1keff results for: Far-Field Consequence Study - 32% H2O/ 8% UO2 (sp40e1) 1000 Years 600K probid = 08/29/96 17:16:39

the initial fission neutron source distribution was read from the srctp file named srctp .
the criticality problem was scheduled to skip 30 cycles and run a total of 130 cycles with nominally 4000 neutrons per cycle.
this problem has run 30 inactive cycles with 119522 neutron histories and 100 active cycles with 400152 neutron histories.

this calculation has completed the requested number of keff cycles using a total of 519674 fission neutron source histories.
all cells with fissionable material were sampled and had fission neutron source points.

the results of the w test for normality applied to the individual collision, absorption, and track-length keff cycle values are:

the k(collision) cycle values appear normally distributed at the 95 percent confidence level
the k(absorption) cycle values appear normally distributed at the 95 percent confidence level
the k(trk length) cycle values appear normally distributed at the 95 percent confidence level

---

the final estimated combined collision/absorption/track-length keff = .93949 with an estimated standard deviation of .00097

the estimated 68, 95, & 99 percent keff confidence intervals are .93852 to .94046, .93756 to .94142, and .93693 to .94205

the estimated collision/absorption neutron removal lifetime = 9.46E-05 seconds with an estimated standard deviation of 2.00E-07

---

the estimated average keffs, one standard deviations, and 68, 95, and 99 percent confidence intervals are:

keff estimator	keff	standard deviation	68% confidence	95% confidence	99% confidence	corr
collision	.93888	.00149	.93739 to .94037	.93591 to .94184	.93495 to .94281	
absorption	.94002	.00117	.93884 to .94119	.93768 to .94235	.93692 to .94311

1keff results for: Far-Field Consequence Study - 32% H2O/ 8% UO2 (sp40f1) 5000 Years 600K probid = 08/16/96 10:52:15

the initial fission neutron source distribution was read from the srctp file named srctp .
the criticality problem was scheduled to skip 30 cycles and run a total of 130 cycles with nominally 4000 neutrons per cycle.
this problem has run 30 inactive cycles with 119861 neutron histories and 100 active cycles with 400844 neutron histories.

this calculation has completed the requested number of keff cycles using a total of 520705 fission neutron source histories.
all cells with fissionable material were sampled and had fission neutron source points.

the results of the w test for normality applied to the individual collision, absorption, and track-length keff cycle values are:

the k(collision) cycle values appear normally distributed at the 95 percent confidence level
the k(absorption) cycle values appear normally distributed at the 95 percent confidence level
the k(trk length) cycle values appear normally distributed at the 95 percent confidence level

---

the final estimated combined collision/absorption/track-length keff = .94166 with an estimated standard deviation of .00081

the estimated 68, 95, & 99 percent keff confidence intervals are .94084 to .94247, .94003 to .94328, and .93950 to .94381

the estimated collision/absorption neutron removal lifetime = 8.94E-05 seconds with an estimated standard deviation of 1.90E-07

---

the estimated average keffs, one standard deviations, and 68, 95, and 99 percent confidence intervals are:

keff estimator	keff	standard deviation	68% confidence	95% confidence	99% confidence	corr
collision	.94222	.00130	.94092 to .94352	.93963 to .94481	.93878 to .94566	
absorption	.94125	.00109	.94016 to .94234	.93909 to .94342	.93838 to .94412	
track length	.94223	.00134	.94089 to .94358	.93956 to .94491	.93868 to .94578

1keff results for: Far-Field Consequence Study - 32% H2O/ 8% UO2 (sp40g1) 10000 Years 600K probid = 08/29/96 12:31:20

the initial fission neutron source distribution was read from the srctp file named srctp .
the criticality problem was scheduled to skip 30 cycles and run a total of 130 cycles with nominally 4000 neutrons per cycle.
this problem has run 30 inactive cycles with 119705 neutron histories and 100 active cycles with 400731 neutron histories.

this calculation has completed the requested number of keff cycles using a total of 520436 fission neutron source histories.
all cells with fissionable material were sampled and had fission neutron source points.

the results of the w test for normality applied to the individual collision, absorption, and track-length keff cycle values are:

the k(collision) cycle values appear normally distributed at the 95 percent confidence level
the k(absorption) cycle values appear normally distributed at the 95 percent confidence level
the k(trk length) cycle values appear normally distributed at the 95 percent confidence level

the final estimated combined collision/absorption/track-length keff = .94531 with an estimated standard deviation of .00095

the estimated 68, 95, & 99 percent keff confidence intervals are .94436 to .94626, .94341 to .94721, and .94279 to .94783

the estimated collision/absorption neutron removal lifetime = 8.49E-05 seconds with an estimated standard deviation of 1.77E-07

the estimated average keffs, one standard deviations, and 68, 95, and 99 percent confidence intervals are:

keff estimator	keff	standard deviation	68% confidence	95% confidence	99% confidence	corr
collision	.94621	.00133	.94488 to .94755	.94356 to .94887	.94270 to .94973	
absorption	.94452	.00112	.94340 to .94565	.94228 to .94676	.94155 to .94749	
track length	.94663	.00133	.94530 to .94797	.94398 to .94929	.94311 to .95016	
col/absorp	.94520	.00094	.94426 to .94614	.94333 to .94706	.94273 to .94767	.1675
abs/trk len	.94537	.00094	.94443 to .94630	.94350 to .94723	.94289 to .94784	.1608
col/trk len	.94639	.00135	.94504 to .94775	.94370 to .94908	.94282 to .94996	.9819
col/abs/trk len	.94531	.00095	.94436 to .94626	.94341 to .94721	.94279 to .94783

1keff results for: Far-Field Consequence Study - 32% H2O/ 8% UO2 (sp40e1n) 1000 Years  600K      probid =  08/29/96 20:06:21
```

the initial fission neutron source distribution was read from the srctp file named srctp .
the criticality problem was scheduled to skip 30 cycles and run a total of 130 cycles with nominally 4000 neutrons per cycle.
this problem has run 30 inactive cycles with 119728 neutron histories and 100 active cycles with 400772 neutron histories.

this calculation has completed the requested number of keff cycles using a total of 520500 fission neutron source histories.
all cells with fissionable material were sampled and had fission neutron source points.

the results of the w test for normality applied to the individual collision, absorption, and track-length keff cycle values are:

the k(collision) cycle values appear normally distributed at the 95 percent confidence level
the k(absorption) cycle values appear normally distributed at the 95 percent confidence level
the k(trk length) cycle values appear normally distributed at the 95 percent confidence level

---

the final estimated combined collision/absorption/track-length keff = .93731 with an estimated standard deviation of .00088

the estimated 68, 95, & 99 percent keff confidence intervals are .93642 to .93819, .93555 to .93907, and .93497 to .93964

the estimated collision/absorption neutron removal lifetime = 9.54E-05 seconds with an estimated standard deviation of 1.78E-07

---

the estimated average keffs, one standard deviations, and 68, 95, and 99 percent confidence intervals are:

keff estimator	keff	standard deviation	68% confidence	95% confidence	99% confidence	corr
collision	.93689	.00133	.93556 to .93822	.93424 to .93954	.93338 to .94040	
absorption	.93762	.00120	.93643 to .93882	.93524 to .94001	.93446 to .94079

1keff results for: Far-Field Consequence Study - 32% H2O/ 8% UO2 (sp40f1n) 5000 Years  600K      probid =   08/20/96 10:58:26
```

the initial fission neutron source distribution was read from the srctp file named srctp .
the criticality problem was scheduled to skip 30 cycles and run a total of 130 cycles with nominally 4000 neutrons per cycle.
this problem has run 30 inactive cycles with 120117 neutron histories and 100 active cycles with 400133 neutron histories.

this calculation has completed the requested number of keff cycles using a total of 520250 fission neutron source histories.
all cells with fissionable material were sampled and had fission neutron source points.

the results of the w test for normality applied to the individual collision, absorption, and track-length keff cycle values are:

the k(collision) cycle values appear normally distributed at the 95 percent confidence level
the k(absorption) cycle values appear normally distributed at the 95 percent confidence level
the k(trk length) cycle values appear normally distributed at the 95 percent confidence level

---

the final estimated combined collision/absorption/track-length keff = .93482 with an estimated standard deviation of .00081

the estimated 68, 95, & 99 percent keff confidence intervals are .93401 to .93563, .93320 to .93643, and .93267 to .93696

the estimated collision/absorption neutron removal lifetime = 9.40E-05 seconds with an estimated standard deviation of 1.90E-07

---

the estimated average keffs, one standard deviations, and 68, 95, and 99 percent confidence intervals are:

keff estimator	keff	standard deviation	68% confidence	95% confidence	99% confidence	corr
collision	.93517	.00121	.93396 to .93638	.93276 to .93758	.93198 to .93836	
absorption	.93456	.00104	.93352 to .93561	.93249 to .93664	.93181 to .93731	
track length	.93519	.00125	.93393 to .93645	.93269 to .93769	.93187 to .93850	
col/absorp	.93482	.00081	.93401 to .93563	.93321 to .93643	.93268 to .93696	.0423

1keff results for: Far-Field Consequence Study - 32% H2O/ 8% UO2 (sp40g1n) 10000 Years 600K probid = 08/29/96 16:44:37

the initial fission neutron source distribution was read from the srctp file named srctp .
the criticality problem was scheduled to skip 30 cycles and run a total of 130 cycles with nominally 4000 neutrons per cycle.
this problem has run 30 inactive cycles with 120052 neutron histories and 100 active cycles with 401833 neutron histories.

this calculation has completed the requested number of keff cycles using a total of 521885 fission neutron source histories.
all cells with fissionable material were sampled and had fission neutron source points.

the results of the w test for normality applied to the individual collision, absorption, and track-length keff cycle values are:

the k(collision) cycle values appear normally distributed at the 95 percent confidence level
the k(absorption) cycle values appear normally distributed at the 95 percent confidence level
the k(trk length) cycle values appear normally distributed at the 95 percent confidence level

---

the final estimated combined collision/absorption/track-length keff = .93357 with an estimated standard deviation of .00080

the estimated 68, 95, & 99 percent keff confidence intervals are .93277 to .93437, .93197 to .93517, and .93145 to .93569

the estimated collision/absorption neutron removal lifetime = 9.33E-05 seconds with an estimated standard deviation of 2.08E-07

---

the estimated average keffs, one standard deviations, and 68, 95, and 99 percent confidence intervals are:

keff estimator	keff	standard deviation	68% confidence	95% confidence	99% confidence	corr
collision	.93359	.00119	.93240 to .93477	.93122 to .93595	.93045 to .93672

1keff results for: Far-Field Consequence Study - 32% H2O/ 8% UO2 (sp40e1y) 1000 Years 600K probid = 08/29/96 23:06:12

the initial fission neutron source distribution was read from the srctp file named srctp .
the criticality problem was scheduled to skip 30 cycles and run a total of 130 cycles with nominally 4000 neutrons per cycle.
this problem has run 30 inactive cycles with 120410 neutron histories and 100 active cycles with 399469 neutron histories.

this calculation has completed the requested number of keff cycles using a total of 519879 fission neutron source histories.
all cells with fissionable material were sampled and had fission neutron source points.

the results of the w test for normality applied to the individual collision, absorption, and track-length keff cycle values are:

the k(collision) cycle values appear normally distributed at the 95 percent confidence level
the k(absorption) cycle values appear normally distributed at the 95 percent confidence level
the k(trk length) cycle values appear normally distributed at the 95 percent confidence level

---

the final estimated combined collision/absorption/track-length keff = .94399 with an estimated standard deviation of .00088

the estimated 68, 95, & 99 percent keff confidence intervals are .94311 to .94487, .94224 to .94574, and .94167 to .94632

the estimated collision/absorption neutron removal lifetime = 9.44E-05 seconds with an estimated standard deviation of 1.91E-07

the estimated average keffs, one standard deviations, and 68, 95, and 99 percent confidence intervals are:

keff estimator	keff	standard deviation	68% confidence	95% confidence	99% confidence	corr
collision	.94424	.00128	.94296 to .94552	.94170 to .94679	.94087 to .94762	
absorption	.94381	.00113	.94268 to .94494	.94155 to .94607	.94082 to .94680	
track length	.94420	.00129	.94291 to .94550	.94163 to .94678	.94079 to .94762	
col/absorp	.94400	.00088	.94312 to .94488	.94225 to .94574	.94168 to .94631	.0573

1keff results for: Far-Field Consequence Study - 32% H2O/ 8% UO2 (sp40e1z) 1000 Years 600K probid = 08/29/96 23:27:14

the initial fission neutron source distribution was read from the srctp file named srctp .
the criticality problem was scheduled to skip 30 cycles and run a total of 130 cycles with nominally 4000 neutrons per cycle.
this problem has run 30 inactive cycles with 119671 neutron histories and 100 active cycles with 400980 neutron histories.

this calculation has completed the requested number of keff cycles using a total of 520651 fission neutron source histories.
all cells with fissionable material were sampled and had fission neutron source points.

the results of the w test for normality applied to the individual collision, absorption, and track-length keff cycle values are:

the k(collision) cycle values appear normally distributed at the 95 percent confidence level
the k(absorption) cycle values appear normally distributed at the 95 percent confidence level
the k(trk length) cycle values appear normally distributed at the 95 percent confidence level

---

the final estimated combined collision/absorption/track-length keff = .93493 with an estimated standard deviation of .00078

the estimated 68, 95, & 99 percent keff confidence intervals are .93415 to .93572, .93337 to .93650, and .93286 to .93701

the estimated collision/absorption neutron removal lifetime = 9.56E-05 seconds with an estimated standard deviation of 2.07E-07

---

the estimated average keffs, one standard deviations, and 68, 95, and 99 percent confidence intervals are:

keff estimator	keff	standard deviation	68% confidence	95% confidence	99% confidence	corr
collision	.93541	.00113	.93427 to .93654	.93315 to .93766	.93242 to .93839	
absorption	.93444	.00118	.93326 to .93562	.93209 to .93679	.93133 to .93755	
track length	.93544	.00117	.93427 to .93662	.93311 to .93778	.93234 to .93854	
col/absorp	.93494	.00078	.93416 to .93572	.93338 to .93650	.93287 to .93701	-.0919

1keff results for: Far-Field Consequence Study - 32% H2O/ 8% UO2 (sp40g1z) 10000 Years 600K probid = 08/29/96 15:14:43

the initial fission neutron source distribution was read from the srctp file named srctp .

the criticality problem was scheduled to skip 30 cycles and run a total of 130 cycles with nominally 4000 neutrons per cycle.
this problem has run 30 inactive cycles with 120373 neutron histories and 100 active cycles with 400336 neutron histories.

this calculation has completed the requested number of keff cycles using a total of 520709 fission neutron source histories.
all cells with fissionable material were sampled and had fission neutron source points.

the results of the w test for normality applied to the individual collision, absorption, and track-length keff cycle values are:

the k(collision) cycle values appear normally distributed at the 99 percent confidence level, but not at 95 percent
the k(absorption) cycle values appear normally distributed at the 95 percent confidence level
warning. the k(trk length) cycle values do not appear normally distributed at the 99 percent confidence level

---

the final estimated combined collision/absorption/track-length keff = .90902 with an estimated standard deviation of .00090

the estimated 68, 95, & 99 percent keff confidence intervals are .90813 to .90992, .90724 to .91081, and .90665 to .91140

the estimated collision/absorption neutron removal lifetime = 9.04E-05 seconds with an estimated standard deviation of 2.10E-07

---

the estimated average keffs, one standard deviations, and 68, 95, and 99 percent confidence intervals are:

keff estimator	keff	standard deviation	68% confidence	95% confidence	99% confidence	corr
collision	.90969	.00123	.90846 to .91092	.90724 to .91214	.90645 to .91293	
absorption	.90829	.00115	.90714 to .90944	.90600 to .91058	.90526 to .91132

1keff results for: Far-Field Consequence Study - 32% H2O/ 8% UO2 (sp40g1x) 10000 Years 600K probid = 08/29/96 13:42:02

the initial fission neutron source distribution was read from the srctp file named srctp .
the criticality problem was scheduled to skip 30 cycles and run a total of 130 cycles with nominally 4000 neutrons per cycle.
this problem has run 30 inactive cycles with 119677 neutron histories and 100 active cycles with 400328 neutron histories.

this calculation has completed the requested number of keff cycles using a total of 520005 fission neutron source histories.
all cells with fissionable material were sampled and had fission neutron source points.

the results of the w test for normality applied to the individual collision, absorption, and track-length keff cycle values are:

the k(collision) cycle values appear normally distributed at the 95 percent confidence level
the k(absorption) cycle values appear normally distributed at the 95 percent confidence level
the k(trk length) cycle values appear normally distributed at the 95 percent confidence level

the final estimated combined collision/absorption/track-length keff = .94482 with an estimated standard deviation of .00089

the estimated 68, 95, & 99 percent keff confidence intervals are .94393 to .94571, .94305 to .94659, and .94247 to .94717

the estimated collision/absorption neutron removal lifetime = 8.46E-05 seconds with an estimated standard deviation of 1.79E-07

the estimated average keffs, one standard deviations, and 68, 95, and 99 percent confidence intervals are:

keff estimator	keff	standard deviation	68% confidence	95% confidence	99% confidence	corr
collision	.94541	.00142	.94399 to .94683	.94259 to .94824	.94166 to .94916	
absorption	.94460	.00111	.94349 to .94571	.94239 to .94682	.94167 to .94754	
track length	.94528	.00138	.94390 to .94666	.94254 to .94802	.94164 to .94892	
col/absorp	.94490	.00091	.94400 to .94581	.94310 to .94671	.94251 to .94730	.0616

1keff results for: Far-Field Consequence Study - 32% H2O/ 8% UO2 (sp40l) 100000 Year Cycle 350K probid = 08/29/96 13:28:41

the initial fission neutron source distribution was read from the srctp file named srctp .

the criticality problem was scheduled to skip 30 cycles and run a total of 130 cycles with nominally 4000 neutrons per cycle.
this problem has run 30 inactive cycles with 120152 neutron histories and 100 active cycles with 399689 neutron histories.

this calculation has completed the requested number of keff cycles using a total of 519841 fission neutron source histories.
all cells with fissionable material were sampled and had fission neutron source points.

the results of the w test for normality applied to the individual collision, absorption, and track-length keff cycle values are:

the k(collision) cycle values appear normally distributed at the 95 percent confidence level
the k(absorption) cycle values appear normally distributed at the 95 percent confidence level
the k(trk length) cycle values appear normally distributed at the 95 percent confidence level

---

the final estimated combined collision/absorption/track-length keff = .99942 with an estimated standard deviation of .00093

the estimated 68, 95, & 99 percent keff confidence intervals are .99849 to 1.00035, .99756 to 1.00127, and .99696 to 1.00188

the estimated collision/absorption neutron removal lifetime = 6.32E-05 seconds with an estimated standard deviation of 1.90E-07

---

the estimated average keffs, one standard deviations, and 68, 95, and 99 percent confidence intervals are:

keff estimator	keff	standard deviation	68% confidence	95% confidence	99% confidence	corr
collision	1.00228	.00146	1.00082 to 1.00375	.99937 to 1.00520	.99842 to 1.00615	
absorption	.99783	.00111	.99672 to .99894	.99563 to 1.00003	.99491 to 1.00075	
track length	1.00239	.00148	1.00091 to 1.00388	.99944 to 1.00535	.99847 to 1.00631	
col/absorp	.99940	.00095	.99845 to 1.00035	.99752 to 1.00129	.99690 to 1.00190	.0741
abs/trk len	.99944	.00093	.99851 to 1.00037	.99759 to 1.00129	.99699 to 1.00190	.0249
col/trk len	1.00231	.00147	1.00084 to 1.00378	.99938 to 1.00524	.99842 to 1.00619	.9753

1keff results for: Far-Field Consequence Study - 32% H2O/ 8% UO2 (sp40ln) 100000 Year Cycle 350K probid = 08/29/96 16:57:28

the initial fission neutron source distribution was read from the srctp file named srctp .
the criticality problem was scheduled to skip 30 cycles and run a total of 130 cycles with nominally 4000 neutrons per cycle.
this problem has run 30 inactive cycles with 119683 neutron histories and 100 active cycles with 399832 neutron histories.

this calculation has completed the requested number of keff cycles using a total of 519515 fission neutron source histories.
all cells with fissionable material were sampled and had fission neutron source points.

the results of the w test for normality applied to the individual collision, absorption, and track-length keff cycle values are:

the k(collision) cycle values appear normally distributed at the 95 percent confidence level
the k(absorption) cycle values appear normally distributed at the 95 percent confidence level
the k(trk length) cycle values appear normally distributed at the 95 percent confidence level

---

the final estimated combined collision/absorption/track-length keff = .94767 with an estimated standard deviation of .00087

the estimated 68, 95, & 99 percent keff confidence intervals are .94680 to .94853, .94594 to .94939, and .94537 to .94996

the estimated collision/absorption neutron removal lifetime = 9.36E-05 seconds with an estimated standard deviation of 1.93E-07

---

the estimated average keffs, one standard deviations, and 68, 95, and 99 percent confidence intervals are:

keff estimator	keff	standard deviation	68% confidence	95% confidence	99% confidence	corr
collision	.94652	.00131	.94520 to .94783	.94391 to .94912	.94306 to .94998
