1. Purpose

This analysis is prepared by the Mined Geologic Disposal System (MGDS) Waste Package Development Department (WPDD) to provide pressurized water reactor (PWR) isotopic composition data as a function of time for use in criticality analyses. The objectives of this evaluation are to generate burnup and decay dependant isotopic inventories and to provide these inventories in a form which can easily be utilized in subsequent criticality calculations.

2. Quality Assurance

The work performed for this analysis is covered by a Waste Package Development (WPD) QAP-2-0 work control Activity Evaluation entitled "Perform Criticality, Thermal, Structural, and Shielding Analyses" (Ref. 5.1). The QAP-2-0 evaluation determined that such activities are subject to Quality Assurance Requirements and Description (QARD) (Ref. 5.2) controls. Applicable procedural controls are listed in the activity evaluation. The waste package is on the Q-List (Ref. 5.3) by direct inclusion by the Department of Energy (DOE), as an item important to safety and waste isolation; because of the direct inclusion of the waste package on the Q-List, a QAP-2-3 evaluation is not required to be conducted.

The work reported in this document is part of the neutronic analysis for the preliminary design; thus, design inputs include unqualified data and unconfirmed assumptions. These design inputs will require subsequent qualification (or superseding inputs) as the waste package design proceeds. This document will not directly support any construction, fabrication, or procurement activity and, therefore, does not require initiation of a TBV (to be verified) number for tracking purposes. However, use of any data or output from this analysis for input into documents supporting procurement, fabrication, or construction is required to be controlled as TBV in accordance with appropriate procedures.

3. Method

The SAS2H sequence in SCALE 4.2 (Ref. 5.4) is used to calculate the isotopic composition, as a function of time, for the PWR criticality design basis fuel assembly. The prime module of this sequence is the ORIGEN-S code. This code does a point depletion of a selected fuel type with user specified irradiation conditions. At the completion of the depletion calculation, decay of the irradiated fuel with user specified time intervals is computed.

4. Design Inputs

The design inputs identified in this document are for preliminary design and shall be treated as unqualified data; the design inputs will require subsequent qualification (or superseding inputs) as the waste package design proceeds. This document will not support any construction, fabrication, or procurement activity and therefore is not required to be procedurally controlled as TBV.

The dimensions listed in this section and throughout this analysis are in the metric units used directly in the neutronics codes to facilitate checking and preclude errors in input.

4.1 Design Parameters

The fuel assembly upon which this calculation is based is the B&W 15 x 15 fuel assembly. The mechanical parameters and typical operating parameters for this assembly type are shown in the two tables below.

Table 4.1-1 Mechanical Parameters of B&W 15x15 Fuel Assembly

Parameter	Value	Units	Metric	Units	Radius (cm)	Ref
Fuel Rods	208	/assbly	208	/assbly		5.5
Fuel Rods on a Lattice Side	15	/side	15	/side		5.5
Guide Tubes	16	/assbly	16	/assbly		5.5
Instrumentation Tubes	1	/assbly	1	/assbly		5.5
Total Guide + Instrument Tubes	17	/assbly	17	/assbly		-
Clad/Tube Material	ZIRC-4		ZIRC-4			5.5
Fuel Pellet OD	0.3686	inches	0.936244	cm	0.468122	5.5
Fuel Stack Height	141.8	inches	360.172	cm		5.5
Mass of U	1023	lb	464	kg		5.6
Mass of UO_2	1160.64	lb	526.38	kg		5.5
Percent of Theoretical Density	95	%	95	%		5.5
Fuel Clad OD	0.430	inches	1.0922	cm	0.5461	5.5
Clad Thickness	0.0265	inches	0.06731	cm		5.5
Fuel Clad ID*	0.377	inches	0.95758	cm	0.47879	-
Fuel Rod Pitch	0.568	inches	1.44272	cm		5.5
Guide Tube OD	0.530	inches	1.3462	cm	0.6731	5.5
Guide Tube Thickness	0.016	inches	0.04064	cm		5.5
Guide Tube ID*	0.498	inches	1.26492	cm	0.63246	-
Instrumentation Tube OD	0.493	inches	1.25222	cm	0.62611	5.5
Fuel Assembly Envelope	8.536	inches	21.6814	cm		5.5

* The inner diameters (IDs) above are calculated by subtracting 2 × thickness from the outer diameter (OD).

The values listed in Table 4.1-2 are preliminary and were obtained through a phone conversation with Framatome Cogema Fuels (formerly B&W Fuel Company) personnel.

Table 4.1-2 Typical Assembly/Core Operating Parameters for a B&W 15x15 Fuel Assembly

Parameter	Value	Units	Metric	Units	Ref
Pellet Average Fuel Temperature	1200	°F	922	K	BWFC
Maximum (peaked) Pellet Average Fuel Temperature	1295	°F	975	K	BWFC
Clad Temperature	50-75 above moderator	°F	28-42 above moderator	K	BWFC
Average Core Exit Moderator Temperature	612	°F	595.4	K	BWFC
Peak Core Exit Moderator Temperature	634	°F	607.6	K	BWFC
Core Exit Moderator Density	-	-	0.6272	g/cm^3	Sat @ 607.6 K
Maximum Beginning of Cycle Boron Concentration	1050	ppm	-	-	BWFC
Number of Assemblies in the Core	177		177		BWFC
Total Core Thermal Power			2568	MWth	BWFC
Typical Power Peaking Across Core	1.2	-	-	-	BWFC
Capacity Factor (lowest expected)	0.6	-	-	-	-
Average Specific Power MW/MTU			31.27	MW/ MTU	BWFC

The theoretical density of UO_2 is 10.96 g/cm^3 as indicated in Table M8.2.1 of the SCALE 4.2 manual (Ref. 5.4).

The atomic weights of isotopes are listed in Table 4.1-3 below (Ref. 5.7).

Avogadro's Number $[N_A] = 0.602252\ (g\text{-}mol)^{-1} \times 10^{24}$ (Ref. 5.7 p. 933). A physical constant is taken to be established fact that requires no additional qualification.

Table 4.1-3 Atomic Weights (Ref 5.7)

4.2 Criteria

This design analysis provides input for criticality analyses which evaluate whether waste package designs meet the repository criticality control design criteria from requirement documents. The *Mined Geological Disposal System Requirements Document* (Ref. 5.8) and the *Engineered Barrier Design Requirements Document* (Ref. 5.9) have criteria which pertain to criticality analyses. Reference 5.9 is the lower level document and contains all of the criteria listed in Reference 5.8. The criteria cited that have bearing on this analysis are the following:

EBDRD Requirements (Ref. 5.9)

"3.2.2.6 CRITICALITY PROTECTION

A. The Engineered Barrier Segment shall be designed to ensure that a nuclear criticality accident is not possible unless at least two unlikely, independent, and concurrent or sequential changes have occurred in the conditions essential to nuclear criticality-safety. Each system shall be designed for criticality safety under normal and accident conditions. The calculated effective multiplication factor must be sufficiently below unity to show at least a five percent margin, after allowance for the bias in the method of calculation and the uncertainty in the experiments used to validate the methods of calculation.

[MGDS-RD 3.2.2.6.A] [10CFR60.131(b)(7)]

B. To mitigate the potential for nuclear criticality, the Engineering Barrier Segment shall be designed and constructed to comply with the nuclear criticality requirements specified by DOE order 6430.1A, 1300-4.

[MGDS-RD 3.2.2.6.B] [DOE Order 6430.1A, 1300-4]"

"3.7.1.3 INTERNAL STRUCTURE REQUIREMENTS

A. The internal structure shall provide separation of the waste forms such that nuclear criticality shall not be possible unless at least two unlikely, independent, and concurrent or sequential changes have occurred in the conditions essential to nuclear criticality safety. The calculated effective multiplication factor (k_{eff}) must be sufficiently below unity to show at least a five percent margin after allowance for the bias in the method of calculation and the uncertainty in the experiments used to validate the methods of calculation (TBD). [MGDS-RD 3.2.2.6.A][10CFR60.131(b)(7)]"

This document provides SNF composition data which may potentially be used in subsequent analyses for calculation of k_{eff} values. This document does not directly address the above listed requirements, but provides input for future analyses which may address these requirements. This document will not directly support any construction, fabrication, or procurement activity and therefore is not required to carry TBV (to be verified) or TBD (to be determined) items

associated with criteria to design outputs.

4.3 Assumptions

All assumptions identified in this section will require verification (or superseding assumptions) as the waste package design proceeds and should be treated as unconfirmed items for preliminary design. For this preliminary design, that will not be used to support procurement, fabrication, or construction, the assumptions are clearly identified and traceable to a source, but are not procedurally controlled as TBV.

4.3.1 Principal Isotope (PI) burnup credit is an acceptable criticality control mechanism for the waste package. (CDA Key 009, Ref. 5.10). This assumption is used throughout Section 7.

4.3.2 The Reference PWR fuel assembly selected for conceptual development is the B&W 15 x 15 fuel type, which has been established as one of the more reactive PWR fuel designs under intact fuel assembly and fixed Multi-Purpose Canister (MPC) geometry conditions (Ref. 5.11 p. II.A.3-35). This assumption is used throughout Section 7.

4.3.3 It is assumed that the criticality design basis fuel (DBF) characteristics are 3.0% U-235 enrichment and 20 GWd/MTU burnup. The basis for this assumption is a re-evaluation of the DBF in which scoping analysis indicates this DBF bounds (regarding criticality) 98% of the PWR SNF. This is more appropriate than the previous analysis which designated a primary criticality DBF with characterisitics of 3.75% U-235 enrichment and 32 GWd/MTU and a secondary criticality DBF with characteristics of 3.75% U-235 enrichment and 18 GWd/MTU providing reactivity coverage of 80% and 96% (Ref. 5.12, p. 11), respectively. Re-evaluation of the DBF will be finalized in early FY97 to verifiy these characteristics. This assumption is used throughout Section 7.

4.3.4 For SNF, the list of "Principal Isotopes" previously established (Ref. 5.13 p 4-4) for long-term criticality control was used. The 29 principal isotopes are shown in Table 4.3-1. This assumption is used in Sections 7.3.2 and 7.4.

Table 4.3-1 Principal Long-Term Burnup Credit Isotopes

-	Mo-95	Ru-101	Tc-99	Rh-103
Ag-109	Nd-143	Nd-145	Sm-147	Sm-149
Sm-150	Sm-151	Sm-152	Eu-151	Eu-153
Gd-155	U-233	U-234	U-235	U-236
U-238	Np-237	Pu-238	Pu-239	Pu-240
Pu-241	Pu-242	Am-241	Am-242m	Am-243

4.3.5 The assembly specific power is assumed to be a reasonable "minimum" value of 7.25 MW/assembly. This assumption should maximize the reactivity of the decayed SNF as documented in ORNL/TM-12973 (Ref. 5.14) studies using a similar group of isotopes as included in this analysis. The use of this value will require verification through a parametric analysis applicable to PI burnup credit. This assumption is used in Section 7.3.7.

4.3.6 The maximum core outlet temperature for B&W 15x15 reactor cores (607.6 K) is used and the reactor operating pressure is assumed to be saturation for the purposes of calculating moderator density. Minimizing moderator density should result in maximizing SNF residual reactivity consistent with DOE/RW-0472, Chapter 4 assumptions (Ref. 5.15). The use of this value will require verification through a parametric analysis applicable to PI burnup credit. This assumption is used in Sections 7.3.4 and 7.3.5.

4.3.7 The maximum pellet average temperature is assumed to be 975 K based on personal communication with BWFC personnel. This is a volume weighted average. The use of this value will require verification through a parametric analysis applicable to PI burnup credit. This assumption is used in Section 7.3.2.

4.3.8 The maximum beginning of cycle, hot full power boron concentration is assumed to be 1050 ppm based on personal communication with BWFC personnel. This is the maximum parts per million boron (ppmb) with Xe and Sm equilibrium buildup. The use of this value will require verification through a parametric analysis applicable to PI burnup credit. This assumption is used in Section 7.3.5.

4.3.9 The clad temperature is assumed to be 42 K higher than the moderator temperature based on personal communication with BWFC personnel. The use of this value will require verification through a parametric analysis applicable to PI burnup credit. This assumption is used in Section 7.3.3.

4.3.10 SAS2H/ORIGEN-S is assumed to provide reasonable predictions of isotopic compositions for a low power criticality event in a waste package over several thousand years. This assumptions will require future verification. This assumption is used in Section 7.5.2.

4.3.11 The temperature in a waste package during a long term low power criticality event is assumed to be an average of 373 K and the water density is assumed to be 1.0 g/cm^3. SAS2H allows only a single average temperature to be entered as was required for this case. This assumption is used in Section 7.5.1.

4.3.12 The power level in a waste package during a long term low power criticality event is assumed to be 2.182 kw (Ref. 5.20, p. 55). This assumption is used in Section 7.5.2.

4.4 Codes and Standards

Not Applicable.

6. Use of Computer Software

6.1 Scientific and Engineering Software

SCALE 4.2 CSCI 30004 V1.0 Rev 0. Hewlett Packard Apollo 9000, Series 735 Workstations

The SAS2H sequence of the SCALE 4.2 code system (Ref. 5.4) was used for this analysis. This software was designed for PWR fuel depletion calculations to determine spent fuel isotopic content, decay heat rates, and radioactive source terms. The application to PWR fuel depletion in a reactor is appropriate for the use of this software and falls within the range of validation of this software. The application to long term low power depletion in a waste package does not fall within the range of validation and must be validated in the future. The associated 27BURNUPLIB cross section library was used for these calculations.

A benchmarking and result biasing methodology is in the process of being developed for SAS2H. Bias and uncertainties are applied to the MCNP results which are based on input from SAS2H.

6.2 Computational Support Software

LOTUS 1-2-3, Release 4.01 for Windows was used to calculate the isotopic number densities from the g/assembly output per time step provided in the SAS2H/ORIGEN-S output.

7. Design Analysis

This analysis is performed to provide the isotopic inventories as a function of time for the design basis PWR fuel and to provide the change in activity of the isotopic inventories as the result of a long term low power criticality event in a waste package.

7.1 Background

Previous analyses have been performed based on spent nuclear fuel (SNF) isotopic compositions obtained from the Characteristics Data Base (CDB) (Ref. 5.16). This is a preliminary analysis to generate PWR SNF isotopic compositions using SCALE 4.2 (Ref. 5.4). The data in the CDB was generated based on nominal fuel and operating characteristics. SCALE 4.2 can utilize bounding physical and operating paramaters as input to provide a conservative estimate of isotopic inventories.

7.2 Evaluation Procedure

The evaluation procedure is broken into three major tasks, with subtasks in each. The general procedure is as follows:

1) Parameter (Input) Identification
    a) Develop physical fuel description - mechanical parameters
    b) Obtain typical operating parameters

2) Run SCALE 4.2
    a) Calculate/ determine input parameters from task 1 for burnup calculation
    b) Determine decay time steps required for isotopic inventories

3) Process Output
    a) Using a spreadsheet, calculate isotopic number densities based upon selected output
    b) Format and extract number densities in a form suitable for use in MCNP

The results of task 1 are listed in Section 4.1. Details of tasks 2 and 3 are presented in Sections

7.3 and 7.4, respectively.

7.3 Code Input Calculations

7.3.1 SAS2H Data Block 5 Input

Table 4.1-1 provides the dimensions required for Data Block 5 in the SAS2H input file. The data is shown in the table below. The material numbers are standard (Ref. 5.4, p. S.2.5.10) for SAS2H.

Table 7.3.1-1 - Data Block 5

PITCH	1.44272
FUELOD	0.936244
MFUEL	1
MMOD	3
CLADOD	1.0922
MCLAD	2
CLADID	0.95758
MGAP	0

7.3.2 Fuel Density and Composition Calculations

The effective density to be used in the calculations is determined by dividing the UO_2 mass in Table 4.1-1 by the volume of the fuel in the assembly. The dimensions necessary to calculate the volume of fuel in the assembly are available in Table 4.1-1. The density is calculated as follows:

ρ_{UO2} = UO_2 mass / {π*(fuel pellet radius)^2 * fueled height * # of fuel Rods/assembly}
= 526.38 kg / {π*(0.468122 cm)^2 * 360.172 cm * 208} = 10.206 g/cm^3

The theoretical density of UO_2 is listed as 10.96 g/cm^3 in the SCALE 4.2 database (Ref. 5.4). Therefore, the effective density of fuel is 93.12% of theoretical.

The isotopic distribution of the uranium is determined by the given initial enrichment and the following emperical relationship (Ref. 5.17).

$wt\%_{234} = 0.007731(wt\%_{235})^{1.0837}$,
$wt\%_{236} = 0.0046 wt\%_{235}$,
$wt\%_{238} = 100\% - wt\%_{234} - wt\%_{235} - wt\%_{236}$

Using this formulation, the fresh fuel isotopics for 3.00% U_{235} enrichment was calculated as shown in Table 7.3.2-1. The U-234 and U-238 concentrations were found to be in error in the check of Rev 00. The wt% used was 0.0240 and 96.9622, for U-234 and U-238, respectively. These minor variations compared to the values in Table 7.3.2-1 would have no effect on the

resulting calculations. For consistency, these concentrations were also used in Rev 01 since only variations of the original case were run.

Table 7.3.2-1 Isotopic Breakdown of Uranium for 3% U_{235} Enrichment.

ISOTOPE	WT%
U-234	0.0254
U-235	3.0000
U-236	0.0138
U-238	96.9608

A trace amount of the fission products for which time dependant cross sections are desired are input along with the U mass fractions on the UO_2 "standard composition specification data" cards as described in Section S2.5.4.1 in the SCALE 4.2 manual (Ref. 5.4). The peak fuel temperature (975 K) from Table 4.1-2 is also entered on each of these cards.

7.3.3 Clad Temperature

The clad temperature is calculated by adding the maximum of 42 K to the peak moderator temperature of 607.6 K, as indicated in Table 4.1-2, giving approximately 650 K. Using the peak or maximum is consistent with the temperatures used for the other material regions. This information is listed on a zircaloy standard composition card as material 2.

7.3.4 Moderator Density

The maximum moderator temperature is assumed to provide a minimum moderator density and maximum temperature to result in maximum SNF residual reactivity consistent with Chapter 4 of the Burnup Credit Topical Report (Ref. 5.15). A temperature of 607.6 K is used from Table 4.1-2. The corresponding density is interpolated from the values listed for saturated water (Ref. 5.18) shown in Table 7.3.3-1. The density for 590 K is also included for trending and estimation of the density corresponding to the average exit temperature (595.4 K).

Table 7.3.3-1 Saturated Water Properties from Fundamentals of Heat Transfer (Ref. 5.18)

Temp (K)	Specific Volume (cm^3/g)	Calculated Density (Inverse Specific Volume, g/cm^3)
590	1.482	0.674764
600	1.541	0.648929
610	1.612	0.620347

The density at 607.6 K is determined as shown below:

$$\{(.648929 - .620347)/(600 - 610)\}(607.6 - 600) + .648929 = 0.6272$$

The moderator temperature and density are entered on a H_2O standard composition card as material number 3.

7.3.5 Boron Concentration

As indicated on page S2.5.12 of the SCALE 4.2 manual (Ref. 5.4), the average boron concentration is calculated by dividing the beginning of cycle value by 1.9. The beginning of cycle value is taken from Table 4.1-2 and the average value is determined to be 552.6 ppm.

The boron concentration along with the moderator temperature and density are entered on an arbitrary material card as described in Table M7.4.5 in the SCALE 4.2 manual (Ref. 5.4) as material number 3.

7.3.6 SAS2H Data Block 8 Input

This problem is making use of the larger unit cell capability of SAS2H. Therefore, the inputs for Data Block 8 must be determined. Four zones are modeled using information from Table 4.1-1.

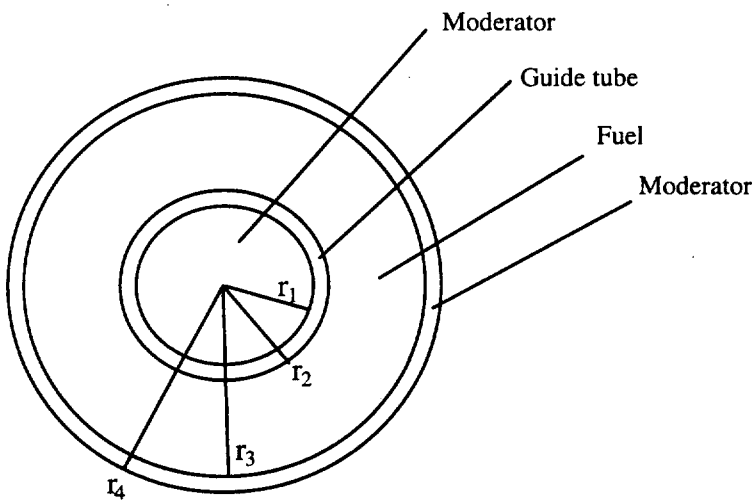

Figure 7.3.6-1 - Larger Unit Cell Model

The first radius, r_1, corresponds to the actual ID of the guide tube (OD of the moderator channel) with a material set to that of the moderator. $r_1 = 0.63246$ cm. The second radius, r_2, is the actual OD of the guide tube with the material set to that of the cladding. $r_2 = 0.67310$ cm. The third radius, r_3, is calculated to give an equal area equivalent to the maximum area of the fuel cell (or the pitch squared). The fourth radius is calculated to preserve the fuel to moderator ratio with the material set to a special number in the code -- 500. The method was determined in consultation with the author of the program at the Radiation Shielding Information Center (RSIC) at Oak Ridge National Laboratory.

The third radius is determined by setting the maximum area of the fuel cell equal to the area of

the equivalent circle.

$$s^2 = \pi \times r_3^2 \qquad r_3^2 = \frac{s^2}{\pi}$$

$$r_3 = \sqrt{\frac{s^2}{\pi}} = \frac{s}{\sqrt{\pi}} = \frac{1.44272}{\sqrt{\pi}} = 0.814cm$$

where r_3 = the third radius of the larger unit cell encompassing the moderator
s = side of the square (or the rod pitch in this case)

The fourth radius is calculated by taking a ratio of the number of available positions for fuel rods in the assembly to the number of positions used by the guide tubes and instrumentation tubes. For this model, the instrumentation tube is taken as equivalent to a guide tube. This ratio is set equal to the ratio of the areas of the fuel and moderator.

$$\frac{N_{positions}}{N_{guidetubes}} = \frac{\pi \times r_4^2}{\pi \times r_3^2} = \frac{r_4^2}{r_3^2}$$

$$r_4^2 = r_3^2 \times \frac{N_{positions}}{N_{guidetubes}}$$

$$r_4 = \sqrt{r_3^2 \times \frac{N_{positions}}{N_{guidetubes}}} = \sqrt{0.814^2 \times \frac{15 \times 15}{17}} = 2.961cm$$

where r_4 = fourth radius of the larger unit cell encompassing the fuel
$N_{positions}$ = total number of available positions in the lattice structure
$N_{guidetubes}$ = number of positions taken up by instrument & guide tubes

To summarize and group these radii and material numbers with the keywords used in the Data Block 8 input table in the SAS2H manual, the Table is presented below:

Table 7.3.6-1 Data Block 8

MIXES	3	Material No. for the moderator
RADIUS	0.63246	cm
MIXES	2	Material No. for the Zircaloy
RADIUS	0.67310	cm
MIXES	3	Material No. for the moderator
RADIUS	0.814	cm
MIXES	500	Special Material No. for fuel in the larger unit cell
RADIUS	2.961	cm

7.3.7 Specific Power and Effective Full Power Days Calculations

The calculated average assembly specific power is 2568 MW / 177 assemblies, or 14.51 MW/assembly. The reasonable minimum assembly specific power is calculated as follows:

1. Divide the average specific power by 1.2 (Table 4.1-2) to account for variation in assembly power across the core; 14.51/1.2 = 12.09 MW/assembly.

2. Multiply the minimum core assembly specific power by a capacity factor assumption of 0.6 (Table 4.1-2); 0.6 x 12.09 = 7.25 MW/assembly.

The Effective Full Power Day (EFPD) input is calculated for the desired burnup assuming the minimum assembly power and an assembly uranium loading of 0.464 MTU/assembly (Table 4.1-1): EFPD = Burnup of 20,000 (MWd/MTU) x 0.464 (MTU/assembly) / 7.25 (MW/assembly) = 1280 days. The power and burn values are entered in Data Block 9.

The burnup calculation was divided into 8 substeps through use of the nlib/cyc entry in Data Block 8.

7.3.8 Decay Input

The decay out to 1 million years was run as a separate case from the burnup calculation. The decay case is a stand alone ORIGEN-S problem which utilizes the output from the SAS2H burnup calculation and decays to a number of specified times.

The ORIGEN-S case was run immediately after the corresponding SAS2H case and utilized the final binary cross section file on unit 21 from the SAS2H case. The case input and output are included in Attachment II. The fact that the correct SAS2H generated library is used (unit 21) is verified by comparing the final downtime print of concentrations in the SAS2H output with the concentrations in the corresponding decay times in the ORIGEN-S output (compositions will match). The library contains only the final cycle step (1 position in library). The library unit

number and data position are entered in the input by the following line:

3$$ 21 0 1 e

The decay times are grouped in 10 steps with the units changing from days to years as appropriate. Based on the SAS2H input, the activities and masses listed in the output are per assembly.

7.4 Number Density Calculations Using ORIGEN-S Output

The grams/assembly output per time step from Attachment II was used to calculate the number density of each of the Principal Isotopes using a LOTUS 1-2-3 spreadsheet. The equation for number density is shown below (Ref. 5.19).

$$N = \rho N_A / M$$

where ρ is the physical density in g/cm^3,
N_A is Avagadro's Number - 0.602252E+24 atoms/mole,
and M is the gram atomic weight.

The units of the resulting number density is in atoms/cm^3. The required units for subsequent use are atoms/b-cm where 1 barn equals 10^{-24} cm^2. The calculations in the spreadsheet drops the E+24 from Avagadro's Number to account for the conversion. As a conservatism in the criticality calculations which will use these number densities, the values are adjusted up to a 96% theoretical density.

The input and output from these calculations are shown in Attachment III.

7.5 Effects of Long Term Low Power Criticality in the Waste Package

An additional set of calculations were performed to demonstrate the effects of a long term low power criticality in the waste package per the request of the originators of Ref. 5.20. These calculations required minor modifications of the previous SAS2H and ORIGEN-S inputs.

7.5.1 SAS2H Input Modifications

Minor changes as indicated below were made to the SAS2H input to facilitate cross section production at an appropriate temperature for the criticality effects calculations performed using ORIGEN-S. The nlib/cycle entry was changed to 1 from 8 and ncycles was increased to 9 from 1 in Data Block 8. Instead of 1 cycle at 7.25 MW/assembly for 1280 days, the Data Block 9 entries were changed to eight cycles at 7.25 MW/assembly for 160 days each with 0 down time between each cycle. The ninth cycle was set up with an arbitrary low power level (4.976E-5 MW/assembly) for 1 day with the addition of the following parameters which are assumed

representative of the postulated criticality in the waste package (Assumption 4.3.11).

bfrac (boron fraction)	-	0.
h2ofrac (inverse of the density in reactor calculation to bring density=1 g/cm^3)	-	1.594
temkcyc (modified temperature of all materials in current cycle)	-	373 K

SAS2H is limited to a single average temperature using this method. The input for this case (s3020ucf4.in) is included in Attachment IV. The output is essentially the same as that included in Attachment I for the original SAS2H case.

7.5.2 ORIGEN-S Input Modifications

Four ORIGEN-S cases were run based on the binary output files created by the SAS2H case discussed in Section 7.5.1. The data used includes cross sections and isotopic compositions from the last cycle run.

The first case (s3020ucfo1.in) is the same as the case described in Section 7.3.8 with minor modification to the time step edits and the addition of activity edits in curies for comparison to the long term low power criticality event simulations that follow. The input for this case is included in Attachment V and the activity edits from the output are summarized in Attachment VI.

The second through fourth cases (joklo7.in, joklo8.in, and joklo9.in) have depletion at a power level of 1.039-4 MW/assembly (2.182 kw/waste package divided by 21 assemblies/package) for periods of 10,000, 1000, and 5000 years, respectively, starting 15,000 years after discharge from the reactor cycles. The inputs for these cases are included in Attachments VII through IX. The summarized activity edits for these three cases are included in Attachment X for times after the depletion at a low power level which simulates a criticality event over a long time period.

The summarized grams/assembly table for the 15,000 year decay point of the decay only case is included in Attachment XI. The summarized grams/assembly tables for the criticality cases for the 10 decay times immediately following the criticality are included in Attachment XII.

8. Conclusions

The number densities calculated as indicated in Section 7.4 are shown in Table 8.1 for each isotope for 27 time steps from 1 to 999,999 years.

The activity tables generated in the cases for long term low power criticality simulations in a waste package are included in Attachments VI and X. The neutron flux distribution between the fast, epi-thermal, and thermal groups is provided from s3020ucf4.out (summarized in Attachment XIII) to demonstrate the components of the total flux indicated in Attachment X.

9. Attachments

The following attachments are case input and output files and spreadsheets as listed. The name of the file is listed in parenthesis. The first three attachments are included in Revision 00 of this document and are unchanged by Revision 01.

I. SAS2H Burnup Case Output (s3020ucf.out) 2/16/96 825 pages
II. ORIGEN-S Decay Case Output (s3020ucfo.out) 2/16/96 122 pages
III. Spreadsheet for Number Density Calculation 3/31/96 18 pages
IV. Modified SAS2H Burnup Case Input (s3020ucf4.in) 3/7/96 2 pages
V. Modified ORIGEN-S Decay Case Input (s3020ucfo1.in) 3/12/96 1 page
VI. Modified ORIGEN-S Decay Case Output Summary (decay.sum) 3/29/96 93 pages
VII. Modified ORIGEN-S 10,000 year Criticality Case Input (joklo7.in) 3/14/96 1 page
VIII. Modified ORIGEN-S 1000 year Criticality Case Input (joklo8.in) 3/14/96 1 page
IX. Modified ORIGEN-S 5000 year Criticality Case Input (joklo9.in) 3/14/96 1 page
X. Modified ORIGEN-S Criticality Cases Output Summary (joklo8.sum) 3/14/96 95 pages
XI. Modified ORIGEN Decay Case Output Summary of grams/assembly tables (s3020ucfO1.sum) 8/8/96 19 pages
XII. Modified ORIGEN Criticality Cases Output Summary of grams/assembly tables (joklo8.grams) 8/9/96 51 pages
XIII. Modified SAS2H Burnup Case Flux Output Summary (flux) 3/12/96 1 page

*                                                                       *
*     welcome to the configuration controlled version of scale4.2.      *
*     any problems should be reported to kay martin at 4-9213.          *
*                                                                       *
*     updates that have been made from version 4.1 to 4.2 include:      *
*                                                                       *
*     nitawl:  parameter added to prevent exponent underflows for very  *
*     dilute resonance calculations on workstation.  (mrr 93-011)       *
*                                                                       *
*     nitawl:  corrected discrepancies in maximum fractional energy loss*
*     of neutron in admixed moderator calculation and simpson rule      *
*     calculation of collision density as documented in "improved       *
*     calculation of flux shapes with the resonance shielding code      *
*     nitawl", by j. oppe, ecn-i--93-003.  affects all calculations.    *
*     impact will vary, but is insignificant for hydrogen-moderated     *
*     systems. (mrr 93-030)                                             *
*                                                                       *
*     sas4:  added option of axial source profile input for both radial *
*     and axial dose calculations. also added option idr = 2 for        *
*     estimation to point detectors from collisions in both top and     *
*     bottom halves of geometry.  (mrr 92-016)                          *
*                                                                       *
*     morse:  modifications made for compatibility with the new options in*
*     sas4 (i.e., the axial source profile input option and             *
*     the option idr = 2 for estimation to point detectors from collisions*
*     in both top and bottom halves of geometry).  (mrr 92-016)         *
*                                                                       *
*     csas & keno-v.a:  error checking during input processing was added*
*     so that these modules terminate with an error message if input    *
*     errors are encountered.  (mrr 93-013, 93-014, 93-015, 93-018)     *
*                                                                       *
*     keno-v.a:  corrections made for applying differential albedo      *
*     boundary conditions to supergrouped problems where global unit    *
*     contains only an array specification.  effect on keff is very large*
*     for this type of problem.  (mrr 93-033)                           *
*                                                                       *
*     keno-v.a:  corrected an error introduced with modification on may 24,*
*     1993 (mrr 93-033). this error affected problems with mirror or    *
*     periodic boundary conditions and could cause problem to loop, fail,*
*     or run incorrectly.                                               *
*                                                                       *
*     xsdrnpm:  corrected calculation of number of direct access data   *
*     blocks needed to weight the cross sections to prevent occasional  *
*     failure.  improved calculation of balance tables.  (mrr 93-021)   *
*                                                                       *
*     origen-s:  modified program to read combined binary libraries that*
*     include multi-cycle cross sections.  add option to edit binary    *
*     library.  (mrr 93-026)                                            *
*                                                                       *
*     sas2:  modified to produce combined binary libraries for origen-s.*
*     (mrr 93-027)                                                      *
*                                                                       *
*     couple:  modified to allow combined binary libraries to be made by*
*     sas2.  (mrr 93-031)                                               *
*                                                                       *
*     origen-s couple, sas2:  modified programs to accept the new updated *
```

```
*     and expanded decay data and fission product yield libraries. (mrr      *
*     92-088, 92-025, 92-026)                                                *
*                                                                            *
*     origen-s libraries: the six standard origen-s card image libraries     *
*     have been replaced by two new libraries, end6dec and xsectpho.         *
*     end6dec contains the updated and expanded decay data library based     *
*     on endf/b-vi data. xsectpho contains the basic cross section and       *
*     photon spectra data and updated fission product yield data based on    *
*     endf/b-v data. (dnr 92-006, 007, 008, 009, 010, and dnr 93-001,        *
*     002, 003, 006, 008, 009)                                               *
*                                                                            *
*     std. comp. library: in dnr 92-033, the following nuclides were         *
*     changed to turn on resonance processing flag but should not have       *
*     been changed: niss, fess, mnss, crss, niinconel, crinconel,            *
*     feinconel. flags for these nuclides have now been returned to off.     *
*     (dnr 93-014)                                                           *
*                                                                            *
*     heating7: replaced heating6 with version 7.2. (mrr 93-038)             *
*                                                                            *
*     htas1: updated for compatibility with heating7 and to interact         *
*     effectively with ocular. fin effectiveness technique was added.        *
*     (mrr 93-036)                                                           *
*                                                                            *
*     ocular: made compatible with heating7 and htas1 on mainframe and       *
*     workstation. (mrr 93-037)                                              *
*                                                                            *
*     sas2: corrected so that 'parm=skipshipdata' would work on              *
*     workstation. (mrr 93-051)                                              *
*                                                                            *
*     aim: ft47ft001 is no longer require for aim to execute on              *
*     workstation. (mrr 93-052)                                              *
*                                                                            *
*     27group, 27burnup, and 218group - these libraries have been            *
*     updated to correct an error found in the chlorine cross-sections.      *
*     (dnr93-022)                                                            *
*                                                                            *
*     bonami: corrected so that a case with a number density of zero         *
*     for a nuclide that has bondarenko data will run without failing.       *
*     (mrr 93-060)                                                           *
*                                                                            *
*     csas: corrected calculation of dancoff correction factor for           *
*     cylindrical cells. note that previous calculations of small            *
*     cylindrical cells (o.d. < 0.3 cm) gave non-conservative keff           *
*     values. also corrected dancoff factor for multiregion slab             *
*     cell with vacuum boundary conditions to be set to zero.                *
*     (mrr 93-065)                                                           *
*                                                                            *
*     csas, sas1, sas2, sas3, sas4: error in miplib was corrected. for       *
*     resonance materials that are not part of the unit cell in lattice-     *
*     cell or multiregion problems, the dancoff factor defaulted to -1.      *
*     check your nitawl output in any previous scale-4.2 calculations        *
*     for dancoff factors =-1.                                               *
*     (mrr 93-070)                                                           *
*                                                                            *

0       -1q array has       1 entries.
0        0q array has       9 entries.
0        1q array has      12 entries.
0select 65 nuclides from the master  library on logical  1
         0 nuclides from the working library on logical  2
         0 nuclides from the working library on logical  3
           to create the new working library on logical  4

        61 resonance calculations have been requested
         0 output option for ampx formatted cross section data
0the storage allocated for this case is 200000 words
0        2q array has      65 entries.
0        3q array has     915 entries.
0        4q array has      65 entries.
0 general information concerning cross section library
     tape identification number                  4321
     number of nuclides on tape                    66
     number of neutron energy groups               27
     first thermal neutron energy group            15
     number of gamma energy groups                  0
0   direct access unit number  9 requires 117 blocks of length  1484 words
- xsdrn tape   4321
                        scale 4.2 - 27 group neutron burnup library
                           based on endf-b version 4 data with endf-b version 5 fission products
                              compiled for nrc     1/27/89
```

1 this xsdrn working tape was created 02/16/96 at 09:58:23
the title of the parent case is as follows
scale 4.2 - 27 group neutron burnup library
based on endf-b version 4 data with endf-b version 5 fission products
compiled for nrc 1/27/89

tape id	4321	number of nuclides	65
number of neutron groups	27	number of gamma groups	0
first thermal group	15	logical unit	4
