studies. Meteorological instrument research is conducted as required to verify and improve the estimates made in connection with the above services and studies. Environmental transport, dispersion and diffusion of pollutants (including modeling and geochemical cycling); physical and chemical transformation of pollutants (e.g., photochemical reactions in atmosphere, adsorption of pollutants by soil particles); processes by which pollutants are removed from air, land and water; meteorological-climatic effects of heat, moisture, and pollutant releases; ecological processes and effects/baseline measurements and determination of ecological parameters; ecological impacts related to chemical disturbances - cycling of pollutants in the biosphere.
APPROACH: Physical and mathematical modeling, and boundary layer structure observations.
RESULTS: The results from this project are in the form of mathematical and physical models describing atmospheric transport and diffusion of energy wastes, the effects of waste heat on the atmosphere, and the structure of the atmospheric boundary layer. These results are directly applicable to environmental impact studies, to Federal regulations, to the design and siting of power plants, and to study of atmospheric effects of energy generation.
PROJECT MILESTONES: (1) 15 Nov. 1976 Wind tunnel operational. (2) 1 June 1977 2-D cooling tower plume model complete. (3) 1 June 1977 Potential flow model operational. (4) 1 Jan. 1978 Mesoscale boundary layer model completed.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To investigate and evaluate the effects of stresses on a coastal marine ecosystem caused by the continuing development of the largest energy converting and petrochemical complex in Puerto Rico.
APPROACH: An integrated team approach will be used to investigate the interaction of physical, chemical and biological systems in the Guayanilla-Tallaboa area. The research will identify and characterize the pollutants in the area and attempt to describe their transport within and through the Bay ecosystem. The stresses on the biological systems caused by these pollutants will be measured and evaluated.
RESULTS: A set of management alternatives for the wise utilization of energy and marine resources.
PROJECT MILESTONES: 1st year, A comprehensive research plan will be developed to determine the programmatic research over the next five years. Specific projects and milestones will come from this plan.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of this project is to examine the antigenic and biochemical changes associated with the earliest stages of cell transformation induced by oncodnaviruses acting synergistically with x-irradiation (low-level) or radiomimetic chemicals.
APPROACH: A highly specific, cytotoxic antiserum has been prepared against fetal antigen (EA) present on 10 but no 14 day gestation hamster fetal or embryonic cells. The serum antibody responsible is also capable of destroying a wide variety of sarcomas which are known to carry EA. This serum is being used to detect (by cell cytotoxicity) the earliest appearance of EA on newly transformed sarcoma cells induced in vitro by the co-carcinogenic interaction of x-irradiation, chemicals and SV40. A new method for detecting the earliest transformed cells that appear in an SV40 infected normal cell population employs the culture of cells in polyacrylamide gels which permit only transformed, EA+ cells to attach and proliferate. The release of soluble EA from new transformant cells induced by co-carcinogenic action will be determined and temporally studied.
RESULTS: A highly cytotoxic, highly specific antiserum containing antibodies against EA has been developed which destroys mid-gestation EA+ fetal cells but not term EA- embryo cells. The serum also is highly cytotoxic for established EA+SV40 tumor cells. New, early transformant tumor cells which are induced by the co-carcinogenic action x-irradiation and SV40 were susceptible to anti-EA serum within one day post-infection with SV40 indicating the very early expression of EA.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING
PROJECT DESCRIPTION: R and D on system parameters and source terms to be measured followed by design, development, fabrication and testing of prototype X-ray fluorescence (XRF) devices suitable for use in measurement and characterization of airborne particulates in and around industrial plants related to energy programs.
APPROACH: Four major task areas are detailed in the contract which might be summarized as follows: (1) theoretical and parametric studies required to develop detailed performance specifications, (2) design, fabricate and laboratory test two XRF survey meters, (3) evaluate XRF survey meters using a minimum of four selected plant environments and perform necessary source-term calibrations, and (4) prepare a final report and an operating and maintenance manual.
RESULTS: Monthly letter reports, interim technical reports, final report, operating and maintenance manual, and two operating, fully calibrated prototype instruments delivered to DOD upon completion of technical effort.
PROJECT MILESTONES: Completion of theoretical and parametric studies by early spring 1978; preparation of detailed performance specifications for review by early summer 1978; completion of prototype fabrication by late 1978; laboratory tests completed by spring 1979; completion of in-plant evaluations by mid-summer 1979; preparation and delivery of final report and manuals, together with prototype, by early fall 1978.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Global;COASTS/Other coasts all
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The goal of this project is to identify the products and to estimate their rates of formation during the chlorination of seawater.
APPROACH: The effects of bromide ion concentrations, temperatures, and sunlight on the rate of ''chlorine'' consumption will be followed by three methods: an amperometric titration with phenyl arsene oxide at pH 4 for hypohalites; an iodometric titration with sodium thiosulfate at pH 1.4 for hypohalites and some halates; and UV spectroscopy.
RESULTS: The first two analytical methods will yield information on absolute concentrations while the third approach may give some clues to the identity of the products.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (50%);ORGANICS (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This project is divided into two subprograms: (1) function and structure of biomembranes, and (2) surfactants and lung metabolism. The aim of the biomembrane subprogram is to determine the mechanism(s) by which environmental toxicants derived from diverse energy sources alter the biochemical properties of membranes and their constituents in liver and other mammalian tissues. The aim of the surfactant-lung subprogram is to determine how energy-related toxicants, such as NO/sub 2/, SO/sub 2/, ozone (peroxides), and aliphatic and aromatic hydrocarbons alter lung function at the molecular level.

APPROACH: The approach in the membrane experiments is to determine how the composition of biomembranes can be manipulated with analcgs of lipid precursors and to evaluate specific functional responses elicited by the membrane alteration. In the assessment of preneoplastic changes induced by chemical toxicants, the emphasis is on critical enzymatic indicators associated with the formation of membrane lipids. The approach in the lung-surfactant project deals with the effect of gaseous and hydrocarbon toxicants (derived from energy sources) on the metabolism, transport, and secretion of pulmonary surfactants, and related lipids and proteins. Type II cells and pulmonary secretions will receive the greatest emphasis; mosof the data will be obtained from tissues of mice, rats, and humans. Alveolar type II cell adenomas and type II cells from rat lung grown as monolayers or isolated by gradient centrifugation will primarily be used as test systems.
RESULTS: Results of the studies on membranes and surfactants will provide highly sensitive biochemical indicatcrs for identifying toxicants and carcinogens and their dose-response relations, in general, and the pulmonary ones in particular. We anticipate that the results from our investigation on the modification of cell membrane components can be useful in altering cell transformation and cell cycle changes induced by chemical toxicants. Ultimately, membrane modification techniques could be used in the prevention and treatment of cellular injury caused by exposure to hazardous environmental substances and radiations. Data obtained in the lung-surfactant subprogram are expected to provide: (1) early and sensitive detection of biochemical signs that identify and characterize toxicants in airway tissues; (2) biochemical indicators for the quantitative assessment of dose responses to toxicants in the lung and of subsequent repair processes; (3) underlying mechanisms of toxicant actions in respiratory tissues as a means of getting at the basis for prevention and a cure for the lesions they produce; and (4) suitable diagnostic tests with sputum and lavage fluids for the clinical assessment of the onset, severity, and recovery stages of respiratory diseases induced by energy-derived toxicants.
PROJECT MILESTONES: 1 Nov. 1976 Establish dose-response effects of NO/sub 2/ and pulmonary surfactant. 1 Jan. 1977 Complete membrane modification experiments with N-isopropylethanolamine. 1 Feb. 1977 Complete experiments on turnover of surfactant in acute and chronic NO/sub 2/-exposed rats. 1 July 1977 Establish enzymatic mechanisms of NO/sub 2/-enhancement of lung surfactant levels. 1 Sep. 1977 Complete solubilization and purification studies of three key enzymes responsible for metabolism of tumor-associated lipids (alkyl synthase, alkyl monooxygenase, alkyl desaturase). 1 Dec. 1977 Prepare antibodies for the purified enzymes for completion studies of their mechanism, turnover, regulatory controls, and for use in the development of inhibitors. 1 Jan. 1978 Establish mechanism of surfactant biosynthesis and secretion in alveolar type II cells. 1 Jun. 1978 Complete cell cycle and cell transformation experiments with N-isopropylethanolamine-modified membranes.

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: ORGANICS (10%);RADIATION (90%)
CHARACTER OF STUDY: RESEARCH/Laboratory (75%);ANALYTICAL (25%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To evaluate the physiologic stress imposed on the immune system by chronic and acute radiation and chemical toxicants of environmental importance. The potential immunosuppressive and carcinogenic qualities of chemicals derived from nonnuclear sources of energy are to be monitored on a background of low-level chronic radiation exposure which by itself may not appear to present a significant risk to the organism for survival in a foreign environment. Perturbations in the humoral and cellular immune systems of both adult and fetal animals will be examined from the viewpoint of a potential loss and/or alteration in the development of immunologic surveillance mechanisms controlling the appearance of aberrant cell types, i.e., malignant clones.
APPROACH: In vivo and in vitro test systems will be used to conduct studies at the organismal and cellular level. Exposure of adults and fetal mice to varying levels of chronic radiation will be made to assess their immediate and long-term effects on different components of the immune system. Animal models having two genetically different cell populations, the marmoset and the allogeneic radiation bone marrow chimera, will also be subjected to radiation stress and mesurements made on the cellular and humoral factors mediating tolerance. Perturbations detected in the fine balance between the two incompatible hemopoietic systems will provide a sensitive monitoring system for the potential carcinogenic activity of environmental pollutants such as those derived from the coal liquefaction process.
RESULTS: The following questions should be answered by this project: (1) Identify the interrelationships of the hemopoietic and lymphocytic systems in their recovery from damages inflicted by acute or chronic radiation. (2) Evaluate the immunologic and tumorigenic consequences of radiation in the adult animal when exposed during fetal life and the limits of exposure which may be deleterious to survival of the organism. (3) Determine the physiologic consequences of a loss in immunologic tolerance imposed by environmental insults which may be predictive of malignant cell transformations. (4) Determine whether a high rate of radiation induced chromosomal damage in somatic cells parallels a similarly large genetic hazard.
PROJECT MILESTONES: (1) 1 October 1978 Identify relative radiosensitivity of T and B lymphocytes after acute and chronic radiation. (2) 1 October 1978 Determine immune competence of adult mouse following radiation exposure during fetal life. (3) 1 October 1977 Determine alterations in T and B cells in marmosets exposed to low-level chronic radiation. (4) 1 October 1978 Evaluate effects of polynucleated aromatic amines on T and B cell function in normal mice and allogeneic radiation chimeras. (5) 1 October 1978 Obtain dose response data on induced chromosome aberrations in somatic and germ-line cells of the marmoset following low-level chronic radiation exposure.

MONITOR: Weyzen, W.W.
TELEPHONE: F353-5468;C(301)973-1000 ext. 5468
TYPE OF FUNDING: Contract No.-E(40-1)-1833
77 FUNDING: Energy Research and Development Administration FY77:$60,000
TECHNOLOGY: HYDROELECTRIC (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Site specific Tropics
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This study examines the ecology of existing hydroelectric reservoirs in Puerto Rico, in order to determine the factors which cause or prevent health problems related to the reservoirs. The major health problem investigated is schistosomiasis. Methods will be developed for prediction of the extent of disease transmission to be expected in new reservoirs being designed but not yet constructed. Alternate design of reservoirs and other preventive or control measures will be studied. In total this project attempts to assess environmental and health impact of proposed hydroelectric reservoirs, and to develop methods to minimize that impact.
APPROACH: Existing reservoirs in Puerto Rico are primarily for hydroelectric power and irrigation. The 25 major reservoirs will be studied for one year to select six which represent various ages, sizes and levels studied to determine water temperature, volume and quality, algal productivity, productivity of macroscopic vegetation, number and species of mollusks, insects and fish. Available computer models for predicting water temperature, algal productivity and mollusk populations will be calibrated with data from the first year of observation and then used to predict the second year. Available methods for control of bilharzia transmission will be studied for cost and benefits and the optimum measures will be specified to the Health Department.
RESULTS: Six of the 25 reservoirs will be selected for intensive study. Then a complete annual cycle of 4 intensive surveys on each of the six reservoirs will be completed. A computer model of snail populations will be developed for each reservoir and snail populations will be predicted for the next year (FY-1978). Subsequently a second annual cycle of 4 intensive surveys on the six reservoirs will be completed. The observed snail populations will be compared with the previous computer predictions in order to verify the reliability of the model. Methods for controlling snail populations in existing reservoirs will be evaluated and presented to the Power Authority for preliminary trials.
PROJECT MILESTONES: (1) Complete first 4 quarterly surveys on six reservoirs 7/1/77. (2) Complete computer predictions for reservoirs 7/1/77. (3) Complete second 4 quarterly surveys 7/1/78. (4) Recommend action to Power Authority 7/1/79. This study examines the ecology of existing hydroelectric reservoirs in Puerto Rico, in order to determine the factors which cause or prevent health problems related to the reservoirs. The major health problem investigated is schistosomiasis. Methods will be developed for prediction of the extent of disease transmission to be expected in new reservoirs being designed but not yet constructed. Alternate designs of reservoirs and other preventive or control measures will be studied. In total this project attempts to assess environmental and health impact of proposed hydroelectric reservoirs, and to develop methods to minimize that impact.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: ERDA-DBER and the Morgantown Energy Research Center are jointly managing a program at the West Virginia University School of Medicine which will develop and/or use bioassays to determine the pathogenic potential of possible fugitive emissions or effluents of pressurized low Btu coal gasification and combustion and of atmospheric pressure fluidized bed combustion processes and affiliated feed preparation and down-stream control and clean-up technologies.
APPROACH: The MERC in-house projects on Coal Gas/Combustion Effluents Assays and Toxic Coal Particle Identification will provide representative emission materials and supporting characterization research for the program. Bioassays include rabbit pulmonary macrophage morphology viability and activity tests, horomonal changes and teratogenic effects in mice or rats, assays and immune system effects in mice and rats, rat digestive tract and rabbit lung morphology studies, carcinogen and co-carcinogen metabolism and microsomal interactions, behavioral changes in the rat, lobster synapse tests, mollusk ciliary motion tests, and others. These studies will be coordinated with those of Lovelace ITRI and other participating ERDA-sponsored institutions.
RESULTS: Acquired information will direct the development and test the effectiveness of clean-up technologies to make the gasification and combustion processes environmentally acceptable.

TYPE OF FUNDING: Contract No.-E-(40-1)-GEN-242
77 FUNDING: Energy Research and Development Administration FY77:$414,000; Environmental Protection Agency FY77:$97,500
TECHNOLOGY: FOSSIL FUEL/General (90%);NUCLEAR/Fission (10%)
ENERGY CYCLE: COMBUSTION OR END USE (100%)
POLLUTANTS: METALS/Cd;METALS/Hg (80%);ORGANICS (20%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To investigate the interactions of energy-related pollutants with essential nutrients under a variety of nutritional and physiological stresses at several levels of biological organization in an effort to understand these interactions and their mechanisms of contol.
APPROACH: Rats on various Ca:P diets for four weeks are being orally dosed with ''tracer,'' 5 mg or 50 mg of Cd, and serially sacrificed over a 5-day period to determine Cd uptake and distribution. Everted sacs from rats are being utilized to determine the kinetics of Cd movement across the intestine. Intestinal absorption of acute and chronic doses of iron, iron and Cd are being studied in rats, guinea pigs, and swine during iron-stress periods. Placental perfusion and/or fetal uptake studies are in progress using CH/sub 3/Hg, Cd and Ca, and Pu-239 (''tracer'' to high doses) in mice, guinea pigs, sheep, and swine. Isolated renal brush borders from the rat are being utilized to kinetically determine the effects of Cd on amino acid-binding sites. Methodologies are being developed to purify and solubilize intestinal brush borders without the loss of peripheral membrane proteins for the preparation of polyspecific antisera to study protein associations using crosslinking reagents and crossed immunoelectrophoresis.
RESULTS: The experiments are designed to determine the competitive effects of various nutrients and specific physiological stresses on the intestinal absorption of Cd, the subcellular distribution of Cd in the intestinal mucosa, and on the effects of Cd to fetal development, reproduction, and growth. Placental studies should clarify existing data on CH/sub 3/Hg movement, interaction of Ca and Cd movements, and the fetal uptake of Pu-239. Results will also determine the mechanism for Cd-induced aminoaciduria and elucidate the transport-related protein associations at the intestinal brush border.

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Much progress has been made in the last few years on research concerning thrombopoietin (TSP). The development of suitable assay procedures for thrombopoietin has made available a useful research tool whereby many questions can be answered. The objectives of this research are to establish the

existence of thrombopoietin (TSP), the site(s) of production, the chemical nature, and mechanisms of action of TSP.
APPROACH: The methods to be used include measurement of megakaryocytopoiesis in mice by TSP; measurement of the production of TSP by kidney cells in culture; investigation of erythropoietin and TSP interactions; continuation of the work on anti-TSP; continuation of work in purification of TSP; further development of a bioassay for TSP; testing for TSP in sera of various patients with platelet production disorders; and measuring the TSP levels and determining the platelet function in dogs with cycling thrombopoiesis. A variety of physical, chemical, and immunological techniques will be used.
RESULTS: Successful accomplishment of the objectives of this proposal will provide additional information for predicting the characteristics of TSP and provide new information concerning the thrombopoietic response in irradiated animals and in humans following irradiation accidents.
PROJECT MILESTONES: The overall goals of this research project are (1) to identify chemically the thrombopoietin (TSP) molecule, (2) to develop a sensitive, reproducible, and easily performed assay procedure for TSP, (3) to determine its site(s) of production, and (4) to determine the mechanisms that cause elaboration of the thrombopoietin molecule in response to thrombocytopenia.

CHARACTER OF STUDY: RESEARCH/Theoretical (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To establish immunochemical markers for the cytoplasmic granules of human polymorphonuclear neutrophil granulocytes. To investigate the contribution of constituents of the granules to antimicrobial action of polymorphs, to study the degranulation, translocation, function and fate of granule constituents in phagocytosis, to ascertain the influence of radiation and atmospheric pollutants such as might be generated by coal gasification on the integrity and function of these cells and their granule mechanisms.
APPROACH: To isolate granules, to dissect them with routine techniques for extraction of membrane bound structures, to resolve the extracted proteins, to identify the biological activity of the constituent proteins (i.e., antibacterial, peroxidatic, proteolytic, neurolytic, etc.) to raise antibodies to these proteins, to develop immunoassays and immunofluorescent conjugates that can be used to detect and measure proteins crucial to intraleukocytic killing of bacteria and to trace them both in bulk phase and at the cellular level, to ascertain their movements and effects during antibacterial phagocytosis and when the cells are exposed to pollutants.
RESULTS: To identify and dissect the normal functions of polymorphs and their granule-phagosomal system in phagocytosis and killing of bacteria. To evaluate the influence of particulate and gaseous air pollutants on these functions.
PROJECT MILESTONES: When we can with quantitative immunochemistry (single radial immunodiffusion, radioimmunoassay), and quantitative as well as qualitative immunofluorescence measure the above parameters in polymorphs from normal persons with or without the in vitro exposure of the polymorphs to atmospheric pollutants.

TITLE: Developmental Approach to the Study of Immunologic Tolerance
PROJECT NUMBER: 006075
PRINCIPAL INVESTIGATOR: Hyde, R.M.
ADDRESS: Department of Microbiology and Immunology, College of Medicine, University of Oklahoma, Norman, OK
AFFILIATION: Oklahoma Univ., Norman (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
TYPE OF FUNDING: Contract No.-E(40-1)3792;Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$10,000
TECHNOLOGY: FOSSIL FUEL/General (20%);GENERAL SCIENCE (80%)
POLLUTANTS: RADIATION (20%);SPECIFIED OTHER POLLUTANTS/Drugs (80%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The research proposed will investigate the nature of the intracellular events which result in the loss of immunologic responsiveness to soluble human gamma globulin (sHGG) in mice. CBF1 mice will be placed on high dose regimens of various drugs, injected with sHGG and used as T cell donors 4 to 48 hours later in immunologic reconstitution experiments. Syngeneic irradiated recipients will be injected with normal bone marrow cells plus thymus cells from animals treated with metabolic modulators and sHGG. Thymus cells will be cultured for short periods of time in vitro and the metabolic events which occur during the development of immune tolerance will be monitored. Attempts will be made to reverse tolerance by trypsin treatment to remove bound antigen. Suppressor cells will be isolated and the mechanism of the immunosuppressive activity will be investigated by the use of metabolic inhibitors.
RESULTS: Puromycin aminonucleoside has been found to block the induction of immune tolerance in murine thyocytes in vivo. Thymus cells can be maintained in culture for 24 to 48 hours without loss of the ability to reconstitute thymus-dependent immune responses in irradiated recipients. Tolerant thymus cells do not spontaneously regain immunocompetence when similarly cultured.

TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: WASTE MANAGEMENT (50%)
POLLUTANTS: RADIATION/Radioiodine (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To study iodine metabolism under different conditions, as it relates to the intake of radioactive iodine. To evaluate the determinants of iodine concentration in thyroid glands and methods to release radioiodine burdens from the thyroid gland. To evaluate natural radioactivity present in normal thyroids, in addition to artificial radioactivity which may be added. To evaluate the safety of methods to inhibit accumulation of radioiodine in thyroids and also to expedite the release of radioiodine in thyroids.
APPROACH: (1) Study iodine metabolism in stimulated glands (experimental animals fed low-iodine diet). (2) Study metabolism of thyroid hormones in human beings and rats. (3) Continuous observation of world-wide fallcut of I-131. (4) Radioaudographs of thyroids containing natural radium received from U.S.A., Columbia, South America, Nigeria, and other areas. (5) Investigate the effects of agents which hasten release of radioiodine from thyroids of adult rats, newborn rats, and embryonic rats. (6) Study undesirable side effects produced by agents which cause the release of iodine from thyroid glands.
RESULTS: (1) To determine, in retrospect, the exposure of animal populations to environmental I-131. (2) To minimize the hazards and reduce the retention of radioiodine in thyroid glands and to hasten the release of radioiodine with minimum undesirable complications. (3) Possibly aid in the world-wide survey for the presence of uranium deposits. (4) Improve the management and prevention of endemic goiter and endemic cretinism.
PROJECT MILESTONES: (1) Found commercial baby food to be very goitrogenic; corrected by manufacturer after our results published. (2) First developed in vivo method of isotope equilibrium; used to study iodine metabolism. (3) First observed worldwide fallout of I-131 in thyroid glands. (4) Measured radioiodine fallout from most atmospheric nuclear tests since 1954, in both hemispheres. (5) Found small pools of iodine in thyroid glands which turn over 20 times slower than major functional pool. (6) First observed radium in cattle thyroids, concentrated in nodules of barium sulfate. (7) First showed that goiter could be produced by fecal excretion of thyroid hormone. (8) First showed that goiter could be produced by interferring with effectiveness of thyroxin in the animal. (9) First to demonstrate liver scans from labelled thyroxin in human beings. (10) First to show that rats born to low-iodine diet had little or no triiodothyronine in thyroids (contrary to adults).

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The proposed work will investigate the response of the major eosinophilic leukocyte compartments of the rat to exposure to x-irradiation of selected areas of the abdomen. The response of the eosinophils population to specific antisera and a number of bacterial endotoxins and their subfractions will also be tested.
APPROACH: Animals will be exposed to x-rays with partial body shielding involving alternatively the abdomen or the rest of the body to determine the reciprocal influence of these organs on eosinophil kinetics. The presence of eosinotactic material in normal and post-radiation intestine will be studied by comparison with extracts from the organs of animals exhibiting massive eosinophil infiltration (trichinella injected rats, dexamethasone treated rats). Such extracts will be fractionated by gel filtration prior to testing of their eosinotactic activity in vitro (millipore chambers) and in vivo (peritoneum, blood, subcutaneous tissue).
RESULTS: The general scope of the research is to identify the factors governing eosinophil production in the marrow and their distribution in peripheral tissues. The prevalent distribution of these cells outside the bloodstream and the availability of an enzymatic method (phospholipase B estimation) to determine their numbers provides a unique model for obtaining quantitative data in both normal and experimental conditions. The long-range impact of these studies can be projected into the fields of bone marrow kinetics (radiation injury and recovery, anti-cancer agents), immunology (asthma, allergies, etc.) and parasitology (Angiostrongylus, Schistosoma, Trichinella).

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective is to increase understanding of radiation effects in biological systems and their cellular and biochemical components. The radiation includes ionizing and photobiological components.
APPROACH: The temperature dependence of the direct action of radiation provides one approach to distinguishing mechanisms independent of solvent-mediated effects. Indirect action is also studied in relation to inactivation kinetics and scavenge processes. The overlap of ionization and excitation-induced processes is studied, together with independent follow-up of excitational photobiological consequences expected.
RESULTS: It is expected that wider varieties of radiation damage mechanisms will be established and that some of these will be understood at a more detailed chemical level than otherwise.
PROJECT MILESTONES: No sharp milestones are expected, but rather an increased understanding of processes already understood in some degree.

PROJECT DESCRIPTION: Total analysis of molecular mechanisms of gene transfer, genetic recombination, damage, repair, and function of DNA.

APPROACH: Analyze genetic processes in pneumococcus, including all stages of transformation by free DNA, and the behavior of phages and their DNA. Use recipient cells mutated in one or more functions affecting DNA metabolism. Cells, DNA, and/or phage are also treated with radiation and/or other agents to assess the nature of the damage and how it affects the overall genetic processes, continual comparison of results to those from other systems, for insight into applicability.
RESULTS: Better understanding of the molecular mechanisms operating on DNA in one particular system, which should help clarify other systems as well.

DIVISION: Oak Ridge Operations
MONITOR: Frost, A.H., Jr.
TELEPHONE: F850-4105
TYPE OF FUNDING: Contract No.-E-(40-1)-3857
77 FUNDING: Energy Research and Development Administration FY77:$50,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of this project is to gain an understanding of the molecular and genetic events that occur during multiplication of an animal virus, reovirus. This virus is representative of a group of viruses that cause diseases in man such as Colorado tick fever and infantile gastroenteritis, as well as diseases in animals of economic importance such as Bluetongue and African horse sickness.
APPROACH: The approach is biochemical (for example, sequencing the 5'-terminal regions of reovirus messenger RNA molecules, the study of the interaction of reovirus-coded polypeptides with both single- and double-stranded RNA and studies of how reovirus induces the synthesis of the antiviral substance interferon), as well as genetic, in that use is made of a series of temperature-sensitive mutants of reovirus that were isolated in this laboratory some time ago.
RESULTS: The results of these studies should add to our understanding of genetic control and regulation. Such studies are much more conveniently studied for small genomes, such as that of reovirus, than for large cellular genomes; but it is expected that many of the insights obtained as a result of these studies will be directly applicable to the human cell and the human genome.
PROJECT MILESTONES: This project has been underway for several years. Among the milestones are the isolation and biochemical and genetic characterization of a series of temperature-sensitive mutants of reovirus (by far the largest series available anywhere; these mutants are now being used by several other laboratories), studies on the mode of induction of interferon by reovirus and its mutants, studies on reovirus-coded polypeptides, studies on the nature of the reactions responsible for virus-induced cytopathogenicity, and studies on the mode of action of interferon.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The repair of DNA damage induced by energy-related physical (e.g., ultraviolet light and ionizing radiation) and chemical agents (benz(a)pyrene) in human cells is of fundamental importance to basic molecular biology as well as the health sciences. The systematic study of formation and excision of products of the 5,6-dihydroxy-dihydrothymine type in DNA induced by ionizing radiation and ultraviolet light and of the guanine-benz(a)pyrene adduct is being undertaken in rodent and human cells under in vivo and in vitro conditions. In particular, excision repair of gamma-ray and benz(a)pyrene lesions will be studied in cells from patients with the hereditary diseases Xeroderma pigmentosum, Fanconi's Anemia, and Ataxia telangiectasia which are characterized by increased chromosomal abberration frequencies and cancer. These studies are expected to provide information about the mechanism(s) of processing of DNA lesions, and the relationship between DNA damage and physical and chemical carcinogenesis.
APPROACH: For in vivo studies, mammalian cells are labeled with thymidine-methyl(H-3), then irradiated with gamma-rays or ultraviolet light. Various cell types and incubation conditions are used and the excision of products of the 5,6-dihydroxy-dihydrothymine type from the acid-precipitable material is measured by an alkaline-acid degradation assay developed in our laboratory. The excision repair of benz(a)pyrene DNA adducts is studied in metabolizing cells in double label experiments using (CO-14)thymidine and (H-3)-benz(a)pyrene. For in vitro studies, radioactively labeled exogenous DNA, primarily from bacteriophage, is irradiated or treated with active benz(a)pyrene metabolites and incubated with extracts from rodent or human cells. Damage excision is measured by chromatographic procedures.
RESULTS: Damage introduced into DNA by various physical (e.g., ultraviolet light and ionizing radiation) or chemical agents, the spontaneous loss of a small number of DNA bases and mismatched base-pairs introduced by errors in repair or replication may impair the biological functions of DNA by similar mechanisms. Most cells have evolved elaborate mechanisms for the repair of DNA damage or more generally of defaults in the DNA structure. Prereplication excision repair is particularly efficient in human cells. If repair does not occur or remains incomplete, the cytopathological effects may range from cell death, induction of mutations to malignant transformation and possibly cell aging. The proposed studies are expected to supply information about the mechanisms of processing of DNA lesions in human cells and the relationship between different types of DNA damage and their biological effects. Emphasis will be placed on studies of prereplication excision repair of products of the 5,6-dihydroxy-dihydrothymine type and guanine-benz(a)pyrene adduct in normal and diseased human skin fibroblasts (Xeroderma pigmentosum, Fanconi's Anemia, Ataxia telangiectasia).

PROJECT DESCRIPTION: To construct a model system capable of the synthesis of gene products in a test tube: The model must. (1) Synthesize enough biopolymers to permit their chemical characterization, (2) Respond to the same internal or external stimuli that the cellular components exhibited in vivo, (3) Be tightly coupled so as to follow the flow of genetic information from DNA through transcription and processing through to translation of a specific protein.
APPROACH: (1) Molecular biology, enzymology and nucleic acid chemistry. (2) Isolate, purify and chemically characterize the cellular components (from corn) that synthesize RNA, process RNA, translate RNA. (3) Reassemble them under experimentally arranged conditions.
RESULTS: To be able to manipulate the use of timing of specific genetic information in agronomically important crops especially corn.
PROJECT MILESTONES: (1) Solubilization of RNA polymerase from a plant tissue (1962) purified in 1964. (2) Isolation of a cell-free protein synthesizer systems in corn (1960). (3) Isolation of the polyadenylylating system in plants (1970). (4) Demonstration of the mode of action of coodycepintic phosphate (1973). (5) Added poly A sequence to histone mRNAs and prepare reverse transcript probes.

PROJECT DESCRIPTION: The enzyme reverse transcriptase is of considerable significance not only for oncogenic viruses but also for its role in normal cell development, differentiation and antibody formation. RNA-Dependent DNA Polymerase (RDDP) first observed by us in N. crassa, will be isolated, purified and characterized. The role of this enzyme in differentiation, gene amplification and RNA mediated transformation in the eukaryotic fungus N. crassa will be investigated.
APPROACH: The enzyme RDDP will be isolated and characterized as to its nature and immunological relationships and will be measured quantitatively in different cell types of N. crassa. Estimation of, and role of RDDP in rRNA gene amplification in cell types will be done using standard nucleic acid hybridyzation and enzymological procedures. RNA mediated transformation will be studied using auxotrophic mutants of N. crassa.
RESULTS: The new knowledge expected from the proposed experiment will be as follows: (1) Characterization of the nature, (including immunological relationships) of the RNA-dependent DNA polymerase in a lower eukaryotic organism. (2) Characterization of a unique RNA-bound reverse transcriptase in a lower eukaryotic cell. (3) Role of RNA-dependent DNA polymerase in rRNA gene repetition in differentiated cell types. (4) The nature (size and nucleotide composition) of RNA molecules which induce transformation in N. crassa, and (5) Understanding of the distinction between RNA and DNA-induced transformation in N. crassa by genetic (tetrad) analysis of the sexual progenies of the crosses between transformants (revertants) and their donor and/or recipient cells.
PROJECT MILESTONES: (1) The purification and characterization of a biomedically significant enzyme, RNA-Dependent DNA polymerase (RDDP) will be done. (2) Extensive investigation on the correlation of virus-like particles (VLP) with RDDP, associated with normal differentiation and development will be done. (3) Role, if any, of RDDP in gene amplification and cell transformation will be done.

PROJECT DESCRIPTION: To measure the genetic effect of tritium incorporated into specific sites in DNA or protein of Drosophila melanogaster spermatozoa. Previous experiments with prokaryotes have shown that transmutation of tritium in the 5-position of cytosine results in C yields T transitions. Work on this project with the eukaryote D. melanogaster has shown that when tritium is incorporated into the 5-position of cytosine there is an increase in the mutation frequency over that observed when the DNA precursor deoxycytidine is generally labeled. Additional data are needed to determine the genetic effect of tritium labeling in other positions within DNA and in a non-DNA molecule.
APPROACH: Tritium is incorporated into specific sites in DNA or nuclear protein by feeding male larvae of D. melanogaster precursors labeled with tritium as follows: 5-, 6- and (G)-labeled deoxycytidine, methyl- and 6-labeled deoxythymidine and 3-labeled arginine. The amount of tritium per cell will be determined by liquid scintillation methods used in our previous experiments to determine the genetic effects of transmutation of P-32, P-33, C-14 and now H-3. The genetic tests for the effect of tritium disintegrations will be for (1) loss of Y or X chromatin, and (2) sex-linked recessive lethals observed as completes in the F/sub 2/ and as mosaics in the F/sub 3/. Temperature-sensitive sex-linked recessive lethal mutations and mutations at the Adh locus will be detected.
RESULTS: In order to compare the relative mutagenic hazard produced by different sources of energy it is necessary to develop reliable means of measuring the dose of mutagen to genes and relating this measured dose to results of accompanying mutagenic tests. Measurement of dose of a mutagen to the genes is also necessary to permit valid comparisons among laboratory test systems, and this comparison will provide a basis for extrapolation to man when the dose to human germ cells has been determined. This project will couple the molecular dosimetry of the localized effects of tritium disintegration at specific sites within the DNA or protein of Drosophila melanogaster with genetic analyses in this eukaryote.
PROJECT MILESTONES: (1) Comparison of 5-labeled deosycytidine with (G)-labeled deoxycytidine completed. (2) Comparison of 5-labeled deoxycytidine with methyl-labeled deoxythymidine completed. (3) Distribution of label in thymine, cytosine and protein labeling to be done FY 77. (4) Comparison of protein with DNA label to be done FY 77. (5) Comparison of 6-labeled deoxycytidine with 5-labeled deoxycytidine to be done when

synthesis of 6-labeled deoxycytidine is completed approximately FY 77. (6) Development of Adh and temperature-sensitive mutation detection techniques FY 77.

PROJECT DESCRIPTION: Our Objective, Approach, and Product/Results Expected: Reexamination of the kinetic reassociation of repair replicated DNA obtained from WIL/sub 2/-A3 cells upon methyl methanesulfonate treatment over the entire C/sub o/t range. Examination of the kinetic reassociation of DNA of WI-38 cells undergoing repair replication at different times after UV or MMS treatment. Comparison of the extent of repair replication occurring in skin fibroblast cells from individuals of different ages grown in vitro and treated at equal passage numbers with UV or MMS, and if significant differences are observed, investigation of the kinetic reassociation of the isolated DNA to determine the distribution of repair replication radioactivity in DNA of different sequence frequencies. Comparison of the extent of repair occurring in human WIL/sub 2/-A3 lymphoblastoid cells and human WI-38 lung cells of embryonic origin, after UV exposure, to confirm the normality of the former. In addition, determination of the extent of repair upon treatment with a second chemical agent, 4-nitroquinoline-1-oxide. Induction of AHH in WI-38 cells in vitro, and attempt to detect whether a greater amount of repair occurs during benz(a)anthracene on DNA synthesized after treatment of WI-38 cells, measuring both incorporation and repetitive distribution of label. The broader investigation which will be initiated is an attempt to correlate the extent of repair replication with mutational events in mouse L5178Y cells.

PROJECT DESCRIPTION: The objective of the work is to develop antigenic markers for early cancer detection using embryonic determinants which appear universally on radiation stimulated cancer cells. The properties of these cancer markers are being studied to learn how to distinguish them from other cellular antigens and from viral antigens.

APPROACH: Immune reagents are being developed to test animals for the expression of the earliest signs of embrycnic antigen as an indicator of a radiation stimulated cancer. Test systems are also being developed to detect the first raciation stimulated transformed cells which appear in an exposed normal cell population.
RESULTS: We have developed the necessary screening sera to carry out the work. A unique method has been developed to detect the earliest transformants that appear in a population of sublethally irradiated cells carrying sub oncogenic viruses which are rendered oncogenic by the radiation exposure.
PROJECT MILESTONES: The discovery that tumors of many types carry reexpressed embryonic product which are auto-antigenic to the host. The discovery that these embryonic components can be used to prevent cancer induction and can, under other circumstances be responsible for cancer cell proliferation.

PROJECT DESCRIPTION: The objectives are to understand the role of cellular repair processes in mutagenesis induced by chemical carcinogens and radiation.
APPROACH: To determine the kinds of mutation induced by carcinogens in microorganisms having various defective repair processes, the Ames Salmonella test system will be employed and its specific his mutations transferred into Escherichia coli. The carcinogens for preliminary experiments include polycyclic hydrocarbons such as acetylaminofluorene, benz(a)pyrene, and nitrosoguanidine.
RESULTS: The research will result in the development of more sensitive tester strains and strains which will permit an assessment of cellular repair and minimum thresholds.
PROJECT MILESTONES: (1) Construction of deep rough mutants of E. coli which are permeable to the polycyclichydrocarbon type of carcinogen. (2) Introduction of the his mutations involved in the Ames system into E. coli via an F-merogenote. (3) Construction of derivatives with various combinations of recombination and excision repair deficiencies. (4) Development of strains that measure specific base pair changes. (5) Identification of specific genetic loci with unusual sensitivities to mutagenesis.

PROJECT DESCRIPTION: To characterize the events leading from the absorption of radiation energy to the expression of damage at the cellular level.
APPROACH: DNA and intact bacterial cells will be irradiated with x-rays in the presence and absence of selected chemical agents to determine how these additives affect radiation sensitivity. B. megaterium spores will be used in uptake studies with some of these agents and in studies on radiation-induced chemical events leading to cell death; DNA (isolated from B. subtilis will be used to study the effects these additives have on radiation-induced, in vitro loss of transforming ability; B. subtilis spores and vegetative cells will be used to examine rates of mutation induction under different conditions of irradiation.
RESULTS: With the two in vivo systems, we expect a characterization and comparison of the radiation-induced processes leading to cell death and mutation. With the in vitro DNA system, we compare the chemical processes that damage this specific molecule with those that affect the intact cell.
PROJECT MILESTONES: August 1975 evaluate results and submit progress report. August 1976 evaluate results and submit progress report. August 1977 evaluate progress, submit progress report and renewal requests.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: DNA, nucleoprotein, chromosomes, cells and other systems are used to study radiation damage and repair of damage by cells. Studies using electron microscopy, centrifugation and electron and alpha-particle beam irradiations imply that the mammalian chromosome is arranged as a quasi-parallel array of 64-DNA molecules of 2 . 10/sup 9/ daltons, each has one primary and many secondary radiosensitive sites (constituting several percent of the total) closely associated with the nuclear membrane. Some 5 to 10% of the nuclear surface area may be in these sites. When cells are lysed in detergent (sarkosyl), most of the DNA sediments anomalously as an apparent aggregate with other cellular material, however DNA of 10/sup 9/ daltons sediments out of the aggregation when cells are exposed to ionizing radiation before lysis. Salt, disulfide, and peptide bonds are not critically involved in the formation of this aggregate, although a single DNA region may be involved. Such DNA regions may represent primary radiation sites in the cell. Incubation of cells after irradiation leads to the repair of single and double strand DNA breaks and to the reformation of the aggregate. Preheating (hyperthermia) of cells to 43 degrees for 45 minutes between irradiation inhibits cell repair both of sub-lethal damage and of single and double strand DNA breaks. If preheating is done in buffer rather than nutrient medium,

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The possibility that emissions from SST's and the fluorocarbons in aerosols may be factors in reducing the stratospheric ozone layer has focussed attention on the potentially harmful effects to cells of increased UV radiation on the earth's surface. UV damages genetic material and induces mutation. There is a ubiquitous enzyme found in many types of plants and animal cells, DNA photolyase, that can repair with light this genetic damage. Our objective is to learn how this enzyme functions.
APPROACH: We have purified the enzyme by a combination of chromatographic techniques and have found it to have a molecular weight of 130,000. Using SDS acrylamide electrophoresis, the enzyme was found to consist of two subunits with molecular weights of 85,000 and 60,000. We expect to separate these subunits by chromatographic methods and or sucrose density sedimentation. We expect to reconstitute the active enzyme from the subunits and to learn the contribution of each to enzyme function. We have isolated a fluorescent substance (activator) from yeast that may be necessary for enzyme action and we will determine its structure.
RESULTS: Our findings will clarify how photolyase uses near UV and visible light to repair UV damage to informational molecules in cells and will tell us whether such repair can help cells survive sunlight irradiation.
PROJECT MILESTONES: We expect to identify the fluorescent substance in Baker's yeast that enhances photolyase activity and that is a necessary component for the enzyme's functioning.

PROJECT DESCRIPTION: To determine how plant communities respond to sustained periods of exposure to sulfur dioxide.
APPROACH: Tree, grass, shrub, and weed species native to the Copper Basin will be surveyed at different distances from the pollution source. Plants will be exposed to varying concentrations of sulfur dioxide in chambers and classified according to susceptibility.
RESULTS: Results will answer the following questions: does the species composition of plant communities change with exposure to SO2; do plants evolve populations tolerant to SO2; which species replace those lost because of their SO2 susceptibility; are the current ambient air quality standards for SO2 sufficient to prevent changes in plant communities.
PROJECT MILESTONES: (1) Completion of radiocesium studies. (2) Initiation of study of long-term adaptation of plants to SO/sub 2/ stress in the Copper Basin.

PROJECT DESCRIPTION: The objectives of this research are to understand part of the environmental effects of energy production in subtropical environments. The program has three elements: The first is directed toward understanding the food chains in the estuarine and coastal systems of Southeast Florida; the second is directed toward a quantitative description of the importance of mangrove leaf detritus in such ecosystems; the third has the goal of understanding the physical and chemical states of copper and chlorine that are released to these environments from energy-related activities.
APPROACH: The food chain research is a field and laboratory program in which the abundance and distribution of the animals in a representative ecosystem is being measured. The food preferences and breakdown of plant and detrital substrates is measured in a laboratory. The mangrove detritus system is being characterized by using quantitative studies of laboratory systems that closely approximate the natural systems. The copper and chlorine studies are predicated on adding these substances to natural waters and observing the products of the reactions.
RESULTS: The expected results are a quantitative description of the functioning of the mangrove detritus and food web systems and the response of these systems to environmental variables, such as waste heat and chemical substances from energy-related activities.

PROJECT DESCRIPTION: Document environmental factors affecting recovery of damaged tundra landscapes. Develop measurement technology to allow rapid aquisition of data amenable to analyses of pattern and process of landscape recovery. Document response of native plant species indicative of various pollutants resulting from man's activities on tundra landscapes, or recovery following insults. Train ecologists to collect,

analyze and evaluate such data.
APPROACH: Classify disturbances as to age, type, cause, subsequent history. Classify disturbances topographically, edaphically and by vegetation type. Field sample across disturbances to obtain data for analyses in the laboratory.
RESULTS: Prediction of natural recovery rates, patterns and processes on various sites given various tundra communities in several tundra environments. Recommendations for intensity of reclamation management required and consequences of unwise reclamation management.
PROJECT MILESTONES: Substantial reduction of costs of reclamation on maritime tundra. Elimination of futile efforts for vegetative establishment on tundra landscapes. Demonstration of the absence of secondary plant succession on tundra, in the presence of vigorous vegetative recovery under certain conditions.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To determine the distribution and chemical behavior of uranium, thorium, and plutonium isotopes in the Gulf of Mexico.
APPROACH: Box core samples of Gulf sediments and suspended sediments from streams contributing to the Gulf will be analysed for Pu isotopes; core samples will be dated by /sup 228/Th//sup 232/Th ratios and /sup 210/Pb concntrations. Ligand concentration effects on the adsorption of Th and Ra on clays will be measured on core samples as well as tested experimentally under lab conditions.
RESULTS: Models depicting the secular and spatial distribution of plutonium and thorium isotopes in the Gulf of Mexico.
KEYWORDS: PLUTONIUM;DISTRIBUTION;SEDIMENTS;GULF OF MEXICO;URANIUM;THORIUM;RADIUM 226;RADIUM 228;RADIATION MONITORING;RADIONUCLIDE MIGRATION;RADIOACTIVITY;OCEANOGRAPHY

TITLE: Studies of Drosophila Dispersal and Species Packing
PROJECT NUMBER: 006404
PRINCIPAL INVESTIGATOR: Richardson, R.H.
ADDRESS: Department of Zoology, University of Texas at Austin, Austin, TX 78712
AFFILIATION: Texas Univ., Austin (USA). Dept. of Zoology
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Watters, Robert L.
TELEPHONE: F233-5329
TYPE OF FUNDING: Contract No.-AT(40-1)-4023
77 FUNDING: Energy Research and Development Administration FY77:$33,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (50%);ORGANICS (50%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (85%);DEVELOPMENT/Laboratory scale (15%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Site specific Hawaii
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: (1) Investigate population structure in rapidly evolving and/or ecologically disrupted population. (2) Determine if isolated sub-populations within a single area are representing incipient or actual species. (3) Relate evolving isolated sub-populations to ''species packing'', to community complexity, and to community stability. (4) Relate behavioral processer and responses to formation of population structure.
APPROACH: New statistical analyses allow the use of molecular variation in enzymatic systems to identify the units of a structured population (i.e., a population with partially isolated sub-units). Samples of Drosophila species evolving in areas of active geological change (Kilanea and) Mauna Loa Volcanoes, Hawaii) and biogeographic shifts (deserts of North America) are taken to determine the population structure present. The behavior of the insects with respect to environmental cues (wind humidity, temperature, chemical constituents in the air) is investigated. The responses are related to the ability to make adaptive changes to become reproductively isolated, or to become ecologically specialized.
RESULTS: Determining if populations are comprised of several partially isolated units or cryptic species in a given area is the major result expected. Secondarily, determining behavioral cues and mechanisms of sensing and responding to environmental variation is necessary to evaluate significance of results in one group of species to expectation of application to other species. In the process of the study, new measurements will be obtained of population and community complexity, and relationships among community stability, buffering to ecological shifts, and adaptation to ecological shifts will be attempted.
PROJECT MILESTONES: (1) Obtaining adequate data to determine community and intra-specific complexity. (2) Analysis of the data from several locations and years, including comparisons among populations. (3) Determining responses to environmental cues and roles of the responses to community properties.

TYPE OF FUNDING: Contract No.-E(40-1)-4066
77 FUNDING: Energy Research and Development Administration FY77:$45,000
TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: RADIATION/Cesium-137 (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/South;GEOGRAPHIC AREAS/Site specific Sandy soils;COASTS/Southeast;COASTS/Gulf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To establish fallout cesium-137 levels in compartments of selected managed and natural ecosystems in Florida. Emphasis is on dairy and beef-forage and mesic hardwood forest; determine the mechanism(s) responsible for the concentration of Cs-137 and develop an analog model for the cycling of Cs-137 in Florida.
APPROACH: Major compartments of selected ecosystems were sampled and Cs-137 activity levels determined using low-level radioassay techniques in combination with Cs specific, ion exchange resins for concentrating Cs-137. Low level (1 microCi)radiotracer Cs-134 is used in field and greenhouse experiments.
RESULTS: Cs-137 is concentrated in the A/sub o/ horizon of forest soils and surface 5 cm of agronomic soils. High levels of Cs-137 activity in grazing animals of Florida forests is accounted for by Cs-137 activity found in mycorrhizal mushrooms (40,000 pCi/kg) that constitute a major part of their diet during periods of the year. Pangola hay from southeastern Florida averaged 3,000 pCi/kg and, using 7% transfer rate, accounts for 90% of the 90 pCi/liter, Cs-137 activity found in the milk of the area. Levels in unimproved pasture are 2 to 3 times that of pangola pasture. Range cattle beef have 5 times the activity as beef from dairy cattle from same area, 740 pCi/kg and 140 pCi/kg, respectively.
PROJECT MILESTONES: A differential uptake of radiocesium as a function of endomycorrhizal presence on pangola rooting system and ectomycorrhizal association on tree roots is expected to be demonstrated during the coming contracting period. Controlled experiments include inoculation with mycorrhizal species and selective control of mycorrhizal development in untreated soil.

TITLE: Atmospheric Tritium
PROJECT NUMBER: 006446
PRINCIPAL INVESTIGATOR: Ostlund, H.G.
ADDRESS: Rosenstiel School of Marine and Atmospheric Science, University of Miami, 4600 Rickenbacker Causeway, Miami, FL 33149
AFFILIATION: Miami Univ., Fla. (USA). Rosenstiel School of Marine and Atmospheric Sciences
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
TYPE OF FUNDING: Contract No.-AT-(40-1)-3944
77 FUNDING: Energy Research and Development Administration FY77:$130,000
TECHNOLOGY: NUCLEAR/General (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (50%);ELECTRICITY GENERATION (50%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: Tritium escapes to the atmosphere from nuclear industry and research. The HTO originates from atmospheric nuclear testing; the HT from reprocessing of nuclear fuel elements and accidental releases; tritiated hydrocarbons, possibly from the underground gas stimulation experiments of several years ago. We are regularly monitoring HT and HTO in Miami, Alaska, Hawaii, and New Zealand; tritiated hydrocarbons (primarily methane) in Miami. We also do synoptic sampling on a global scale by ship, and sample the stratosphere by aircraft. The distribution pattern of these tritium compounds yields data on the interhemispheric mixing time scale of the troposphere (HT), the residence time in the lower stratosphere of water vapor (HTO), and the chemical lifetime of hydrogen gas (HT) and, perhaps, methane. We are able to detect large new tritium injections into the atmosphere and the distribution by space and time of these perturbations. Studies of the infiltration into the groundwater of Biscayne Aquifer of water from the cooling canals of the Turkey Point nuclear power plant will be undertaken. In addition to the intrinsic scientific value according to reasoning above, the distribution patterns, as they emerge, will make it possible to project the fate of future releases, accidental or not, of tritium into the environment on global or local scales.
RESULTS: We have found one major source of HT in the atmosphere to be venting from underground thermonuclear events; thus, the northern hemispheric inventory of about 550 g of tritium as hydrogen gas, appeared to receive an injection of about 80 g of tritium from two large underground events in 1973 October-November. The global distribution of HT is also telling us that the chemical lifetime of hydrogen gas in the atmosphere is more than five years. The downward transfer of water vapor from the lower stratosphere to the troposphere occurs on a time scale of about three years.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Techniques have been developed for measuring the electronic structure of condensed materials. These studies consist of measuring the reflectance and transmittance of liquids in the vacuum ultraviolet spectral region as a function of angle of incidence and wavelength. Such measurements are usually analyzed to yield the optical and dielectric functions of the liquid as functions of wavelength. These in turn may be interpreted in terms of the electronic structure of each liquid as it is excited by the passage of a charged particle. Studies have been initiated on chloroform, solutions of lecithin and cholesterol in chloroform, aqueous solutions of fucose, sucrose and galactose. Isotopic effects between H/sub 2/O and D/sub 2/O are being investigated.
APPROACH: Several techniques are being used in the study on optical properties of liquids. Transmission measurements made on liquid films of approximately 1000A thickness in a transparent, closed cell yield values of absorption coefficient to 1250A. Another method involves measuring the reflectance of liquid in equilibrium with its vapor. The optical functions are obtained from a Kramers-Kronig analyses of the reflectance measured at nearly normal incidence. In an alternate method, the reflectance as a function of incidence angle was measured at the interface of water and a transparent, flat window which forms one side of a semicylinder. A new approach currently being developed is an ionization method for making precision reflectance measurements (and hence optical and dielectric parameters). The ratio of ionization of the vapor by the beam just before and after reflectance is measured using a ratio meter of our own design.
RESULTS: Optical parameters of the monosaccharides galactose, glucose and fructose in agueous solution are being extended to 10 eV. The vacuum UV properties will be compared for differences arising from structural change. Spectra of the solid solutes will be studied for purposes of comparison with the solvent and solution parameters. Studies are being completed on the sugars fucose and galactose, on the phospholipid lecithin, and cholesterol, and on the solvent chloroform. The primary goal of this effort is the identification of substances giving rise to a repulsive force between cells such as constitute metastasis. The newly-designed photoionization technique will be used to examine previously studied (optically) low vapor pressure liquids (e.g., glycerol, DC-704, DC-705, tetramethyltetraphenyltrisiloxane and trimethylpentaphenyltrisiloxane, respectively, and C/sub 14/H/sub 30/ and C/sub 14/H/sub 36/, normal tetradecane and normal heptadecane, respectively) for evidence of photoemission.
PROJECT MILESTONES: (1) 1/1/77 Completion of data and analysis of optical properties of sugar fucose in aqueous solution; of chloroform and of solutions of lecithin and cholesterol in chloroform. Determination of isotopic effects on electronic properties of H/sub 2/O and D/sub 2/O. Ionization chamber in routine use for precision measurements of reflectance from low major pressure liquids. (2) 7/1/77 Completion of optical and photoemission survey of four low vapor pressure organic solvents, formamide, triethylphosphate, dimethylacetamide and hexamethylphosphorotriamide. (3) 1/1/78 Data and analysis of solid films, of oriented lecithin in the vacuum UV and soft x-ray region. Introduction of solutions into photoionization chamber for comparison with solvents. (4) 7/1/78 Develop interpretation of solution data.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The project will perform energy analysis by developing energy sources and primary interactions with other externals including environment and international exchange. Evaluations of the models is followed by calculations of net energy of primary sources, calculations of investment ratios of secondary sources and environmental interactions, and simulations of further aggregated models for alternatives of energy policy and external possibilities. Tables of energy quality transformation factors are developed from evaluated energy models of selected typical subsystems.
APPROACH: Principles of the design of energy systems are used to scan the main types of energy flow supporting the U.S. economy and its environment, including sources, interactions, feedbacks, economic flows, and pattern of energy chains using the stocks and flows and process functions from the diagrams. Tables are prepared that document with data from many sources the energy flows. Where needed new subsystems are studied to get new energy quality factors. Field trips are made to sites and centers of energy transformation study and operation to assemble reports and other information found to be critical and otherwise not available.
RESULTS: (1) Simulation graphs of indices of U.S. economy, inflation, international exchange, energy use and environmental load for various alternatives possible or projected. (2) Tables of net energy for alternative energy sources based on case histories. (3) Tables of economic viability as measured by matching energy of environment for alternative projects and proposed developments of national consequence especially of environmental nature. (4) Tables of energy quality factors for principal components of U.S. model. (5) Suggestions for public policy to prepare for expected trends.
PROJECT MILESTONES: (1) Showing the net energy method for evaluating energy sources 1972. (2) Developing the energy quality measurement scale for evaluating work potentials 1974. (3) Showing the low net energy of nuclear and solar energy compared to coal and oil and the fallacy in project independence. (4) As a result of the project a book of principles was written for the public and for schools (Energy Base of Man and Nature, H. T. Odum and E. C. Odum) 1975. Controversial presentations at NSF conference on net energy 1975. (5) Presentation and publication of results in Congressional hearing 1976. Future Milestones: Completion of analysis of primary sources 1977. Completion of environmental energy evaluation cases 1978.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Southeast;COASTS/Southeast;HYDROGRAPHIC AREAS/Continental shelf;HYDROGRAPHIC AREAS/Other hydrographic areas Estuarine
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine the effects of cyclic temperatures, as opposed to constant temperatures, on larval development of estuarine and continental shelf species of marine invertebrates. The research entails: (1) a more detailed consideration of the relative roles of temperature cycle constituents; (2) an extension of the use of cyclic temperatures to cover a wider range; (3) an examination of the response of larval stages to cyclic temperatures at the metabolic and biochemical level; (4) effort to determine the possible synergistic to cut effects between cyclic temperatures, other natural environmental factors, and ''artificial'' factors such as pollutants.
APPROACH: Larval stages of estuarine and continental shelf invertebrates, including crustacea, mulluscs, and polychaetes are cultured from hatching to the juvenile stages in the cyclic temperature regimes as opposed to constant temperatures. Temperature cycles, 5 degrees C-24 hr., have been designed which incorporate equal rates of increase or decrease combined with equal periods of maximum and minimum temperatures, unequal rates of increase and decrease combined with equal periods of maximum and minimum temperatures, and unequal rates of increase and decrease combined with unequal periods of maximum and minimum temperatures. Data on survival, rates of development, and incidents of abnormalities should provide an insight into which elements of a temperature cycle are most important in regulating developmental patterns of marine invertebrates.
RESULTS: Results should provide the basis from which to develop a concept relative to how cyclic temperatures, far more natural than constant temperatures within the estuarine and coastal environments, affect an element of marine invertebrates. This should provide for application to the effect of thermal effluent on planktonic organisms within the relatively closed system of an estuary and, within limits, the relatively open system of the continental shelf waters. The unifying concept, ''the integrated thermal experience'' is being developed to provide a more informative and efficient means of comparing development within and between species at various combinations of environmental factors normally found within an estuarine or continental shelf area.
PROJECT MILESTONES: The significant increase in survival has been described for larvae of one particular estuarine species of crab when cultured in a cycle of 30 to 35 degrees C as opposed to either a constant temperature of 30 or 35 degrees C. Although an explanation for this phenomenon is not presently available, further biochemical and physiological studies are planned which will hopefully elucidate the mechanisms responsible for the increased survival.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
JECT DESCRIPTION: To assess the energy related pollutant's impact on nearshore semitropical seagrass communities. Specifically, the effects of heat, high salinity, heavy metals and radionuclides (Zn, Cf, Pd, Co, etc.) on the survival and productivity of the plant community and elements of the animal community. To find alternatives, such as restoring plant communities, to the pollution effects.
APPROACH: Combined laboratory and field studies on the major plants in the ecosystem; seagrasses, especially the dominant Thalassia testudinum, macroalgae, microalgae (epiphytes), and phytoplankton. Field

measurements include effect of heat, salinity, silt, heavy metals and radionuclides on standing crop and productivity. Laboratory measurements include defining lethal limits and effects of temperature, high salinity, light, heavy metals and radionuclides.
RESULTS: Results are to aid decision makers in siting and solutions for existing energy related industry in subtropics and tropics by having extensive data base of effects on which to base decision.
PROJECT MILESTONES: (1) First time the productivity and dynamics of subtropical seagrass community has been delineated (a series of publications). (2) The upper lethal limit for the seagrass community in subtropics has been defined (several publications and incorporated into siting of Florida power plants and Florida State Department of Pollution Control Standards). (3) The interrelationship between subtropical and tropical seagrass community plants and animals is outlined for the first time (several publications). (4) The first large-scale restoration (transplantation) of seagrasses by seed. The first large-scale restoration of tropical seagrasses. (Publs.) (5) The understanding of ion uptake in subtropical and tropical seagrasses for the first time (publications).

PROJECT DESCRIPTION: We plan to determine the roles of various substrates, cofactors and enzymes of DNA metabclism in DNA synthesis after irradiation or chemical damage, using bacteria and cultured mammalian cells made permeable to nucleoside triphosphates and other small molecules.
APPROACH: A wide variety of environmental agents are known which induce damage in DNA leading to an inhibition of DNA synthesis or faulty DNA replication. The extent to which DNA repair processes restore the original fidelity of the DNA will ultimately determine the fate of the damaged cell. We are using both bacteria and mammalian cells to assess the roles of several known DNA polymerases and other DNA metabolic enzymes and factors in DNA repair, replication and recombination. DNA mutants of E. coli and B. subtilis provide a genetic approach to defining the roles of individual components of the DNA repair and replicative systems. The information obtained with prokaryotes should provide leads to assess the details of DNA repair and replication in mammalian systems including man.
RESULTS: Our program should provide additional insight into the cellular systems for repairing chromosomal damage. The similarities and differences between ionizing radiation and certain chemicals in regard to the repair response elicited will be further clarified.

POLLUTANTS: RADIATION/Isotopes of plutonium (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The research proposed under this project includes the (a) physical, chemical and mineralogical characterization of selected surface and subsurface soils; (b) measurement of the rate and amount of plutonium movement by ion diffusion and convective flow under transient flow conditions/ (c) determination of the soil properties responsible for adsorption, and desorption of plutonium in the exchangeable form under a range of soil physical and chemical conditions; (d) using the data obtained under the objectives (a), (b), and (c) to develop mathematical models and equations to predict the transport of plutonium in soils.
APPROACH: Refine techniques for the adsorption, diffusion, and radioassay of plutonium in soils and in aqueous salt solutions; expand the adsorption and diffusion work from three soils studied in 1975 to include four new ones plus three standard clay minerals; compare the adsorption and diffusion of Pu-237, Pu-238, and Pu-239 isotopes in the nitrate chemical form and in the complexed (EDTA and DTPA) form; initiate an in-depth study of the effect and particle size of Pu-238 microspheres upon the dissolution and diffusion rates of Pu-238 in soils in cooperation with Dr. Jack Corey (S.R.L., Aiken, SC) in that he would provide the microspheres and some laboratory facilities for analytical work, particularly for experiments requiring more alpha activity than our laboratory will handle.
RESULTS: The adsorption and diffusion data will enable the development of a prediction equation for estimating the transport rate of plutonium in soil and water systems and the rate of accumulation in the soil systems over time. Data now available for 3 soils shows over 95% of Pu adsorbed in as little as 6 minutes; diffusion rates vary from 1 x 10/sup -8/ for sandy soils to 1 x 10/sup -11/ cm/sup 2//sec for clay loam-high organic matter soils. Plutonium in the nitrate form is adsorbed more and diffuses slower

than in the EDTA or DTPA chemical form. Dissolution rate of Pu-239 from microspheres in soil systems is also under study.
PROJECT MILESTONES: By the end of this year, the project is expected to provide significant data permitting he prediction of the rate of accumulation, transport, and Pu flux in the soil solution phase of the soil. he effect of chemical form, pH, and soil property will be related to the concentration of Pu transported nd moving in the soil profile.

POLLUTANTS: METALS (50%);PARTICULATES (25%);SPECIFIED OTHER POLLUTANTS/Sulfates and other inorganics (25%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The project is comprised of 4 sub tasks (hydrologic, contaminant mobilization within spoil banks, heavy metals distribution in sediment, and biological impacts on small watersheds). The overall project objective is to quantitate environmental effects resulting from contour coal strip mining, focusing on the small, primary watershed. Each sub task objective is to achieve this goal for its specific focus, while simultaneously providing necessary data for each of the other sub tasks. Jointly, full characterization of the mining impact is sought to allow economic and technological judgements to be made.
APPROACH: Continuous rainfall and streamflow data are being collected to allow assessment and modelling of the mining process on small watershed hydrology. Hydrologic and chemical (water and overburden) data are being taken directly from the spoil bank interior to assess the quantitative aspects of the spoil bank role for more general basin modelling purposes. Sediment studies focus on direct sediment load measurements during rainfall events and physical/chemical characterizations of suspended and bed load sediment. The latter involves determining heavy metal content as a function of particle size and nature of binding in the particle. Biological studies include comparison of disturbed and undisturbed watersheds for species diversity. Metal content of individual species is being assessed to compare with separate water quality studies conducted on the streams. Effects of streamload and suspended solids on biota is being determined.
RESULTS: Results have been obtained for hydrologic, water quality, sediment and biological baseline data and changes associated with mining activity in the New River Basin of Tennessee. The outstanding feature of this study is the comparative analysis between impacted and virgin watersheds. Significant and quantified differences have been documented for a number of parameters of the different watersheds. For example, the results leave no doubt that contour mining for coal as practiced in the New River drainage basin profoundly affects population size, species richness and species equitability of the different groups of organisms. Yet, for insects, streams can return to a healthy, if not normal, condition over a period slightly in excess of 20 years. Such results describe baseline rehabilitation of reclamation standards of the millions of acres required by the new Surface Mine Control Law.
PROJECT MILESTONES: (1) June 1977 Estimate recovery of aquatic biota for non-treated ecosystems. (2) June 1977 Complete development of hydrologic model. (3) Oct. 1977 Provide data for implementing strip-mine enforcement law. (4) Oct. 1977 Complete 3-year water quality program. (5) Dec. 1977 Test hydrologic transport model with independent water quality data. (7) March 1978 Correlate biotic responses with water quality parameters.

REGIONS OF INTEREST: BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/South;GEOGRAPHIC AREAS/Southwest;COASTS/Gulf;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To develop and monitor the execution of an energy-related oceanographic research program in the Gulf of Mexico. This program will be structured as an inter-disciplinary and inter-institutional effort. It will emphasize the processes in the marine environment, and build on the base of data gathered in studies such as those sponsored by BLM and USGS. The geographical areas of concern will be the estuarine and continental shelves of the Gulf. Primary orientation will be toward understanding the environmental processes, and development of a predictive capability.
APPROACH: To evaluate the present and potential energy-related activities of the Gulf of Mexico; to identify those processes of the environment which may affect, or be affected by, energy activities; to highlight research work which will aid in understanding these processes; to identify researchers and institutions which are capable and available to carry out the work; and to prepare recommendations to ERDA concerning the research program and the means for implementing it.
RESULTS: The submission to ERDA of the proposed research program outlined above. In follow-on years, the monitoring of the execution of the program if approved by ERDA, and continued planning of a program to take advantage of results achieved in the research.
PROJECT MILESTONES: A management structure (steering committee) and advisory structure (scientific advisory committee) have been formed. A workshop brought together experts on the problem, and the workshop proceedings were published as a general scientific framework for program development. Potential PI's have been brought together in working groups and encouraged to develop interdisciplinary and interinstitutional proposals. An annual meeting with PI's, the steering and advisory committees will provide the opportunity for interchange of ideas and planning for future operations.

PROJECT DESCRIPTION: To provide background to assess the impacts of oil-gas activities in the Gulf of Mexico
APPROACH: (1) Conduct seasonal studies of benthic community metabolism along transects on the continental shelf of Florida, Alabama, Mississippi and Louisiana. Measurements would include total O2 uptake, uptake after formaldehyde poisoning (to measure chemical oxidation), assay of dehydrogenase activity and ATP levels (anaerobic metabolism), estimation of respiratory quotient and analyses of sediment for pH, Eh, reduced substances, organic carbon and nitrogen, plant pigments and their degradation products, silt and clay content. (2) Do the same measurements around an existing oil rig in the Gulf. (3) Apply direct calorimetry in order to make a comparative study of metabolic heat release, dehydrogenase activity and ATP

concentrations

PROJECT DESCRIPTION: To provide means for the recycle of metallic scrap slightly contaminated with Special Nuclear Material (SNM) back into commercial use. Present Federal regulations (10CFR70) prohibits possession, use or sale of SNM except by holders of an NRC license. The first objective is to have current regulations amended to permit unlicensed possession of de minimis quantities of SNM. The second objective is to provide means to decontaminate scrap metals to the de minimis levels.
APPROACH: To work with the Nuclear Regulatory Commission to revise existing regulations, and develop scrap metal smelters capable of recovering and decontaminating metals to the de minimis levels established.
RESULTS: During FY 77 evaluation of alternative smelter processes will be continued. Conceptual designs of a portable smelter will be considered. A Draft Environmental Impact Statement is being prepared. As a basis of NRC consideration in revising the existing regulations.
PROJECT MILESTONES: (1) Review EIA with NRC, start revisions as required. (2) Start reassessment of radiological impact. (3) Initiate review of general nuclear industry scrap metal problem areas.
KEYWORDS: METALS;CONTAMINATION;ENRICHED URANIUM;RECOVERY;DECONTAMINATION;SMELTING;RADIOACTIVE WASTES;RADIOISOTOPES;DECOMMISSIONING

PROJECT DESCRIPTION: ERDA, successor to AEC, has retained possession of 52 acres containing the four raffinate pits as a radioactive disposal area subject to perpetual control. The construction of the pits utilizing ten feet of impermeable clay on all sides, effectively eliminates liquid seepages to surface or underground waters.
APPROACH: Removal of the supernatant liquors from all pits will be completed and the raffinate pits area will be regraded for decommissioning and sale.
RESULTS: After removal of the radioactive sludges by others, it is proposed to decommission the ERDA-Weldon Spring site (approximately 52 acres). Predicted upon the receipt of a NPDES Discharge permit, the supernatant liquors in the pits would be discharged to the Missouri River utilizing the same discharge route as was used during the operation of the Weldon Spring Production Center. Thereafter, the earthen pit dikes would be destroyed, with the earth used to grade the entire area to an esthetically pleasing contour. The disturbed area would be seeded to prevent erosion and silt carryover offsite.
PROJECT MILESTONES: (1) Monitoring and caretaking actively. (2) Removal of radioactive residues by others. (3) Application for and receipt of discharge permit. (4) Raffinate pits decommissioning. (5) Reduction of quarry discharge.
KEYWORDS: RAFFINATE;PITS;NUCLEAR ENERGY;ENVIRONMENTAL EFFECTS;RADIOACTIVE WASTE DISPOSAL;URANIUM;RADIOACTIVE WASTES;UNDERGROUND DISPOSAL;RADIOACTIVE WASTE FACILITIES;DECOMMISSIONING;RADIATION MONITORING;LAND RECLAMATION;DECONTAMINATION;STABILIZATION

TECHNOLCGY: HYDROELECTRIC (100%)
ENERGY CYCLE: ELECTRICITY GENERATION (100%)
POLLUTANTS: PARTICULATES (100%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Site specific Tropics
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: In the development of new energy production facilities and in programs to reduce the pollution from existing facilities, planners need tools for predicting the environmental and health impact of these changes. Special concern is given to tropical diseases related to hydroelectric impoundments. More subtle diseases caused by air pollution from oil-fired steam plants also occur in tropical areas, and these merit attention. The purpose of this project is to develop epidemiological models which can be used by planners to predict the changes in disease prevalence and incidence related to the power facilities in Puerto Rico and other tropical areas.
APPROACH: This project will be concerned with laboratory and field investigations necessary for formulation, calibration, and verification of models related to specific diseases. In addition, the completed models will be used to examine alternate strategies for reducing the related diseases in Puerto Rico and other tropical areas. The models will be developed sequentially starting with schistosomiasis and within two years moving onto the next disease which will depend on availability of data from other projects such as the air pollution study. The following scheme relates specifically to the next two years and the epidemiological modelling of schistosomiasis.
RESULTS: The specific objectives are to develop a model of schistosomiasis transmission based on hydroelectric reservoirs as the epidemiological unit. The reservoirs in Puerto Rico to be modelled will include Lago Loiza and Rio Blanco. In addition, a model will be developed for Volta reservoir in Ghana, for Taveras and Bao reservoirs in the Dominican Republic and for some of the larger power reservoirs on the Sao Francisco River in Brazil. The models will be verified with the field data and used to predict effects of various designs, operational schedules and control programs for these reservoirs.
PROJECT MILESTONES: (1) Complete analysis of 1976 skin-test survey for schistosomiasis 1/10/76. (2) Complete laboratory studies of pathogens 1/1/77. (3)Complete epidemiological studies in rural communities 1/1/77. (4) Complete computer modelling 30/9/77.

TYPE OF FUNDING: Contract No.-E(40-1)-1833
77 FUNDING: Energy Research and Development Administration FY77:$40,000
TECHNOLOGY: FOSSIL FUEL/General (100%)
ENERGY CYCLE: PROCESSING, CONVERSION (10%);ELECTRICITY GENERATION (90%)
POLLUTANTS: PARTICULATES (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Site specific Tropics
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The project will put emphasis on the effect of pollution from the utilization of oil for energy and related enterprises in the tropics especially in Puerto Rico. We will utilize several approaches to correlate the levels of pollution with human and animal health. In the first, we will study the epidemiology trying to put the problem in prospective and to find some links between morbidity and mortality in populations with high and low risk. Analytical studies of the contaminants in human and domestic animals will be made to correlate contaminants with incidence of symptoms and disease. Functional tests of environmental aggression will be made in humans on lung, and liver function, chromosomal patterns, etc. The biological half life of the main pollutants from oil will be determined in human and domestic animals. Tissue culture studies of human cell lines will be made trying to extrapolate effects of contaminants on human health.
APPROACH: Given the difficulties and complexities of this project, the proposal calls for a gradual development as follows: Localize and define the problem, Epidemiological studies from available data, Locate specific populations in which it will be possible to correlate analytical data on pollutants in humans and biota, with specific effects. Technical Results FY-1976 The Project has been funded at a minimal level during the current fiscal year. Because of the limited funding it was necessary to set up very limited research objectives and to make use of students to implement this research.
RESULTS: Biological test systems are being developed in the laboratory for detecting substances in the atmosphere which have the potentiality of damaging DNA. In one the growth of an E. coli mutant deficient in DNA polymerase is inhibited by mutagens because the deficient polymerase is not capable of repairing the damage to the DNA. The response of the mutant to benzopyrene and hydroxyurethane will be quantitated. In another method the uptake of labeled thymidine by cells exposed to pollutants will be monitored. Having established laboratory methods of detecting substances which damage cellular DNA these methods will be used to detect potentially damaging substances emitted by the power plants of Puerto Rico.
PROJECT MILESTONES: (1) Quantitate response of E. coli mutant to pollutants 1/1/77. (2) Detect potentially toxic substances from power plants 1/6/77. (3) Complete report 30/9/77.

PROJECT DESCRIPTION: This activity is an extension of the public education programs described under Activity UH 01 02 01, Traveling Presentations. The exhibit ''Transporting Radioactive Cargoes'' is designed to be used primarily at convention sites. Its purpose is increased public awareness and understanding of the present and potential requirements for the transport of radioactive materials. It emphasizes ERDA's continuing concern for the safety of every citizen and the protection of our environment.
APPROACH: Show a specially designed exhibit, ''Atoms on the Move,'' manned by an ORAU teacher-demonstrator at large conferences of the Transportation Industry and related groups to emphasize ERDA's continuing concern for the safety of every citizen and protection of our environment in the transport of radioactive materials.
RESULTS: Increased public awareness by showing the exhibit at 5 to 7 large conferences per year.

PROJECT DESCRIPTION: The overall objective of the project is to organize, test the curriculum developed during Phase I, begin classes of instruction in order to reach ERDA's objective of providing a trained manpower base to respond to the needs of the nation in controlling the problems created by oil spills.
APPROACH: The curriculum developed during Phase I emphasizes the current ''state of the art'' of oil spill control as practiced throughout the nation and for the contingency planning necessary to improve the nation's readiness to react to oil spills.
RESULTS: The training program provided will furnish a manpower base to local communities to respond to emergencies caused by oil spills and to develop contingency plans for dealing with problems of oil spills.
PROJECT MILESTONES: The proposed schedule for the academic year 1977-78 will consist of five practice sessions with selected students to test the curriculum plus fourteen, five-day class sessions.

TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Northeast
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To improve the quality and reliability of data in the ERDA site ground water monitoring program. Site supervision would be continued. Removal of residues from the site by others is being considered.
APPROACH: Nine new wells will be installed to replace existing deficient wells on the site. A new sample collection system will be provided and employed.
RESULTS: The installation of the improved groundwater sampling system would be completed.

TYPE OF FUNDING: Contract No.-E(40-1)-1833;Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$50,000
TECHNOLOGY: NUCLEAR/General (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Southeast;COASTS/Gulf
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objective of the project is to decontaminate the PRNC reactor facility after termination of reactor operations. The PRNC TRIGA reactor will be decommissioned and transferred to Argonne National Laboratory-West after termination of operations in September 1976.
APPROACH: Following removal of the reactor fuel the reactor facility will be cleaned of all contaminated equipment, materials, and debris and decontaminated of all radioactivity. All unserviceable radioactive material will be packaged and shipped for burial in the continental U.S.
RESULTS: During FY-77 a complete assessment will be made of all contaminated systems, equipment, materials and debris in the facility. This will include all reactor equipment and components in the pool, irradiation facilities, water purification system, hot liquid waste system, normal and emergency ventilation system, and air and area monitoring systems. Decontamination levels to required limits will be set for each area. Plans and procedures for the dismantling and disassembly of systems and components, shielding, packing, monitoring, labeling and shipment of all radioactive materials will be prepared, reviewed and submitted for approval.

TITLE: Health and Mortality Study
PROJECT NUMBER: 2493
PRINCIPAL INVESTIGATOR: Tompkins, E.
AFFILIATION: Oak Ridge Associated Universities, Inc., Tenn. (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
MONITOR: Weyzen, W.W.
TYPE OF FUNDING: Contract No.-EY-76-C-05-0033;Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$40,000
TECHNOLOGY: FOSSIL FUEL/Coal Conversion liquefaction;FOSSIL FUEL/Coal Conversion gasification (50%);NUCLEAR/General (50%)
ENERGY CYCLE: PROCESSING, CONVERSION (100%)
POLLUTANTS: ORGANICS (50%);RADIATION (50%)
CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific Hanford and Oak Ridge coal conv. sites
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Use modern epidemiological technology as the means for monitoring large populations of workers in industries related to fuel and energy production to detect any harmful effects of these occupations as soon as possible so that health protection can be constantly improved.
APPROACH: The disability and mortality experience of persons with a history of employment in selected installations associated with the nuclear industry and the coal conversion industry will be studied. Employment histories and medical records are used as primary inputs. Where lacking, plans for medical

surveillance of workers are being designed to provide early detection of health effects. In the coal conversion area, plans for industrial hygiene programs are being designed to minimize exposure of workers to carcinogens.
ULTS: The professional staff of epidemiologists and statisticians needed to conduct the study have been recruited and become familiar with the existing data banks. A study of the mortality experience of the workers exposed to metallic nickel at the Oak Ridge Gaseous Diffusion Plant has been implemented, and a study of the mortality experience cf workers at the Savannah River Plant has been completed.
PROJECT MILESTONES: (1) The study of mortality of workers exposed to metallic nickel will be completed and submitted for publication, Sept. 30, 1978. (2) The design of forms for collection of data on clinical findings and medical, occupational, and family histories fcr coal-conversion workers will be completed, Sept. 30, 1978. (3) The first analyses of mortality of workers in Oak Ridge employed before 1950 will be completed, Sept. 30, 1979. (4) The forms and protocols designed for collection of health data on coal-conversion workers will be field tested and redesigned, if indicated, Sept. 30, 1979.

POLLUTANTS: NOXIOUS GAS (10%);METALS (30%);PARTICULATES (30%);HEAT, THERMAL (30%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Southeast;COASTS/Gulf;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: This study will test the feasibility of using an existing natural phenomenon (warm, saline discharge of a major submarine spring in the eastern Gulf of Mexico) to determine the long-term effects upon shelf biota of thermal discharge from offshore power plants.
APPROACH: The study will assess the regional setting, magnitude variability and properties of the Mud Hole Submarine Spring by means of geophysical, geological, chemical, hydrographic and limited biological sampling. Reconnaissance and quarterly shipboard surveys will be supplemented by continuous in situ monitoring of flow rate and temperature and by periodic aerial mapping of sea surface temperature patterns. Mathematical modeling of the spring's flow regime and its interaction with ambient shelf waters will help determine the near-field and far field significance of discharge plume in comparison with nutrient, trace metal, dissolved oxygen and primary productivity anomalies.
RESULTS: Advances in understanding the distribution of continental shelf fracture patterns, the potential flow paths of waste injected in deep wells, the nature of geothermal processes in non-volcanic areas and the dynamics of water-sediment-organism interactions.
PROJECT MILESTONES: Initial reconnaissance 1977; establishment of film-recording thermograph and flowmeter for continuous, unattended monitoring of the spring 1977.
KEYWORDS: THERMAL SPRINGS;PHYSICAL PROPERTIES;CHEMICAL PROPERTIES;UNDERWATER;SEAS;FEASIBILITY STUDIES;GULF OF MEXICO;MONITORING;FLOW RATE;TEMPERATURE MEASUREMENT;ENVIRONMENTAL EFFECTS;CONTINENTAL SHELF;FRACTURES;AQUATIC ECOSYSTEMS;TEMPERATURE EFFECTS;GEOPHYSICAL SURVEYS;GEOCHEMICAL SURVEYS

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Northeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To characterize effluents, process streams, and wastes from fluidized bed combustion and low-Btu gasification for toxic agents present; (2) to define the pathogenic chemicals in these processes by in vitro screening, and (3) to understand the biochemical mechanism(s) involved in the effect.
APPROACH: (1) Sample and chemically analyze process streams and effluents. (2) Analyze chemical reactions that lead to contaminant release. (3) Conduct cellular and biochemical screening bioassay lung macrophages, membranes and model lipid membranes.
SULTS: In conjunction with investigators at Inhalation Toxicology Research Institute, an integrated chemical and biological analysis program will define the major effluents and emissions from both advanced coal combustion and gasification processes. Information from the in vitro bioassays will be used to establish priorities among chemical agents to be used in animal experiments in the joint ITRI-MERC program.
PROJECT MILESTONES: (1) Obtain samples and chemically characterize 1-6-77. (2) Prepare samples for in vitro bioassay 1-9-77. (3) Preliminary bioassay lung macrophages 1-1-78. (4) Data on PAH activating enzymes

1-6-78.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To mathematically model whole-body transport and deposition of ingested or injected Cd and Nb in comparative animal species in order to supply the tissue and organ dose. The dose component of dose-effect studies will be used to improve human risk estimates from experimentally derived data.
APPROACH: We will study neonatal and weanling and adult rodents, swine and sheep using intravenous and oral routes of administration to derive experimental transport coefficients among animals and across species and associated error terms to avoid confounding data variations due to experimental variation as opposed to real variations in transfer coefficients for various species.

RESULTS: We expect to find some transfer coefficients are species independent and therefore directly applicable tc man. Others will be shown to be species dependent and the anatomical, physiological and metabolic basis will be defined. Where actual human data exist, these will be incorporated into the model.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Middle Atlantic;COASTS/Northeast;HYDROGRAPHIC AREAS/Other hydrographic areas Coastal
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) To determine the potential effect of grazers (including nauplii) on phytoplankton succession in coastal temperate waters by assessing their selection of different sized species and grazing rates on different species of comparable sizes. (2) To determine the trophic status of the seasonally dominant species of zooplankton in mid-Chesapeake Bay. (3) To determine the extent to which phytoplankton size composition limits production of zooplankton in coastal temperate waters. (4) To determine the potential effect of phytoplankton succession of zooplankton grazer interaction by assessing the mechanistic response of particular grazers to particular feeding conditions.
APPROACH: Wild or laboratory-cultured species of zooplankton are presented with natural or contrived distributions of particulate matter. Particles removed from suspension by the grazing zooplankton are determined with an automatic particle counter.
RESULTS: Selection by the grazers for certain sizes or classes of particles will be interpreted in light of observed selective mortalities of phytoplankton that are pumped through power plants. Subtle effects of large power plants on estuarine ecosystems may thus be evaluated.
PROJECT MILESTONES: May 1977 Complete full year's study of selection of experimentally contrived particle distributions. (Testing of hypotheses formulated during first year's work).

CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Northwest;GEOGRAPHIC AREAS/Site specific Hanford;COASTS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This project is being carried forward to develop and maintain criteria to determine the long range effect of low level chronic radiation exposure to man, including the incidence of leukemia or cancer in general, and to study the effect on the mortality rate and differential causes of death between those exposed occupationally to ionizing radiation and their appropriate controls not so exposed.
APPROACH: The ERDA-RL Contractors' employees health, radiation exposure, and job assignment records have been searched dating from 1944. This, with other data, will be studied to determine any relationships between radiation exposure and mortality. The study design utilizes multiple control groups. One of the control groups is, employees in the same installations who were less exposed to ionizing radiation. One of the controls is the siblings of exposed employees. The mortality experience of each control group is being compared with the mortality experience of the exposed groups graded according to their exposure to ionizing radiation received in the course of employment in an ERDA installation.
RESULTS: The main purpose of this study is to ascertain whether or not any detectable life-shortening or increase in mortality has occurred among atomic energy workers, especially those exposed to occupational radiation compared to non-exposed employees selected from appropriate control populations.

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (20%);ANALYTICAL (80%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Site specific USA
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of the U.S. Transuranium Registry is to determine any observable effects of work exposures on health, longevity and cause of death of transuranium workers in major ERDA contractor and licensee installations.
APPROACH: This continuing program provides for the centralized accumulation and evaluation of the uptake, distribution, retention, elimination and biological effects of transuranium nuclides in occupationally exposed workers. There is in progress a rapid evaluation of present health, mortality and cause of death of plutonium workers who have known depositions as compared with control groups with no such depositions.
RESULTS: Some nine thousand transuranium workers who have been at risk have been identified and continuing search of past records is expected to add two or three thousand more. Eight hundred forty-five authorities

for autopsy have been obtained and 58 autopsies obtained as of May 1, 1976. No serious adverse health effects, related to work exposures, have been found to date and results have been published in reports to ERDA and in the professional journals. A study of 452 Hanford employees with depositions of Pu has shown no statistically significant difference in present health, mortality and cause of death in those with higher depositions of Pu (2 nCi to 400 nCi) as compared to those with lower depositions (2 nCi). A Registry study of present health and longevity and cause of death of presently employed Hanford Pu workers with that of Hanford workers not so exposed as well as with other controls is expected to be completed during fiscal year 1977. Continued progress is expected in the accumulation of sufficient data to develop an improved model of the metabolism of Pu in man.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: This laboratory discovered a new physical phenomena associated with the interaction (collision) of molecules in solution. When molecules collide in free solution the diffusion coefficients of one each of the pair are influenced. In general, free solution interaction reduces the diffusion coefficient and there is no ''useful'' effect of such collisions. When a membrane separates two solutions and the processes of transmembrane diffusion is being studied, molecular (solute) interaction can lead to a large unidirectional effect. The large asymmetric flux of a second solute caused by the presence of a hyperosmotic agent (first solute) on one side of the membrane has been given the descriptive name ''solute drag.'' The present studies are directed to defining the specifics of molecular structure, molecular size, etc. of the solute drag. We are attempting the quantitate the phenomena and to describe conditions under which solute drag may be put to practical use.
APPROACH: Details of the approach have been described in a series of publications from this laboratory, the latest of which was entitled ''Solute Flux Coupling in a Homopore Membrane.'' This appeared in the J. Gen Physicl. 83, 639-656, 1974. The usual experiment involves following the flux of a radioactive tracer as it moves from one chamber to another across a selected membrane. Solutes other than the tracer are added to the solutions in appropriate amounts to elicit solute-solute interaction and solute drag.
RESULTS: It is expected that the work will firmly establish solute-solute interaction as a basic process of both biological and non-biological systems. Its recognition in biological systems may lead to a better understanding of mechanisms of transmembrane movement of solutes into and out of cellular and organ systems. Its recognition as a basic process in non-biological systems may lead to its application in industry to energy-related mechanisms of application.
PROJECT MILESTONES: It is possible that the application of the concept of solute drag to specific biological systems will reveal that the present ''cloudy'' explanations of biological transport do in fact have a component of solute drag within the process. It is possible that the application of the principle of solute drag may permit the useful modification of the rate of transmembrane separation processes so as to accomplish separation with a ''force'' not yet utilized. It may also help to explain the limitations of current transmembrane separations in which the presence of solute drag had not been appreciated.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) Elucidate the mechanism of azide mutagenesis. (2) Elucidate the nature of azide-induced mutations.
APPROACH: Previous work indicates that azide is a potent and specific mutagen. In bacteria only base substitution mutations are induced and possibly only transversion-type base substitutions. The mechanism of azide mutagenesis is not understood. Work on this contract during the past year has provided preliminary evidence that azide is converted in vivo to the actual mutagen. Research proposed on this contract will concentrate on elucidating the in vivo reaction that results in the actual mutagen. The nature of this unknown in vivo mutagenic product as well as the role of DNA replication in azide

mutagenesis will be investigated. The waxy pollen locus system is being developed to study the molecular nature of the induced mutants.
RESULTS: Elucidation of the mechanism of action of a very unusual and potent environmental mutagen, sodium azide. Development of systems for the characterization of the nature of eukaryotic mutations.
PROJECT MILESTONES: (1) Discovery of sodium azide as a mutagen. (2) Realization of the unique mode of action of azide as a mutagen. (3) Determination that azide induces only point mutations in bacteria and possibly in eukaryotes.

PROJECT DESCRIPTION: To obtain understanding of the chemical alterations introduced into self-replicating molecules of ribonucleic acids by exposure to ultraviolet light and other radiation. The process whereby various proteins, especially viral capsomer proteins, can protect genetic material from the damaging effects of ultraviolet light and other electromagnetic radiation will be ascertained. The ability of various plants to repair damage to genetic material will be studied using plant viruses.
APPROACH: The small ribonucleic acids of precisely determined sequence will be used to determine the effects of ultraviolet radiation on the replication of ribonucleic acids. Various plant viruses containing different types of capsomer proteins will be used as means of determining the protective effects of capsomer proteins on genetic material. Plants which are hosts for these viruses will be used to study environmental effects on the ability of plants to repair nucleic acids.
RESULTS: Expected results will be a determination of the types of lesions introduced into nucleic acids and their effects on the ability of these nucleic acids to replicate. The protective effects of proteins will be determined by a study of the molecular nature of the dissipation of the radiant energy in plant viruses. The protective nature of plants in repairing damage will be indicated by the ability to rescue infectivity of virus particles inactivated by ultraviolet radiation.
PROJECT MILESTONES: In the case of small self-replicating molecules, a milestone will certainly represent a determination of the chemical nature of lesions introduced into the self-replicating molecule by ribonucleic acid and the exact determination of the site of these lesions in molecules whose space sequence is ascertained.

PROJECT DESCRIPTION: Identification and characterization of physical and chemical processes responsible for transporting, immobilizing, remobilizing and transfering between constituent phases, heavy metals in Alaskan ecosystems, particularly fjord estuaries.
APPROACH: A multi-faceted basic research program currently emphasizing the role of copper. Approach includes: (1) laboratory studies on chemical speciation in saline solutions, (2) exchange between natural solid inorganic phases and estuarine waters, (3) remobilization and migration at and from the sediment-water interface, (4) transport processes (advection and diffusion within fjords, and (5) development of the analytical methods required for the previous objectives.
RESULTS: Knowledge of the processes controlling the transport rates and routes and the major sinks for selected heavy metals in estuarine systems with specific reference to Alaskan fjords.
PROJECT MILESTONES: Project milestones through calendar year 1976 include: (1) inter-agency selection of intensive study, Alaskan estuarine sites July, (2) preliminary data on copper and lead speciation published September, and (3) comprehensive reports on chemical characteristics and water circulation in one Alaskan fjord September and November.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Alaska
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The overall goal of this project is to study the effects of industrial development in Alaska on the physiological status and performance of arctic animals, especially caribou and reindeer. Additional studies with moose, fox, wolf, hare, lemming and ptarmigan will be undertaken in collaboration with other investigators. Environmental contaminants and pollutants resulting from energy extraction, mineral exploitation and from recreational use of the arctic wilderness as well as the exotic plants that are introduced for revegetation of transportation corridors are included among the environmental stresses of concern to this project. Studies will be directed at determining the effects on various parameters on indices of performance, i.e., on grazing behavior, animal productivity, milk production, body composition, physiological and nutritional status, and the passage of fallout radionuclides through food chains. In addition and in order to study the performance of herbivores grazing revegetated transportation corridors in alpine tundra/taiga areas, special grazing paddocks are being prepared at the Cantwell Reindeer Research Station. This new development affords considerable opportunity for agronomic, plant ecology and plant physiology/nutrition research and therefore we are listing appropriate long-term research in this area as a new contract objective. Studies will be directed at seed
APPROACH: Various arctic mammals, especially reindeer, Rangifer tarandus, are fed or allowed to graze atypical and/or petroleum-contaminated vegetation under controlled circumstances that simulate existing or anticipated conditions along transportation and/or petroleum pipeline corridors. The consequences of ingesting these atypical and/or polluted foodstuffs are monitored via a number of physiological and biomedical parameters. Additional studies are conducted simultaneously to determine levels of voluntary food intake, palatability and preferences for the various plant species used in revegetating tundra rangelands.
RESULTS: The results from these studies will provide information on the toxicity of orally ingested crude oil to arctic mammals, will establish the syndrome of such toxicity and provide guidelines for preventing the syndrome or treating animals that have accidentally ingested crude oil. The study will also establish the suitability of plant species used to revegetate disturbed land toward meeting the nutritional requirements of arctic animals grazing especially in alpine tundra rangelands.
PROJECT MILESTONES: (1) 1977, Perfection of in vivo techniques for determining physiological status of large arctic ungulates. (2) 1977, Initiation of studies on the nutritional and ecological significance of lichens in the winter diets of Rangifer. (3) 1977, Initiation of study to examine the importance of

introduced revegetation species to arctic herbivores. (4) 1978, Conclusion of studies on the effects of nutritional and environmental factors on accumulation and metabolism of radiocesium.

REGIONS OF INTEREST: BIOMES/Freshwater;BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Northwest;COASTS/Northwest;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This program was originally planned and designed to evaluate the effects of ionizing radiation from radioactive effluents of nuclear reactors on the salmon. Although under present regulations very little if any radioactivity from nuclear power plants affects the rivers, there is a major public concern about the potential danger to the salmon which use the waters for spawning and nursery areas. More data is needed to assure the public that even in the unlikely event of a ''leak'', the possibility of radiation damage to aquatic resources is remote. To provide information addressed to this concern, experiments were designed and carried out at the College of Fisheries to investigate the long-term effects of chronic irradiation on salmon through use of the salmon runs developed at the college.
APPROACH: The program was originally planned and designed to evaluate the effects of radioactive effluents from nuclear reactors on the salmon. One of the major problems posed by placement of nuclear reactors on major rivers is the long-term effects exposure to chronic irradiation has on the chinook salmon (Oncorhynchus tshawytscha) which use the river as a spawning and nursery area. To evaluate these effects, chinook salmon eggs and alevins were exposed to low levels of gamma irradiation from a Co-60 source from fertilization until the yolk sac was completely absorbed. These fish were compared with a similar stock that was not exposed to irradiation. The level of exposure was incrementally increased from 0.5 R/day in 1960 to 1.3 R/day in 1965, 2.8 R/day in 1966, 5.0 R/day in 1967, 10.0 R/day in 1968, 20.0 R/day in 1969, and 50.0 R/day in 1970. After a period of rearing in freshwater, the fish were released to migrate to sea where they compete in the natural environment. The effects of the irradiation are monitored during the early development of the fish and when the fish return as adults from the sea. Possible genetic changes are also monitored in the returning adults and in the F/sub 1/ progeny.
RESULTS: No damaging effects were found at the lower exposure rates (0.5-5.0 R/day). At the higher levels (10-50 R/day) the irradiated fish, when compared to the controls, demonstrated slower growth, increased mortality, damage to the gonadal tissue, lower numbers of returning adults, and some sterility in the adult males. Genetic analysis of the returning adults and their F/sub 1/ progeny has shown some genetic differences which could be explained by the irradiation treatment. The data for the highest level of exposure (50 R/day) will be evaluated further as the adults return.
PROJECT MILESTONES: Analysis and summarization of the entire series of experiments should be completed by the end of 1976 providing information on biological effects on chinook salmon of low levels of chronic irradiation.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Northwest;HYDROGRAPHIC AREAS/Other hydrographic areas Saline lakes
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Building on a large record of previous experience and data, the project continues to investigate some of the mechanisms that control productivity, abundance, and the general character of aquatic communities. Emphasis is on the study of lakes that have been modified in some clear way, and can be treated as experiments and on lakes that have some distinct character especially well developed. Most of the data concern the changes in fauna in two saline lakes that have been diluted and in a lake that was formerly meromictic (permanently stratified) that became mixed.
APPROACH: Measurements are made of appropriate properties of the environment and of the kind and quantity of organisms and of their productive activities. Correlations are established between changes in the character of the lake and the biological characteristics, and are followed up by appropriate experiments in the laboratory. While most emphasis has been on the changes brought about by dilution of salt lakes and mixing of a meromictic lake, certain special problems have been picked out for detailed study. The ecological effect of the carotenoid content of red copepods is one; the carotenoid protects the animals against lethal solar radiation. The special effectiveness of the predatory insect Chaoborus in controlling the structure of freshwater planktonic communities is another.

RESULTS: The results will be an improved understanding of what controls the abundance and species makeup of freshwater communities and the communities of salt lakes. We should be able to predict better the effects of certain kinds of environmental disturbances and of the various techniques available for restoration.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this program is to study the biogeochemistry of the transuranic radionuclides in Bikini Atoll. In particular, this year's program is to continue investigations of the changes since 1958 in the radionuclide concentrations and redistribution processes of the atoll, with particular reference to the measurements of the concentrations and physico-chemical states of transuranic radionuclides in the water column.
APPROACH: The approach will be to collect water samples for radionuclides at selected stations in the lagoon with the Battelle large-volume water sampler (BLVWS) and by conventional methods of co-precipitation. Changes in the physico-chemical state of Pu were indicated in 1972 from injection at the sediment-water interface to the water column. Samples will be collected to evaluate these processes and to measure the uptake of transuranic elements in the food chain. It is expected that the physico-chemical states of radionuclides are fundamental to their uptake by organisms.
RESULTS: From these results, we plan to evaluate those processes which are important to the remobilization of transuranium and other radionuclides in natural ecosystems. The results of the measurements should also give sufficent data to evaluate the new sampling system (BLVWS) for collecting and concentrating low levels of radionuclides and trace quantities of heavy metals in seawater.
PROJECT MILESTONES: The data collected so far have shown that (1) the Pu and Am are not removed from the atoll ecosystem once they are associated with sediments, (2) the concentrations of Pu and Am in the Bikini Lagoon water vary from 3-250 pCi/m-cubed and depend strongly on location, and (3) the highest concentrations of Pu and Am are found associated with sediment located not in the bomb craters but in the NW quadrant of the lagoon.

POLLUTANTS: METALS (5%);PARTICULATES (5%);ORGANICS (5%);HEAT, THERMAL (5%);SPECIFIED OTHER POLLUTANTS/Transfer through marine food chain (80%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Northwest;COASTS/Northwest;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The goals include a better understanding of the communities of organisms, including the processes governing them, in the water column, on the sea bed, and in the surf zone. The investigations concentrate on the algal producers of organic matter with emphasis on the formation and maintenance of subsurface maximum layers, the subsequent consumption by herbivorous zooplankton and its growth, and the fate of the organic matter that reachs the sea bed. The role of benthic organisms in nutrient recycling and resultant effect on the plankton of the continental shelf is being studied, and investigations are proposed to assess mechanisms and species involved in controlling community structure and function. Quantitative models of plankton production are under development in cooperation with the physical circulation studies as part of a long-term program to improve our quanititative understanding of the system.
APPROACH: The project is an extension of a multidisciplinary study begun in 1961 on the effects of the Columbia River on the Northeast Pacific Ocean and includes, in addition to biological studies, investigations of the physics, chemistry, and geology of the river effluent area. Since 1971, the biological research has functioned as a separate contract as have the physical oceanography and geochemistry programs.
RESULTS: The research is expected to provide insight into the dynamics of this complex coastal system as well as to provide information of practical interest. The siting of nuclear power plants along the outer coasts

and offshore regions over continental shelves requires a basic understanding of the processes governing the distribution and abundance of organisms found in these highly productive regions of the oceans. Our studies are aimed at principles and concepts, not only applicable to the outer coast of Washington but to coastal zones in general. Our ultimate aim is to simulate the gross characteristics of biological data and, in so doing, identify and quantify the physical, biological, and chemical processes that determine the distribution of plankton organisms. If those processes can be described quantitatively, models can then be used as experimental tools to determine the effects of certain modifications of the coastal environment on biological production.
PROJECT MILESTONES: In the coming year, we plan to accomplish the following: first, the sensitivity analysis of the offshore model will be completed, appropriate conclusions drawn, and recommendations made regarding those particular biological and physical processes which should be given highest priority in field work. Second, a summary of relevant field data, including biological and chemical parameters, recently acquired off the Washington-Oregon coast will be assembled, preferably in the form of a working report, to facilitate model evaluation and comparison, and then be made available to those who are involved in all phases of the project. Third, the numerical model of primary production and nutrient distributions will be modified to model the effect of the circulation of nutrient-rich, upwelled water near the continental shelf. Fourth, certain submodels will be investigated in greater detail.

PROJECT DESCRIPTION: The ultimate goal is to provide tested predictive models to characterize the current field, wave motion and associated movement of sediment on the continental shelf.
APPROACH: A field program of direct current, wind and hydrographic measurements on the continental shelf is designed to produce data that are required to elucidate the physical processes of major concern and to provide input to physical oceanographic models of shelf circulation. Measurements of the flow and pressure fields in the bottom boundary layer are made to provide input for sediment transport modeling.
RESULTS: Detailed understanding of physical processes active on continental shelves in order to provide the ability to predict where pollutants and thermal effluents are transported and to answer questions of sediment transport related to siting of offshore nuclear power plants.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Develop a scientific base for predicting and testing the behavior and fate of various trace chemicals in coastal and estuarine areas.
APPROACH: Perform laboratory and field studies off the Washington coast north of Columbia River including: (1) surface chemical studies of scavenging of various species dissolved in seawater by well characterized natural particulates; (2) studies of uptake and transfer of several isotopes in particularly well defined parts of the marine food web; (3) studies of the behavior of Pb-210 and Po-210 in sediments off the Washington coast and the application of Pb-210 dating to determine sediment accumulation rates over the past 100 years.
RESULTS: Several M.S. theses, Ph.D. dissertations and publications in referenced scientific journals.
KEYWORDS: LEAD 210;POLONIUM 210;RADIOECOLOGICAL CONCENTRATION;SEDIMENTS;COASTAL WATERS;PACIFIC OCEAN;SEAWATER;SCAVENGING;FOOD CHAINS;RADIONUCLIDE MIGRATION;AQUATIC ECOSYSTEMS;RADIOACTIVE EFFLUENTS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Our objective is to learn the fate and mechanism of transport of iron-55 in the marine envircnment.
APPROACH: We plan to explore the problem of selective concentration of iron-55 in marine organisms by sampling seawater, zooplankton, fish and sediments from the same locations. We also intend to study mechanisms of vertical transport, considering both biological and physical mechanisms of transport. Causes of selective concentration of iron-55 will be studied by various chemical extractions of iron-55 and stable iron from naturally labeled sediments and by allowing organisms to remove iron-55 from naturally labeled sediments.
RESULTS: We expect to quantify our observation that marine organisms concentrateiron-55 in preference to stable iron in the ocean.

TECHNOLOGY: NUCLEAR/Fission (100%)
ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objectives of the proposed research are to determine distribution ratios and diffusion coefficients of Am/sup 3+/, Cm/sup 3+/, and NpO/sub 2//sup +/ in representative soil-squatic environments. Determination of the important environmental factors, such as adsorption, complex formation with organic components of the soil, and radiocolloid formation, is a secondary objective of the research.
APPROACH: Distribution ratios of Am/sup 3+/, Cm/sup 3+, and NpO/sub 2//sup +/ for the soil-water system will be determined using alpha counting techniques. Diffusion coefficients will be determined by the method developed by Olsen, Kemper, and Van Schaik. To minimize contamination problems, sub-microcurie amounts of Am-241, Cm-244, and Np-237 will be used. Gamma counting techniques will be used for the diffusion experiments. Radiocolloid formation of Am/sup 3+/, Cm/sup 3+/, and NpO/sub 2//sup +/ will be determined by autoradiographic, dialysis, centrifugation, and filtration methods. Complex formation will be determined by well known distribution techniques.
RESULTS: Distribution ratios of 241-Am/sup 3+/, 244-Cm/sup 3+/, and 237-NpO/sub 2//sup +/ have been determined for several representative soils. Diffusion coefficients of NpO/sub 2//sup +/ and Am/sup 3+/ in representative soils have been determined. The radiocolloidal behavior of Am/sup 3+/ and Cm/sup 3+/ in the soil-aquatic environment has been established.
PROJECT MILESTONES: (1) Setting up of laboratory procedures. 82) Establishment of experimental methods. (3) Determination of ditribution ratios of 241-Am/sup 3+/ and 237-NpO/sub 2//sup +/. (4) Construction, testing, and use of diffusion cells. (5) Determination of diffusion experiments initiated.

POLLUTANTS: HEAT, THERMAL (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Continental;HYDROGRAPHIC AREAS/Other hydrographic areas Streams
SEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Heated water from natural sources raise the temperatures of the Firehole River by an average of more than 10 C, an amount comparable to the increase in temperature of cooling water used by nuclear powered electric generating plants. This stream is inhabited by rainbow and brown trout, whose reproduction is known to be especially sensitive to increased temperatures. The purpose of this study is to determine the effects of such an elevated thermal regime on the reproduction of resident trout, and the nature of possible reproductive adaptations, if any, to this altered environment.
APPROACH: Temperatures of the river above, within, and below the sources of heated water continuously monitored by recording thermometers. Trout sampled from thermally affected and unaffected areas for ovary and testis samples, analyzed for information on histological progress and normality of development and seasonal reproductive cycling. Occurrence and timing of reproduction also monitored by samplings for young and observations of possible spawning ares. Movements of fish at the sample areas determined by mark-and-recapture methods employing electrofishing. Laboratory determinations to be made of thermal resistance of young, and of thermal limits for seasonal gonadal development.
RESULTS: We hope to answer the question of whether rainbow and brown trout can continue to reproduce in an originally cold-water stream whose temperatures have been raised by an amount comparable to that produced by a nuclear power-generating station. If they are able to, we hope to determine how this is accomplished under temperatures that often exceed their published lethal levels; whether they have increased thermal tolerances, or behavioral adaptations, or some other means of accommodation. If trout residing in this one stream have been able to adapt successfully to such a high level of thermal elevation, then the potential relevance to the question of discharge of waste heat into similar streams is obvious.

TECHNOLOGY: FOSSIL FUEL/Coal (100%)
CHARACTER OF STUDY: RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Site specific Unspecified
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To investigate plant establishment and succession on treated surface mined coal lands in SE. Montana; to investigate the stability and permanence of artificial plant communities on surface mined lands; to investigate the nature and rate of soil development on surface mined lands.
APPROACH: Establishment, succession and soil development are being investigated on strip-mine spoil dumps created 45 to 53 years ago. Revegetation of sites disturbed less than 5 years ago are included in the chronological sequence evaluation. Basic methodology includes detailed monitoring of quadrants located within fenced enclosures on lands mined for coal since 1923. Thirteen enclosures on 1 to 8 year old reclamation plantings and on 44 to 53 year old naturally revegetated coal spoils were established. Transects were set up to monitor plant population parameters including cover, density, frequency, constancy, and diversity. Root production, above ground biomass, and soil development are monitored. Rate and trends of plant succession over a five year or longer period will be analyzed. Permanent stereophotographic records of vegetational development over the period are being collected.
RESULTS: Success of reclamation using existing reclamation technology is compared with natural recovery processes. Data have been obtained for the common measures of vegetative succession and development, e.g., biomass productivity, cover, frequency and density. Comparative results are presented; total production of disturbed sites is greater than that of an undisturbed site, but composition is different. Productivity of the control site is dominated by native perennial grasses while the 40 to 50 year-old sites produce largely shrubs. This is an important observation because the agriculture economy of the range is highly dependent on the native perennial grass component of the grassland ecosystem. In contrast, where disturbed lands have been seeded with native species, the productivity of native perennial grasses exceeds that of the reference site after a four to nine year period. It is apparent from compositional differences 40 to 50 years after disturbance that plant succession has not reached the same endpoint as the native

undisturbed community. Succession by natural mechanisms over this period, unaided by designed reclamation measures, evidently has not satisfied Montana's statutory requirement of strip-mined land reverting to a natural state.

77 FUNDING: Energy Research and Development Administration FY77:$45,000; Forest Service
TECHNOLOGY: FOSSIL FUEL/Coal (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Northwest;COASTS/Other coasts Northern Great Plains
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objectives are to: (1) inventory natural seed maturation and production, (2) determine optimum seed collection and handling procedures, (3) determine physical and chemical requirements for breaking seed dormancy, (4) measure seed viability and seedling vigor, (5) examine vegetative propagation characteristics, and (6) determine phenology of native species for application to reclamation of strip-mined land.
APPROACH: Study phenology of seed maturation and dispersal, measure production of viable seed in the field by species and ecotype, examine several systems of collection, treatment, and storage; measure germination under controlled environment conditions and use various mechanical and chemical means of breaking dormancy as required; chemicals used are acetone, ethanol, and sulfuric acid all under vent-hood conditions. Seedling vigor is to be determined from root and shoot rate production. Cuttings are to be studied for ease of rooting. Test plots are established on strip-mined land.
RESULTS: Data have been obtained on the phenology of seed maturation for approximately 40 native species, on seed production under natural conditions, on seed collection methods and handling, on physical requirements for breaking seed dormancy, and on vegetative propagation methods. Results from this research are important to revegetation of strip-mined lands in the Northern Great Plains. The research is providing valuable information on suitable native plant species in the reclamation of strip-mined land in the semi-arid west.
PROJECT MILESTONES: (1) Complete preliminary Native Plant Seed Manual for Fort Union Basin from existing data 10/76. (2) Complete collection handling and germination requirements on major plant species 10/77. Update on Native Plant Seed Manual 10/77. (3) Complete germination requirements of minor plant species 10/78. (4) Complete vegetation propagation evaluation 10/78.

PROJECT DESCRIPTION: Provide the maintenance, surveillance and property control of the retired Hanford Reactor facilities in 100 D-DR, 100-F and 100-H Areas, to assure the facilities are maintained in safe and/or protected condition.
APPROACH: The reactor buildings and the surrounding cyclone fences are maintained in a locked status and an approved permit is required for entry. Fire protection equipment is maintained in service and the housekeeping of area grounds is maintained at a level to minimize fire and personnel safety hazards. Scheduled radiation monitoring surveillance is made of the posted radiation zones in the reactor buildings and of all the burial grounds, cribs and trenches to assure they are controlled within prescribed limits.
RESULTS: The retired Hanford Reactor Facilities are maintained in a safe and secured condition to minimize damage due to fires, personnel injuries and loss of Government property. Radiation monitoring surveillance prevents the release of radioactive contaminants to the environment.
PROJECT MILESTONES: Continuous program.

RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: The objective of this program is to develop, design, and demonstrate process equipment which will reduce the volume of contaminated equipment to a size and form suitable for terminal storage or disposal.
APPROACH: Equipment and metallic waste, typically, has an average void volume of 90 to 95 percent. Since prior attempts to develop decontamination techniques of general applicability which can reduce contamination to releasable levels at reasonable costs have not been successful, this program plans to develop methods to melt the scrap metal and store the contaminated waste as ingots. A cold mold vacuum furnace will be built and tested. Size reduction to convert large process vessels to pieces small enough to be accepted by the proposed vacuum furnace appear to be one of the most difficult aspects of the problem. Future plans are to design and build a size reduction system which can safely cut vessels into pieces small enough to charge a melt furnace.
RESULTS: A vacuum furnace will be designed, built and demonstrated by FY-1980. (1) A size reduction facility will be designed, built and demonstrated by FY-1979. The final result of this program is the demonstration of a system which can reduce unwieldy, irregularly shaped metallic scrap to a convenient storable product. Laboratory tests suggest that it may also be possible to use slag entrapment of plutonium oxide to reduce most of the resulting ingots to non-TRU status. The final storable product could be non-TRU low-level waste in a metal matrix.

PROJECT DESCRIPTION: This activity is an extension of the ERDA public education program. The exhibit ''Transporting Radioactive Cargoes'' is designed to be used primarily at convention sites in the western U.S. Its purpose is increased public awareness and understanding of the present and potential requirements for the transport of radioactive materials. It emphasizes ERDA's continuing concern for the safety of every citizen and the protection of our environment.
APPROACH: Show a specially designed exhibit manned by a NORCUS teacher-demonstrator at large conferences of the Transportation Industry and other concerned groups to emphasize ERDA's continuing concern for the safety of every citizen and protection of our environment in the transport of radioactive materials.
RESULTS: To increase public awareness and understanding of the present and potential requirements for the transport of nuclear materials.
PROJECT MILESTONES: Show exhibit at 12 to 16 western U.S. conferences and meetings each year. Provide necessary exhibit maintenance. Evaluate each showing within two weeks.

REGIONS OF INTEREST: BIOMES/Estuarine;GEOGRAPHIC AREAS/Alaska;COASTS/Alaska;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Because of the energy-related projects now under construction and those proposed for rapid implementation on or adjacent to the coast near the mouth of the Copper-Bering River system, it is imperative to document the importance of this area to the survival of two species of migrant shorebirds, the western sandpiper and the dunlin. This question arises because of three potentially threatening energy-related developments close to the Copper River intertidal system: (1) marine oil-tanker traffic through Prince William Sound, (2) offshore continental shelf leasing, and (3) development of a large natural gas liquefaction plant at Sheep Bay.
APPROACH: Up to 100 birds of each species will be shot for detailed carcass analysis at stopover locations for the two species during April and May. Cinematographic records on 16 mm film will be made periodically at Bodega Bay, California and the Copper River Delta to determine whether rates of jabbing and probing actually differ significantly between wintering and migrating birds. A trip to the major collections in the continental U.S. will be made to record occurrence, phenology, body weights and other pertinent parameters recoverable from museum collections at low cost and at great benefit to extending the span of years covered by the study.
RESULTS: Applications of the information presented in reports and publications of this project will be important in documenting or refuting the supposed importance of the Copper-Bering River system. The results may be useful in specifically indicating protective measures by state and federal resources.
PROJECT MILESTONES: Initiation of research, April 1, 1977; project completion and final report, March 31, 1978.

SEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To characterize the concentrations and distributions of transuranics in sediments of the Columbia River, its estuary and offshore Pacific Ocean. To determine uptake, loss and tissue distribution of Pu in aquatic and marine organisms, with emphasis on determining whether main uptake route is food or water.

APPROACH: Core samples will be collected and analyzed for Pu by alpha spectroscopy and sections age dated by the lead-210 method. Aquaria experiments using plutonium-237 tracer will be conducted with the aquatic and marine organisms.
RESULTS: Clarification of the geobiochemical behavior of plutonium buried in the sediments.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To identify mechanisms that control the growth and balance of organized mammalian cell populations and the way in which these mechanisms are affected by energy-related toxic agents. The studies are focused on bone marrow regulation and regeneration, modulation of the extracellular environment and comparative tissue sensitivity.
APPROACH: Experiments are performed in vivo with mice and rabbits and in vitro with hematopoietic and stromal cells of bone marrow and spleen, endosteal cells, macrophages, fibroblasts and tumor cell lines. Biochemical, cytological, physiological and specific lethal endpoints are used in conjunction with a variety of perturbations to uncover control systems and to develop methods for evaluation of acute and chronic sequelae of exposure to prototypic environmental contaminants.
RESULTS: (1) Relationship of bone to bone marrow function: possible implications of damage by bone-seeking agents. (2) Role of bone marrow stroma in hematopoietic stem cell regulation: implications of stromal damage. (3) Hematopoietic stem cell traffic: possible effect of airborne pollutants on circulatory stem cells. (4) Simulation of chronic localized bone marrow exposure to chemical carcinogens. (5) Role of macrophage activation in chronic inflammatory processes in lung and other tissues. (6) Interaction of potential carcinogens during cytotoxic T lymphocyte differentiation. (7) Modification of interactions of carcinogenic agents and cellular components by sulfhydryl reagents. (8) Application of radiation-derived specific lethal endpoints to evaluation of low level toxicity by chemical agents. (9) Application of single X-ray dose equivalents to prediction of radiation tolerance in man.
PROJECT MILESTONES: (1) In vitro Hematopoietic Stem Cell Assay FY 1978. (2) Circulating stem cell turnover parameters FY 1978. (3) Establishment of functional indices for bone-bone marrow interactions FY 1979. (4) Influence of sulfhydryl reagents on interactions of carcinogenic agents and cellular components FY 1977. (5) Possible implications of lung macrophage activation FY 1978. (6) Application of radiation-derived specific lethal endpoints to low-level pollutant effects FY 1978.

POLLUTANTS: METALS (10%);ORGANICS (40%);RADIATION (45%);HEAT, THERMAL (5%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The research in this area is concerned with the effects of energy-related toxic agents (e.g., radiation, chemical carcinogens) on the organization and replication of eukaryotic DNA. The consequences of these effects, as manifested in changes in RNA and protein synthesis and in mutagenesis and carcinogenesis, are also under study.
APPROACH: Mammalian cells in culture are used: After being exposed to agents suspected or known to damage DNA the response of the normal DNA replicative system and of the systems which repair damage are monitored using isopycnic centrifugation, velocity sedimentation, gel electrophoresis, autoradiography and other techniques along with radioisotopic tracers. Viability and mutation rates are also measured in some studies.
RESULTS: This program continues to reveal how radiation and other noxious agents damage DNA, how the mammalian cellular repair systems respond to the damage and how the system that normally replicates the genetic materials (DNA) responds to such damage. A spin off of this work has been and continues to be information on how the genetic material is normally organized and duplicated in mammalian cells.
PROJECT MILESTONES: (1) Identification of lesion inhibiting initiation of DNA synthesis FY 1978. (2) Determination of repairability of DNA-protein cross links FY 1977. (3) Chemically characterize DNA-protein cross link FY 1978. (4) Define the comparative mutation rate for C-14 compared to H-3-induced mutagenesis FY 1977. (5) Identify the chromosome carrying the human UV-specific endonuclease FY 1978.

MONITOR: Carter, Charles
TELEPHONE: F233-5468
TYPE OF FUNDING: Contract No.-AT(04-3)-1012;Agency in-house effort
77 FUNDING: Energy Research and Development Administration FY77:$257,000
TECHNOLOGY: FOSSIL FUEL/General (25%);NUCLEAR/General (25%);GENERAL SCIENCE (50%)
POLLUTANTS: ORGANICS/Mutagens;ORGANICS/Carcinogens (35%);RADIATION/X ray;RADIATION/Uv-irradiation (35%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of these experiments is to be able to reverse the genetic changes that are induced by the contaminants and pollutants produced in the process of the generation of energy. In order to do this, we have to have a more complete understanding of the biophysical and biochemical processes involved in the genesis of the genetic changes. The program is designed therefore to obtain a basic understanding of chromosome structure, function, exchange formation, and replication in order to elucidate the mechanisms involved in the induction of chromosome changes by radiation and other environmental mutagens that are formed in the chain of energy production.
APPROACH: Inasmuch as we still do not have a complete understanding of eukaryotic chromosomes and how radiation and other mutagens can disrupt their structure and function, the genetics program focuses on biochemical and biophysical studies of the structure of chromosomes and the mechanisms by which aberrations are induced. The processes involved in the production of chromosome exchanges are being investigated in order to gain insights into the mechanisms involved in chromosomal replication, breakage, repair, and mutation induction.
RESULTS: The relation between sister chromatid exchange in somatic cells and genetic recombination that occurs in meiosis hopefully will be determined. In addition, the lesions that are involved in the production of sister chromatid exchanges, which seem to be different from those lesions involved in the induction of chromosome aberrations, will be characterized in studies using x rays, ultraviolet light, and mutagen-carcinogens. An in vitro system will be developed to enable us to determine the effect of compounds requiring metabolic activation to induce sister chromatid exchanges. The physical, enzymatic, and genetic analysis of chromosome replication and repair will give further clues to the basic principles of chromosome structure and the mechanisms of lethal chromosome damage.
PROJECT MILESTONES: FY 1977-1978 The structure of DNA replication sites in isolated chromatin will be described. FY 1977-1978 The effects of radiation damage to replicating embryonic DNA will be observed by electron microscopy. FY 1978 Drosophila mutants will be obtained which affect DNA replication and repair. FY 1977-1978 New staining methods will be used which will enable us to observe sister chromatid exchange in meiotic cells. FY 1977-1978 The lesions which are involved in the induction of sister chromatid exchanges will be characterized. FY 1977 The biological longevity of chemically-induced lesions that affect chromosomes will be determined.

TITLE: The Effect of Prolonged Low Dose Rate Co-60 Gamma Ray Exposure of Beagles
PROJECT NUMBER: 000433
PRINCIPAL INVESTIGATOR: Goldman, M.
ADDRESS: Radiobiology Laboratory, University of California, Davis, CA 95616
AFFILIATION: California Univ., Davis (USA). Radiobiology Lab.
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Carter, Charles E.
TELEPHONE: F233-5468
TYPE OF FUNDING: Contract No.-E(04-3)-472
77 FUNDING: Energy Research and Development Administration FY77:$200,000
TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: RADIATION/Gamma (100%)
CHARACTER OF STUDY: RESEARCH (75%);DEVELOPMENT (25%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Studies using Co-60 irradiation of susceptible beagle populations are being designed to: (1) Evaluate the promotional aspects of leukemogenesis as reflected in bone marrow culture systems supporting hematopoietic stem cells as well as poietin producing cell populations; (2) Define the role of ''candidate'' mesenchymal progenitor cells in the chronic irradiation state and in radiation-induced leukemia; (3) Construct a cellular map of radiation injury using in vitro culture technique; (4) Correlate the general and leukemic-specific immune responses to the pathogenesis of radiation-induced disease; and (5) Study the efficacy of bone marrow-plaque transplantation therapy and TF immunotherapy in the radiation-induced leukemia model.
APPROACH: A variety of dose levels will be included; the higher levels (14 R/day and 5 R/day) to insure the production of sufficient cases of leukemia to permit the proposed evaluations, and lower levels (0.5 R/day and 1.5 R/day) to allow determinations of the ability of the proposed techniques to serve as sensitive biologic indicators of radiation injury. The variety of doses would also facilitate the study of mechanisms involved in radiation leukomogenesis as well as permit the determination of dose response relationships. Several in vitro techniques have been developing radiation-induced myeloproliferative disorders in association with the internal emitter program. The use of these techniques in the Co-60 leukemogenesis study will allow for extension of preliminary observations and for comparative studies on pathogenetic mechanisms involved in leukemogenesis in animals subjected to intramedullary as opposed to whole-body forms of radiation. The dogs at the higher leukemogenic levels will also provide an ''anchor point'' for low level biodosimetric studies being performed simultaneously for the purpose of risk modeling for man (NRC).
RESULTS: The major leukemogenesis study will be underway during FY 78. The field will be filled with weanling beagles at the 15, 10, 5, and 2 R/day dose levels in order to provide for animals manifesting with radiation-induced myeloproliferative disorders inducing leukemia. In these animals several routine hematological evaluations on peripleural blood and bone marrow will be performed as will be several quantitation of changes in in vitro colony forming units for granulocyte-monocyte, lymphoid and candidate mesenchymal progenitor populations. Changes in T, B-lymphocyte ratios and reduction in immune response in the higher dose level may be observed. Thus, the temporal quantitation of changes in the various hematological and immunological parameters will be determined for animals manifesting with continuous irradiation, preleukemic and leukemic conditions.
PROJECT MILESTONES: Beagles will be placed in the Co-60 field as they become available. It is anticipated that all the dogs will have been entered into the study by FY 79. Blood and bone marrow samples will be taken prior to irradiation and sequentially during and following the end of irradiation in accordance with a detailed schedule.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: This study involves the cytogenetic evaluation of hard and soft tissues obtained from animals to bone-seeking radionuclides and non-nuclear energy derived pollutants. Additional studies to characterize the morphologic and behavioral parameters of canine mammary tumors are conducted. Dogs and rodents are used as experimental animals in the conduct of these studies. The objectives being to provide additional techniques to aid in the biomedical assessment of various pollutants derived from energy production.
APPROACH: Various tissues, i.e., blood, bone marrow, hard and soft tumors, are prepared for cytogenetic evaluation. Karyotypes are analyzed and abnormalities noted. Data obtained is compared to normal and dose-effect relationships and differences between tumor types are compared. Mammary tissues, malignant and normal or benign, are studied in chick embryo or egg culture techniques to determine invasiveness and correlate this with morphologic appearance of various tissue.
RESULTS: The results of these studies will provide basic information about the various tissues studied. Information that can be utilized in the development of treatment of the diseases studied. Dose response relationships relating to various pollutants and levels of pollutants will be derived.
PROJECT MILESTONES: (1) Sr-90 or Ra-226 induced tumor evaluation by cytogenetic means completed September 30,

1978. (2) Mammary tumor studies methodology development completed September 30, 1977. (3) Mammary tumor studies reduced in scope September 30, 1978.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Determine and quantify the spectrum of dose-effects resulting from continual acute and/or fractionated exposure to beta and alpha emitting bone-seeking radionuclides in a colony of canines studied for their lifespan. Develop sensitive indicators of radiation injury, mechanism of effects and amelioration, models for human risk assessment.
APPROACH: Exposure to Sr-90 fed at graduated levels from mid-gestation to adulthood covering a 10/sup 3/ range of dose are compared to comparable dosages acutely given to adults and to dogs receiving fractionated, graded administration of Ra-226 as young adults. Metabolic, dosimetric, clinical and patholcgic parameters are included, as well as fundamental cellular, immunologic, and ultrastructural studies.
RESULTS: Metabolic model of beta and alpha emitters in dogs extrapolated to man for those commitment estimates related to standards for exposure limitation. Pathogenesis of chronic low level tissue irradiation. Rapid biodosimetric assessment of radiation exposure. Development in vitro model for cell effects of tissue irradiation and repair.
PROJECT MILESTONES: This study is a life-span study. The beagles currently have a median age of 10-11 years. Data are being collected on clinical and pathologic changes including geriatric effects, so that radiation-induced changes may be distinguished from normal aging effects. (1) Determine dose effect curve for radiation effects of Sr-90 vs Ra-226 (1984); (2) Evaluate radiation quality factor of chronic beta exposure of skeleton to fractionated alpha exposure (1984); (3) Determine ''map'' of cells at risk for cancer induction in skeleton (1979); (4) Develop age related metabolic and dosimetric model for radionuclides in dog adapted to human extrapolation (1980); (5) Develop sensitive injury repair model for radiation effects (1983).

TELEPHONE: F233-5468
TYPE OF FUNDING: Contract No.-E-(04-1) GEN 12
77 FUNDING: Energy Research and Development Administration FY77:$125,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this research are to understand the factors that control the development and maintenance of specific function of the mammalian heart. This includes development of the capacity to synthesize myosin in myoblasts, its control in mature myocytes, location of lipoprotein lipase in heart cells and its role in cell nutrition, the effect of heavy metals on heart cells in culture and a study of the structure and function of chromatin in developing systems and the role of cycAMP and Ca/sup 2+/ protein synthesis.
APPROACH: For most of these studies, the beating heart cells in culture is being used. To study the control of myosin synthesis by Ca/sup 2+/ and cycAMP, the effect of catecholamines and Ca/sup 2+/ concentration on beating, myosin synthesis and cycAMP level (in relationship tc phosphodiesterase activity) are being investigated. The study of the physical nature of phosphodiesterase and the location and isolation of adenyl cyclase will be carried out. Continued investigation of the effect of Pb and Cd on the properties of muscle cells, particularly fusion of skeletal muscle cells, will be investigated in embryos of pregnant rats fed these metals. The structure of chromatin at stages of development will be studied.
RESULTS: A model for the relationship of beating of heart cells and Ca/sup 2+/ flux has been formulated and will be tested in a sarcoplasmic reticulum preparation. The isolation of a reasonably pure preparation of sarcolemma from heart has been accomplished and will be used to measure the control of adenylcyclase, a constitutive enzyme. The development of myoblasts to myocytes in vivo and in culture has been quantitated and will be related to control of myosin synthesis. The location of lipoprotein lipase in the heart has been determined and the relationships of this enzyme to heart cell nutrition will be investigated.
PROJECT MILESTONES: In FY 1977 the relationship of Ca/sup 2+/ to myosin synthesis should be understood. A Ca/sup 2+/ dependent phosphodiesterase activator protein will be localized and its nature further clarified. Phosphodiesterase itself will be isolated and its nature as a monomer-dimer complex will be

reported. In FY 1978 the mechanism of heavy metal action on developing cells will be reported. The complex interrelationships of Ca/sup 2+/, catecholamines, cycAMP and phosphodiesterase in muscle cell development will be delineated.

TITLE: Membrane Biosynthesis and Properties (Formerly General Metabolism)
PROJECT NUMBER: 000451
PRINCIPAL INVESTIGATOR: Mead, J.F.
ADDRESS: 900 Veteran Avenue, Los Angeles, CA 90024
AFFILIATION: California Univ., Los Angeles (USA)
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Carter, C.E.
TELEPHONE: F233-5468
TYPE OF FUNDING: Contract No.-E-(04-1) GEN 12
77 FUNDING: Energy Research and Development Administration FY77:$110,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To show how the lipid components of the brain membranes are transported into the brain, metabolized and removed. (2) To study the mechanism of destruction of the membrane lipids by an oxidative process initiated by gaseous and other pollutants. (3) To understand the means by which malignant cells are able to induce transport of membrane lipids from other tissues.
APPROACH: (1) This research involves the synthesis, administration by several routes, separation, analysis and structure determination of labeled lipids for metabolism by brain. (2) This project involves the exposure to oxidative pollutants of model or actual biomembranes, the analysis of the products and the rate and mechanism of their formation and the inhibition of the oxidative destruction in vitro and in vivo. (3) This project will involve the analysis of the membrane lipids of growing tumors and of other organs affected by the tumor growth and will attempt to study by means of labeled fatty acids the turnover of normal membrane lipids as affected by tumor growth.
RESULTS: (1) An understanding of the means by which brain development depends on the nutrients and their access to the brain through the blood and of the mechanisms by which the brain membranes are formed as well as the interruption of this process by toxic substances in the environment. (2) An understanding of the mechanism of oxidative damage to membranes initiated by atmospheric pollutants and suggested means of preventing such damage. (3) An understanding of the means by which a growing tumor can influence other tissues to supply it with required constituents and suggestions as to how to interrupt this communication and transport.
PROJECT MILESTONES: (1) Fall 1976 Submission of 4-5 manuscripts describing characteristics of destruction of membranes by autoxidative processes and their protection by antioxidants. (2) Winter 1976-7 Shifting of emphasis of research from mechanisms of damage to initiation by pollutants. (3) FY 1978 The relationships between the fatty acid elongation in the brain, the transport of these cellular membrane building units from other sources and myelination and certain other aspects of brain development should be clarified.

TYPE OF FUNDING: Contract No.-E(04-1)GEN-12
77 FUNDING: Energy Research and Development Administration FY77:$150,000
TECHNOLOGY: FOSSIL FUEL/Coal (10%);FOSSIL FUEL/Oil and Gas (10%);NUCLEAR/Fission (80%)
POLLUTANTS: METALS (10%);ORGANICS (10%);RADIATION (80%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this research are: to determine the molecular mechanisms by which alpha-, beta-, and gamma-, accelerated heavy ion and ultraviolet radiations and energy-related toxic chemicals damage living organisms and to use this information in developing means of preventing or repairing the damage and of sensitizing cells to radiation or chemicals so as to take advantage of the damage for cancer therapy and other biological and medical purposes.
APPROACH: This research is carried out largely with DNA and RNA because of their importance in the reactions involved. Using such techniques as pulse radiolysis, EPR spectroscopy, uv absorption spectroscopy and tracer studies, attempts are made to understand the nature of the immediate products formed by the various damaging entities and the means by which these initial substances are transformed into intermediate and final products. These results will explain the nature of the damaging reactions in each case and this knowledge will, through extrapolation, lead to an understanding of the toxic effects in living organisms.
RESULTS: In FY 1976 the mechanism of attachment of alcohols to nucleotides (AMP and TMP) under the influence of ionizing radiation should be partially understood and in 1977 should be clarified. At this point, research will continue using other types of small molecules. The mechanism by which 5-bromouracil sensitizes DNA to ionizing radiation has been hypothesized as the result of formation of the uracilyl free radical, which then reacts by hydrogen abstraction from neighboring groups. This reaction should be understood in 1977 and applied to studies of other radiation modifiers. The effects of radiation and chemical toxicants on lymphocytes leading to DNA repair will lead to an assessment of the comparative hazard from these agents.
PROJECT MILESTONES: In 1976 the first major review of ionizing radiation-induced attachment reactions of nucleic acids and their components was published. In 1977 results of research in this field should be forthcoming and the mechanism of sensitization of DNA to radiation by bromouracil should be understood.

In 1978 the mechanism of damage to DNA in lymphocytes by radiation and chemical toxicants should be revealed and should lead, in 1978, to suggestions for modifying radiation and chemical damage.

77 FUNDING: Energy Research and Development Administration FY77:$201,000
TECHNOLOGY: FOSSIL FUEL/Coal (10%);FOSSIL FUEL/Oil and Gas (10%);NUCLEAR/Fission (80%)
POLLUTANTS: METALS (10%);ORGANICS (10%);RADIATION (80%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this research are to translate knowledge of the effects of radiation and fossil fuel-related pollutants on substances of known structure and properties into an understanding of the effects of these agents on more complex substances of biological origin and, in turn, to attempt, by this means, to understand their effect on living organisms.
APPROACH: At present, the investigation is concerned with radiation effects on DNA as the most likely substance involved in ultimate radiation damage and to the effects of hydroxyl radicals as the most likely effector of damage in aqueous media. Model systems for DNA are the deoxynucleotides, in which different types of damage, such as strand breakage and base damage are studied. Information gained with the model systems is being applied to the study of the complex DNA molecule.
RESULTS: Yields of strand breaks and base damage have been shown to increase with post-irradiation time under a variety of conditions. Measures used are yield of monophosphate end groups, the further yield of breaks with a single strand specific ribonuclease and the spectrum of the .OH-DNA transient and its reaction with oxygen. The modifying effects of chromosomal structure on DNA will be measured by irradiation of DNA-histone complexes. The altered base, 8-hydroxyadenine is being analyzed as a measure of damage to DNA by its easy separation and uv absorption. Similar assays of thymine will be developed. High LET damage to DNA is being investigated using alpha particles from the Berkeley 184'' cyclotron with particular attention to interstrand cross-links. These several methods of assay for damage will also be used to assess the effects of radiosensitizers, such as metranidazole, other nitroimidazoles and nitrofuranes.
PROJECT MILESTONES: In FY 1976, the strand-break and base damage and release methods of assay should have provided information on the effects of both high and low LET radiation on the DNA molecule. In FY 1977, the effects of histones will lead to a better understanding of chromosome damage and the effects of radiosensitizers will have been assessed.

TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: METALS (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To study the regulation of genetic expression by hormonal and other effectors, such as carcinogens and (2) to understand the mechanism of action of lead compounds in their toxic effects on cells and to attempt to modify these effects by substances such as hormones, enzymes and inhibitors.
APPROACH: The experimental systems are several established cell lines: an epithelial liver cell line (RLC-GAI) cultured in chemically defined medium and a culture of rabbit endometrial cells, also in chemically defined medium and retaining its response to hormones and glial and neuroblastoma cell lines. Addition of lead nitrate to the RLC-GAI cells has been shown to induce delta-aminolevulinate (ALS) synthetase and to inhibit cell growth. The effect of lead in inhibiting heme synthesis was found to be related to ALS induction but not to cell growth and this latter effect is not clear. Therefore the effect of lead on the glial and neuroblastoma cells was assessed and attempts to isolate lead-resistant lines from these cells have been initiated.
RESULTS: In 1976 the antagonistic actions on the endometrial cells of diethylstilbestrol and progesterone have been described and their relationship to cell proliferation and secretion are being delineated. Their effect on chemical carcinogenesis is also being clarified. In 1977, the techniques of cell fusion should lead to an understanding of the relationships of hormonal receptors in the fused cells to hormone-dependent function. Lead resistant cell lines will reveal the mechanism of lead toxicity, possibly through mutagenesis.
PROJECT MILESTONES: (1) In 1976, an understanding of the actions of hormones and the related action of chemical carcinogens on endometrial cells will be obtained. (2) In 1977, some understanding of the nature of lead toxicity and cell resistance to this toxicity should be on hand.

POLLUTANTS: ORGANICS (50%);HEAT, THERMAL (50%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) To investigate the biological control mechanisms that adaptively regulate lipid composition, particularly the unsaturated fatty acid composition, of cell membranes in response to changes in temperature, oxygen tension and other environmental factors and (2) to characterize the O/sub 2/-dependent hydroxylases from microorganisms that initiate the oxidation of hydrocarbon chains. (3) To provide a rational basis for assessing the biological effects of hydrocarbon pollution of the environment and to determine the feasibility of utilizing selected microorganisms to remove such pollution from the environment.
APPROACH: (1) Bacillus megaterium is subjected to changes in temperature between 35 and 20 degrees and the rate of fatty acid desaturation is measured and related to desaturase activity, biosynthesis and denaturation. (2) A soluble hydroxylase, prepared from B. megaterium, is used to study the kinetics of hydroxylation of the hydrocarbon portion of compounds containing long alkyl chains under different conditions and the rate and location of the hydroxylation are used to gain information on the enzyme system.
RESULTS: (1) An understanding of the mechanism of the temperature effect on the bacterial Triangle 5-desaturase and on the properties of the membranes of which the lipids form a major part. (2) The clarification of the mechanism of action of the hydroxylase, with particular reference to substrate specificity with the ultimate aim of understanding the factors involved in its ability to attack hydrocarbon chains.
PROJECT MILESTONES: In FY 1977: (1) An understanding of the relationships between desaturation of exogenous and endogenous fatty acids leading to clarification of the nature of the fatty acid pools. A fatty acid auxotroph of B. megaterium will be created and will reveal the relationship between fatty acid structure and growth at different temperatures. (2) The components of the hydroxylase system will be separated and identified and structure of the active site of the enzyme will be investigated.

77 FUNDING: Energy Research and Development Administration FY77:$110,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: NOXIOUS GAS (20%);METALS (60%);RADIATION (20%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this research are to study the effects of a number of substances that affect the development and functional differentiation of the brain, e.g., environmental pollutants, hormones and drugs. This is done largely by focusing on the regulation of certain key enzymes, glycerol phosphate dehydrogenase (GPDH) and lactate dehydrogenase (LDH). As a model for the whole brain, the studies are conducted largely with specific glial and neuronal cell lines.
APPROACH: To study the regulation of GPDH, a rat glial cell line, C-6, is used and a radioimmunoassay for GPDH has been developed. GPDH-induction is also used as a measure of the effect of lead. Protein kinase activity and cAMP-dependent protein phosphorylation are measured in subcellular fractions of the glial cells whereas the effect of catecholamines on the secretion of gonadotropins and gonadotropin-releasing hormones is studied in cell cultures prepared from pituitaries of gonadectomized rats.
RESULTS: Increased GPDH activity induced by glucocorticoid has been shown to be due to increased synthesis. Use of a cell-free synthesizing system will permit the study of regulation of this synthesis by hormone-receptor interaction and to isolate its specific messenger RNA. Stemming from this research may be the development of a routine diagnostic test for minimal heart damage based on GPDH assay. GPDH has been located in intervascular oligodendrocytes but not in neurones. Whether it is also present in astrocytes will be determined. A mechanism of induction of enzymes by catecholamines may have been shown to involve the redistribution of protein kinase activity between cell organelles. The study of the regulation of PK through cycAMP or cycGMP by catecholamines leading to enzyme induction and to feedback inhibition of adenylcyclase by a specific peptide will be aided by characterization of the peptide.
PROJECT MILESTONES: During FY 1977, the effect of lead and cadmium on GPDH synthesis induction and the mechanism and site of this action will be clarified. The cellular localization of GPDH will be confirmed and its use as a marker enzyme for oligodendrocytes will permit a facile identification of these cells. The routine diagnostic test for minimal heart damage using GPDH will be tested.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To determine how virus, host and environmental factors act to produce lymphoma in mice. (2) To better understand hemopoietic stem cells as they relate to radiation protection and lymphomagenesis. (3) To define the alteration of cell mediated immunity that occurs in preleukemic mice and to relate them to the development of lymphoma. (4) To study lipid metabolism of leukemic and preleukemic mice. (5) To study lipids of normal and leukemic human leukocytes. The overall objective is to increase our understanding of the pathogenesis of leukemia in man.
APPROACH: High incidence lymphoma strain mice when given murine leukemia virus as newborns all develop typical thymic lymphoma between 8 and 12 weeks of age. 5 week old virus inoculated animals are compared with age matched normal controls with regard to immune responses, hemopoietic stem cell function, thymus epithelial cell function and liver lipid metabolism. Studies of lipid metabolism, normal and leukemic human leukocytes from blood and bone marrow are carried out.
RESULTS: We wish to define a specific defect in cell mediated immunity (CMI), in preleukemic mice. This is important because the thymus, the organ that regulates CMI, is the target organ for lymphomagenesis. Thymic epithelial cultures will be established which will allow us to study the role of normal and murine leukemia virus infected epithelium in promoting maturation of thymus derived lymphocytes. We will study the potential for hemopoietic stem cell production in the liver of mice and expect to show that this organ has dormant stem cells left from fetal life which can be activated to protect lethally irradiated animals. Studies of liver lipid metabolism in normal and tumor bearing animals will tell us if increased membrane synthesis accompanying neoplasia is reflected in altered liver lipid metabolism. The lipid metabolism of normal and leukemic human leukocytes will be defined to determine if some therapeutically exploitable differences exist.
PROJECT MILESTONES: January 1977 completion of studies on immunity. June 1977 development of a system of in vitro transformation of normal thymocytes to lymphoma cells using epithelial cell monolayers. January 1978 initiation of studies of effects of the pollutants cadmium, copper, chromium on immune responses as co-carcinogens. Completion of studies with liver stem cells preliminary assessment of lipid metabolism of human leukemic cells and leukemic and normal mouse liver. Development of a maturation scheme using the in vitro techniques of bone marrow derived thymocyte precursors to mature immunologically competent cells under the influence of thymic epithelial cells. July 1978 A determination of the effect of infection of lymphocytes and epithelial cells with murine leukemia virus on this scheme.

PROJECT DESCRIPTION: The objective of this study is to determine the accumulation, movement, and availability of trace elements from coal fly ash in the soil, litter, plants and rodents of a desert environment.
APPROACH: Chemical analysis of samples taken at different distances from power plants and after application of fly ash are performed. Measurements of litter fall and decomposition rate are being made.
RESULTS: Results will aid in the determination of the fate and effects of fly ash from coal burning power plants in the southwestern U.S. on desert environments.
PROJECT MILESTONES: Study plots in southern Nevada will be established by December 31, 1976. Ash application will begin during 1976 and be continued, in monthly increments, for two years. Comparisons of growth and

reproduction by treated and untreated plants during the growing season of 1977 will be completed by September 30, 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objectives of this research are (1) to support and collaborate with researchers in those areas where specialists are needed in solving problems relative to analytical, inorganic and radiochemistry, and (2) to assist the bio-medical cyclotron facility in solving problems relative to target preparation, bombardments and final isolation of the induced radio-products in forms suitable for animal or human tracer studies.
APPROACH: The primary effort of this branch over the past fiscal year has been devoted to developing rapid analytical techniques for the determinations of stable carbon-13 oxygen-18 and nitrogen-15 as single tracers or in combination (i.e., C-13 O-18, N-15 O-18). Developmental techniques for the analysis of O-18, C-13 and N-15 have been essentially completed and manuscripts are in progress. The work dealing with O-18 analysis has been published. These methods will be used to study the fundamental processes of carbon fixation in photosynthesis as well as the fundamental studies of environmental impact upon plant and animal species from excessive exposure to CO and NO/sub 2/ pollutants.
RESULTS: This section will continue to support divisional research programs at the present level. The analytical techniques for determining C-13 O-18 and N-15 O-18/sub 2/ are essentially complete except for publication. Research will be started to develop techniques for identifying chemical species relative to toxicity studies in plant and animal systems. Studies will continue to develop methods for the identification of the inorganic and organic species of the heavy metals incorporated on plant and animal tissues.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The primary research objective of this project is to study the distribution and interrelationship of the elements present in biological systems. Of fundamental importance to this goal is the development of efficient analytical methods which will produce accurate results.
APPROACH: An optical emission spectrometric system has been developed for the simultaneous determination of 29 elements important to the study of biological tissues.
RESULTS: Biological tissues are analyzed at the rate of 10 to 20 thousand per year. Eighty percent of these samples are plant tissues related to the various 'heavy metal' uptake studies of our laboratory. The remaining 20% are land and marine animal tissues related to studies of metal pollution in the environment and to studies of trace element essentiality. The relationship between trace element input, tissue levels and kidney disease are being studied in humans.

PROJECT DESCRIPTION: To determine the nature and function of soil arthropods, their distribution and their role in degradation of detritus. To determine the environmental parameters governing population densities, including relationship to plants, soil temperature and moisture, salinity, etc. To deterine the effects of heavy metals and of fly ash and of salinity on populations. Determine possible evolutionary response to long term exposure to heavy metals and salinity from natural environment.
APPROACH: Sampling over long periods together with recording of abiotic data. Experimental manipulation of conditions including temperature, moisture, salinity and pollutants concentrations. Measurement of degradation in presence and absence of various faunal components. Field and laboratory studies on these questions.
RESULTS: Information about the significance of soil anthropods in desert ecosystems, and about the effect of pollutants from fossil fuel or geothermal sources upon them. Information about population dynamics and trophic relationships of soil anthropods.

TECHNOLOGY: FOSSIL FUEL/General (20%);NUCLEAR/General (40%);GEOTHERMAL/General (20%);CONSERVATION/General (20%)
ENERGY CYCLE: ELECTRICAL TRANSMISSION (40%);WASTE MANAGEMENT (60%)
POLLUTANTS: METALS (50%);RADIATION (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southwest
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this project is to gain a better understanding of the following processes involving environmental pollutants: (1) radionuclide cycling in the desert ecosystem with emphasis on the transuranic elements Pu-239-240 and Am-241, and (2) stable element cycling in soils and vegetation with emphasis upon trace elements of concern as environmental pollutants when released in the burning of fossil fuels and in the development and application of geothermal energy resources as a source of power generation.
APPROACH: Several interacting studies form the basis of this research program. Work is proceeding along the following lines in response to mission needs of ERDA: (a) define the manner in which plants function in the vegetation-carrier transport of plutonium and other transuranic elements through the food chain from contaminated soil, (b) characterize the patterning, association and distribution of desert vegetation as influenced by nutrient gradients and other edaphic factors, (c) investigate the cycling of non-nuclear trace element pollutants in soils and vegetation, and (d) establish baseline assessments of such elements in natural ecosystems near geothermal resource areas (KGRA's) in the Imperial Valley, CA.
RESULTS: We shall continue to obtain information concerning ecosystem radionuclide cycling of the transuranic elements Pu-239-240 and Am-241. Work which has been underway in conjunction with the US/IBP Desert Biome Program shall be organized into final reports and papers for publication. Related soil-plant studies contributing basic information on the structure and function of the desert ecosystem shall be continued in order to obtain necessary information to complete several research papers and monographs in preparation for publication from these basic studies. New geothermal-related work started in FY 1976 shall be directed toward trace element surveys in natural vegetation, native animals, and key agricultural crops as part of the ecological baseline assessments work underway at KGRA sites in the Imperial Valley.
PROJECT MILESTONES: (a) Complete an estimate of the inventory and geographical distribution of transuranic elements in the vegetation of fallout areas at the Nevada Test Site. Our work in 'safety shot' sites is expected to be complete during FY 1977 and shifted to nuclear events sites for continuation during FY 1978. (b) Initiate during FY 1977 terrestrial desert ecosystem cycling studies of trace element pollutants identified from surveys of fly ash disseminated from a coal-fired power generating station. (c) Complete during FY 1977 base-line ecological studies involving producer-consumers at the East Mesa KGRA geothermal study site in the Imperial Valley, CA.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Far West
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) To provide baseline data for soils and plant processes in the desert ecosystem representative of the southwestern U.S.A. These complement with other on-going studies in the division to provide a reasonably complete ecosystem approach. The information is vital to programs leading to both preservation and restoration of natural systems associated with energy generation programs. (2) To support the major objective with laboratory studies of trace metal and radionuclide effects and transport rates in the soil-plant system. (3) To respond to needs of ERDA with environmental assessments research in solving problems related to fossil fuel, nuclear, geothermal, or other technologies.
APPROACH: (1) Ecophysiolcgy of desert plants; study processes of photosynthesis, transpiration, nitrogen and mineral cycling, carbon budget, populations dynamics, and root growth and activity. (2) Laboratory and field studies of trace metal uptake and translocation rates and effects. Special emphasis is given to determination of the threshold acute and chronic toxicity levels of various trace metals in plants. These studies are supported by emission spectrography, N-15 spectrometry, and neutron activation work done in the laboratory.
RESULTS: (1) Trace metal uptake, translocation, interactions, toxicities. (2) Threshold levels of acute and chronic toxicity for trace metals. (3) Baselines for salt tolerance in desert ecosystem. (4) Transuranium element transfer in soil-plant systems. (5) Carbon cycle information and synthesis for desert ecosystems. (6) Nitrogen cycle information and synthesis for desert ecosystems.
PROJECT MILESTONES: (1) April 1976 Threshold toxicity levels for several different trace metals for lettuce plants will be developed. (2) June 1976 Plant uptake and distribution of several trace metals of concern of fossil fuel technology will be obtained. (3) June 1976 Input rates for nitrogen in the Northern Mojave Desert (Nevada Test Site) will become available. (4) January 1976 A report appeared on radiation damage to a different plant species in the Rock Valley gamma radiation study area. (5) March 1976 Am-241 uptake by a root crop growing in a contaminated soil was obtained.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: First, to measure the energy and material budgets of several key vertebrate species in desert ecosystems while they are living normally in the field; determine minimum dietary requirements for energy, electrolytes, minerals, nitrogen and water, and the roles of each relevant organ in maintaining balance; determine the influence of season and year to year variation in climate (rainfall primarily) on animal survival. Second, make identical measurements on animals living in polluted areas (gamma radiation, geothermal) to detect any pathological conditions.
APPROACH: Field studies involve measurements of energy and material fluxes with doubly-labeled water, diet analysis, behavior, and reproduction. Laboratory studies involve itemization of avenues of energy and material fluxes in feeding experiments, development and testing of measurement procedures, and determination of animal's minimum dietary requirements.
RESULTS: (1) Understanding of how desert vertebrates survive the rigors of their harsh environment. (2) Assess the effects of pollutants on the above abilities. (3) Pinpoint affected organs or organ systems for further detailed research.
PROJECT MILESTONES: (1) March 1976 End field portion of lizard (Uta stansburiana) studies (3). Continue lab work and write up. (2) March 1976 Begin field portion of desert tortoise study. (3) May 1976 Complete lizard (Sceloporus occidentalis) field HTO-18 study, write up. (4) May 1976 Complete review article on ''osmoregulation in Amphibians and Reptiles'' for Ann. Rev. Physiol. (5) June 1976 Complete HTO-18 analysis of errors study, write up. (6) October 1976 Complete marsupial mouse (Antechinus) study, write paper. (7) October 1976 Complete lizard (Sceloporus jarrovi) field hibernaculum study, write paper. (8) December 1976 Complete review article on doubly-labeled water. (9) January 1977 Explore possibility of initiating bird and rodent HTO-18 studies.

PROJECT DESCRIPTION: (1) To delineate the various factors that influence the solubility, precipitation, fixation, ion exchange, and colloid formation of Np, Pu, Am, and Cm. (2) To determine the chemical and biological availability of Np, Pu, Am, and Cm in soils and to correlate the chemical availability to biological availability.
APPROACH: The experiments will be done by laboratory chemical and physical measurements. The plant uptake experiments will be done in the plant growth chambers and in the greenhouse. Some field work is anticipated at the Nevada Test Site.
RESULTS: It is anticipated that the influence of various soil factors such as pH, cation exchange capacity, amount and kind of clay minerals, salinity, organic matter, lime, exchangeable cations, particle size distribution, etc. will be determined. Relative behavior of Np, Pu, Am, and Cm in soils will also be determined. Soils from different parts of the United States will be examined.

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Our objectives are to evaluate radiation effects on developmental processes and to

assess capabilities for repair of radiation damage in mammalian germ cells and embryos. In vitro culture of pre-implantation and early post-implantation embryos allows direct assessment of early developmental impact of radiation delivered to the parents during gametogenesis or to the embryo itself, without nterference from maternal factors. Thus, it is possible to study the mechanisms of radiation injury and epair.

...OACH: Mouse embryos are cultured from the two-cell stage to the blastocyst stage, and then to attachment and outgrowth stages that resemble post-implantation growth in utero. Experiments are designed with large numbers of embryos grown in chemically or biologically defined conditions, so that damage to germ cells or embryos can be assessed rapidly and accurately.

RESULTS: We will determine whether observed differences in UV-induced unscheduled DNA synthesis in oocytes, eggs, and embryos are due to actual changes in repair enzyme activites. We expect to measure the ability of the mouse egg to repair mutagen-and-radiation-induced damage to sperm DNA. We will also measure the cytogenetic damage that results from radiation and mutagen treatment of male parents to determine whether chromosome breakage is the specific cause of pre-implantation embryo death.

PROJECT MILESTONES: (1) September 30, 1977 Determine whether UV-repair activity in embryo cells can be used as a quantitative assessment of ability to recover from radiation damage. (2) September 30, 1977 Determine whether mouse egg can repair damage to sperm DNA. (3) September 30, 1978 Determine whether chromosome breakage is specific cause of ''dominant lethal'' embryo death.

PROJECT DESCRIPTION: To determine the relative biological effects of internal emitters with respect to X-ray using bone marrow tissue culture systems that allow for the simultaneous quantitation of radiosensitive granulocyte-monocyte clonogenic progenitors and more radioresistant progenitors of bone marrow stroma. Such endpoints will be obtained for both in vitro and in vivo exposures situations.

APPROACH: (1) Bone marrow cultures will be obtained from mice receiving a series of doses of radiation of a variety of qualities. The survival or radiosensitive progenitors for granulocyte-monocyte pathways and for radioresistant marrow stromal progenitors will be determined on the basis of effects on the clonogenic growth of the two populations in a modified bone marrow tissue culture system. (2) The radiation-survival characteristics for these two clonogenic populations will also be determined for in vitro radiation of bone marrow.

RESULTS: The relative biological effects of a series of nuclides relative to X-irradiation will be determined for radiosensitive and radioresistant clonogenic bone marrow progenitors in situations of in vitro and in vivo radiation insults to the bone marrow.

ECT MILESTONES: (1) Development of bone marrow techniques for quantitation of clonogenic populations of ranulocytic (CFU-C) and fibroblastic (PFU-C) pathway, 1974. (2) Characterization of radiation survival haracteristics of marrow progenitors for CFU-C and PFU-C in mice subjected to acute whole-body X-irradiation, 1975. (3) Observations of functional changes in marrow PFU-C with respect to their ability to produce candidate granulopoietin (CSA) in response to irradiation and preliminary observation on the response of CFU-C and PFU-C in weaning beagles subjected to acute, whole-body gamma-irradiation, 1975. (4)

Preliminary studies on the response of CFU-C and PFU-C to continuous irradiation by Ra-226 and Sr-90 in beagles, 1975-76.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Determine what in vitro immunologic test correlates best with transfer of immunologic reactivity in vivo using the dog as a model.
APPROACH: A variety of transfer factors with different immunologic specificities will be injected subcutaneously and intradermally below the popliteal lymph node of a hind leg. The contralateral popliteal lymph node will be removed, for control studies, prior to injection. Twenty-four hours post-injection the popliteal lymph node will be removed. Lymphocytes from the node will be tested with the appropriate antigens in the lymphocyte stimulation and leukocyte migration inhibition tests.
RESULTS: We plan to determine whether transfer factor, using above system, is a specific or non-specific immunologic enhancer of sensitivity in the recipients. Determine whether thymosine would react in a similar fashion, as preliminary tests suggest it might. Determine which in vitro test is best suited for measuring in vivo transfer of activity.
PROJECT MILESTONES: By July 1977 Determine mode of action of transfer factor and possible in vitro measurements of its activity.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this study are to develop sensitive indicators and to evaluate pathologic mechanisms of the biologic effects associated with inhalation of coal-combustion by-products. These studies will specifically elucidate the biologic mechanisms of damage including recovery and repair of energy-derived air pollutants. This information is vital for the comparison of the biological risks associated with nuclear power production to those associated with fossil fuel power production.
APPROACH: To evaluate biologic effects of coal derived effluents, animal exposure techniques will consist of using intratracheal intubation, ingestion, intravenous injection and acute and chronic inhalation in rodents, dogs and a small number of primates. Particulates of three types will be studied alone and in combination with oxides of nitrogen and sulfur: (1) soluble particulates generated from sulfate solutions, (2) insoluble, chemically inert silicate particles, and (3) actual fly ash particulates from a coal-burning electrical generating plant. Fly ash of four size classes will be studied to provide information on the biologic effects of those particles known to be efficiently deposited deep in the pulmonary region of the respiratory tract (median diameter = 2.2 mu m and 3.2 mu m) partially removed to the pharynx by cilial action (median diameter = 6.2 mu m) and completely removed by cilial action and swallowed (median diameter = 20 mu m).
RESULTS: This project will provide information regarding the biologic dose response of laboratory animals to combinations of coal-derived fly ash and oxides of sulfur and nitrogen. The subsequent pathogenesis of lung damage and potential systemic effects and their recovery and repair will be assessed. Such data will provide regulatory agencies with the information necessary for setting realistic air quality standards and designing pollution abatement technologies for coal-combustion power-generation processes.
PROJECT MILESTONES: (1) 6/30/77 Chemical and physical characterization of stack-collected fly ash will be completed. (2) 6/30/77 Design and construction of aerosol generator for small animal exposure. (3) 6/30/77 Preparation and initial distribution studies N-13 and S-38 labelled particulates, in non-human primates. (4) 6/30/77 Evaluation of Ames Salmonella test system and other cell culture systems for mutagenic and carcinogenic agents in fly ash will be completed. (5) 9/30/77 Effects of fly ash on macrophages and cell-mediated immune response will be initially evaluated in rodents. (6) 6/30/78 Initiate life-time

studies in rodents of health hazards associated with fly ash alone and in combination with SO/sub x/'s and NO/sub x/'s.

PROJECT DESCRIPTION: To determine mechanisms of mutagenesis in mammalian cells and in DNA viruses, and to evaluate potential applications of these systems to screening for potential mutagens.
APPROACH: Chinese hamster cells are exposed to DNA damaging agents and the yields of mutants resistant to 6-thioguanine and ouabain determined. DNA viruses that are temperature-sensitive will be damaged by radiation or chemicals and the yields of mutations that represent reversion to wild type will be determined.
RESULTS: The dose response curves and expression times for radiation and carcinogen-induced mutation to thioguanine and ouabain resistance will be obtained. The efficiency of ultraviolet light in causing reversion of temperature-sensitive viruses to wild type will be obtained.
PROJECT MILESTONES: (1) The dose response curves for Chinese hamster mutants produced by ultraviolet light, X rays, and some alkylating agents will be determined in FY 1977. (2) Herpes viruses suitable for reversion studies will be screened in FY 1977.

TECHNOLOGY: FOSSIL FUEL/General (100%)
POLLUTANTS: METALS/Nickel;METALS/Lead;METALS/Mercury (10%);PARTICULATES (10%);ORGANICS/Teratogens;ORGANICS/Mutagens (80%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Our purpose is to develop cytological and biochemical criteria for analyzing the effects of fossil-fuel and other energy-related pollutants on early differentiation of mammalian embryos. In order to investigate mechanisms of embryo toxicity under controlled conditions we aim to extend the reliable culture period for mouse blastocysts to the beginning of organogenesis, and we will study embryos perturbed by model teratogenic compounds or genetic abnormalities. The results of these studies should provide an in vitro test system for observing mechanisms of action of energy-related toxic agents, and may in addition provide a screening technique for certain teratogenic effects, particularly those that occur during early organogenesis.
APPROACH: Mouse embryos will be cultured from the 2-cell to the blastocyst stage, and then to attachment and outgrowth stages that resemble early post-implantation stages of development in utero. Embryos will be treated for brief periods (1-4 hrs), for 24 hr periods, or continuously with teratogenic compounds that act by known mechanisms; i.e., by interfering with differentiation (5-bromodeoxyuridine) RNA synthesis (Actinomycin-D) or protein synthesis. To improve culture conditions, embryos will be treated continuously with potential nutritional or growth promoting substances. All experiments carried out with replicated block and factorial designs. The treatment effects will be assessed by culturing embryos for 5-8 days beyond the blastocyst stage, and observing their morphology, cell number, and capacity for DNA, RNA and protein synthesis. In addition to measuring quantitative effects of these treatments on embryo growth, we expect to determine whether there are qualitative changes in the pattern of gene expression, by using sensitive one-dimensional and two-dimensional gel-electrophoresis techniques to study the proteins being synthesized by the embryos.
RESULTS: The known growth promoting effects of amino acids and serum on embryo growth will be analyzed by testing effects of polypeptide hormones present in serum (insulin, somatomedin) and by measuring interactions of several essential amino acids when present at high concentrations in the culture medium. We will determine the cytological and biochemical consequences of treatment with model teratogenic compounds, and determine dose-effect relationships for selected fossil fuel derivatives (benzopyrene and methylcholanthrene). From these results it should be clear whether substances that perturb early development act by common mechanisms that might be used as sensitive indicators of developmental hazards.
JECT MILESTONES: (1) September 30, 1977 Improve culture conditions to obtain 50% primary germ layer (endoderm, ectoderm, and mesoderm) formation and 10% heart formation in vitro. Complete assessment of normal development and model compounds for cytological and biochemical effects. (2) September 30, 1978 Improve culture conditions to 75% primary germ layer formation, and 25% heart formation in vitro. (3) September 30, 1978 Complete assessment of cytological and biochemical consequences of energy related compounds. (4) September 30, 1979 Complete assessment of teratogenic effect on early organogenesis stage

embryos. Define the limits of mouse embryo culture systems for analyzing mechanism of teratogenesis, and decide whether embryo culture systems will augment existing test systems in a reliable way.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Site specific Desert
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The overall objective is to understand in quantitative terms the response of desert plants to their natural environment. Understanding the ecophysiology under natural conditions will not only allow us to understand how plants survive in arid regions, but also will allow us to predict the responses to new, presumably man-made, environmental stresses.
APPROACH: Transpiration and photosynthesis are being measured with a Siemen's null-point compensating closed-circuit gas exchange system. Soil water potential, temperature, wind velocity, rainfall, and absolute humidity are being monitored. Plant morphology is being examined with a phase contrast microscope using sectioned material.
RESULTS: Using analogies to electrical circuits, the relative effects of the various anatomical components of desert plants (especially those with bluff-body profiles) are being described in unified fashion. The influence of environmental parameters on productivity can then be evaluated for these plants and the responses to environmental stresses predicted. An energy budget analysis is being used to assess data on the barrel cactus as well as selected broadleafs.

CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this work are to determine rates of reactions and properties of the highly reactive intermediate substances produced by ionizing radiation and chemical toxicants in biological materials. The substances referred to are the ones which cause critical biological damage.
APPROACH: Samples are exposed to a short intense burst of ionizing radiation (10 nanoseconds, 1000 rads) and changes in optical absorbance are determined over a period of 1 microsecond to one millisecond. Results are used to calculate rate constants, rates of reactions, and to determine reaction mechanisms.
RESULTS: In FY 1976 the mechanism of attachment of alcohols to nucleotides (AMP and TMP) under the influence of ionizing radiation should be partially understood, and in 1977 should be clarified. This reaction is probably an important reaction in the damage of DNA by radiation. Research on the project will be continued with other small molecules which in biological systems are in the neighborhood of DNA. This work will also contribute to studies of the mechanisms by which ionizing radiation modifies radiation effects of DNA. This mechanism should be understood by 1977 and applied to studies of other radiation modifiers. During 1976 procedures will be developed for studying reactions of chemical toxicants such as /sup ./O/sub 2//sup -/ and organic free radicals using radiation to generate the reactive chemical species. This work will continue into 1977 with application of the techniques developed.
PROJECT MILESTONES: Research in 1976 contributed information to the first major review of ionizing radiation-induced attachment reactions of nucleic acids. In 1977 this project will contribute to results of research in this field and to research on the mechanism of modification of the response of DNA to radiation by 5-bromouracil. In 1978 this project will contribute further information which should lead to suggestions for modifying radiation and chemical damage.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: High-risk, gamma-irradiated dogs will be typed for histocompatibility antigens. This will provide information on the relation of dog leukocyte antigens (DLA) types, radiation resistance and leukemogenesis, and will permit bone marrow (or other cell) transplantation into matched recipients. By avoiding problems of histocompatibility rejection phenomena, these studies will provide important data on such therapeutic approach and data on mechanisms of leukemic recurrence in transplantation recipients.
APPROACH: Tumor immunology hinges on the presence of tumor specific antigens (TSA) on tumor surface. The production of specific antibodies to TSA is extremely difficult. Using DLA matched dogs (one control and one which will become leukemia in the 60-Co field), we will produce chimeras. The chimeric dog will subsequently be immunized with the leukemic cells and will produce TSA in leukemic dogs by fluorescent and radioimmune assays. Each specific antibody also will be used to isolate TSA by affinity chromatography. The isolated TSA, in turn, will be used to detect circulative antibody in suspected or tumor dogs.
RESULTS: Using these reagents we will follow both humoral and cell mediated responses in high risk dogs prior to and following neoplastic development. These data will permit correlating immune reactivity to radiation-induced tumor-genicity (M. Shifrine, F.D. Wilson, and I.J. Fidler).

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of the work carried out under the present contract is to characterize the postradiation immunological injury in precise terms as it relates to various immunocompetent cells. It is the objective of this program to identify the radiosensitive andradioresistant phase of the immune response in terms of the cellular events involved and to characterize these events. The intent of this study is also to define the effector and accessory cells involved in certain autoimmune diseases as to their sensitivity to irradiation in hope of better understanding and managing this disease. Another objective is to characterize the effect of radiation induced injury on both chronic viral infection and oncogenicity.
APPROACH: Approaches to be used to determine the immune status of lymphocytes after whole body irradiation

will involve the use of adoptive transfer techniques in the reconstitution of lethally irradiated experimental animals. Both normal and immune mice in which the immune status of T and B cells are known prior to and after irradiation will be irradiated and the exact status of the T and B cells and their subpopulations will be assessed by the ability to reconstitute the irradiated recipients with subpopulations of T and B cells with known immunological function. A similar approach will be taken to establish the immune status of T and B cell populations in experimental outoimmune thyroiditis, experimental autoimmune encephalomyelitis, and in chronic viral infections.
RESULTS: It is anticipated that the above approach will permit a characterization of T and B cells and their subpopulations which are involved in the radioresistance and susceptibility of the humoral antibody response. Furthermore, the role of radioresistance and susceptible subpopulation of cells in the induction, maintenance and termination of immunological tolerance can readily be determined and may give some insight to the cellular events involved in self-tolerance, autoimmunity, chronic viral infections and possibly some aspects of oncogenicity.
PROJECT MILESTONES: Using the above approach, it has been possible to determine the immune status of T and B cells during various phases of the tolerant state to both heterologous and self antigens. Such information has permitted a clear determination of the cellular parameters involved. in self tolerance and certain autoimmune diseases. The radiosensitivity of the various events involved in these phenomenon has also clarified the present understanding of regulatory mechanisms in the humoral immune response.

REGIONS OF INTEREST: BIOMES/Terrestrial
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: One general aim of this project is to contribure to understanding of carcinogenesis and normal development, in particular the genetic regulation of these processes and their inter-relationships. Another is to describe and interpret the genetic program for autoimmune disease.
APPROACH: The subjects of research are complex organisms, and the technology is mainly drawn from immunology, biochemistry and genetics.
RESULTS: The work is expected to produce new facts about, and insights into, the basic biological phenomena with which it deals.
PROJECT MILESTONES: Substantial understanding of how the cellular progeny of the fertilized egg, presumably genetically identical, come to be different from each other in form and function, of how it comes about that cancer cells frequently produce molecules normally characteristic of an earlier stage in development. Identifying, locating, and understanding the action of genes that control these molecules, and of genes that are involved in the development of autoimmune disease.

REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: We propose to add to and improve a set of bacterial mutants that we have assembled for the detection and analysis of mutagenic agents. One objective is to have a set of strains that can be used by government agencies, and other interested parties, to screen environmental effluents, pesticides, herbicides, food additives, drugs, etc., as mutagens. Our second objective is to use these strains for investigating the mode of action of various mutagens and in particular for finding mutagens that make specific changes in the DNA.
APPROACH: We are attempting to: (1) introduce a mutation in the depurination repair system into the tester strains to see if this will magnify the errors introduced by certain alkylating agents; (2) develop a new tester strain TA92 which has normal excision repair (uvr repair) and is useful for those few mutagens, such as mitomycin, that require normal excision repair to cause mutations; (3) improve our TA1537 frameshift tester strain by introducing a string of 8C's at the point of the mutation; (4) develop a

tester strain with a string of A's at the site of a frameshift mutation; and (5) improve the metabolic activation system for chlorinated chemicals and dimethylnitrosamine.
ULTS: We hope to improve the correlation (presently 90%) between carcinogenicity and mutagenicity in the test system, to pick up the 18 carcinogens which have been negative with the present set of tester strains.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To elucidate the way in which the different organelles in cells cooperate in their metabolism. This involves showing what parts of the metabolic sequences operate in particular organelles by (1) enzymatic tests on isolated factions, (2) analysis of organelle factions for labeled metabolites following applications of C-14 and H-3-labeled intermediates. The biogenesis of the organelles during normal growth is also under study.
APPROACH: We have developed a technique which allows the excellent separation of several classes of organelles, including spherosomes, endoplasmic reticulum, mitochondria and glyoxysomes, on a single sucrose gradient. This method is the basis for our analyses as outlined in (1).

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Elucidation of the nature of the energized state in biological membranes and the mechanisms of oxidative and photophosphorylation; development of methods for measurement of rapid labelling of phosphoryl enzymes and ATP at active sites; further assessment of the molecular integrity of parental DNA during replication. The mechanism of oxidative phosphorylation remains as one of the principal unsolved problems of biochemistry. The studies will test our new hypothesis that one mode of energy input is to bring about the release of ATP by protein conformational change. Experiments completed on the molecular integrity of DNA define the level of incorporation of P-32 and H-3-thymidine, and indicate the possibility of nuclease cleavage from O-18 probes.
APPROACH: Purified coupling factor ATPases and more complex preparation capable of partial reactions will be assessed for bound ATP, phosphoenzyme formation, and O-18 exchanges. Rapid mixing techniques will test the early events and primary acceptors in oxidative and photophosphorylation. Parental DNA integrity will be assessed using C-13 and N-15 density labelling techniques. Mitochondria and chloroplast infractions thereof, membranes of muscle, microsomes, bacterial cells and bacterial membranes.
RESULTS: Preliminary experiments indicate that AMP may be an early acceptor of P-32/sub i/ and photophosphorylation, but the ADP is the primary acceptor in oxidative phosphorylation. Isotopic exchange probes indicate that in oxidative phosphorylation bound ATP can be formed at the catalytic site but not released unless energy is present. The O-18 exchanges may result from reversible covalent bond cleavage and formation.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To understand the genetic, molecular and cellular mechanisms involved in morphogenesis/development of tissues in animals. This includes induction of mutations which block specific morphogenetic processes.
APPROACH: The morphogenesis of epidermal embryonic tissues to produce legs and wings in the insect Drosophila melanogaster is used as a model system. Leg/wing morphogenesis occurs in vitro in the presence of the steroid molting hormone beta-ecdysone and is inhibited by juvenile hormone. Mutants have been recovered which block morphogenesis. Studies on synthesis of macromolecules, on the movement of cells, and the assembly of supramolecular structures are being conducted.
RESULTS: Information on the basic processes involved in tissue morphogenesis will be obtained. The kinds of genetic input and the nature of the macromolecules (mainly proteins) involved will be elucidated. An understanding of the role of gene function in morphogenesis should evolve.
PROJECT MILESTONES: (1) Recovery of mutants blocking morphogenesis. (2) Understanding of the cellular basis of morphogenesis in this tissue. (3) Understanding of the mechanisms of action of insect hormones. (4) Role cf cytoskeletal/cytomusculative structures in morphogenesis of an epidermal tissue.

CHARACTER OF STUDY: RESEARCH (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To understand the developmental and physiological events in plant cells and tissues in terms of biochemical and physicochemical mechanisms. In particular to understand the sequence of events in maturation and aging in fruits and to delineate and characterize the epigenetic influences in development and differentiation.
APPROACH: (1) To relate the commonality of structure in those compounds which serve as triggering agents in the resperatory burst which attends maturation and ripening in fruits to their mechanism of action. (2) To interfere with the natural sequence of maturation changes in a way which illuminates the causative elements in the maturation process. (3) To develop a theoretical base for triggering action which can be tested experimentally.
RESULTS: (1) An ability to simulate the natural triggering hormone's effects by compounds of our choice which allow mechanistic interpretations. (2) To be able to distinguish between causative events and consequential events in relation to discrete and basic developmental changes. (3) To develop means of sustaining plant tissues, especially fruits and fibers, through extended periods which are normally associated with deterioration.
PROJECT MILESTONES: The discovery that the ripening hormone, ethylene, operates only in tissues which have an operative cyanide-insensitive path of elecyron transport, and that the normal ripening hormone is in fact instrumental in engaging or unplementing the activity of the alternate, or cyande-insensitive path. Further, that the operation of the cyanide-insensitive path is central to the biochemical changes which attend maturation and ripening.

TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The primary thrust of this research program is the study of the genetic control of gametogenesis. Two broad aspects of gametogenesis have been selected for intensive investigation; these are spermatogenesis and meiosis. The genetic requirements for the normal discharge of these functions are being defined by identifying and understanding genotypic perturbations that interfere with them. Mutations allow us to perturb the individual proteins (of which we estimate there are over 500 for spermatogenesis) necessary for these functions; chromosome rearrangements allow us to upset and thus to identify control of gene activity at the chromosomal level; synthetic aneuploids allow us to investigate the importance of the relative doses of the various genes involved in these processes. Effects of abnormal genotypes in meiosis are assessed by monitoring recombination (both meiotic and mitotic) and disjunction (both sex chromosomes and autosomes) in both males and females. Effects on spermatogenesis are detected by reductions in fertility; the testes of sterile males are examined morphologically at the level of both the light microscope and the electron microscope.

POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To study the process of DNA repair in human cells and in bacteria.
APPROACH: Enzymes and other factors will be isolated from human culture cells as well as from bacteria, and their mechanism of action in repairing damage brought about by radiation and environmental mutagens will be studied. In addition, enzyme defects associated with diseased states of humans and mutations of bacteria will be described.
RESULTS: In this way we hope to catagorize which types of DNA damage might be most mutagenic or carcinogenic, and how such responses might be prevented. In addition, we hope to find the molecular basis of several diseases in order to learn how to treat these diseases.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: To develop methods for determining environmental damage in the man or woman who has been exposed to carcinogens.
APPROACH: Characterization of human lymphocyte populations. We are studying the changes that are produced directly in the lymphocytes as the result of exposure to radiation and other carcinogens and we are studying the changes that occur in lymphocytes as the result of the presence of a cancer in the host. The studies involve the use of a multiparameter cell sorter and various fluorescent agents.
RESULTS: Specific changes in the lymphocyte populations associated with exposure to radiation and other carcinogens and specific changes associated with the development of a cancer will be used to assess the health of individuals.
PROJECT MILESTONES: Assembly of the multiparameter cell sorter and associated equipment and the applications to characterization of lymphocyte populations obtained from peripheral blood of human subjects was begun in the 75-76 contract year.
KEYWORDS: INSTRUMENTATION;LYMPHOCYTES;RADIATION INJURIES;BIOLOGICAL REPAIR;CARCINOGENS;BIOLOGICAL RADIATION EFFECTS;BIOLOGICAL EFFECTS;NEOPLASMS;MAN;RADIOINDUCTION;BLOOD;ANIMAL CELLS;IMMUNOLOGY

CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The aim of this proposal is to ascertain the precise function of chloroplast DNA in determining chloroplast proteins. A variety of approaches are taken including microscopy and model building, peptide analysis, biochemical and genetic experiments. Much of the work is given added breath by being put into an evolutionary contact. Work in progress and some recent results can be summarized as follows: (1) Three dimensional structure of higher plant chloroplasts: A three-dimensional computer model of the chloroplast was constructed which allows one to observe the consequences of sectioning the hypothetical chloroplasts at different angles. This resolved an apparent conflict between Wildman's light microscopy studies and previously published electron micrographs of chloroplasts. Another computer model visualizes the thylakoid membrane system of chloroplasts as a continuous chain of beads folded into a flat spiral and embedded in a translucent matrix of stroma. The beads represent the grana and the chain the connections between the grana. The chain is continuous and the flat spiral is stabilized by occasional cross links. (2) Body Inheritance of Chloroplast DNA: It is largely a matter of faith rather than experimental fact that mitochondrial and chloroplast DNA are transmitted exclusively by the maternal line. Experiments using tobacco species that have chloroplast DNA's of different

PROJECT DESCRIPTION: We propose to direct our specific efforts in 1975/76 toward the following three specific aims: (1) To reevaluate whether the assignment of the ESR signal at g-2.0106 to the RS. free radical is indeed correct, and if not, then to both determine the correct assignment of that signal and to determine the ESR characteristics of the true RS. free radical. (2) To continue the identification and characterization of the nature and structure of the disulfide and related radical cations, and of the possible participation of these charged radical species in radiobiological processes. (3) To complete, insofar as possible, experiments relating to the alternating line width effect, the testing of the variable temperature flow cell, and other problems related to thiyl free radicals, as defined in the overall proposal.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The study of the molecular mechanisms of DNA damage caused by physicochemical environmental agents and the repair of such damage is being studied using bacteriophage, bacterial and mammalian cell systems. The objective of the project is to isolate and characterize enzymes and nonenzyme cofactors involved in various DNA repair modes and to identify the biochemical basis for defects in DNA in a number of human diseases characterized by an increased frequency of chromosomal aberrations and/or cancer.
APPROACH: Both in vivo and in vitro (cell-free) systems are established using substrate models in the form of DNA damaged by UV and a variety of chemicals.
RESULTS: A detailed understanding of the molecular biology of DNA damage and its repair.
PROJECT MILESTONES: (1) Isolation and characterization of pyrimidine dimer specific endonuclease from extracts of normal human cells. (2) Demonstration of identifiable molecular defect in extracts of xeroderma pigmentosum cells. (3) Isolation and characterization of defective protein from xeroderma cells.
KEYWORDS: DNA;BACTERIOPHAGES;BACTERIA;MAMMALS;ANIMAL CELLS;BIOLOGICAL REPAIR;ENZYMES;BIOCHEMISTRY;NEOPLASMS;CHROMOSOMAL ABERRATIONS;ULTRAVIOLET RADIATION;BIOLOGICAL RADIATION EFFECTS;BIOLOGICAL MODELS;MOLECULAR BIOLOGY

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: To understand the nature of the enzymatic repair mechanisms that operate in living systems to repair damage in the genetic material, DNA. Additionally, to determine whether physiological conditions can be imposed to improve or increase the efficiency of DNA repair processes in man.
APPROACH: We use principally the method that was developed in our laboratory;the combined use of density labeling and radioactive labeling of DNA to detect the nonconservative mode of repair replication. We first demonstrated repair replication in bacteria and our continuing studies utilize bacteria as model systems while additionally exploring repair in eucaryotes such as yeast and human cells in culture. Repair pathways are characterized by analysis of mutant cell lines deficient in different enzymatic steps.
RESULTS: A clear description of the systems that enable living cells (e.g., human) to survive in the presence of noxious agents (e.g., chemical carcinogens and radiation) in the environment.
PROJECT MILESTONES: The demonstration of ''inducible'' DNA repair in humans. The restoration of DNA repair capability in cells of Xeroderma pigmentosum patients (genetically defective in repair) by the incorporation of a virus carrying the appropriate genes.

77 FUNDING: Energy Research and Development Administration FY77:$655,000
TECHNOLOGY: GENERAL SCIENCE (100%)
POLLUTANTS: METALS/Copper in seawater (1%);SPECIFIED OTHER POLLUTANTS/Chlorine in seawater (5%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Far West;COASTS/Far West;HYDROGRAPHIC AREAS/Other hydrographic areas S. Calif. Borderland
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To measure the standing stocks, growth and activities of planktonic organisms of the coastal waters of the Southern California Borderland, the significance of the plankton in marine food webs, spatial and temporal variations of plankton, and the modulation by both physical and biological processes, including human activities, of plankton stocks. In part, we view as our charge the definition and assessment of potential effects on plankton of the use of seawater for cooling by coastal power stations in this region. Studies of microbial activities in surface sediments will be added in 1976-77.
APPROACH: A program of quarterly cruises has been carried out since September 1974 in support of these objectives. The shipboard measurements, using the methods of modern biological oceanography, are supported by laboratory studies of processes of interest carried out with cultures of bacteria, phytoplankton and zooplankton.
RESULTS: The program is expected to reveal seasonal and spatial variations in plankton stocks that will provide insight and hypotheses for the study of their regulation. Acute effects of chlorine releases from the San Onofre generating station on phytoplankton photosynthesis, bacterial activity, and the halogenation of organic matter are being evaluated. Measures of the ecological health of the planktonic ecosystem are being defined.
OJECT MILESTONES: Publication of integrated observations constitute milestones in this work. A few examples are: (a) acute effects of chlorine on phytoplankton photosynthesis and chlorine reactions with seawater constituents (1976); (b) spatial and temporal distribution of phytoplankton in the region; (c) a partial nitrogen budget for the region; (d) separation and characterization of free-living and attached bacteria in the water column; (e) relation of the depth distribution of herbivorous zooplankton to that of

phytoplankton; (f) a physical explanation for the presence of a phytoplankton maximum at mid-depth in the euphotic zcne; (g) development of adequate methods for calculating surface circulation in nearshore areas; (h) definition of the spatial and seasonal variation in the California undercurrent; (i) clarification of the rcle of breaking internal waves and tides in nutrient input to the euphotic zone; etc.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: It now appears that the ultimate capacity for waste disposal of a coastal environment like that near the San Onofre Nuclear Power Plant depends strongly upon hydrodynamic and chemical parameters that have been little explored. Recent experimental studies of the behavior of plutonium on algal and cther surfaces suggests that ultimate dispersal of many of the trace metals that come from coastal power plants may be influenced, and in some instances controlled, by their ratio of transfer to surfaces through aqueous boundary layers. there is evidence that surfaces of inorganic particulates as well as surfaces of microalgae must be included in any dynamic disposal model. Inevitably studies must be made of transfer properties of all hazardous nuclides that might escape at San Onofre. However, the principal investigator, having reached University retirement status, must propose only some limited investigations that will add to the information needed for assessing impacts of coastal power plants.
RESULTS: During the first month, four alpha spectrometers and accessory equipment have been modified to make more reliable measurements of rates of deposition of heavy metals out of sea water into algal and other surfaces. Preliminary studies have uncovered aging changes in behavior of plutonium, americium and polonium in sea water.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: To understand the geochemical and geophysical behaviors of elements in sea water and the consequences of such activities to general earth science problems and to the management of industrial wastes. Emphasis has been placed upon the transfer processes of elements introduced into the oceans either from the continents, atmosphere or sea floor and to the time relationships of such reactions. The development of new geochronological techniques has formed an important part of our efforts. We have been concerned with the construction of new instruments and with the devising of new methods to further these goals. Over the past years we hve been studying the mobilization of transuranics and heavy metals from fuel cycles into the coastal environment.
APPROACH: We utilize the fluxes of transuranics and heavy metals to anoxic sediments, either estuarine or coastal marine, to obtain pollution histories. Time frames are introduced into the sediments usually with radiometric geochronological techniques and sometimes with natural varving. To ascertain the amounts of materials transported atmospherically from the continents to the oceans we have collected and measured pollutants in airborne dusts and in glaciers (which can have their strata dated by radiometric techniques). We have also developed coring techniques to recover relatively undisturbed samples from both coastal and deep sea sites.
RESULTS: (1) Pollution histories, both transuranic and fossil fuel metals, as recorded in coastal, estuarine and glacial sediments, for a variety of U.S. sites. (2) Monitoring strategies for transuranic and heavy metals released during fuel cycles with respect to the coastal marine environment. (3) Detailed geochemical behaviors to transuranic elementsand heavy metals in the atmosphere and in the coastal marine environment. (4) New geochronological techniques applicable to a variety of sedimentary environments. (5) Novel chemical analytical techniques applicable to transuranics and to heavy metal analyses in a variety of environmental samples.

PROJECT MILESTONES: (1) Development of novel geochronologies, Ra-226, Pb-210 and Th-228/Th-232 for coastal marine zones. (2) Development of the concept that remobilized soil debris is an important vehicle for mobilizing transuranics and heavy metal pollutants to the coastal marine environment. (3) development of the use of coastal marine sediments, lake sediments and glaciers for recording pollution histories. (4) Development of the importance of atmospheric transport in moving pollutants from nuclear and fossil fuel cycles to the marine environment.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Estuarine;BIOMES/Marine;GEOGRAPHIC AREAS/Northwest;GEOGRAPHIC AREAS/Alaska;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: This project will look for the causes to explain the distribution of organic substances in marine sediment, particularly the hydrocarbons. The depth distribution of hydrocarbons in relation to total carbon will be studied to determine whether enrichment or depletion at any one time interval is the result of climatic events related to erosion from land, or whether it reflects change of productivity in the water column. A number of trace metals will be studied to better ascertain the relationship between carbon compounds and the metals. Content of metals in sediments will be studied with a view toward determining whether the enrichment process is the result of allocthonous or in situ processes.
APPROACH: The following studies will be undertaken: (1) Evaluation and differentiation of marine and terrestrial contributions of carbon compounds to ocean sediments. (2) Fluxes of carbon, nitrogen, phosphorus and sulfur at the sediment-water interface. (3) Evaluation of carbon and nitrogen fluxes into marine sediment as a function of climatic changes. (4) Differentiation of marine biogenic and petrochemical hydrocarbons. (5) Fate of hydrocarbons in the sediment column. (6) Role of sediment organic matter in mobilization and removal of trace metals. (7) Distribution of trace metals in sediment as a function of climatic changes.
RESULTS: In order to differentiate hydrocarbons originating from naturally occurring sources, from those introduced into the ocean by anthropogenic processes, a very broad approach must be considered. First, one must be able to predict with confidence that certain classes of compounds are not normally synthesized by marine organisms. Second, it must be shown that the hydrocarbons are not introduced from land by rivers or natural drainage systems. Third, it must be demonstrated that anthropogenic hydrocarbons in any specific location in the ocean can be differentiated from petroleum typesubstances either produced in natural seeps, or from oil shales cropping out on the ocean floor.
PROJECT MILESTONES: (1) The use of N-15/N-14 and S-34/S-32 stable isoope ratios in crude oils and petroleums have proved to be an effective method to differentiate their origin and source. (2) Gas chromatography and gas chromatography-mass spectrometry methods are able to establish compound recognition of petroleum products in marine sediments. (3) Trace metal concentrations, such as uranium, fluctuate with climatic changes, as evidenced by the depth distribution of uranium in marine sediments.

CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Site specific Arctic tundra
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The underlying objective of the research is to develop the conceptual understanding of Arctic tundra dynamics through an interplay of field investigations, simulation modeling, and laboratory experimentation. The broad hypotheses to be tested is that the models developed to express the dynamics of the coastal, wet meadow tundra can predict the dynamics of inland tundra ecosystem types, given values for the parameters in the model which define the new ecosystems. The specific hypothesis are the values of parameters and relationships between variables currently being used. Some of the research needed to establish these will be carried forward in an on-going field study, sponsored by the NSF, of the grazer-vegetation interactions in inland tundra. More will be carried out as part of this proposal.

RESULTS: Existing models have been used to guide the 1975 summer field research funded under the NSF RATE program. Data from the summer field program is being used to validate existing models for the diverse vegetation types found at Meade River, Alaska. Models of grazer-vegetation interactions are being developed.

77 FUNDING: Energy Research and Development Administration FY77:$26,000
TECHNOLOGY: GENERAL SCIENCE (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: (1) To measure genetic loads in natural populations, and their relationships to natural selection and evolution; (2) to ascertain the role of natural selection and of random processes on the maintenance of genetic variation in natural populations; (3) to ascertain the role of genetic factors in determining certain behavioral traits, and the feasibility of modifying such genetic factors; (4) to ascertain the amount of genetic variation underlying protein variation in populations of animals. It has recently become established that a great deal of genetic variation exists in natural populations of most kinds of organisms. The various aspects of the project are concerned with more precise measures of the amounts of genetic variation, and with the natural processes by which the polymorphisms are maintained, as well as their role in the adaptation and evolution of populations. Special attention is paid to certain behavioral traits, like phototaxis and geotaxis. The research is conducted for the most part on populations of *Drosophila* flies.
RESULTS: Perhaps more than 50% of all gene loci are polymorphic in a given natural population. The variation is adaptively significant, since individuals homozygous for a whole chromosome have very low fitness (less than 15% of normal individuals). Genetically controlled protein variants affect various fitness components, such as fertility, viability, longevity, and the like.

NERGY CYCLE: WASTE MANAGEMENT (10%)
POLLUTANTS: RADIATION (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory;RESEARCH/General (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Our principal aim is to achieve a more thorough understanding of the mechanisms employed by higher organisms to repair radiation and chemical damage in DNA. To achieve this end we are performing a combined genetic, biochemical, and cytological investigation of DNA repair mechanisms in Drosophila.
APPROACH: (1) Mutant Isolation. (2) Genetic Characterization. (3) Physiological Characterization. (4) Chemical Characterization of DNA Repair. (5) Enzymology. (6) Repair in Isolated Nuclei. (7) Mutagen Testing.
RESULTS: (1) A more thorough understanding of the DNA repair mechanisms employed by eukaryotes to respond to environmentally induced damage. (2) Development of more sensitive strains for detecting environmental mutagens.
KEYWORDS: IONIZING RADIATIONS;GENETIC RADIATION EFFECTS;DNA;DROSOPHILA;BIOLOGICAL REPAIR;MUTAGENS;TESTING;ULTRAVIOLET RADIATION;CARCINOGENS;BIOCHEMISTRY

POLLUTANTS: RADIATION/Ultraviolet (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: Determination of the Mechanism of Action of the Photoreactivating Enzyme. Ultraviolet light (wavelengths between 240 and 320 nm) causes death and mutations in procaryotic and eucaryotic organisms. In man, ultraviolet light can produce skin cancers. The primary molecular lesion responsible for these biological effects are thought to be photochemical modifications of the organisms DNA. Cells of organisms throughout the phytogenetic tree have developed enzymatic mechanisms to repair damage produced in their DNA by ultraviolet light. We are studying the molecular mechanism of action of one of these enzymatic repair systems, the photorectivating enzyme. The photoreactivating enzyme (PRE) uses visible or near ultraviolet light (300 < lambda < 600 nm) to monomerize pyrimidine dimers (cyclobutyl-dipyrimidines). Thus the PRE has two unique and valuable properties: (1) It uses a 3eV photon to remove damage produced by a 5eV photon and (2) It is specific for the major class of ultraviolet induced molecular lesions. Thus if an effect can be reversed by photoreactivation, then the effect is caused by pyrimidine dimers.
APPROACH: The PRE uses visible and near ultraviolet light to repair DNA damaged by far ultraviolet light. We are studying the PRE using a variety of spectroscopic techniques using the same weavelengths (i.e., 240-600 nm). The spectroscopic techniques which have been used to study the PRE include: absorption and absorption difference spectroscopy, fluorescence, phosphorescence, circular dichroism, magnetic circular dichroism and action spectroscopy.
RESULTS: We expect to determine which of several theoretical mechanisms correctly describes the mechanism of action of the PRE. We also will characterize the human PRE and compare it with PRE from other sources (bacterial, plant, insect). We are developing new spectroscopic techniques for studying biological materials.
PROJECT MILESTONES: (1) We were first to measure the action spectrum of the human PRE. We discovered that the human PRE can use wavelengths greater than 500 nm. Thus yellow ''safe lights'' widely used in PRE experiments are in fact ''unsafe'' for the human PRE. (2) We have detected new absorption resulting from complex formation between PRE and dimer containing DNA. This observation explains the mysterious lack of absorption greater than 300 nm of the purified PRE and also suggests that the mechanism of action involves formation of a ground state complex between PRE and dimer containing DNA. (3) New Spectroscopic Techniques: We have measured the degree of circular polarization of fluorescent light induced by an external magnetic field. Ours was the frst demonstration of this technique at physiological (non-cryogenic) temperatures. We were also first to demonstrate fluorescence detected magnetic circular dichroism of both fluorescent and nonfluorescent compounds.

TITLE: Chronic Irradiation and Brain Development
PROJECT NUMBER: 008012
PRINCIPAL INVESTIGATOR: Zamenhof, S.
ADDRESS: Department of Microbiology and Immunology, UCLA School of Medicine, Los Angeles, CA 90024
AFFILIATION: California Univ., Los Angeles (USA). School of Medicine
MONITORING AGENCY: Energy Research and Development Administration, Washington, D.C. (USA)
DIVISION: Division of Biomedical and Environmental Research
MONITOR: Carter, C.E.
TELEPHONE: P233-5468
YPE OF FUNDING: Contract No.-E(04-3)-34, P.A. 230
7 FUNDING: Energy Research and Development Administration FY77:$44,000
TECHNOLOGY: NUCLEAR/Fusion (100%)
POLLUTANTS: RADIATION/Tritium (100%)
CHARACTER OF STUDY: RESEARCH/Applied (100%)
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objective of the project is to study the effect of low level of chronic radiation

(radioactive pollutants) on mammalian (rat) brain development over several generations, emphasizing the dose-effect relationships.
APPROACH: First approach: (1) The pregnant rats (F/sub 0/) and their fetuses will be exposed to chronic low level radiation that does not produce sterility. (2) Some of the newborns (F/sub 1/) will be examined for first generation effects on brain development. (3) The remaining F/sub 1/ females will be raised without further addition of radioisotopes, mated with non-irradiated males, and their offspring F/sub 2/ examined for cerebral parameters. Second approach: The possibility of cumulative effect of radiation over generations will be investigated by continuous (chronic exposure of pregnant mothers and of their progeny to low (non-sterilizing) level of radiation (radioisotopes), and examination of the brains in consecutive generations (first through fifth) as described above.
RESULTS: One aim in this proposed study will be a precise and direct administration of a low dose of radioactive material to the developing fetal brain. Another aim will be an attempt to mimic the more natural exposure type such as ''hidden'' irradiation, due to ingestion of foods containing weakly radioactive materials. It is very likely that even low doses of radioactive material reaching the developing fetus directly will cause an irreversible change in the brain histology and anatomy. It is also expected that other fetal organs, especially sensitive ones such as the endocrine glands, will suffer lasting alterations after in utero exposure to radioactive materials, and subsequent exposure due to residual label in DNA.
PROJECT MILESTONES: Initiate studies to establish a dose of radiochemicals (H-3 thymidine, H-3 leucine, H-3 glucose) which still allows sufficient fertility and viability for the long-range maintenance of the chronically irradiated rat colony. Monitor the status of all animals (placental and body weights, fertility and mortality rates). Initiate similar studies on rat population that has been malnourished (protein and/or calorie deficiency). Initiate the studies of the effects on brain development. Finish the study of chronic radiation on brain development in first generation as outlined above. Continue the studies, now on second and third generation: (1) under continued low dose radiation (study of cumulative effects and (2) with radiation discontinued after first generation (study of non-mendelian inheritance and study of recovery).

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The objective of this study is to develop the means for predicting the effects on the atmosphere resulting from the injection of large amounts of heat and moisture.
APPROACH: One approach is to develop numerical models to simulate the physical processes leading to possible weather changes. A second approach is to identify analogs such as heat islands and to study their atmospheric effects.
RESULTS: One result expected is the development of a simulation model to predict the effects on the atmosphere of the operation of large power generation complex. The second is the assessment of analogs simulating power station operation.
PROJECT MILESTONES: Several R and D reports resulting from this work may be considered as milestones: (1) Koenig, L. Randall, 1976, Application of Analogs to the Assessment of Waste Heat Dissipation Effects on the Atmosphere, WN-9550-ERDA; (2) Murray, Francis W., 1976, The Role of the Perturbation in the Modeling of Atmospheric Thermal Convection, WN-9549-ERDA.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Alaska
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objective of this project is to use shorebirds as indicators of environmental quality based on the fact that shorebird species differ in their habitat use strategies. Each is finely tuned to a distinct pattern of resources, and each, therefore, is differently susceptible to a given perturbation.
APPROACH: Variability in the arctic ecosystem and energy activity dictates a comparative approach. Shorebird

communities will be examined at three locations on the Arctic coast: Barrow, Wainwright, and Prudhoe Bay to determine the abundances and habitat-use patterns of each species and the species-typical patterns of space utilization. Species will be studied along an array of kilometer-long transects and in large (17 to 25 ha) census plots.
RESULTS: Patterns in habitat use and fluctuations in density of a given species should reflect the conditions of their specific habitat. Thus, shorebird distribution and population fluctuations should serve as indicators of habitat disturbances and change resulting from energy extraction and transportation which otherwise might not be readily apparent.
PROJECT MILESTONES: Study areas and transects established, 1977; completion of collection of first year's data on species populations and behavior.

PROJECT DESCRIPTION: The partially dismantled SNAP reactor facilities (Buildings 010, 024, 028, and 059), and the Radioactive Materials Disposal Facility (RMDF), all of which are located at the Santa Susana Nuclear Development Field Laboratory, contain extensive radioactive materials in the form of activated or contaminated structures and components. All of these facilities, with the exception of portions of the RMDF, are inactive and ''stored in plane.'' The RMDF is used in support of the surveillance and dismantling of the inactive SNAP reactor facilities and the SRE. The irradiated fuel from SRE Cores I and II is stored in a below-grade storage vault at the RMDF. The SNAP reactor facilities have been inactive and stored in place for varying periods of time ranging up to more than 10 years.
APPROACH: Priorities for the sequence of the dismantling of these facilities have been established on the basis of (1) degree of hazard potential, (2) program capabilities, (3) cost effectiveness, (4) funding limitations, and (5) special planning and tooling development requirements. The planning in all cases assumes the complete dismantling and burial of all activated structures or components, and the dismantling or decontamination of all contaminated structures or components.
RESULTS: Continue to complete planned dismantling of surplus SNAP facilities.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;HEALTH EFFECTS
PROJECT DESCRIPTION: These investigations are aimed at providing pertinent and useful information concerning aerosol and gas characteristics that will contribute to understanding the potential biological effects of particulate and gaseous products of energy technologies. This research also provides essential supporting information for current and planned inhalation studies with respect to choice and generation of suitable exposure atmospheres. In addition, these studies may provide suggestions for technology development for effluent abatement and point to new areas for prevention and therapy research.
APPROACH: These studies encompass six different areas of scientific research, although not necessarily simultaneously. (1) Field studies to evaluate specific characteristics of particulate and gaseous products of energy technologies. (2) Generation of aerosols and gases as required for biological studies. (3) Delivery and exposure systems for inhalation studies. (4) Characterization of atmospheres containing aerosols and gases. (5) Behavior of aerosols and aerosol-gas mixtures. (6) Fundamental studies directed to providing needed physical-chemical information related to the deposition and clearance of inhaled aerosols and/or potentially toxic gases.
RESULTS: Important information will be developed concerning the physical-chemical character and behavior of aerosols and gaseous products of energy technologies. Needed physics-chemical information will also be provided related to the deposition and clearance of inhaled aerosols and potentially toxic gases. New methods will be developed for the generation and delivery to experimental animals of aerosols and gases and for the characterization of atmospheres containing aerosols and gases.
PROJECT MILESTONES: (1) 11/15/76 Operational system for acute exposure of individual nonhuman primates to test aerosols with respiratory measurements. (2) 12/15/76 Installation and calibration of spiral-duct aerosol centrifuges. (3) 1/1/77 Fly ash aerodynamic characterization and submicrometer fractionation begun. (4) 4/15/77 Initial aerodynamic characterization and behavior measurements of fly ash completed. (5) 10/15/77 Completion of analysis of aerodynamic shape-factors for fly ash aerosol particles. (6) 12/1/77 Completion of initial phase of in vitro dissolution studies of chemical components. (7) 1/1/78 Initiation of fly ash surface interaction studies.

CHARACTER OF STUDY: RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The objectives of this research project are: (1) to develop the methodology for the longitudinal assessment of immunologic competence at the cellular level in relationship to radiation and aging; and (2) to ultimately apply the methods and to collaborate in a study of the influence of late radiation effects in the A-bomb survivors of Hiroshima and Nagasaki.
APPROACH: Special emphasis will be placed on the development of methods which can be applied to the study of monozygotic and dizygotic twins where both were exposed, where neither were exposed, and where only one was exposed to radiation. Preliminary studies will be carried out with Hiroshima immigrants who immigrated to the U.S. before 1940 and their Japanese-American descendants in the Los Angeles area. This proposal includes provisions for assisting in the development of competent investigators and laboratory facilities at the Radiation Effects Research Foundation (RERF) in Hiroshima and Nagasaki.

CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Global
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:HEALTH EFFECTS
PROJECT DESCRIPTION: The purpose of this task is to identify and evaluate the health hazard potential of toxic agents released into the general environment and the work environment during energy-producing processes. The societal consequences must be evaluated in terms of potential chemical and radiation hazards to the industrial worker and to the general population at risk to low-level chronic exposure. When dealing with the complex substances produced by utilization of fossil fuel, nuclear, or other energy technologies, synergism among different chemical substances and the relationship to the production of tumors cannot be ignored.
APPROACH: This task will be accomplished through a comprehensive scientific literature survey. If sufficient biologic/toxicologic information is not available in the immediately accessible literature, then appropriate research needs will be recommended to ERDA.
RESULTS: A final summary report will be prepared covering all work under this task. The expected products of this task will include working papers, briefing materials, visual aids, and supporting data that can be integrated by ERDA with the outputs of other tasks into a report on energy futures.
PROJECT MILESTONES: (1) Start work 12 May 1977. (2) Complete on 2 June 1977. (3) Summary report required no later than June 15.

CHARACTER OF STUDY: ANALYTICAL (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Site specific off-shore;COASTS/Northeast;COASTS/Southeast;COASTS/Gulf;COASTS/Far West;COASTS/Northwest;COASTS/Alaska
SEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:INTEGRATED ASSESSMENT
OJECT DESCRIPTION: (1) To analyze the types of organizational relationships that may occur in the development of a coastal energy facility siting plan. (2) To identify a number of the major institutional, legal, and political problems that may occur among state agencies and between state agencies and local units of government in the development and implementation of an energy facilities siting plan. (3) To recommend various procedures, policies, and institutional arrangements to resolve or minimize the problems identified in Objective Two.

APPROACH: A telephone survey would be first conducted among the 30 coastal states to determine, if in fact, there are four basic arrangements for siting and planning energy facilities. The telephone survey could also seek to obtain copies of laws, regulations, and documents that relate coastal zone management to energy facility siting, as well as to establish a list of key contacts in each of the coastal states. The telephone survey should also serve to focus and refine the analytic approach to be used in the four states.
RESULTS: The final product will be a report that ERDA could distribute to coastal states in order to provide them with guidance on developing and implementing coastal energy facility plans. The report would also be expected to identify areas of requiring further research work and therefore assist ERDA in citing research priorities.
PROJECT MILESTONES: It is anticipated that work would commence July 1, 1977 and terminate on or before October 1, 1977.

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Northeast;GEOGRAPHIC AREAS/Midwest;GEOGRAPHIC AREAS/Southeast;GEOGRAPHIC AREAS/Middle Atlantic;GEOGRAPHIC AREAS/South;GEOGRAPHIC AREAS/Southwest;GEOGRAPHIC AREAS/Far West;GEOGRAPHIC AREAS/Northwest
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: (1) Identify and determine the significance of all potential interactions between coal slurry and/or recovered slurry water and the environment; (2) Assess water pollution control and water treatment strategies used for existing and proposed coal slurry pipeline systems; (3) Assess current and developing technologies for control of suspended particles, trace elements and trace organics in waste waters; and (4) Determine the feasibility of using saline water or partially treated sewage effluent as the carrier medium, and the resulting interactions between the liquid and solid phases. (5) Analyses of actual or laboratory-prepared coal slurries for: transfer of inorganic species (including trace metals) from solid to liquid phase; leaching of organic species; analysis will be by gas chromatography/mass spectrometry; effects of slurry exposure upon wastewater characteristics; analysis will include determination of biochemical oxygen demand and coliform bacteria.
PROJECT MILESTONES: Final report draft 15 March 1978.
KEYWORDS: COAL;SLURRIES;SLURRY PIPELINES;ENVIRONMENTAL IMPACTS;WATER POLLUTION CONTROL;WATER TREATMENT

TECHNOLOGY: FOSSIL FUEL/Oil and Gas (100%)
ENERGY CYCLE: TRANSPORTATION (50%);STORAGE (50%)
CHARACTER OF STUDY: RESEARCH/Laboratory (20%);ANALYTICAL (80%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Marine;GEOGRAPHIC AREAS/Alaska;GEOGRAPHIC AREAS/Continental
RESEARCH CATEGORY: ENVIRONMENTAL CONTROL TECHNOLOGY
PROJECT DESCRIPTION: To compile and assess pertinent existing data about LNG fires; to review thoroughly the capabilities, deficiencies, characteristics, and costs of various devices used to measure pertinent parameters of LNG tests (e.g., liquid depth, gas concentration, temperature, radiation); to prepare a list of criteria for use in selecting sites of future LNG experiments; to assess the usefulness of wind tunnel modeling studies in evaluating the effects on vapor dispersion of facility-control measures and terrain.
APPROACH: To survey available records and current research to obtain data, then to draw on expertise within RDA for analysis and assessment.
RESULTS: A significant data base exists only for pool fires on confined land areas; some data is becoming available on pool fires on water. Radiosity is dependent upon vertical position within the flame. Desirable properties of a test site, in addition to nearness of LNG supply, are a relatively level area where both land and water spills can be studied and a range of wind speeds, temperatures, and humidity. Wind tunnel modeling of gravitational effects of LNG clouds is well established as an economical and convenient technique. A major limitation to existing meteorological wind tunnels is the smallness of the working areas. Wind tunnels can be useful in planning instrumentation layouts. Flow visualization tests show that simulated LNG vapor can flow significant distances upwind down a 2% slope; in the presence of a slope the vapor cloud structure shows large variability. No available methane concentration sensors have the required time resolution and insensitivity to atmospheric water vapor, water droplets, and dust needed for field tests. A dual-film aspirated probe appears likely to satisfy technical test requirements. infrared analyzers, Raman scattering devices, and thermocouples all show promise as concentration sensors, but require further investigation to define their capabilities and costs. No adequate testing apparatus suitable for establishing the dynamic response of sensors in an LNG vapor environment are known to exist.
PROJECT MILESTONES: (1) Begun 1 Jan 1977. (2) Draft report 15 April 1977. (3) Final report 31 Aug 1977.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Measure the effects of power plant type thermal discharges on dominant food-chain components of representative aquatic systems.

APPROACH: Utilize existing thermal effluents in streams and a cooling lake to quantify correlative observations about relationships between thermal effluents and crop, survivorship and metabolism of dominant aquatic organisms. Use these same streams experimentally to separate site-specific from general effects. Utilize experimental stream system to examine component response to once-through cooling treatment covering temperatures from ambient to + 12.5C.
RESULTS: Predictive statements about species and community response to temperature elevation and other aspects of reactor operations including crop, species composition, metabolic rate and ecological processes such as predation, grazing primary production, and substrate utilization.
PROJECT MILESTONES: (1) Quantification of alterations in producer, bacteria and primary consumer crops as a function of temperature. (2) Quantification of the effect of temperature elevation upon metabolic processes: respiration, heterotrophic utilization of substrates and primary productivity. (3) Comparison of the effects of comparable effluent temperature upon ecologically equivalent components of once through vs recirculatory effluent systems. (4) Preparation of a review document summarizing the ecological effects of 20 years of cooling pond operation.

TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: NOXIOUS GAS (20%);PARTICULATES (10%);RADIATION (70%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/Applied (90%);ANALYTICAL (10%)
REGIONS OF INTEREST: BIOMES/Atmospheric;BIOMES/Terrestrial;BIOMES/Freshwater;BIOMES/Estuarine;GEOGRAPHIC AREAS/South
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The major objective of this program is to develop (or adapt), test, and apply comprehensive mathematical models to calculate the dose-to-man from the release of radionuclides from one or more sources via atmospheric and aqueous vectors.
APPROACH: Preliminary work indicates that atmospheric transport processes are the primary means by which radionuclides are transported beyond the SRP site boundary, so initial efforts are focused in the atmospheric sciences. Because of the distribution of population that is affected by SRP and commercial facilities being built in the area the scale of primary interest will be from one to hundreds of kilometers. The meteorological aspects of the study take advantage of the unique opportunity which exists at the SRP site for atmospheric related research because of the existing instrumented 1200 ft TV tower, a mesoscale wind measurement network, and a network of Kr-85 samples which can provide a data base for applying atmospheric transport, diffusion, and deposition models in a geographical area containing a large nuclear complex.
RESULTS: (1) Develop (or adapt) models of transport, dispersion, and depletion phenomena out to distances of 1000 km. (2) Develop a data base for TV tower, seven tower system, routine monitoring and planned experiments which can be used to test atmospheric and other transport models. (3) Develop methodology for air quality assessment for the Southeastern United States. (4) Develop and apply competance in aqueous and terrestrial transport mechanisms and integrate models in these areas to atmospheric transport models. (5) Develop and apply competence in environmental effects of releases, incorporating in the models work on pathways and biological effects (using dosimetry values developed by others) of radioactive and non-radioactive materials released.
PROJECT MILESTONES: FY 76: (1) An extensive climatology of the top of the mixed layer has been prepared using an acoustical sounder; this work revealed a ''momentum burst'' phenomenon in the boundary layer. (2) Atmospheric diffusion estimates were improved by publication of a comparison of differing methods for categorizing diffusion, improving numerical solution of the advection-diffusion equation, improving methods for calculating atmospheric diffusivities and improving methods of calculating fluxes of pollutants to the surface. (3) Energy and water balance experiments were begun with the installation of soil-water instrumentation and implementation of data acquisition system. (4) Comparisons of calculated dose from drinking water and fish down stream from SRP and monitoring data indicate models are adequate for chronic release condition. Linkage of this model with stream transport code for estimates of accidental releases also accomplished. FY 77: (1) Incorporate acoustic sounder into WIND minicomputer system. (2) Make extensive comparison of diffusion calculations from models using tower data as inputs and Kr-85 concentatons from the sampling network. (3) Incorporate improved estimates of eddy diffusivity from TV and 7-tower system, and surface heat flux and sink source terms from energy balance work into diffusion models. (4) Begin acquisition and use of regional balloon trajectory experimental

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Timber management. Since 1952, over 100 million pine trees have been planted on the SRP site, and there are now approximately 118,000 acres of pine and 48,000 acres of hardwood under Forest Service management. Reforestation, timber stand improvement, preparation and supervision of timber sales, maintenance of woods, roads, and prescribed burning are carried out on the SRP site. Wildlife management and research. Key wildlife habitats are maintained, primarily for birds. The endangered red-cockaded woodpecker colonies have been censused and are under study. The deer herd on the SRP is managed, and a public hunt is administered each year.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: To improve our understanding of how tritium and transuranics are transported and cycled into and through the estuary regions and to estimate their ultimate dose to man.
APPROACH: To employ a multidiscipline-cooperative approach to measure the concentrations of these radionuclides present in the biota, sediment and water, to quantify these results with coefficients for models, and to measure the environmental variables responsible for transport.
RESULTS: (1) Determine tritium and plutonium concentrations in fresh water and marine organisms. (2) Evaluate the important cycling-transport mechanisms for tritium and plutonium in estuary systems. (3) Evaluate dose-to-man models to estimate the impacts of these radionuclides.
PROJECT MILESTONES: 1976: (1) Developed field and laboratory procedures for plutonium analysis and employed these procedures to determine plutonium levels in 3 estuaries of the southeastern U.S. and in seafood. (2) Designed a station capable of measuring and recording ocean and meteorological conditions near the mouth of the Savannah River estuary. 1977: (1) Determine the cycling and transport modes for transuranics and tritium in estuarine and salt marsh systems in the southeast. (2) Install a mass spectrometer (cooperatively with other program) to identify plutonium isotopic source terms for aquatic systems. (3) Develop a code to calculate dose commitment from seafood. (4) Collect environmental data necessary to support above. 1978: (1) Initiate studies on food chain relationships for plutonium and tritium. (2) Based on data, construct models to describe transport of radionuclides in the coastal area.

TECHNOLOGY: NUCLEAR/Fission (100%)
POLLUTANTS: NOXIOUS GAS (15%);PARTICULATES (5%);RADIATION (80%)
CHARACTER OF STUDY: RESEARCH/Applied (20%);DEVELOPMENT/Pilot plant (60%);FULL SCALE DEMONSTRATION (20%)

REGIONS OF INTEREST: BIOMES/Atmospheric;GEOGRAPHIC AREAS/Southeast;COASTS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this program is to develop and evaluate methodology of predicting the consequences of accidental releases to the atmosphere of the Southeastern United States. This information will be of major input to decision makers who must take consequence limiting actions in case of accidental atmospheric releases. Associated with this objective is the development of tools and communications in order to permit the information to be developed and presented in a timely fashion.
APPROACH: Develop or adapt computer models to predict the path and concentrations from accidental releases of materials to the atmosphere. Develop simple displays for immediate use by operating personnel. Conduct field tests of the ability to calculate paths and concentrations in real time. Conduct these tests in conjunction with the Lawrence Livermore Laboratory's (LLL) evaluation of their Atmospheric Release Advisory Capability (ARAC) concept. Incorporate dose calculations into predictive models.
RESULTS: Install a minicomputer system to acquire meteorological data in and around the Savannah River Plant (SRP) and use this as input into predictive models which will display the path and concentrations from postulated or accidental atmospheric releases. These displays will be available within the Emergency Operating Center (EOC) of the SRP. Validate the computer models used at the Savannah River Plant and those developed by the Lawrence Livermore Laboratory in their ARAC concept using routine releases of radioactive nuclides from production activity at the SRP. Demonstrate both the feasibility and the validity of the LLL ARAC concept and establish a realtime support to the decision makers at the SRP.
PROJECT MILESTONES: Complete installation of the minicomputer system with real time displays in the SRP Emergency Operating Center- July 1976. Complete report of joint Savannah River Laboratory (SRL)/LLL aircraft tests performed December 1975 which demonstrates the feasibility and the validity of the ARAC concept - 4Q FY 77. Conduct additional aircraft tests in FY 78. Develop, adapt, verify and evaluate very fine mesh prediction mesoscale and regional scale models for support to ARAC - FY 77. Connect minicomputer system to SRL's IBM-360/195 in order to run more advanced computational models - FY 77. Continue cooperative efforts with LLL in development of real time atmospheric release prediction capability as an aid to the SRP EOC - through FY 78. Take steps such that SRL can serve as an alternative center to LLL for ARAC capability for the entire United States - beyond FY 78.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To determine the level of plutonium contamination of various ecosystems which are in close proximity to a nuclear fuel-reprocessing plant and to evaluate the importance of the various modes of contamination (i.e., foliar deposition, root uptake). The systems include agricultural (wheat and soybean), old-field, and fresh water aquatic ecosystems.
APPROACH: To sample the various ecosystems with respect to time of exposure to transuranic input and distance relative to the source of the transuranic input. For example, the agricultural crops are sampled periodically over the growing season to evaluate the concentration level with respect to maturity of the plant and time of exposure of the plant organ. The spatial sampling evaluates the effect of a gradient in atmospheric and soil transuranic concentration which decreases with distance from the source.
RESULTS: The old-field, wheat and soybean ecosystem sampling has been completed. Analysis of the Pu concentration of the old-field and wheat samples are very near completion, manucript are in preparation reporting this data. Research is continuing in the fresh water aquatic ecosystem as well as several other systems.
PROJECT MILESTONES: (1) Fall 1974 Oil-field sampling complete, agricultural fields prepared and planted with wheat. (2) Spring 1975 Wheat harvest, soybean crop planted. (3) Fall 1975 Soybean crop harvested. (4) Winter 1975 Pu analysis of old-field samples complete. (5) Spring 1976 Corn crop planted, Pu analysis of wheat samples complete.

PROJECT DESCRIPTION: Develop new and improved data on plutonium transport through, and change within, the environmental systems of the southeastern United States.
APPROACH: Multidisciplined and cooperative research to evaluate the transport, cycling, distribution, redistribution and radiation dose of transuranics in the environment.
RESULTS: (1) Determine under field conditions adjacent to an operating fuel reprocessing plant the plutonium transport to man from eating wheat, soybeans, corn, leafy vegetables, and root crops. (2) Evaluate the influence of environmental releases of plutonium to dose-to-man through the drinking water pathway. (3) Evaluate the physical and chemical characteristics of the source term for a reprocessing plant. (4) Examine the contribution of the aquatic foodchain to the dose-to-man. (5) Evaluate the importance of resuspension of Pu particles in the dose-to-man.
PROJECT MILESTONES: (1) 1976 Effect of water treatment operations on the removal of plutonium from the water supply. (2) Determine plutonium content of soybeans and wheat grown on field that has received plutonium (3 mCi) from operating nuclear fuel reprocessing plant. (3) 1977 Evaluate importance of resuspension of plutonium-bearing soil under agricultural and non-agricultural conditions using field studies. (4) 1977 Evaluate aquatic transport of plutonium in streams under southeastern U.S. conditions. (5) Install and operate mass spectrometer for differentiating plutonium isotopes. (6) 1978 Determine transuranic source term particulate characteristics. (7) Refine modeling capabilities for transuranic transport to man through foodstuffs typical of the southeastern United States.

PROJECT DESCRIPTION: Obtain Kr-85 data and associated meteorological data with which to evaluate various methods of calculating transport and dispersion of gaseous effluents to distances of 25-150 km.
APPROACH: Collect air samples at 13 cryogenic samplers at varying distances encircling the SRP. Determine hourly emission data from SRP. Archive pertinent meteorological data. Use above to test various meteorological models.
RESULTS: Compile 2 years of weekly Kr-85 samples at 13 sites. Compile 2 months of daily Kr-85 samples at 13 sites. Compile hourly source rate for SRP's two fuel reprocessing plants. Compile meteorological data base consisting of wind, temperature and inversion height at SRP and surface and upper level weather data from the National Weather Service in the Southeastern U.S. Compile all of above on magnetic tape in computer compatible format. These tapes containing source, meteorology and observations will be a unique data set which will be extremely useful to the meteorological community in evaluating calculational techniques over distances of 25-150 km.
PROJECT MILESTONES: (1) Verify Kr-85 hourly release rate for SRP's two fuel processing plants with stack measurements FY 76. (2) Prepare computer compatible archives of meteorological measurements for the Southeastern U.S. for period of study FY 77. (3) Deactivate the Kr-85 samplers FY 77. (4) Utilize data base to test simple diffusion models for short and long sampling times FY 77.

PROJECT DESCRIPTION: To evaluate management techniques of forests, pine plantations, animals, and watersheds on the Savannah River Plant.
APPROACH: The effects of prescribed burning and litter removal on the cycling of nutrient element is being determined.
RESULTS: The results of this study will provide a basis for managing the Savannah River forest for optimum productivity of all resources with minimum alteration of wildlife habitats.
KEYWORDS: FORESTS;MANAGEMENT;NUTRIENTS;BIOLOGICAL ACCUMULATION;SAVANNAH RIVER PLANT;ANIMALS;BIOMASS;ECOSYSTEMS;PLANTS

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:CHARACTERIZATION, MEASUREMENT, AND MONITORING;ENVIRONMENTAL TRANSPORT;HEALTH EFFECTS;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: Our research program to investigate the cycling processes of the southeastern coastal plain is designed to determine: (1) the availability of stable elements to the biota; (2) the role of primary producers, consumers and detritivores in cycling processes; (3) which factors are limiting to rate processes; (4) the importance of interactions among energy flow, thermal environments and cycling processes upon the rate of biomass accumulation and transfer; (5) the extent to which transfer coefficients are modified by population processes that influence the temporal or spatial turnover to compartmental standing crops; and (6) validate models of these cycling processes at various sites on the southeastern coastal plain. Emphasis in our program is directed toward the derivation of predictive relationships that can be used in the solution of local and regional problems and in land use planning on a regional scale.
APPROACH: The SRP provides numerous opportunities to study the interaction of heavy metal and other stable element cycling between the biotic and abiotic components of the environment. The broad variety of available habits includes reservoirs, ponds, streams, abandoned agricultural land, forest plantations and several forest types. Some of these have received various production reactor and industrial pollutants from plant operations for many years. This region receives high rainfall but possesses little organically-enriched soil. The rapid leaching rates from the porous sandy soil have resulted in relatively tightly closed mineral loops in the biota which reduce nutrient loss. Many minerals which are normally held in the organic or clay fraction of the soil are concentrated in the biota, establishing a unique aspect of minearl cycling which cannot be investigated in other geographica regions.
PROJECT MILESTONES: Studies will continue in the following areas of research: (1) Transport and mobilization of stable and radioactive metals in SRP streams and swamps. (2) Fate of cadmium in stream microcosms. (3) Availability of heavy metal associated with humic acids to algae and higher plants. (4) Uptake of heavy metals and trace contaminants by fish. (5) Frequency distributions of minerals in ecosystem components. (6) Elemental concentrations in southeastern coastal plain vegetation; investigations into seasonal and microgeographic variation. (7) Mineral cycling in social insects.

REGIONS OF INTEREST: BIOMES/Terrestrial;BIOMES/Freshwater;GEOGRAPHIC AREAS/Southeast;COASTS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To study the movement of radionuclides, primarily radiocesium, in aquatic and adjacent terrestrial ecosystems. To study the dispersal and transport of radionuclides from the contaminated areas.
APPROACH: The emphasis of this laboratory has been placed on three basic types of radionuclide movement: (1) the distribution and cycling within the aquatic ecosystem into which the radionuclides were released; (2) the uptake and lateral movement from the aquatic to the adjacent terrestrial ecosystem; and (3) the transport and dispersal of the radionuclides away from the contaminated areas. These studies are of basic importance to the understanding of transport of radionuclides in the southeastern United States.
RESULTS: Recent studies have investigated the distributional patterns of radiocesium in stream channel sediments and its incorporation into plant and arthropod communities of the stream. In the past year studies have been directed toward cycling mechanisms within aquatic food webs. Past research has investigated the movement of radiocesium into emergent aquatic and streamside terrestrial plants and thence to terrestrial insects. Studies document that plant uptake is not necessarily correlated to radionuclide concentration in the root area. Research also shows Ce movement into trees and its return to the streambed with leaf fall. Past studies have indicated that overwintering migrant waterfowl export statistically significant amounts of radiocesium from SRP, potentially into the human food chain.
PROJECT MILESTONES: (1) Fall 1976 Data analysis of almost 1500 samples will be completed and correlations between cesium uptake and the trophic level, food habits, specific habitat, and the size and age of the fish will be determined. (2) Spring 1976 Evaluate factors affecting the soil-plant relationship in a

variety of aquatic habitats resulting in predictable models for plant uptake; and evaluate uptake, retention, and elimination of radiocesium by small mammals and aquatic waterfowl living under natural conditions. (3) Summer 1976 Investigate transport of radionuclides from contaminated seepage basins.

TYPE OF FUNDING: Contract No.-AT(38-1)-819
77 FUNDING: Energy Research and Development Administration FY77:$161,000
TECHNOLOGY: FOSSIL FUEL/General (40%);NUCLEAR/General (40%);GENERAL SCIENCE (20%)
ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: HEAT, THERMAL (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Our fundamental objective has been to examine both thermal and natural temperature systems at all levels of biological organization from the individual to the community, with emphasis on those parameters which reflect thermal alteration of an environment. Studies in extreme temperature systems and many of those in thermally unaltered areas are considered separately but strongly complement the studies in areas of moderate thermal elevation.
APPROACH: In addition to monitoring the ecological effects of established thermal effluents under field conditions and conducting laboratory experiments on thermal stress, SREL will be utilizing field facilities to manipulate thermal regimes in natural aquatic ecosystems, both lotic and lentic. The effects of these controlled perturbations on trophic relationships, species diversity, genetic diversity, population dynamics, spacial organization and movements, biomass, productivity, and nutrient and energy flow will complement and broaden the interpretive base on more conventional studies. These studies will include investigations of chronic and other sub-lethal stressors in addition to conventional documentation of tolerance and lethality.
RESULTS: Studies conducted in the thermally influenced areas are coordinated when appropriate with studies in control habitats where temperatures have never been artificially altered. The availability of post-thermal environments allows us to examine ecosystem responses following removal of the heat input. We utilize the opportunity provided on the SRP to examine both short- and long-term thermal effects and recovery patterns. Field research at SREL will continue to be complemented with thermal experimentation in the laboratory. Information learned will allow us to understand ecological responses to anthropomorphic perturbations, and to make intelligent decisions in assessing the impact of thermal pollution.
PROJECT MILESTONES: (a) SREL, in conjunction with ERDA, has sponsored, organized, and published two symposia on thermal ecology. Future plans include additional symposia incorporating other environmental stresses in conjunction with thermal effects. (b) SREL has embarked upon a special study the Castor Creek Project, which will allow controlled perturbations of thermal regime in a natural stream ecosystem. (c) Future plans include additional facilities for manipulating a thermal environment in a series of small ponds. The Cassel's Pond project will complement the Castor Creek project and other field and laboratory studies. (1) Castor Creek-Experimental Stream Facility, January 1, 1977: Expected completion of pipeline construction by DuPont. (2) Cassels' Pond-Experimental Facility, September 1, 1977: Scheduled beginning of conceptual design study (by DuPont).

MONITOR: Hamilton, D.H.
TELEPHONE: F233-5324
TYPE OF FUNDING: Contract No.-AT(38-1)-819
77 FUNDING: Energy Research and Development Administration FY77:$113,000
TECHNOLOGY: FOSSIL FUEL/General (40%);NUCLEAR/General (40%);GENERAL SCIENCE (20%)
ENERGY CYCLE: WASTE MANAGEMENT (100%)
POLLUTANTS: HEAT, THERMAL (100%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/Laboratory;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Studies described within this project focus on temperature as one of several key environmental factors that influence biological phenomena. By establishing the relationships among major ecological parameters under natural conditions, we hope to identify and quantify responses created by thermal modification. Response of biological systems to ecological perturbations provide bases for determining which levels of pollution are ''acceptable''. In many instances, predictable relationships can be established between a factor that influences natural temperature and particular physiological, population, or community characteristics.
PPROACH: Studies proposed here seek to characterize the alterations in the physiology, behavior, life history phenomena and community structure among organisms and populations living in thermally affected habitats. Studies involving cattails, fish, alligators and turtles are designed to provide baseline data from natural areas with which to compare information from a variety of heated streams and reservoirs. A variety of individual, population, and community parameters will be measured to compare habitats ranging from ambient temperature to +20 C above ambient.

RESULTS: Natural temperature shifts occur as a result of seasonal, diel, meteorological, latitudinal and elevational factors. Results of these studies will compare artificial thermal alteration in terms of these interacting variables. The ultimate result will be to establish a predictive relationship between temperature regimes and a variety of other environmental variables. It is anticipated that specific thermal regimes will prove to enhance selected biological processes; doubtless some will be unaffected and others will be impaired. A determination of these key levels of thermal input will contribute to a functional interpretation of thermal ecology.
PROJECT MILESTONES: During FY 1977 this project will deal mainly with biological interactions and thermal stress. By September 1, 1977, however, we intend to deal with multiple environmental stresses (e.g., thermal and heavy metal pollution) acting in concert with biological interactions such as competition, predation, and parasitism.

REGIONS OF INTEREST: BIOMES/Freshwater;GEOGRAPHIC AREAS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: To examine the physiological, population and community strategies used by plants and animals to cope with an environmental stress; in this case, thermal effluent from nuclear reactors.
APPROACH: The studies are designed to take advantage of the thermal and post-thermal aquatic habitats of the area. Studies are designed to determine the effects of thermal effluent upon the life cycles, physiology, thermal tolerance, movements, growth and host-parasite relationships in plants and animals.
RESULTS: Data will have been collected and manuscripts prepared in (1) productivity of thermal areas, (2) physiological, behavioral and genetic responses in fish, (3) ecology of plant communities exposed to various effluents, (4) heated effluents and limiting nutrients, (5) germination success of plants in thermal and non-thermal reservoirs, and others.
PROJECT MILESTONES: (a) By FY-77 we hope to have in operation a full-scale experimental system which will involve the controlled addition of effluent from a thermal canal to a natural stream system. Such an in-the-field experimental situation will allow testing of hypotheses which have resulted from earlier studies. (b) Establishment of a series of experimental ponds receiving effluent from a thermal stream (FY 78).

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) Encourage coordinated environmental research at the Savannah River Plant site, principally to address these general objectives: (a) to develop methods to assess and monitor the environmental impact of man's activities; (b) to develop methods to estimate and predict the environmental response to proposed and ongoing activities; and (c) to demonstrate the impact of various activities and evaluate methods to minimize adverse impacts. (2) Provide administrative and facility support to offsite researchers engaging in environmental research on ERDA sites. (3) Thoroughly characterize the Savannah River Plant site, to provide basic information, to support environmental assessments, land use plans and environmental research programs.
APPROACH: The NERP program at Savannah River is administered primarily by the Operations Office, with some work performed by contractors: the U.S. Forest Service, the University of Georgia, and the duPont Savannah River Laboratory.
RESULTS: (1) Regional universities and the public will be informed of ongoing research and opportunities for research on the site. This may include preparing and disseminating a brochure, surveying universities for their interest in using the site, sponsoring a symposium, and setting up a speakers corps made up of site researchers. (2) Funds may be available for equipping field facilities, establishing public demonstration areas, and reimbursing some researchers for travel costs to the site.

PROJECT MILESTONES: The Savannah River Plant site was designated as a National Environmental Research Park in 1972.

PROJECT DESCRIPTION: Provide a basic capability for numerical modeling of physical transport mechanisms on the continental shelf of the southeastern United States. Develop an integrative and evaluative framework for theoretical and experimental marine science efforts in the South Atlantic Bight.
APPROACH: (1) Obtain existing data for this oceanographic area and convert to usable form. (2) Develop computer system for the evaluation, summarization, and display of these data. (3) Adapt existing hydrodynamical numerical models to the geography and boundary conditions of the South Atlantic Bight. (4) Develop framework within which chemical and biological studies can be evaluated and converted to ecosystem models.
RESULTS: (1) State-of-the-art oceanographic and marine ecosystem data base. (2) Integrated system of physical transport, chemical and biological computer simulation models. (3) Capability for environmental impact assessment of energy related activities on the continental shelf of the southeastern United States.
PROJECT MILESTONES: Strongly dependent upon funding. At present level, only existing data collection and overall system planning will be completed in FY 1976. Given sufficient funding, data base and physical transport model will be applied to determine tidal and seasonal movement patterns of water column on the shelf. Models of nutrient and pollutant input, transport and consumption will be integrated into the system.

TECHNOLOGY: SOLAR/Biomass (100%)
CHARACTER OF STUDY: RESEARCH/General (100%)
PROJECT DESCRIPTION: We are studying the chemistry and enzymology of the efficient conversion of chemical energy into light by the sea pansy (Renilla). There are three proteins involved in light emission; one is catalytic, one is involved in changing the color of the light from blue to green by an energy transfer process and one is involved in the nerve-linked control of the bioluminescent flash. All three proteins have been purified to homogeneity and their chemical and physical characteristics are being studied. We have recently quantitated the in vitro transfer of energy from luciferase-product excited state to the green fluorescent protein. This process is approximately 100% efficient although the phenomenon occurs at protein concentrations of 10/sup -6/ M. Highly specific protein-protein interaction is involved. Advances in the nature of calcium activated photoproteins have also been made with the discovery that the native chromophore in three different photoproteins (aequorin, mnemiopsin and berovin) is Renilla luciferin. We are attempting to elucidate the nature of an oxygenated species in photoproteins which we feel must reside at a site on the protein and not on the chromophore (luciferin).

PROJECT DESCRIPTION: Objective: To study the regulation of gene expression in cotton seed embryogenesis and germination. Scientific Background: Messenger RNA for the enzymes that bring about germination in cotton cotyledons is biosynthesized in embryogenesis, but not utilized until germination begins. The plant growth regulator, abscisic acid, is involved in the inhibition of the translation of this mRNA during the late stages of embryogenesis when this mRNA is present but not utilized. Proposed Procedures: Investigate the effects of cordycepin on the appearance of the germination enzymes; study poly A addition in vivo to preexisting, non ribosomal RNA during germination; isolate informosomes from embryos in the last stages of embryogenesis to determine their poly A content. Test Objects and Agents: Cotton cotyledons at various stages of embryogenesis and germination.

PROJECT DESCRIPTION: (1) To characterize the nonhistone chromosomal proteins by biochemical and physicochemical methods. (2) To characterize the subclass of the nonhistones that show very high affinity for DNA with respect to its effect on the DNA structure and possible role in gene regulation.
PROACH: Chromatographic, electrophoretic and sedimentation procedures are employed for the characterization of the protein. DNA-binding methods are employed in examining the DNA-protein interaction. The effects of the binding proteins on the DNA structure are examined by physical changes in the DNA structure by spectrophotometric and centrifugation methods.
RESULTS: We have to date fractionated this complex class of chromosomal proteins into subclasses that are characterized. We expect to identify those proteins that may play an important role in the regulation of genes in higher organisms. We also expect to elucidate some aspects of the mechanism of molecular events in regulation.
PROJECT MILESTONES: We have isolated a protein fraction that unwinds DNA under physiological conditions. This, we feel, is a valuable contribution in elucidating some of the functions of the nonhistone proteins. We hope to provide further proof for a regulatory role for these unwinding proteins by demonstrating their enrichment at chromosomal sites of genetic activity such as chromosomal puffs, by using fluorescent antibodies.

REGIONS OF INTEREST: BIOMES/Terrestrial;GEOGRAPHIC AREAS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: (1) Develop further the application of radioactive tracer techniques for the analysis of trophic functions in soil-litter arthropod food chains. (2) Develop and test experimental models which will estimate assimilation of nutrient elements by soil-litter arthropods. (3) Evaluate the ability of current techniques and models for estimating input fluxes from nutrient element contents.
APPROACH: Determine fungal-arthropod interactions and how nutrient elements are thereby released from litter and soil for availability as slant nutrients. Radiotracer studies determine the excretion curves for nutrient elements in arthropods and these data can be used to develop models of accumulation, mobilization and transfer in the cycling process.
RESULTS: Publications in scientific journals and topical reports.
KEYWORDS: SOILS;LEAVES;DECOMPOSITION;ARTHROPODS;MICROORGANISMS;TRACER TECHNIQUES;FOOD CHAINS;BIOLOGICAL ACCUMULATION;BIOLOGICAL MODELS;TERRESTRIAL ECOSYSTEMS;PLANTS;ANIMALS;ENVIRONMENTAL TRANSPORT;CALCIUM;POTASSIUM;RADIOISOTOPES;RADIONUCLIDE MIGRATION

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Characterization of the metabolic condition and rates of the microbial components of the continental shelf ecosystem. Development of indices of condition that may be used to detect stress of changes introduced by energy-related technology on the continental shelf ecosystem.
APPROACH: Development of continuously or frequently measured parameters of such rate processes as photosynthesis and respiration. Development of biochemical indices of condition, such as adenylate energy charge ratio.
RESULTS: Basic information about the natural rate processes and condition of the continental shelf ecosystem. Rapid methods of monitoring effects of stress on the ecosystem, some of which may be useful in detecting stress before it has reached lethal proportions. Development of methods suitable for evaluation of extensive areas, such as continental shelves.
PROJECT MILESTONES: Application of Adenylate energy charge method to whole microbial communities. Measurement of phytoplankton release of dissolved organic matter as a substrate for marine bacteria.
KEYWORDS: CONTINENTAL SHELF;ENERGY SOURCES;MICROORGANISMS;METABOLISM;PHOTOSYNTHESIS;RESPIRATION;BIOCHEMISTRY;AQUATIC ECOSYSTEMS;ENVIRONMENTAL EFFECTS;WATER;PLANTS;PHYTOPLANKTON

POLLUTANTS: HEAT, THERMAL (100%)
CHARACTER OF STUDY: RESEARCH/Laboratory (100%)
REGIONS OF INTEREST: BIOMES/Estuarine;GEOGRAPHIC AREAS/Southeast;COASTS/Southeast
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: The objectives of this study were to determine the effect of acute temperature shock on: defined developmental stages of the mummichog, Fundulus heteroclitus; the period of starvation death; and feeding and growth of larvae. In addition, we measured the interaction of temperature shock/developmental stage and chlorine exposure and whether the effect on hatching was a function of the acute exposure or the duration of exposure.
APPROACH: Embryos of the mummichog Fundulus heteroclitus were subjected to acute thermal shock at defined developmental stages. Fish embryos could be subjected to acute exposures by entrainment in cooling systems or by effluents from power plants. The response of the embryos could be quite different than that of the adults. Embryos and larvae were exposed to acute thermal shock for different durations. An experiment also tested the response of embryos and larvae to differing levels of chlorine at differing temperatures for varying periods of time.
RESULTS: The most sensitive stages to acute thermal shock were the 1-2 and 2-4 cell stages of periods of cell division and late embryos and larvae were more tolerant of temperature and chemical stress than were juveniles or adults. The level and duration of exposure was not critical at less than 40 deg C for 24 deg C acclimated fish. Increased incubation temperatures shortened the time to hatching and fish reared at high but non-lethal temperatures had higher feeding rates than those reared below an apparently sensitive environmental level of 24 deg C. The result of the exposure of different developmental stages to chlorine and temperature at different levels and for different durations are still undergoing analysis but preliminary interpretation showed the 0 and 7 day larvae stage were more sensitive than were embryos.
PROJECT MILESTONES: Determination of sensitive stages of fish.

REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Southeast;COASTS/Southeast;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT
PROJECT DESCRIPTION: The overall goal of this project is to determine the principal physical processes controlling the flux of nutrients onto the southeast continental shelf of the United States. The initial goal is to test the hypothesis that intrusions of nutrient-rich subsurface Gulf Stream water are the principal source of new nitrogen and phosphorus.
APPROACH: The methods involve the cooperative efforts of North Carolina State University deploying current meter arrays and Skidaway Institute running space and time intense sampling. Onslow Bay, North Carolina, is the site of the 1976 experiment. Five arrays of 2 or 3 meter (Aanderaa) each will be deployed by NCSU in late June. Skidaway will run a continuous survey in July and August using CTD, XBT and Rosette Samplers. The sampling will be coordinated wth biological sampling by Drs. Dunstan and Paffenhofer (Skidaway) and trace metal sampling by Dr. Windom (Skidaway). The variable field observations are compared with velocity field distributions providing estimates of the advective nutrient flux. Salinity, temperature, and nutrients are used for water mass analysis and confirmation of the current meter record. Equipment acquisition, testing and software development have consumed much of the first year's effort. A Plessey 9400 CTD/Data Logger system will be used with data processing by a CDC Cyber 70 computer.
RESULTS: Observations in Onslow Bay revealed the stranding of an intrusion and subsequent assimilation into

the water column by wind induced vertical mixing. Data analysis reconfirms our hypothesis that intrusions are a significant nutrient source for the shelf waters.
PROJECT MILESTONES: Understanding of the effect of Gulf Stream on continental shelf waters.
KEYWORDS: CONTINENTAL SHELF;OCEANOGRAPHY;NUTRIENTS;NITROGEN;PHOSPHORUS;SAMPLING;METALS;TRACE AMOUNTS;SEAWATER;SALINITY;TEMPERATURE MEASUREMENT;MONITORING;AQUATIC ECOSYSTEMS;ATLANTIC OCEAN

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The objective of this project is to examine the impact of thermal and organic loading on the epizooticlcgy of Aeromonas hydrophila and Epistylis sp. among centrarchid fish in a southestern U.S. cooling reservoir. Ultimately, the study will provide a baseline for either preventing or minimizing the epizootic outbreak of disease among these and other gamefishes within reservoirs in the southeast.
APPROACH: The extent and incidence of disease in bass from thermal and ambient locations in the reservoir will te monitored seasonally. Bacterial cell counts will be made seasonally at selected sites in the reservoir. Laboratory studies will differentially characterize strains of Aeromonas isolated from the water column, sediments and surface lesions on bass. Water quality parameters such as pH, temperature, dissolved oxygen, redox potential, conductivity and organic loading, will be measured at selected sites in the reservcir.
RESULTS: These studies should permit the identification of the water quality parameter(s) associated with creating conditions which would lead to epizootic outbreak of the disease among gamefish. In essence, the complete epizootiology of the disease will be studied.
PROJECT MILESTONES: The prevention or minimization of 'red-sore' disease in reservoirs in the southeastern United States.

POLLUTANTS: METALS (10%);PARTICULATES (10%);ORGANICS (50%);RADIATION (10%);HEAT, THERMAL (20%)
CHARACTER OF STUDY: RESEARCH/Theoretical;RESEARCH/General;RESEARCH/Applied (100%)
REGIONS OF INTEREST: BIOMES/Marine;GEOGRAPHIC AREAS/Southeast;COASTS/Southeast;HYDROGRAPHIC AREAS/Continental shelf
RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ENVIRONMENTAL TRANSPORT;ECOLOGICAL PROCESSES AND EFFECTS;INTEGRATED ASSESSMENT
PROJECT DESCRIPTION: The overall long range objective is the determination of physical/dynamical processes controlling/affecting the flux of nutrients onto and their subsequent distribution on the continental shelf. The purpose of the physical dynamics part of the overall program is to describe the physical oceanographic nature of the South Atlantic Bight.
APPROACH: The development of lateral and vertical plane circulations, current shear and sea level and hydrographic parameter changes and the time scales involved in their persistence and decay are being studied. Currents, temperature, conductivity, wind and sea level have been monitored in a time series fashion by North Carolina State University and hydrographic surveys will be directed by Skidaway with the help of N.C.S.U. The hydrographic surveys offer a comprehensive attack on the surface and subsurface density character in Onslow Bay. The CTD-Rosette and XBT stations are gridded to maximize the information, given the hardware, shiptime and numbers of personnel involved, necessary to sense and monitor intrusions and other phenomena. The hydrographic surveys complement and necessarily enhance the current meter observations.
RESULTS: A description (ultimately, a predictive capability) of the physical/oceanographic nature of the continental shelf of the South Atlantic Bight and the determination of physical/dynamical processes controlling/affecting the flux of nutrients onto and their subsequent distribution on the continental shelf.
PROJECT MILESTONES: During the initial 25 day experiment the grid was sampled over a period of two days followed by a third day of biological sampling. During the third day the physical and chemical data were examined to determine the portion of the grid that would be sampled during the next two days. During August of 1975 two current meter moorings, consisting of two Endeco current meters per mooring, were established in the midshelf region of Onslow Bay. This initial array was removed in mid-September 1975 giving us approximately 1-1/2 months of data sampled at 20 minute intervals. This data transcended the ''established'' to ''degradated'' modes of several intrusions. During the late fall 1975 and early spring 1976, currents, temperature and salinity were continuously monitored over 60 day periods in Onslow Bay. The individual arrays consisted of two thermographs and two Endeco current meters per mid-shelf station. Station data was taken using XTB's. This data should help in an understanding of the relative order of the horizontal and vertical eddy momentum convergences on the shelf as well as fill in part of the gap in our knowledge of what the horizontal and vertical time scale energetics are at the edge of and across the continental shelf.

RESEARCH CATEGORY: BIOMEDICAL AND ENVIRONMENTAL RESEARCH:ECOLOGICAL PROCESSES AND EFFECTS
PROJECT DESCRIPTION: Depending upon the latitude and season, either solar radiation or the availability of inorganic nutrients appear to control the productivity of marine phytoplankton. Nutrients are probably the limiting factor through much of the year along the SE coast. There are two major sources of these nutrients in this area: (1) Runoff and exchange from rivers and estuaries, (2) intrusions of nutrient rich water from mid-depths of the Gulf Stream. There are at least three other minor or unevaluated nutrient sources: (1) direct rainfall, (2) regeneration, (3) N/sub 2/-fixation by blue-green algae. These authors propose an intensive study of the impact of Gulf Stream intrusions on changes in the phytoplankton production and the resulting changes in the zooplankton densities and species composition. In conjunction with Atkinson's nutrient determinations, they will make a series of biological measurements (chlorophyll-a, particulate spectrum analysis and light profile) on a grid of stations in Onslow Bay. From these determinations they will have a measure of the phytoplankton standing crop and the food available for zooplankton. On each cruise, three stations will be selected for intensive and additional measurements. The latter would include phytoplankton species composition, phytosynthetic rates, particulate organic carbon analyses, particulate organic nitrogen analyses, and zooplankton

PROJECT DESCRIPTION: The principal continuing objective of this project is to maintain the HWCTR facility in sufficiently good physical condition to ensure its safety, so that it can eventually be decommissioned with a minimum expenditure of time and money.
APPROACH: The physical facilities of the fuel will be maintained in the same condition, as described earlier, until decommissioning begins.
RESULTS: The principal objective during this period was to maintain the HWCTR facility in ''abandoned in plane'' status. The area was patrolled and inspected to ensure that protective measures were adequately maintained. Power was provided for minimum ventilation and lighting of the HWCTR containment building, control house, and administrative building.

PROJECT DESCRIPTION: There are two objectives. One is to conduct measurement programs centered around the use of an aircraft measurement program. The primary measurements are air concentrations over or near the Savannah River Plant as the result of routine and controlled releases of material to the atmosphere. The other objective is to combine the data generated from the first objective with data collected under several other programs at the Savannah River Laboratory.
RESULTS: The combined data base will be used to validate models which are used to calculate dose-to-man from routine releases to the atmosphere, and those used to support the Atmospheric Release Advisory Capability--Development Support Studies (ARAC-DSS) Program and the Emergency Operating Center of the SRP. Field tests conducted under this program will be to test SRL's ability to calculate paths and concentrations in real time. These tests will be conducted in conjunction with the Lawrence Livermore Laboratory evaluation of their ARAC concept.

PROJECT DESCRIPTION: This is an effort to coordinate the research funded by Division of Biomedical and Environmental Research in the South Atlantic Bight. This broad geographic, four state, coastal area encompasses the Carolina Capes and Florida Narrow Shelf areas that could contain future offshore nuclear power plants. Future outer-continental shelf oil-gas exploration is also possible off the Georgia embayments. With such energy related facilities it is important to focus our oceanographic research program on these applied problems. This contract does that by holding workshops among contractors, arranging for sharing of large pieces of equipment and maximizing the available shiptime in the area.
