Berkeley, CA 94720, USA

Abstract: Nuclear structure data pertaining to all known A=166 nuclides (Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, Hf, Ta, W, Re, Os, Ir, Pt) have been compiled and evaluated, and incorporated into the ENSDF data file. This evaluation for A=166 supersedes the previous publication (E.N. Shurshikov and N.V. Timofeeva, *Nuclear Data Sheets* **67**, 45 (1992) (literature cutoff date 1 October 1990)) and the revision by C.M. Baglin of ^{166}W (literature cutoff date 16 April 2000). It includes literature available by 1 March 2008. Subsequent to the previous evaluation, ^{166}Gd has been observed for the first time and the first observations of excited states in ^{166}Tb, ^{166}Re, ^{166}Os and ^{166}Ir have been reported; also, knowledge of collective structure in ^{166}Dy, ^{166}Ho, ^{166}Er, ^{166}Tm, ^{166}Yb, ^{166}Lu, ^{166}Hf, and ^{166}Ta has been considerably expanded. However, the structure suggested here for ^{166}Re is highly tentative and a further, more detailed study of α decay into (and out of) ^{166}Re could be informative.

Cutoff Date: Data received by 1 March 2008 have been evaluated.

General Policies and Organization of Material: See the January issue of the *Nuclear Data Sheets* or http://www.nndc.bnl.gov/nds/NDSPolicies.pdf.

Acknowledgments: The evaluator is grateful to the reviewer of this mass chain for a thorough reading of the manuscript and for constructive comments; the evaluator also thanks the XUNDL database compilers (D. Reed, M. Lee, B. Singh) for initial data entry for 10 publications.

General Comments: Uncertainties of absolute γ−ray intensities are calculated using the method of Browne (1986Br21).

Throughout this evaluation, rotational band parameters are calculated from the standard energy equation:

$$E(J,K)=E_0+A[J(J+1)+\delta_{K,1/2}(-1)^{J+1/2}a(J+1/2)]+BJ^2(J+1)^2$$

where **A** is given in keV, **B** is given in eV, and the decoupling constant **a** is dimensionless. When not explicitly stated, **B** is assumed to be 0. The minimum number possible of the lowest energy levels was used to calculate each set of parameters, unless noted otherwise.

Theoretical conversion coefficient data are from relativistic Dirac−Fock calculations using the frozen−orbital approximation (2005KiZT).

* This work was supported by the Director, Office of Science, Office of Nuclear Physics of the U.S. Department of Energy under contracts DE−AC03−76SF00098 and DE−AC02−05CH11231.

Adopted Levels

$Q(\beta^-)$=3360 *SY*; S(n)=6000 *SY*; S(p)=11130 *SY*; $Q(\alpha)$=–2070 *SY* 2003Au03.
Uncertainty in $Q(\beta^-)$, S(n), S(p), $Q(\alpha)$ is 600, 780, 920 and 780, respectively (2003Au03).
Production: 15.5 MeV proton–induced fission of ^{238}U; JAERI–ISOL on–line mass separation of products; plastic scin and Ge detectors for x and γ detection (2005Ic02).

^{166}Gd Levels

E(level)	Jπ	$T_{1/2}$	Comments
0.0	0+	4.8 s *10*	$\%\beta^-$=100. Jπ: g.s. of even–even nucleus. $T_{1/2}$: from γ(t) in 2005Ic02.

Adopted Levels, Gammas

Q(β⁻)=4695 *70*; S(n)=5170 *SY*; S(p)=8580 *SY*; Q(α)=−1540 *SY* 2003Au03,2007Ha57.
Uncertainty in S(n), S(p), Q(α) is 220, 510 and 310, respectively (2003Au03).
Q(β⁻): 4695 *70* from 2007Ha57 (see also 2006HaZT) cf. 4830 *100* from 2003Au03. Uncertainty includes statistical uncertainty and 60–keV systematic uncertainty from the Fermi–Kurie plot method.
Production: ^{238}U(p,F) E=15.5 MeV, Gas–jet coupled JAERI–ISOL (1996Ic01,2005Ic02).

x1570.60a *13*		77 *18*			
6789.6b *4*	(7043.5)				
6968.0b *10*	(7043.5)				

† From 1990Ka21, except as noted.
‡ Photon intensity per 1×10^{5} neutron captures in ^{164}Dy. From table 2 of 1990Ka21. Values from 1988Ka44 differ slightly, but evaluator presumes that the data in 1990Ka21 supersede those in 1988Ka44.
§ From ce data in 1983KeZS and 1984KeZV; authors normalized their α(K)exp data assuming α(K)(E2 theory)=0.0035 for the 857γ.
# From list of unassigned and unplaced γ's from ^{164}Dy(n,γ) E=thermal (1990Ka21, table 2).
@ 1990Ka21 place this γ from a 1482 level in ^{165}Dy; however, a γ of this energy is expected in ^{166}Dy accompanying the 173γ from the 1030 level, as in ^{166}Tb β^{-} decay. The evaluator, therefore, tentatively places it from the 1030 level of ^{166}Dy.
& Eγ=857.146 *11* in 1988Ka44 is presumed to be a misprint.

† From (n,γ) E=thermal, except as noted; obtained from least–squares fit to Eγ, excluding data for multiply–placed transitions and for the 48.303γ and 232.286γ, both of which fit their placement particularly poorly. However, it should be noted that 28 of the remaining 570 Eγ data deviate by at least 3σ from the least–squares prediction and, of those, 12 deviate by at least 5σ.

‡ Spin from the angular distribution measurements of the primary γ transition (1979Bo08).

§ From comparison of σ(exp) and σ(calc) in (t,α).

\# (A): Kπ=0–, α=0 (π 7/2[523])–(ν 7/2[633]) band. A=9.0 B=-1.2×10^{-3}. Jπ established by (d,p) cross section fingerprint for J=1 through 5 members of this configuration.

@ (B): Kπ=0–, α=1 (π 7/2[523])–(ν 7/2[633]) band. A=8.9, B=-1.6×10^{-3}. See comment on signature partner of this band.

& (C): Kπ=7–, (π 7/2[523])+(ν 7/2[633]) band. Jπ established by (d,p) cross section fingerprint for J=7 through 9 members of this configuration.

a (D): Kπ=3+, (π 7/2[523])–(ν 1/2[521]) band. A=8.7, B=2.2×10^{-3}. Jπ established by (d,p) cross section fingerprint for J=3 through 7 members of this configuration.

b (E): Kπ=5+, (π 3/2[411]+ν 7/2[633])+(π 7/2[523]+ν 3/2[521]). A=14.45, B=-4.5×10^{-2}.

c (F): Kπ=6+, (π 7/2[523])+(ν 5/2[512]) band. A=9.1 if B=0.

d (G): Kπ=4+, (π 7/2[523])+(ν 1/2[521]) band. A=9.9 if B=0. Jπ established by (d,p) cross section fingerprint for J=4 through 6 members of this configuration.

e (H): Kπ=1–, (π 1/2[411])+(ν 1/2[521]) band.

f (I): Kπ=1+, (π 7/2[523])–(ν 5/2[523]) band. A=9.65, B=-3.7×10^{-3}. Jπ established by (d,p) cross section fingerprint for J=1 through 5 members of this configuration.

g (J): Kπ=2+, (π 3/2[411]–ν 7/2[633])+(π 7/2[523]–ν 3/2[521]). A=9.1, B=-26.6×10^{-3}. Jπ established by (d,^{3}He) cross section fingerprint for J=3 through 6 members of this configuration.

h (K): Kπ=2–, (π 7/2[523])–(ν 7/2[633])+Q_{22} band. A=8.9, B=-1.3×10^{-3}.

i (L): Kπ=1+, (π 7/2[523])–(ν 5/2[512]) band. A=9.4 if B=0. Jπ established by (d,p) cross section fingerprint for J=1 through 6 members of this configuration.

j (M): Kπ=3+, (π 1/2[411])–(ν 7/2[633]) band.

k (N): π=+ band 1 (1982De37). Configuration not known; the Kπ=3+ configuration assigned in (t,α) (1982De37) is now assigned to a different sequence of levels.

l (O): Kπ=4+, (π 1/2[411])+(ν 7/2[633]) band. Configuration from (t,α) data (1982De37).

m (P): π=+ band 2 (1982De37). Configuration not known; the Kπ=4+ configuration assigned in (t,α) (1982De37) is now assigned to a different sequence of levels.

n (Q): Kπ=4+, (π 7/2[523])+(ν 1/2[510]) band.

o (R): Kπ=3+, (π 7/2[523])–(ν 1/2[510]) band.

p (S): Kπ=1–, (π 3/2[411])–(ν 1/2[521]) band.

q (T): Kπ=2–, (π 3/2[411])+(ν 1/2[521]) band.

r (U): Kπ=5–, (π 7/2[523])+(ν 7/2[633])–Q_{22} band.

s (V): Kπ=0–, (π 1/2[411])–(ν 1/2[521]) band.

t (W): Kπ=3– band. Configuration (π 1/2[541])–(ν 7/2[633]) or (π 1/2[411])+(ν 5/2[512]).

u (X): Kπ=6+, (π 7/2[523])+(ν 5/2[523]) band.

v (Y): Kπ=2+, (π 7/2[523])–(ν 3/2[521]) band.

w (Z): Kπ=5+, (π 7/2[523])+(ν 3/2[521]) band.

x (a): Kπ=0+, α=0 (π 7/2[404])–(ν 7/2[633]) band. Configuration from (t,α) data (1982De37). Jπ established by (t,α) cross section fingerprint for J=0 through 3 members of this configuration.

y (b): Kπ=0+, α=1 (π 7/2[404])–(ν 7/2[633]) band. Configuration from (t,α) data (1982De37). See comment on signature partner band.

z (c): Kπ=7+, (π 7/2[404])+(ν 7/2[633]) band. Configuration from (t,α) data (1982De37).

α (d): Kπ=1+, (π 5/2[413])–(ν 7/2[633]) band. Configuration from (t,α) data (1982De37). Jπ established by (t,α) cross section fingerprint for J=1 through 5 members of this configuration.

β (e): Kπ=6+, (π 5/2[413])+(ν 7/2[633]) band. Configuration from (t,α) data (1982De37).

η (f): Kπ=6–, (π 5/2[532])+(ν 7/2[633]) band. Configuration and level energy from (t,α) (1982De37).

^{166}Dy β^- Decay 1979Ba40,1967Mo05

Parent ^{166}Dy: E=0.0; Jπ=0+; $T_{1/2}$=81.6 h *1*; Q(g.s.)=486.8 *10*; %β^- decay=100.
The values of the angular correlation coefficients for the 28.23γ–54.239γ cascade are A_2=–0.242 *15*, A_4=+0.031 *34*; these are in agreement with a 1(D)2(Q)0 spin sequence for the cascade (1979Ba40).

Decay Scheme

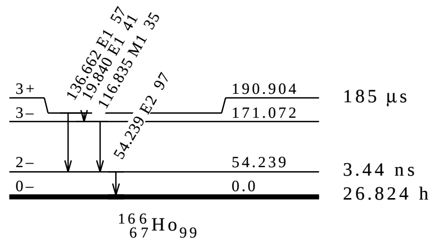
Intensities: I(γ+ce) per
100 parent decays
%IT=100



^{165}Ho(n,γ) E=thermal 1967Mo05,1984Ke15,2000Pr03

Other measurements: 1958Sk59, 1959Dr75, 1959Jo33, 1960Al27, 1961Es02, 1961Kr01, 1963Gi03, 1963Or02, 1973He15, 1973PrZI, 1979Bo08, 1988Ba79, 1989Du03, 2003ChZS, 2007ChZX.

Includes (pol n,γ) E=0.065 eV.

Jπ(target)=7/2−.

σ_n=61.2 *11* (2006MuZX). Abundance(^{165}Ho)=100%.

2007ChZX: provides an evaluation of experimental data including new Eγ and elemental cross section measurements using Ge(Li) detector for 148 primary and 73 secondary transitions (herein referred to as 'Budapest data', and taken from the EGAF section of the CD that is part of this publication). Supersedes 2003ChZS.

2000Pr03: three−crystal pair spectrometer, FWHM≈5.5 keV at 6.5 MeV; calibration based on S(n) and pattern of primary transitions to several well−established low−lying levels; measured Eγ, γγ coin; deduced band structure.

1984Ke15: >99.9% Ho target; Ge detector inside quadrisected NaI(Tl) annulus (FWHM=3.1−4.5 keV for Eγ=4000−6200); measured Eγ, Iγ for 270 transitions with Eγ>4050; ^{14}N(n,γ) reaction used for calibration.

1979Bo08: (pol n,γ); polarized E=0.065 eV neutrons and polarized single−crystal ^{165}Ho target; measured γ(θ) for 15 primary gammas; deduced J.

1967Mo05: 99.8% Ho target; measured primary Eγ, Iγ using Ge(Li) detector as two−escape pair spectrometer (FWHM=8.0 keV; Eγ=5000−6200); measured secondary Eγ, Iγ using Riso curved−crystal spectrometer (Eγ=30−750) or Iγ using Ge(Li) detector (Eγ=70−550); measured conversion electrons (E=29−500) using Elephant spectrometer at Munich (FWHM=0.6% at 100 keV, 0.3% at 200 keV; thick source) and the Studsvik β^- spectrometer (FWHM=0.2%; thin source).

The level scheme includes refinements made by 2000Pr03 to the schemes proposed by 1967Mo05 and others, in which γ placements were based on the Ritz principle (somewhat unreliable at this level density); γγ coin data from 2000Pr03 led to the placement or relocation of many transitions and the elucidation of a number of additional bands.

[†] From least−squares fit to Eγ, excluding data for multiply placed transitions and for the 48.303γ and 232.286γ, both of which fit their placements particularly poorly. However, it should be noted that 28 of the remaining 570 Eγ data deviate by at least 3σ from the least−squares prediction and, of those, 12 deviate by at least 5σ. The latter are noted in comments on the relevant γ.

[‡] Recommended value from 2000Pr03, unless otherwise noted; based on transition multipolarity and deduced band structure.

[§] From 1978Sc10.

[#] Spin from the angular distribution measurements of the primary γ feeding level (1979Bo08).

[@] From least−squares fit to Eγ (cf. S(n)=6243.64 *2* in 2003Au03).

[&] s−wave capture on Jπ=7/2− target.

[a] (A): Kπ=0−, (π 7/2[523])−(ν 7/2[633]) band.

β 4 or possibly 3 from 5523γ(θ) (1979Bo08).

γ(^{166}Ho)

Iγ normalization: from 1967Mo05. If, instead, one obtained Iγ normalization by requiring that Σ(I(γ+ce) to g.s.)=100, a value of 1.02 *9* would be obtained, in excellent agreement with the normalization recommended by 1967Mo05. The ratio R=Iγ(2007ChZX, 'Budapest data')/Iγ(1967Mo05) varies widely but, if cases where the intensities differ by at least a factor of 3 are removed from consideration, the average value of R is 0.93 for secondary lines and 1.10 for primary transitions. Some, but not all, of the inconsistencies may stem from the poorer energy resolution of the 2007ChZX measurement or from the presence of unidentified impurities. For the strong 116.8γ, 136.7γ, 5181γ, 5212γ and 5813γ, Iγ(2007ChZX)/Iγ(1967Mo05) is 0.83 *9*, 0.85 *10*, 0.95 *9*, 1.04 *11* and 0.93 *8*, respectively. With the adopted normalization, the total observed primary γ intensity is 16%.

† Eγ data are from 1984Ke15 if E>4050, and E<4050 data are from 1967Mo05 (cryst.), except as noted. 1967Mo05 also report two separate Ge(Li) detector measurements of Eγ and/or Iγ for a number of γ rays. Eγ data from 2007ChZX (Budapest data) are, in general, less precise and less extensive, but in reasonable agreement with the crystal data; Iγ data show poor to fair agreement with the crystal data. The evaluator gives the latter Eγ, Iγ data in comments; the possible existence of complex lines (due to poorer resolution or presence of impurities) makes it difficult to combine these data with the crystal data. The Eγ data of 1967Mo05 are from wavelength measurements and probably need to be increased by about 9 ppm to correspond to a scale on which Eγ(^{198}Au)=411.80205 *17*. Also, the uncertainties do not include an uncertainty of 0.3 ppm in the conversion of wavelength to energy (see, e.g., 2000He14).

‡ From conversion electron data (1967Mo05,1973PrZI), except as noted. The photon and electron intensity scales were normalized by 1967Mo05 assuming α(K)(116γ)=1.46, α(L1)(116)=0.18 (from M1 theory) and α(K)(137γ)=0.117 (from E1 theory); current theoretical values are 3.7% lower, 1.3% lower and 5.4% higher, respectively, but in view of the relatively much larger uncertainties in the experimental data, the evaluator has chosen not to renormalize those authors' values.

§ Questionable transition.

Line is complex (1967Mo05).

@ From 1989Du03 (Si(Li)).

& From 1989Du03; a calibration uncertainty of 6% has been added in quadrature with the statistical uncertainty.

^{165}Ho(n,γ) E=thermal: γγ Coin 2000Pr10

2000Pr10: 99% purity Ho metal target; Ge x–ray detector (Eγ=20–465 keV; FWHM=1.39 keV at 305 keV), Ge detector (Eγ=59–760 keV; FWHM=2.2 keV at 305 keV); measured γγ coin (resolving time 23 ns). Additional data taken using 99.99% purity Ho oxide target; HPGe and Ge(Li) detectors (FWHM=1.9 and 2.1 keV, respectively, at 1332 keV). Measured Eγ, Iγ, γγ coin; deduced intermediate level energies for two–photon cascades to known low–energy states. See also 2000Pr03 (included in ^{165}Ho(n,γ) E=thermal data set) which incorporates some of these results.

^{166}Ho Levels

E(level)†	Comments
0.0	
54.3‡	
82.6‡	
171.1‡	
180.5‡	
191.7‡	
262.1‡	E(level): probably includes both the 260.7 and 263.8 levels from Adopted Levels.
329.9‡	
348.4‡	
372.1‡	E(level): probably includes both the 372.0 and 373.1 levels from Adopted Levels.
416.2‡	
430.1 *10*	
453.9‡	
475.9 *12*	
483.1 *11*	
522.2‡	
543.0 *8*	
548.1‡	
563.7 *11*	
593.8 *7*	Corresponds to adopted level at 592.5.
599.5 *18*	E(level): probably a multiplet including the adopted 597.0 and 598.4 levels.
651.5 *8*	
658.1 *5*	
668.3 *4*	
683.3 *15*	
701.5 *16*	No other evidence exists for this level.
717.0 *14*	
719.7 *15*	
757.7 *10*	
770.3 *7*	
790.1 *20*	Possibly a doublet including the adopted 788.6 and 792.8 levels, but γ deexcitation pattern agrees with neither.
807.9 *20*	Probable multiplet; levels adopted at 806.6 and 807.0 could not have been resolved in this experiment and the presence of an additional level cannot be ruled out. A 434γ and 546γ are known to deexcite the adopted 806.6 level but they should be accompanied by much stronger 336γ and 325γ, neither of which is seen here.
816.0 *10*	
826.1 *16*	
832.7 *12*	
873.6 *24*	Probable multiplet including levels adopted at 870 and 876.
881.9 *9*	Possible multiplet including levels adopted at 881.2 and 884.0.
891 *5*	Possible multiplet including levels adopted at 885.4, 891.1 and 895.5.
906.0 *10*	
947.1 *6*	
953.4 *11*	
960.3 *18*	
973.7 *18*

1028.7 *15*	
1029.0 *12*	
1030.2 *7*	
1035.8 *6*	
1053.9 *7*	
1060.8 *6*	

Continued on next page (footnotes at end of table)

^{165}Ho(n,γ) E=thermal: γγ Coin 2000Pr10 (continued)

^{166}Ho Levels (continued)

E(level)†	Comments
1062.7 *9*	Adopted J=2,4 for this level but the proposed deexciting gammas feed levels with Jπ including 5+ and 4− and 1−, so some placements are presumably incorrect.
1087.8 *10*	
1099.8 *11*	
1115.3 *12*	Possible doublet; levels are adopted at 1114.7 and 1118.7.
1121.2 *7*	
1134.3 *15*	This may be a doublet; levels are adopted at 1131.0 and 1135.0.
1137.9 *5*	
1143.4 *16*	
1155.5 *27*	
1161.5 *10*	
1166.2 *18*	Possible doublet; Eγ values for deexciting transitions consistent with levels at 1164 and 1167 keV.
1189.9 *11*	

† Authors' values. These have larger and more realistic uncertainties than would be obtained from a least−squares fit to the Eγ data. Further, it should be noted that the level density is high and, in some cases, the energies are for multiplets.
‡ Difference between capture state energy and energy of gate for sum spectrum (2000Pr10).

γ(^{166}Ho)

E(level)	Eγ†	Iγ‡	Comments
	ˣ405.4 *6*	0.4 *1*	E(primary γ)=5656.5, E(sum gate)=6062.2.
	ˣ426.8 *12*	0.2 *1*	E(primary γ)=5635.1, E(sum gate)=6062.2.
	ˣ427.4 *9*	0.8 *2*	E(primary γ)=5443.4, E(sum gate)=5870.6.
	ˣ516.4 *7*	0.5 *2*	E(primary γ)=5534.6, E(sum gate)=6051.0.
	ˣ593.1 *9*	0.5 *2*	E(primary γ)=5173.5, E(sum gate)=5766.6.
	ˣ596.1 *9*	0.7 *3*	E(primary γ)=5564.0, E(sum gate)=6160.1.
	ˣ773.8 *11*	0.5 *2*	E(primary γ)=5386.3, E(sum gate)=6160.1.
	ˣ892.6 *6*	0.5 *1*	E(primary γ)=5179.0, E(sum gate)=6071.6.
	ˣ945.4 *13*	0.5 *2*	E(primary γ)=5116.3, E(sum gate)=6062.2.
430.1	238.5 *1*	5.7 *4*	
475.9	304.2 *2*	2.5 *3*	
	420.5 *6*	0.5 *2*	
483.1	220.1 *4*	0.6 *1*	Probably feeds the adopted 260.7 level.
	303.6 *5*	0.5 *1*	Placement not adopted; Eγ expected from Adopted Gammas is 301.4 and I(304γ)/I(220γ) here is much too large for the 304γ to have been unnoticed in independent studies in which the 220γ was observed.
543.0	488.0 *8*	0.3 *1*	
	543.8 *7*	5.0 *15*	I(544γ)/I(488γ) is much larger than the adopted value; possibly, γ is contaminated in this experiment.
563.7	391.6 *6*	0.4 *1*	
	508.2 *8*	0.3 *1*	
593.8	401.5 *2*	2.3 *3*	
	414.0 *6*	0.3 *1*	
599.5	408.8 *6*	0.5 *1*	Based on Eγ, this γ probably deexcites the 598.4 level.
	421.7 *7*	0.3 *1*	Not included in Adopted Gammas; this Eγ implies a level at 602.2 *7* for which no other evidence exists.
	426.7 *4*	0.9 *2*	Probably a doublet deexciting both the adopted 597.0 and 598.4 levels. From adopted branching for 597 level, I(427γ)/I(543γ)=0.069 *27*, so I(427γ) from 597 level expected here is 0.07 *3* leaving 0.83 *20* to deexcite the 598 level.
	543.1 *4*	1.0 *2*	Deexcites 597.0 level.
651.5	304.1 *7*	0.8 *3*	
	596.6 *6*	0.4 *1*	
658.1	328.2 *4*	1.3 *3*	
	477.5 *7*	0.3 *1*	
668.3	488.0 *5*	0.3 *1*	
	613.9 *6*	0.5 *1*	Iγ: I(614γ)/I(488γ) is much larger than the adopted value; possibly, γ is contaminated in this reaction.
683.3	491.6 *7*	0.3 *1*	Not included in Adopted Gammas; none of the previously−known transitions from the 683 level is present and no γ with this energy has been reported in (n,γ) E=thermal.
701.5	369.6 *10*	0.7 *3*	

Continued on next page (footnotes at end of table)

^{165}Ho(n,γ) E=thermal: γγ Coin 2000Pr10 (continued)

γ(^{166}Ho) (continued)

E(level)	Eγ†	Iγ‡	Comments
717.0	456.0 *1*	7.1 *5*	Probably deexcites the 719.7 level instead; see comment on 347.6γ. Eγ would be consistent with placement from the 719.7 level if γ fed the 263.8 (rather than the 260.7) member of the 262.1–keV doublet.
	715.4 *8*	3.3 *11*	
719.7	347.6 *7*	0.8 *3*	Based on Adopted Gammas, this γ should be accompanied by an order of magnitude stronger 455.6γ; probably the 456.0γ which 2000Pr10 place from a separate 717.0 level.
757.7	426.9 *9*	0.6 *3*	Omitted from Adopted Gammas; Iγ too large for transition to have been missed in (n,γ) E=thermal.
	578.1 *7*	0.3 *1*	
770.3	421.9 *5*	1.9 *5*	
790.1	598.4 *7*	0.2 *1*	May deexcite the adopted 788.6 or 792.8 level but other gammas known to deexcite those levels are not seen here and no γ with the appropriate energy for the former placement has been reported in (n,γ) E=thermal. Not included in Adopted Gammas.
807.9	394.8 *9*	0.9 *3*	Presumably does not deexcite either 806.6 or 807.0 level because those placements would imply E3 or M4 multipolarity, respectively. Omitted from Adopted Levels, Gammas.
	433.1 *8*	0.3 *1*	Deexcites the 806.6 level in Adopted Levels, Gammas.
	479.2 *11*	0.4 *2*	Not included in Adopted Gammas because it is unclear which member of a probable 808 multiplet is deexcited by it.
	545.4 *5*	0.5 *1*	Deexcites the 806.6 level in Adopted Levels, Gammas.
	628.4 *8*	0.4 *2*	Not included in Adopted Gammas because it is unclear which member of a probable 808 multiplet is deexcited by it.
816.0	401.4 *2*	5.8 *8*	Not included in Adopted Gammas; Eγ fits placement poorly and γ is far too strong to have been overlooked in other studies that excited this level.
	442.6 *2*	2.4 *3*	
	485.2 *10*	0.5 *2*	The evaluator considers this placement to be doubtful since it implies M2 multipolarity for the 485γ.
	554.4 *3*	1.1 *2*	
	624.1 *1*	3.9 *3*	
826.1	456.3 *4*	0.7 *2*	Placement not adopted. This Eγ would imply the existence of a level for which no other evidence exists.
	563.3 *5*	0.5 *1*	
	633.2 *3*	1.4 *2*	
832.7	652.2 *7*	0.3 *1*	
873.6	546.6 *5*	1.5 *3*	
	614.6 *9*	0.3 *1*	
	692.4 *7*	0.3 *1*	
	790.0 *10*	0.5 *2*	
	816.1 *4*	1.0 *2*	Based on Eγ, this γ probably deexcites the 870 level in Adopted Levels.
881.9	511.5 *2*	4.9 *5*	Not included in Adopted Levels, Gammas. Presumably does not deexcite 882 level because it is too strong to have been overlooked in other studies; also Eγ fits placement poorly.
	620.5 *7*	0.6 *2*	
	690.2 *4*	0.7 *2*	
	708.9 *6*	0.5 *1*	Deexcites level adopted at 881.1 keV.
	798.3 *4*	3.0 *5*	Deexcites level adopted at 881.1 keV.
	826.9 *3*	2.0 *3*	Deexcites level adopted at 881.1 keV.
891	519.0 *7*	0.6 *2*	
	545.7 *6*	1.2 *4*	Eγ suggests that this γ deexcites the level adopted at 895.5. Not included in Adopted Gammas.
	626.6 *7*	0.4 *1*	
	708.6 *10*	0.3 *2*	Not included in Adopted Gammas; Eγ implies that it deexcites a level at 899.5 keV.
	714.7 *5*	0.7 *2*	Eγ suggests that this γ deexcites the level adopted at 885.4. Not included in Adopted Gammas.
	716.1 *7*	0.8 *3*	Eγ suggests that this γ deexcites the level adopted at 895.5. Not included in Adopted Gammas.
	805.4 *7*	1.2 *3*	Not included in Adopted Gammas; E3 multipolarity required if γ deexcites the 891.1 level.
906.0	714.3 *1*	5.1 *4*	
	734.4 *3*	0.6 *1*	
947.1	774.9 *3*	0.7 *1*	
	892.4 *5*	1.3 *3*	
953.4	624.6 *10*	0.5 *2*	
	898.1 *10*	0.4 *2*	
960.3	542.6 *7*	1.0 *3*	
	700.1 *3*	1.3 *2*

(6242.6 *6*)	3–,4–	E(level): deduced from Eγ=6188.3 assuming E=54.2 for the first excited state of ^{166}Ho. This differs from S(n)=6243.64 *2* (2003Au03); all primary γ energies from 1970Bo29 appear to be approximately 1 keV low. Jπ: assuming s–wave capture by Jπ=7/2– target; p–wave capture is expected to be relatively small (1970Bo29).

† From 1970Bo29, except as noted.

‡ The assignments are from 1970Bo29, except as noted. They are based on the measured reduced intensities in average resonance capture, coupled with empirical reduced intensities to final states with known Jπ values.

^{165}Ho(n,γ) E=2 keV 1970Bo29,2000Pr03 (continued)

γ(^{166}Ho)

1970Bo29 and 2003Pr03 have measured the average γ spectrum that results when neutrons in a relatively broad band of energy (FWHM of the order of several hundred eV) are captured in many resonances. From the γ–ray line shapes, 1970Bo29 conclude that all the γ rays they observed are primary γ rays.

1970Bo29 state that their data suggested that more than six γ rays are present in the 5559.1γ–5584.4γ range.

† From 1970Bo29; the authors have corrected for the 0.65 keV shift due to the non–zero energies of the captured resonance neutrons; thus, the energies they reported are those that would be expected in thermal–neutron capture. However, they are consistently lower than the similarly–corrected Eγ from 2000Pr03 by about 1 keV. Uncertainties include 0.6 keV systematic uncertainty.

‡ Relative reduced photon intensity, IγEγ^{-3}, from 1970Bo29 for a ^{10}B absorber thickness of 0.107 g/cm^2; see 1970Bo29 for reduced intensities for ^{10}B absorber thicknesses of 0.036 and 0.418 g/cm^2. Relative reduced intensities from 2000Pr03, defined instead as IγEγ^{-5}, are given in comments; values for M1 transitions are about a factor of 6 lower than those for E1 transitions.

§ Probably a doublet.

Placement of transition in the level scheme is uncertain.

^{166}Ho Levels (continued)

E(level)[†]	I(p) (45°)[‡]	Comments
1605 *4*	5 *2*	Other E: 1604 *1* (1965St06).
1615 *4*	8 *1*	
1623 *2*	10 *1*	E(level): from 1965St06; 1623 *4* in 2000Pr03.
1636 *4*	9 *1*	
1642 *1*	6 *1*	E(level): from 1965St06; 1643 *4* in 2000Pr03.
1654 *4*	8 *1*	
1677 *4*	5 *1*	
1686 *4*	4 *1*	
1692 *4*	38 *2*	
1697	12 *1*	E(level): reported energy (1687 *4*) appears to be a misprint since it is listed out of numerical order. 1697 seems a reasonable possibility.
1702 *4*	5 *1*	
1717 *4*	10 *1*	
1723 *5*	8 *1*	
1731 *5*	20 *1*	
1745 *5*	27 *2*	
1753 *5*	16 *1*	
1759 *5*	14 *10*	
1765 *5*	54 *20*	
1779 *5*	22 *3*	
1784 *5*	21 *3*	
1788 *5*	35 *3*	

† From 2000Pr03, except as noted. 1965St06 reported additional levels at 308 *3*, 401 *2*?, 942 *3*, 1105 *1*, 1122 *2*, 1312 *1*, 1661 *1*; since they were not confirmed in 2000Pr03, either they do not belong in ^{166}Ho or are unresolved doublets.

‡ Relative proton intensity at 45°. See 2000Pr03 for relative proton intensities at 15° and 30°.

§ From 2000Pr03, based on band structure deduced from comparison between the experimental cross section and theoretical cross sections calculated for available low–lying Nilsson orbitals and the DWBA.

\# (A): Kπ=0–, (π 7/2[523])–(ν 7/2[633]) band. Jπ established by cross section fingerprint for J=1 through 5 members of this configuration.

@ (B): Kπ=7–, (π 7/2[523])+(ν 7/2[633]) band. Jπ established by cross section fingerprint for J=7 through 9 members of this configuration.

& (C): Kπ=3+, (π 7/2[523])–(ν 1/2[521]) band. Jπ established by cross section fingerprint for J=3 through 7 members of this configuration.

a (D): Kπ=5+ band. Configuration: (π 3/2[411]+ν 7/2[633])+(π 7/2[523]+ν 3/2[521]).

b (E): Kπ=6+, (π 7/2[523])+(ν 5/2[512]) band.

c (F): Kπ=4+, (π 7/2[523])+(ν 1/2[521]) band. Jπ established by cross section fingerprint for J=4 through 6 members of this configuration.

d (G): Kπ=1+, (π 7/2[523])–(ν 5/2[523]) band. Jπ established by cross section fingerprint for J=1 through 5 members of this configuration.

e (H): Kπ=2+ band. (π 3/2[411]–ν 7/2[633])+(π 7/2[523]–ν 3/2[521]) band.

f (I): Kπ=1+, (π 7/2[523])–(ν 5/2[512]) band. Jπ established by cross section fingerprint for J=1 through 6 members of this configuration.

g (J): Kπ=3+, (π 1/2[411])–(ν 7/2[633]) band.

h (K): Kπ=4+, (π 7/2[523])+(ν 1/2[510]) band.

i (L): Kπ=4+, (π 1/2[411])+(ν 7/2[633]) band.

j (M): Kπ=3+, (π 7/2[523])–(ν 1/2[510]) band.

k (N): Kπ=5–, (π 7/2[523])+(ν 7/2[633])–Q_{22} band.

l (O): Kπ=6+, (π 7/2[523])+(ν 5/2[523]) band.

m (P): Kπ=2+, (π 7/2[523])–(ν 3/2[521]) band.

$^{167}Er(d,^{3}He)$ 2000Pr03

Target Jπ=7/2+.
E(d)=27 MeV; Q3D spectrograph with proportional chamber (cathode strip readout) and scin, FWHM≈9 keV; 95.6% ^{167}Er target; θ(lab)=30°, 40°, 50°; E(level)≤1.2 MeV; DWBA and Nilsson model calculations.

^{167}Er(t,α) 1982De37 (continued)

^{166}Ho Levels (continued)

† From 1982De37, based on comparison of measured cross sections with DWBA calculations for specific Nilsson orbitals, unless otherwise noted.
‡ From comparison of σ(θ)(exp) and σ(θ)(DWBA).
§ dσ/dΩ at 35° in μb/sr.
# (A): Kπ=0−, (π 7/2[523])−(ν 7/2[633]) band.
@ (B): Kπ=7−, (π 7/2[523])+(ν 7/2[633]) band.
& (C): Kπ=5+ band. (π 3/2[411])+(ν 7/2[633]) and (π 7/2[523])+(ν 3/2[521]).
a (D): Kπ=2+ band. (π 3/2[411])−(ν 7/2[633]) and (π 7/2[523])−(ν 3/2[521]).
b (E): π=+ band 1. Configuration of (π 1/2[411])−(ν 7/2[633]) assigned to this band in 1982De37 is assigned to a different band in Adopted Levels.
c (F): Kπ=0+, (π 7/2[404])−(ν 7/2[633]) band. Jπ established by cross section fingerprint for J=0 through 3 members of this configuration.
d (G): π=+ band 2. Configuration of (π 1/2[411])+(ν 7/2[633]) assigned to this band by 1982De37 is assigned to a different band in Adopted Levels.
e (H): Kπ=7+, (π 7/2[404])+(ν 7/2[633]) band.
f (I): Kπ=1+, (π 5/2[413])−(ν 7/2[633]) band. Jπ established by cross section fingerprint for J=1 through 5 members of this configuration.
g (J): Kπ=6+, (π 5/2[413])+(ν 7/2[633]) band.
h (K): Kπ=6−, (π 5/2[532])+(ν 7/2[633]) band.
i Not adopted; configuration nominated in 1982De37 is now assigned to a different level sequence.

Adopted Levels, Gammas

Q(β⁻)=−3038 *12*; S(n)=8474.6 *19*; S(p)=7316.0 *9*; Q(α)=830.3 *12* 2003Au03.
For finestructure, hyperfine structure and isotope shift data see, e.g., 1989Kr16, 2000As04.

Other Reactions:.
^{167}Er(^{3}He,αγ), E=45 MeV: measured primary γ spectra; deduced level density and γ−ray strength function; see, e.g., 2001Me07. Observed pygmy resonance at E=2.98 *8* MeV with Γ=1.3 *3* MeV.
^{148}Nd(^{18}O,γ), E=78 MeV: measured γ(θ) for gammas emitted by the GDR in hot ^{166}Er at moderate excitation energy and spin (1993Br09, 1994Ca11).

^{166}Er Levels

The evaluator has not included the 1784.8 level from (n,n'γ). A comparison of branching of 1704γ and 1889γ, placed from 1969 level in ε decay, suggests that this level is being seen in both reactions and that entire Iγ(1704γ) in (n,n'γ) can be assigned to the 1969 level. The 1784γ is placed only from the 1865 level in ε decay with assignment of the 1704γ entirely to the 1969 level, the alternative placement of the 1784γ from a possible 1785 level is less convincing.
For discussion of structure of one−phonon states see, e.g., 2006De30.

Adopted Levels, Gammas (continued)

^{166}Er Levels (continued)

E(level)†	XREF
4442@	F

† From least–squares fit to Eγ, omitting the 646.8γ from the 2160 level, the 1053γ from the 1964 level, and all three placements for the 1216.173γ because these transitions have Eγ values that deviate from the expected value by at least 5σ. Exceptions are noted.

‡ Deduced from measured $\Gamma_{\gamma0}^2/\Gamma$ and $\Gamma_{\gamma1}/\Gamma_{\gamma0}$, in (γ,γ') assuming $\Gamma=\Gamma_{\gamma1}+\Gamma_{\gamma0}$. Thus, deduced $T_{1/2}$ will be an upper limit if branches exist to levels other than the g.s. and the 81–keV level.

§ Assignments for J<16 g.s. band members are based on known Jπ of g.s., the E2 transition between J=2 and 0 members and large B(E2) for excitation of levels in multiple Coulomb excitation.

Assignments based on (^{3}He,d) or (α,t) cross section and (^{3}He,d) to (α,t) cross section ratios.

@ From ^{165}Ho(^{3}He,d),(α,t).

& Fit to a band, unless otherwise noted.

a (A): Kπ=0+ g.s. band. A=13.9, B=–12.8×10^{-3}.

b (B): Kπ=2+ γ–vibrational band. A=12.44, B=–10.4×10^{-3}.

c (C): Kπ=(2)– octupole vibrational band. K=2 octupole–vibrational states are strongly Coriolis mixed with Kπ=4– two–quasiproton 7/2[523]+1/2[411] states for J≥4. K=2 dominates in 1458, 1514,1596 and 1692 levels, K=4 dominates in 1572 and 1666 levels and K=2 and K=4 amplitudes are comparable in E>1692 levels (see 1974Ka02 and 1989Ad12; see also 2000Gr33). Attribution of predominant K=2 character has been based on mixing calculations from 1989Ad12. The 1458, 1514 and 1596 level energies imply A=10.75, B=–0.034.

d (D): Kπ=(4)– band. Kπ=4– two–quasiproton 7/2[523]+1/2[411] states strongly mixed with Kπ=2– octupole vibration states (please see comment on that band). Attribution of predominant K=4 character has been based on mixing calculations from 1989Ad12.

e (E): Kπ=0+ band. A=11.7, B=–0.05.

f (F): Kπ=0– band.

g (G): Kπ=3– band (1993Li12). Configuration: 7/2[523]–1/2[411].

h (H): Kπ=4+ band (1993Li12). Configuration: 7/2[523]+1/2[541]; established from (α,t), (^{3}He,d) cross section fingerprint for observed band members.

i (I): Kπ=7– band (1993Li12). Configuration: 7/2[523]+7/2[404].

j (J): Kπ=(5–) band (1975Pa15). Configuration: 7/2[633]+3/2[521].

k (K): Kπ=1+ band.

l (L): Kπ=2– band. Configuration: 7/2[523]–3/2[411].

m (M): Kπ=3+ band. Configuration: 7/2[523]–1/2[541]; established from (α,t), (^{3}He,d) cross section fingerprint for observed band members.

n (N): Kπ=8+ band. Configuration: 7/2[523]+9/2[514].

o (O): Kπ=1+? band (1993Li12). Possible configuration: 7/2[523]–9/2[514].

p (P): Kπ=1– band. Configuration: 7/2[523]–5/2[402].

q (Q): Kπ=(6–) band (1975Pa15). Configuration: 7/2[633]+5/2[523].

r (R): Kπ=(4–) band (1975Pa15). Configuration: 7/2[633]+1/2[521].

s (S): Kπ=(3–) band (1975Pa15). Configuration: 7/2[633]–1/2[521].

t (T): Possible Kπ=4+, γγ vibration band (1998Fa15).

\# Data for this γ are discrepant (χ^2 exceeds critical value).
@ statistical outlier based on Chauvenet criterion; datum excluded from average.
s Iγ data were reported relative to I(810γ)=80.0; values have been scaled so I(810γ)=79.0, the value adopted here.
d for doublet.
e weighted average with uncertainty expanded to encompass most precise datum.

Iγ normalization: the absolute intensity per decay for the 184γ determined from activity measurements is 0.699 *14* (1989Da18), 0.7258 *22* (1994Mi22), 0.7021 *35* (1996Mo11), 0.724 *7* (2000Hi01), 0.726 *5* (2002Be04). No β^- feeding is expected from the (7)− ^{166}Ho parent to the 0+ g.s., 2+ 80.6 level or the 4+ 265 level. Σ(I(γ+ce) to 265 level) + Σ (I(γ+ce) for crossover transitions to g.s. and 81 level)=100 implies Iγ normalization=0.731 *9* and Σ(I(γ+ce) to 81 level)+I(γ+ce)(786γ)+I(γ+ce)(859γ)=100 implies Iγ normalization=0.723 *6*; the evaluator adopts the weighted average of these two values and the five absolute measurements, viz., 0.720 *4*. However, Σ(I(γ+ce) to g.s.)=100 implies Iγ normalization=0.773 *11* which gives an unphysical intensity imbalance at the 81 level, suggesting that the adopted I(81γ) is too low.

^{166}Ho β^- Decay (1200 y) (continued)

$\gamma(^{166}$Er) (continued)

§ From Adopted Gammas.

The recommended I(521γ)=0.227 *6* is for a doublet. Based on I(786γ+705γ)=0.045 *9* here and the adopted 786 level branching of I(521γ)/I(786γ+705γ)=0.00911 *25*, I(521γ from 786 level)=0.00041 *8* is expected in this decay. This represents a negligible fraction of the doublet intensity, so I(521γ from 1596 level)=0.227 *6* is adopted.

@ Eγ and branching assumed from Adopted Gammas.

& For absolute intensity per 100 decays, multiply by 0.720 *4*.

a Placement of transition in the level scheme is uncertain.

x γ ray not placed in level scheme.

x2861.4 *10*		0.0043 *15*		

† From 1989Ad11, except as noted.

‡ Deduced from α(K)exp=ce(K)/Iγ normalized to α(K)(778.90γ)=4.79×10^{-3} (E2 theory), ce(K) from 1979Ad06, Iγ from 1989Ad11, except as noted.

§ Measured Eγ=1119.50 *4* (Iγ=1.35 *5*) is doublet, Iγ divided by 1989Ad11. α(K)exp=0.00089 *22* for doublet (1993BaZS).

\# Measured Eγ=194.678 *15* (Iγ=4.34 *13*) is doublet, Iγ divided by 1989Ad11.

@ Measured Eγ=646.75 *4* (Iγ=0.117 *6*) is doublet, Iγ divided by 1989Ad11.

& Eγ deviates by at least 5σ from value expected for this placement. Datum excluded from least–squares fit.

a if the unplaced 1641γ in ε decay corresponds to the 1641γ deexciting a 1722 level in (n,n'γ), then one should also see a 1456.6γ in ε decay. From Iγ(1456.6γ)/Iγ(1641.2γ)=0.78 *16* in (n,n'γ) and I(1641γ)=0.127 *15* in ε decay, one expects Iγ(1456γ)=0.099 *24* for a possible 1456.6 *10* transition in ε decay. This could have been masked by the 1457.17γ, with Iγ=0.35 *5*. However, if present, Iγ(1457γ) from the 2243.1 level in ε decay should then be decreased to 0.25 *6*.

b For absolute intensity per 100 decays, multiply by 0.191 *11*.

d Multiply placed; undivided intensity given.

e Multiply placed; intensity suitably divided.

f Placement of transition in the level scheme is uncertain.

x γ ray not placed in level scheme.

† From least–squares fit to Eγ.
‡ From Adopted Levels.
§ (A): Kπ=0+ g.s. band.
# (B): Kπ=2+ γ–vibrational band.
@ (C): Kπ=(2−) band. In Adopted Levels, the 1787 level is assigned, instead, to a Kπ=4− band which is strongly mixed with this Kπ=2− band.
& (D): Kπ=(0+) band.
a (E): Kπ=(2−,5−) band. In Adopted Levels, the 1514, 1692 and 2246 levels are assigned, instead, to the Kπ=(2−) band based on the 1458 level, and the 1665 and 2328 levels are assigned to a Kπ=(4)− band (based on a 1572 level that 1985Fi04 do not observe) which mixes strongly with the 2− band. Different or no band assignments are adopted for the 1992 and2091 levels.
b (F): Kπ=(5−) band (1985Fi04). Band not adopted. In Adopted Levels, the 1827 and 2144 levels are assigned, respectively, to Kπ=2− and 4− bands, which are strongly Coriolis mixed. (The latter band is based on a 1572 level which 1985Fi04 do not observe.).

† From 1979Pa15, except as noted. If level is observed in both (^{3}He,d) and (α,t), the mean of the two energies is given.
‡ Assignments based on (^{3}He,d) or (α,t) cross section and (^{3}He,d) to (α,t) cross section ratios.
§ dσ/dΩ at 60° and Eα=27 MeV for the (α,t) reaction (μb/sr) (1979Pa15).
# Definite Jπ assigned based on cross section fingerprint.
@ From 1993Li12. Uncertainty not stated by authors.
& (A): Kπ=0+ g.s. band. Configuration: 7/2[523]−7/2[523].
a (B): Kπ=2+ γ−vibrational band.
b (C): Mixed Kπ=2− and 4− bands. K=2 octupole−vibrational states are strongly Coriolis mixed with Kπ=4− two−quasiproton 7/2[523]+1/2[411] states for J≥4. K=2 dominates in 1458, 1514, 1596, and 1692 levels, K=4 dominates in 1572 and 1666 levels and K=2 and K=4 amplitudes are comparable for the E>1692 levels (see mixing calculations in 1989Ad12).
c (D): Kπ=3− band. Configuration: 7/2[523]−1/2[411].
d (E): Kπ=4+ band. Configuration: 7/2[523]+1/2[541]; established from (α,t), (^{3}He,d) cross section fingerprint for observed band members.
e (F): Kπ=7− band. Configuration: 7/2[523]+7/2[404].
f (G): Kπ=2− band. Configuration: 7/2[523]−3/2[411].
g (H): Kπ=3+ band. Configuration: 7/2[523]−1/2[541]; established from (α,t), (^{3}He,d) cross section fingerprint for observed band members.
h (I): Kπ=8+ band. Configuration: 7/2[523]+9/2[514].
i (J): Kπ=1+? band. Possible configuration: 7/2[523]−9/2[514].
j (K): Kπ=1− band. Configuration: 7/2[523]−5/2[402].

^{166}Er(γ,γ') 1996Ma18,1976Me04,1973Me17

Other studies: 1991Zi01.
1973Me17: bremsstrahlung E=1.6–4.2 MeV; measured σ(98°) and σ(127°) (1976Me04).
1996Ma18: bremsstrahlung endpoint energy=3.55 MeV; 95.5% ^{166}Er metal target; HPGe detector, 3 Ge detectors, true−coaxial HPGe Compton polarimeter with 8−crystal BGO Compton shield; θ=95°, 127°; measured Eγ, integrated cross section, γ anisotropy, γ polarization; deduced Γ_0, $\Gamma_{\gamma0}^2/\Gamma$, $\Gamma_{\gamma1}/\Gamma_{\gamma0}$, Jπ, K.

^{166}Er Levels

Values of K, deduced by 1996Ma18 from measured $\Gamma_{\gamma1}/\Gamma_{\gamma0}$, are given in comments on the relevant levels.

E(level)†	Jπ#	$T_{1/2}$‡	$\Gamma_{\gamma0}^2/\Gamma$ (meV)§	Comments
0.0	0+			
80.6	2+			E(level): rounded value from Adopted Levels. Jπ: from Adopted Levels.
1663 *1*	1−	5.2 fs *5*	13.9 *16*	E(level): from 1991Zi01. K=(0) (1996Ma18). $\Gamma_{\gamma0}^2/\Gamma$: weighted average of 15.2 *17* (1996Ma18) and 17.1 *11* (1991Zi01, from reported $\Gamma_{\gamma1}/\Gamma_{\gamma0}$=1.50 *4* and $\Gamma_{\gamma0}$=42.8 meV 28) and 12.0 *8* (1976Me04).
1812 *1*	1(+)	34 fs *7*	5.5 *10*	E(level): from 1973Me17. $T_{1/2}$: value becomes 39 fs *7* based on adopted branching. $\Gamma_{\gamma0}^2/\Gamma$: weighted average of 7.0 *9* (1996Ma18) and 4.8 *6* (1976Me04). K=1 (1996Ma18).
1830		45 fs *8*		E(level): from 1973Me17; not reported in 1996Ma18. $T_{1/2}$: $\Gamma_{\gamma0}\Gamma_{\gamma1}/\Gamma$=1.8 *3* meV (1973Me17); deduced by evaluator from authors' calculated $\Gamma_{\gamma0}$ and assumed $\Gamma_{\gamma1}/\Gamma$. Assuming adopted I(1749γ):I(1830γ)=100.0 *21*:29.9 *5* and J=1, this gives Γ=10.1 *17* meV.
2055?				From 1976Me04. $\Gamma_{\gamma0}^2/\Gamma$=0.8 *5* meV if the only branch is to the g.s.

† From level energy difference, except as noted.

‡ Relative branching based on ($\Gamma_{\gamma1}/\Gamma_{\gamma0}$) calculated by evaluator from experimental R=($\Gamma_{\gamma1}/\Gamma_{\gamma0}$)($E_{\gamma0}/E_{\gamma1}$)^3 in 1996Ma18, except as noted. Values of $\Gamma_{\gamma1}/\Gamma_{\gamma0}$ are given in comments.

§ ΔJ from γ anisotropy (1996Ma18), Δπ from γ linear polarization (1976Me04, except as noted).

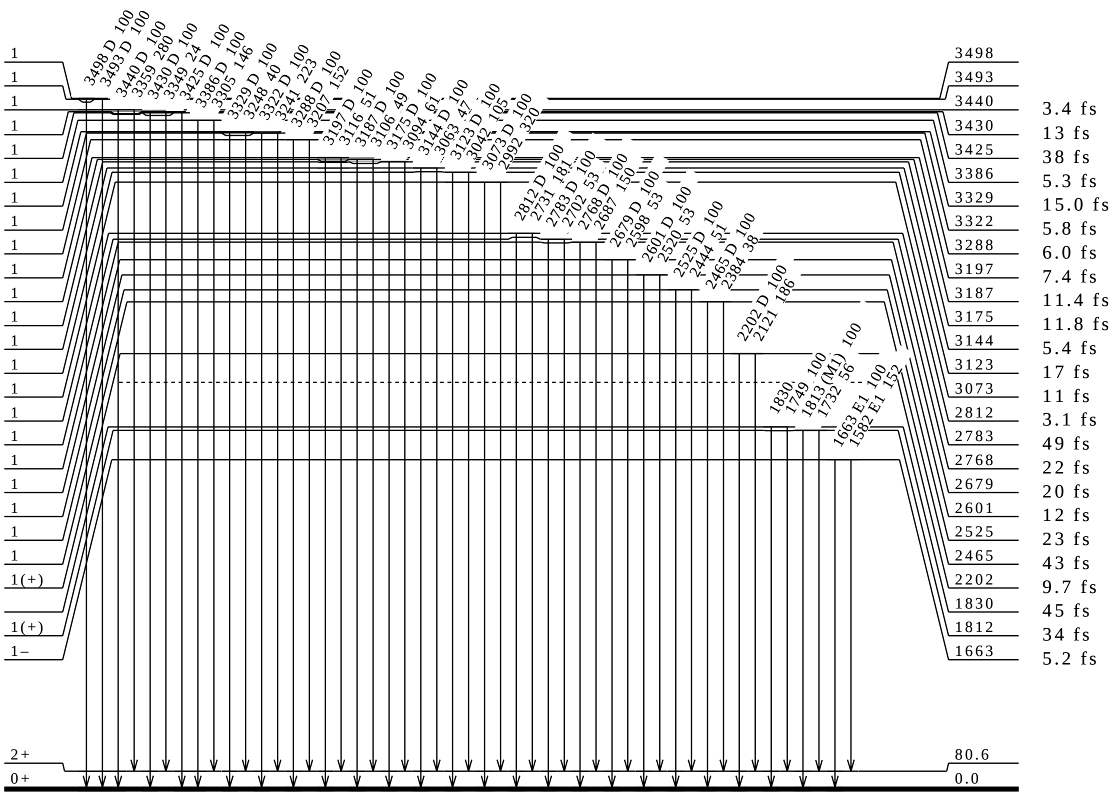
Level Scheme

Intensities: relative photon branching from each level



^{166}Er(n,n'γ) 1992Be29,1982Bo39,1981Bo40

Others: 2000De59, 1997Ga11, 1997Ga13.

1997Ga11, 1997Ga13: E(n)=1.4 to 3.2 MeV, using nearly monoenergetic neutrons from the ^{3}H(p,n) reaction; 98% enriched ^{166}Er target; HPGe detector (FWHM=2.1 keV at 1332 keV); measured excit (E(n)=1.4–3.1 MeV), γ(θ) (E(n)=2.1 MeV, 10 angles; 2.5 MeV, 11 angles), γγ coin (E(n)=3.2 MeV), $T_{1/2}$ using DSAM; searched for two–phonon γ–vibrational states. See also 2000Ga22.

1992Be29: reactor neutrons; 96.1% ^{166}Er enriched oxide target; Ge detector (FWHM=2.4 keV at 1300 keV); two–crystal Compton polarimeter; measured Eγ, Iγ, γ(θ) (θ=90°, 105°, 115°, 125°, 135°, 142° and 150°), γ linear polarization. See also 1991Be38 and 2000De59. 2000De59 (which supersedes 1999DeZX) reanalyses γ(θ) for six transitions.

1981Bo40: E=reactor spectrum; 96.3% ^{166}Er target; Ge(Li) detector (FWHM=3 keV at Eγ=700); measured Eγ, Iγ. See also 1982Bo39.

For further discussion of band structure, see 2000Gr33.

^{166}Er Levels

CITATION:
Nuclear Data Sheets (1992)

^{166}Er(n,n'γ) 1992Be29,1982Bo39,1981Bo40 (continued)

^{166}Er Levels (continued)

E(level)[†]	Jπ[‡]	Comments
2459.0? *10*		Jπ: 1992Be29 suggest J=(2), but this is inconsistent with negative A_2 for 2459γ(θ).
2504.6 *11*	(3,4)+	

[†] From least–squares fit to Eγ, assigning ΔE=1 keV to Eγ data for which the authors gave no uncertainty.
[‡] From 1992Be29, based on deduced band structure and γ(θ) data for interconnecting transitions, except as noted.
[§] (A): Kπ=0+ ground–state band.
[#] (B): Kπ=2+ band.
[@] (C): Kπ=2– band. Note that, in Adopted Levels, the J=5, 1666 level is assigned to a Kπ=4– band which is strongly mixed with the 2– band.
[&] (D): Kπ=0+ band.
[a] (E): Kπ=0– band.
[b] (F): Kπ=0+ band. Not adopted. One of the three levels associated with this band in (n,n'γ) (at 1785 keV) is not adopted and the available information concerning the 1703 and 1969 levels is quite limited.
[c] (G): Kπ=1+ band.
[d] (H): Kπ=1–? band. Not adopted. The 1918 level is adopted, instead, as the bandhead of a 3– band, and no band assignment is adopted for the 1– 1831 level.
[e] The evaluators have not included the 1784.8 level from (n,n'γ). A comparison of branching of 1704γ and 1889γ, placed from 1969 level in ε decay, suggests that this level is being seen in both reactions and that entire Iγ(1704γ) in (n,n'γ) can be assigned to the 1969 level. The 1784γ is placed only from the 1865 level in ε decay with assignment of the 1704γ entirely to the 1969 level; the alternative placement of the 1784γ from a possible 1785 level is less convincing.

γ(^{166}Er)

A_2 and A_4 from γ(θ), and γ linear polarization data (P(γ)), are given in comments on the relevant γ rays.
See 2000De59 and 1999De37 for discussion of relative signs of mixing ratios for low–lying transitions connecting the g.s. band and/or the γ and β bands.

γ(^{166}Er) (continued)

Eγ[†]	E(level)	Iγ[‡]	Mult.[§]	Comments
2120.5 *10*	2201.8	1.9 *9*	D+Q	Mult.: A_2=−0.05 *4*, A_4=−0.07 *5* (1992Be29). Shown as unplaced in 1992Be29.
[x]2134.5 *10*		1.9 *9*	D+Q	Mult.: A_2=−0.15 *3*, A_4=+0.01 *5* (1992Be29). Eγ is consistent with placement from the 2134 level, but multipolarity is inconsistent with that placement if J(2134)=3+ as proposed in 1992Be29.
2177[c]	2442.1?		D+Q	Eγ: from 1992Be29. Mult.: A_2=+0.06 *5*, A_4=−0.12 *7* (1992Be29). δ: −3.2 *+11−7* or −0.19 *+8−9* (1992Be29) if J(2441)=3; +2.3 *+6−5* or −0.41 *10* (1992Be29) if J(2441)=4.
2185[c]	2265.6?		Q(+D)	Eγ: from 1992Be29. Mult.: A_2=−0.06 *6*, A_4=−0.25 *8* (1992Be29). δ: −0.47 *+14−19* or 1/δ=−0.02 *+12−13* (1992Be29).
2202[bc]	2201.8	1.0[b] *5*		Mult.: A_2=−0.31 *6*, A_4=−0.04 *8* (1992Be29) for doubly−placed γ. δ: −0.11 *+5−8* or −2.7 *+5−6* (1992Be29) for doublet.
	2282.6?	1.0[b] *5*		Mult.: A_2=−0.31 *6*, A_4=−0.04 *8* (1992Be29) for doubly−placed γ. δ: −0.11 *+5−8* or −2.7 *+5−6* (1992Be29) for doublet..
2424	2504.6			Eγ: from 1992Be29. Mult.: A_2=+0.18 *4*, A_4=−0.05 *6* (1992Be29). δ: δ(D,Q)=+0.36 *+6−4* or +9 *+7−3* (1992Be29) if J(2506 level)=3, but γ(θ) does not rule out stretched Q.
2459[c]	2459.0?			Eγ: from 1992Be29. Mult.: A_2=−0.014 *7*, A_4=+0.17 *10* (1992Be29); not consistent with stretched Q.

† From 1981Bo40, except as noted.

‡ Photon intensity normalized to Iγ(847γ,^{56}Fe)=1000 for the equal weight of ^{56}Fe and ^{166}Er. Data are from 1981Bo40, except as noted; they are not corrected for the angular distributions of the transitions, but the authors do not expect those corrections to exceed 10–15%.

§ Based on γ(θ) and linear polarization data from 1992Be29.

\# γ probably misplaced because, based on adopted branching from the 2160 level, Iγ here is far too large relative to I(2079γ).

@ Placement shown as tentative and γ omitted from Adopted Gammas because γ is absent in ε decay even though its branching here is too large for transition to have been missed in the ε decay studies.

& I(521γ doublet)=3.9 *5*. From adopted I(521γ)/I(705γ)=0.0172 *4* and I(705γ)=84 *5* in (n,n'γ), I(521γ from 786 level)=1.5 *2* leaving Iγ=2.4 *5* to be placed elsewhere. From adopted I(521γ)/I(736γ)=0.668 *18* and I(736γ)=6.7 *5* in (n,n'γ), one expects I(521γ from 1596 level)=4.5 *8*, leaving no intensity for the proposed placement from the 1978 level. Consequently, the evaluator does not include a 521γ from the 1978 level.

a Multiply placed; intensity suitably divided.

b Multiply placed; undivided intensity given.

c Placement of transition in the level scheme is uncertain.

x γ ray not placed in level scheme.

^{166}Er(pol p,p'),(^{3}He,^{3}He'), (α,α') 1992Ka07,1984Ic01,1983Ro11

Others: 1968He24 ((α,α'), E=50 MeV).

1992Ka07: E=30 MeV/nucleon; 97.69% ^{166}Er target; RAIDEN magnetic spectrograph with two–dimensional position sensitive proportional counter, dual single–wire proportional counter and plastic scintillator; θ(lab)=10°– 95° for (p,p'), 10°– 62° for (^{3}He,^{3}He') and (α,α'); measured σ(θ) for all three reactions, analyzing power for (p,p'); coupled channels analysis, folding–model calculations; deduced quadrupole moments of deformed optical potentials.

1984Ic01: (pol p,p'), E=65 MeV; 97.69% ^{166}Er target; RAIDEN magnetic spectrograph (FWHM=20–26 keV) with two–dimensional position sensitive proportional counter, dual single–wire proportional counter and plastic scintillator; measured E(p'), σ(θ), analyzing power (θ=11° –35° in 1° steps, θ=36° –70° in 2° steps); coupled channels analysis; deduced deformation parameters, multipole moments; observed J=0,2,4,6 members of g.s. band and J=2,4 members of γ band. 1986Ic02 and 1987Ic04 extended and further refined analysis.

1983Ro11: (pol p,p'), E(p)=133.9 MeV; 96% enriched ^{166}Er target; magnetic spectrometer with with helical wire counter backed by two plastic scintillators (FWHM=45 keV); measured E(p'), σ(θ) and asymmetry (θ(lab)=22.5° – 70° in 2.5° steps).

^{166}Er Levels

For deduced moments of deformed optical potential and/or imaginary and spin–orbit potential deformation parameters, see 1983Ro11, 1984Ic01, 1984Ic02, 1992Ka07.

Coulomb Excitation 1992Fa01,1992Th04,1996Br09

Other measurements: 1963Yo09, 1970Ka45, 1972Er04, 1973Be40, 1974Wo01, 1974Sh12, 1972Do01, 1974Ke04, 1977Ke06, 1977Wo03, 1978Mc02, 1983Hu01, 1986Do13, 1992Br07, 1994OsZZ (and 1994KuZY), 1996Fa21, 1998Fa15.

Model–dependent deformation parameters deduced from Coulomb excitation: see 1970Ap03, 1972Er04, 1972Yu03, 1973Be40, 1973He28, 1975Le22, 1977Fi01.

1998Fa15: (^{58}Ni,^{58}Ni'γ), E=240 MeV; GASP spectrometer, two position–sensitive parallel–plate avalanche detectors; measured Eγ, γ(θ) and γγ coin gated by scattered projectiles.

1996Br09: (^{58}Ni,^{58}Ni'γ), E=165, 210, 225 MeV; measured γ(θ,H,T) in polarized Gd (IMPAC technique); deduced g–factors.

1996Fa21: (^{58}Ni,^{58}Ni'γ), E=225 MeV; one high resolution Ge detector and circular segmented Si detector, all surrounded by the Heidelberg Darmstadt Crystal Ball spectrometer array of 160 NaI detectors, operated in coincidence with Ge and Si detectors. Measured Eγ, γγ coin.

1994OsZZ: (^{74}Ge,^{74}Ge'γ), E=295 MeV; (^{58}Ni,^{58}Ni'γ), E=235 MeV; four Ge–BGO γ spectrometers; measured Eγ, Iγ; observed g.s. band to 16+ state, γ band to 10+ state, and candidate for γγ vibrational state; data analysis performed using GOSIA code. See also 1994KuZY.

1992Br07: (^{58}Ni,^{58}Ni'γ), E=210 MeV; parallel–plate avalanche counter (for backscattered projectiles), four Ge detectors; Gd ferromagnetic host; measured Eγ, Iγ(θ,H,t); deduced g–factors.

1992Fa01: (^{16}O,^{16}O'γ), E=57 MeV; (^{32}S,^{32}S'γ), E=115, 120 MeV; (^{58}Ni,^{58}Ni'γ), E=221 MeV; E(beam) at center of 96% ^{166}Er target was 56, 112, 117, 214 MeV, respectively. Two parallel–plate avalanche detectors, annular surface–barrier detector, four Ge detectors. Measured Eγ, Iγ and γ(θ), gated with scattered projectiles.

1992Th04: (^{58}Ni,^{58}Ni'γ), E=227 MeV; 96.24% ^{166}Er target, Ni backing; Measured lifetimes using the Recoil Distance Method (RDM).

1986Do13: ^{166}Er(^{58}Ni,^{58}Ni'γ), E=160, 200 MeV; HPGe detector; measured g–factors using transient field technique.

1983Hu01: ^{166}Er(α,α'γ), E=12.5 MeV; ^{166}Er(^{16}O,^{16}O'γ), E(^{16}O)=48 MeV; measured particle–γ coincidence σ, inelastic σ, Ge(Li) and silicon surface–barrier detectors.

1978Mc02: ^{166}Er(α,α'γ), E=14 MeV; measured Iγ, Eγ, γ(θ); Ge(Li).

1977Wo03: ^{166}Er(α,α'γ), E=11.5–12 MeV.

1977Ke06: ^{166}Er(^{56}Fe,^{56}Fe), (^{84}Kr,^{84}Kr'); E(^{56}Fe)=232 MeV, E(^{84}Kr)=348 MeV; measured Eγ (Ge(Li)).

1978Mc02 proposed a 2+ level at 1159 keV and deexcited by 1159γ, 1078γ, 373γ. These γ's probably arise from an impurity, based on their absence in the (n,n'γ) reaction study in 1981Bo40.

^{166}Er Levels

Values for Q have been estimated by the evaluator from the static (diagonal) matrix elements in table 3 of 1992Fa01 using the relation Q= <J M(E2) J>x $[16\pi\ J(2J-1)/(5(2J+1)(2J+3)(J+1))]^{1/2}$, unless noted to the contrary. They are not included in Adopted Levels.

$^{166}_{68}Er_{98}$–140

^{167}Er(d,t),(^{3}He,α) 1979Pa15

Target Jπ=7/2+.
1979Pa15: E(d)=15 MeV (FWHM=7–8 keV) and E(^{3}He)=24 MeV (FWHM≈21 keV); magnetic spectrograph, photographic emulsions; measured dσ/dΩ.
Other measurement: 1969Bu01.

† From least−squares fit to Eγ.
‡ Values given without comment are based on deduced band structure in (^{11}B,5nγ) and transition multipolarities.
§ D+Q 245γ to (10+) 605+x.
\# (A): Kπ=6−, α=0 (π 7/2[404])+(ν 5/2[523]) band.
@ (B): Kπ=6−, α=1 (π 7/2[404])+(ν 5/2[523]) band.
& (C): Kπ=6+, α=0 (π 7/2[523])+(ν 5/2[523]) band. Note that adopted J values are two units higher than shown in (α,3nγ) and π is opposite. The configuration proposed in (α,3nγ) differs also.
a (D): Kπ=6+, α=1 (π 7/2[523])+(ν 5/2[523]) band. See comment on signature partner of this band.
b (E): Kπ=6−, α=0 (π 7/2[523])+(ν5/2[642]) band.
c (F): Kπ=6−, α=1 (π 7/2[523])+(ν5/2[642]) band.
d (G): Kπ=6+, α=0 (π 7/2[404])+(ν5/2[642]) band. Note that adopted J values are one unit higher than shown in (α,3nγ).
e (H): Kπ=6+, α=1 (π 7/2[404])+(ν 5/2[642]) band. See comment on signature partner of this band.
f (I): Kπ=2+,3+, α=0 (π 1/2[411])⊗(ν 5/2[642]) band. Note that adopted J values are one unit higher than shown in (α,3nγ).
g (J): Kπ=2+,3+, α=1 (π 1/2[411])⊗(ν 5/2[642]) band. See comment on signature partner of this band.
h (K): Kπ=2−,3−, α=0 (p1/2[541])⊗(ν 5/2[642]) band. Note that adopted J values are one unit higher than shown in (α,3nγ) and π is opposite. The configuration proposed in (α,3nγ) differs also. From the adopted Kπ=3− configuration=(π 1/2[541])+(ν 5/2[642]).
i (L): Kπ=2−,3−, α=1 (p1/2[541])⊗(ν 5/2[642]) band. See comment on signature partner of this band.
j (M): Kπ=2+,3+, α=0 (π 1/2[541])⊗(ν 5/2[523]) band. Note that adopted J values are one unit higher than shown in (α,3nγ) and π is opposite. The configuration proposed in (α,3nγ) differs also.
k (N): Kπ=2+,3+, α=1 (π 1/2[541])⊗(ν 5/2[523]) band. See comment on signature partner of this band.
l (O): α=1 band including (21+) 3699+x level.
m (P): Kπ=1+,2+, α=0 (π 1/2[541])⊗(ν 3/2[521]) band.
n (Q): Kπ=1+,2+, α=1 (π 1/2[541])⊗(ν 3/2[521]) band.
o (R): Kπ=1+, α=0 (π 7/2[404])−(ν 5/2[642]) band.
p (S): Kπ=1+, α=1 (π 7/2[404])−(ν 5/2[642]) band.
q (T): Kπ=1−, α=0 (π 7/2[523])−(ν 5/2[642]) band. Note that adopted J values are three units higher than shown in (α,3nγ). The configuration proposed in (α,3nγ) differs also.
r (U): Kπ=1−, α=1 (π 7/2[523])−(ν 5/2[642]) band. See comment on signature partner of this band.
s (V): Possible band fragment (1995Ma07). Observed only in (α,3nγ).

^{166}Yb ε Decay 1973De22,1963Ja06,1959Gr06

Parent ^{166}Yb: E=0; Jπ=0+; $T_{1/2}$=56.7 h *1*; Q(g.s.)=305 *14*; %ε decay=100.
Others: 1959Br17, 1961Gr33, 1963Pa08, 1967Bu14, 1995Ma07.

^{166}Tm Levels

E(level)†	Jπ‡	$T_{1/2}$	Comments
0.0	2+	7.70 h *3*	
82.29 *2*	1+	385 ps *40*	$T_{1/2}$: from Adopted Levels. <3 ns (1973De22, K x ray–82γ delayed coin), <0.45 ns (1966Ja16).

† From Eγ.
‡ From Adopted Levels.

$β^+$,ε Data

Eε	E(level)	Iε†	Log *ft*	Comments
(223 *14*)	82.29	100	4.91 *8*	εK=0.748 *9*; εL=0.191 *7*; εM+=0.0612 *23*. εK(exp)/ε=0.73 *+6–2* (1963Ja06).

† Absolute intensity per 100 decays.

γ(^{166}Tm)

No new γ rays attributable to ^{166}Yb decay found for 10–keV<Eγ<150–keV; authors deduce a limit of 0.3% for such gamma–rays (1973De22). No γ rays attributable to ^{166}Yb decay found for 20–keV<Eγ<65–keV; limit Iγ<0.05 Iγ(82.3γ) (1967Bu14). No γ rays attributable to ^{166}Yb decay found for 86–keV<Eγ<250–keV; limit Iγ<0.003 Iγ(82.3γ) (1967Bu14).
No transitions with 20≤Eγ≤500 were found in coincidence with 82.3γ (1995Ma07).
Iγ(Tm K x ray)/Iγ(82.3γ)=8.68 *21* (1973De22); =8.17 *23* (1963Ja06).

Eγ	E(level)	Mult.	α	I(γ+ce)†	Comments
82.29 *2*	82.29	M1	5.43	100	ce(K)/(γ+ce)=0.707 *6*; ce(L)/(γ+ce)=0.1075 *19*; ce(M)/(γ+ce)=0.0240 *5*; ce(N+)/(γ+ce)=0.00646 *12*. ce(N)/(γ+ce)=0.00561 *11*; ce(O)/(γ+ce)=0.000806 *15*; ce(P)/(γ+ce)=4.35×10^{-5} *8*. † Absolute intensity per 100 decays.

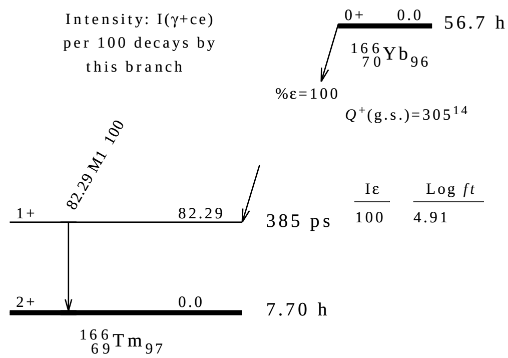
^{166}Yb ε Decay 1973De22,1963Ja06,1959Gr06 (continued)

Decay Scheme



^{160}Gd(^{11}B,5nγ),^{164}Dy(^{6}Li,4nγ) 2002Ca46,1996Dr07

2002Ca46:
^{160}Gd(^{11}B,5nγ), E(^{11}B)=61 MeV; GASP array (40 Compton–suppressed large volume Ge detectors, and a multiplicity filter of 80 BGO elements); measured Eγ, Iγ (for E(^{11}B)=61 MeV), γγ coin, γγ(θ)(DCO).
^{164}Dy(^{6}Li,4nγ), E(^{6}Li)=38 MeV. Measured lifetimes in the 10–100 ns range using a high resolution planar Ge detector and an 11–element NaI(Tl) multiplicity filter.

1996Dr07: ^{160}Gd(^{11}B,5nγ) E=57–66 MeV; 95.1% ^{160}Gd metallic target; pulsed beam; three HPGe detectors (two low energy detectors and one coaxial). Isomers in ^{166}Tm identified. Measured Eγ, Iγ (for E(^{11}B)=61 MeV), γγ coin, $T_{1/2}$ (recoil shadow method).

^{166}Tm Levels

E(level)†	Jπ‡	$T_{1/2}$	Comments
0.0[e]	2+		
0+x[f]	(3+)		E(level): x<16 keV from estimated Eγ<50 keV for (4+) to 2+ transition.
33.65+x[e] *8*	(4+)		
74.92+x[f] *4*	(5+)		
109.34+x[§] *5*	(6−)	340 ms *25*	E(level): 1996Dr07 assumed that the isomer depopulated via an unseen transition of energy x<25 keV. However, based on energy differences, 2002Ca46 find x=0.2 *5* and conclude that the isomer decays directly via a 34.42γ to the 75+x level. $T_{1/2}$: 34.4γ(t) (1996Dr07). Other: 370 ms *40* from K x ray(t) (1996Dr07). Pulsed beam (1 s on, 4 s off).

† ΔE assigned as 0.1 keV for Iγ>5 and 0.3 keV for Iγ≤5 based on a general statement by 2002Ca46 that uncertainties range from 0.1 keV to 0.3 keV.

‡ From α(exp) data based on intensity balance (2002Ca46), when available. From DCO ratios, otherwise; measurements were made using gates on stretched Q transitions, θ_1=(31.7°, 36°, 144°, 148.3°), and θ_2=90°.

§ From 2002Ca46, except as noted. Uncertainties range from 10% to 50%, depending on the intensity and complexity of the peak in the gamma–ray spectrum.

From authors' analysis of DCO ratio data (2002Ca46).

Others: 1988Pe08 (E(α)=40 MeV; Dumond curved crystal spectrometer); 1982El02 (Eα=41 MeV).
1995Ma07: ^{165}Ho(α,3nγ), Eα=32.6 to 47.9 MeV; iron–free double orange β spectrometer with NE102 plastic scintillator (FWHM=1.4 at 125 keV), curved–crystal spectrometer (reflection orders n=1, 2, 3, 5 recorded, energy resolution≈50 eV at 100 keV for n=2), two Ge detectors (one planar and one 65 cm^3 coaxial). Measured Eγ, γγ coin (15 ns FWHM), Iγ, γ(θ), I(ce) (prompt and delayed), ce–ce coin.
1992Dr03: Eα=32.6, 38.1, 43.1, 47.9 MeV; two intrinsic HPGe detectors and a curved–crystal spectrometer; measured Eγ, Iγ, γγ coin (15 ns FWHM), γ(θ) (15° –90°), γ(t).

2725.7?[@] *11*	18+	E(level): not adopted. In Adopted Levels, Gammas, a 569.7γ feeds the 2121 level, not the 605.2γ suggested in 1995Ma07.
2906.4+x[e] *8*	20−	

† From least−squares fit to Eγ.
‡ Authors' values based on deduced band structure and transition multipolarities.
§ (A): Kπ=6−, α=0 (π 7/2[404])+(ν 5/2[523]) band. 1995Ma07 assigned only the bandhead but a number of unplaced transitions associated with this band were placed by the evaluator in accord with Adopted Levels, Gammas.
# (B): Kπ=6−, α=1 (π 7/2[404])+(ν 5/2[523]) band. See comment on signature partner of this band.
@ (C): Kπ=2+, α=0 (π 1/2[411])−(ν 5/2[642]) band. Note that adopted J values are one unit higher than shown here.
& (D): Kπ=2+, α=1 (π 1/2[411])−(ν 5/2[642]) band. See comment on signature partner of this band.
a (E): Kπ=3+, α=0 (π 1/2[411])+(ν 5/2[642]) band. Note that adopted J values are one unit higher than shown here and π is opposite. The configuration proposed in 1995Ma07 also differs from the adopted Kπ=3− configuration=(π 1/2[541])+(ν 5/2[642]).
b (F): Kπ=3+, α=1 (π 1/2[411])+(ν 5/2[642]) band. See comment on signature partner of this band.
c (G): Kπ=3−, α=0 (π 1/2[411])+(ν 5/2[523]) band. Note that adopted J values are one unit higher than shown here and π is opposite. The configuration proposed in 1995Ma07 also differs from the adopted Kπ=3+ configuration=(π 1/2[541])+(ν 5/2[523]).
d (H): Kπ=3−, α=1 (π 1/2[411])+(ν 5/2[523]) band. See comment on signature partner of this band.
e (I): Kπ=6−, α=0 (π 7/2[523])+(ν 5/2[642]) band.
f (J): Kπ=6−, α=1 (π 7/2[523])+(ν 5/2[642]) band.
g (K): Kπ=5−, α=0 (π 7/2[404])+(ν 3/2[521]) band. Note that adopted J values are two units higher than shown here and π is opposite. The configuration proposed in 1995Ma07 also differs from the adopted Kπ=6+ configuration=(π 7/2[523])+(ν 5/2[523]).
h (L): Kπ=5−, α=1 (π 7/2[404])+(ν 3/2[521]) band. See comment on signature partner of this band.
i (M): Kπ=6+, α=0 (π 7/2[404])+(ν 5/2[642]) band. Note that adopted J values are one unit higher than shown here.
j (N): Kπ=6+, α=1 (π 7/2[404])+(ν 5/2[642]) band. See comment on signature partner of this band.
k (O): Kπ=4−, α=0 (π 7/2[404])+(ν 1/2[521]) band. Note that adopted J values are three units higher than shown here. The configuration proposed in 1995Ma07 also differs. From the adopted Kπ=1− configuration=(π 7/2[523])−(ν 5/2[642]).
l (P): Kπ=4−, α=1 (π 7/2[404])+(ν 1/2[521]) band. See comment on signature partner of this band.
m (Q): Band #1.
n (R): Band #2.
o (S): Possible band fragment.

[†] From 1995Ma07; many of these data were already reported in 1992Dr03. Eγ data for the six transitions measured by 1988Pe08 using a curved−crystal spectrometer are in excellent agreement.

Footnotes continued on next page

^{165}Ho(α,3nγ) 1995Ma07,1992Dr03 (continued)

γ(^{166}Tm) (continued)

‡ From ce data of 1995Ma07, when available; otherwise, from γ(θ) data. 1995Ma07 normalized photon and electron intensity scales using unspecified transitions of known multipolarity from other reaction channels or from ^{166}Tm decay. γ(θ) data combined with 15 ns FWHM for γγ coin have been used by the evaluator to rule out Δπ=yes for a number of transitions, based on RUL.

§ From authors' analysis of γ(θ) (1992Dr03), except as noted.

Delayed transition (1995Ma07).

@ 1995Ma07 report a close doublet in their curved–crystal spectrometer data; Eγ=74.920 *3*, Iγ=23.5 *25* and Eγ=74.903 *11*, Iγ=11.021, the former being the isomeric transition.

& Placement not adopted. In Adopted Levels, Gammas, Eγ=478.3 *3* is placed in the signature partner of the band suggested here and an interband Eγ=479.1 *1* feeds the 875+Z level. However, no other evidence exists for excitation of the signature partner band in (α,3nγ) and the intraband 461.9γ expected to accompany the interband 479γ is absent in (α,3nγ).

a Placement of transition in the level scheme is uncertain.

b Multiply placed; undivided intensity given.

c Multiply placed; intensity suitably divided.

x γ ray not placed in level scheme.

Er(p,xnγ) 1976Sv01

^{167}Er(p,2nγ), E(p)=8–12 MeV; 91.5% ^{167}Er target.
^{166}Er(p,nγ), E(p)=10, 12 MeV; 94.9% ^{166}Er target.
1976Sv01 report a few weak transitions, attributed to ^{166}Tm, observed during their investigations of ^{165}Tm and ^{167}Tm using Er(p,xnγ) reactions. Detectors: LEPS, FWHM 0.5 keV at 80 keV (for Eγ<300 keV); Si(Li) detector mounted in magnetic spectrometer with 16% momentum resolution (for ce measurements). Measured Eγ, E(ce), ce(t).

† From least–squares fit to Eγ, assigning 1 keV uncertainty to data for which authors did not state an uncertainty.
‡ Values given without comment are based on band structure deduced in the (α,xnγ), (^{16}O,4nγ) and (^{40}Ar,4nγ) reaction studies and supported in part by transition multipolarities.
§ The half–lives of excited states are from (^{40}Ar,4nγ), unless otherwise noted.
# Based on known Jπ=0+ for the g.s. bandhead, stretched E2 character for the 102γ connecting the J=0 and 2 members and stretched Q character for a number of other intraband transitions, firm Jπ assignments are adopted for J≤22 members of the g.s. band.
@ Based on established Jπ=7− for the 1959 level and regular progression of Eγ and Iγ for cascade gammas in band, many of which are stretched Q.
& The regularity and the stretched Q character of the cascade transitions populating the (6)− 1865 level justify the classification of this cascade as a band.
a Based on established Jπ=8+ and 10+ for the 2030 and 2215 levels, respectively, and E2 character of the 375γ connecting the J=16 and 14 members of the band, firm Jπ assignments have been adopted for the J=8 through 36 members of this band.
b Tentatively assigned on the basis of systematics (1984Fi18).
c Fit to a band.
d (A): Kπ=0+ g.s. band. A=16.99, B=−=0.027.
e (B): Kπ=2+ γ–vibrational band. A=13.86, B=0.021 (even J); A=17.58, B=−0.036 (odd J).
f (C): Kπ=0+ β–vibrational band. A=17 if B=0.
g (D): Kπ=(0)− band. π=− for band is established by E1 1165γ and 843γ to π=+ g.s. levels.
h (E): Kπ=5−, α=1 band.
i (F): Kπ=5−, α=0 band.
j (G): Kπ=(2−) band.
k (H): π=+ super band. Becomes yrast for J≥16.

^{166}Lu ε Decay (2.65 min) 1974De09,2007Mc08

Parent ^{166}Lu: E=0. ; Jπ=6−; $T_{1/2}$=2.65 min *10*; Q(g.s.)=5570 *30*; %ε+%$β^+$ decay=100.

2007Mc08: measured γγ(θ) out−of−beam for three cascades using 8 Compton suppressed segmented YRAST Ball Clover HPGe detectors. These data are a byproduct of a study of ^{168}Ta ε decay for which the source was produced using 130−MeV ^{16}O bombardment of ^{159}Tb; the ^{166}Lu component may be a mixture of all three isomers, but the 6− isomer's presence is confirmed by the observation of the 997γ which is known from that decay but not from the 0− or 3(−) isomer decays.

† The total intensity of γ rays not placed in the decay scheme is 14%; consequently, Iε and log *ft* values are given for only the strongest branches, and the values for the 2233 level alone can be considered to be reliable.
‡ E($β^+$) to the 2233−keV level has been measured as 2225 keV *160*.
§ Absolute intensity per 100 decays.
# Existence of this branch is questionable.

^{166}Lu ε Decay (2.65 min) 1974De09,2007Mc08 (continued)

γ(^{166}Yb)

1974De09 pointed out that the following γ rays definitely belong to ^{166}Lu decay but could not be assigned with sufficient certainty to one of the three activities. The intensity given for these lines is normalized to the ground–state decay values of ^{166}Lu.

β^+,ε Data (continued)

† Absolute intensity per 100 decays.
‡ Existence of this branch is questionable.

γ(^{166}Yb)

Iγ normalization: The normalization is based on the assumption that the ε+β^+ feeding to the ground state of ^{166}Yb is first–forbidden; log *ft*>5.9 then implies a g.s. branch of <24%, so Σ(I(γ+ce) to g.s.)=88 *12*.

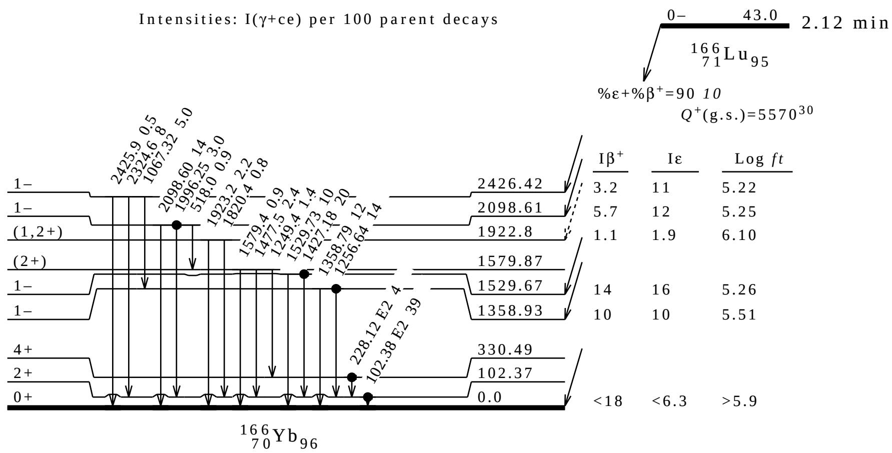
† From 1974De09.
‡ From Adopted Gammas.
§ For absolute intensity per 100 decays, multiply by 0.135 *45*.

^{166}Lu ε Decay (2.12 min) 1974De09 (continued)

Decay Scheme

Intensities: I(γ+ce) per 100 parent decays



^{124}Sn(^{48}Ca,6nγ) 1994Ol04

Other: 2001Bu11; E=215 MeV; measured recoil–gated conversion electron spectra with and without a gate on the L line of the 228–keV 4+ to 2+ g.s. band transition in ^{166}Yb.

1994Ol04: E=210, 220 and 225 MeV; 97% ^{124}Sn target stack; HERA array consisting of 20 Compton–suppressed Ge detectors and an inner ball of 40 BGO detectors; measured Eγ and γγ coin.

† From least–squares fit to Eγ, assigning ΔE=1 keV for all data.

‡ (A): ((π 7/2[523])+(π 7/2[404]))(ν $i_{13/2}^{2}$)? band. Configuration assignment supported by large B(M1)/B(E2) ratios, bandhead energy and crossing frequency arguments (1994Ol04).

§ (B): ((π 7/2[523])+(π 7/2[404]))(ν $i_{13/2}^{2}$)? band. See comment on signature partner of this band.

γ(^{166}Yb) (continued)

† From DCO ratios, assigning Δπ=(no) for stretched Q intraband transitions, unless otherwise noted. Note that expected values for DCO ratios from 1987Be07 are 2 for stretched D and 1 for Q (ΔJ=2) or D (ΔJ=0); however, due to deorientation of the reference state, values for expected ΔJ=2 transitions from J>10 states are systematically low (DCO=0.50 *17* in the worst case).

‡ From 1987Be07, unless otherwise noted. ΔE=0.2 keV, except for weakest transitions; ΔE=0.5 keV for the latter and the evaluator assigns this uncertainty if Iγ≤5.

§ From ^{130}Te(^{40}Ar,4n), E(^{40}Ar)=180 MeV (1987Be07). Iγ data are mostly obtained from gated coincidence spectra and normalized to the 228.1γ. Intensity values are known to 10%, except for weakest peaks for which uncertainties can be up to 50%. The evaluator assumes the latter to be those for which Iγ≤5.

From Adopted Gammas.

@ Q from DCO ratio; not M2 from RUL.

& Multiply placed; undivided intensity given.

a Placement of transition in the level scheme is uncertain.

† From least–squares fit to Eγ.
‡ From 1984Fi18.
§ (A): K=0+ g.s. band.
# (B): K=2+ γ–vibrational band.
@ (C): K=0+ β–vibrational band.
& (D): Kπ=5–, α=1 band.
a (E): Kπ=5–, α=0 band.
b (F): Super band. Becomes yrast for J≥16.
c (G): Kπ=0– band.
d (H): Kπ=(2–) band.
e g–factor=−0.14 *4* (1983Na14), deduced from measured multipolarities and branching ratios of the interband transitions.
f Assigned by evaluator, consistent with Adopted Levels.
g The adopted band assignment is shown here. 1984Fi18 assigned level as J=13 member of 0– band instead.
h The adopted band assignment is shown here. 1984Fi18 assigned level as J=11 member of 0– band instead.
i From Adopted Levels.

γ(^{166}Yb)

γ(θ): A_2,A_4, extracted by 1967Ne02, 1972Li34 (or 1972Be39).

† From γ(θ), assigning Δπ=(no) for stretched Q intraband transitions, unless otherwise noted.

‡ From 1984Fi18, unless otherwise noted. 1984Fi18 report ΔE=0.1 keV; however, that uncertainty appears to have been underestimated based on the large number of energies that differ by at least 3σ from the value expected from a least−squares fit to Eγ. The evaluator has, therefore, increased the uncertainty to 0.3 keV to overcome this problem.

§ From ^{164}Er(α,2nγ), Eα=24 MeV (1984Fi18, except as noted). Iγ data are from 55° singles spectrum.

\# 1984Fi18 report α(K)exp=0.0118 *6* for the 507.4 triplet.

@ 1984Fi18 report α(K)exp=0.014 *4* for the 445.4 doublet.

& 1984Fi18 report α(K)exp=0.016 *6* (cf. 0.018 *4* in 1983Fi12) for the 713.3 doublet.

a Placement of transition in the level scheme is uncertain.

b Multiply placed; undivided intensity given.

x γ ray not placed in level scheme.

2114.2+x[g] *17*	(17+)	D

† From least–squares fit to Eγ, assigning 1 keV uncertainty to data for which the authors gave no uncertainty.

‡ Values given without comment are based on deduced band structure. It should be noted, however, that different authors may disagree on the spin of a given level, even when they agree on the configuration assignment. See detailed comments on the individual bands.

§ Level energy is dependent on the validity of the 163γ and 251γ transitions linking the Kπ=2– and ΔJ=2 bands; these gammas were reported in (^{30}Si.3nγ) and (^{12}C,5nγ) but not in (^{19}F,5nγ).

\# Assignments for the lowest energy levels are consistent with systematics for neighboring nuclides (1974De09). Based on low–energy structure of odd–odd Lu isotopes, the 7/2[404], 1/2[411] and 5/2[402] proton orbitals are expected to lie lowest in energy (and at almost the same energy) for N=95, with the 1/2[541] and 9/2[514] orbitals at somewhat higher energy. Unhindered allowed ε decay from the g.s. to a ^{166}Yb level and a (ν 5/2[523]) g.s. for ^{165}Yb support the inclusion of the (ν 5/2[523]) orbital in the g.s. configuration in this mass region, so low–energy 6–, 3– and 0– levels are anticipated based on the Gallagher–Moszkowski rule, with 1– and 3+ states a little higher in energy.

@ (A): Kπ=6+, α=0 (π 7/2[404])+(ν 5/2[642]) band. J values are from (^{19}F,5nγ), based on level energy systematics for similar bands in neighboring odd–odd nuclei and checked by the alignment additivity rule; they are one unit higher than suggested in independent (^{12}C,5nγ) (1992Ho02) and (^{30}Si,3nγ) (2000Le25) studies.

& (B): Kπ=6+, α=1 (π 7/2[404])+(ν 5/2[642]) band. See comment on signature partner band.

a (C): Kπ=7–, α=0 (π 9/2[514])+(ν 5/2[642]) band (2000Le25). J values are based on energy systematics, the alignment additivity rule and systematics of signature inversion for low–lying states for yrast bands in odd–odd Lu isotopes; these values are from (^{19}F,5nγ) and (^{30}Si,3nγ) and they are one unit higher than suggested in an earlier (^{12}C,5nγ) study (1992Ho02).

b (D): Kπ=7–, α=1 (π 9/2[514])+(ν 5/2[642]) band (2000Le25). See comment on signature partner band.

c (E): ΔJ=2 band (2000Zh51). Assigned as Kπ=2+, α=0 (π 1/2[411])–(ν 5/2[642]) band (with Jπ(196 level)=6+) in (^{19}F,5nγ) (2000Zh51), based on similarity of level structure to that for the α=0 band in ^{162}Tm with the same configuration assignment. However, assigned as signature partner of the Kπ=2– (π 1/2[541])–(ν 5/2[642]) band (with Jπ(196 level)=7–) in (^{30}Si,3nγ) (2000Le25). If the adopted Jπ values for the α=0 (π 1/2[541])–(ν 5/2[642]) band are correct, the former configuration would imply M2 multipolarity for the three transitions linking it to the ΔJ=2 band. The alternative scenario is problematic also because a different band has already been assigned as the signature partner of the Kπ=2– band.

d (F): Kπ=2–, α=0 (π 1/2[541])–(ν 5/2[642]) band (2000Zh51). Configuration assignment supported by similarity of band structure to that for bands in ^{162}Tm and ^{164}Tm with the same configuration assignment (large signature splitting, low–spin signature inversion, delayed BC crossing and small B(M1) to B(E2) in–band cascade to crossover transition probability ratios) (2000Zh51).

e (G): Kπ=2–, α=1 (π 1/2[541])–(ν 5/2[642]) band (2000Zh51). α=1 sequence is observed only in (^{19}F,5nγ). See comment on signature partner of this band.

f (H): Kπ=5+, α=0 (π 5/2[402])+(ν 5/2[642]) band (2000Zh51). Configuration assignment supported by similarity of band structure to that for a ^{162}Tm band with the same configuration assignment. Strongly coupled, weakly populated band reported in (^{19}F,5nγ) alone.

g (I): Kπ=5+, α=1 (π 5/2[402])+(ν 5/2[642]) band (2000Zh51). See comment on signature partner of this band.

† From least−squares fit to Eγ, assigning equal weight to all data.
‡ Authors' values.
§ From Adopted Levels.
# (A): Kπ=6+, α=0 (π 7/2[404])+(ν 5/2[642]) band.
@ (B): Kπ=6+, α=1 (π 7/2[404])+(ν 5/2[642]) band.
& (C): Kπ=7−, α=0 (π 9/2[514])+(ν 5/2[642]) band. J values are based on energy systematics, the alignment additivity rule, and systematics of signature inversion for low−lying states for yrast bands in odd−odd Lu isotopes; they are one unit higher than suggested in an earlier (^{12}C,5nγ) study (1992Ho02).
a (D): Kπ=7−, α=1 (π 9/2[514])+(ν 5/2[642]) band. See comment on signature partner band.
b (E): π=−, α=1 (π 1/2[541])(ν 5/2[642]) band. Note that this band assignment differs from that in Adopted Levels.
c (F): π=−, α=0 (π 1/2[541])(ν 5/2[642]) band.

† From least–squares fit to Eγ, assigning equal weight to all Eγ data.

‡ Authors' values.

§ (A): Kπ=6+, α=0 (π 7/2[404])+(ν 5/2[642]) band. J values are based on level energy systematics for similar bands in neighboring odd–odd nuclei and checked by the alignment additivity rule; they are one unit higher than suggested in independent (^{12}C,5nγ) (1992Ho02) and (^{30}Si,3nγ) (2000Le25) studies.

(B): Kπ=6+, α=1 (π 7/2[404])+(ν 5/2[642]) band. See comment on signature partner band.

@ (C): Kπ=7−, α=0 (π 9/2[514])+(ν 5/2[642]) band.

& (D): Kπ=7−, α=1 (π 9/2[514])+(ν 5/2[642]) band.

a (E): Kπ=2+, α=0 (π 1/2[411])−(ν 5/2[642]) band. Assigned as π=−, α=1 (π 1/2[541])(ν 5/2[642]) band (with J values one unit higher than here) in two independent (HI,xnγ) studies (1992Ho02 and 2000Le25). Present assignment supported by similarity of level structure to that for α=0 band in ^{162}Tm with same configuration assignment.

b (F): Kπ=2−, α=0 (π 1/2[541])−(ν 5/2[642]) band. Configuration assignment supported by similarity of band structure to that for bands in ^{162}Tm and ^{164}Tm with the same configuration assignment (large signature splitting, low–spin signature inversion, delayed BC crossing and small B(M1) to B(E2) in–band cascade to crossover transition probability ratios) (2000Zh51).

c (G): Kπ=2−, α=1 (π 1/2[541])−(ν 5/2[642]) band. See comment on signature partner of this band. α=1 sequence is reported in this reaction alone.

d (H): Kπ=5+, α=0 (π 5/2[402])+(ν 5/2[642]) band. Configuration assignment supported by similarity of band structure to that for a ^{162}Tm band with the same configuration assignment. Very weakly populated, strongly coupled band reported in this reaction alone.

e (I): Kπ=5+, α=1 (π 5/2[402])+(ν 5/2[642]) band. See comment on signature partner of this band.

f Not adopted; tentative deexciting 719γ differs from adopted 736.2γ deexciting the J=22 band member.

g Not adopted; tentative deexciting 718.8γ differs from adopted 749.1γ deexciting the J=24 band member.

h From Adopted Levels, u=358.2.

i From Adopted Levels, z=196.0.

j From Adopted Levels, y=287.2.

k From Adopted Levels, x=189.8.

† From least−squares fit to Eγ, assigning 1 keV uncertainty to data for which the authors did not state an uncertainty.
‡ Values given without comment are from (^{74}Ge,4nγ) and based on deduced band structure, alignment gains, B(M1)/B(E2) ratios and comparison with structures in neighboring nuclides.
§ The half−lives of excited states are from recoil Doppler measurements in (HI,nγ), except as noted.
\# The interband transition between side band 1 and the ground−state band show angular distributions of pure stretched dipole type, most likely E1.
@ Transitions connecting the two side bands have positive anisotropies and are interpreted as mixed M1,E2 transitions (1987Bl06) in (HI,xnγ).
& Proposed by 1977Le08 in ε decay.
a (A): Kπ=0+ g.s. band. A=26.5 if B=0.
b (B): BC band (2000Ri11).
c (C): AB band (2000Ri11). Yrast above J=14. Alignment gain 10ħ at ħω≈0.25 MeV. Becomes ABCDfg band at high spin with possible admixture of ABEFfg.
d Jπ established for J=12 through J=42 band members based on smooth progression of Eγ for intraband cascade, Jπ=14+ for 3007 level and E2 intraband 275γ to 2566.
e (D): EFBC band (2000Ri11).
f (E): AGEF band (2000Ri11).
g (F): AGEH band (2000Ri11).
h (G): Kπ=10−, α=0 gfAE band (2000Ri11). Likely configuration: ν (5/2[642]+5/2[523])+ π (1/2[541]+9/2[514]); strongly supported by measured B(M1)/B(E2) ratios.
i (H): Kπ=10−, α=1 geAE band (2000Ri11). See comment on Kπ=10− signature partner band.
j (I): Kπ=5− AE band (2000Ri11). A=13.7 if B=0.
k (J): AF band (2000Ri11).
l (K): AGBC band (2000Ri11). Large alignment, consistent with four−quasineutron structure.
m (L): AHBC band (2000Ri11).
n (M): BE band (2000Ri11). Low alignment at low J.
o (N): BF band (2000Ri11).
p (O): Band 1 (2000Ri11).
q (P): Band 2 (2000Ri11).
r (Q): Band 3 (2000Ri11).
s (R): Kπ=2+ γ−vibrational band.

$^{166}_{72}$Hf$_{94}$–22

^{166}Ta ε Decay 2005Mc01,1977Le08

Parent ^{166}Ta: E=0; Jπ=(2)+; $T_{1/2}$=34.4 s *5*; Q(g.s.)=7760 *40*; %ε+%β^+ decay=100.
^{166}Ta produced using ^{159}Tb(^{16}O,9n) reaction at E=147 *5* MeV (1977Le08) or E=155 MeV (2005Mc01).
1977Le08: measured Eγ, Iγ, γγ coin, parent $T_{1/2}$.
2005Mc01: aluminized Kapton tape transport of reaction recoils to low background area; three Compton–suppressed Clover HPGe detectors and one low–energy photon spectrometer; measured Eγ (E<2400), Iγ, γγ coin, γγ(θ) (two cascades).

^{166}Hf Levels

The decay scheme is adopted from 2005Mc01; it differs significantly from that proposed in 1977Le08 on the basis of limited coincidence information. The authors of 2005Mc01 introduce new levels at 897, 1405, 1551 and 1603; they also reject those at 695, 852, 909, 1023, 1213 and 1447 proposed in 1977Le08. However, the deduced ε+β^+ feeding and the Jπ of the levels fed still fail to present an entirely consistent picture, suggesting that the scheme is incomplete, as might be expected given that Q=7760 and no Eγ>2400 transitions have been measured.

E(level)†	Jπ‡	$T_{1/2}$‡

† From least–squares fit to Eγ, assigning 1 keV uncertainty to each datum.
‡ Authors' values, based on band structure, alignment gains, B(M1)/B(E2) ratios and comparison with structures in neighboring nuclides.
§ (A): Kπ=0+ g.s. band.
# (B): BC band.
@ (C): AB band. Yrast above J=14. Alignment gain 10ħ at ħω≈0.25 MeV. Becomes ABCDfg band at high spin with possible admixture of ABEFfg.
& (D): EFBC band.
a (E): AGEF band.
b (F): AGEH band.
c (G): Kπ=10−, α=0 gfAE band (2000Ri11). Likely configuration: ν (5/2[642]+5/2[523])+ π (1/2[541]+9/2[514]); strongly supported by measured B(M1)/B(E2) ratios.
d (H): Kπ=10−, α=1 geAE band (2000Ri11). See comment on Kπ=10− signature partner band.
e (I): Kπ=5− AE band.
f (J): AF band.
g (K): AGBC band. Large alignment, consistent with four–quasineutron structure.

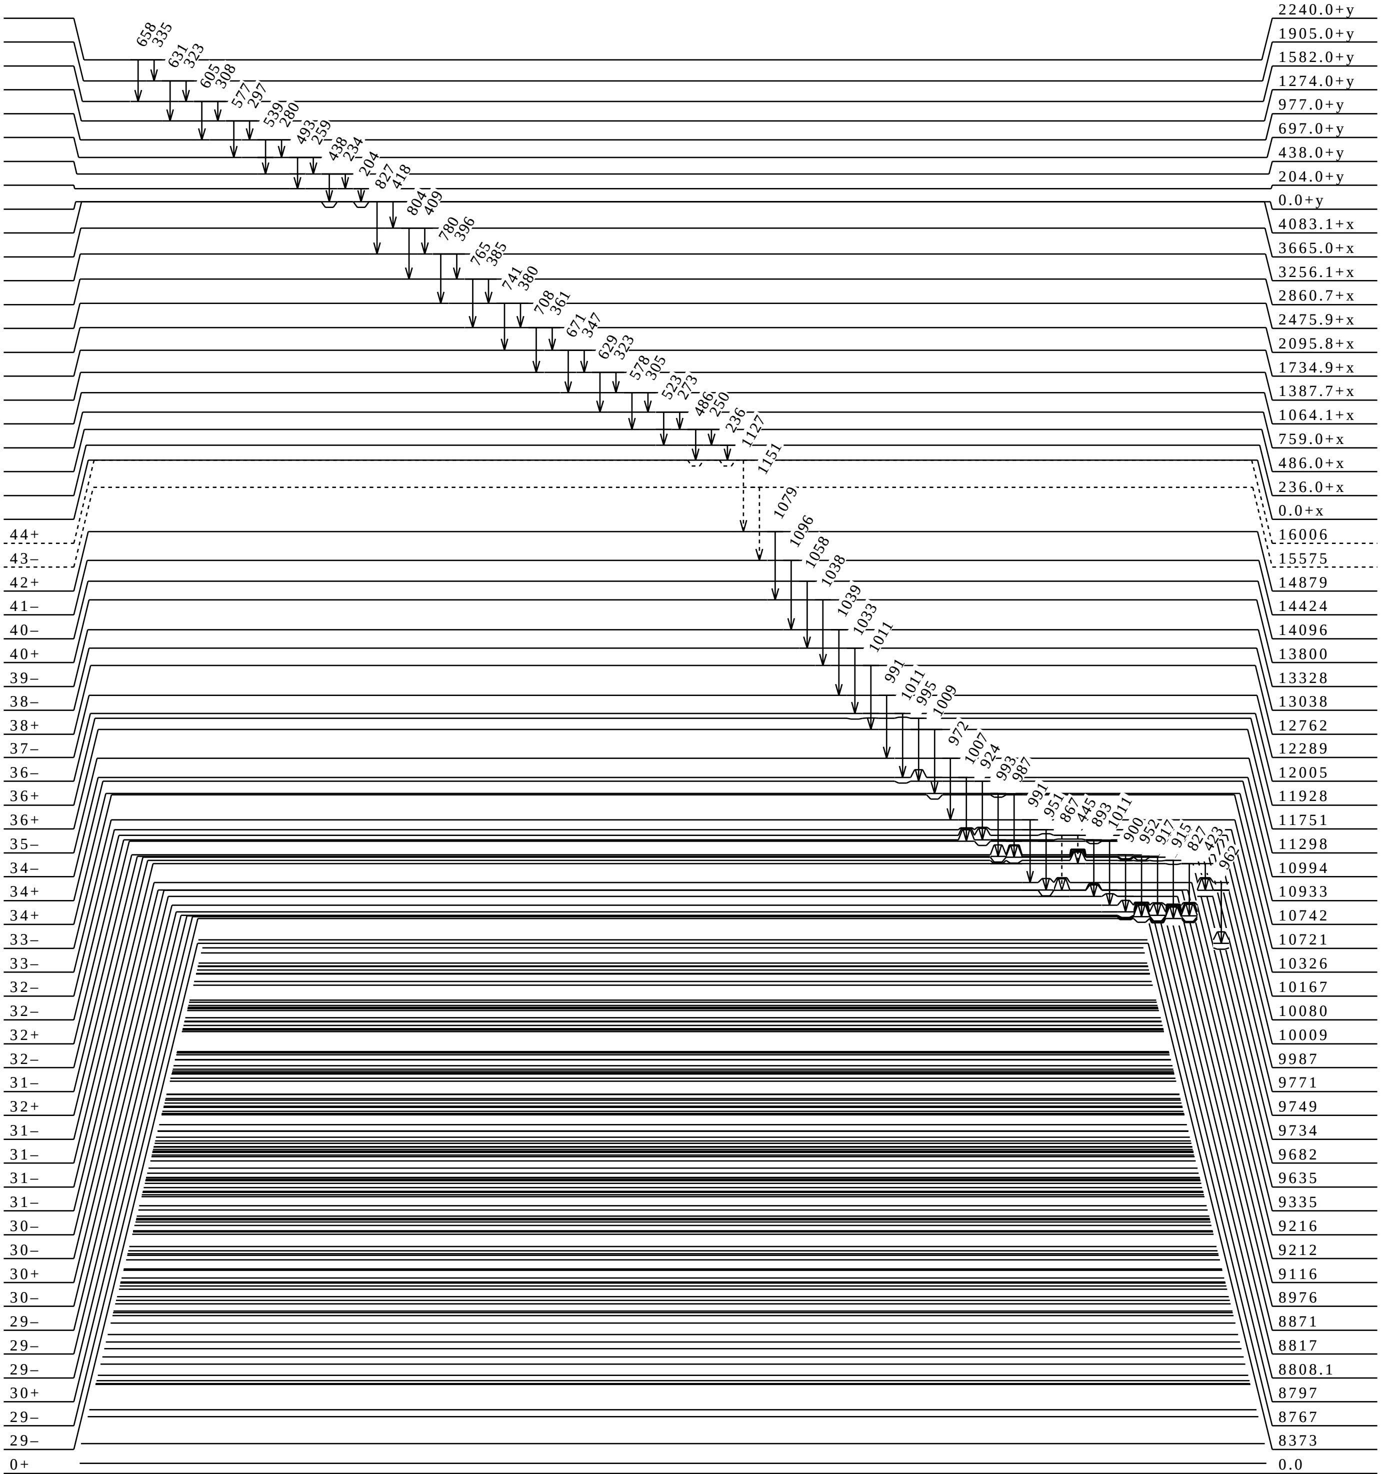
Level Scheme



$^{166}_{72}Hf_{94}$

(HI,xnγ) 1987Bl06,1983Ag01,1977Bo14

See separate data set for information from ^{96}Zr(^{74}Ge,4nγ).

Other: 1990JaZR (^{142}Ce(^{29}Si,5nγ), E=160 MeV; searched for large–deformation triaxiality in ^{166}Hf).

2006Mc02: ^{122}Sn(^{48}Ti,4n) E(^{48}Ti)=200 MeV; SPEEDY detector array (8 Compton–suppressed HPGe clover detectors, θ=41.5° and 138.5°); measured $T_{1/2}$ using recoil distance Doppler shift and differential decay curve method applied in coincidence mode (gate on shifted component of a feeding γ).

1987Bl06: ^{148}Sm(^{22}Ne,4n) E(^{22}Ne)=106–117 MeV; measured Eγ, Iγ, DCO ratios (30°, 90°, Q γ in gate), γγ–coin.

1983Ag01: ^{150}Sm(^{20}Ne,4n) E(^{20}Ne)=105 MeV, measured Eγ, Iγ, γγ(θ), γγ–coin. γ–ray angular correlations were measured with two Ge(Li) detectors at 10 angles between 90° and 360° with respect to the beam direction.

1977Bo14: ^{122}Sn(^{48}Ti,4n) E(^{48}Ti)=195 MeV, measured recoil distance Doppler shift, Iγ. Other measurements: 1973Ne08, 1965St03.

[†] From least−squares fit to Eγ.
[‡] From recoil distance Doppler shift measurements by 1977Bo14 and/or 2006Mc02, as indicated in comment on each level.
[§] Authors' values (1987Bl06). See Adopted Levels for evaluator's assignments.
[#] Transitions connecting the two side bands have positive anisotropies and are interpreted as mixed M1/E2 transitions (1987Bl06).
[@] (A): K=0+ g.s. band. The assignment is based on γ−angular distributions and supported by the intensity balance.
[&] (B): Side band 1. The interband transition between side band 1 and the ground−state band show angular distributions of pure stretched dipole type, most likely E1.
[a] (C): Side band 2.
[b] (D): π=+, α=0 band.
[c] (E): Super band. The assignment is based on γ(θ) and supported by intensity balance.

γ(^{166}Hf)

A_2 and A_4 normalized to the 565.8γ 10+ to 8+ E2 transition.

0.0	(2)+	A	34.4 s *5*	%ε+%β⁺=100. Assignment: ^{159}Tb(^{16}O,9n), E(^{16}O)=147 MeV, excit (1977Le08). $T_{1/2}$: from 1982Li17. Other: 32 s *3* (1977Le08). Jπ: M1+E2 126γ from 1+ 126; allowed ε decay to 2+ 159 in ^{166}Hf. The adopted Jπ=(2)+ is in conflict with a previous assignment of (2−) based, in part, on apparent ε+β⁺ feeding to 4+ and (0+) levels. The ^{166}Ta ε+β⁺ decay scheme is probably incomplete (large Q value), so the above feedings might be accounted for by as yet unobserved transitions; the strongest ε+β⁺ branches feed 2+ levels.
0.0+x#	(9−)	B		
53.6+x§ *8*	(10−)	B		
125.79 *18*	1+	A		Jπ: allowed (log *ft*=4.0) ε decay from 0+. The apparently unhindered allowed ε decay to this state and the probable (ν 5/2[523]) g.s. for ^{165}W suggest that the configuration for the ^{166}Ta(126 level) includes the (π 7/2[523]) orbital.

Adopted Levels, Gammas (continued)

^{166}W Levels (continued)

† From least–squares adjustment of Eγ, assigning ΔE_γ=1 keV to Eγ values to which the authors did not assign an uncertainty.
‡ Based on measured transition multipolarities and band structure deduced in (HI,xnγ) studies, supported by cranked shell model calculations of 1992Si12 and systematics of band properties in neighboring nuclides.
§ A cascade of stretched Q intraband transitions exists between the J=18 and the J=0 band members; the 0+ g.s. is the band head, and an E2 353γ links the J=2 and 0 members. Definite Jπ values have, therefore, been assigned below the first band crossing (i.e., to J=0 through 10 band members).
# (A): Kπ=0+ yrast band (1992Si12). Becomes (ν 3/2[651])^2 band at ħω=262 *4* keV.
@ (B): (ν 3/2[651])(ν 3/2[521]), α=+1/2 band (1992Si12). Crossed by 4 quasineutron (3/2[651])^2(3/2[521])(1/2[660]) band at ħω=348 keV *4*. (AE band crossed by AEBC band). Stretched dipole interband transitions link this band to the 0+ g.s. band. Many of the intraband cascade transitions are stretched Q. π=– consistent with systematics of the odd–parity sidebands in heavier W nuclei.
& (C): (ν 3/2[651])(ν 3/2[521]), α=–1/2 band (1992Si12). Crossed by 4 quasineutron (3/2[651])^2(3/2[521])(1/2[660]) band at ħω=336 keV *4*. (AF band crossed by AFBC band).

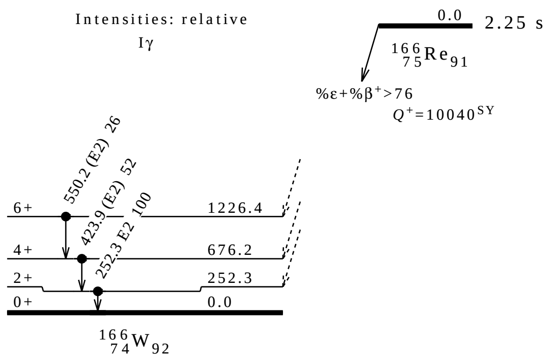
^{166}Re ε Decay 1992Me10 (continued)

Decay Scheme



^{170}Os α Decay 1996Pa01,1995Hi02,1982En03

Parent ^{170}Os: E=0; Jπ=0+; $T_{1/2}$=7.37 s *18*; Q(g.s.)=5539 *3*; %α decay=9.5 *10*.
^{170}Os–%α decay: from weighted average of %α(to ^{166}W g.s.)=12 *1* (1982En03), 8.6 *6* (1996Pa01), 10 *3* (2004GoZZ). The unweighted average is 10.2 *10*. Others: %α=3 estimated by 1978Sc26 based on comparison of measured α intensities and calculated excitation function for reaction producing ^{170}Os; %α=5 *1* (1995Hi02, assuming 162γ and 216γ in ^{170}Re are M1), or %α=9 *2* (1995Hi02, neglecting internal conversion of 162γ and 216γ).
Parent $T_{1/2}$=7.37 s *18* from weighted average of 7.2 s *2* (2004GoZZ, α(t)) 9.0 s *10* (1996Pa01), 7.9 s *3* (1995Hi02, from α(t)), 8.5 s *5* (1995Hi02, from 216γ(t)), 9.3 s *16* (1995Hi02, from 162γ(t)), 6.9 s *8* (1984Sc06), 7.1 s *2* (1982En03), 7.1 s *5* (1972To06). Other: 4.0 s *2* (1978Sc26). The unweighted average is 7.9 s *3*.

^{166}W Levels

E(level)	Jπ	$T_{1/2}$	Comments
0.0	0+	19.2 s *6*	Jπ,$T_{1/2}$: from Adopted Levels.

α radiations

Eα	E(level)	Iα†§	HF‡	Comments
5407.1 *24*	0.0	97 *3*	1.0	Eα: weighted average of 5410 *5* (2004GoZZ), 5407 *10* (2002Ro17), 5408 *15* (2002Ro17), 5403 *7* (1995Hi02), 5393 *8* (1984Sc06), 5411 *4* (1982De11), 5405 *10* (1982En03), 5403 *10* (the 5400 *10* datum of 1972To06, after adjustment by 1991Ry01). Other Eα: 5400 *10* (1978Sc26) for line with discrepant $T_{1/2}$. Eα=5406 *3* implies Q(α)=5537.4 *24* cf. 5539 *3* in 2003Au03.

† This is the only α observed. Were there a 5161α to the 2+ 252 level of ^{166}W, the requirement that HF exceed 1 implies that its intensity must be <6% of all ^{170}Os α decays. Consequently, the evaluator adopts 97 *3* for I(g.s.)/Iα(total).
‡ r_0=1.560 *6* from HF=1 for α to ^{166}W g.s., consistent with r_0 systematics for W.
§ For α intensity per 100 decays, multiply by 0.095 *10*.

^{106}Pd(^{63}Cu,p2nγ) 1992Si12

1992Si12 (supersedes 1990HaZP): E(^{63}Cu)=285, 290 MeV; self–supporting foil targets. POLYTESSA array (20 Ge detectors with BGO suppression shields), θ=101°, 117°, 143°, recoil separator; measured Eγ, Iγ, γγ coin, recoil–γ coin, DCO ratios (Iγ(40°,40°)/Iγ(40°,79°) and, from recoil–gated spectrum, Iγ(40°)/Iγ(79°)). TESSA3 array (16 Ge detectors with 50–element inner ball of BGO detectors), θ=30°, 60°, 90°, 120°, 150°; measured Eγ, Iγ, γγ coin, feeding transition DCO ratios Iγ(30°,30°)/Iγ(30°,90°). Cranked shell model calculations.

† Uncertainties unstated by 1992Si12.

‡ Relative photon intensity for E(^{63}Cu)=285 MeV, normalized so Iγ(423.9)=100.

§ Based on measured DCO1=Iγ(30°,30°)/Iγ(30°,90°), DCO2=Iγ(40°,40°)/Iγ(40°,79°) and/or DCO3=Iγ(40°)/Iγ(79°) recoil gated. For all three ratios, values of 0.5 and 1.0 are expected for stretched D and stretched Q (or D, ΔJ=0) transitions, respectively.

Placement of transition in the level scheme is uncertain.

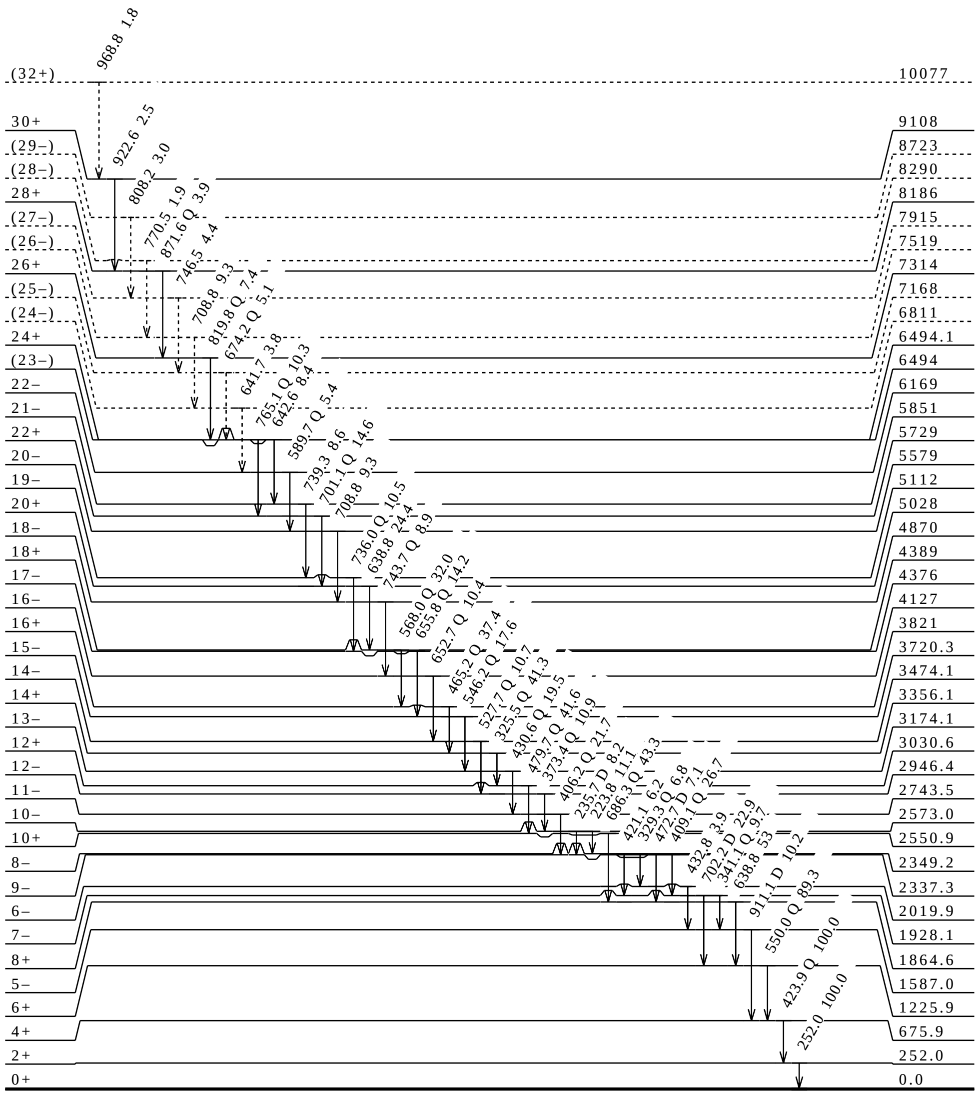
Level Scheme

Intensities: relative Iγ



$^{166}_{74}W_{92}$

Adopted Levels, Gammas

Q(β⁻)=−6410 *SY*; S(n)=9260 *SY*; S(p)=280 *SY*; Q(α)=5510 *SY* 2003Au03.
Uncertainty in Q(β⁻), S(n), S(p) and Q(α) is 90, 90, 90 and 70, respectively (2003Au03).
Q(α): 2003Au03 deduce Q(α) from Eα in ^{166}Re α−decay (1992Me10 and 1996Pa01) assuming an E(level)=150 *50* to g.s. transition. If, instead, it were a g.s. to g.s. transition, those two measurements would imply Q(α)=5657 *16*.
Assignment: ^{93}Nb(^{84}Kr,α7n), ^{89}Y(^{84}Kr,7n), E=5.1 to 5.5 MeV/u and 5.8 to 6.4 MeV/u, excit (1978Sc26); ^{141}Pr(^{32}S,pxn), E=204 MeV, excit (1992Me10).

^{166}Re Levels

Cross Reference (XREF) Flags

A ^{170}Ir α Decay (0.87 s)
B ^{170}Ir α Decay (811 ms)

E(level)†	Jπ	XREF	$T_{1/2}$	Comments
0.0	‡	A	2.25 s§ *21*	%α<24; %ε+%β⁺>76. %α: both α decay and ε decay have been observed, but the branching has not been measured. Based on a comparison of excitation function data for the various nuclides they studied, 1978Sc26 estimate 30≤%α(^{166}Re)≤100. However, based on $T_{1/2}$ and assuming r_0(^{162}Ta)=1.562 *3* (unweighted average of r_0=1.567 *24* (^{160}Hf), 1.556 *16* (^{162}W), 1.563 *11* (^{164}W) from 1998Ak04), %α<24 for HF>1 if a g.s. to g.s. transition is assumed and %α<6 if Q(α)=5510 *70* from 2003Au03; further, if this is an unhindered decay, HF<4 would imply %α>6 or >1.35 respectively, for these two Q(α) possibilities. The evaluator adopts an upper limit of 24 for %α, implying %ε+%β⁺>76 since p decay is not expected (S(p)>0 from 2003Au03). The much higher estimate of %α in 1978Sc26 might be unreliable due to the similarity of both Eα and $T_{1/2}$ for the ^{166}Re and ^{165}Re decays.
0.0+x		B		E(level): it is not known whether this is the g.s. or an excited state.
0.0+y	(3−)	A		E(level): this may or may not be the g.s.; if it is, y=0. However, a comparison of Eα from low−spin ^{170}Ir α decay with Q(α) from systematics (2003Au03) suggests that it is not. Jπ: α decay is possibly unhindered (HF=4.4 *18*) from (3−) low−spin isomer in ^{170}Ir.
53+x		B		E(level): an alternative value of 69+x is possible because the order of the 53γ and the 69γ has not been established. π probably opposite to π(0+x) level based on (E1) 53γ to 0.0+x level.
65+x		B		π probably same as π(0+x) level based on (E1) 110γ from 175+x level.
75+x		B		E(level): 70+x 14 from energy difference between possible α group feeding this level and the 6121α feeding the 0+x level. π probably same as π(0+x) level based on (M1) 75γ to 0.0+x level.
122+x		B		E(level): 117+x 12 from energy difference between possible α group feeding this level and the 6121α feeding the 0+x level. π probably opposite to π(0+x) level based on (E1) 122γ to 0.0+x level.
175+x		B		E(level): 174+x 14 from energy difference between possible α group feeding this level and the 6121α feeding the 0+x level. π probably opposite to π(0+x) level based on (E1) 175γ to 0.0+x level.

† From Eγ, except as noted.
‡ The lowest−energy orbitals available for the 75th proton are probably 1/2[411] ($d_{3/2}$) and 9/2[514] ($h_{11/2}$) based on possible Jπ=(1/2+) and (9/2−) for the g.s. of ^{165}Re and ^{167}Re, respectively; the lowest−energy neutron orbital available to the 91st neutron is probably 5/2[523] ($f_{7/2}$) based on Jπ=(5/2−) for the g.s. of the isotone ^{165}W (1995Hi02). If the deformation is large enough for the Gallagher−Moszkowski rule to be valid, low−lying 3− and 7+ states might be expected, but no low−lying isomeric excited state has been identified in ^{166}Re as yet. ε decay to ^{166}W indicates an intensity imbalance at each of the 2+, 4+ and 6+ levels observed so far; this is probably the result of a very incomplete decay scheme, so this provides no useful indication of Jπ(g.s.) for ^{166}Re. The possibility that the 0+x or the 0+y level is, in fact, the g.s. cannot be ruled out.
§ Weighted average of 2.23 s *27* from 252γ(t) and 2.28 s *34* from 424γ(t) in ε decay (1992Me10). Other data: 2.2 s *4* (1978Sc26, for Eα=5495 *10*); 1.9 s *11* (1992Me10, for Eα=5501 *13*; however, A=165 contribution cannot be ruled out); the Eα=5506 *10*, 2.4 s *6* line assigned by 1981Ho10 to ^{165}Re has $T_{1/2}$ and Eα consistent with those for ^{166}Re (to which 1978Sc26 assign their 5495 *10* line and 1982De11 assign their 5527 *4* line) but 1996Pa01 confirm its assignment to ^{165}Re. $T_{1/2}$=2.8 s *3* (1984Sc06, for Eα=5372 *10*) was assigned by those authors to ^{166}Re, but neither 1992Me10 nor 1996Pa01 see this line so the evaluator presumes it to have been misassigned. Note that the assignment of this $T_{1/2}$ to the ^{166}Re g.s. here is at variance with the assumption in 2003Wa32 that the observed ^{166}Re α decay takes place from an excited state, unless both states have comparable $T_{1/2}$.

Adopted Levels, Gammas (continued)

γ(^{166}Re)

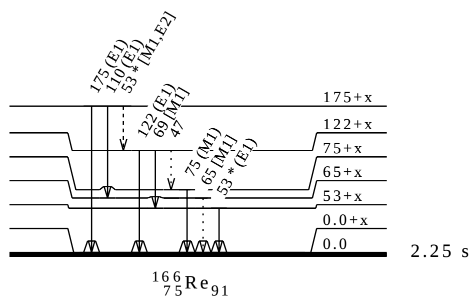
E(level)	Eγ†	Mult.‡	α	Comments
53+x	53§	(E1)	0.410	See comments on 53γ from 175+x level.
65+x	(65)	[M1]	3.12	Eγ,Mult.: γ expected to form a cascade with 110γ to 0+x level in ^{170}Ir α decay (811 ms); may be a highly–converted transition because transition is not evident in relevant α–γ coin spectrum, so 2007Ha45 suggest M1 multipolarity, consistent with level scheme.
75+x	75	(M1)	11.75	Mult.: suggested in ^{170}Ir α decay (811 ms) based on 6053α–γ coin spectrum which includes significant I(K x ray) attributed to internal conversion of the 75γ; analogous to authors' observations for known M1 92γ from ^{171}Re α decay.
122+x	(47)			Eγ: highly tentative; however, observation of 2007α–75γ coin (2007Ha45) suggests the existence of a transition connecting the 122+x and 75+x levels and such a transition may be too highly converted to be seen in α–γ coincidence spectrum. Level scheme implies Δπ=(yes), suggesting a multipolarity of M2 or higher.
	69	[M1]	2.62	
	122	(E1)	0.229	Mult.: since I(75γ)/I(Kα x ray) in ^{170}Ir α decay (811 ms) is approximately the same in spectra gated by the 6053α and by the 6007α, 2007Ha45 conclude that the 122γ is probably E1 since it provides no significant contribution to K x ray peak's intensity via internal conversion.
175+x	53§#	[M1,E2]	40 *40*	This second placement of 53γ is suggested by energy difference between 175γ and 122γ that deexcite the same level. Mult.: assumed, based on level scheme; however, I(53γ)/I(122γ) in ^{170}Ir α decay (811 ms) is approximately the same in the spectra gated by 5951α or by the 6007α (2007Ha45). Authors favor M1 multipolarity for this component and E1 for the other.
	110	(E1)	0.300	Mult.: based on an argument similar to that used by 2007Ha45 to assign multipolarity to 122γ.
	175	(E1)	0.0906	Mult.: based on an argument similar to that used by 2007Ha45 to assign multipolarity to 122γ.

† From ^{170}Ir α decay (811 ms); uncertainties unstated by authors.
‡ Very tentative values from arguments based on γ and K x ray intensities in α–γ coin spectra in ^{170}Ir α decay (811 ms), except as noted.
§ Multiply placed.
# Placement of transition in the level scheme is uncertain.

Adopted Levels, Gammas (continued)

Level Scheme

* Multiply placed



^{170}Ir α Decay (0.87 s) 2004GoZZ,2002Ro17,1996Pa01

Parent ^{170}Ir: E=0.0; Jπ=(3−); $T_{1/2}$=0.87 s *+18−12*; Q(g.s.)=6110 syst; %α decay=5.2 *17*.
^{170}Ir−%α decay: from %α=5.2 *17* for 5815α in 2002Ro17.
1996Pa01: ^{170}Ir produced in 354 MeV ^{70}Ge bombardment of ^{106}Cd; measured Eα, α(t), parent−daughter α correlations.
2002Ro17: ^{170}Ir produced by α decay of ^{174}Au; Si strip detector; measured Eα, parent−daughter α correlations, $T_{1/2}$ for ^{170}Ir.
2004GoZZ: ^{170}Ir from α decay of ^{174}Au produced by ^{92}Mo(^{84}Sr,pn) at E=390, 395 MeV; fragment mass analyzer and double−sided Si strip detector (for recoils and decay α particles) surrounded by 4 Ge detectors and a low−energy photon spectrometer; recoil decay tagging technique; measured Eα, Iα, recoil−α−γ coin, α(t), parent−daughter α correlations.
^{170}Ir α decay: please see summary tabulation of data from the two known ^{170}Ir isomer decays at the beginning of the ^{170}Ir α decay (811 ms) data set.
Adopted low−spin parent $T_{1/2}$: 0.87 s *+18−12* from 5815α(t) (2002Ro17). It is unclear whether any other observed α from ^{170}Ir also originates from the low−spin isomer. Eα=6045 *10* and Eα=6030 *10* (1978Sc26) each has a compatible $T_{1/2}$, but the 5815α, the only α from low−spin ^{170}Ir reported by 2002Ro17 or 2004GoZZ, was absent in the study by 1978Sc26. Eα=6027 *5* (1982De11) may be the same line that 1978Sc26 reported, but $T_{1/2}$ was not measured. The evaluator considers the 6045α, 6030α and 6027α to be of uncertain parentage.

^{166}Re Levels

E(level)	Jπ	Comments
0+x	(3−)	E(level): this may or may not be the g.s.; comparison of Eα with Q(α) from systematics (2003Au03) suggests that it is not. Jπ: α decay possibly unhindered from low−spin (3−) ^{170}Ir.

α radiations

Eα	E(level)	Iα‡	HF†	Comments
5815 *4*	0+x	100	4.4 *18*	Eα: weighted average of 5815 *10* (2002Ro17) and 5815 *5* (2004GoZZ). This Eα would imply Q(α)=5955 *4* were this a g.s. to g.s. transition; this is 150 keV lower than 6110 *50* from systematics in 2003Au03. Correlated with α from low−spin isomer of ^{174}Au (2002Ro17, 2004GoZZ).

† r_0=1.5602 *23*, the unweighted average of r_0(^{166}W)=1.555 *9* and r_0(^{166}Os)=1.565 *3* (from this evaluation), and r_0(^{164}W)=1.563 *11* and r_0(^{168}Os)=1.558 *8* from 1998Ak04.
‡ For α intensity per 100 decays, multiply by 0.052 *17*.

^{170}Ir α Decay (811 ms) 2007Ha45,2004GoZZ,1996Pa01

Parent ^{170}Ir: E=0.0+x; Jπ=(8+); $T_{1/2}$=811 ms *18*; Q(g.s.)=6110 syst; %α decay=38 *5*.
^{170}Ir–%α decay: from weighted average of %α=36 *10* (1996Pa01) and %α=39 *6* (2004GoZZ). Note, however, that Eα values reported by 1996Pa01 and 2004GoZZ for one strong α differ from values from 2007Ha45.
Others: 1977Ca23, 1978Ca11, 1978Sc26, 1982De11, 2002Ro17.
1996Pa01: ^{170}Ir produced in 354 MeV ^{70}Ge bombardment of ^{106}Cd; measured Eα, parent–daughter α correlations.
2002Ro17: ^{170}Ir produced by α decay of ^{174}Au; Si strip detector; measured Eα, parent–daughter α correlations, $T_{1/2}$ for ^{170}Ir.
2004GoZZ: ^{170}Ir from α decay of ^{174}Au produced by ^{92}Mo(^{84}Sr,pn) at E=390, 395 MeV; fragment mass analyzer and double–sided Si strip detector (for recoils and decay α particles) surrounded by 4 Ge detectors and a low–energy photon spectrometer; recoil decay tagging technique; measured Eα, Iα, recoil–α–γ coin, α(t), parent–daughter α correlations.
2007Ha45: ^{170}Ir source from ^{112}Sn(^{60}Ni,pn), E(^{60}Ni)=266 MeV; 93% enriched, self–supporting target; JUROGAM spectrometer (43 EUROGAM type Compton–suppressed HPGe detectors) for prompt–γ detection; fusion–evaporation products selected using RITU gas–filled recoil separator and GREAT spectrometer (2 double–sided Si strip detectors, a multiwire proportional avalanche counter and an array of 28 Si PIN diode detectors); Ge detector near RITU focal plane to detect isomeric γ decay; measured Eγ, Eα, α–γ coin, γγ coin, α–recoil correlated γγ coin; Iγ and Iα not enumerated.

Summary of ^{170}Ir α decay data (for both isomers):

Eα	%α(Ir)	Half–life		Reference(s)	Correlation(s)
5815 *10*	5.2 *17*	0.87 s *+18–12*	L	2002Ro17	^{174}Au(6538α)
5815 *5*	–	–	L	2004GoZZ	^{174}Au(6547α)

^{166}Re Levels (continued)

E(level)†	Comments
122+x	Other E: 119+x 12 from energy difference between α group feeding this level and the possible 6121α feeding the 0+x level.
175+x	Other E: 174+x 14 from energy difference between α group feeding this level and the possible 6121α feeding the 0+x level.

† From least–squares fit to Eγ.

α radiations

Eα	E(level)	Comments
5951 *10*	175+x	Eα: reported by 2007Ha45 only. Coincident with 110γ and 175γ as well as 53γ, 75γ and 122γ.
6005 *7*	122+x	Eα: weighted average of 6003 *10* (1996Pa01) and 6007 *10* (2007Ha45). Other: 6010 *10* (1977Ca23, 1978Ca11); however, this α has $T_{1/2}$=1.1 s *2*, somewhat longer than value adopted for ^{170}Ir high spin isomer. 6003α correlated with 5533α from ^{166}Re (1996Pa01). Strong coincidence with 122γ as well as 53γ, 69γ, 75γ (2007Ha45).
6053 *10*	75+x	Eα: from 2007Ha45. Other Eα: 6088 *5* (2004GoZZ), 6083 *11* (1996Pa01), 6082 (2002Ro17); the inconsistency between these data and the adopted Eα=6053 *10* is troubling and unexplained. Correlated with 6544α from ^{174}Au (1996Pa01); correlated with 6433α, 6471α and 6618α from high–spin ^{174}Au (2004GoZZ). No correlation with α decay from ^{166}Re was observed (1996Pa01). Coincident with 75γ and Re K x ray.
6121# *10*	0.0+x	Eα: from 2007Ha45 only; shown as tentative because authors cannot rule out the possibility that this is a sum peak arising from 6053α+ce(L)(75γ) and/or 6007α+ce(L)(122γ). No coincidence with γ or Re(K x ray) observed by 2007Ha45.

Existence of this branch is questionable.

γ(^{166}Re)

Eγ†	E(level)	Mult.	α	Comments
(47)	122+x			Eγ,Mult.: highly tentative γ; however, observation of 6005α–75γ coin (2007Ha45) suggests the existence of a transition connecting the 122+x and 75+x levels and such a transition may be too highly converted to be seen in the α–γ coincidence spectrum. However, level scheme suggests Δπ=(yes) so multipolarity of M2 or higher may be implied.
53‡	53+x	(E1)	0.410	α(L)=0.317 *5*; α(M)=0.0732 *11*; α(N+..)=0.0199 *3*. α(N)=0.01723 *25*; α(O)=0.00258 *4*; α(P)=0.0001057 *15*. See comments on 53γ from 175+x level.
	175+x	[M1,E2]	40 *40*	α(L)=28 *24*; α(M)=7 *6*; α(N+..)=1.9 *17*. Mult.: assumed, based on level scheme; however, I(53γ)/I(122γ) is approximately the same in the spectra gated by the 5951α and by the 6007α (2007Ha45). Authors favor M1 multipolarity for this component and E1 for the other. This second placement of 53γ is suggested by energy difference between 175γ and 122γ (2007Ha45).
(65)	65+x	[M1]	3.12	α(L)=2.41 *4*; α(M)=0.551 *8*; α(N+..)=0.1578 *22*. α(N)=0.1337 *19*; α(O)=0.0225 *4*; α(P)=0.001638 *23*. Mult.: expected by 2007Ha45 to form a cascade with 110γ to 0+x level. γ is absent in 5951α–γ spectrum; this may indicate significant conversion, and authors suggest M1 multipolarity, consistent with level scheme.
69	122+x	[M1]	2.62	α(L)=2.02 *3*; α(M)=0.463 *7*; α(N+..)=0.1325 *19*. α(N)=0.1123 *16*; α(O)=0.0189 *3*; α(P)=0.001376 *20*. Eγ,Mult.: Eγ coincides with energy of Kβ x ray(Re) but peak is too strong relative to Kα x ray in 6007α–γ coin spectrum to be attributed entirely to Re Kβ x ray. Authors tentatively suggest M1 multipolarity based on the level scheme.
75	75+x	(M1)	11.75	α(K)=9.70 *14*; α(L)=1.588 *23*; α(M)=0.363 *5*; α(N+..)=0.1039 *15*. α(N)=0.0880 *13*; α(O)=0.01479 *21*; α(P)=0.001079 *16*. Mult.: suggested by 2007Ha45 based on 6053α–γ coin spectrum which includes significant I(K x ray) attributed to internal conversion of the 75γ; analogous to authors' observations for known M1 92γ from ^{171}Re α decay.

Continued on next page (footnotes at end of table)

† From least−squares fit to adopted Eγ.
‡ Values given without comment are based on band structure deduced in ^{106}Cd(^{64}Zn,2p2nγ), similarities of band structure to that in ^{168}Os and on measured γ asymmetry.
§ Definite Jπ assigned for J≤10 g.s. band members based on Jπ=0+ for even−even nucleus g.s., mult=E2 for the J=2 to 0 432γ and stretched Q character for several other intraband transitions.
\# (A): Yrast band (2002Ap03). g.s. band crossed at ħω=0.30 MeV (with 11 ħ gain in alignment) by ν $i_{13/2}^2$ band (2002Ap03).
@ (B): Kπ=(3−), α=1 band (2002Ap03). Bandhead deexcites to J=2 and 4 members of g.s. band; structure of band appears to be similar to that of a 3− band in ^{168}Os. Possible configuration: ν ($i_{13/2}$)($h_{9/2}$,$f_{7/2}$).
& (C): π=(−), α=0 band (2002Ap03). Very weak band decaying through the (3−) band, analogous to a side band known in ^{168}Os; on this basis, authors tentatively assign π=− and even spin. Possible configuration: ν ($i_{13/2}$)($h_{9/2}$,$f_{7/2}$).

Adopted Levels

Q(β⁻)=–8410 *SY*; S(n)=9650 *SY*; S(p)=–1152 *8*; Q(α)=6724 *6* 2003Au03.
Uncertainty in Q(β⁻) and S(n) is 540 and 300 (2003Au03).
Assignment: targets of elements from Mo through Sn and V through Ni were irradiated with beams of ^{58}Ni and ^{107}Ag, respectively. Specific beam energies were in the range between 4.4 MeV/U and 5.9 MeV/U. Velocity filter, ion implantation in Si (surface–barrier and position–sensitive) detectors (1981Ho10,1981HoZM); ^{58}Ni bombardment of ^{112}Sn, E=297 MeV (1996Pa01).

^{166}Ir Levels

Cross Reference (XREF) Flags

A ^{170}Au α Decay (0.29 ms)
B ^{170}Au α Decay (0.62 ms)

E(level)	Jπ†	XREF	$T_{1/2}$	Comments
0.0	(2–)	A	10.5 ms *22*	%α=93 *3* (1997Da07); %p=7 *3* (1997Da07). %α: from 1997Da07. 99% calculated by 1981HoZM. Only α decay was investigated by 1981Ho10. Jπ: $d_{3/2}$ proton emission observed from level (1997Da07). Probable configuration=(π $d_{3/2}$)⊗(ν $f_{7/2}$); the Nordheim strong rule predicts that the lowest energy state for this configuration will have Jπ=2– (1997Da07) (possibly (π 3/2[402]–ν 7/2[514]) at small prolate deformation). $T_{1/2}$: 10.5 ms *22* from 1997Da07 (6565α(t)). Others: 17 ms *+12–5* (2004Ke06), 12 ms *1* (1996Pa01, 6556α(t)), >5 ms (1981Ho10).
172 *6*	(9+)	B	15.1 ms *9*	%α=98.2 *6* (1997Da07); %p=1.8 *6* (1997Da07). E(level): from 1997Da07, based on measured E(p)=1316 *8* and 1145 *8*, respectively, to ^{165}Os g.s. from this level and from ^{166}Ir g.s. (uncertainty takes into account the cancellation of systematic uncertainty included in quoted E(p)). $T_{1/2}$: from 6561α(t) (1997Da07). Other: 14.3 ms *+19–15* (2004Ke06) from 6545α(t). Jπ: $h_{11/2}$ proton emission observed from level (1997Da07). Probable configuration=(π $h_{11/2}$)⊗(ν $f_{7/2}$); the Nordheim weak rule favors Jπ=9+ or possibly 2+ (which should not be isomeric) for the lowest energy state for this configuration (1997Da07) (possibly π 11/2[505]+ν 7/2[514] at small prolate deformation).

† Based on a comparison between measured and calculated partial half–lives for proton emission to (7/2–) ^{165}Os, 1997Da07 conclude that the odd proton occupies the $d_{3/2}$ orbital in ^{166}Ir(g.s.) (L=2 proton emission) and the $h_{11/2}$ orbital in ^{166}Ir(172 level) (L=5 proton emission). At very small deformation, the 89th neutron is expected to occupy an $f_{7/2}$ orbital.

^{170}Au α Decay (0.29 ms) 2004Ke06

Parent ^{170}Au: E=0.0; Jπ=(2–); $T_{1/2}$=0.29 ms *+5–4*; Q(g.s.)=7170 *10*; %α decay=11 *10*.
^{170}Au–%α decay: based on %p(^{170}Au)=89 *10* (2004Ke06).
2004Ke06: source from ^{96}Ru(^{78}Kr,p3n), E(^{78}Kr)=385 MeV; tof and energy–loss gas detector and position–sensitive focal plane detector; observed correlated recoil–proton–α decay chain; measured $T_{1/2}$, %p, Eα for ^{170}Au α decay, α–α correlations (2004Ke06).
Parent Jπ: unhindered (HF<4) α decay to (2–) ^{166}Ir.

Eα	E(level)	Iα‡	HF†	Comments
7107 *6*	172	100	2.6 *4*	Eα: from 2004Ke06. Other Eα: 7056 *15* (2002Ma61); reason for discrepant value is unknown. Iα: only one α group has been observed. Correlated with known excited–state α decays from ^{166}Ir, ^{162}Re and ^{158}Ta (2004Ke06).

† If r_0=1.56 *1*, estimated from r_0(^{164}Os)=1.554 *17* (1998Ak04), r_0(^{166}Os)=1.5638 *12* (this evaluation), r_0(^{168}Pt)≈1.55; r_0(^{166}Pt) not known; Q(α)=7170 *10* (from Eα=7001 *10* for g.s. to g.s. decay); $T_{1/2}$=0.62 ms *+5−4* from combination of p(t) and α(t) data (2004Ke06) (other value: 0.57 ms *+31−15* (2002Ma61)).
‡ For α intensity per 100 decays, multiply by 0.42 *5*.

Adopted Levels

S(p)=460 *SY*; Q(α)=7286 *15* 2003Au03.
ΔS(p)=550 (2003Au03).
Production: $^{92}Mo(^{78}Kr,X)$, E=357,384 MeV; $^{96}Ru(^{78}Kr,2n2p)$, E=420 MeV. Measured $T_{1/2}$, Eα (1996Bi07).

^{166}Pt Levels

E(level)	Jπ	$T_{1/2}$	Comments
0.0	0+	300 μs *100*	%α=100. Jπ: g.s. of even–even nucleus. $T_{1/2}$: from 1996Bi07.
